

ABSTRACTS

The Gerontological Society of America
62nd Annual Scientific Meeting
November 18–22, 2009
Atlanta, GA

Abstracts are arranged numerically by session and in the order of presentation within each session.

SESSION 5 (PAPER)

AGING AND TECHNOLOGY: FRIENDS

PROTOTYPE GOOGLE MAPS WEB SITE TO SELECT NURSING HOMES: USABILITY TESTING BY OLDER ADULTS

B. Xie¹, G. Pearson², 1. *College of Information Studies, University of Maryland, College Park, Maryland*, 2. *National Library of Medicine, Bethesda, Maryland*

The National Library of Medicine of the National Institutes of Health is developing a web site – called “Nursing Home Screener” (NHS) – for quick and convenient screening of U.S. nursing homes by the public. NHS incorporates Google Maps to display nursing home locations and quality ratings. Such applications of electronic maps are gaining in popularity, facilitated by increasing adoption of broadband Internet access. We report a usability study of a prototype NHS site conducted in April of 2008. The study took place at a health-related computer training class for older adults in a Maryland public library. Participants were ten adults between 57 and 83 years of age ($M=69.75$, $SD=7.87$) with little prior computer experience. Data were collected from interviews, surveys, and observation. Overall, participants felt positive about the information potentially available from NHS, yet less positive about the site’s navigation and information presentation. The map page was particularly puzzling to the majority of these older adults. Lack of knowledge and skills, age-related declines in vision and fine motor skills, prototype shortcomings, and the public library setting all contributed to participants’ difficulties in using NHS. Based on the test findings, we suggest design and training accommodations to facilitate older adults’ adoption and use of Web map applications. Specific simplifications, choice of controls, and alternative ways of presenting search results are proposed. These findings have been applied to a NHS redesign as it heads towards a beta release, and have implications for designing electronic maps for older adults beyond the nursing home domain.

THE RELATIONSHIP BETWEEN COMPUTER GAME CONTENT AND INTERACTION RELATIVE TO OLDER ADULTS

H.R. Marston, P. van Schaik, C. Fencott, *School of Computing, University of Teesside, Middlesbrough, United Kingdom*

The evolution of computer gaming since the 1960’s has significantly evolved forming an entertainment medium which for many is perceived as a young persons pastime and life style. Would older adults consider playing games with their children/grandchildren or within social networks given the current technology and game content? This study investigated the notion of game content and interaction in two phases, the first through a step-by-step approach of individuals designing their own game idea related to a hobby or interest, the second through playing three games from the sports genre on one of two consoles (Wii and PS2). Qualitative and quantitative data reported positive results from participants in both phase one and two. Examples of positive results from phase one included: 1) “The computer game for the elderly must encompass an exercise element and purpose;” 2) “I would like to play computer games to play with my grand-daughter;” 3) “If a game was of help to

any particular hobby I could be interested. Come a time when I am not very active, computer games could have a place in my life;” and 4) “I still think that playing games is educational and fun”. Results from participants in phase two have seen a significant response to game interaction and flow during game playing of the Nintendo Wii. The findings from this study indicate game content needs to be addressed further by the games industry and consideration of game design guidelines, to enable additional success, well-being and benefits towards older adults.

BRIGHTEN OUTCOMES: BRIDGING RESOURCES OF AN INTERDISCIPLINARY GERO-MENTAL HEALTH TEAM VIA ELECTRONIC NETWORKING TO IMPROVE PATIENT AND PROVIDER ACCESS TO MENTAL HEALTH CARE

E. Emery, A. Eisenstein, R. Golden, L. Bederow, *Rush University Medical Center, Chicago, Illinois*

Introduction: The BRIGHTEN initiative seeks to address the growing problem of undiagnosed and untreated depression in older adults through use of an interdisciplinary “virtual team.” Methods: Older adults completed a three-item depression screen in primary and specialty care clinics. Those with depression symptoms were interviewed by the BRIGHTEN Project Coordinator. A summary of the interview was sent out electronically to the virtual team for discussion and recommendations for a treatment plan. The virtual team included a social worker, psychologist, psychiatrist, primary care physician, occupational and physical therapists and nutritionist. The Project Coordinator relayed the recommendations and developed a treatment plan with the participant. Three and 6-month outcome assessments were completed. Results: 660 older adults completed screening forms, 11% pursued further evaluation; 50% of those were African American or Hispanic. The nutritionist saw the greatest number of participants. Summary scores on the SF12 for mental-health and the GDS improved significantly between enrollment and 6-month follow-up. Discussion: The BRIGHTEN project has shown that (a) providing a mechanism for assessing and treating older adults with depression and anxiety in medical practices is a critical part of care, (b) health care providers not typically associated with depression management can play an effective role in treatment activities, and (c) virtual teams are an effective mechanism for provider communication and treatment planning.

TRAINING AND DEVELOPMENT IN GLOBAL PERSPECTIVE: INSIGHTS INTO AGING WORKFORCES

T.K. McNamara¹, E. Parry², M. Pitt-Catsouphes¹, 1. *Boston College, Chestnut Hill, Massachusetts*, 2. *Cranfield University, Cranfield, United Kingdom*

As workforces age, the training and retraining practices of firms take on special importance to older workers thinking about recareering or further advancement within their current careers. From an organizational perspective, training and development of workers should lead to higher levels of organizational productivity, profitability, and innovation. However, little is known about the efficacy of various strategies for training, such as a focus on managerial or nonmanagerial workers or a focus on strengthening one training program as opposed to offering a larger variety of options, particularly the role that different age structures might

play. This paper attempts to address this gap, using the 2005 CRANET data, a survey of organizations around the world. When looking at developed economies, such as Australia, the United States, and the United Kingdom, we find that managerial and nonmanagerial workers tend to have equal access to low-cost training methods such as special tasks to stimulate learning, cross-organizational tasks, and project team work. However, higher cost methods such as networking and formal career plans are less frequently offered to nonmanagerial workers.

DIRECTION SENSE AND WAYFINDING IN MIDDLE AGE AND OLDER ADULTS: A VIRTUAL REALITY STUDY

R.L. Davis, *Kirkhof College of Nursing, Grand Valley State University, Grand Rapids, Michigan*

This study examined how gender affects place learning in older adults. Place learning, the ability to learn and remember environments is a critical cognitive function for wayfinding in new or changed environments that becomes impaired in many people with age. Some studies, conducted in humans and animals, have indicated that males are more effective at place learning tasks than females, yet there are some disparate findings. We hypothesized that men would learn environments faster and with less errors than women, and that this difference would occur in environments with different types of environmental cues. A virtual reality place learning task in which subjects were asked to find their way to a hidden target using extramaze cues was used to test this hypothesis in 131 healthy older men and women aged 55-96 years ($m=65$ years). Subjects were tested for 6 trials in 3 different cue conditions over 3 consecutive days. Results showed a significant difference in directional heading error (DHE) with respect to gender, with males having significantly less DHE ($F(1, 32)=7.95, p<.0001$), and showing a trend for a better learning curve over days ($F(2, 978)=2.92, p=.06$). Women still showed learning, but needed more time to learn. When questioned about their wayfinding strategy, more men than women used geometric information. Thus, older women are especially at risk for getting lost, and may need more time to learn environments. As women are the primary inhabitants of many senior environments, this lends important information to address, especially when environments are unfamiliar.

SESSION 10 (PAPER)

CHANGING MINDS OVER TIME

COGNITIVE CHANGES OVER TIME: A COMPARISON OF AFRICAN AMERICAN AND CAUCASIAN OLDER ADULTS

C. Flynn Longmire, J. Mintzer, *Medical University of South Carolina, Charleston, South Carolina*

Background: Studies suggest that African American (AA) elders have a higher prevalence of Alzheimer's disease (AD) and may experience patterns of cognitive changes that are different than their Caucasian (C) counterparts. The progression of AD in African American elders has not been established to the same extent that it has for Caucasian elders. Purpose: This study compares rates of cognitive change in African American and Caucasian elders with normal (N) cognitive function, mild cognitive impairment (MCI), or AD. Methods: The project includes an analysis of memory, language and executive functioning data from a five-year longitudinal study (baseline and four yearly follow-up visits) via the South Carolina Alzheimer's Disease Clinical Centers. Results: To date 100 (AA= 69, C = 31) participants have received a research diagnosis of N, MCI or AD. The median age and education are 73 and 12 years respectively. Although the two groups are generally similar, at baseline, the elders with AD varied significantly ($p=0.03$) on cognitive and functional ability with AA elders showing more impairment. Rates of cognitive change from baseline to year one will be presented at the meeting. Implications: Better understanding of the progression of Alzheimer's disease in the African American population is needed for proper diag-

nosis and treatment of the disease, ultimately minimizing the disparity in the quality of care available to African American elders.

BOTH OLFACTION AND APOE CONTRIBUTE TO DECLINE TRAJECTORIES IN NORMAL COGNITIVE AGING

D. Finkel¹, C.A. Reynolds², N. Pedersen^{3,4}, *1. School of Social Sciences, Indiana University Southeast, New Albany, Indiana, 2. University of California, Riverside, Riverside, California, 3. Karolinska Institutet, Stockholm, Sweden, 4. University of Southern California, Los Angeles, California*

Research indicates that apolipoprotein E (ApoE) plays a role in the development of Alzheimer's disease (AD) and in the normal cognitive decline associated with primary aging. More recently, researchers have found that carriers of the $\epsilon 4$ allele associated with AD also display olfactory impairments. As a result, deficits in odor identification have been interpreted as a sign of pre-diagnostic AD. In the current analyses, we investigated the contribution of ApoE and olfactory ability in decline trajectories associated with normal cognitive aging, using longitudinal data on cognitive functioning available from the Swedish Adoption/Twin Study of Aging. Data on both ApoE status and olfactory functioning were available from 448 individuals ranging in age from 42 to 88 years at the first measurement occasion. Olfactory functioning was measured via mailed survey in 1990. Cognitive function was assessed in up to 5 waves of longitudinal data covering a period of 16 years. Latent growth curve analyses incorporating olfaction and ApoE status as covariates indicated that both variables contributed to the decline trajectories for cognitive function, although ApoE explained a larger proportion of variability in decline.

LOWER EDUCATION PREDICTS STEEPER TRAJECTORIES OF COGNITIVE DECLINE

A. Watts^{1,2}, C. Prescott², M. Gatz², B. Plassman³, *1. University of Kansas, Lawrence, Kansas, 2. University of Southern California, Los Angeles, California, 3. Duke University, Durham, North Carolina*

We investigated education as a predictor of dementia and cognitive decline using data from the NAS-NRC WWII Veteran Registry and Duke Twins Study of Memory in Aging ($N=6,352$). The modified Telephone Interview for Cognitive Status (TICS-m) was used to assess cognitive decline over 4 occasions. In the entire sample, not completing high school increased risk of dementia ($OR=1.53, 95\% CI 1.09, 2.15$). Not completing high school predicted, on average, 1.7 years earlier onset of dementia ($\beta=-1.68, p=.03$). In the non-demented sample, multiple-group latent growth curve models assessed changes in TICS-m comparing individuals with <12 years of education to those with 12+ years of education. Mean age at first and last occasion were 66 and 77 respectively. Of several models tested, the best fitting was a two-piece spline in which slope 1 was estimated between occasions 1, 2, & 3 and slope 2 was estimated separately between times 3 & 4. The model fit for both groups when mean levels of baseline TICS-m score were allowed to differ. Those with less education had nearly 5 points lower baseline scores than those with 12+ years. Improved fit in subsequent models ($\Delta\chi^2/df=20/2$) suggested the group with <12 years of school had a steeper decline ($M=-0.44$) between the first 3 occasions than did those completing 12+ years ($M=+0.13$), while the groups had similar declines between occasions 3 and 4. This suggests that education delays the onset of decline. Our results are consistent with the cognitive reserve hypothesis and demonstrate disparities for those with low education.

ACTIVITY PARTICIPATION PREDICTING 4-YEAR COGNITIVE CHANGE: A COMPARISON ACROSS MID AND OLDER ADULTHOOD, AND LOW, MEDIUM, AND HIGH EDUCATION

A.A. Bielak, K. Anstey, *Ageing Research Unit, Australian National University, Canberra, Australian Capital Territory, Australia*

There is strong empirical evidence in favour of the engagement hypothesis of cognitive aging, according to which active individuals attain and maintain better cognitive ability than their inactive peers. However, there is little information regarding whether the hypothesized benefits of lifestyle engagement are present in mid-life to the same degree as in late-life, and whether they vary according to educational achievement. The present study examined the differences across 2 groups of healthy adults (40-44 years at baseline; 60-64 years), and 3 levels of educational achievement (≤ 12 years; 13-15 years; ≥ 16 years) in whether baseline activity participation could predict 4-year cognitive change. 4541 participants from the PATH Through Life Project completed a range of cognitive tasks at baseline and follow-up, and reported their participation in 50 lifestyle activities over the past 6 months. Regression based models covarying for baseline cognitive test score, physical and mental health, sex, and occupational status were conducted for each Age X Education group. Those 60-64 years with low education had the greatest number of significant activity effects predicting 4-year cognitive change (e.g., processing speed, R^2 change = .015, $p < .001$), and greater activity participation was associated with a higher cognitive score at follow-up. Activity effects were also present in the mid-life cohort and in high education groups, but the pattern of findings were inconsistent for these groups. Therefore, activity may confer the greatest benefit for older adults with low levels of education.

EARLY LIFE CHARACTERISTICS, PSYCHIATRIC HISTORY, AND COGNITIVE FUNCTION IN LATER LIFE

M. Brown, *Center for Policy Research, Syracuse University, Syracuse, New York*

Advocates of the life course perspective suggest that a history of psychiatric problems might be particularly detrimental for later life cognitive functioning among individuals whose early life characteristics (poor childhood health or low SES) place them at risk of experiencing cumulative disadvantage. While considerable attention has been paid to the relationship between later-life depression and cognitive function, the relationship between a history of psychiatric problems and cognitive function or decline in later life is not very well documented. Previous studies of relationships between childhood health, childhood disadvantage, and cognitive function in later life explore different facets of this relationship using a variety of datasets. Very few consider both childhood health and SES, include measures for psychiatric history, or use nationally representative longitudinal data. This study explores the relationships between childhood health and SES, psychiatric history, and cognitive function in later life using six waves of the Health and Retirement Study (HRS). Growth curve models are used to analyze these relationships, controlling for demographics, health behavior, and health status. Findings indicate that at age 65, individuals with a history of psychiatric problems show lower cognitive scores and steeper declines in cognitive function as they age. Childhood health appears to be unrelated to cognitive function in later life. Sex and race/ethnicity do not interact with psychiatric history. Race interacts with childhood disadvantage to affect cognitive function at age 65, but does not affect cognitive decline. These effects are partially mediated by later-life demographic, socioeconomic, or health characteristics.

SESSION 15 (PAPER)

DEMOGRAPHIC PERSPECTIVES ON AGING

HYPERTENSION PREVALENCE AND HOUSEHOLD INCOME AMONG OLDER US AND CANADIAN ADULTS

M.S. Kaplan¹, N. Huguet¹, D. Feeny³, B. McFarland², *1. Portland State University, Portland, Oregon, 2. Oregon Health & Science University, Portland, Oregon, 3. Kaiser Permanente Center for Health Research, Portland, Oregon*

Hypertension is one of the most common chronic conditions worldwide. There is strong evidence that low socioeconomic status is associated with elevated rates of blood pressure-related cardiovascular disease. Few studies have examined the association between socioeconomic circumstances and hypertension among people aged 65 years and older. The purpose of this study was to examine the relationship between household income and hypertension prevalence among elderly persons in the United States and Canada. Data were obtained 755 Canadian and 1,151 US adults aged 65 and older from the 2002-03 Joint Canada/United States Survey of Health. Aggregate hypertension prevalence rates in the United States and Canada were generally similar (52.6% versus 48.3%, $p = .09$). In the United States, lower income older adults were 1.27 times more likely (95% confidence interval 1.07 to 1.50) more likely to report hypertension than their higher income counterparts; however, there was no evidence of a gradient in the association between income and hypertension in Canada. The results demonstrate that in Canada, unlike the United States, the burden of hypertension is approximately equal for socioeconomically advantaged and disadvantaged older adults. It is important to consider these findings in the context of long-term and broader institutional policies. Social disparities in health care access and primary prevention across the age span in the United States may play a role in the higher hypertension prevalence rate among low income older adults.

TRENDS IN THE ABILITY TO WORK AMONG THE OLDER US WORKING POPULATION, 1997-2007

S. Reynolds¹, E. Crimmins², *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Southern California, Los Angeles, California*

Even before the current economic situation, the issue of the ability of older workers to continue working was a major economic issue. Eligibility for full Social Security benefits is being increased to age 67, with periodic calls to raise it to age 70. In prior work ten years ago, Crimmins and colleagues examined this issue, concluding in 1999 that workers in their 60s improved in the ability to work, enough to justify age 67 for full retirement. Because of the current economic crisis, and the imminence of the baby boomers' retirement, we re-examine trends in self-reported work disability, using the National Health Interview Surveys between 1997 and 2007, separately for men and women. Findings indicate that men's reported work disability continued to decline in the ages between 62 and 69, while women's declined only during ages 67 to 69. When examining socioeconomic subgroups, we find that men's improvement was primarily in Hispanic men between ages 60 and 64, and in nonHispanic White men at ages 65-66; among highly educated men, and those in the lowest quartile of income. In contrast, women's improvements in work disability were primarily for NonHispanic Black and White women in their late 60s, with the exception of some improvement for nonHispanic Black and Hispanic women in their early 60s. Further research needs to be done to further refine these results and examine other factors driving these minimal improvements in work disability.

OPERATIONALIZING AND MEASURING THE THIRD AGE: RACE AND GENDER DIFFERENCES IN THIRD AGE LIFE EXPECTANCY (TALE)

D.C. Carr, J. Brown, *Miami University, Oxford, Ohio*

In this presentation, we demonstrate a new approach for calculating the amount of time people can expect to spend in the third age. Extending methods used to calculate active life expectancy, third age life expectancy (TALE) measures the number of years individuals can expect to spend in the third age, and thus, the amount of time they can expect to spend in a period of probable productive engagement. We operationalize the third age in three different ways using measures of health and employment status to explore how much time people can expect to spend in this life stage by race and gender. Results suggest that different conceptualizations of the third age shape the amount of time people can expect to spend in this period across different social groups. For example, measured as a state when an individual works 20 hours per week or less and has no activities of daily living (ADL) disabilities, the proportion of remaining life lived in the third age declines for black women much earlier than for other groups with white men experiencing the latest decline. This suggests that onset of severe disability shortens the period of the third age for black women and allows white men to experience a third age similar to that described in the rhetoric surrounding this life stage. We discuss ramifications of differentially defining the third age for social policies aimed at increasing opportunities for older adults to meaningfully engage in productive roles.

LOCAL AREA CHARACTERISTICS AND HEALTH AT OLDER AGES

E.M. Vogelsang, J. Raymo, *Center of Demography and Ecology, University of Wisconsin Madison, Madison, Wisconsin*

Existing research on linkages between local area characteristics and health at older ages is limited, especially in settings such as Japan where population age structure is changing rapidly and geographic variation in the pace of population aging is striking. Using data from the 1987, 1990 and 1993 waves of the National Survey of Japanese Elderly, we examine the extent to which health is associated with the demographic and economic characteristics of the place in which respondents reside. We consider five measures of health: self-rated health, satisfaction with health, health status relative to others of the same age, a seven-item CES-D index, and a five-item measure of difficulties with activities of daily living. Preliminary analysis indicate that respondents living in cities, villages, and towns with a relatively high proportion of the population aged 65+ report significantly worse health, controlling for age, sex, marital status, and educational attainment. For example, the relative odds of being in one of the two worst categories of self-rated health (not very good or poor) were 19% higher among those living in places with a high proportion (top quintile) of residents aged 65 and above. The magnitude of this relationship is similar to that of being unmarried. Subsequent analyses will examine ways in which a wider range of local area demographic and economic characteristics are related to change in health between surveys and trajectories of health across multiple survey waves.

DETECTING FUNCTIONAL DECLINES OVER THREE YEARS: A COMPARISON OF MEASURES

P. Sawyer¹, C. Brown^{2,1}, J.M. Roseman¹, R. Allman^{2,1}, *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

This study compares the frequency of change over three years detected by four validated measures of function among community dwelling older adults. The four measures included the UAB Study of Aging Life-Space Assessment of mobility (LSA; range 0-120), Activities of Daily Living (ADLs; range 0-5), Instrumental Activities of Daily Living (IADLs; range 0-6) and the physical component score of the SF-12 (PCS; range 0-100). Baseline mobility status was categorized by LSA ≥ 60 and LSA < 60 . Baseline in-home and three-year follow-up tele-

phone assessments from the UAB Study of Aging were used to define decline in all measures (N=784). Mean age was 74.8 (54% female; 50% African American; 52% rural). 63% (N=493) had LSA ≥ 60 at baseline. Among persons with higher mobility (LSA ≥ 60), the percentage with any 3-year functional decline in LSA, PCS, IADL, and ADL was 66.1%, 40.2%, 28.4%, and 10.8%, respectively. In persons with LSA < 60 , functional declines were noted in 56.0%, 39.5%, 55.2%, 36.9%, respectively. When decline was defined as a 10-point decrease for LSA and PCS, functional decline was noted in 52.1% and 11.0%, respectively among those with LSA ≥ 60 . In those with LSA < 60 , decline was noted in 32.6% and 11.1%, respectively. All measures detected functional decline over three years regardless of baseline life-space mobility. However, LSA was more likely to detect functional decline in older adults with higher baseline mobility than the other three measures. This suggests that the LSA may be a particularly sensitive and appropriate measure for studies including higher functioning older adults.

SESSION 20 (PAPER)

FROM THE CRIB TO HEALTHY AGING: LIFECOURSE ISSUES

CHILDHOOD DISADVANTAGE AND HEALTH DECLINES OF CHINESE ELDERLY

D. Lowry, A. Zajacova, *University of Michigan, Ann Arbor, Michigan*

Numerous studies of health inequalities have documented an association between early life disadvantage and late life health. Little is known, in contrast, about the effects of early life disadvantage on the trajectory of later-life health decline over time. Moreover, much of the research on life course dynamics of health inequalities has been conducted within the context of developed countries. This paper investigates the influence of early life socioeconomic disadvantage on trajectories of health decline among Chinese oldest old. We use data representative of elderly Chinese 80-105 years old from a unique four-wave Chinese Longitudinal Healthy Longevity Survey (CLHLS, 1998-2005). We employ latent growth models—both standard growth curve models and growth mixture models—to examine variation in trajectories of later-life health over time and the effect of childhood covariates on the trajectories. Preliminary analyses indicate that childhood disadvantage was associated with significantly worse health among the oldest old. Respondents who were female, had no formal education, reported inadequate medical care in childhood, grew up in low-SES families, had more siblings, and did not have both parents when young reported worse self-rated health at the beginning of the survey. We found no evidence of health convergence over time, however. The trajectories of decline were not significantly related to any indicators of disadvantage, suggesting the influence of childhood conditions remained strong for the 7-year study duration. We discuss implications of these findings, comment on the limitations of the study, and suggest directions for future research.

DOES MILITARY SERVICE OFFSET THE EFFECT OF CHILDHOOD SES DISADVANTAGE ON MEN'S LATER LIFE PHYSICAL FUNCTIONING?

J. Wilmoth, W.M. Parker, A. London, *Syracuse University, Syracuse, New York*

No research has examined whether the effect of childhood socioeconomic (SES) disadvantage on men's later life physical functioning is moderated by military service status. Military service can offset such disadvantage by improving: access to education and job training; marital prospects, social status, and integration; and access to health care. This study uses 1992–2004 HRS data to examine whether the effect of childhood SES disadvantage on older men's activities of daily living (ADL) limitations differs among nonveterans, veterans with war service (WWII, Korea, Vietnam), and veterans without war service. Child-

hood SES disadvantage is measured by paternal and maternal education, paternal occupational prestige, and family-of-origin financial status. Controls include demographic characteristics and mid- to later-life socioeconomic and health statuses. Growth curve models estimate differences in men's age-related trajectories of ADL limitations. Results indicate that childhood SES disadvantage is related to higher ADL limitations and a steeper age-related increase in ADL limitations. Compared to nonveterans, veterans with wartime service have significantly higher ADL limitations, which are partly explained by their poorer overall health, but have similar age-related increases in ADL limitations. In contrast, compared to nonveterans, veterans without wartime service have an ADL limitation trajectory that does not increase as rapidly with age. The effect of childhood SES disadvantage on ADL limitations is offset for veterans with and without wartime service such that men from disadvantaged backgrounds who served in the military have better physical functioning than comparable men who did not serve in the military.

SELECTION INTO OLD AGE - CHILDHOOD ADVERSITY, SOCIAL CLASS IN ADULTHOOD AND EARLY DEATH

S. Fors^{1,2}, C. Lennartsson¹, O. Lundberg³, *1. Aging Research Center, Karolinska Institutet/Stockholm University, Stockholm, Sweden, 2. Department of Social Work, Stockholm University, Stockholm, Sweden, 3. Centre for Health Equity Studies, Stockholm University/Karolinska Institutet, Stockholm, Sweden*

Research has shown associations between living conditions throughout the life course and subsequent mortality. Individuals exposed to social and economic adversity have higher mortality risk. This study examined the association between childhood living conditions, social class in adulthood and the risk of early death (i.e., dying before the age of 75). Two questions were addressed: Is there an association between childhood living conditions and early death and if so, is the association mediated or modified by social class in adulthood? The questions were explored using the Swedish Level of Living Survey from 1968. Mortality information for 1968 – 2006 was gathered from registry data. Childhood living conditions were assessed using self-reports of social and economic conditions in the household during childhood. Results from multivariate analyses showed independent associations between living in a broken home (i.e., losing at least one biological parent), father's social class, social class in adulthood and early death. Exposure to a broken home during childhood, having a father classified as a manual worker and/or being classified as a manual worker in adulthood was associated with an increased risk of early death. There seemed to be no modifying effect of adult social class on the association between childhood conditions and early death. However, the results suggest that some of the effect of father's social class is mediated through own social class in adulthood. These results suggest a substantial impact of social and economic adversity during both childhood and adulthood on the risk of premature mortality.

CHILDHOOD SOCIAL AND ECONOMIC CIRCUMSTANCES AND OLDER ADULT HEALTH: FINDINGS FROM A DIVERSE SAMPLE

I. Yen, S. Gregorich, A. Stewart, *University of California, San Francisco, San Francisco, California*

Childhood social and economic circumstances ('childhood circumstances') are important for older adults' health. Research has documented associations between childhood socioeconomic status (SES), a subset of childhood circumstances, and adult health. Traditional measures of childhood SES such as father's occupation or educational attainment limit our ability to explore mechanisms by which childhood SES affects health. Using a conceptual framework resulting from qualitative research, we developed a retrospective survey to measure childhood circumstances. We interviewed 400 racially/ethnically diverse community-dwelling participants aged 55 and older (mean age=67 years); 61%

women. Retrospective assessments measured household composition, perception of quality of schooling, extracurricular activities, and adult encouragement and discouragement during the childhood/teen years (ages 5-18). Using backward elimination regression models, we investigated the extent to which childhood circumstances were independently associated with current health. For self-rated health (1-5, 5 is best), key childhood circumstance predictors included growing up with two parents (vs. not) ($B=0.36$; $p=0.002$), perception of school as a way to get ahead ($B=0.15$; $p=0.02$), and participation in high school extracurricular activities ($B=0.048$; $p=0.03$). For physical functioning (0-100, higher is better), key salutary childhood circumstances were growing up with two parents ($B=7.94$; $p=0.01$), perception of school as a way to get ahead ($B=6.64$; $p=0.0001$), and high school extracurricular activities ($B=1.10$; $p=0.05$); adult discouragement was associated with worse functioning ($B=-1.12$; $p=0.03$). Adjusting for race/ethnicity or father's educational attainment did not attenuate these results. Measures of childhood family, school, and social circumstances are promising additions to traditional childhood SES measures for understanding older adult health.

SESSION 25 (PAPER)

GENDER MODELS AND ISSUES IN LATER LIFE

HEALTH AND IDENTITY OF RURAL OLDER WOMEN

K.A. Roberto, B. McCann, *Virginia Tech, Blacksburg, Virginia*

The majority of older women have at least one chronic health problem and coping with multiple conditions is common with advancing old age. How women perceive threats to their health may influence their beliefs about themselves and ability to cope with health-related changes. In this longitudinal, qualitative study we explored the health perceptions of older rural women ($n = 36$) with multiple chronic conditions. Guided by a symbolic interactionist perspective, our research questions asked (a) How do rural older women with chronic health conditions define health in general, and their own health in particular? and (b) How do they talk about their health with others? We found that women depended on their embodied self, or signs from the body, to interpret their everyday health, that is, how they felt on a given day. Moreover, perceptions of everyday health and beliefs about various selves (e.g., an aging self, an embodied self, and continuity of selves developed earlier in life), rather than presence of an illness, accounted for women's assessment of their own health. It was not until functional limitations challenged salient identities that women began to incorporate the presence of a chronic health condition into their identities. The women engaged in identity management to make sense of limitations caused by their chronic health conditions. They regulated how much and with whom they were willing to share issues related to their everyday health. Findings suggest that the meaning of health for rural older women with chronic health conditions is context dependent.

GENDER DIFFERENCES IN THE LIFE EXPERIENCES OF JAILED OLDER ADULTS

B. Stanback¹, T.L. Young², *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. Georgia State University, Atlanta, Georgia*

Women and older adults are the fastest growing population within the U.S. criminal justice system. Prior research studies tends to focus on aging imprisoned men ignoring older offenders in local jails and female older offenders; both groups of offenders with traditionally different criminal histories and individual circumstances. The goal of this preliminary study was to use chi square and regression analyses to explore life course variables such as childhood, adolescent, and adult experiences, and criminal history, as well as socio-demographics to understand the life experiences of older jailed women and men. These gender ($n=84$ women; $n= 246$ men) differences were examined using data from the 2002 wave of the Survey of Inmates in Local Jail (U.S.

Department of Justice, 2002). Chi square tests revealed significant gender differences in ethnicity, parental substance use, delinquent childhood friends, regular adult alcohol use, employment status, physical or sexual abuse history, and mental illness history. A logistic regression significantly predicted women (as opposed to men) to more likely have delinquent childhood friends, regular alcohol use, employment, and less likely to have physical or sexual abuse histories. Our findings suggest the life course perspective is a valuable perspective for understanding the life experiences of older offenders. The findings also imply that interventions should target childhood friendships, as well as employment and alcohol as an adult. Attendees of this session will understand the different life experiences of jailed women and men, and thereby understand the type of interventions needed to enhance these individual's lives.

A BLUEPRINT FOR 'BEING A MAN' AS ATTESTED BY OLDER MEN

E.H. Thompson, A.S. Leichthammer, *Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts*

The dominant blueprint of "being a man" in North American culture calls for masculinity performances that project emotional and physical toughness and avoid "sissy stuff." Are these also the masculinity standards that old men endorse? This study examines the masculinity norms that older men perceive as the manhood mandate. Survey data with 349 men (age 60 and older) and structural equation modeling provide evidence that old men uphold masculinity norms that are similar to younger men's, but older men reorder the priorities of manhood. Maintaining respect emerges as the primary masculinity directive, followed by a reaffirmation of the precept "be tough". The damaging "no sissy stuff" directive remains a social force but is held in much greater disfavor. Of particular interest is old men's continued description of themselves as "masculine" and "not feminine," even though they describe themselves in more expressive, compassionate terms and less in vocabularies of being dominant and forceful. We find that the old men perceive the standards of masculinity that script later life as having softened the edges. But, their self-presentations as men and backing of masculinity norms underscore that gender matters. There is no blurring of their sense of masculinity. The importance of old men continuing to champion many aspects of the traditional standards of masculinity and to "do gender" is discussed in terms of the ways they do volunteer work, care work, and engage one another as men, rather than as their bodies reveal them to be, as old men.

THE EMERGENT DEPARTMENT CHAIR: BUILDING SUCCESS ONE INDIVIDUAL AT A TIME

C. Isaac, L. Griffin, M. Carnes, *Center for Women's Health Research-UW-Madison, Madison, WI*

Women have consistently comprised a greater proportion of geriatric fellows than other medical subspecialties, currently accounting for 58%. Women's rate of advancing to program directorship has slowly progressed depending on specialty, ranging from 24% in family practice to 41% in internal medicine. While these percentages seem promising, there are no women directors in the Geriatric Research, Education and Clinical Centers (GRECCs), and women only represent 4% of prestigious full professorships. Examining clinical departments with new women chairs provides an opportunity to assess changing views toward women leaders in academic medicine, particularly in the context of assumptions about gender-linked traits and leadership skills, and to gain insights into characteristics a woman chair. This qualitative study employed textual analysis of 28 semi-structured interviews of male and female faculty members, as well as interviews and observations of their respective women chairs. We used a theoretical sampling strategy consistent with grounded theory methodology. Standard qualitative methods enhanced the validity of 4 emerging themes: 1) the prior environment; 2) the characteristics of the new chair: tough, direct, transparent; 3) the use of communal actions to "Shepherd one's vision into reality";

and 4) the ability to build power through consensus. Results indicated that these women leaders are building and maintaining the success of their departments in large part by connecting and supporting the individuals. Souba states that leadership development has become the "single most important organizational competency;" our three women chairs appear to have met all Souba's criteria for desirable physician leaders in academic medicine.

SESSION 30 (PAPER)

HEALTH PROMOTION PROGRAMS

NURSING ASSISTANTS PROVIDING MOUTH CARE TO NURSING HOME RESIDENTS WITH DEMENTIA: ACTUAL OBSERVATIONS

R.A. Jablonski¹, M.B. Ligon³, C. Munro², M. Grap², *1. Penn State, University Park, Pennsylvania, 2. Virginia Commonwealth University, Richmond, Virginia, 3. York College, York, Pennsylvania*

Background: Almost 2 million older adults reside in nursing homes (NHs). The majority have some level of cognitive impairment and require assistance with routine daily activities such as dressing and brushing teeth. The number of older adults entering NHs with some or all of their own teeth has risen from 54% (1980s) to 70% (2000). Poor oral health has been linked to pneumonia, cardiovascular diseases, poor glycemic control, urinary tract infections, and weight loss. Purpose: to compare observed oral care provided by certified nursing assistants (CNAs) before and after an educational intervention. Setting: the dementia care units of two similarly sized NHs. One NH was located in an urban area and its primary reimbursement was Medicaid; the second NH was located in a suburban area and its primary reimbursement was private pay. Design: Quasi-experimental. CNAs observed prior to educational intervention (n=26) and 4 weeks after the educational intervention (n=19). The majority of CNAs were female and African-American. Data Analysis: Descriptive statistics and group comparisons using t-tests and chi-square analyses were used. Findings: Prior to the intervention, the majority of mouth care was provided by the CNA alone. Sponge toothettes were used 15% of the time. After the intervention, CNAs were more likely to allow the resident to perform his or her own care or to provide assistance. When residents were allowed to brush their own teeth, the average brushing time was 95.5 seconds; when CNAs brushed residents' teeth, the average brushing time was 52 seconds (significance = 0.022).

THE PRAISED PROGRAM: LESSONS LEARNED TO CHANGE HEALTH BEHAVIORS IN LOW INCOME OLDER ADULTS

M. Shaughnessy^{2,1}, B. Resnick¹, E. Galik¹, *1. Organizational Systems and Adult Health, University of Maryland School of Nursing, Baltimore, Maryland, 2. Baltimore VA Geriatric Research Education and Clinical Center, Baltimore, Maryland*

Despite clear guidelines and known benefits of cardiovascular disease (CVD) prevention behaviors, inactivity, high fat/high sodium diets, and poor adherence to medication regimens is prevalent among low income and African American older adults. A social-ecological model, addressing intrapersonal, interpersonal, institutional/organizational, environmental and policy factors, was used to develop and implement the People Reducing Risk and Improving Strength through Exercise, Diet and Drug Adherence (PRAISED) intervention. The intervention included three phases: Phase I Education Initiation Phase (week 1); Phase II Practice Phase (weeks 2-12); and Phase III Inoculation Phase (weeks 13-48). Combined education, motivation, and exercise classes were provided three times per week in Phases I and II, and once a month in Phase III. A total of 22 participants were recruited, the majority of whom were female (84%) and African American (86%). The mean age of participants was 76.4(SD=7.6). Class attendance was 60%, with 12

to 14 participants attending each class. At 4 months, there was a significant decrease in systolic ($p=.02$) and diastolic blood pressures ($p=.01$), and there were non-significant improvements in cholesterol intake ($p=.09$), in medication adherence ($p=.18$), and in overall mental health ($p=.11$). There was generally no or minimal change in self-efficacy and outcome expectations. This pilot work demonstrates the feasibility and potential effectiveness of the PRAISEDD intervention. Investigators will describe the successes and challenges of this pilot and how these are used to develop future plans using a randomized controlled trial design to determine intervention effectiveness and document change in cardiovascular risk profiles.

IMPLICATIONS OF RURAL RESIDENTS' MANAGEMENT OF MULTIPLE MORBIDITIES FOR DISEASE PREVENTION

S. Bardach^{2,1}, N.E. Schoenberg², 1. *Gerontology, University of Kentucky, Lexington, Kentucky*, 2. *Behavioral Science, Lexington, Kentucky*

Context: Older adults often experience several simultaneously occurring chronic conditions, referred to as Multiple Morbidities (MM), and are living longer with these conditions. These conditions should be managed and, ideally, other conditions should be prevented. However, managing both MM and disease prevention may be overwhelming, particularly in vulnerable populations. **Purpose:** We sought to improve our understanding of the ways in which rural residents with MM engage in both disease management and prevention. **Methods:** Forty rural Appalachian residents age 50+ with an average of five chronic conditions participated in interviews about MM management and disease prevention. Transcripts were content analyzed and techniques were implemented to enhance transferability and rigor. **Findings:** Participants' medical visits appear to focus on chronic disease management, including discussing problems and managing medications, rather than on prevention. Yet, most reported compliance with certain preventative health practices, including cancer screening. Given this sample's frequent interaction with health care providers, the sizable number failing to meet screening recommendations and the inadequate understanding of prevention practices is alarming. **Implications:** We discuss strategies to increase disease prevention among this rural, vulnerable population burdened by MM.

THE RELATION OF HEALTH LITERACY TO HEALTH STATUS IN PARTICIPANTS 65 YEARS OF AGE AND OLDER IN THE NATIONAL ASSESSMENT OF ADULT LITERACY (NAAL)

R. Ownby¹, D. Waldrop-Valverde², 1. *Psychiatry and Public Health, Nova Southeastern University, Fort Lauderdale, Florida*, 2. *University of Miami, Miami, Florida*

Health literacy has emerged as an important factor related to health in the elderly. Health literacy is linked to risk for hospitalization, health care utilization, poor diabetic control, and medication nonadherence. Low health literacy skills are an independent risk factor for mortality in elders. The reason for these relations is not clear but includes possible links to income, education, health-related behaviors, perceptual impairments, or access to health care. In this study we investigate the relation of health literacy to self-reported health status and explore the impact of possible explanatory variables on the observed relation in participants aged 65 years and older with data from the 2003 National Assessment of Adult Literacy (NAAL). Regression models using data drawn from 2,668 individuals selected to be representative of the population of the US aged 65 years or older evaluated the impact of explanatory variables on the relation of health literacy to self-reported health status. A model that included ethnicity, education, and income showed significant links between these variables and health status and reduced but did not eliminate the significant relation between health literacy and health status. Other variables, such as preventive health behaviors, access to medical insurance, reading habits, self-reported reading skills, perceptual status, physical activity, and computer use, were independent

predictors of health status but did not attenuate the still-significant relation between health literacy and health status. Health literacy may be a proxy for executive cognitive abilities that have been linked to health status and mortality in other studies with older persons.

SESSION 35 (PAPER)

HEALTHY AGING

THE GARDEN OF HEALTHY AGING: COLLABORATIVE PROJECT DEVELOPMENT IN THE VIRTUAL WORLD OF SECOND LIFE

S. Toth-Cohen, *Thomas Jefferson University, Philadelphia, Pennsylvania*

The population of older adults worldwide is growing exponentially, creating an increased concern to "add life to years" and great interest in the topic of healthy or successful aging. Learning ways to promote health and prevent decline as persons age is critically important, because the costs of decline and disability are significant for individuals, families, and society overall. New ways of educating older adults about health have emerged along with the growing interest in healthy aging. In particular, interactive health communication (IHC) has shown promising results in providing information on health and health conditions, promoting healthy behaviors, and providing information exchange and support. IHC consists of interactions between people and healthcare information that are mediated through electronic devices or communication technology such as the Internet. Among the most recently developed areas of IHC are the use of virtual environments such as Second Life®. Second Life® has been used by many healthcare organizations, including the Centers for Disease Control, to educate people about healthy behaviors. Second Life and other virtual environments enable participants to feel a sense of presence and of being immersed in the environment, which may lead to deeper learning. Additionally, learning can be customized to fit the needs of various users—a factor that is critical to the success of IHCs. This presentation will detail the process of developing and evaluating an exhibit on healthy aging in Second Life. Unique affordances of virtual worlds for IHC exhibits and strategies for creating and managing these exhibits will be discussed.

MAKING MEANING OF TURNING POINTS: RELATIONS TO VALUES, WISDOM, & LIFE SATISFACTION

K.M. Doukas, T. Le, *Colorado State University, Fort Collins, Colorado*

In the life review process, individuals engage in meaning making, and this often entails re-appraising events in their lives including turning points. This study examined older adults' appraisal of turning point events as being positive, negative, or neutral over time (then and now). Re-appraisal of turning points from positive to negative was hypothesized to be negatively associated with life satisfaction and wisdom, and positively associated with endorsement of self-enhancement values. Conversely, re-appraisal of turning points from negative to positive was hypothesized to be positively related to endorsement of self-transcendence values, wisdom, and life satisfaction. In a sample of 50 healthy older adults (65-96 years old), classical content analysis revealed that approximately half of the participants rated their turning point event as initially negative with significant re-appraisal from negative and neutral to positive over time. The majority of participants were also more likely to report themes of self-transcendence values in their life purpose as compared to themes of self-enhancement values. Independent t-tests also revealed that those individuals whose appraisal of their turning point changed from either neutral or negative to positive scored significantly higher on life satisfaction than those whose appraisal did not change. These results suggest that individuals who are able to overcome adversity and retell their life stories in a positive way are more likely to have higher life satisfaction and to illustrate gaining wisdom in their narra-

tives. In addition, there are indications that the passing of time allows individuals a wisdom advantage in their reflection process.

SELF-REGULATORY STRATEGIES AND WELL-BEING. RETAINING A SENSE OF MASTERY AND SATISFACTION IN OLD AGE

A.K. Leist¹, D. Ferring¹, S. Filipp², 1. *Faculté des Lettres, des Sciences Humaines, des Arts et des Sciences de l'Éducation, University of Luxembourg, Walferdange, Luxembourg*, 2. *University of Trier, Trier, Germany*

It is well known that well-being remains stable in old and very old age despite numerous challenges, e.g. the loss of loved ones and physical decline, that turn the balance of gains and losses more and more negative. Several suggestions have been made to explain this paradoxical finding, mainly by the motivated use of specific self-regulatory strategies, e.g. downward social comparisons. The objective of our research was to explore the differential adaptiveness of self-regulatory strategies in old age and to identify variables that might play a moderating role between self-regulatory strategies and well-being. A total of $N = 133$ participants, $N = 41$ nursing home residents and $N = 92$ non-institutionalized individuals, aged between 65 and 98 years ($M = 76.02$, $SD = 7.35$) reported via questionnaire different facets of well-being (mastery, autonomy, life satisfaction, self-esteem, satisfaction with social relationships, self-reported cognitive and health status) and rated a current problem of their life situation (e.g. health, financial or living situation) with regard to various self-regulatory strategies (e.g. goal engagement, positive reappraisals). Factor analyses showed that self-regulatory strategies could partly be grouped into two broader categories that allowed for differentiation in problem- and emotion-focused coping. With gender, institutionalization and age as control variables, regression analyses and structural hierarchical modeling revealed distinct relationships between self-regulatory strategies and measures of well-being. In addition, we could identify several variables that moderated these relationships: The more individuals reported perceived self-changes and satisfaction with social relationships, the higher the impact of self-regulatory strategies on well-being.

THE MODERATING EFFECT OF PSYCHOLOGICAL RESOURCES ON THE RELATIONSHIP BETWEEN DECLINE IN HEALTH AND SELF-RATED HEALTH

K.A. Sargent-Cox¹, K. Anstey¹, M. Luszcz², 1. *Australian National University, Canberra, Australian Capital Territory, Australia*, 2. *Flinders University, Adelaide, South Australia, Australia*

Decline in self-rated health (SRH) is an indicator of deterioration of health and well-being, predicting mortality and other functional outcomes. We examined the influence of psychological resources on decline in older adults' SRH in a large representative sample ($N=2034$) of older adults (65+ years) from the Australian Longitudinal Study of Ageing. We investigated whether depressive symptoms and locus of control moderated the relationship between change in physical and functional health and change in SRH ratings in two different SRH measures: global (overall health) and age-comparative (health compared to same aged peers). Ordinal latent growth models revealed an interaction between depressive symptoms and the relationship between change in health and global SRH ($OR=0.996$, $CI=0.99-0.999$), and an interaction between locus of control for age-comparative SRH ($OR=0.99$, $CI=0.98-0.999$). These interactions were in the reverse direction to the hypothesis that having positive psychological resources moderate the negative effects of health decline on SRH ratings, and indicate a limiting ceiling effect associated with change in SRH ratings. A significant age effect on the age-comparative SRH slope showed that for each year over 78 years (mean age wave 1) the odds of decline in ratings decreased by 1.16 ($p<.05$). These results suggest that the process of age-comparison may protect older adults' health evaluations regardless of health decline. Session participants will gain greater understanding of how older adults' percep-

tions of their own health relate to psychological resources and mental health.

SESSION 40 (PAPER)

LIVING LONG AND HEALTHY

STRESSORS OVER THE LIFE COURSE AND PHYSIOLOGICAL DYSREGULATION IN COSTA RICA

O. Gersten¹, W.H. Dow², L. Rosero-Bixby³, 1. *Institute of Sociology, Academia Sinica, Nankang, Taipei, Taiwan*, 2. *UC Berkeley, Berkeley, California*, 3. *University of Costa Rica, San Jose, Costa Rica*

Allostatic load (AL) theory purports that stress experienced over the life course exacts a cumulative, physiological toll on the body that eventually contributes to poor health. Although mounting evidence indicates that elevated levels of AL is a risk factor for poor health later in life, it is not yet clear whether those same elevated levels are due to stressor exposure. To better understand the connection between stressor exposure and AL levels, we analyze data from the Costa Rican Healthy Aging Study, a new, nationally representative survey of older Costa Rican men and women. This paper focuses on the relation between a variety of stressors experienced over the life course (e.g., economic deprivation early in life, death of children and years widowed) and four neuroendocrine markers analyzed in an index. None of the stressors examined were associated with riskier neuroendocrine biomarker profiles, suggesting that neuroendocrine system dysregulation stems from sources other than stressor exposure.

THE CUMULATIVE INFLUENCE OF SOCIOECONOMIC DISADVANTAGE ON TRAJECTORIES OF PHYSICAL LIMITATION, CHRONIC DISEASES, AND DEPRESSIVE SYMPTOMS IN LATE ADULTHOOD

K. Kwag, K. Wickrama, P. Martin, J. Lempers, *Iowa State University, Ames, Iowa*

The objective of this study was to explore the cumulative effects of socioeconomic disadvantage (old age, female, unmarried, minorities, and low socioeconomic status) on trajectories of physical limitation, chronic diseases, and depressive symptoms and the longitudinal cross-domain influences of health problems in late adulthood. This study used the data of the Health and Retirement Study (HRS) collected in 1998, 2000, 2002, 2004, and 2006. Variables are included ethnicity (non-Hispanic White, African American, and Hispanics), age category (young-old, old-old, and oldest-old), gender, marital status, education, occupational prestige, and household income, physical limitation, chronic diseases, and depressive symptoms. Results of this study demonstrated that disadvantages (old age, gender, unmarried, minorities, and low socioeconomic status) detrimentally affected the initial levels and progresses of multiple health problems. The association of the initial levels and the rates of change among multiple health problems one another. In specific, the initial level of chronic diseases positively influenced the progress of physical limitation and depressive symptoms. The initial level of physical limitation negatively influenced the progress of depressive symptoms. The initial levels physical limitation, chronic diseases, and depressive symptoms were negatively associated with the slopes of them, respectively. The initial levels and slopes of different health problem trajectories were positively correlated. The study demonstrated adverse effects of chronic stressors or disadvantages on a) severity (level) and b) changing disparities of health problems during late adulthood. The initial level of a specific health problem influenced the change in other health problems, supporting the process of stress-response proliferation over the life course.

GENETIC AND ENVIRONMENTAL INFLUENCES ON PULMONARY FUNCTION IN A MIDDLE-AGED TWIN COHORT

M.D. Grant¹, W. Kremen^{2,3}, C. Franz^{2,3}, M.S. Panizzon², R. Toomey¹, J. Karlinsky^{4,5}, R. Murray¹, M. Lyons¹, 1. *Psychology, Boston University, Boston, Massachusetts*, 2. *University of California, San Diego, San Diego, California*, 3. *Center for Behavioral Genomics, UCSD, San Diego, California*, 4. *Boston University School of Medicine, Boston, Massachusetts*, 5. *VA Boston Healthcare, Boston, Massachusetts*

Forced vital capacity (FVC) and forced expiratory volume in one second (FEV1) decline with age and are associated with age-related morbidity and mortality (time to death). The purpose of this study was: (1) to estimate the genetic and environmental influences on the variation of FVC and FEV1, and (2) to examine the association among specific health variables with FVC and FEV1 in a middle-aged twin cohort. This analysis examined 1115 twin participants (278 identical twin pairs, 47 singletons; 235 fraternal twin pairs, 42 singletons) from the Vietnam Era Twin Study of Aging (VETSA). Mean age of the sample was 55.4±2.5 (range 51-60). Pulmonary function was measured by spirometry (MedGraphics SpiroCard) in accordance with current American Thoracic Society criteria. Average FVC and FEV1 were 4.8±1.3 and 3.7±.99, respectively. FVC and FEV1 were significantly ($p < .01$) correlated with age ($r = -.14$; $r = -.15$, respectively), grip strength ($r = .28$; $r = .24$, respectively), and 10 meter walk time ($r = -.19$; $r = -.16$, respectively). Significant mean differences for both FVC and FEV1 were seen by smoking status (256 current smokers). Genetic modeling revealed heritability estimates of .37 and .43 for FVC and FEV1, respectively. Non-shared (unique) environmental influences accounted for ~57% of the variance for both FVC and FEV1. Genetic factors accounted for a moderate proportion of variance in pulmonary function in this middle-aged twin cohort. FVC and FEV1 proved to be significantly associated with age, measures of physical functioning, and smoking status in this healthy middle-aged cohort.

EXCEPTIONAL LONGEVITY IN A LONG-TERM COSTA RICAN COHORT FOLLOW-UP

W.H. Dow¹, L. Rosero-Bixby², 1. *School of Public Health, UC-Berkeley, Berkeley, California*, 2. *University of Costa Rica, San Jose, Costa Rica*

Although Costa Rica is a middle-income country, with per capita income about one-fifth the level of the United States, vital statistics data indicate that life expectancy in the 1990's has been approximately equivalent to that of many developed countries. To further explore this apparently exceptional longevity we have recently completed the Costa Rican National Longitudinal Mortality Study (CR-NLMS) which tracks mortality events in a cohort of approximately 20,000 Costa Ricans drawn from the 1984 census. These are among the first comprehensive data of their type from a setting outside high-income countries. In this paper we first detail the methodology by which we link individuals to the Costa Rican National Death Index and validate our ability to comprehensively identify mortality events and thus accurately estimate mortality rates. Next we show that our data closely track aggregate mortality patterns from previously analyzed vital statistics data, further confirming Costa Rica's remarkably low mortality rates. We then estimate survival models to characterize socioeconomic patterns of mortality, prospectively analyzing mortality in relation to 1984 census characteristics. Prior research had found remarkably flat socioeconomic gradients in recent Costa Rican older adult mortality, which some had interpreted as providing evidence consistent with the hypothesis that Costa Rica's strong safety net and historically equitable society may have protected low SES individuals. Our new analyses with CR-NLMS are able to establish Costa Rica's mortality patterns much more definitively, increasing the confidence in lessons that can be drawn from this country's unique longevity accomplishments.

OLDER ADULTS' VIEWS ON EXTENDING THE HEALTHY LIFE SPAN

V.G. Cicirelli, *Psychological Sciences, Purdue University, West Lafayette, Indiana*

Numbers of centenarians (100-109) and supercentenarians (110-122) are increasing, providing an impetus for some anti-aging researchers to work toward extending the life span to age 150, and others (e.g., deGrey at Oxford) to work toward attaining life without death. This has led to conflict with pro-aging gerontologists who accept death and are concerned with consequences for society and behavior if the anti-aging researchers succeed. Yet the extent to which elders would welcome a healthy life extension is unknown. The aim of the present exploratory study was to examine elders' attitudes toward such possibilities and to identify related factors. The first participants of the ongoing study were 50 elders (21 men, 29 women) aged 60-86 ($M = 73.94$, $SD = 8.17$). Measures included attitudes toward Living Long (e.g., 150 years) and Living Forever, desired age, neutral death acceptance (Reker), and internality (Wallston's health locus of control). Attitudes were more positive toward living an extended life than toward living forever ($p < .01$). In structural analyses, more positive attitudes toward extending life were directly predicted by greater desired age ($\beta = .24$), less death acceptance ($\beta = -.43$), and greater internality ($\beta = .30$). Gender and education had indirect effects through their effect on desired age, with men and those with more education desiring to live to a more advanced age. Qualitative analyses explored elders' reasons and goals for an extended life. Elders are cautious about life without death but are more positive about increasing longevity in order to complete their goals.

SESSION 45 (SYMPOSIUM)

PERSONALITY DISORDERS IN DSM-V: ASSESSMENT CHALLENGES AND IMPLICATIONS FROM A LATER LIFE PERSPECTIVE

Chair: S. Balsis, *Psychology, Texas A & M, College Station, Texas*

Discussant: P.A. Lichtenberg, *Institute of Gerontology, Detroit, Michigan*

There is solid consensus among clinicians and researchers that the DSM diagnostic category of personality disorders (PDs) is severely flawed. Indeed, it has been argued that the DSM PD criteria have limited reliability, validity, and utility because they are measured categorically. This categorical system is problematic because it cannot reflect the actual nature of PD pathology, which is thought to exist along several associated dimensions. Given the limitations associated with the current categorical system, discussions surrounding its revision have focused almost exclusively on changes to more sound dimensional measurement. But there is another problem that looms. The DSM system dramatically mischaracterizes PDs in later life. The lack of attention to the mischaracterization of PDs in later life is remarkable, given that it likely influences clinicians' and researchers' abilities to conduct reliable and valid assessments on a large (and growing) segment of the population. The implications extend even further. For instance, serious questions can be raised about the viability of theories that rest on data linked to the current criteria. The aims of the presentations in this symposium are to illustrate the theoretical understanding of personality that is gained from closely considering the context of later life, to analyze specific measurement problems in any PD classification system that does not closely consider older adults, and to outline relevant guidelines to inform the development of DSM-V. Indeed, this topic is timely as conversations regarding revising DSM-IV currently are taking place and the expected publication of DSM-V is merely three years away.

ASSESSMENT OF PERSONALITY DISORDERS IN LATER LIFE: CONCEPTUAL AND THEORETICAL ISSUES

T.F. Oltmanns, *Psychology, Washington University, St. Louis, Missouri*

Serious questions remain unanswered regarding the trajectory of personality disorders in later life. Some personality disorders remit over time, but we do not know whether these problems re-emerge later (with either similar or modified presentations). I will present preliminary findings from a prospective, longitudinal study of the stability and impact of personality pathology in later life which is being conducted with a representative sample of 900 participants. The study is concerned with the extent to which personality and personality disorders influence the ability to adapt successfully to important life transitions. Nosological comparisons are being made between two different approaches to the definition of personality pathology: the approach represented in DSM-IV and the Five Factor Model of personality. Consideration is also being given to the incremental validity of informant reports (relative to self-report measures) of normal and pathological personality traits. Implications for DSM-V will be addressed.

ASSESSMENT OF PERSONALITY DISORDERS IN LATER LIFE: CLINICAL ISSUES AND STRATEGIES

D. Segal, *University of Colorado, Colorado Springs, Colorado*

This presentation will provide an overview of the major issues involved in the psychological assessment of PDs in later life. First, conceptual issues regarding the measurement of personality pathology in later life will be presented, including a critique of the current diagnostic criteria for personality disorders, followed by a discussion of general assessment strategies. Next, several popular self-report objective personality disorder instruments will be reviewed with emphasis on their application to and psychometric support with older adults. Semi-structured diagnostic interviews for personality disorders will be described next, also with as focus on their suitability to older adults. The presentation will conclude with a discussion of possible changes to be made in the DSM-V and description of a research agenda to improve the assessment of PDs in later life.

ASSESSMENT OF PERSONALITY DISORDERS IN LATER LIFE: EMPIRICAL AND PSYCHOMETRIC ISSUES

S. Balsis, L.D. Cooper, A.A. Unger, S.N. Wrenn, *Psychology, Texas A & M, College Station, Texas*

A growing body of evidence suggests that the DSM personality disorder diagnostic criteria contain measurement bias across age groups. Items such as, "Avoids occupational activities," cannot measure personality equally well in younger and older adults because the items focus on a younger occupational and social context. In this presentation we illustrate the extent of this measurement bias using two different samples ($n = 43,093$ and $n = 1109$). We also show how this measurement bias has cascading consequences on the criteria's psychometric properties, including negative consequences for various forms of reliability and validity. If the new version of DSM, which is slated for publication in 2012, does not closely consider the presentation of personality in later life, it may continue to be hampered by these psychometric issues. Recent discussions suggest that a leading dimensional model could replace Axis II and potentially address this type of measurement bias.

SESSION 50 (PAPER)

REAL AND SIMULATED AGING: USING COMPUTERS TO UNDERSTAND AGING

CREATING AN ONLINE COMMUNITY FOR ACTIVE AGING PROFESSIONALS: LESSONS LEARNED

A.M. DeMano, K. Turnbaugh, *Human Kinetics, Champaign, Illinois*

With an abundance of organizations, institutions, and professionals involved in active aging, staying up with advances in the field can be

daunting. To provide professionals and researchers with a forum for interacting and sharing information, Human Kinetics, in cooperation with the International Coalition for Aging and Physical Activity (ICAPA), created the Active Aging Community Center (AACC). This unique Web site was designed to be a central source for news and vital information on programming and research in the field of active aging. A Steering Committee of 20 international active aging leaders developed and continue to create content for the Web site; while international "reporters" regularly write about news and events in their areas. Another means to gather content comes from Grant-funded projects, as these initiatives are continually searching for methods to keep their content in the public eye. A project of this magnitude required seeking endorsement from and the cooperation of numerous national and international agencies, organizations, professionals and researchers with an interest in active aging. To remain current and comprehensive, the AACC relies heavily upon the timely and regular submissions of interested individuals. In addition, there were challenges associated with creating such an endeavor that had to be overcome. A few of these include the fact that content is gained solely from volunteer contributions, as well as that language could be a barrier to participation since this is an international site. In this presentation, participants will learn how they can create this type of online community to benefit other areas of gerontological health promotion.

AGE RELATED CHANGES IN EPISODIC SIMULATION OF HEALTH EVENTS

D. Korovikov, *Rutgers University, Millburn, New Jersey*

Our goal is to replicate Addis, Wong & Schacter's (2008) finding that narratives generated by younger adults contain more concrete, situation specific details and fewer abstract, non situational elements than narratives generated by elderly respondents in response to non health cues and test whether these differences extend to narratives generated to health relevant cues. Method: Tape recorded narratives of prior and anticipated experiences for 4 specific non-health cues and 8 health cues were obtained from 24 undergraduates and 12 elderly adults. The Autobiographical Interview system was used to identify episodic details intrinsic to the situation and abstract details extrinsic to the situation. Findings: Analysis of variance comparing narrative responses to non-health cues replicated prior findings. Significant differences between age groups in narrative responses were also found for medical cues. Specifically, younger and older adults produce same-length narratives but younger adults produce more episodic context-specific details whereas older adults produce more abstract and un-related details. Analyses also found that non-medical cues produce significantly more episodic narratives than medical cues. Lastly, acute medical cues result in specifically more episodic narratives than chronic medical cues. Discussion: Differences in accessing of abstract Vs situation specific information will be discussed in terms of life span factors affecting the use and/or avoidance of episodic content that is threatening. Implications for future studies and interventions intended to increase end of life planning among the elderly will also be discussed.

TECHNOLOGY AND AGING PROJECT: INITIAL LESSONS LEARNED FROM IMPLEMENTATION OF A TECHNOLOGY TRAINING PROGRAM FOR OLDER ADULTS

A.T. Woodward¹, P.P. Freddolino¹, C.M. Blaschke¹, M. Fox², D.J. Wishart², L. Bakk¹, 1. *School of Social Work, Michigan State University, East Lansing, Michigan*, 2. *Otsego County Commission on Aging, Gaylord, Michigan*

There is increasing evidence that use of information and communication technology (ICT) can improve the physical and mental health of older adults by enhancing social support and psychosocial well-being. Although rates of ICT use among older adults are increasing they are still below other age groups in the US. The absence of good training opportunities is one reason for this difference. The Technology and Aging

Project attempts to address this barrier by evaluating a training program in ICT use provided to adults aged 60 and older in a rural county in Northern Michigan. The study includes a total of 83 adults aged 60 and older at baseline. Forty-five were randomly assigned to an experimental group that participated in the training and 38 were assigned to a control group. Data were collected at baseline with additional data collection to take place at 3 months, 6 months, and a 9 month follow-up. Data include measures of loneliness, depression, social networks, perceived social support, and computer self-efficacy. On average, participants were high functioning reporting little loneliness or depression and having social networks from which they feel supported. Although results for computer self-efficacy were more mixed, the vast majority (86.8%) reported feeling comfortable learning new technology and most (63.9%) reported being very or somewhat knowledgeable about computers. In addition to describing the structure of the intervention, lessons learned about recruiting participants, assessing baseline knowledge, and providing training will be shared.

LONELINESS AMONG OLDER ADULTS: THE INFLUENCE OF COMPUTER USE AND OTHER CHARACTERISTICS

S. Levien, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Objectives: Loneliness adversely affects well-being and is associated with increased use of health services, greater risk of institutionalization, and poorer medical treatment outcomes among older persons. Research shows that technology can reduce feelings of loneliness but computer use (as a determinant or deterrent) has not been extensively studied. This study examined the association between computer use and loneliness. **Methods:** The sample included 6,008 community-dwelling adults aged 70 and over from the 2004 Health and Retirement Study. Hierarchical stepwise regression was used to investigate the relationship between loneliness and computer use along with other confounding factors. Sociodemographic, health, and social factors were also included in the model in a series of three sequential blocks. **Results:** Although health and social factors reduce its statistical effect, computer use was negatively associated with loneliness ($p < .001$) in all three models. In the full model, regular computer users were 40% less likely to feel lonely than their non-computer-using counterparts. **Discussion:** Since the costs of computers have declined dramatically and both the number of elder computer users and their proficiency levels are expected to rise, computers present a practical solution to combat loneliness for many older adults, especially those with social networks that are widely dispersed or compromised by disability, lack of transportation, and unsafe neighborhoods. This study suggests that older adults should acquire and maintain computer skills, firms in the computer industry should consider the needs of older persons and deem them a viable market, and senior services organizations should offer computer access and training.

THE SIMULATOR SICKNESS QUESTIONNAIRE AS A PREDICTOR OF SUBSEQUENT SIMULATOR SICKNESS

M.R. Bewernitz, O. Shechtman, S. Classen, *Occupational Therapy, University of Florida, Gainesville, Florida*

Driving simulators provide a means to assess driving skills in a well-controlled environment. However, some people experience simulator sickness, which limits their ability to complete the simulated driving assessment (SDA). One strategy used to decrease simulator sickness (SS) is a short acclimation period prior to driving the full SDA. The Simulator Sickness Questionnaire (SSQ) is a widely accepted tool used to assess SS (Kennedy, et al., 1993). The purpose of this study was to: 1) examine if there are differences in post-acclimation SSQ scores between participants who did and did not complete the SDA, and 2) to establish a cut-off SSQ score to indicate if participants should proceed with the SDA. Participants (age = 57.3(20.6); 36 males and 27 females), completed the SSQ before and after a five-minute acclimation period. Of the 63 participants, 43 completed the subsequent SDA and 20 did

not (due to experiencing SS). There was a significant interaction ($F = 33.78, p < .001$) and main effect ($F = 19.20, p < .001$) between participants who did and did not complete the SDA, indicating that SSQ scores were similar at baseline, but became significantly greater post-acclimation among participants who did not complete the SDA. Receiver operating characteristic (ROC) curve analysis established a cutoff score of 13 (sensitivity = .85; specificity = .65; overall error = .50), above which a participant should not attempt the full SDA due to SS symptoms. The area under the curve was .82, indicating good discriminability between signal (correct prediction) and noise (incorrect prediction).

SESSION 55 (PAPER)

STAFF ISSUES IN NURSING HOMES

INFLUENCE OF STAFFING LEVELS ON PRESSURE ULCER MANAGEMENT IN NURSING HOMES

A. Kris, *Fairfield University, Fairfield, Connecticut*

Pressure ulcers continue to be a significant problem in long-term care facilities. Previous research has found that nearly 50% residents develop pressure ulcers during the terminal phase of illness. Complications can be serious, and patients with pressure ulcers often experience pain and a diminished quality of life. The purpose of this study was to explore the role of nurse staffing levels in the development and management of pressure ulcers. Data were obtained from two facilities: one with nurse staffing levels similar to the national average, and a second with RN staffing levels 1.5 times higher than the national average. Participant observation, in-depth interviews and event analysis were used to obtain data about the development and management of pressure ulcers in these nursing homes. Results indicate that the residents in the nursing home with higher levels of nurse staffing tended to identify pressure ulcers at earlier stages. In addition, the nursing assistants in the facility with higher levels of nurse staffing were less likely to report that they did not have adequate time to turn and reposition patients. The presence of a full-time wound care specialist contributed to improved monitoring and surveillance of pressure ulcers at the more richly staffed facility. Findings suggest that changes to facility level staffing patterns will improve pressure ulcer management and decrease the severity of pressure ulcers.

THE EFFECTS OF NURSING HOME CULTURE AND CLIMATE ON OUTCOMES FOR EMPLOYEES AND RESIDENTS

K. Cassie, *College of Social Work, University of Tennessee, Nashville, Tennessee*

Culture change movements in nursing homes across the country are gaining momentum, but much of the literature on the topic is theoretical, anecdotal, or reports on the efforts of a few facilities with limited statistical analysis. This research furthers our understanding of the organizational social context of nursing homes by examining the relationship between the organizational culture and climate of nursing homes and outcomes for employees and residents. It was hypothesized that in nursing homes with more positive organizational cultures and climates, we expected to find: 1) better employee morale; 2) better resident health; and 3) better resident psychosocial health. Data was obtained from a sample of 27 nursing homes in a single southeastern state, 1,114 employees and 3,927 residents. Organizational culture and climate were measured by the Organizational Social Context (OSC) system. Resident health and psychosocial outcomes were measured by the Minimum Data Set (MDS). Hierarchical Linear Modeling (HLM) was used to examine hypotheses. Findings revealed partial support for the proposed hypothesis in that climate was associated with greater employee morale, improved resident health and improved resident psychosocial conditions. Definitions of culture and climate based on previous research and the dimensions of each construct are reviewed. Details of findings are

provided and opportunities for practitioners, researchers, policy makers and educators to enhance to the well-being of residents through culture and climate change efforts are discussed.

WORK STRESS AND BURNOUT AMONG DIRECT CARE WORKERS SERVING ADULTS AGING WITH INTELLECTUAL/DEVELOPMENTAL DISABILITIES: THE ROLE OF WORK SOCIAL SUPPORT AND LOCUS OF CONTROL

J. Gray-Stanley¹, N. Muramatsu², 1. *School of Nursing and Health Studies, Northern Illinois University, DeKalb, Illinois*, 2. *University of Illinois at Chicago, School of Public Health, Chicago, Illinois*

Though direct care workers (DCWs) serving adults with intellectual and developmental disabilities (ID/DD) serve as caregivers and key role models for adults with ID/DD, work stress can impede capacities. External resources, such as instrumental and emotional support from supervisors and coworkers and internal resources, such as internal locus of control, can help DCWs perceive stressors as less threatening, and galvanize them to cope more actively. We examined how work stress and resources were associated with burnout, using data from a survey of DCWs (n = 323) who serve adults with ID/DD from 5 community-based organizations which provide residential, vocational, and personal/respite/foster care services. Work stress was defined according to both aggregate and sub-dimensions, as was work social support. A series of multiple regression analyses indicated that, while work stress was positively associated with burnout, work social support lessened the effects of work stress on burnout. Furthermore, locus of control had stronger inverse relationship with burnout among workers with a lighter workload. Locus of control also lessened the negative effects of work stress on burnout among workers experiencing higher levels of exclusion from organizational decision-making. Considering that heavy workloads are an inherent part of direct care work, particularly in organizations with limited funding and staffing, work social support proves to be an essential resource. Our findings may suggest limits to personal control resources (i.e., locus of control) in managing high stress levels.

DOING THE JOB: CNAS AND LPNS VIEW THEMSELVES AND ONE ANOTHER

P. Parmelee¹, M.C. Laszlo¹, J.A. Taylor², A. Snow¹, 1. *Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama*, 2. *Long-term care consultant, Asheville, North Carolina*

The nursing home (NH) industry continues to grapple with staff turnover, absenteeism, understaffing and heavy reliance on agency staff. Staffing problems are especially acute for nursing assistants (NAs), but often extend to the licensed practical nurses (LPNs) who are their immediate supervisors. Previous research has examined NAs' views in depth, but less often included those of LPNs. This study used focus group methodology to examine how NAs and LPNs view their own and the other group's work roles and challenges. Twelve NA groups (total N=94) and 7 LPN groups (N=61) convened at the National Association of Health Care Assistants, regional meetings of southeastern quality improvement organizations, and non-NH sites throughout Georgia. Groups drew from different NHs to ensure confidentiality and diverse representation. Facilitators used broad questions to encourage open-ended discussion (e.g., NAs' and LPNs' work roles and challenges, causes of turnover, characteristics of a good staffer). Audiotaped sessions were transcribed verbatim, content analyzed by multiple readers using an emergent coding system, and recoded by additional readers to ensure validity and reliability. Several similar themes emerged for both groups: strong influence of organizational culture (e.g., cliques and gossip, NAs' fear of being fired), poor working conditions, challenging relationships with supervisors, lack of teamwork among NAs. Each group also voiced unique concerns, e.g., NAs emphasized interpersonal conflict and work/home spillover, LPNs often cited multiple job roles and communication within the organizational hierarchy. This presentation

reviews each group's common and unique themes, and implications for workplace interventions to address staffing problems.

INTENT TO LEAVE AMONG DIRECTORS OF NURSING (DONS) IN NURSING HOMES

B.A. Kash¹, G.S. Naufal², R.K. Dagher³, C.E. Johnson¹, 1. *Texas A&M Health Science Center, College Station, Texas*, 2. *School of Business and Management, Sharjah, United Arab Emirates*, 3. *University of Florida, Gainesville, Florida*

Purpose: Scarce literature exists on determinants of intent to leave among directors of nursing (DONS) in nursing homes. The purpose of this study was to examine factors that influence DON intent to leave. **Design and Methods:** We developed a framework of analysis at three levels: individual (DON), facility, and county level factors. A survey of nurse supervisors in Texas nursing homes, the 2003 Texas Nursing Facility Medicaid Cost Report, and the Area Resource File, were merged. A total of 626 observations at the facility level were included in the study. Only DON respondents were included in this study. We examined differences in DON characteristics based on ownership type and urban influence. To predict the likelihood of DON intentions to leave we constructed three logit models. **Results:** DONS working in for-profit homes were more inclined to leave, less satisfied with their job, and had lower levels of perceived empowerment in terms of autonomy. More DONS with a college degree worked in urban versus rural settings. Intention to leave was significantly higher for DONS working in urban areas. Job satisfaction was significantly and inversely associated with intent to leave in all three logit models. Higher perceived salary competitiveness and level of empowerment was associated with reduced odds of intending to leave. **Implications:** It is important to consider psychological factors when studying and understanding intentions to leave among DONS. Nursing home administrators should focus on job satisfaction, empowerment in decision making, and salary competitiveness when considering retention strategies for DONS.

SESSION 60 (PAPER)

WHAT IMPACTS TREATMENT PLANS FOR OLDER ADULTS

THE COMPLEMENTARITY AND SUBSTITUTION OF PHYSICAL THERAPY AND CHIROPRACTIC CARE AMONG OLDER CONSUMERS

V. Bhargava¹, G. Hong², 1. *University of Georgia, Athens, Georgia*, 2. *Ohio State University, Columbus, Ohio*

Prevalence of Complementary and Alternative medicine (CAM) use in general and chiropractic specifically among elderly in the U.S. is well documented. Promoters of CAM are optimistic about the economic implications. Economic consequences of CAM use depend on whether CAM and conventional care are substitutes or complements. However, there is dearth of analytical investigation of the relationship of CAM with conventional care. This study uses Grossman's model of demand for health to estimate demand for physical therapy and chiropractic and examine the relationship between physical therapy and chiropractic among older adults with arthritis, back problem and /or other musculoskeletal problems. Data used are from the 2002 and the 2004 Medical Expenditure Panel Survey. Sample is comprised of 9,347 individuals age 50 and over with arthritis, back problem and /or other musculoskeletal problems. Demand is estimated using a two-part model. Own- and cross-price elasticities are computed. About 6% of the sample reported using physical therapy, 8% used chiropractic care and 2% used both. Price of chiropractic care (—), time constraint (—), unearned income (+), and smoking status (—) were significant predictors of likelihood of use of physical therapy. Medicaid insurance (—) and time constraints (—) have significant impact on number of visits to physical therapist. Demand for chiropractic is primarily a function of preferences of

consumers. Results show that demand for physical therapy is price inelastic. The total cross-price elasticity of chiropractic is positive suggesting complementarity. This study has several implications for consumers, practitioners, health insurers, policy makers, and researchers.

LONG-TERM CARE SERVICE USE AND NEED AMONG BABY BOOMERS AND OLDER ADULTS WITH MENTAL ILLNESS

K.G. Kellett, J. Robison, *Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*

The exponential growth of Americans age 65 and older impacts every aspect of society presenting both challenges and opportunities to families, businesses, health care providers, and policymakers. Demographic projections indicate the numbers and proportion of older adults in the United States will increase significantly as the cohort of baby boomers start turning 65 in 2011 (U. S. Census Bureau, 2000). As the nation experiences this unprecedented population growth, demographic trends suggest that the number of older people with mental illnesses is also increasing (Jeste and Muñoz, 1999). Since the beginning of deinstitutionalization, many people with mental illness have moved into the community but experience difficulty in finding adequate long-term care (LTC) services and supports. This study evaluates LTC use and need among a subset of baby boomers and older adult respondents reporting mental illness in the 2007 Connecticut Long-Term Care Needs Assessment. Older adults report greater impairment in activities of daily living and instrumental activities of daily living (50% and 82% respectively) than baby boomers (34% and 77% respectively) and are less likely to report unmet service need (46% vs. 56% respectively). The two greatest community LTC service needs reported by both older adults and baby boomers are transportation (19% and 25% respectively) and home-maker services (19% and 23% respectively). Identifying the LTC needs of older adults and baby boomers reporting mental illnesses is an important step in helping them remain in the community as long as possible and in informing policy at the state and local level.

ADVANCE CARE TREATMENT PLAN FOR AFRICAN AMERICAN FAMILY CAREGIVERS: PRELIMINARY STUDY RESULTS

G.J. Bonner, D.M. Ingram, E. Wang, D.J. Wilkie, B. Dancy, C. Ferrans, *School of Public Health, University of Illinois at Chicago, Chicago, Illinois*

Research is limited on end-of-life (EOL) treatment decisions made by African American (AA) family caregivers. A pilot study was conducted to examine the feasibility of implementing an advance care treatment plan (ACT-Plan) with AA caregivers of relatives diagnosed with dementia. Cardiopulmonary resuscitation (CPR), mechanical ventilation (MV) and tube feeding (TF) were EOL treatments discussed in the ACT-Plan. In a pretest and 4-week posttest, two-group randomized design, 64 caregivers were assigned to the ACT-Plan ($n = 32$) or attention control ($n = 32$) condition. Based on Bandura's Social Cognitive and Kolb's Experiential Learning theories, the ACT-Plan used strategies such as case studies to enhance knowledge, self-efficacy, and behavioral skills to make EOL treatment plans in advance. Two similar adult day care centers served as either an intervention or control site. Participants were recruited concurrently at each center. They participated in 4 weekly sessions in a group setting of eight. The ACT-Plan condition (site 1) received EOL treatment discussions. The attention control condition (site 2) received health promotion. Pre and posttest questionnaires were compared between the two conditions that measured knowledge, self-efficacy, CPR, MV and TF outcomes. Descriptive statistics, ANCOVA and logistic regression models were used to compare the two groups. Preliminary findings suggest that the ACT-Plan is feasible and content is culturally appropriate. Caregivers' responses indicate an increase in knowledge and comfort with EOL advance care plan decisions.

CHANGES IN MUTUALITY AMONG ALZHEIMER'S AND PARKINSON'S DISEASE CAREGIVERS

B. Shim, L.L. Davis, *School of Nursing, Duke University, Durham, North Carolina*

Background: Alzheimer's Disease (AD) and Parkinson's Disease (PD) are the two most common nonreversible neurodegenerative disease in the US. AD and PD family caregivers are reported to have multiple adverse social, financial, psychological, and physical health outcomes. **Mutuality**, the caregiver's perception of the positive quality of the care relationship, is reported to influence caregivers' psychological outcomes. **Purpose:** To explore changes in mutuality among AD and PD caregivers with disease progression over time. **Methods:** Secondary analysis of longitudinal data from an ongoing clinical trial of skill training for AD and PD caregivers. Baseline, 6 months and 12 months data were analyzed on 91 caregivers from the wait-listed group. Ninety one percent were family members (65% spouses, 26% adult children caregivers). To test whether the independent variables had significant effects on mutuality at baseline and over time, multilevel models for change were used for analyses. **Results:** Mutuality showed a slight decline for both AD and PD caregivers. Caregivers with significantly lower mutuality: 1) had less caregiving experience, 2) were caring for care recipients with greater functional dependency (higher IADL scores), and 3) had more depressive symptoms (higher CES-D scores). **Conclusions:** Caregivers with more caregiving experience continued to have higher mutuality throughout the one year follow up period. Lower mutuality was correlated with higher levels of care recipient functional dependence and more caregiver depressive symptoms. Clinicians should consider promoting relationship focused skill training to enhance psychological outcomes for AD and PD caregivers.

SESSION 65 (SYMPOSIUM)

WITHIN-FAMILY DIFFERENCES IN AMBIVALENCE: WITHIN AND ACROSS GENERATIONS

Chair: *J. Suito, Purdue University, West Lafayette, Indiana*

Discussant: *A. Shapiro, Purdue University, West Lafayette, Indiana*

The role of ambivalence in interpersonal relations has received considerable attention in the literature across the past decade. This research has shown that ambivalence is common in families and is consequential for exchanges of support, relationship quality, and well-being. In this symposium, we bring together the study of ambivalence and within-family differences, exploring several types of interpersonal family relationships. Suito, Gilligan, and Pillemer begin the symposium with a paper on conceptualizing and measuring ambivalence in intergenerational relations. Using data on mothers and adult children from the Within-Family Differences Study (WFDS), they discuss the ways in which using different measures of ambivalence result in variations in which mother-child dyads are classified as ambivalent. Next, Pillemer, Suito, Fuller-Rowell, and Mock use data from the WFDS to investigate differences in the levels and predictors of mothers' and fathers' ambivalent feelings toward their adult children. Third, Birditt, Fingerman, and Tighe examine the transmission of parent-adult child ambivalence across generations using data from grandparents, parents, and adult children, collected as part of Fingerman's Family Exchanges Study. Last, Gilligan, Suito, and Pillemer study congruence in adult siblings' reports of ambivalence in their relationships with one another, using data from the WFDS. Finally, panelists and the discussant explore the ways in which the collective findings from this set of papers shed light on patterns of ambivalence in family relations, and the implications of these patterns for theory and practice.

"ARE YOU SURE I'M AMBIVALENT?" CONCEPTUALIZING AND MEASURING AMBIVALENCE IN MIDDLE AND LATER-LIFE FAMILY RELATIONS

J. Sutor, M. Gilligan, K. Pillemer, *Purdue University, West Lafayette, Indiana*

In recent years the concept of ambivalence has played an increasing role in the study of parent-adult child relations. A variety of direct and indirect measures have been used across these investigations, with the implicit assumption that these measures are conceptually similar and therefore relatively interchangeable. In the present paper, we use data on 2,138 mother-adult child dyads nested within 566 later-life families as part of the Within-Family Differences Study to explore the ways in which different measures of ambivalence produce variations in the classification of mother-child dyads as ambivalent. Specifically, we compare several of the most commonly used direct and indirect measures of ambivalence, examining whether the same dyads are classified as moderately to highly ambivalent, based on the mothers' reports. These comparisons show substantial differences in classification across measures, calling into question whether they are sensitive to variations in this relational phenomenon.

INTERGENERATIONAL AMBIVALENCE: ARE THERE DIFFERENCES BETWEEN MOTHERS AND FATHERS?

K. Pillemer¹, J. Sutor², S. Mock³, T. Fuller-Rowell¹, *1. Cornell University, Ithaca, NY, 2. Purdue University, West Lafayette, Indiana, 3. University of Waterloo, Waterloo, Ontario, Canada*

In this paper, we apply a within-family design to the study of ambivalence, using data collected from 129 older couples as part of the Within-Family Differences Study. Specifically, we compare mothers' and fathers' assessments of ambivalence toward all of their adult children, as well as gender differences in predictors. Overall, fathers report higher levels of ambivalence towards their children than do mothers. However, this varies by child's gender; fathers report more ambivalence towards sons than daughters whereas mothers report more ambivalence toward daughters than sons. Effects of child's educational achievement and parent-child similarity also differed by parents' gender; low educational achievement was a stronger predictor of fathers' than mothers' ambivalence whereas dissimilarity of outlook was a stronger predictor of mothers' than fathers' ambivalence.

IT'S A FAMILY AFFAIR: AMBIVALENCE ACROSS THREE GENERATIONS

K. Birditt¹, K. Fingerman², L. Tighe¹, *1. Institute for Social Research, University of Michigan, Ann Arbor, Michigan, 2. Purdue University, West Lafayette, Indiana*

Family systems theory suggests that patterns of interaction are passed from one generation to the next. Likewise, feelings of ambivalence in intergenerational ties may be transferred across generations. This study examined whether reports of intergenerational ambivalence are similar across three generations. Participants included 633 middle aged participants (ages 40 to 60), 592 of their offspring (ages 18 to 41), and 337 of their parents (ages 59 to 96). The youngest generation (G3) reported the highest levels of ambivalence while the oldest generation (G1) reported the lowest levels. Participants reported greater ambivalence toward mothers than fathers. Multilevel models revealed that greater ambivalence between middle aged participants (G2) and their fathers (G1) predicted greater ambivalence among middle aged participants regarding their own children (G3). It appears that ambivalence varies across generations and that ambivalence may transfer via fathers rather than mothers.

DESCRIBING AND EXPLAINING CONGRUENCE IN ADULTS' AMBIVALENCE TOWARD THEIR SIBLINGS

M. Gilligan¹, J. Sutor¹, K. Pillemer², *1. Purdue University, West Lafayette, Indiana, 2. Cornell University, Ithaca, New York*

Recent research has shown that ambivalence is useful in understanding the complex nature of family relations. Studies have demonstrated the presence of both positive and negative emotions in several familial relationships; however, this research has not examined whether there is congruence in family members' ambivalent feelings. It is possible that some family members may feel ambivalent about a particular relationship whereas other family members do not. The present paper uses data from the Within-Family Differences Study to examine congruence in adult siblings' reports of ambivalence in their relationships with one another. An indirect measure of ambivalence was created using data collected from 708 adult children nested within 274 later-life families. Preliminary results suggest that siblings experience ambivalence in the sibling relationship differently. Less than half of the adult-child dyads shared a similar level of ambivalence regarding their relationship with their siblings. This finding offers a more complete and nuanced understanding of sibling relationships in later-life.

SESSION 70 (PAPER)

CAREGIVER ISSUES

BALANCING RESIDENTS' NEEDS FOR A HOMELIKE ENVIRONMENT WITH CAREGIVERS' NEEDS FOR EFFICIENT WAYS TO DELIVER CARE

L. Liu¹, D.L. Milke², S. Maisey³, M. Mayan¹, *1. University of Alberta, Edmonton, Alberta, Canada, 2. CapitalCare, Edmonton, Alberta, Canada, 3. Shepherd's Care Foundation, Edmonton, Alberta, Canada*

This study examines how three residential care centres in Canada balance residents' needs for homelike environment with staff needs for efficient care delivery. Research questions: (1) How do the residential care centres rate on two standardized measures of physical therapeutic environments - the Professional Environmental Assessment Protocol (PEAP) and the Therapeutic Environment Screening Survey-Nursing Home (TESS-NH/RC)? (2) What factors are related to homelikeness that facilitate or hinder care delivery, according to family members and staff? (3) What suggestions, if any, do family members and staff members have to balance homelikeness with efficient ways to deliver care? (4) How do planning and research managers reconcile the suggestions with required standards, policies, procedures and guidelines? Methods: Interviews are used with family members, serving as proxies for residents, and separately with staff, to discuss participants' experience and their needs for homelikeness and efficient delivery of care. A focus group session with planning and research managers provides data for how organization representatives reconcile the suggestions of family and staff member. Transcripts are coded by identifying persistent words, phrases, themes, or concepts within the data. The analytic technique is content analysis. Preliminary results: Homelikeness is associated with more than physical features in an environment, and includes pets, program, sensory experiences and staff attitude. Recent policies on safety take staff time away from residents thereby reducing homelikeness for residents. As well, staff members feel they are not as effective in caring for residents. The results are discussed in the context of health care restructuring.

INTERNET SAVVY CAREGIVER: DEMENTIA TRAINING

M. Lewis¹, J.V. Hobday², K. Hepburn¹, *1. Emory University, Atlanta, Georgia, 2. HealthCare Interactive, Inc., Minneapolis, Minnesota*

The goal of the Internet Savvy Caregiver program, conceptually derived from the previously validated face-to-face Savvy Caregiver Program, was to develop and test an Internet-based psycho-educational program designed to provide persons caring for relatives with dementia the

knowledge, skills, and outlook they need to succeed in the caregiving role. The project employed an iterative process to develop and test the prototype. Forty-seven subjects completed the Internet program and follow-up questionnaire, a 60% return rate. The participants, who came from ten states, were 79% white and 21% African American, Asian, or Native American. Their average age was 55 years (range 29-87), with an average of 5 years of caregiving (range 1-21). The formative evaluation focused on issues of acceptability, usability, and satisfaction, along with a self-reported effectiveness assessment. Results indicated that participants perceived they gained confidence in caring for their family member (93.6%), new ideas and strategies for caring (95.7%), and better understanding of changes in thinking (100%). Only 76.5% of participants stated they enjoyed learning in the internet format as opposed to attending a class. Open-ended questions yielded rich data. The respondents most liked information and caregiving strategies; videoclips of professionals, caregivers and persons with dementia; convenience of the internet program; and presentation of the program. They least liked repetition of information, length of the program, and not being able to ask questions, or interact with others. This suggests adding interaction such as a chat room or an opportunity to email a professional with questions would enhance the program.

WHAT MATTERS MOST TO CARERS OF PEOPLE WITH MILD TO MODERATE COGNITIVE IMPAIRMENT AS EVIDENCE FOR TRANSFORMING CARE

D.J. Hain¹, T. Touhy¹, G. Engstrom², *1. Nursing, Florida Atlantic University, Boca Raton, Florida, 2. Malardalen University, Eskilstuna, Sweden*

There is scant qualitative research regarding the experience and needs of carers of persons with cognitive impairment and few evidence-based interventions to guide them on their journey. The purpose of this qualitative pilot study was to describe what matters most to family carers of persons with mild to moderate stage of cognitive impairment in order to design individualized strategies. Community dwelling family members were recruited from a university based memory disorder clinic. As part of a GNP consultation program, participants met once with a GNP who used open-ended questions, such as 1) what matters most to you right now; and 2) what are your hopes and dreams for the future, to promote dialogue with the carer. A descriptive phenomenology approach was used to analyze the transcribed interviews. Ten family carers, spouses (n = 7) and daughters (n = 3) participated in the study with ages ranging from 45-80 years. Four themes emerged from the data: 1) Struggling to keep normalcy in life; 2) Seeking guidance; 3) Preserving self and loved one; and 4) Being uncertain and frightened of the future. Coming to know what matters most to carers of persons with cognitive impairment guided individualized strategies. These approaches included partnering between the GNP and the family carers and mutual goal setting that could be incorporated into their everyday lives. This study provides evidence of the importance of considering the unique and ongoing needs of carers throughout their journey as health care professionals strive to transform care.

FRONTOTEMPORAL DEMENTIA CAREGIVERS AND RESEARCHERS: PARTNERING FOR BRAIN DONATION

M.G. Austrom^{1,2}, S.L. Dickinson³, S.S. Denny³, B.R. Matthews^{4,2}, B. Ghetti^{5,2}, *1. Indiana University School of Medicine, Indianapolis, Indiana, 2. Indiana Alzheimer Disease Center, Indianapolis, Indiana, 3. Association for Frontotemporal Dementias, Philadelphia, Pennsylvania, 4. IUSM Dept of Neurology, Indianapolis, Indiana, 5. IUSM Dept of Pathology and Laboratory Medicine, Indianapolis, Indiana*

No information exists about brain donation among caregivers of persons with frontotemporal dementia [FTD]. Similarly, no conclusive information exists to suggest that caregivers of FTD are aware of the importance of participation in advancing biomedical research on this

rare disease. To advance science and understand morphological and biochemical changes occurring in FTD it's important to understand caregivers' concerns and perceived barriers to research participation, especially brain donation. To address this the Association for Frontotemporal Dementias [AFTD] and the Indiana Alzheimer Disease Center Education Core [IADC] partnered using a community-based participatory research [CBPR] model. CBPR is especially relevant in for rare diseases, where the small number of patients exacerbates issues of grant funding and statistical sample size. Organizations such as AFTD can combine their ability to coordinate their constituents with scientists to drive forward research aimed at translational goals. The AFTD-IADC CBPR project was designed to address barriers to brain donation from the caregivers' perspectives to design appropriate, respectful educational materials and recruitment tools to increase participation in brain donation programs. It's anticipated results will also inform researchers working with other rare neurodegenerative diseases. Six focus groups in three cities are designed to gain insight about caregivers' understanding of and barriers to brain donation and effective recruitment strategies. Developing a CBPR project, implementing communication systems, addressing the challenges of virtual collaboration and results from the first four focus groups will be presented. Research supported by: NIH R03HD059655-01 & R03NS065490-01. Drs. Guerriero Austrom, Matthews and Ghetti are also supported by NIH P30AG10133.

SESSION 75 (SYMPOSIUM)

CAUSES AND CONSEQUENCES OF DEPRESSION: EVIDENCE FROM THE ENGLISH LONGITUDINAL STUDY OF AGEING

Chair: *M. Stafford, Epidemiology and Public Health, UCL, London, United Kingdom*

Discussant: *J. Smith, University of Michigan, Ann Arbor, Michigan*

This symposium exploits longitudinal data capturing the economic, social, psychological, biological and health elements of the ageing process in the English Longitudinal Study Of Ageing (ELSA). Taking the onset of depressive symptoms as its focal point, this collection of papers brings together work investigating factors which may contribute to their development as well as the consequences of those symptoms for subsequent disease risk. Depressive symptoms are a relatively common phenomenon for older people and their causes are multi-factorial. Three papers in this session will summarise work which relate biomedical factors (namely body size and shape) and socioeconomic factors (including work and retirement) to the onset of depressive symptoms in older age. In addition to the functional and quality of life limitations experienced by many people with depression, studies suggest that it may play a causal role in the development of physical disease, including coronary heart disease. Two further papers explore the impact of depression on markers and risk factors for CHD. Low grade inflammation might be an important mechanism in explaining the link between depression and cardiovascular disease and work describing its link with depression will be summarized here. The relationship between depression and incident diabetes will also be described. This collective work highlights the role of psychosocial factors in the development of disease as well as the intimate relationship between physical and mental illness in older age. It exemplifies the use of longitudinal data to explore the interplay of the social, economic and health domains unfolding over time.

PERSISTENT DEPRESSIVE SYMPTOMATOLOGY AND INFLAMMATION: TO WHAT EXTENT DO HEALTH BEHAVIORS AND WEIGHT GAIN MEDIATE THIS RELATIONSHIP?

M. Hamer, G. Molloy, C. de Oliveira, P. Demakakos, *Epidemiology and Public Health, University College London, London, United Kingdom*

We examined if persistent depressive symptoms are associated with markers of inflammation (C-Reactive Protein-CRP and fibrinogen), and if this association can be partly explained by weight gain and health behavior. The study sample included 3609 adults (aged 60.5 +/- 9.2 yrs) from The English Longitudinal Study of Ageing. Depressive symptoms (8-item CES-D scale), inflammatory markers, health behaviors, and body weight were assessed at baseline and 2 yrs follow up. Baseline CES-D score was associated with CRP ($\beta = .035$, SE = .0066) and fibrinogen ($\beta = .023$, SE = .0060) at follow up. Depressive symptoms were also associated with weight gain, smoking, physical inactivity, and alcohol abstinence. We observed both a direct association of depressive symptoms on CRP ($\beta = .013$, SE = .0066) and indirect mediating effects through health behavior (β for total indirect effect = .022, SE=.0023). Associations between depressive symptoms and inflammation can be partly explained by poor health behavior.

DEPRESSIVE SYMPTOMS AND INCIDENT DIABETES IN THE ENGLISH LONGITUDINAL STUDY OF AGING (ELSA)

P. Demakakos¹, M. Pierce², R. Hardy², 1. *Department of Epidemiology and Public Health, University College London, London, United Kingdom*, 2. *MRC Unit of Lifelong Health and Aging, University College London, London, United Kingdom*

We examined whether baseline elevated depressive symptoms (scoring 4 or higher on an 8-item CES-D scale) were associated with incident self-reported doctor diagnosed diabetes and whether this association was mediated by health behaviors and body mass index (BMI). Our sample consisted of 6111 individuals aged 50+ from the English Longitudinal Study of Aging. We estimated Cox proportional hazards models that were gradually adjusted for baseline characteristics (age, sex, marital status, education, household wealth and cardiovascular, psychiatric and other comorbidities). We found that those with elevated depressive symptoms had significantly higher risk of developing diabetes over 4 years of follow-up. The hazard ratio for diabetes was 2.14 (95% CI 1.56-2.94) in the age-adjusted model and 1.62 (95% CI 1.15-2.29) in the fully-adjusted model. We conclude that elevated depressive symptoms are associated with increased risk of developing diabetes in older ages irrespective of sociodemographic factors, previous medical history, health behaviors and BMI.

OBESITY, CENTRAL OBESITY AND DEPRESSIVE SYMPTOMS IN ELSA

P. Zaninotto¹, M. Pierce², E. Breeze¹, C. de Oliveira¹, M. Kumari¹, 1. *UCL, London, United Kingdom*, 2. *MRC, London, United Kingdom*

We used data from 8688 participants of the second (2004-05) and third (2006-07) waves of the English Longitudinal Study of Ageing (ELSA) to explore cross-sectional and longitudinal relationships between depressive symptoms (CES-D; dichotomised at a score greater than or equal to 3) as our outcome measures and compare BMI and waist circumference as predictors. At the second wave of ELSA, increased waist circumference is related to higher odds of reporting depressive symptoms. Increased BMI is related to higher risk of depressive symptoms (OR=1.14 95% Confidence Intervals (CI) = 1.06; 1.2) in women. In mutually adjusted analyses, no association was apparent between BMI and depressive symptoms (OR=0.91 95% CI= 0.79, 1.04) while the association between waist circumference and depressive symptoms remained (OR=1.12, 95% CI=1.05, 1.18). Similar data were apparent when depressive symptoms were examined two years after anthropometric assessment. We conclude that among older people and particularly in women,

waist circumference is a more robust marker than BMI of being at increased risk of reporting depressive symptoms.

SESSION 80 (PAPER)

GERIATRIC EDUCATION

MEASURING "DOSE" OF GERIATRICS IN MEDICAL SCHOOL CURRICULA: AN INNOVATIVE EVALUATION STRATEGY

T. Wetle^{1,2}, R. Shield², S.E. Campbell², A.R. Wang², L. McNicoll², 1. *Public Health, Brown University, Providence, Rhode Island*, 2. *Center for Gerontology and Healthcare Research, Brown University, Providence, Rhode Island*

The new curriculum at Alpert Medical School, Brown University, integrated geriatrics content throughout all pre-clerkship courses with Donald W. Reynolds Foundation support, beginning 2006-2007. This study reports an innovative strategy to evaluate quality and calculate the quantity or "dose" of geriatrics content through "tracking" of all courses by pre-clerkship medical students. Methods: The baseline amount of geriatrics content was calculated by a thorough review of the 2006-2007 syllabi. Course leaders were then provided appropriate geriatrics content for integration into all courses. First and second year medical student volunteers were recruited and provided a modest honorarium to complete "tracking" forms for each lecture, small group, and clinical experience. Forms were designed to record elements and count the minutes of geriatrics content; assign a numeric rating for quality; and provide evaluative comments regarding perceived success of integration and suggestions for improvement of content. "Dose" was calculated using the average of the reported tracked minutes. Results: First year geriatrics content increased from 5.6 hours at baseline to approximately 40 hours in 2007-2008, while second year geriatrics content increased from 15.9 hours at baseline to approximately 22 hours. Student feedback provided useful real-time suggestions for improvement in the content and integration. Immediate feedback of elements that work well or need improvement allowed for timely mid-course corrections for optimal geriatrics. Conclusions: Tracking provides an effective method to quantify the amount of aging content delivered while eliciting useful student perspectives and suggestions. Seamless integration of geriatrics content may result in underestimating "stealth" aging content.

POST-EVENT EVALUATIONS YIELD VALUABLE INSIGHT TO THE IMPACT OF CONTINUING EDUCATION PROGRAMS

R. Chernoff^{1,2}, S.H. Jasin², S. McKee^{1,2}, K. Clement², S.M. Porbeck², 1. *GRECC, Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*, 2. *Arkansas GEC, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Among the challenging issues in continuing education (CE) is assessment of CE impact on practice and patient outcomes. To evaluate this link, the Arkansas Geriatric Education Center developed a follow-up evaluation instrument for CE programs. The objectives of the survey, containing demographic items and 5 questions (Q), were to gauge the impact of programs on attendees' practice (Q1-3); learn about knowledge transfer (Q4); and assess usefulness of handouts (Q5). This report looks at results obtained from follow-up evaluations collected for 20 programs in a 1 year period. The evaluation, an introductory letter and return envelope were mailed to 1463 attendees of 20 programs (symposia, video teleconferences, in-service training, outreach seminars) offered by the AGECC and its partners through 2008. Response to mailings has been excellent (46%). Response rates are higher when attendees are told to expect the follow-up survey at the time of the program event. Data collected (reported as means) show that 76.2 % of responders reported an impact after attendance at these events. Impact was defined as using the knowledge gained in patient care (55.2%), modi-

fy patient assessment (25.4%), changing patient counseling strategies (22.5%), and noticing improved patient outcomes (10.6%). Responders provided specific comments related to outcomes (5.5%). Reasons for having no impact were: content unrelated to practice (43.3%); content level too high/too low (2.4%), or retired status (7.3%). Sharing knowledge was reported by 66.6% and the handouts were considered useful (59.7%). It is clear that CE is having a positive impact on changes in providers' practice.

FACULTY TRAINING LEADS TO ENRICHED GERIATRICS CURRICULUM

R. Chernoff^{1,2}, S.H. Jasin², S. McKee², K. Clement², I. GRECC, *Central Arkansas Veterans Healthcare System, Little Rock, Arkansas, 2.*

Arkansas GEC, University of Arkansas for Medical Sciences, Little Rock, Arkansas

To expand geriatric content in the education of the next generation of health care professionals, the Arkansas Geriatric Education Center offers a Summer Institute (SI) designed to update the theoretical and practical geriatric knowledge of academic health professionals. For 8 years, faculty at Arkansas colleges and universities has had an opportunity to participate. The SI consists of 24 hours of lectures and 36 hours of shadowing experiences. Lecture topics include normal aging, nutrition, functional independence, end of life issues, speech/voice characteristics of elders, dementia, pharmacotherapy, substance abuse, sexuality, neuropsychiatric assessment, LTC alternatives, legal issues, osteoporosis, fitness and other topics. After encouraging participants to expand their knowledge beyond the comfort zone of their disciplines, they chose shadowing activities of interest to them. Shadowing occurs at UAMS and VA sites. During the program, participating health professionals were urged to incorporate their newly acquired geriatric knowledge into the curricula at their respective institutions. To gauge the impact of the SI in the professional activities of the participants, we sent evaluation surveys to 33 past participants, reached 28 and received 18 responses (61% return rate). Results were: 88.2% have used SI information to develop course materials, 88.2% introduced it into existing classes, and 52.3% incorporated it into course syllabi; 64.7% used SI information in other settings; and 41.2% used it to develop a new course or program. Such outcomes suggest that updating geriatric skills and knowledge of academic health professionals has a significant impact on the educational content provided to future healthcare providers.

FALLS RISK OBJECTIVE STRUCTURED CLINICAL EXAMINATION (OSCE): CREATIVE APPROACH TO GERIATRIC EDUCATION

E. Roberts, P. Gregory, T. Shubert, A. Caprio, D. Woodyard, U. Lavelle, J. Busby-Whitehead, *Division of Geriatric Medicine, University of North Carolina School of Medicine, Chapel Hill, North Carolina*

Falls are a leading cause of mortality and morbidity among adults over the age of 65. An important part of resident and medical student education is training in evaluating and identifying the patients at risk in order to institute preventive measures. A Falls Risk and Prevention Objective Structured Clinical Examination (OSCE) was developed to improve the quality of patient care by training residents (n=9) and medical students (n=70) in falls prevention. During 2008, the Falls OSCE was administered to medical students and Physical Medicine and Rehabilitation residents. The residents and medical students performed a history and physical examination on standardized patients while being directly observed and graded. The residents, only, received scores and feedback on their performance. Since this exercise was designed as a pre-test, the residents and students received no prior training in falls assessment. The overall mean scores indicated that both the medical students and the residents were weak in their abilities to write a SOAP (Subjective, Objective, Assessment, Plan) note for assessing patients at risk for falls. The highest scoring area on the SOAP note for both disciplines was the "Plan," with the residents' overall mean score 37% and the med-

ical students' 34%. The standardized patients' ratings of the residents' and medical students' performance on the cognitive and mobility assessments were as follows: overall mean for the residents was 43%, and for the medical students 23%. These weaknesses are being addressed in falls risk training, with success to be recorded in future OSCEs.

SUSTAINABILITY: IMPLICATIONS FOR THE HEALTHY AGING OF NATIONAL GERONTOLOGICAL INITIATIVES

T. Kennedy, *School of Social Work, Arizona State University, Phoenix, Arizona*

Geriatric Education Centers (GECs) have been charged by the Health Resources and Services Administration (HRSA) with becoming self-sustaining beyond the period of their funding. In programs that impact the public health, including geriatric health, "sustainability is critical". This study of GECs sought to arrive at a definition of sustainability, determine how GECs pursued sustainability over time, identify changes that occurred in the types of GEC revenue over time, and ascertain whether GECs would have pursued different strategies to prepare for the goal of sustainability. Sources of data included fiscal and narrative portions of multi-year GEC grant applications, and in-depth interviews with thirteen GEC administrators, faculty, staff, and advisory board members representing seven GECs sites, three of whom were national officers of the National Association of Geriatric Education Centers and the National Association of Geriatric Education. Ironically, this study concerning sustainability was undertaken at the very time at which there was a complete elimination of funding for all GECs across the country. The theoretical framework of academic capitalism and the knowledge/learning regime served as the lens through which this study of GECs was explored. Four conceptions of sustainability emerged from this study: 1) maintenance of geriatric mission and activities, 2) institutionalization of organizational infrastructure, 3) community visibility, and 4) strategic response to change. These categories were not mutually exclusive. Rather, multiple paths toward sustainability could be pursued by each GEC. Each of these definitions of sustainability will be explored, with implications for the healthy aging and survival of national gerontological initiatives.

SESSION 85 (PAPER)

PHYSICAL ACTIVITY-HS PAPER SESSION

ACTIVITY LIMITATION STATUS TRENDS BY MARITAL STATUS AMONG OLDER ADULTS, 1983-2003

H. Liu, *Sociology, Michigan State University, East Lansing, Michigan*

The past several decades have witnessed rapid change in the predominant family structures and norms in the United States, and these changes may alter the link between marital status and health. However, we know very little about historical trends in the relationship between marital status and health. Activity limitation status, one of the most often used measures for health status, is particularly relevant in advancing age when activity limitations become more prevalent. Based on data from the National Health Interview Survey (NHIS) 1983-2003, this study examines activity limitation status trends by marital status among older adults aged 60 and above over the past two decades in the United States. Results from preliminary analyses suggest that married older adults became less likely to report any activity limitation from 1983 to 2003; while widowed older adults became more likely to report any activity limitation over the same time span. Gender and race variations in those trends are also examined.

MISPERCEPTION OF MEETING THE PHYSICAL ACTIVITY RECOMMENDATION IN OLDER PERSONS USING ACCELEROMETRY

M. Visser^{1,2}, R. Brychta³, C. Kong³, D.J. Deeg², *1. Department of Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, 2. Department of Epidemiology and Biostatistics, VU University Medical Center, Amsterdam, Netherlands, 3. NIDDK, National Institutes of Health, Bethesda, Maryland*

The aim of this study was to investigate whether older persons correctly perceive meeting the physical activity recommendation using objective measurements of physical activity. Self-report (questionnaire) and objective (7-day accelerometry using 1 minute epochs and Actigraph model GT1M) information on physical activity level and meeting the Dutch recommendation were obtained from 138 men and women aged 65-75 years who participated in the lifestyle study (n=1,058) of the Longitudinal Aging Study Amsterdam. The study sample was slightly older (71 vs 69 y, $p < 0.05$) but had a similar gender, age, education, BMI and self-reported physical activity ($p > 0.3$) compared to the total sample. A majority of the sample (89.6%) reported to be physically active for at least 30 min/d on at least 5 days of the week. For 91.7% this information was confirmed using accelerometry data. After thoroughly explaining the recommendation, 56.8% reported to meet this recommendation. Based on objective accelerometry this percentage was only 25.8% when using the cutpoint 760 cpm to indicate moderate to vigorous activity. Based on this cutpoint, 37.1% of the older persons overestimated their physical activity level and 6.1% underestimated their level. Determinants of overestimation included male gender ($p < 0.001$), lower satisfaction with physical activity level ($p < 0.05$), lower attitude ($p < 0.05$) and lower self-efficacy ($p < 0.001$) of meeting the recommendation. In conclusion, one out of four older persons meet the physical activity recommendation based on objective data. This percentage is much lower compared to self-report. This misconception may hamper the effectiveness of health promotion campaigns in older persons.

DISABILITY-SPECIFIC AND GRADED PROTECTIVE EFFECTS OF REGULAR PHYSICAL EXERCISE ON SURVIVAL IN CHINESE OLDER ADULTS

J.L. Purser, Q. Feng, Y. Zeng, *Department of Medicine - Geriatrics; Department of Community and Family Medicine - Physical Therapy, Duke University Medical Center, Durham, North Carolina*

Background and Objectives: We previously identified four meaningful disability subtypes based on cross-classification of self-reported and physical performance testing. The current study investigates the disability-specific impact of exercise on 3-year survival. **Methods:** We studied 16,020 elders age 65+ from the Chinese Longitudinal Healthy Longevity Survey. Self-reported ADLs included bathing, dressing, toileting, transfers, feeding, and continence. Physical performance measures included chair stands, picking up a book, and turning 360°. A 2X2 table cross-classified presence or absence of any self-reported or observed limitation. We used Cox proportional hazards models to estimate 3-year survival patterns among those exercising or not, within each disability subtype, and adjusted for potentially important confounders (demographic, medical, socioeconomic, and lifestyle). **Results:** Prevalence of "regular physical exercise" was 47% in elders without disability, dropping to 26% and 14% in those with performance limitations and severe disability, respectively. Within each disability strata, regular physical exercise was strongly protective, with hazard ratios ranging from 0.79-0.92. Those with the most severe disability subtype always had the greatest mortality hazard, regardless of whether exercising or not (HR ex = 1.81, 1.55-2.12; no ex = 2.17, 1.93-2.43). Interestingly, the mortality hazards in the groups with mild disability who were exercising (HR 1.25, 1.08-1.45; HR 1.29, 1.04-1.59) were more similar to those with no disability but who were not exercising (1.13, 1.01-1.27) whereas mortality hazards for those with mild disability who were non-exercisers (1.51, 1.35-1.70; 1.66, 1.40-1.97) were more similar to the most

severely disabled group. **Conclusion:** Regular physical exercise has disability-specific and graded protective effects on 3-year survival in elderly Chinese adults.

EFFECTS OF LIFESTYLE MODIFICATION ON MUSCLE STRENGTH AND QUALITY IN OBESE OLDER ADULTS

T. Manini, H. Patel, M. Pahor, S. Anton, *University of Florida, Gainesville, FL*

Background: Very few studies have evaluated the effect of weight loss in older obese subjects because of concerns for paralleled muscle loss. **Objective:** To determine the effects of a six-month weight loss and exercise (WL+E) intervention on muscle strength and quality in older obese women. **Methods:** Participants were randomized to either an educational control group (EC) (n = 13, 64 ± 7.3 years) or weight loss and exercise group (WL+E) (n = 13, 63.6 ± 4.7 years). The WL+E intervention consisted of educational sessions to reduce 500-100 kcal/day and aerobic and resistance exercises 3 days per week. The EC intervention included a series of classes, lectures and field trips/outings. Area for the vastus lateralis muscle was assessed via magnetic resonance imaging in the thigh. Leg strength was assessed during maximal voluntary isokinetic extension. **Results:** The WL+E group lost 7.2 ± 3.9% of body weight, whereas weight did not change in the EC group (0.5 ± 3.5%). The WL+E group lost 2.5 ± 11.7% lean muscle mass whereas muscle mass did not change in the EC group (0.3 ± 1.2%). Absolute leg extension strength increased 14.3 ± 18.0% in the WL+E group and slightly increased in the EC group (4.4 ± 19.6%). Muscle quality (Leg extension strength / muscle area) increased 8.6 ± 37% in the WL+E group and 3.1 ± 11.5% in the EC group. **Conclusion:** Despite muscle loss, older obese women who underwent weight loss plus exercise maintained their muscle strength and showed strong signs of improved muscle quality.

SESSION 90 (PAPER)

AGE AND WORK

TEN YEARS LATER: A FOLLOW-UP STUDY OF PROFESSORS STILL WORKING AFTER AGE 70

L. Dorfman, *University of Iowa, Iowa City, Iowa*

Little is known about the impact of the end of mandatory retirement on professors over the long term. This follow-up study investigates the ten-year experience of professors who chose not to retire from a major research university after the elimination of the age 70 mandatory retirement age in 1994. The initial interview study took place in 1998 (Dorfman, 2000, 2002; Dorfman & Kolarik, 2005). The present study investigates major reasons for continuing to work or retire, professional and non-professional activities, perceptions of departmental and institutional atmosphere and student and faculty attitudes toward older faculty, and preparation and plans for retirement. All surviving professors (n = 13; age 80+) agreed to be re-interviewed in 2007; 9 were now retired and 4 continued to work full time. Content analysis of the tape-recorded open-ended questions (inter-rater reliability = .94) revealed that employed professors said they continued to work mainly because they enjoyed it, whereas retired professors said they retired mainly because of age or felt it was time to retire. Retired professors (88%) as well as their employed counterparts continued professional activities, primarily research. Both groups reported mixed reactions to the overall atmosphere in their departments and the university as well as to student and faculty attitudes toward older faculty, with one-third of retirees reporting departmental or institutional pressures to retire. The major type of planning for retirement was financial. Implications for individuals and institutions are discussed.

LABOUR MARKET POSITION AND HEALTH AT OLDER AGES IN ENGLAND AND WALES, 1971-2001

R.D. Wiggins¹, B. Akinwale², K. Lynch³, S. Harding⁴, M. Bartley⁵, D. Blane²,
1. *Quantitative Social Science, Institute of Education, London, United Kingdom*, 2. *Imperial College, London, United Kingdom*, 3. *Office for National Statistics, Fareham, United Kingdom*, 4. *University of Glasgow, Glasgow, United Kingdom*, 5. *University College, London, United Kingdom*

Labour Market Position and Health at Older Ages in England and Wales, 1971-2001 After attending this talk, participants will have a sound appreciation of the changing circumstances under which two cohorts of older citizens in the UK leave the labour market during the years 1971-2001 and the resulting consequences for their health and mortality. Recent UK government initiatives to plan for population ageing include measures to encourage people to retire later and whilst many studies have demonstrated the relationship between labour force position and health during people's working lives across there is less evidence on the health consequences of labour force position in later life. The analysis draws upon linked census and death records in the UK's Office for National Statistics Longitudinal Study, cohorts of people around State Pension age (50-69 years) were selected from each decennial census, 1971-2001, and their subsequent health. Despite considerable change in the nature of the labour market, the relationship between labour force position in early old age and mortality has remained remarkably stable over time for both men and women. People in work when approaching their pensionable years have enjoyed relative risks of mortality around a third lower than other groups among men, and up to 40 per cent lower among women. As expected, being out of work due to sickness is associated with the poorest health. The persistence of poor health among the permanently sick suggests that policies aimed at encouraging later life employment should ensure provision which takes careful account of the circumstances of people with chronic health conditions.

LABOUR MARKET PARTICIPATION AND DEPRESSIVE SYMPTOMS AT OLDER AGES IN THE US AND UK

R. Conti¹, J. Banks³, F. Cornaglia², 1. *The University of Chicago, Chicago, Illinois*, 2. *Queen Mary University of London and Institute for Fiscal Studies, London, United Kingdom*, 3. *University College London and Institute for Fiscal Studies, London, United Kingdom*

In this paper we analyze the relationship between depressive symptoms and labour market activity as households reach retirement age in the US and the UK. We use two exceptionally rich datasets, the ELISA dataset for the UK and the HRS dataset for the US, constructed by design to provide analogous information from country specific representative populations. First we examine cross-sectional variation in the direction and magnitude of reported depressive symptomology, using a psychometrically validated scale, the CES-D, by labour market status, by occupation and by other health, behaviour and socioeconomic characteristics in overlapping time periods in the US and England. Second we take advantage of the panel data construction to investigate the correlation between depression symptomology overtime and labour market participation based on typical retirement ages in the two countries overall and by socioeconomic correlates. We believe the comparative approach is particularly interesting for two reasons. First it allows us to explore cross-country differences in diagnosis (and treatment) of depression, in co-morbid conditions and in disability benefit institutions. Second, it allows us to exploit variation in labour market institutions such as state pensions which leads to similar individuals in the two countries (e.g. women aged 61) being differentially likely to be working for country-specific, as opposed to individual-specific, reasons.

JOB FACTORS ASSOCIATED WITH RETIREMENT INTENT IN OLDER BEDSIDE NURSES

S. Klaus, Y. Yankovskyy, C. Potter, K. Leiker, *School of Nursing, University of Kansas, Kansas City, Kansas*

Although there is anecdotal evidence to suggest some job characteristics are unappealing to older nurses, research on specific factors that may contribute to the intent to retire is limited. As large numbers of RNs near retirement age it is of paramount importance to understand modifiable factors that could potentially delay retirement, leaving veteran nurses in the workforce. We conducted an exploratory study using data from the 2008 National Database of Nursing Quality Indicators® (NDNQI®) RN Survey. The sample included RNs age 60 and older (n=10,666) that work in acute care hospitals in direct care roles. The majority of the study respondents were female (94%), white (81%), and worked full time (64%) on the day shift (68%). Sixty five percent of the sample had a diploma or associate degree as their highest nursing degree and had been in practice on average 32 years. Logistic regression was performed and revealed that a nurse's perception of the unit's general quality of care (OR=0.875, p=.029) and whether important things get done on the unit (OR=0.922, p=.005) were inversely related to retirement intent. Additionally, job enjoyment (OR=0.834, p=.002), and satisfaction with job autonomy (OR=0.889, p=.006) and the nurse manager (OR=0.897, p=.005) were negatively related to intent to retire. Nurses that work overtime (OR=1.351, p<.001) or float outside their regular unit (OR=1.244, p=.04) were also more likely to say they will retire within the next year. This work highlights the impact that working conditions play in retirement plans of nurses.

SESSION 95 (PAPER)

INTERPERSONAL RELATIONSHIPS IN RESIDENTIAL SETTINGS: RESIDENTS, STAFF, AND NON-STAFF

THE INCIDENCE AND CORRELATES OF ELDER MISTREATMENT BY NON-STAFF IN MICHIGAN NURSING HOMES

Z. Zhang¹, C. Page¹, T. Conner¹, L. Post², 1. *Michigan State University, East Lansing, Michigan*, 2. *Yale University, New Haven, Connecticut*

Although elder mistreatment by staff in nursing homes has caught the attention of the public and the Congress in recent years and generated a significant amount of research on the incidence, prevalence, and risk factors of abuse and neglect in nursing homes, there is little attention on another type of abuse that may be more prevalent in nursing homes: the mistreatment of nursing home residents by non-staff including other residents, family members, and other visitors. In this study, we drew data from the 2005 and 2007 Michigan Survey of Households with Family Members Receiving Long-Term Care Services to estimate the incidence and correlates of elder mistreatment by non-staff members in nursing homes. We combined data from two surveys to increase sample size (N=1,051). Our preliminary results showed that about 10% of family members reported that their relatives were abused by persons in nursing homes that are not staff or caregivers (most probably other residents). Age of the elderly has a negative association with non-staff abuse. Women are significantly more likely than men to be abused by non-caregivers. Having behavior problems more than doubled the odds of non-staff abuse. Experiencing staff abuse multiplied the odds of non-staff abuse by 5.65, a very strong effect. These results demonstrated that non-staff abuse is a significant problem in nursing homes and strongly correlated with staff abuse. More research is needed to identify risk factors of non-staff abuse as well as actions that the nursing home can take to mitigate non-staff abuse.

FEAR OF RETALIATION

I. Reed, J. Robison, *University of Connecticut Health Center, Farmington, Connecticut*

Fear of retaliation is a concept that comes up frequently in much of the literature regarding elder abuse and nursing home abuse. While many studies refer to fear of retaliation, few have focused on the perception the person has experiencing this fear. For individuals who rely on others for assistance with the ADLs or IADLs, there is a belief that if they were to complain, their situation could become worse. A total of 150 residents from 57 supportive housing residences were asked, "Do you worry about retaliation if you were to report a complaint or concern?" In addition to these responses, seven in-depth interviews were conducted with individuals regarding interactions with staff and retaliation. They described what emotions they had when they experienced physical or verbal abuse, and the internal conflicts resulting from deciding whether or not to report the incident. About a fifth (19%) of the total sample do worry about retaliation if they were to report an incident. All of the in-depth interviews reported incidences of retaliation and the different ways individuals responded to the situation. For those who did not report abuse, feelings of hopelessness and despair were expressed. Findings from this study will be used to inform the CT Long Term Care Ombudsman program, Fear of Retaliation Workgroup. They will utilize this information in order to develop videos teaching both residents and staff at nursing homes to recognize and respond to retaliation.

THE AFFECT OF CAREGIVER INTERACTIONS ON DISRUPTIVE BEHAVIORS OF RESIDENTS WITH DEMENTIA IN ALFS

T. Sharpp, *Betty Irene Moore School of Nursing, University of California, Davis, Sacramento, California*

Significance: Assisted living facilities (ALFs) are a prominent source of housing for seniors in the United States. It is estimated that over 50% of the residents in ALFs have some form of cognitive impairment. As caregivers receive little formal education they rely on experience and inherent qualities they possess to provide care to residents with dementia. Purpose: The purpose of this presentation is to describe and analyze the affect of person-centered or me-centered caregivers as they interact with residents with dementia in an ALF. Methods: An ethnographic study was conducted in an ALF that specializes in dementia care. Over 100 hours of participant observation was conducted over a period of six months. Chart reviews were completed on all residents (n=35) and formal and informal interviews were completed with employees (n=20) and family members (n=5). Results: Caregivers interacted in ways that were either person-centered or me-centered. Caregivers who were person-centered demonstrated affection and patience while me-centered caregivers were insensitive to residents and communicated poorly. 64% of the instances of agitated behavior by a resident with dementia occurred during or after an interaction with a me-centered caregiver. Implications: By teaching person-centered care, disruptive behaviors of residents with dementia may be decreased.

SESSION 100 (PAPER)

NURSING HOME STAFFING AND QUALITY OF CARE

QUALITY OF CARE: IMPACT OF NURSE STAFFING ON PROCESSES AND OUTCOMES OF CARE

H. Lee, M.A. Blegen, C. Harrington, *UCSF School of Nursing, San Francisco, California*

In the United States, staffing shortages and inadequate staff expertise were major contributors to many chronic and recurring quality problems in nursing homes. The main purpose of this study was to better understand the effects of nursing home characteristics on quality of care. This paper demonstrated the second aim of the study, which examined multidimensional relationships among organizational characteristics,

nurse staffing levels, and resident outcomes controlling for resources, resident, and market characteristics. This study used secondary data from Online Survey Certification and Reporting (OSCAR) data, Minimum Data Set (MDS) 2.0, quarterly staffing data from the state inspections, and Area Resource File (ARF). The population of 195 nursing homes out of 199 Colorado freestanding homes in 2000 was analyzed. Two-stage least squares regression and ordinary least squares regression models were used for data analysis. Larger nursing homes have significantly lower rates of pressure ulcers, urinary tract infections, and incontinence. Higher RN staffing hours per resident day (hprd) were associated with lower (11%) percentage of pressure ulcers, while RN hours did not have a significant effect on other process and outcome QMs. Higher total staffing hprd were significantly related to higher percentages of three process QMs (catheter and restraint use, and bedfast status). Excess nursing home beds in the Health Service Areas were significantly associated with lower percentages of catheter and restraint use. Given the findings, this study suggests that higher registered nurse (RN) staffing levels can improve quality of care in nursing homes.

DO STABLE NURSING HOME STAFF IMPROVE RESIDENT OUTCOMES?

L. D'Arcy, S.C. Stearns, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Many nursing homes experience high turnover rates among staff providing direct resident care. While low levels of turnover may facilitate selection of quality staff, high staff turnover may have deleterious effects on resident outcomes. This study estimates the effects of two measures of staff stability [turnover among certified nursing assistants (CNAs) in the past three months and the percent of CNAs on staff for more than one year] on five resident outcomes: hospital or emergency room use, pressure sores, falls within 30 days, falls within 180 days, and presence of pain. We use the resident and facility components of the National Nursing Home Survey (NNHS). The 2004 NNHS selected 1,500 of the 16,628 nursing homes in the United States. The facility response rate was 81%. A total of 14,017 residents were sampled from these homes; the resident response rate was 96%. Exclusions for missing data result in an analysis sample of approximately 10,100 residents at 909 facilities, with up to 12 resident observations per facility. The effects of staff stability on resident outcomes are quite modest. Instead, much of the between-facility variation in outcomes not attributable to measured differences in resident case mix severity appears to be associated with unobserved facility characteristics. While reducing turnover and promoting staff retention remain desirable goals for nursing homes, this analysis shows that broader measures of facility quality are likely critical in explaining variation in resident outcomes.

OUTCOMES OF INCREASED NURSE STAFFING POLICIES IN FLORIDA NURSING HOMES: STAFFING LEVELS, QUALITY, AND COSTS

K.S. Thomas, K. Hyer, S. Mehra, *School of Aging Studies, University of South Florida, Tampa, Florida*

In 2001, Florida crafted a nursing home (NH) reform bill requiring staffing mandates. Specifically, facilities were required to gradually increase nurse aides from 1.7 hours per resident day (HPRD) in 2001 to 2.9 HPRD in 2007 and licensed nurse staff from 0.6 HPRD in 2001 to 1.0 HPRD. Using data from 1999-2007 for 650 NHs (specifically the Online Survey and Certification Report, Florida Medicaid Cost Reports, and the Nursing Home Staffing Report) this study examined the impact of the increased nurse staffing on NH direct and indirect care staffing, deficiencies, and Medicaid per diem rates. To meet the new standards, close to 11,000 nursing staff were newly employed in Florida NHs. We also report on the mix of nursing staff and the change in HPRD. This paper provides evidence that Florida NHs' averages for serious deficiencies are lower than the national averages and the improvement followed the introduction of new staffing. Florida Medicaid has paid for

these increases; Medicaid NH reimbursement grew 58% from 1999-2008, with the fastest growing component being direct patient care costs. This paper documents Florida's experience implementing staffing ratios in NHs and provides lessons learned for other states that may consider mandating nursing staff ratios.

STATE NURSE STAFFING POLICY AND QUALITY OF CARE IN NURSING HOMES

N.J. Zhang, L. Unruh, L. Ni, Y. Hong, T. Wan, *Department of Health Management and Informatics, University of Central Florida, Orlando, Florida*

Background: Majority of states has more stringent policies on minimum level of nurse staffing in nursing home than the federal requirements mandated in OBRA 87. The policy continues to change with growing evidence-based knowledge on the relationship between state minimum nurse staffing policy and quality of care. The state policies vary across the staffing measures, type of staffing and civil money penalty. Some state policies are related to the number of residents, more focusing on specific type of nurse, and charge more fine for violation than others. **Objectives:** The aim of this study is to 1) profile the current variation of state minimum nurse staffing policies; 2) examine the effects of state minimum nurse staffing policy and civil monetary penalty on nurse staffing levels; and 3) investigate the impacts of state minimum nurse staffing policy and civil monetary penalty on quality of care in nursing homes. **Research Design:** we conducted a cross-sectional analysis to test the hypotheses using 2007 Online Survey Certification and Reporting Data and Minimum Data Set of all certified U.S. nursing homes. Multiple linear regression and path analysis were used. **Results and Discussions:** state minimum nurse staffing policies have different effects on type and levels of nurse staffing. For example, the policy on RN was not associated with the RN staffing levels across states. The amount of civil monetary penalty has a positively relationship with RN staffing. The association between state policies and resident level quality of care is statistically significant and positive.

SESSION 105 (PAPER)

OLDER DRIVERS

EVALUATION OF POLICIES AND PROCEDURES FOR DETERMINING FITNESS-TO-DRIVE ACROSS CANADA

A. Myers¹, B. Vrkljan², S. Marshall³, R.A. Blanchard⁴, *1. University of Waterloo, Waterloo, Ontario, Canada, 2. McMaster University, Hamilton, Ontario, Canada, 3. Ottawa Hospital, Ottawa, Ontario, Canada, 4. University of Waterloo, Waterloo, Ontario, Canada*

This project was initiated following a national Aging Driver Mobility forum hosted by the Canadian Council of Motor Transport Administrators. There was support in principle that fitness-to-drive should be based on functional assessment of at-risk drivers (rather than age or medical conditions alone), and that conditional licensing may be a desirable alternative to an outright ban for some drivers. However, concerns included costs, operational issues and consequences of falsely labeling drivers as safe or unsafe. To document current policies and practices, e-mail surveys and follow-up interviews are being conducted with two groups of key informants: (1) clinicians who assess drivers referred for medical reasons; and (2) ministry personnel (both medical review and licensing) who decide whether or not to reinstate licenses (with or without restrictions). Results to date indicate substantial variability across the 13 provinces and territories with respect to: ministry approval of driver assessment centers, accessibility, wait times and costs (ranging from \$65 to \$800) for drivers, qualifications of clinical assessors, assessment procedures (off and on-road), and how clinical results inform licensure decisions. Findings will be added to the searchable database being developed by the AAA Foundation for Traffic Safety which thus far only includes policy data for US states. Most importantly, results will assist

policy makers in making informed decisions on issues such as expanding conditional licensing or adopting potentially less costly approaches for driver assessment. Ultimately, the goal is to ensure fair and equitable licensure decisions for drivers, regardless of where they reside in Canada.

CHARACTERISTICS, PERCEPTIONS AND PATTERNS OF LOW MILEAGE OLDER DRIVERS

R.A. Blanchard, A. Myers, *University of Waterloo, Waterloo, Ontario, Canada*

Proponents of the low mileage bias assert that drivers of any age reporting < 3,000 km have higher crash rates than those who drive >14,000 km/year. However, only a few studies (e.g., Keall & Frith, 2006) have examined the driving patterns and characteristics of low mileage older drivers using self-report methods. The current study extended this work using vehicle data for seven consecutive days from 58 drivers, aged 67 to 92 (mean 80). Participants completed daily activity diaries, the Driving Comfort and Perceived Abilities Scales, and an interview. Adjusted to one week, 29% fell into the low, 48% middle and 23% into the high mileage groups. Contrary to prior findings, the low mileage group overestimated (mean 32.7 km), while the high mileage group underestimated (mean -17.8 km) their distance driven over the week. Vehicle data showed that the low mileage group drove less in challenging situations ($p < .001$), made fewer trips ($p < .001$), drove proportionately less on rural roads ($p < .001$), highways ($p < .001$) and freeways ($p = .05$) and traveled closer to home with smaller average ($p < .001$) and maximum ($p < .001$) radii. Those with an average radius of ≤ 5 km also made fewer social but more medical trips. Low mileage drivers were more likely to live in urban areas and with a spouse ($p < .05$), had lower nighttime driving comfort scores ($p < .001$), poorer perceived abilities ($p < .05$) and higher avoidance scores ($p < .01$) than high mileage drivers. This study highlighted the importance of examining older driver characteristics and perceptions for understanding self-regulation.

THE IMPACT OF FORMAL AND INFORMAL TRANSPORTATION SUPPORT ON THE DECISION MAKING OF DRIVING CESSATION AMONG COMMUNITY-DWELLING OLDER ADULTS

M. Choi, K.B. Adams, E. Kahana, *Case Western Reserve University, Cleveland, Ohio*

The study aims to examine the impact of formal and informal transportation support on the decision making of driving cessation among community-dwelling older adults. Data were obtained from three waves of the Florida Disability Study (1990-1992). The study population consists of generally healthy community-living old-old persons residing in Florida retirement communities. We restricted our sample to those who were driving at baseline ($N = 604$). Respondents had a mean age of 78.3 at baseline, and 62% of older drivers were female. A discrete-time multivariate hazard model was used to examine the impact of transportation support on driving cessation while controlling sociodemographic characteristics (age, gender, and education) and health conditions (comorbidity, hospitalization history, functional impairment, and vision impairment). Transportation support from spouse, family members, friends and neighbors were categorized into informal transportation support. Formal transportation support included transportation support that respondents had received from organizations and hired assistants. The results showed that both formal and informal transportation support influenced older adults to cease their driving even after controlling sociodemographic factors and health conditions. The statistically significant transportation support influencing driving cessation was from friends and neighbors ($OR = 1.81, p < .001$), hired assistants ($OR = 1.65, p < .01$), and spouse ($OR = 1.39, p < .01$). Transportation support from family members and organizations was not statistically significant. These results imply that accessibility of alternative transportation is important in older adults' decision making of driving cessation given the limited

routes of transportation provided by organizations and the restricted availability of rides offered by family members.

LIMITED CONGRUENCE BETWEEN THE ROADWISE REVIEW DETERMINATION OF SAFETY TO DRIVE AND ON-ROAD EVALUATIONS

M. Bedard^{1,2,3}, J. Riendeau¹, B. Weaver^{1,2}, M. Porter⁴, 1. *Public Health Program, Lakehead University, Thunder Bay, Ontario, Canada*, 2. *Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada*, 3. *St. Joseph's Care Group, Thunder Bay, Ontario, Canada*, 4. *University of Manitoba, Winnipeg, Manitoba, Canada*

The Roadwise Review (RR) CD-ROM has been proposed as one way for older drivers to self-evaluate the skills that support safe driving. Further validation of RR vis-a-vis actual driving scores is needed. To that end, we contrasted the results of RR with those of on-road performance (based on demerit points) in 30 older drivers (mean age = 73.9, SD = 5.6). We also examined correlations between Roadwise Review versions and original versions of UFOV 2 and the Trail Making Test (TMT). The number of mild or serious problems identified by RR ranged from 0 to 7 (mean = 2.1, SD = 1.4). The number of driving test demerit points ranged from 15 to 80 (mean = 49.1, SD = 19.6). The correlation between the number of problems and demerit points was .17 ($p = .376$). We further divided the demerit points into five sub-domains (e.g., turning). Correlations between the number of problems and demerit points ranged from -.15 to .41; only the latter (for "moving in the roadway") was statistically significant ($p = .026$). The correlation between the RR UFOV and subtest-2 of the actual UFOV was .20 ($p = .318$). The correlation between the RR TMT and the sum of the original TMT A and B was .29 ($p = .119$). These results indicate a lack of convergence between findings obtained with RR and actual performance using standardized approaches, and point to the importance of post-market-evaluation of material aimed at older drivers.

SESSION 110 (SYMPOSIUM)

THE NEW NATIONAL RESOURCE CENTER FOR PARTICIPANT-DIRECTED SERVICES: A RESEARCH DRIVEN ORGANIZATION

Chair: L. Simon-Rusinowitz, *Health Services Administration, University of Maryland School of Public Health, College Park, Maryland*

Discussant: P. Doty, *US DHHS ASPE, Washington, District of Columbia*

The Cash and Counseling Demonstration and Replication projects have produced extensive evaluation findings and "lessons learned" about designing and implementing this participant-directed model of providing personal care services. Based on more than 10 years of experience, the new National Resource Center for Participant-Directed Services (NRCPS) at Boston College offers research-based services to assist all programs, regardless of funding source, to develop and improve their participant-directed services. Previous and current research informs the Center's services, including training and technical assistance. Services may address needed support such as counseling and fiscal management, developing performance measures, and continuous quality improvement. The Center also maintains a pulse on policy issues impacting participant-directed services and establishes meaningful ways in which program participants contribute to all aspects of Center programming. Lori Simon-Rusinowitz will begin the symposium with an overview of Center research priorities. Next, Mark Sciegaj will present findings from an inventory of participant-directed programs. Dr. Simon-Rusinowitz will also present findings from a pilot ethnographic study of Cash and Counseling consumers with mental health diagnoses. Kevin Mahoney will present an overview of the Center, introduce new participant-directed programs funded by the Administration on Aging and Veterans Administration, and, discuss ideas for further program evaluation. Finally,

Pamela Doty, of the US DHHS, will discuss the Center's planned contributions to help expand the availability of participant-directed programs nationwide.

BETTER TRAINING, BETTER CARE: IDENTIFYING TRAINING NEEDS OF CAREGIVERS AND OLDER CONSUMERS WITH MENTAL HEALTH DIAGNOSES IN A CONSUMER-DIRECTED PERSONAL CARE PROGRAM

L. Simon-Rusinowitz, K. Ruben, *Health Services Administration, University of Maryland School of Public Health, College Park, Maryland*

With a growing elderly population, there is an increased need for caregivers to assist disabled elders with daily living activities that may allow them to remain in their homes. Disparities in quality of home health care exist for minority elders; especially for individuals with mental health issues. There is also a nationwide shortage of caregivers and difficulty recruiting and retaining these workers. A consumer-directed (CD) approach allows for greater flexibility and control of personal care services, and may increase the satisfaction and well-being of caregivers and elders with mental health diagnoses. There is, however, a need to develop training informed by the views of consumers and caregivers to enhance CD services. To develop a pilot training program, we are conducting in-depth interviews with consumer teams to better understand their needs, and ultimately lead to better outcomes. This study will build on current research and contribute to plans for a larger project.

AN INVENTORY OF SELF-DIRECTED HOME AND COMMUNITY-BASED PROGRAMS

M. Sciegaj, *Health Policy and Administration, Penn State University, University Park, Pennsylvania*

Self-direction is a philosophy and orientation to the delivery of home and community-based long-term care that enables individuals' flexibility of choice and control in managing their disability-related supportive service needs. At a minimum, the self-directed services model allows persons with disabilities of all ages or their representatives to select and dismiss the individuals who are paid to provide assistance with basic and instrumental activities of daily living and other disability-related supportive services. Such programs have grown considerably over the past decade. In January 2009, the National Resource Center for Participant-Directed Services began collecting detailed information and conducting key informant interviews about such programs. The purpose of this study is to develop a descriptive inventory of publicly funded programs offering self-directed home and community-based personal assistance services. This presentation focuses on self-directed programs serving elders and adults with disability that are funded by Medicaid.

THE NEW NATIONAL RESOURCE CENTER FOR PARTICIPANT-DIRECTED SERVICES: PROGRAM OVERVIEW

K.J. Mahoney, *GSSW, Boston College, Chestnut Hill, Massachusetts*

The new National Resource Center for Participant-Directed Services (NRCPS) at Boston College offers research-based services to assist all programs, regardless of funding source, to develop and improve their participant-directed services. Previous and current research informs the Center's services, including training and technical assistance. Services may address needed support such as counseling and fiscal management, developing performance measures, and continuous quality improvement. The Center also maintains a pulse on policy issues impacting participant-directed services and establishes meaningful ways in which program participants contribute to all aspects of Center programming. Kevin Mahoney will present an overview of the Center's research-driven services, introduce new participant-directed programs funded by the Administration on Aging and Veterans Administration, and, discuss ideas for further program evaluation.

UNDERSTANDING THE UNIQUE CHALLENGES OF LIVING WITH EARLY ONSET DEMENTIA FOR THE PERSON AND THE FAMILY

Chair: P. Harris, *Sociology, John Carroll University, Cleveland, Ohio*

Discussant: L. Snyder, *University of California, San Diego, San Diego, California*

There has been a growing awareness over the last five years, that research on a subgroup of the dementia population, people with early onset dementia, has been very limited. In order to reverse this trend, in 2006 the Alzheimer's Association conducted an epidemiological study that revealed that in the US alone between 220,000 and 640,000 individuals under age 65 have some type of dementia, and the study urged further examination of the unique needs of this population. This symposium focuses on five issues related to this group. Roach, Keady, and Bee discuss a unique methodology for gathering evidenced-based data about the family experience. Researchers and families in the UK co-constructed family biographies to deepen the understanding of the impact of the diagnosis on family functioning. Keady, Clarke, and Wilkinson focus on a group of early onset individuals that is often overlooked, people with alcohol-related dementia, examining their lived experiences. Cox's study explores the affect of the diagnosis on people in the work place, who are still trying to financially support their young families. Harris examines one of the most intimate aspects of a marital relationship, a couple's sexual relationship, once a diagnosis of dementia is pronounced. Finally, Morhardt using multi-methods rounds out the symposium by discussing the overall educational and service needs of caregiving families across many dimensions from work to relationships. Together these studies deepen our understanding of the challenges of living with early onset dementia. This symposium is sponsored by the Alzheimer's disease Interest Group

INTIMACY, SEXUALITY AND EARLY ONSET DEMENTIA: THE CHANGING MARITAL RELATIONSHIP

P. Harris, *Sociology, John Carroll University, Cleveland, Ohio*

When one's marital partner receives a diagnosis of dementia, it has major ramifications for a couple. Such a diagnosis affects every aspect of marital life, including the most intimate areas. This impact is even more stressful when the diagnosis occurs in individuals below the age of 65, for studies have shown that this group has unique challenges. This qualitative study: 1) focuses on the perspectives of married couples, caregivers and their spouses in the early stage of early onset dementia, as they discuss their intimate relationships, both positive and negative aspects, 2) identifies how they cope with these changes to their marital relationship, and 3) develops evidenced-based recommendations for other couples in the early stages of dementia, and for their health care providers. Data were collected through 8 focus groups, four with caregivers and four with people with dementia.

ALCOHOL-RELATED BRAIN DAMAGE: SHARING STORIES, LIVING LIVES

J. Keady¹, C.L. Clarke², H. Wilkinson³, 1. *School of Nursing, Midwifery and Social Work, The University of Manchester, Manchester, United Kingdom*, 2. *Northumbria University, Newcastle-upon-Tyne, United Kingdom*, 3. *Edinburgh University, Edinburgh, United Kingdom*

This paper will provide an understanding about the experience of living with alcohol-related brain damage (ARBD) from individual accounts of 6 people diagnosed with the condition and resident in a specialist rehabilitative care unit in the UK. Participants were aged between 39-58 and all had been in the unit for at least 8 weeks prior to the interview and abstinent from alcohol for at least this duration of time Using a narrative research approach built around storyline generation, 3 storylines were generated that encapsulated the experience of living with ARBD, namely: Five Minute Memory; Fractured Lives; and Believing

in Recovery. Each of these storylines will be addressed during the presentation. The paper will conclude with a discussion on the practice implications of the study where the importance of health education and the promotion of self-management, such as through the use of orientation prompts, will be highlighted.

THE EXPERIENCES OF YOUNGER ONSET PERSONS WITH AD IN THE WORKPLACE: FINDINGS FROM A SURVEY OF YOUNGER ONSET PERSONS

C. Cox, *Fordham University, New York, New York*

Many people with AD are still employed and it is often at the workplace that symptoms are first noticed. Frequently, these persons lose their jobs as a result of their impairment and thus their primary source of income. Younger persons with AD are frequently raising young families with many financial commitments and expenses. Losing employment can impact self-esteem and potentially stress relationships as persons must confront a significant life change. Employers may be held responsible for making accommodations for these workers. However, the extent to which this is done is not clear nor are the persons' responses to such accommodations. This presentation reports on the findings of a survey of over 30 persons with early onset AD and their experiences at the workplace including the responses of their employers, types of accommodations that were made, and subsequent well-being. The types of services and programs that these persons need to assist them with regards to their employment are also discussed

WORKING TOGETHER: YOUNG ONSET DEMENTIA AND FAMILY EXPERIENCES

P. Roach, J. Keady, P. Bee, *School of Nursing, Midwifery and Social Work, University of Manchester, Manchester, United Kingdom*

To date, the dementia care literature has focused on the subjective experience of living with dementia, the experience of primary carers or the experience of the dyad. This study takes a more inclusive view of families and asks younger people with dementia to nominate (up to) 5 members of their family for participation in the study. This work is being undertaken in Greater Manchester, UK. In order to construct a family biography, recruited families are being visited over a period of 12-18 months with visits by the primary presenter occurring every 2-3 months. These visits consist primarily of group interviews with the families, whilst allowing for non-textual data collection (e.g. photographs, drawings) and flexible interviewing arrangements to be made. In addition to discussing the emergent findings, the presentation will consider the challenges of collecting, presenting and analysing biographical data when working with family groups.

EARLY ONSET DEMENTIA: SERVICE AND EDUCATION NEEDS OF CAREGIVING FAMILIES

D.J. Morhardt¹, R.L. Beard², J. Urbanic³, 1. *Cognitive Neurology and Alzheimer's Disease Center, Northwestern University, Chicago, Illinois*, 2. *College of the Holy Cross, Worcester, Massachusetts*, 3. *Rush University Medical Center, Chicago, Illinois*

It is estimated between 220,000 and 640,000 individuals under age 65 have a dementia. Little research exists documenting service and education needs of this group. Evidence suggests that younger persons with dementia have different needs than older and data is needed to better understand their experience. In-home interviews (N=15), survey (N=30) and focus group (N=7) with caregivers of persons with early onset dementia (EOD) were conducted. Seventy percent (36) cared for a person with FTD, 21% (11) AD and 10% diagnosis pending. Qualitative analysis revealed the following areas of concern: 1) Experience with services and the healthcare system, 2) Coping with symptoms, 3) Financial issues, 4) Social support, 5) Loss of relationship, 6) Impact on dependent children, 7) Changes in Career and Retirement Plans; and 8) Lack of public awareness of disease. Further documentation of these

issues needed to develop appropriate interventions, policy and programs for EOD individuals and families.

SESSION 120 (SYMPOSIUM)

WORKER INJURIES IN LONG-TERM CARE

Chair: N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Discussant: J. Wiener, *RTI International, Washington D.C., District of Columbia*

The long-term care workforce consists of hundreds of thousands of workers. For example, in nursing homes care is provided by a labor force consisting mostly of about 1.4 million nurse aides. However, long-term care workers have some of the most hazardous jobs in the U.S. For example, nurse aides suffer a higher prevalence (18.8%) of work related back pain than any other category of worker. The overall injury rate for nurse aides is second among all industries. Injuries have important implications, including the health of the worker and lost work days for the industry as a whole. However, despite the very high rates of injuries in long-term care, and the large numbers of workers, very few studies have examined these injuries. In this symposium, research will be presented that expands our understanding of injuries in long-term care settings, including an analysis of workers compensation claims for nurse aides and nurse aide injuries in nursing homes.

A LONGITUDINAL VIEW OF WORKPLACE INJURIES IN NURSING HOMES

N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Little is known about lost workday injuries in nursing homes. In this research, data from a large panel of nursing homes were used to examine the association between workplace injuries and organizational factors, caregiver staffing levels, and quality. Occupational Safety and Health Administration data initiative, the OSCAR, and ARF data were used (from 2002 through 2006). For the organizational characteristics of interest, for-profit facilities were less likely to report high injury rates and facilities with a higher average occupancy were more likely to report high injury rates. For the staffing characteristics of interest, facilities with high staffing levels of nurse aides were less likely to report high injury rates. For the quality characteristic of interest, facilities of low quality were more likely to report high injury rates. Workplace injuries are associated with organizational, caregiver, and quality characteristics of nursing homes. This may present an opportunity to reduce high injury rates.

SELF-REPORTED ON-THE JOB INJURIES AMONG CERTIFIED NURSING ASSISTANTS IN NURSING HOMES

G. Khatutsky, *Aging, Disability and LTC, RTI, International, Waltham, Massachusetts*

Certified nursing assistants working in nursing homes are at significant risk for work-related injury, but little is known about the frequency and types of such injuries, as well as how technology such as patient lifts affects injury rates. Aside from the direct impact on workers, understanding the prevalence and nature of injuries is important for assessing their impact on productivity, retention and job satisfaction. This study uses 2004 data from the National Nursing Assistant Survey and the National Nursing Home Survey to describe the prevalence, nature and predictors of these injuries and assesses their impact on CNA job satisfaction and intent to leave the workplace. Analysis suggests that 59 % of nursing assistants reported work-related injuries, with 17% specifying back injuries and over 15% - other strains and pulled muscles. Multivariate results indicate that younger age, mandatory overtime, and poor job preparedness increase the likelihood of being injured.

DOCUMENTING OCCUPATIONAL INJURIES AMONG PERSONAL CARE WORKERS

T. Scherzer, *Social & Behavioral Sciences, University of California, San Francisco, San Francisco, California*

Personal care workers provide critical support to elderly and disabled persons living at home or in community settings, and comprise one of the largest and fastest growing workforces. Prior research documents difficult working conditions and widespread occupational injury. However, numerous barriers prevent assessing the prevalence of injury. Beyond personal reluctance to report injury, structural barriers for personal care workers may stem from employment arrangements in which they are hired directly by individuals, including family members in many publicly-funded programs. As the personal care workforce grows, it is important to understand the prevalence of injury and the barriers for addressing and reporting injury. The paper will focus on results from two studies of directly-hired workers in California's Medicaid personal care program: (1) a survey of workers that assesses the prevalence, consequences, and barriers to reporting occupational injuries, and (2) a qualitative study of injured workers' experiences.

SESSION 125 (POSTER)

BS POSTER SESSION I - FACE-TO-FACE TIME: 1:00 PM - 2:30 PM

CORTISOL AND 6-YEAR CARDIOVASCULAR MORTALITY

N. Vogelzangs¹, A. Beekman¹, Y. Milaneschi², L. Ferrucci³, B. Penninx¹, *1. Psychiatry and the EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands, 2. Tuscany Health Regional Agency, Florence, Italy, 3. Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*

Introduction: The stress hormone cortisol has been linked with unfavorable cardiovascular risk factors, but longitudinal studies examining whether high levels of cortisol predict the onset of cardiovascular mortality are largely absent. **Methods:** In a sample of 874 participants aged 65 years and older of the InChianti Study we examined the association of 24-hour urinary cortisol levels with all-cause and cardiovascular mortality during 6 years of follow-up. Cardiovascular mortality included deaths due to ischemic heart disease and cerebrovascular disease. **Results:** During a mean follow-up of 5.7 (SD=1.2) years, 184 persons died, of whom 41 from cardiovascular disease. After adjustment for sociodemographics, lifestyle behaviors, depressive symptoms, number of chronic diseases and baseline cardiovascular disease, 24-h urinary cortisol levels did not increase the risk of all-cause mortality (HR per SD increase=1.06, 95%CI=0.91-1.23, p=.45), but did increase cardiovascular mortality risk (HR per SD increase=1.34, 95%CI=1.03-1.76, p=.03). This effect was found to be consistent across persons with and without cardiovascular disease at baseline (p interaction=.89). **Discussion:** High cortisol levels predict cardiovascular death among both persons with and without pre-existing cardiovascular disease. The specific link with cardiovascular - and not all-cause - mortality suggests that high cortisol levels might be particularly damaging to the cardiovascular system.

A TOOLBOX FOR SUCCESS: MEETING THE NEEDS OF MEN AND THEIR PARTNERS AFTER RADICAL PROSTATECTOMY

B.A. Weber, *University of Florida, Gainesville, Florida*

Forty-million men are approaching or have attained 50 years, the age when prostate cancer begins to emerge and eventually becomes the most prevalent cancer in American men. Clinical practice guidelines do not provide information about daily management of surgery side effects. Thus, men recovering from the gold standard surgical treatment for prostate cancer have to deal with severely debilitating urinary incontinence, erectile dysfunction, and psychosocial consequences on their

own or with partners who do not know how to support them. No research, to date, is focused on providing tangible support in the form of products and information. In this study, 30 men and their partners will be provided a prostate cancer Survivor's Toolkit that will contain a variety of products and information designed to help these men and their partners deal with treatment side effects. Outcomes will focus on (1) variation in needs over time, (2) self-efficacy, depression, uncertainty and satisfaction with care, (3) and Toolkit usefulness. Descriptive statistics will be used to assess the participant response to the Toolkit. A one-way ANOVA test will be performed to assess differences among the time since surgery groups for Needs Assessment Factors: Men's Needs, Partner's Needs (2 subscales), Physical Dysfunction and Associated Bother, and The Survivor's Toolkit Usefulness; and Psychological Factors: Self-efficacy, Depression, Uncertainty, Satisfaction with Care, and Having Choices and Making Choices. Significant ANOVA tests will be followed up with pair-wise t-tests to more precisely locate the potential differences. Information provided by men and their partners will be used to streamline the Toolkit to contain only those products considered most useful, making it a low-cost strategy that can be easily translated into practice in busy clinical settings.

ALTERATIONS IN MITOCHONDRIAL FUEL METABOLISM AND SURVIVAL WITH REDUCED MANGANESE SUPEROXIDE DISMUTASE (SOD2)

H. Lum^{1,2}, T.R. Koves^{2,1}, K.L. DeBalsi², O. Ilkayeva², H. Van Remmen³, D.M. Muoio², 1. *Geriatric Medicine, Duke University, Durham, North Carolina*, 2. *Sarah W. Stedman Nutrition and Metabolism Center, Durham, North Carolina*, 3. *University of Texas Health Sciences Center, San Antonio, Texas*

Mitochondria, often called the "powerhouse" of a cell, are also a primary source of cellular reactive oxygen species, a fundamental element of the free radical theory of aging. Here, we examine the interplay between skeletal muscle mitochondrial function, metabolism and oxidative stress using mice haploinsufficient for the free radical scavenger, manganese superoxide dismutase (SOD2). Although these mice have lower ATP production and decreased exercise tolerance compared to wild-type controls, their lifespan is not compromised. To date, SOD2[±] mice have only been characterized in the context of a low fat diet. We hypothesized that high fat feeding might increase production of reactive oxygen species and thereby reveal susceptible metabolic pathways that account for the weakened bioenergetics in heterozygous mice. To this end, SOD2[±] mice and their wild-type littermates were fed either a high fat or standard chow diet for 24 weeks. Diet-induced weight gain was similar between genotypes, whereas the development of glucose intolerance was slightly more severe in SOD2[±] mice. Consistent with our predictions, high fat feeding decreased the survival rate from 100% in wild-type mice to 50% in SOD2[±] mice. Comprehensive metabolic profiling revealed accumulations of long, medium as well as short chained acylcarnitines (by-products of incomplete beta oxidation) in skeletal muscle of high fat fed SOD2[±] mice. Interestingly, the opposite pattern was evident in liver. Thus, ablation of SOD2 appears to provoke tissue-specific perturbations in β -oxidation and perhaps the TCA cycle. Assessment of specific mitochondrial enzyme activities is currently underway.

A BIOMARKER OF LONGEVITY IN C. ELEGANS: ASSOCIATED PHENOTYPES

T. Johnson, J.R. Cypser, P. Tedesco, D. Wu, T. Ishii, S. Park, *IBG, University of Colorado, Boulder, Colorado*

Expression of a Phsp-16::gfp fluorescent reporter transgene is a strong predictor of improved survival and stress resistance even within isogenic populations of the nematode *C. elegans* (Rea et al, 2005 *Nature Genetics* 37, 894). Here we examine other characteristics of animals displaying "bright" or "dim" expression of this Phsp-16.2::gfp reporter and ask whether those characteristics are likewise associated with

improved survival. Animals expressing higher levels of hsp-16.2 display greater mobility during early adulthood (greater mobility is associated with increased longevity), but this mobility difference is lost fairly rapidly. Measurements of fertility indicate that animals expressing lower levels of hsp-16.2 do not exhibit lower fertility, as might be expected if they were somehow debilitated and thus short-lived for uninteresting reasons. We used micro arrays to investigate what genes are differentially expressed in bright and dim animals, and found that very few genes are differentially expressed; only four additional heat shock genes are more highly-expressed in bright, longer-lived animals. We also found some evidence for inheritance of overall expression level of this Phsp-16.2::gfp reporter; bright worms have brighter progeny than do dim worms, even in isogenic populations. (This work was supported by grants from the NIH.)

CD8+ LYMPHOCYTES FROM INDIVIDUALS WHO HAVE RECOVERED FROM WNV POSSESS UNIQUE "AGE" PHENOTYPE

A.M. Wertheimer^{1,3}, S. Griffiths⁵, S. Njoroge³, K.O. Murray⁴, A.N. Akbar⁵, J. Nikolich-Zugich^{1,2,3}, 1. *University of Arizona - Arizona Center on Aging, Tucson, Arizona*, 2. *University of Arizona - Immunobiology, Tucson, Arizona*, 3. *Vaccine and Gene Therapy Institute, Portland, Oregon*, 4. *University of Texas Health Science Center at Houston, Houston, Texas*, 5. *University College London, London, London, United Kingdom*

We are measuring three immunological parameters which have each separately been found associated with impaired immunity and/or decreased longevity in experimental animals and humans: T-cell naïve/memory ratios (by 8-11 color flow cytometry), number of T-cell clonal expansion (TCE) and exposure to CMV. Low T-cell naïve/memory ratios, high number of T-cell clonal expansions (TCE) and CMV exposure are hypothesized to represent separately or together, risk factors for poor immunity and, perhaps, for increased WNV susceptibility. We have initiated our measurement and evaluation of T-cell naïve/memory ratios within our cohort of WNV-exposed and age matched healthy human subjects. Whole blood was processed using cell preparation tubes (CPT tubes (BD)) to obtain peripheral blood mononuclear cells which were stained for assessment of a variety of markers including those to determine both CD4⁺ and CD8⁺ naïve (CD28^{int}CD95^{low}) or CD45RA⁺CD27⁺; central memory (CD28^{hi}CD95^{hi}) or (CD45RA⁺CD27⁺); and effector memory (CD28^{neg}CD95^{hi}) or (CD45RA⁺CD27⁻) populations. We assayed 20 WNV- exposed and 20 age matched healthy control healthy old (65+ yrs) controls and found that the CD8⁺ effector memory population ratios are significantly lower for the WNV- exposed vs. respective age matched control population and that total CD8⁺ and CD8-CD4⁻ telomere length is significantly shortened in the WNV-exposed individuals p value<0.05 (unadjusted). In addition, staining with Ki67 a marker for cell division, revealed that CD8⁺ effectors (memory and revertant) T cells have significantly lower turnover in WN⁺ vs. healthy controls. Whether this is a primary consequence of aging or a secondary consequence of WNV infection remains to be elucidated.

GENETIC REGULATION OF FEMALE SEXUAL MATURATION AND AGING

R. Yuan, Q. Meng, D. Harrison, B. Paigen, *The Jackson Laboratory, Bar Harbor, Maine*

A longstanding evolutionary theory of aging proposes that genes that regulate female sexual maturation also control lifespan. To test this hypothesis, at the Jackson Laboratory, we investigate the longevity and age of female sexual maturation, by observing the age of vaginal patency of 32 inbred strains, including domesticated and wild derived inbred strains. Our results show that the age of vaginal patency varies considerably among inbred strains, suggesting sexual maturation is a complicated trait and regulated by multiple genetic loci. Wild strains have significantly delayed age of sexual maturation than domesticated inbred

strains, indicating the alleles that delay sexual maturation might be excluded during the process of domestication but reserved in wild strains, whose ancestors were not domesticated. Correlation study shows a positive correlation between the age of vaginal patency and the median life spans of the 32 inbred strains ($R^2=0.17$, $p=0.05$), suggesting the existence of common genetic mechanisms that co-regulate processes of sexual maturation and aging. Haplotype association mapping study suggests three loci, one on Chr4 and two on Chr16, that are significantly associated with the age of vaginal patency. Interestingly, the wild strains have the same alleles at all these three loci but different from other domesticated inbred strains, supporting the idea that wild strains carry alleles that may delay sexual maturation. In vivo genetic studies are ongoing to test the effects of these alleles on sexual maturation and longevity.

PITUITARY-THYROID FUNCTION CHANGES IN OLD RATS INDUCED BY VALPOIC ACID

T.J. Theodoropoulos, J. Vriani, *USF/VA, Bay Pines, Florida*

Valpoate (VPA) differs in structure from the other anti-epileptics. It exerts its effect through gamma-aminobutyric acid (GABA), which may influence pituitary hormone secretion. The clearance of VPA is reduced in the elderly. In this study, VPH 50mg/kg or diluent were given i.p. daily for 30 days in old male rats. Blood was collected for hormone determinations. Serum levels of T4, free T4 and free T3 were normal in all animals. Serum T3 and TSH levels were slightly decreased in the experimental group. After challenge with TRH 50ngIV, the increment of serum TSH at 10 min. was lower in the VPA group. (5.6 ± 2.4 vs. 8.8 ± 2.2 , mcU/ml, $p<0.02$). This data suggests an inhibitory effect of VPH on TSH secretion in the old animal, presumably through GABA. The lower T3 may be due to plasma protein displacement by the drug.

CHANGES IN MITOCHONDRIA ULTRA-STRUCTURE IN A FRAIL MOUSE MODEL

F. Ko¹, M. Zauher¹, H. Yang¹, C. Cooke², N.S. Fedarko¹, J.D. Walston¹, *1. Division of Geriatrics and Gerontology, Johns Hopkins University School of Medicine, Baltimore, Maryland, 2. Microscope Facility, Johns Hopkins University School of Medicine, Baltimore, Maryland*

Background. Genes related to decreased mitochondrial function and increased apoptosis are up-regulated in skeletal muscles of older IL-10tm/tm frail mice compared to age-matched C57BL/6J controls. We hypothesized that these changes are associated with ultra-structure changes in skeletal muscle mitochondria morphology and sought to characterize mitochondrial differences between the IL-10tm/tm frail mice and age-matched C57BL/6J controls. Methods. Transmission electron microscopy (TEM) was performed on the hind leg skeletal muscles of 90-week-old female IL-10tm/tm ($n=5$) and C57BL/6J ($n=5$) mice. Ten representative photomicrographs at 20,000X magnification were captured from duplicate sections per mouse. Coded photographs were used for mitochondria quantification by a blinded rater. Mitochondria morphology was classified as abnormal if the mitochondrion showed high luminosity due to cristae depletion and matrix dissolution. Mean percentages of abnormal mitochondria in IL-10tm/tm and C57BL/6J mice were tested for statistical significance by two-tailed t-test. Results. 90-week-old female IL-10tm/tm frail mice showed significantly more abnormal mitochondria with cristae depletion and matrix dissolution compared to age- and gender-matched C57BL/6J mice ($17.01 \pm 13.28\%$ vs. $8.88 \pm 8.70\%$, p value < 0.001). Conclusion. Although abnormal mitochondria morphology is present in the skeletal muscles of very old IL-10tm/tm and C57BL/6J mice, abnormal mitochondrial ultra-structure is twice as common in the IL-10tm/tm mice as in control mice. Given that frail mice have significantly higher markers of systemic inflammation and evidence of shifts toward gene expression that drive apoptosis, further studies of the influence of chronic inflammation and/or accelerated apoptosis on mitochondrial structure and function are indicated.

SESSION 130 (SYMPOSIUM)

THE SEARCH FOR ANTI-AGING MEDICINES

Chair: R. Miller, *University of Michigan, Ann Arbor, Michigan*

Discussant: R. Miller, *University of Michigan, Ann Arbor, Michigan*

A drug that could slow the human aging process to the same extent that caloric restriction or pituitary dwarfing genes do for mice would extend healthy lifespan by about 10-fold more than a cure for cancer or heart disease. The scientific search for effective anti-aging medications has to tread the narrow path between the hype of hucksters and the hopeless pessimism of most scientists and expert commentators. This session will feature four perspectives on this touchy topic. Roger McCarter will review the 70 years of literature on caloric restriction, to summarize which proposed CR mechanisms have been ruled out, and which are still plausible. David Allison will provide a critical discussion of strategies aimed at discovering pharmaceuticals that might mimic the beneficial effects seen in calorically restricted rodents. Matt Kaeberlein will discuss sirtuin activators, including resveratrol, weighing reasons for enthusiasm against reasons for caution. Richard Miller will present the most recent findings on the NIA Interventions Testing Program, including data on NDGA, aspirin, and rapamycin as well as other agents in the ITP screening system.

NIA'S INTERVENTION TESTING PROGRAM – SCREENING FOR ANTI-AGING DRUGS

R. Miller, *University of Michigan, Ann Arbor, Michigan*

The National Institute on Aging has organized a multi-site study of drugs that might extend lifespan in genetically heterogeneous mice. Of the seven agents for which complete information is available, two (aspirin and nordihydroguaiaretic acid) lead to significant increase in lifespan in males, and one other, rapamycin, leads to an increase in maximal longevity in both males and females, with significant increases at all three test sites. This progress report will include an update on these and the other test agents, which are listed at <http://www.nia.nih.gov/ResearchInformation/ScientificResources/CompoundsInTesting.htm>. Key collaborators: Nancy Nadon, David Harrison, Randy Strong.

CALORIC RESTRICTION: HAVE WE ELIMINATED ANY MECHANISMS YET?

R.J. McCarter, *Biobehavioral Health, Penn State University, University Park, Pennsylvania*

The importance of caloric restriction (CR) is that it represents the most robust environmental manipulation known to alter aging processes. The problem with CR is that it changes the entire metabolic profile over the lifespan. It is indeed remarkable that reducing the quantity of food eaten results in a qualitative change in characteristics of metabolism. This complexity of change makes it difficult to identify mechanisms of action of CR and, by implication, mechanisms of aging. Evidence for and against currently suggested mechanisms of CR will be discussed, including that associated with changes in body composition, metabolism, physical activity, plasma metabolites and hormone actions. The conclusion is that several of these are not major components of mechanism. However, integration by CR of metabolic pathways into less damaging characteristics of living results in elevated functional set point and reduced rate of aging.

ARE SIRTUINS GOOD TARGETS FOR TREATING AGE-ASSOCIATED DISEASES?

M. Kaeberlein, *Pathology, University of Washington, Seattle, Washington*

Sirtuins are a family of NAD-dependent protein deacetylases and ADP-ribosyltransferases homologous to the yeast Sir2 histone deacetylase. Sirtuins promote longevity in yeast, worms, and flies, and may play a role in the response to dietary restriction. Recently, the mammalian

sirtuin, SirT1, has been implicated in a variety of age-associated diseases in mice, and chemical modifiers of SirT1 activity are currently under development and testing in clinical trials. The most notable SirT1 activator is resveratrol, a naturally occurring compound found in grapes and red wine. Although it remains unclear whether resveratrol or SirT1 are relevant for human aging, evidence from model organisms suggests that targeted activation or inhibition of SirT1, and perhaps other sirtuins, may prove therapeutically useful toward a subset of age-associated diseases in people.

METHODOLOGIC ISSUES IN TESTING FOR THE ANTI-AGING EFFECTS OF CALORIC RESTRICTION MIMETICS

D.B. Allison, *Biostatistics, The University of Alabama at Birmingham, Birmingham, Alabama*

Longitudinal and lifespan studies, including those done with caloric restriction, present multiple challenges. These include questions about how to accommodate potential nonproportionality in the hazard ratios, how to test for effects on “maximum” lifespan, how to deal with time varying covariates, and how to assess the effects of putative mediating variables when measuring those variables requires killing the animal before its lifespan can be observed. These questions will be addressed. Existing methodologic approaches will be offered and areas for new investigation identified.

SESSION 135 (SYMPOSIUM)

BIOSOCIAL STUDIES OF HEALTH AND AGING IN THE WISCONSIN LONGITUDINAL STUDY

Chair: R.M. Hauser, *Sociology, University of Wisconsin-Madison, Madison, Wisconsin*

The most important scientific development in life-course and aging research in the past decade has been the increasing overlap and integration of socio-behavioral and biomedical research facilitated by the collection of biomarkers in longitudinal social surveys. This symposium brings together several exemplars of biosocial research, drawing in common on a single, rich longitudinal set of data from the Wisconsin Longitudinal Study (WLS). The Wisconsin Longitudinal Study (WLS) is a long-term study of a random sample of 10,317 men and women who graduated from Wisconsin high schools in 1957 and who have been followed for more than half a century. The WLS provides an opportunity to study the life course, intergenerational transfers and relationships, family functioning, physical and mental health and well-being, and morbidity and mortality from late adolescence through the retirement years. WLS data also cover social background, youthful aspirations, schooling, military service, labor market experiences, family characteristics and events, social participation, psychological characteristics, and retirement. The papers in this symposium focus on several of the complex relationships among genetic makeup, social characteristics, and health, ranging from the effect on chronic disease conditions of parental age at birth, to the psychosocial stress response to a cancer diagnosis, genetic sources of impulsivity and their consequences for education and careers, to relationships between youthful social participation, social support, and health in later life.

PARENTAL AGES AT BIRTH ARE ASSOCIATED WITH MAJOR CHRONIC DISEASES AND SOMATIC SYMPTOMS OF THE OFFSPRING IN LATER ADULTHOOD

D. Kuo, *University of Wisconsin-Madison, Madison, Wisconsin*

In this paper, I used Wisconsin Longitudinal Study to examine the relationships between parental age at birth and physical symptoms and major chronic diseases of the offspring in later adulthood. In an earlier study, I found that parental ages were associated with self-reported health status, total number of diagnosed illnesses, and number of physical symptoms, using both multivariate regression analysis and structural

equation model. In the current study, the observed outcomes were specific medical conditions and systems of physical symptoms. The chronic conditions included high blood pressure, angina, stroke, high blood sugar, diabetes, allergy, asthma and cancer. Parental socioeconomic status, childhood health, family environment and one's own socioeconomic status were controlled. Multivariate logistic regression was employed in the current study. The following research questions were addressed: 1) Whether paternal age and maternal age were associated with those conditions and types of symptom of the offspring in later adulthood; 2) Whether the relationships were independent of parental socioeconomic, for example, parental education, occupation, maternal employment, and family income; and early family environment, for example, family structure, health environment in the household/family, and violence/abuse in the family; and 3) Whether socioeconomic status of the offspring explain the relationship. The multivariate logistic regression analysis showed that parental age, especially father's age, have small but robust relationships with many chronic conditions and most types of physical symptoms.

UNDERSTANDING THE ROLE OF SUPPORT IN PROMOTING HEALTHY AGING

E. Siegl¹, P. Brenner², 1. *Sociology, University of Wisconsin-Madison, Madison, Wisconsin*, 2. *University of Michigan, Ann Arbor, Michigan*

Evidence of a robust relationship between social support and health has accumulated over the past several decades. However, questions remain about how the support/health relationship varies among different health outcomes and whether benefits are universal. In fact, growing evidence points to wide variation in which aspects of health are improved by what type of support and for whom. In this study, we contribute to the understanding of this variation by comparing how structural (social integration) and functional (instrumental) support predict different indicators of health: physical functioning, number of illnesses, self-reported health and depression. Further, we examine how these relationships vary by gender. Using longitudinal panel data to control for baseline health, we create a rigorous test of when and for whom structural and functional forms of support provide direct pathways to mental and physical health.

CAN YOUNG ADULTS' SOCIAL PARTICIPATION EXPLAIN VARIATION IN OLDER ADULTS' HEALTH?

E. Siegl, *Sociology, University of Wisconsin-Madison, Madison, Wisconsin*

A growing body of evidence links health and adult social participation. What remains unclear is whether these relationships are unique to adulthood or have their roots in adolescence. Because many studies of adolescent participation end in early adulthood, little is known about how participation-health relationships develop across the life course. This study employs longitudinal panel data from the Wisconsin Longitudinal Study to assess whether adolescent social participation has lingering direct or indirect effects on health in late adulthood using three indicators of mental and physical health: depressive symptoms, body mass index and activities of daily living. Initial results indicate that relationships between health and participation are strongest in adulthood. However, adult participation is predicted by adolescent levels and types of participation. Both cross-sectional and some longitudinal indicators of participation predict lower levels of depressive symptoms and less difficulty with activities of daily living, but a higher body mass index.

CHARACTERIZING THE MAGNITUDE AND LONG-TERM TEMPORAL COURSE OF THE PSYCHOLOGICAL STRESS RESPONSE BEFORE AND AFTER A CANCER DIAGNOSIS

J.R. Schumacher, M.A. Smith, *Population Health Sciences, University of Wisconsin-Madison, Madison, Wisconsin*

Forty percent of cancer survivors report psychological distress, which is costly in terms of well-being and health care use. It is unknown whether

stress predates the illness or differs from non-cancer patients because studies are limited to patient follow-up after diagnosis. We estimate the magnitude and temporal course of the stress response pre- to post-cancer diagnosis using data from the Wisconsin Longitudinal Study. The change in stress (depression, anxiety, psychological well-being) in participants diagnosed with cancer between 1992-1993 and 2003-2004 was compared to participants without cancer. Cancer survivors were more likely to experience clinically significant worsening of depression and anxiety symptoms compared to no-cancer controls. Within five years of diagnosis, cancer survivors were more likely to experience worsening, while after five years were more likely to experience improvements in depression relative to no-cancer controls. Characterizing the stress response is a pre-requisite for identifying patients at-risk and facilitates proactive resource provision.

SESSION 140 (SYMPOSIUM)

DIARY APPROACHES FOR STUDYING THE EFFECTS OF DAILY STRESSORS ON THE HEALTH OF CAREGIVERS

Chair: J. Savla, *Center for Gerontology, Virginia Tech, Blacksburg, Virginia*

Discussant: S. Charles, *University of California, Irvine, California*

A preponderance of studies on caregiving have relied on caregivers' retrospective accounts of their situations and experiences over a relatively long period of time, covering weeks, months, and years. As a result, these accounts are likely to be confounded by co-occurring events and memory distortions and are typically limited to assessment of mean level processes and outcomes. Recently, researchers have recognized the importance of examining the more immediate impact of caregiving against the context of daily living and its cumulative effects over time for the caregiver. Using daily diary methods, the presentations in this symposium highlight the conceptual and methodological advances in structuring the passage of time using daily diary designs to arrive at descriptions and dynamic explanations of how everyday factors have immediate and long term effects on caregivers' health. Zarit and colleagues examine caregivers' appraisals of daily behavior problems of persons with dementia and implications for caregivers. Berg and colleagues examine couples' shared daily distress and how it is affected by husband's symptoms from prostate cancer. Savla and colleagues examine daily stressors associated with living with persons of mild cognitive impairment and its consequences on marital relationship and health. Finally, Almeida and Seltzer combine longitudinal and daily assessments of behavior challenges of children with autism to predict the diurnal rhythms of salivary cortisol of their caregivers as an indicator of destabilizing health. The critique and discussion of Charles focuses on the promises and challenges of daily diary studies to further our understanding of everyday health and illness.

DAILY STRESS AND WELL-BEING OF FAMILY CAREGIVERS

S.H. Zarit¹, E. Femia¹, K. Kim¹, J. Savla², 1. *Human Development & Family Studies, Penn State University, University Park, Pennsylvania*, 2. *Virginia Tech University, Blacksburg, Virginia*

Most research on family caregivers has depended on retrospective reports of stressors such as behavior problems that had occurred during the past week or past month. These reports provide little information about fluctuations that might happen from day to day or in relation to interventions designed to lower exposure to stressors. This presentation looks at findings from the Family CARES study, which examined daily stress of caregivers of persons with dementia and the variability in exposure to stressors related to use of adult day services (ADS). Caregivers' daily exposure to stressors was 66% lower after two months on days their relative attended ADS, and their reports of daily subjective stress also decreased. Decreases in stressors were associated with a decline in feelings of overload and role captivity after three months.

These results indicate the potential for using daily assessments for understanding caregivers' stress and the effects of interventions.

DAILY STRESSORS AND IMPLICATIONS OF MILD COGNITIVE IMPAIRMENT FOR CARE PARTNERS

J. Savla, K.A. Roberto, R. Blieszner, *Center for Gerontology, Virginia Tech, Blacksburg, Virginia*

The effects of mild cognitive impairment (MCI) on everyday functioning of elders and burden on their relatives are not well understood. This research assesses the daily frequency and intensity of behaviors and symptoms associated with MCI and their effects on the marriage and spouse care partners' health and well being. Thirty spouse care partners participated in a seven-day daily diary study and reported on behavior problems associated with MCI and daily stressors and strains experienced by the care partner. They also provided saliva samples on four of the study days. Within- and between-person analysis revealed variability and change in mental and physical health across the seven days. Marital relationship, daily stressors, and everyday situations predicted these changes. Findings shed light on MCI-specific interventions that address couples' needs before severe disease progression occurs that could interfere with their ability to provide home-based care and support to persons with MCI.

SHARED DAILY DISTRESS IN HUSBANDS AND WIVES DEALING WITH PROSTATE CANCER

C.A. Berg¹, M.A. Skinner¹, D.J. Wiebe², J. Butner¹, M. Freitag¹, M. Forsman¹, 1. *Psychology, University of Utah, Salt Lake City, Utah*, 2. *University of Texas Southwestern Medical Center, Dallas, Texas*

The shared daily distress experienced by couples dealing with prostate cancer was examined and factors affecting distress. Fifty-nine husbands and wives completed diaries for 14 days reporting stressful events, distress, whether the stress was due to cancer; husbands reported on symptoms. Hierarchical Linear Modeling revealed that greater distress for husbands was accompanied by greater distress of the wife ($b=.15$, $p<.01$). Husbands reported greater distress on days when they experienced greater symptoms associated with the illness ($b=.14$, $p<.01$) and their problems were more due to prostate cancer ($b=.22$, $p<.01$). Wives' distress was not associated with husbands' symptoms, but was higher when the distress was due to prostate cancer ($b=.15$, $p<.01$). Qualitative analyses of the content of the stressful events also revealed concordance. The results demonstrate the linked nature of couples' daily experience as they deal with a chronic illness.

DAILY EXPERIENCES AND DIURNAL CORTISOL IN MIDLIFE MOTHERS OF INDIVIDUALS WITH AUTISM AND CONTROLS

D. Almeida¹, M. Mailick Seltzer², J. Hong², J. Greenberg², L. Smith², R. Stawski¹, 1. *Penn State University, University Park, Pennsylvania*, 2. *University of Wisconsin, Madison, Wisconsin*

This paper will examine daily stress in the lives of midlife mothers of adolescents and adults with autism ($n=86$), in contrast to a comparison group of similar mothers whose children do not have disabilities ($n=171$) drawn from the MIDUS study. Using identical daily diary methods, mothers provided ratings of their daily time use, positive and negative mood, stressors, and positive events over an 8-day period. In addition, on days 2 - 5 of the study, mothers provided 4 saliva samples each day from which cortisol was measured (when they woke up, 30 minutes later, before lunch, before bedtime). The results show how the two groups of mothers differ with respect to the association between characteristics of daily stressors and cortisol expression. The discussion will focus on how capturing situational variability is vital to elucidating how stressors trigger cortisol regulation, in typical and atypical populations.

EMOTIONS

THE RELATIONSHIP BETWEEN DAILY STRESS AND NEGATIVE AFFECT: THE ROLE OF PRIMARY AND SECONDARY CONTROL

A. Russell, C. Bergeman, *Psychology, University of Notre Dame, Notre Dame, Indiana*

Two key types of control beliefs have been distinguished in the literature—control over one's environment, referred to as primary control, and control over one's internal and emotional self, or secondary control (Heckhausen & Schulz, 1995; Rothbaum, Weisz, & Sneider, 1982). Although both types of control may help individuals cope with adversity, it is unclear how each type of control influences emotion regulation in the face of daily life events. The present study compares the ability of primary control, measured by the Environmental Mastery scale (Ryff, 1989) and secondary control, assessed using the Perceived Control of Internal States Scale (Pallant, 2000) to predict the relationship between daily stress and daily negative affect in a sample of older adults. Preliminary multi-level modeling analyses indicate that both primary and secondary control moderate the relationship between perceived stress and negative affect using a daily process design. Subsequent analyses will investigate lagged effects of stress resistance and recovery on emotional well-being.

EMOTIONAL INTELLIGENCE AND SUBJECTIVE WELL BEING ACROSS THE ADULT LIFESPAN: COMPARATIVE ANALYSIS IN THREE AGE GROUPS

N. Galdona¹, C. Martinez-Taboada⁵, P. Fernandez-Berrocá³, K. Pillemer⁴, A. Reoyo², I. Laskibar¹, J. Yanguas¹, E. Urdaneta¹, *1. Fundación Instituto Gerontológico Matia - INGEMA, Research & Development Department, San Sebastian, Spain, 2. Masinnova.net, San Sebastian, Spain, 3. Facultad de Psicología - Universidad de Málaga - Departamento de Psicología Básica, Málaga, Spain, 4. Cornell Institute for Translational Research on Aging (CITRA), Ithaca, New York, 5. Universidad del País Vasco - Departamento de Psicología Social y Metodología de las CCC, San Sebastian, Spain*

Emotional Intelligence is an important aspect of well-being and it is an important predictor of real life outcomes (Charboneau & Nicol, 2002). When we examine the empirical evidence regarding age-related changes in Subjective Well Being (SWB), there is somewhat of a paradox (Kunzmann, Little & Smith, 2000). This study focuses on age-related differences in some facets of perceived emotional intelligence (attention, clarity and repair) as well as in subjective well-being (positive affect, negative affect and satisfaction with life). 188 people from three age groups (younger, middle aged and older adults) participated in this study. A statistically significant difference was found in emotional attention, between young people and adults group ($p=0.000$) but we did not find age differences in emotional clarity and repair. Regarding the affective dimension of SBW, there was a significant difference in positive affect, between young people and adults ($p=0.020$) as well as between young and older adults ($p=0.001$), that is, young people reported lower levels of positive affect compared to middle aged and younger participants. Some researchers have suggested an age-associated increase of positive affect accompanied by a decrease of negative affect due to acquisition of more efficient emotion regulations skills. These results partially support these findings; we found an age-associated increase of positive affect but we didn't find differences with negative affect. In addition, the age differences found in emotional attention, might suggest that an age associated increase of positive affect due to older adults might pay less attention to their emotions.

AFFECTIVE FORECASTING: AGE DIFFERENCES IN PREDICTING AFFECTIVE REACTIONS TO EVERYDAY ACTIVITIES

X. Ma, Y. Chen, O. Pethtel, *Bowling Green State University, Bowling Green, Ohio*

The current study explored age differences of affective forecasting in everyday activities. We tested age differences in the predicted intensity and duration of happiness across two types of activities (i.e., hedonic activities vs. growth-related activities). Thirty younger and 30 older adults completed the hypothetical everyday activities questionnaire. Results showed that younger adults predicted higher affective intensity than older adults did only in hedonic activities. The frequency of engaging in hedonic activities in the past year mediated the age group effects. No age-group effect, however, was revealed for the predicted duration of happiness in everyday activities.

EXPLORING HAPPINESS IN EXCEPTIONAL OLD AGE: THE MEDIATING ROLE OF POSITIVE AND NEGATIVE AFFECT

A. Bishop¹, P. Martin², M. MacDonald², L. Poon³, *1. Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma, 2. Iowa State University, Ames, Iowa, 3. University of Georgia, Athens, Georgia*

The purpose of this study was to explore the indirect influence of physical and mental health indicators on happiness in exceptional old age. Participants included $N = 239$ centenarians from the Georgia Centenarian Study. Path models were computed to assess how positive and negative affect mediate the association between perceived and functional health status, cognitive performance, fatigue, and distal life event stress on current happiness. Fatigue maintained a direct negative association with positive affect ($B = -.35, p < .01$) but had a direct positive relationship with negative affect ($B = .19, p < .05$). In addition, cognitive performance maintained a direct negative association with negative affect ($B = -.57, p < .01$), and distal life event stress had a direct positive relationship with negative affect ($B = .45, p < .01$). Furthermore, negative affect had a direct negative association on current happiness ($B = -.33, p < .01$), whereas positive affect maintained a positive direct association with happiness ($B = .18, p < .05$). Evidence of an indirect link between fatigue and happiness through positive and negative affect, as well as an indirect association between distal life event stress and negative affect was provided. Results indicate that fatigue and past life stressors erode happiness in the presence of negative affect. However, it appears only fatigue diminishes current feelings of happiness despite the presence of positive affect. The findings have implications relative to improving positive emotionality in very late life.

AGE-RELATED EFFECTS OF ONLINE EMOTION REGULATION STRATEGIES ON MOOD AND MEMORY

A.H. Coats¹, F. Blanchard-Fields², *1. Department of Psychology, Westminster College, Fulton, Missouri, 2. Georgia Institute of Technology, Atlanta, Georgia*

Past studies suggest that older adults have enhanced emotional outcomes compared to young adults. Further research is needed to determine the source of these age differences. One candidate explanation is that older adults handle their emotions differently than young adults when they become upset. Indeed, older adults report using different emotion regulation strategies (e.g., more distraction and more positive reappraisal) relative to young adults. The present study investigated the mood and memory-related effects of these strategies in young and older adults. Participants watched a sad film clip (i.e., selected scenes from 21 Grams) while being instructed to use specific emotion regulation strategies (i.e., avoiding negativity, focusing on positivity, focusing on negativity, or no instructions). Young adults who were instructed to avoid focusing on negativity showed better mood outcomes and more positive memory for the film compared to non-instructed young adults. Instructions to down-regulate emotions did not affect older adults, possibly because they used

such strategies spontaneously. Older adults' increased dispositional tendency to focus on positive stimuli in their everyday lives partially explained older adults' greater mood improvement. The results have implications for the effectiveness of particular emotion regulation strategies and for the generalizability of the positivity effect.

IS THERE AGE INVARIANCE IN THE EMOTION REGULATION QUESTIONNAIRE?

L. Emery, *Psychology, Appalachian State University, Boone, North Carolina*

The Emotion Regulation Questionnaire (ERQ; Gross & John, 2003) was designed to measure two emotional regulation processes: reappraisal and suppression. Although it has been suggested that older adults are more likely to use reappraisal and less likely to use suppression than young adults, previous research has yielded mixed results. One potential problem is that the ERQ has not been rigorously tested for measurement invariance across age groups. The current study used nested structural equation models to test for measurement invariance in the ERQ across a group of 150 younger adults and 145 older adults. An unconstrained model in which the loadings were free to vary in both age groups produced an adequate fit to the data [$\chi^2(66, N = 295) = 94.70$, IFI = .97, RMSEA = .04]. Constraining the loadings in one group to be equal to the other, however, significantly worsened the fit, $\Delta\chi^2(10) = 21.26, p = .02$. Subsequent partial invariance tests indicated that the lack of invariance was confined to the suppression scale. Specifically, allowing the loadings for item 4 ("When I am feeling positive emotions, I am careful not to express them") to vary across age groups resulted in no significant worsening of fit compared to the configural model, $\Delta\chi^2(9) = 12.23, p = .20$. Although the ERQ measures the same two constructs in both groups, the weightings of the items that make up the suppression scale differ between groups.

AGE DIFFERENCES AND THE EFFECTS OF MOOD ON FALSE RECALL

T. Elliott¹, L. Emery², T.M. Hess¹, *1. Psychology, North Carolina State University, Raleigh, North Carolina, 2. Appalachian State University, Boone, North Carolina*

Recent research with young adults suggests that elevated positive mood or arousal prior to encoding may influence susceptibility to false recall during the DRM False Memory paradigm (Forgas, Laham, & Vargus, 2005; Storebeck & Clore, 2005). This is an intriguing finding with important implications for understanding age differences in false recall, as both false recall and positive affect/arousal are increased in older adults during testing situations. This may suggest that some of this age-related variance in false recall can be accounted for by affective factors. In this study, we investigated age differences in recall of non-presented words as a function of induced mood. Using a procedure based on Storebeck and Clore, young and older adults ($N=182$) were assigned to a positive mood induction, a negative mood induction, or a control condition, followed by the DRM memory task. Initial data analyses revealed that the mood induction worked similarly in older and younger adults, eliminating any age differences in baseline mood. The mood induction, however, did have differential effects on DRM performance. Consistent with previous research, veridical recall was higher in younger adults, and was unaffected by the mood induction in either group. Intrusions were more common in older adults, and were unaffected by mood in the young adults. However, older adults in the positive mood condition made significantly more intrusions than older adults in the other conditions. This suggests that a positive mood may result in a more liberal response criterion for older adults.

SELF-ESTEEM IN THE CONTEXT OF DAILY LIFE

R.C. Intrieri, P. Goodwin, *Psychology, Western Illinois University, Macomb, Illinois*

A popular topic of research in Gerontology is the self-regulation of affect in daily life (Baltes & Carstensen, 1996; Lawton, 1996). The consensus is that the individual's context (both subjective and objective) has an influence on affective experience. The current analysis explores the role of self-esteem in the relationship between context and affect. Sixty-nine older adults participated in an Experience Sampling Study examining daily experiences. Participants (50 women & 19 men; average age 71.96) were signaled 6 times daily for 7 consecutive days (or 42 times per participant). Participants provided information regarding the objective situation (activity, location, companion) as well as their subjective state. The present analysis employed multilevel random coefficients modeling using HLM 6.06 to examine the effects among variables representing context, self-esteem, and positive or negative affect (level 1). We also estimated the extent to which level 1 variables vary as a function of sex (level 2). For Positive Affect, statistically significant coefficients were obtained for the objective context ($b = -.89; p = .013$) and self-esteem (coefficients range from $b = 1.06$ to $b = .57; p < .0001$). The coefficient for sex on level 2 was also significant ($b = -4.54; p = .015$). Comparable results were obtained for Negative Affect with statistically significant coefficients for the self-esteem variables (ranging from $b = -.24$ to $b = -.21; p < .0001$). Results for sex on level 2 were not significant. Results suggest self-esteem influences the link between daily context and affective experience.

AGE DIFFERENCES IN THE BENEFIT OF CONGRUENT FACIAL EXPRESSIONS ON EMOTION RECOGNITION ACCURACY

J.T. Stanley, D. Isaacowitz, *Brandeis University, Waltham, Massachusetts*

Past research suggests that young adults are better at recognizing facial expressions of emotion than older adults. However, the typical emotion recognition task is devoid of contextual elements that may facilitate emotion recognition in everyday life. In the present study, young and older adults were asked to identify the emotion expressed by a target face accompanied by four other faces which were either expressing the same emotion as the target face (congruent) or a different emotion (incongruent). We investigated whether the pattern of age differences would change as a function of the congruency of the accompanying faces. For sad faces, young adults were more accurate than older adults on incongruent trials, but there were no age differences on congruent trials. Conversely, while there were no age differences in anger recognition for incongruent trials, young adults were better at recognizing angry faces on the congruent trials than older adults, $p < .05$. Within age groups, young adults were better at recognizing anger, disgust, and fear faces accompanied by congruent facial expressions as compared with incongruent faces. Older adults were better at recognizing fear facial expressions on congruent trials than incongruent trials. Overall, the results suggest that both young and older adults can benefit from additional contextual information when identifying emotions. It may be that congruent faces can serve as additional examples of the target emotion, facilitating emotion recognition (e.g., sad faces) while incongruent faces might at times highlight the distinct aspects of the target emotion (e.g., anger recognition).

YOUNG AND OLDER ADULTS' INTERACTIONS WITH STRANGERS AND FRIENDS IN AN ITERATED PRISONER'S DILEMMA GAME

A. Mienaltowski¹, F. Blanchard-Fields², *1. Psychology, Western Kentucky University, Bowling Green, Kentucky, 2. Georgia Institute of Technology, Atlanta, Georgia*

When faced with interpersonal conflict, young and older adults often recommend different coping strategies. Whereas young adults confront the second party, older adults use passivity to dampen emotional tur-

moil before otherwise acting. Emotion-focused strategies are often considered to be less effective than proactive, problem-focused strategies. However, in interpersonal conflicts, emotion-focused strategies reduce tensions and enable us to implement proactive strategies with fewer emotion-related obstacles. Recent research suggests that an emotion-focused approach to resolving interpersonal conflict is consistent with older adults' socioemotional goals. To examine age differences in behavioral reactions to conflict, young and older adults were asked to interact with a stranger or a friend in an iterated Prisoner's Dilemma game. Although the participants believed that they were interacting with a human partner, their partner was actually a computer program that reciprocated their choices or behaved selfishly. Problem-solving effectiveness was defined in terms of the amount of reward earned during the game. Consequently, cooperative behavior led to greater accumulated reward, even in the face of conflict. The results demonstrated that young and older adults both cooperated more with friends than with strangers and more with the reciprocating partner than the selfish partner. Interestingly, young and older adults were equally cooperative with a selfish friend, but older adults were more cooperative than young adults when interacting with a selfish stranger. In addition to their behavioral reactions during the game, older adults were less prone than young adults to rancor when providing their impressions of their gaming partners.

THE EFFECTS OF GRADED COGNITIVE CONTROL LOAD ON AGE-RELATED POSITIVITY EFFECTS IN GAZE

E.S. Allard, D. Isaacowitz, *Psychology, Brandeis University, Waltham, Massachusetts*

What amount of cognitive control effort is needed for older adults to display motivated preferences toward positive and/or away from negative emotional stimuli? The present study investigated whether or not age-related positivity effects in visual fixation emerged under varying levels of cognitive control demand. Younger and older adults viewed a series of emotional (positive and negative) and neutral image pairs in conditions of both full and divided attention. Within the divided attention conditions, participants performed a secondary task that provided incremental increases in effortful distraction: auditory n-back with n-0, n-1, and n-2 lags. Younger adults demonstrated gaze preferences for both positive and negative images, while older adults demonstrated preferences for positive images in full attention. However, older adults also showed gaze preferences for positive images in the most difficult divided attention condition (n-2). These results suggest that older adults' positive gaze preferences are sometimes resilient to high levels of cognitive distraction.

EMOTIONAL REACTIVITY AND MEMORY BIASES IN OLDER AND YOUNGER ADULTS

M. Feng, M. Dawson, C.G. Courtney, G. Davison, *Psychology, University of Southern California, Los Angeles, California*

This study investigated age differences in emotional reactivity and regulation, as well as memory recall for images of varying affective states. A total of 69 younger and 56 older adults viewed a series of negative, neutral, and positive images on a projector screen. Affective states were measured during presentation of stimuli using the acoustic startle eyeblink response, as well as a self-rated measure of valence and arousal following the procedure. Fifteen minutes after presentation but prior to subjective ratings of the images, participants were asked to recall as many images they could remember from the series. Results revealed the typical startle valence pattern for younger adults but not for older adults, a distinction that remained after controlling for age differences in arousal level. Both age groups recalled approximately the same number of images; however older adults recalled a higher ratio of positive images, a lower ratio of negative images, and approximately the same ratio of neutral images than younger adults. Results are discussed in relation to the Socioemotional Selectivity theory for emotion regulation and emotional reactivity along with the Startle Reflex theory of modulation.

PREDICTORS OF SEXUAL INTIMACY AMONG ETHNICALLY DIVERSE OLDER ADULT SPOUSES

M.D. Bentrout, J. Margrett, *Iowa State University, Ames, Iowa*

Prior research has evaluated associations between sexual satisfaction and important outcomes such as relationship quality, mental health, and overall marital satisfaction among spouses. However, the influence of distinct categories of indicators (e.g., positive and negative relationship dimensions, physical state, relationship characteristics) on sexual intimacy among older adult spouses warrants further investigation. The current study investigated perceptions of sexual intimacy among 190 married spouses between the ages of 59 and 88 years, among which 79% of participants were White and 20% were African American. Some differences in relationship perceptions were noted across the ethnic groups. Hierarchical regression was employed to examine predictors of sexual intimacy ($R^2 = .55$). Results indicated several significant predictors including feelings of attachment, willingness to reveal intimacy, anger and resentment, and efforts to maintain one's relationship. Self-reported physical health and length of marriage were not significant predictors above and beyond these relationship-oriented variables.

AGE DIFFERENCES IN POLARIZATION OF POSITIVE AND NEGATIVE WORDS: THE IMPACT OF COGNITIVE AND EMOTIONAL LOAD

A. Gilet¹, J. Studer¹, K. Iglesias¹, D. Gruehn², G. Labouvie-Vief¹, *1. University of Geneva, Geneva, Switzerland, 2. North Carolina State University, Raleigh, North Carolina*

Divergence exists in the literature concerning emotion regulation capacities in adulthood. Some findings suggest that emotion regulation improves with age while other findings suggest that emotion regulation becomes more difficult for older adults, especially for complex or highly arousing information. To investigate the impact of cognitive and emotional activation on young and older adults' evaluations, we asked 142 participants from 20 to 87 years of age to evaluate the valence of 120 positive and 120 negative words under six conditions that varied on two dimensions: cognitive load (load vs. no load) and emotional activation (neutral, positive, negative). A score of intensity was derived from the original rating scale and was used as an indicator for polarization of positive and negative words. There are two main findings: First, under cognitive load negative words are judged less intense than with no cognitive load. Thus, the cognitive load manipulation interferes with the experience of negative affect. This was the case for all age groups. Second, a multilevel model with cross random effects yielded a significant Age x Valence x Emotional Activation interaction, indicating that after a negative emotional priming, positive words were rated as more intense than negative words; and this effect was stronger with increasing age. Results are interpreted as suggesting that older adults are motivated to avoid negative or high arousing information.

AGE DIFFERENCES IN NEGATIVE EMOTIONS: FEWER RELATED TO BLOCKED GOALS BUT MORE RELATED TO LOSS

C.D. Kellenberger, G. Luong, S. Charles, *University of California, Irvine, Irvine, California*

Studies of emotional well-being and aging have revealed that negative affect decreases with age. We examined age differences in negative emotional experiences in a group of adults ($N=239$) spanning from 21 to 87 years-old who live with functional disabilities. In this sample, levels of perceived personal constraints are higher among older adults than younger adults ($r = .19$), and the physical effects related to the disability are more pronounced with age. Thus, we tested whether the same age-related decreases in negative emotional experiences would be observed. Consistent with studies of non-disabled adults negative affect decreased, and depressive symptoms were unrelated to older age. When controlling for different types of emotional experiences, however, a different picture emerged: in an analyses including both general nega-

tive affect (such as frustration and anger) and depressive symptoms, the association between age and general negative affect became even stronger, but the association between depressive symptoms now revealed a strong, positive relationship with age. Theorists have long recognized the functional utility of different types of emotional experiences. For example, anger and frustration are associated with blocked goals and problem-solving actions. Depressive symptoms, in contrast, are associated with irrevocable losses and are associated with more passive styles of coping. The findings from this study suggest that with advanced age, people living with severe functional disabilities report more frequent experiences of negative emotions related to loss and less frequent experiences related to blocked goals.

AGE DIFFERENCES IN EMPATHY: ROLE OF INHIBITION IN SELF-OTHER DIFFERENTIATION

J. Studer, G. Labouvie-Vief, *University of Geneva, Geneva, Switzerland*

Empathy has been widely studied in childhood and young adulthood, but little is known on how empathy develops from young to late adulthood. Based on recent theories differentiating an automatic component of empathy (resonate with an other's emotional state) and a controlled and effortful one (understand an other's emotional state, differentiate one's own state from that of an other), we predicted that the automatic component would be well preserved with aging, while the controlled component would show aging-related declines. Using a pain judgment task, 116 adults from 20 to 80 years of age evaluated painful and neutral stimuli either in a self (automatic) or a distant-other (controlled) perspective. Individuals also were given measures of inhibition, self-evaluated empathy and fluid intelligence. Data were analyzed using mixed-effects models with subjects and items as crossed random effects on response time as dependent variable. A significant age \times perspective \times inhibition interaction revealed that young adults with poor inhibition capacities have high cost of shifting from self to other perspective, but that cost is smaller for good inhibitors. Older adults with good inhibition capacities perform equal to younger with poor inhibitors, but older poor inhibitors fail to distinguish self and other perspective. Additional analyses with fluid intelligence and self-evaluated empathy further support that self-other differentiation becomes more difficult as people age.

AGE DIFFERENCES IN EMOTION COMPLEXITY OF AUTOBIOGRAPHICAL MEMORY

J. Kellough, B.G. Knight, *Department of Psychology, University of Southern California, Los Angeles, California*

Socioemotional Selectivity Theory (SST) suggests that constraints on time left in life increase the saliency of social goals over the pursuit of knowledge. This shift towards achieving emotional satisfaction and meaning directly influences emotional experience, such that emotional states become increasingly mixed. These age-differences have been demonstrated in studies of daily emotional experience, as well as when individuals are prompted to think about meaningful endings. The current study sought to examine whether similar age differences would emerge in the emotional content of autobiographical memories. One hundred and three younger adults ($M = 20.5$, $SD = 2.02$) and 107 older adults ($M = 75.6$, $SD = 6.3$) were instructed to recall an emotional memory from high school. The emotional content of the memory was coded for positivity, negativity, and mixed emotional content (presence of both positive and negative emotion). Multinomial logistic regression analysis revealed that age group is a significant predictor of the emotional classification of the autobiographical memories ($p < .01$). Contrary to previous findings, the odds of older adults recalling a mixed memory were approximately 70% lower than the odds of recalling a positive memory, compared to younger adults ($OR = .284$, $p < .01$). The SST model was only marginally supported as the odds of older adults recalling a negative memory were less than half the odds of recalling a positive memory, compared to younger adults ($OR = .57$, $p = .08$). Possible explanations for this unexpected finding will be discussed.

"NOBODY LIKES TO ADMIT WHAT'S GOING ON":

AVOIDANCE BEHAVIORS OF FAMILIES COPING WITH MCI
N. Brossoie, K.A. Roberto, R. Blieszner, *Center for Gerontology, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Managing stress using avoidance coping strategies allows family members to manage their emotional responses as well as cope with changes in their relative's memory, behavior, and sociability that manifest with mild cognitive impairment (MCI). The purpose of this study is to examine the use of avoidance coping behaviors by identifying conditions preceding an avoidance response, strategies used to cope, and the differences between individuals who use and do not use such strategies. This qualitative investigation included a sample of 99 families in which multiple family care partners were interviewed over a three-year period. Data analysis used Strauss and Corbin's (1990) method of constant comparison, guided by Lazarus and Folkman's (1984) conceptualization of avoidance coping behaviors. Thirty-eight care partners from 35 families reported behaviors we interpreted as avoidance-type coping responses to MCI-related stressors. Results show that avoidance behavior use was planned, unplanned, or imposed. The majority of respondents used planned behaviors to avoid conflict, deny a problem, place blame, or leave outcomes to fate. Unplanned behaviors occurred when primary care partners took advantage of opportunities to avoid conflicts or confrontations. Imposed behaviors typically occurred among adult children in response to external pressures to ignore or deny problems. Reasons cited by adult children for avoiding problems included parents being uncommunicative, unwilling to provide necessary information or insight, or insistent that they do not interfere. Study findings contribute to identification of emotional risk factors and understanding of coping strategies for family care providers.

SOCIAL AND EMOTIONAL REGULATION: AGE DIFFERENCES IN NEGATIVE AFFECT AMONG ADULTS WITH A SPINAL CORD INJURY

G. Luong, S. Charles, *Psychology and Social Behavior, University of California, Irvine, Irvine, California*

Negative affect generally decreases in older age (e.g., Charles, Reynolds, & Gatz, 2001), but it is unclear whether people with a spinal cord injury (SCI) would report less negative affect because they may be dependent on their social networks for instrumental support, which may strain social and emotional experiences. The present study examined the social and emotional experiences of adults with SCI between the ages of 21 and 87 years ($N = 239$). Consistent with previous research, older age was associated with less global negative affect ($r(237) = -.14$, $p < .05$) and this effect was mediated by fewer social partners involved in negative instrumental exchanges. Interestingly, older adults do not report a lower frequency of negative exchanges than younger adults, suggesting the selection of social partners may play a role in emotion regulation. Participants classified their social partners into three different levels of emotional closeness (emotionally closest (EC), very close (VC), and less close (LS) social partners) and the effect was primarily driven by older adults reporting fewer negative instrumental exchanges with their EC and LS social partners. Participants who classified more family members as VC also reported greater negative affect ($r(213) = .14$, $p < .05$). Altogether, the findings suggest that older adults may be adept at avoiding negative instrumental exchanges with certain social partners to regulate their emotions, but negative interactions with kin ties may be unavoidable and contribute to greater negative affect. Future research should examine how older adults optimize social interactions to regulate their emotions.

TRAINING EMOTION RECOGNITION IN OLDER ADULTS

M. Larcom, D. Isaacowitz, *Psychology, Brandeis University, Waltham, Massachusetts*

Research has shown that, in comparison to younger adults, older adults do not spend as much time looking at the eye region when view-

ing facial expressions of anger, fear, and sadness. This neglect of eye region information is one possible reason for why older individuals show deficits in recognizing these emotions. In the current study, 55 older adults ($M = 72.20$ years of age, $SD = 8.67$) were trained to direct their attention toward the eye ($N = 31$) or the mouth region ($N = 24$) of faces displaying angry, fearful, and sad expressions. All participants experienced two types of training. In the first training, participants were instructed to follow a dot with their eyes as it traveled around the eye or mouth region of the face. In the second training method, participants were instructed to look at either the eye region or the mouth region of the face in order to help them identify the expressed emotion. In both, feedback as to the intended expression was presented after each face. A non-specific effect of training was found such that directing attention toward either the eye or the mouth region resulted in significant improvements in the recognition of angry, fearful, and sad expressions. For anger and sadness, both types of training worked equally well at improving emotion recognition; however, for fear the training that used the dot as a visual guide was more effective as compared to instructing participants to look at either the eye or mouth regions.

SESSION 150 (PAPER)

GROWING OLDER TOGETHER: AGING AND MARRIAGE

CROSSOVER OF HEALTH SYMPTOMS IN OLDER MARRIED COUPLES MANAGING BOTH DIABETES AND ARTHRITIS

J. Yorgason, J. Sandberg, S. Roper, *School of Family Life, Brigham Young University, Provo, Utah*

Studies examining the association of health problems with marital relationships have indicated that spousal health predicts partner outcomes (see Booth & Johnson, 1994; Yorgason et al., 2006; Bigatti & Cronan, 2002). Few studies have examined how husband and wife health covary on a daily basis. When health of one spouse predicts health of the other, little is known about the mechanisms of this transfer. This study examined how one partner's health symptoms were associated with their spouses' diabetes and arthritis symptoms, and how daily relationship satisfaction might mediate health-to-health crossover effects. Data were collected from 28 later-life couples where one spouse had been diagnosed with both diabetes and osteoarthritis (15 ill female partners, 13 ill male partners). Couples completed 14 days of daily diary surveys comprised of marital and health measures. Multilevel model results indicated that husbands with diabetes and arthritis reported more arthritis symptoms, activity limitations, and general health symptoms, when their wives reported higher average symptoms across days. Husband relationship satisfaction did not mediate these relations. Wives diabetes and arthritis health symptoms did not covary as frequently with their husband's symptoms; only their reports of hypoglycemic episodes were related to husbands' average health symptoms. However, these wives reported that their arthritis symptoms, activity limitations, hypoglycemic episodes, and health symptoms in general, were all predicted by their own daily satisfaction with their marriage. In the current sample, partner health symptoms more often have crossover effects for husbands, and that relationship satisfaction is a more important predictor for wives' health.

MARITAL QUALITY AND MORTALITY AMONG OLDER ADULTS

J. Bulanda, T. Yamashita, J. Brown, *Miami University, Oxford, OH*

A number of studies have documented that married adults have lower mortality rates than do unmarried adults (e.g., Johnson, Backlund, Sorlie, & Loveless, 2000; Lillard & Waite, 1995; Waite & Gallagher, 2000). However, studies have largely treated married adults as a homogenous group; few have examined potential variations in mortality rates among

those who are married according to marital quality. Unhappy marriages have been linked to poorer health outcomes across a variety of domains (e.g., Ren, 1997; Umberson et al., 2006; Wickrama et al., 2001), suggesting mortality may also be higher for those in lower-quality marriages. Using a sample of 7,565 married adults aged 50 and over, we examine the relationship between baseline marital quality and mortality outcomes over a six-year period using discrete time event history models with data from the 1992, 1994, 1996, and 1998 waves of the Health and Retirement Study (HRS). Marital quality is measured by two questions asking respondents how happy they are with their marriage overall and how much they enjoy the time they spend with their spouse. Results show that, net of controls for sociodemographic characteristics, marital happiness and enjoyment of time spent with spouse are both related to lower odds of mortality, although enjoyment of time with spouse is a stronger predictor of mortality than marital happiness.

MULTIPLE TRAJECTORIES OF MARITAL HAPPINESS IN MID- AND LATER-LIFE

R.B. Miller, J. Yorgason, *School of Family Life, Brigham Young University, Provo, Utah*

Past research has examined the course of marital happiness over the life course, with inconsistent results either suggesting that marital happiness declines throughout mid- and later-life, or that it dips in mid-life but then increases in later-life. Studies have also indicated that declines in health, and especially spousal health, are related to lower marital happiness. The current study examined longitudinal trends of marital happiness in 736 mid- to later- life adults using data from the Marital Instability over the Life Course study. Longitudinal mixture modeling was used to assess the growth curve trajectories adults between the ages of 40 and 76, between 1988 and 2000. A two-class model fit the data the best, with one trajectory having a higher intercept ($B=29.7$) and a linear positive slope ($B=.07$, $p < .05$) across time; (19.5% of the sample fell into this group). The other group had a lower intercept ($B=23.5$) and a linear negative slope ($B=-.12$, $p < .05$) across time; (80.5% of the sample was in this group). Moreover, health status at the first time point was predictive of class membership ($B=.26$, $p < .05$), with better health being related to membership in the higher marital happiness group. Random coefficients of intercepts and slopes for both trajectories indicated a heterogeneity within each trajectory, suggesting a range of marital experiences in mid- and later- life. The effect of health suggests a potential for higher marital happiness for those who are in good health during mid-life.

VISION IMPAIRMENT AND DEPRESSED AFFECT IN OLDER ADULTS: THE MODERATING ROLE OF MARITAL QUALITY

J. Bookwala, *Psychology, Lafayette College, Easton, Pennsylvania*

Data from 707 older adults (mean age=67.9) who participated in the National Social Life, Health, and Aging Project (NSHAP) were used to examine the extent to which a good marriage buffers the known adverse role of poor vision in depressed affect. Vision was assessed in NSHAP both subjectively (via a single self-reported item) and objectively (via a vision test). Five dimensions of marital quality were measured including spouse's supportive behavior; spouse's unsupportive behavior; marital happiness; the extent of physical pleasure derived from the relationship; and the level of emotional satisfaction with the relationship. Depressed affect was measured using the shortened Center for Epidemiological Studies-Depression scale. A moderated regression analysis indicated that, after controlling for sociodemographic factors and the objective measure of vision, greater self-reported vision impairment, more unsupportive spousal behavior, less marital happiness, and a less physically pleasurable marriage were independently related to greater depressed affect ($\Delta R-sq=.131$). More interestingly, a significant interaction of self-reported vision loss x physically pleasurable marriage emerged ($\Delta R-sq=.021$). A test of simple slopes showed that for respon-

dents whose marriages were less physically pleasurable, greater self-reported vision impairment predicted higher depressed affect; in contrast, for those whose marriages were more physically pleasurable, there was no link between self-reported vision impairment and depressed affect. In the second model, the objective measure of vision impairment was used as the criterion. This objective measure was unrelated to depressed affect; in addition, no interactions between objective vision scores x marital quality indicators were statistically significant. These results show that, although objective assessments of vision are unrelated to depressed affect among older adults, poor self-reported vision is a significant contributor to depressed affect among older adults, and that this link is significantly attenuated by a marriage that is marked by greater physical pleasure.

THE ROLE OF MARITAL SATISFACTION IN PREDICTING POSITIVE MENTAL HEALTH AMONG CAREGIVING COUPLES WITH A SON OR A DAUGHTER WITH SCHIZOPHRENIA

S. Ghosh^{1,2}, J. Greenberg^{1,2}, 1. School of Social Work, Waisman Center, University of Wisconsin Madison, Madison, Wisconsin, 2. School of Social Work, University of Wisconsin Madison, Madison, Wisconsin

The purpose of this study was to examine differences in the well-being between aging mothers and fathers caring for an adult child with schizophrenia and the impact of marital satisfaction on parental well-being. The sample included 102 aging father/mother dyads. The fathers and mothers were on average, aged 71 and 69 years, respectively. There were no significant differences between mothers vs. fathers on measures of depression (10.26 vs. 9.79), psychological well-being (71.26 vs. 69.91), subjective burden (33.01 vs. 33.10) or marital satisfaction (77.36 vs. 81.17). For both mothers and fathers, higher levels of marital satisfaction was associated with lower levels of subjective burden and higher levels of psychological wellbeing. The relationship of marital satisfaction to lower levels of depression was stronger for fathers ($\beta = -.502$) than for mothers ($\beta = -.249$). For fathers, but not mothers, the amount of assistance they provided to their adult child with schizophrenia was associated with higher levels of distress, even though they provided much less care than their wives. Our findings underscore the vulnerability of aging fathers to the stress of caring for an adult child with schizophrenia, and challenge the belief that it is only mothers who experience the negative consequences of caregiving. The study points to the importance of the marital relationship as a resource to aging parental caregivers and the need for services that support this relationship.

SESSION 155 (PAPER)

IMPACT OF QOL ON HEALTHY LIVING

SOCIAL ISOLATION, ORAL HEALTH, AND HEALTH RELATED QUALITY OF LIFE IN A MULTI-ETHNIC SAMPLE OF OLDER RURAL ADULTS

T.A. Arcury¹, M. Savoca², A. Anderson³, H. Chen³, X. Leng³, R. Bell³, S.A. Quandt³, 1. Dept of Family and Community Medicine, Wake Forest University School of Medicine, Winston-Salem, North Carolina, 2. University of North Carolina Greensboro, Greensboro, North Carolina, 3. Wake Forest University School of Medicine, Winston-Salem, North Carolina

Social isolation among older adults has been related to poor health (e.g., greater risk for specific conditions, such as cardiovascular disease and diabetes) and lesser health related quality of life. This population-based survey of oral health among adults 60+ years included a random sample of 635 stratified by gender and ethnicity (African American, American Indian, white) recruited from rural North Carolina. Respondents completed in-home interviews which included items needed to construct measures of social engagement and social interaction, oral health, and health related quality of life (SF-12). Measures of social iso-

lation included no social engagement (no participation in church, social club, senior center, or employment) and limited social interaction (four or fewer face-to-face interactions with children, other relatives, or friends per month). No social engagement was associated with being white, male, unmarried, below poverty, and lower education, while limited social interaction was associated with not being married. Having no social engagement was associated with having fewer teeth ($p = .0080$), a lower score on the SF-12 physical health subscale ($p < .0001$), and lower self-rated health ($p = .05436$). Having limited social interaction had a curvilinear association with number of teeth ($p = .0216$), not having oral pain ($p = .0181$), and lower self-rated health ($p = .0125$). As anticipated by the disablement process model, in this multi-ethnic sample of rural older adults, social isolation is associated with oral health problems and low health related quality of life. Further research is needed to delineate the social mechanisms connecting social isolation with disability and diminished quality of life. (NIH Grant R01-DE17092)

QUALITY OF LIFE AND ADULT DAY HEALTH CENTER PARTICIPATION

E.M. Schmitt^{1,2}, L. Sands^{3,4,5}, S. Weiss², G. Dowling^{2,1}, K. Covinsky⁶, 1. Institute on Aging, San Francisco, California, 2. University of California, San Francisco Department of Physiological Nursing, San Francisco, California, 3. School of Nursing, Purdue University, Purdue, Indiana, 4. Center on Aging and the Life Course, Purdue University, Purdue, Indiana, 5. Regenstrief Center for Healthcare Engineering, Purdue, Indiana, 6. University of California San Francisco Department of Medicine-Geriatrics, San Francisco, California

Offering social, nursing, and rehabilitation assistance, Adult Day Health Centers (ADHC) are an integral part of community services for disabled older adults. However, little is known about whether participants feel they benefit from ADHC attendance. Utilizing 3 domains (Role-Physical, Social Functioning, and Role-Emotional) of the Medical Outcomes Survey Form SF-36, this 12-month case-controlled prospective study compared perceived quality of life of ADHC participants with community-dwelling older adults from social service agencies and subsidized senior housing. The ethnically diverse ADHC ($n = 57$) and comparison group ($n = 67$) subjects did not differ significantly at baseline in mean age (77 vs. 79 years), ethnicity, medical conditions, depression, cognitive status, immigration history, education, income, and marital status. Significantly more comparison group subjects lived alone than ADHC subjects ($p = .002$). One year after enrollment, adjusted Role Physical scores for ADHC participants improved (17.6 vs. 28.0), but declined for the comparison group (31.6 vs. 19.5, time by group interaction $p = .006$). Role Emotional scores improved for ADHC participants (52.0 vs. 58.2), but declined for the comparison group (55.2 vs. 43.1, time by group interaction $p = .048$). No significant time by group interaction occurred for Social Functioning. Enhanced quality of life is the first goal of Healthy People 2011 and this study provides evidence that ADHC programs may help chronically disabled older adults achieve this important public health goal. After attending this presentation, participants will be able to discuss the association of ADHC attendance and participant outcomes as well as the importance of ADHC in the continuum of community care.

QUALITY OF LIFE OUTCOMES IN THE NURSING HOME: INDIVIDUALIZED POSITIVE PSYCHOSOCIAL INTERVENTION

K. Van Haitsma^{1,2}, G. Towsley^{1,3}, M.H. Kleban¹, 1. Polisher Research Institute, North Wales, Pennsylvania, 2. University of Pennsylvania, Philadelphia, Pennsylvania, 3. University of Utah, Salt Lake City, Utah

This study examined the effectiveness of an Individualized Positive Psychosocial Intervention (IPPI) designed to enhance the quality of life for persons with dementia residing in nursing homes. The IPPI included communication training for certified nursing assistants (CNAs) who

delivered a 1-1 individualized recreational activity to residents. We hypothesized that persons receiving the IPPI would demonstrate more positive affect and more positive verbal and nonverbal behaviors compared to those in attentional control (AC) and usual care (UC) groups. Residents were randomly assigned to receive one of the following conditions: IPPI (n=44), AC (n=43), a standardized 1-1 interaction (e.g. reading a magazine aloud) between the CNA and resident, or UC (n=93). The assigned interventions were conducted for 10 minutes, three times per week, for three weeks. Real time direct observation techniques were utilized by employing a hand held device “the Observer” to measure affect and verbal and nonverbal behaviors. Multivariate analyses of covariance (MANCOVA) were conducted to determine the effect of the study conditions (IPPI, AC, and UC) on affect, verbal behavior, and nonverbal behavior. Significant differences were found on affect, Wilks’ Lambda = .87, $F(10, 340) = 18.52$, $p < .001$; verbal behaviors Wilks’ Lambda = .22, $F(10, 340) = 37.96$, $p < .001$, and nonverbal behaviors Wilks’ Lambda = .27, $F(10, 340) = 22.17$, $p < .001$. The effect sizes ranged from .74 to 1.06. These findings suggest that individualized recreational activities administered by CNAs increase resident quality of life evidenced by increased pleasure, alertness, very positive verbal statements, engagement, and positive touch.

HEALTH AND QUALITY OF LIFE: INVESTIGATING YEARS TO BE LIVED HEALTHY AND SATISFIED WITH LIFE

S.M. Lynch, L. George, *Sociology, Princeton University, Princeton, New Jersey*

Recent research has begun to investigate happy life expectancy—the number of years of remaining life individuals can expect to live happy (vs. unhappy)—and life course patterns therein. Even more recent research has begun to simultaneously consider years of remaining life to be spent in combined health and happiness states. All of this research to date, however, has used cross-sectional mortality and survey data and cannot, therefore, actually capture individual-level patterns in health and happiness across age. In this research, we broaden the current literature in two ways. First, we use panel data from the four in-person waves of the Duke EPESE and investigate individual-level patterns in health and life satisfaction across age. Second, while previous research on health and happiness has been limited to measuring health via self-rated health, we are able to measure health states using a variety of health measures, including ADL and IADL limitations in addition to self-rated health. Preliminary findings indicate that a substantial proportion of respondents (roughly 40%) experience transitions between being satisfied vs. unsatisfied with life. In addition, the majority of the sample experiences transitions into and out of healthy and unhealthy states, regardless of how health states are defined. These findings suggest that multistate life table results that decompose the latter life course into years lived in each health/happiness state provide a realistic depiction of later life. These results and their implications are discussed.

HEALTH-RELATED QUALITY OF LIFE AS A PREDICTOR OF MORTALITY: A DOMAIN-SPECIFIC ANALYSIS

M.S. Kaplan¹, D. Feeny², H. Orpana³, N. Huguet¹, B. McFarland⁴, *1. Portland State University, Portland, Oregon, 2. Kaiser Permanente Center for Health Research, Portland, Oregon, 3. Statistics Canada, Ottawa, Ontario, Canada, 4. Oregon Health & Science University, Portland, Oregon*

A number of studies confirm that overall measures of health-related quality of life (HRQL), such as the Health Utilities Index Mark 3 (HUI3), are predictive of mortality (Kaplan et al 2007). This study examined which specific domains of HUI3 (vision, hearing, speech, ambulation, dexterity, emotion, cognition, and pain and discomfort) were associated with mortality risk. Data derived from the Longitudinal Canadian National Population Health Survey, consisting of 12,375 female and male adults. HUI3 was measured at baseline in 1994/1995. Cox proportional hazards regression models were applied to estimate mortality

risks over 12 years. Of the eight domains examined, ambulation (Hazard Ratio [HR] = 0.16; 95% Confidence Interval [CI] = 0.06 – 0.39) and hearing (HR = 0.19; 95% CI = 0.06 – 0.60) were significantly associated with an elevated risk of mortality after controlling for an array of potential confounders. This research indicates that ambulation and hearing at baseline are predictive of subsequent mortality. The finding regarding the predictive ability of ambulation is consistent with previous studies; however, the result concerning hearing is novel. It is possible that hearing loss is a marker of neurological decline. Furthermore, hearing loss may contribute to social isolation and subsequent declines in physical and psychological health. This research emphasizes the need to examine further the underlying mechanisms of the association between ambulation or hearing and mortality risks.

SESSION 160 (PAPER)

LATE LIFE DEPRESSION

SUBTHRESHOLD DEPRESSION AMONG RESIDENTS OF CONGREGATE HOUSING: CHARACTERISTICS AND SYMPTOMS

K.B. Adams, H. Moon, *Mandel School of Applied Social Sciences, Case Western Reserve University, Cleveland, Ohio*

Objectives: This study examined symptoms of subthreshold depressed older adults compared with their non-depressed peers, and tests a conceptual model of subthreshold depression. Hypotheses included that subthreshold depression would be characterized and distinguished by low energy, social withdrawal and depletion, rather than sadness, and that subthreshold depressed elders would be distinguished by poorer health and functioning, loneliness and grieving a recent loss. **Method:** A self-administered survey was followed by a diagnostic interview by telephone to N = 166 white and African American residents of independent and assisted living apartments from six retirement communities, average age 82.9 years. The MINI diagnostic interview determined depression status. The 30-item Geriatric Depression Scale was used to measure symptoms. **Results:** Forty-six individuals (27.7%) were identified as subthreshold depressed, seven as suffering from major depression, and 113 as non-depressed. Subthreshold depression was characterized by low energy, difficulty with initiative, worries about the future, lack of positive affect, sadness and irritability. Negative affect symptoms such as sadness and irritability best discriminated the subthreshold group from the non-depressed. Risk factors for subthreshold depression in this sample included lower socio-economic status, grieving, and social loneliness. **Conclusion:** Subthreshold depression in this group of residents of congregate housing was similar to the depletion experienced by many non-depressed elders, but further characterized by negative affect and lack of hope for the future. Social factors, such as socioeconomic status, loneliness and personal losses, constituted greater risks for subthreshold depression than did health and functioning.

CHARACTERIZING THE RELATION BETWEEN DEPRESSIVE SYMPTOMS AND PARKINSON’S DISEASE IN A SAMPLE OF SWEDISH TWINS

R.K. Widoe¹, A. Fiske¹, M. Gatz^{2,3}, K. Wirdefeldt³, N.L. Pedersen^{3,2}, *1. Psychology, West Virginia University, Morgantown, West Virginia, 2. University of Southern California, Los Angeles, California, 3. Karolinska Institutet, Stockholm, Sweden*

Depression commonly co-occurs with Parkinson’s disease (PD). Psychosocial stressors and biochemical changes associated with PD have both been implicated in the etiology of depression in PD. The purpose of the current study was to examine whether genetic or environmental influences contribute to the increased risk for depression among individuals with PD in a population of twins. Among individuals with PD, 24% endorsed a moderate-severe level of depressive symptoms, and 40% endorsed at least a mild level of depressive symptoms. Case-con-

trol results indicated that PD is a significant risk factor for both mild (OR = 1.86, CI = 1.11-3.12) and moderate-severe (OR = 3.15, CI = 1.74-5.67) depressive symptoms, adjusting for age, sex, and prior history of major depression. Odds ratios were not significantly attenuated in the co-twin control analysis compared to the case control analysis for either mild or moderate-severe depressive symptoms, suggesting that genetic influences are unlikely to account for the increased risk of depression among PD patients. Further support for environmental rather than genetic influences on the PD-depression relation was revealed by examining the risk of depression among co-twins of PD patients versus co-twins of non-PD controls. Controlling for age, sex, and prior history of depression, PD in the co-twin was not a risk factor for mild or moderate-severe depressive symptoms in the non-PD twin. These findings indicate that environmental influences likely play an important role in the etiology of depression in individuals with Parkinson's disease. Alternatively, brain changes associated with PD may heighten biological vulnerability to depression.

CHILDHOOD ADVERSITY, RECENT LIFE EVENTS AND DEPRESSION IN LATE LIFE

H. Comijs^{1,2}, A. Beekman^{1,2}, D.J. Deeg², *1. Psychiatry, GGZinGeest/VUMC, Amsterdam, Netherlands, 2. VU University Medical Center, Amsterdam, Netherlands*

The study investigates whether persons who have experienced childhood adversity are more likely to develop depressive symptoms when faced with recent events. Data were used from a population-based sample, aged 55 to 85 years (n=1,887), which were not depressed at baseline. Childhood adversities and recent stressful life events were retrospectively assessed. Depressive symptoms were measured with the CES-D. 14.4% of our sample experienced adverse events during childhood (<18 yrs) and 35.4% experienced recent events. Persons who experienced adverse events during childhood reported more recent events than the persons who did not report childhood adversity. Associations of depressive symptoms were found with both, childhood adversity (OR 1.80, 95%CI 1.21-2.69) and recent life events (OR 1.42, 95%CI 1.01-2.00). The effect of recent events on depressive symptoms was not modified by childhood adversity. Therefore, no evidence was found for the assumption that older persons were more vulnerable for depression in reaction to recent life-events when they were exposed to childhood adversity.

CEREBROVASCULAR RISK FACTORS, COGNITIVE FUNCTIONING AND DEPRESSIVE SYMPTOMS IN WOMEN OVER 80

D. Paulson, M.E. Bowen, P.A. Lichtenberg, *Department of Psychology, Wayne State University, Detroit, Michigan*

Women over age 85 are the fastest growing population segment, but are underrepresented in vascular depression research. This study examined the relationship between cerebrovascular burden and depressive symptoms over six years. The baseline sample included 1,355 stroke-free women 80 years and over in the Health and Retirement Survey (1998-2004). Cerebrovascular risk factors (CVRFs) included hypertension, heart disease, diabetes and lifetime smoking. Respondents were grouped into low (0 or 1 CVRF) and high (2+ CVRFs) cerebrovascular burden and low and high cognitive functioning based on the Telephone Interview for Cognitive Status (TICS). The dependent variable, depression symptoms, was measured using the 8-item Center for Epidemiological Studies Depression Scale. Cross-sectional analysis revealed a significant interaction between baseline CVRFs and cognitive test performance predicting depression symptoms at baseline ($F=8.198, p=.004$) but not at follow-up. The main effect for baseline CVRFs significantly predicted depression symptoms at all four waves ($p\leq.001$). Longitudinal analysis revealed that CVRFs ($F=9.795, p=.002$) predicted depression symptoms. The interaction between CVRFs and Time showed a trend toward significance ($F=2.434, p=0.065$). Results support the vas-

cular depression hypothesis in older-old women. The interaction between CVRFs and cognitive functioning predicted depression symptoms cross-sectionally and CVRFs predicted depression symptoms across 6 years of follow-up. The relationship between CVRFs and depression is likely underestimated in the longitudinal analysis. While it is normative to lose older-old participants due to death and incapacity, the attrited group, reported greater baseline depression symptoms, scored significantly lower on cognitive testing and had significantly greater cerebrovascular burden than did the non-attrition group.

SESSION 165 (POSTER)

MENTAL HEALTH

MENTAL HEALTH AND SOCIAL ISOLATION IN ETHNICALLY DIVERSE OLDER ADULTS

D. Fuentes¹, L. Palinkas¹, S. Shepherd^{2,3}, V. Criado⁴, P. Garcia⁴, D. Jeste², *1. School of Social Work, University of Southern California, Los Angeles, California, 2. University of California, San Diego, San Diego, California, 3. NAMI San Diego, San Diego, California, 4. County of San Diego Mental Health Services, San Diego, California*

Social support has long been considered a key component of optimal physical and mental health (Cohen & Wills, 1985; House et al., 1988), and lack of such support is linked to increased rates of depressive disorders especially among older adults (Arean & Reynolds, 2005; Palinkas et al., 1990). We explore the association between social isolation and the need for and use of mental health services among older adults in San Diego, California. Semi-structured interviews were conducted with 23 providers/administrators of health and social services, 19 caregivers/family members and patient advocates, and 16 service clients and other older adults ages 55+. These were followed by 15 focus groups composed of the three aforementioned stakeholder groups, separately. Bilingual interviewers and/or interpreter services were utilized to accommodate Spanish- and Arabic-speaking participants. Results show that older adults experience loneliness and depression due to loss of or geographic separation from loved ones, lack of affordable housing, meaningful employment opportunities, and limited income. Socially isolated older adults are more likely to have mental health problems that are undetected by others and thus go without treatment. Lack of transportation and information on available services further restricts access. Even when services are available, the unwillingness to use them due to stigma contributes to further isolation. Language and other cultural factors further compound the isolation and depression experienced by immigrant older adults. Results suggest that social isolation is both a cause and consequence of mental health problems in older adults, and language and culture should not be ignored when providing outreach.

CREATIVELY AGING: EXPLORING MEANING IN LIFE IN OLDER ADULTS

N.E. Sherman, R. Earhart, *Bradley University, Peoria, Illinois*

An interdisciplinary team consisting of counselors, dietitians, nurses and physical therapists investigated physical, emotional, mental and spiritual wellness in a sample of 147 adults between the ages of 63 and 98 living independently in Peoria County, Illinois. The sample was representative of older adults in the state with regard to gender, race, and economic status. Researchers gathered data through a battery of assessments including the Geriatric Depression Scale, Meaning in Life Scale and the Life Satisfaction Questionnaire. Significant relationships were found between meaning in life and depression, health satisfaction, life in general, volunteerism and health in general. These relationships provide implications for creatively engaging and counseling older adults within an integrated approach to development. Recommendations are made to enhance and promote a meaningful life for older adults.

MENTAL HEALTH LITERACY AMONG OLDER AFRICAN AMERICANS RESIDING IN A SOUTHERN STATE

T.L. Peterson¹, K.L. Stansbury², 1. *Social Work, University of Alabama, Moundville, Alabama*, 2. *Eastern Washington University, Cheney, Washington*

Older adults often have limited mental health literacy which may lead to lower use of preventive services, worse self-management skills, and higher hospitalization rates. We conducted qualitative interviews to assess mental health literacy with 22 African American seniors residing in central Kentucky. Semi-structured interviews covered four domains: familiarity with mental disorders, risk factors and causes of mental disorders, self-help and professional interventions, and mental health information-seeking. Content analysis was conducted to organize and summarize the data. Study findings indicated the most recognized mental disorders affecting this sample of older African Americans were dementia (73%) and depression (32%). Additionally, participants in the study frequently reported physical and psychosocial challenges as risk factors for mental disorders. With respect to self-help and professional interventions, these participants highly endorsed the use of spiritual interventions, social support, physicians, and community mental health services. Finally, over three-fourths of participants were knowledgeable about mental health information-seeking. Older African Americans would benefit from health care professionals including more mental health content in comprehensive assessments. Specifically, health care professionals can assist older African Americans in linking with culturally appropriate interventions to offset mental health problems.

AGE DIFFERENCES IN COMORBID MENTAL AND PHYSICAL ILLNESS: FINDINGS FROM THE NATIONAL SURVEY OF AMERICAN LIFE

A.T. Woodward¹, L. Bakk¹, R.J. Taylor², L. Chatters², 1. *School of Social Work, Michigan State University, East Lansing, Michigan*, 2. *University of Michigan, Ann Arbor, Michigan*

Comorbid chronic physical illness is often cited as one barrier to the diagnosis and treatment of mental disorders among older adults. However, there is little epidemiological evidence that older adults with mental illness have comorbid physical illnesses at a greater rate than their younger counterparts. This study uses data from the National Survey of American Life to examine the prevalence of mental and physical disorders across different age cohorts. The analytic sample is adults aged 18 and older with at least one mental or physical illness (n=3,820). Mental disorders include mood and anxiety disorders. Physical illness includes a range of common chronic problems such as asthma, high blood pressure, and diabetes. Using multinomial logistic regression we examine the effect of age on the likelihood of having a mental disorder only, a physical disorder only, or both. Two percent of adults age 55 and older have a mental disorder only, 80% have a physical disorder only, and 18% have comorbid mental and physical disorders. Controlling for other factors, those aged 55 and over are more likely than those age 18 to 29 to have comorbid mental and physical disorders compared to having a mental disorder only; however, older adults are more likely than all other age groups to have a physical disorder only. These findings confirm the importance of understanding chronic physical illness and the ways in which it may interact with mental illness among older adults. Potential implications for service use and treatment will be discussed.

THE EFFECTS OF EDUCATIONAL ATTAINMENT AND GENDER ON DEPRESSION IN LATER LIFE

C.M. Wong, *University of Massachusetts Boston, Cambridge, Massachusetts*

The purpose of this study is to investigate the effects of educational attainment on depression during later life. Furthermore, an objective of this study is to clarify whether the effect of education on depression is different for men and women. Historically, females had less access to educational opportunities during their early years than males. The tra-

ditional expectation for women, as they reached adulthood, was to be married, create a family, and fulfill the role of the caregiver for the family. The social expectation of men to be the financial supporter for the family may be a more significant determinant of psychological health during old age. Therefore, in the current cohort of older persons, the role of obtaining an education may render different meanings on psychological health for men and women. Utilizing a nationally representative data set of older persons, the Health and Retirement Study (HRS), the statistical analyses entails estimating two logistic regression models that incorporate interaction variables to test the difference between men and women in education, income, and net worth coefficients. The sample for this study consists of participants from the 1998 wave of the HRS (N=9,626). The findings indicate that the level of education appears to have implications for mental health in older women, while income may have greater importance for men's psychological health during later life.

RACIAL AND ETHNIC DIFFERENCES IN THE ASSOCIATION BETWEEN SELF-RATED MENTAL HEALTH AND MENTAL DISORDERS AMONG OLDER AMERICANS

G. Kim, D.A. Chiriboga, Y. Jang, *Aging and Mental Health Disparities, University of South Florida, Tampa, Florida*

This study focuses on self-rated mental health (SRMH), a single item question worded as "How would you rate your mental health?" The purpose of this study was to examine the association between self-rated mental health and clinical diagnoses of mental disorders (mood and anxiety disorders) in racially/ethnically diverse older adults. Four racial/ethnic elderly groups were drawn from the Collaborative Psychiatric Epidemiology Surveys (CPES) and included 429 Whites, 586 Blacks, 260 Hispanics, and 165 Asians who provided information on self-rated mental health. Kappa statistics and logistic regression analyses were conducted. Results showed that self-rated mental health was not identical to clinical diagnoses of mental disorders. Apparent racial and ethnic differences existed in the association between SRMH and mental disorders: older Whites were most likely to be screened while older Asians were least likely to be screened for both mood and anxiety disorders. The findings provide useful information on developing race/ethnicity-specific strategies to screen mental disorders in diverse elderly populations. Future studies are needed to investigate possible reasons that influence responses to self-rated mental health across diverse populations.

IS LIVING ALONE THE LONE LIVING ARRANGEMENT THAT POSES RISK FOR LONELINESS IN LATER LIFE?

D. Russell, E. Greenfield, *Institute for Health, Rutgers University, New Brunswick, New Jersey*

Purpose: Previous studies have identified living alone as a risk factor for loneliness in later life without examining the extent to which other types of living arrangements pose a similar risk. The purpose of this study was to explore linkages between multiple types of living arrangements and loneliness in later life. Design and Methods: We analyzed data from the National Social Life Health and Aging Project. We estimated multivariate models to examine associations between a variety of types of living arrangements (living only with a spouse, living with a spouse and children, living only with a non-marital partner, living only with adult children, living with others, living alone) and loneliness among adults ages 60 years and older. Results: Older adults living with other people besides an intimate partner (i.e., children or other relatives and friends) reported levels of loneliness comparable to adults who lived alone and reported more loneliness than adults residing with a spouse or non-marital partner. Implications: Living alone is not the only risk factor for loneliness in later life. Results suggest the importance for interventions aimed at reducing loneliness to target those living alone as well as those living with others, but not among those who live with an intimate partner.

MENTAL HEALTH CARE PREFERENCES OF YOUNGER ADULT AND OLDER HISPANICS

L.W. Dupree, J.R. Herrera, D. Martinez Tyson, Y. Jang, B.L. King-Kallimanis, *Aging and Mental Health Disparities, Univ of South Florida/FMHI, Tampa, Florida*

Research on mental health service utilization patterns has shown that older adults under utilize outpatient services, particularly minority and ethnic populations. This often inadvertently places greater reliance on more expensive inpatient services when a mental health problem can no longer be ignored. In a prior study, Dupree, Watson and Schneider (2005) compared the attitudes and beliefs of African American and Caucasian older adults about mental health care preferences and preferred providers. Continuing this comparative approach, a Spanish language version of the original 47-item survey was administered to a convenience sample of 255 younger adult and old Hispanics at various community sites. They were surveyed regarding willingness to receive/consider services, preferred mental health care, preferred care providers, preferred locations of service, and personal barriers to care. Results showed similarities and differences in Latino adults' mental health care preferences and perceived barriers by age groups (< 65 vs. 65+), suggesting that policy makers and providers need to consider the impact of age, culture, and ethnicity in the development of appealing and culture appropriate outpatient mental health services.

CHARACTERIZATION OF EATING DISORDERS IN OLDER ADULTS: A REVIEW

J. Beenhakker^{1,2}, S.A. Beaudreau^{2,1}, *1. Stanford University School of Medicine, Stanford, California, 2. Palo Alto VA Health Care System, Palo Alto, California*

Eating disorders (ED) are thought to occur exclusively in adolescent and young adults, although a few older cases have been reported. We conducted a literature review of ED in older adults: (a) to determine if existing reports were consistent with DSM-IV diagnostic criteria for ED; and (b) to characterize existing cases based on gender, ED disorder type, precipitating factors, and psychiatric comorbidity. After completing a comprehensive scientific database search of ED in adults 50 and older, we identified 10 relevant articles of 25 cases. Twenty-two cases (88%) were women. Anorexia Nervosa (AN), restricting type was the most common diagnosis (44%), followed by AN binge/purge type (28%). Of the 23 cases reporting age of onset, 19 reported that ED occurred for the first time in middle to older adulthood, compared with only 4 reporting a history of adolescent ED. Loss of a loved one was the most common precipitant of ED and Major Depressive Disorder was the most common psychiatric comorbidity. The predominance of ED in women with comorbid depression parallels what has been described in young adults. We identified no cases of Bulimia Nervosa without Anorexia Nervosa in older adults, perhaps due to the physically strenuous nature of purging behaviors such as vomiting and exercise. The paucity of ED cases (n = 25) in older adults may be due to high mortality and poorer health of those who suffer the disorder at younger ages, although a diagnosis of ED should not be overlooked in this population.

RELIGION AND SPIRITUALITY IN THERAPY: PATIENT PREFERENCES AND RELATED CHARACTERISTICS

M.E. Camp¹, J. Cully¹, C.R. Barber¹, L. Phillips^{2,1}, A. Bush¹, D. Zeno¹, H. Casciani¹, M. Stanley¹, *1. Baylor College of Medicine, Houston, Texas, 2. Veterans Administration Hospital, Temple, Texas*

Background: Religiosity is higher in older adults. Church attendance and certain forms of religious or spiritual coping are associated with decreased stress and depression. Thus, the integration of R/S into counseling may improve outcomes in older patients with anxiety and depression. However, little is known about patient preferences in this area. Methods: Sixty-six older adults from studies of the treatment of anxiety and/or depression in the Houston area completed the Client Attitudes toward Spirituality in Therapy (CAST), Brief Religious Coping

(RCOPE), Geriatric Depression Scale (GDS) and Santa Clara Strength of Religious Faith. The percentages and characteristics of patients preferring R/S interventions were assessed. Results: A majority of patients thought it would be important to discuss spiritual issues (44% extremely important, 39% somewhat important) or religious issues (26% extremely important, 35% somewhat important) in counseling. Those who found R/S issues extremely important reported more positive religious coping ($p \leq .005$) and greater strength of faith ($p < .001$) than the other patients. Those who found religious issues somewhat important had more negative religious coping ($p \leq .05$) than the other patients, and more depression than those who said it was not important ($p < .02$). Conclusions: The majority of older adults think that it is important to address spiritual or religious issues in therapy. This is likely to have future implications for treatment in this population.

AGING AND THE PERCEPTION OF MENTAL ILLNESS STIGMA

J. Brown¹, M. Tausig², J. Subedi¹, S. Subedi¹, K. Basnyat¹, C. Broughton², S.L. Santangelo³, *1. Sociology and Gerontology, Miami University, Oxford, Ohio, 2. University of Akron, Akron, Ohio, 3. Harvard University, Cambridge, Massachusetts*

Stigma associated with mental illness is a significant barrier to treatment for and recovery from mental illness throughout the world. Surprisingly, the extent of stigma and its implications for persons labeled as mentally ill did not decline significantly in the US with the advent of community-based treatment. However, it appears that younger, better-educated persons are less likely to attribute stigmatic characteristics to persons with mental illness. The purpose of this study is to examine the accuracy of this latter observation in the developing country of Nepal where stigma is strongly associated with mental illness for a variety of cultural, religious and economic reasons. We focus, particularly, on the role that elders in the community play in sustaining or modifying stigmatic perceptions. Although we expect that education might play a role in reducing stigmatic perceptions, we also suspect that, because elders are likely to suffer from physical disabilities that are also stigmatized, they will be more "open minded" regarding the stigma attribution. Data for the study come from interviews of 375 adults conducted in the village of Jiri, Nepal using the survey instrument from the "Stigma in Global Context: Mental Health Study" coordinated at Indiana University-Bloomington by Bernice Pescosolido. We expect that greater amounts of family burden from illness and disability reported among family members will be associated with less endorsement of stigmatic attributions for behavior. This will hold regardless of network position but is more likely to be observed among older persons because of potential personal implications of stigmatic attribution.

MEETING THE NEEDS OF THE GERIATRIC POPULATION: THE USE OF PSYCHOLOGY IN AN INTEGRATED HEALTHCARE SETTING

S.A. Ogbeide², L.M. Garcini¹, *1. University of Houston Clear Lake, Houston, Texas, 2. The School of Professional Psychology at Forest Institute, Springfield, Missouri*

The elderly has the highest rate of illness, disability and activity restrictions (Keuthen & Wisocki, 1991). Research shows that of those over age 65, 85% have at least one chronic medical condition, and more than 50% have two or more chronic illnesses (Black, Garcini & Baker, 2008). As the health and functional ability of older adults with chronic medical conditions decline, the risk of mental disorders increases (Ikes, 1998). Primary care is usually a constant source of health access and continued care among geriatric populations. Integrating mental health-care services into primary care, either in outpatient or inpatient settings, provides an effective way to reduce morbidity, improve quality of life, and promote successful aging (O'Donohue, Byrd, Cummings & Henderson, 2005). This review of literature provides a detailed overview on the role of psychology in primary care as a way to better address the

needs of aging medical patients. It aims at increasing awareness and promoting interest to include mental health services as a way to optimize patient health thorough biopsychosocial modes of prevention and intervention. Included in this review is a description of integrated healthcare; a discussion of how "primary care psychology" differs from traditional practice; a proposal of ways in which mental health providers may collaborate with physicians and other medical professionals to provide services and assist in case conceptualization; examples of psychological services valuable to geriatric populations and their caregivers; and an overview of the advantages, challenges, and ethics involved in the practice of integrated healthcare with older populations.

BELIEFS ABOUT MENTAL ILLNESS AND WILLINGNESS TO SEEK HELP ACROSS THE LIFESPAN

S.C. Gibson, D. Segal, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Previous research suggests older adults hold some negative attitudes about mental illness compared to younger adults (Segal et al., 2005). This study further investigates attitudes about mental illness across the lifespan. Participants in three age groups (Younger: 35 years or less, $n = 144$; Middle-aged: years 36 to 65, $n = 219$; Older: 66 years and above, $n = 89$) completed the Willingness to Seek Help Questionnaire (WSHQ) and Beliefs Toward Mental Illness questionnaire (BMI). One-way between-groups ANOVAs revealed significant age differences regarding BMI Dangerousness subscale and BMI Poor Interpersonal and Social Skills subscale as well as BMI Total Score: $F(2, 451) = 5.75, p = .00$; $F(2, 451) = 4.65, p = .01$; and $F(2, 451) = 6.36, p = .00$, respectively. Post-hoc comparisons revealed that older adults scored significantly higher than middle-aged adults ($M = 11.76, SD = 11.32$; $M = 9.03, SD = 4.36$) on the Dangerous subscale and the Total Score ($M = 38.12, SD = 15.46$; $M = 45.88, SD = 23.56$). Furthermore, older adults scored higher on the Poor Interpersonal and Social Skills subscale than the younger and middle-aged groups ($M = 19.55, SD = 8.45$; $M = 16.71, SD = 7.63$; $M = 16.61, SD = 8.15$, respectively) which did not differ. There were no statistically significant age differences on WSHQ Total Score or BMI Incurability subscale. It is possible that older adults' stigmatized beliefs about mental illness may negatively influence their recognition of psychiatric symptoms and help-seeking behaviors.

PREDICTING PSYCHOLOGICAL WELL-BEING AMONG CENTENARIANS

J. Cho, P. Martin, D. Russell, *Iowa State University, Ames, Iowa*

This study examined predictors of psychological well-being among centenarians across four domains (demographics, health, functional ability, and socioeconomic support). Sixty five participants from the Iowa Centenarian Study and who had fewer than 3 errors on the SPMSQ (Short Portable Mental Status Questionnaire) participated in this research. Autonomy and growth, two subscales of Ryff's (1995) psychological well-being measure, were used as outcome variables. Six pairs of multiple regression analyses showed that health and socioeconomic support were significant predictors for growth and autonomy among Iowa centenarians. In other words, higher levels of social support, economic status and better health were positively associated with better psychological well-being. The results suggest that social support and economic status are critical factors for psychological well-being among oldest old adults who live in rural settings.

DOES TIME HEAL ALL WOUNDS? THE IMPACT OF EVENT DISTANCE ON THE MENTAL HEALTH OF CENTENARIANS

G. da Rosa¹, P. Martin¹, M. MacDonald¹, J. Margrett¹, L. Poon², *1. Iowa State University, Ames, Iowa, 2. University of Georgia, Athens, Georgia*

This study assessed the most important and most frequent life events report by centenarians and examined the influence of distance of the

time of the event on the mental health status (i.e. positive and negative affect) among centenarians of the Georgia Centenarian Study. One-hundred and thirty seven centenarians were interviewed about life events and how long ago they had occurred. On the frequency analyses, marriage was the most important and most commonly reported life event for centenarians. Several correlation analyses were conducted to assess the influences of time since the event occurred on the mental health status of oldest old adults. Length of time after the loss of a child was positively related to positive affect ($r = .05, p < .05$), suggesting that centenarians were more likely to report lower positive affect if they had lost a child more recently. Centenarians reported lower levels of positive affect if they had more recently experienced the worsening of the relationship to a child ($r = .08, p < .01$). Time of spouse institutionalization was negatively related to positive affect ($r = -.10, p < .05$), suggesting that centenarians were more likely to show lower positive affect if the experience of having a spouse institutionalized occurred a longer period ago. Overall our study demonstrates that stressful life events that happened more recently had a stronger impact on centenarians' mental health. In addition, centenarians generally had lower levels of mental health if they had experienced long-term exposure to a stressful life event.

THE EFFECTS OF AGE AND NEUROTICISM ON TWO MEASURES OF EMOTIONAL COMPLEXITY

A.M. Akerstedt, R. Ready, *University of Massachusetts, Amherst, Amherst, Massachusetts*

Older adults report greater emotional complexity than younger adults (e.g., Ready et al., 2008); however, it is possible that age-related findings are due to age-based differences in Neuroticism (Ong & Bergeman, 2004). The current study examined age and personality differences in positive (PA) and negative (NA) affected from the covariation and the heterogeneity perspectives. Covariation refers to the capacity to experience different emotions as independent (Carstensen et al., 2000; Ong / Bergemeian, 2004) whereas heterogeneity refers to the experience of multiple emotions over a period of time (e.g., Charles, 2005). Older age and low Neuroticism were expected to be associated with greater emotional complexity. Participants ($N = 1503$; 20-70 years) were from the Midlife in the United States (MIDUS) studies. PA and NA items were obtained using a brief PA/NA scale and an abbreviated PANAS. Neuroticism was assessed with a 4-item scale (Prenda & Lachman, 2001). Older age was associated with lesser covariation in PA and NA; however, this association was moderated by Neuroticism. Persons higher in Neuroticism had a more bipolar association between PA and NA than persons lower in Neuroticism. Age-related differences in heterogeneity in PA and NA were found. Controlling for Neuroticism, only NA heterogeneity remained significantly associated with age. Greater emotional complexity (i.e., lesser covariation) between PA and NA was found in older relative to younger adults. Older age also was associated with more heterogeneity in PA but lesser heterogeneity in NA. Overall, age-related differences were largely due to individual differences in Neuroticism.

EFFECTS OF ILLNESS TYPE AND GENDER ON PERCEPTIONS AND EMOTIONAL AND BEHAVIORAL REACTIONS TO MENTALLY ILL OLDER ADULTS

A. Webb, J.M. Jacobs-Lawson, *University of Kentucky, Lexington, Kentucky*

Inadequate knowledge of mental illness can lead to misconceptions and discrimination. The purpose of this study was to examine how illness type and gender influence how people perceive and react to mentally ill older adults. Participants ($N = 276$, aged 19-88 years, M age = 49.88) were presented with four vignettes depicting an older adult with a mental illness: depression, anxiety disorder, schizophrenia, or bipolar disorder. Participants were randomly assigned to either receive vignettes describing older men or older women. For each vignette, participants indicated their (a) perceptions (how responsible the older adult

was for his/her condition, and how dangerous and dependent on others the person was), (b) emotional responses (how much pity, fear and anger they felt toward the person), and (c) behavioral reactions (willingness to help and interact with the older adult). Results showed that schizophrenia and bipolar disorder were associated with the most negative reactions, while anxiety was treated as the least severe illness. Regardless of illness, participants' perceptions, emotional reactions and behaviors toward women were much more positive than they were toward men. This confirms that both illness type and the gender of mentally ill older adults affect how they are viewed and treated. This suggests that (a) the general public would benefit from programs aimed at educating individuals about mental illness in old age and (b) compared to older women, older men with a mental illness may need more support because of the increase in negative perceptions and potential stigma associated with mental illness for men.

AN EXAMINATION OF THE VALIDITY OF THE BARRIERS TO MENTAL HEALTH SERVICES SCALE

R. Pepin, D. Segal, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

The purpose of this study was to examine the convergent and divergent validity of a newly created questionnaire, the Barriers to Mental Health Services Scale (BMHSS) (Pepin, Segal, & Coolidge, in press), as well as conduct a principle components analysis to explore the underlying structure of this instrument. The BMHSS is comprised of 10 subscales representing possible barriers to mental health service utilization, conceptualized in two domains: intrinsic (e.g. stigma) and extrinsic (e.g. transportation concerns). Community-dwelling younger adults ($N=76$, $M=23.0$ years) and older adults ($N=88$, $M=71.4$ years) completed the BMHSS, the Beliefs toward Mental Illness Scale (BMI) (Cohen, 1999), the Willingness to Seek Help Questionnaire (WSHQ) (Hirai & Clum, 2000), and the Center for Epidemiologic Studies Depression Scale (CES-D) (Radloff, 1977). The stigma subscale was significantly and positively correlated with the BMI total score, $r(154) = .21$, $p < .01$. The help seeking subscale was significantly and negatively associated with the WSHQ, $r(152) = -.38$, $p < .00$. As predicted, the CES-D was not significantly correlated with either stigma, $r(149) = .08$, $p = .35$ or help seeking, $r(150) = -.15$, $p < .07$ subscales. A principle component analysis indicated one factor accounting for 23.3% of variance, another factor accounting for 10.2% of the variance, and a third factor accounting for 5.2% of the variance. An implication of this study is the preliminary evidence for the validity of the BMHSS provides support for further development of this instrument.

LONELINESS, TIME USE, AND EXPERIENCED AFFECT IN OLDER ADULTS

L. Damron, C. Depp, A. Cain, *University of California, San Diego, San Diego, California*

Loneliness is a risk factor for poor health and cognitive decline among older adults. It is unclear to what extent the negative effects of loneliness are due to diminished social engagement or to emotional factors. We examined time use and affective experiencing among lonely vs. not lonely people using a modified version of the Day Reconstruction Method (DRM). The DRM is a survey method that is a hybrid of Ecological Momentary Assessment (EMA) and daily diary methods, and asks about the social context, affective experiences, and time use over a single day. In a sample of 47 community-dwelling adults 60 years and older, we dichotomized participants based on responses to a single-item question into lonely (sometimes or frequently) vs. not lonely (never or infrequently). We then assessed the proposition of time spent alone, time use, and affect ratings for events throughout the day (e.g., happy, interested, sad). The mean age of the 47 person sample was 75.5 ($sd=9$). Overall, 38% were lonely sometimes or frequently. Surprisingly, the group that endorsed loneliness spent marginally less time alone than the group that reported never feeling lonely (32% vs. 42%, respectively)

and the distribution of activities did not differ across groups. However, on affective experience, the group that endorsed loneliness has significantly lower ratings of "interested" collapsed across activities. In light of the small sample size, our diary-based study suggests that loneliness may have more to do with emotional responses to daily events than to time spent alone or distribution of activities.

RELATIONSHIPS BETWEEN COGNITIVE DETERRENTS TO SUICIDE, DYSFUNCTIONAL BELIEFS, AND HOPELESSNESS AMONG OLDER ADULTS

M. Marty, W. Meyer, D. Segal, *Psychology Department, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

The Reasons for Living Inventory (RFL; Linehan et al., 1983) measures cognitive deterrents to suicide with six subscales: survival and coping beliefs, responsibility to family, child-related concerns, fear of suicide, fear of social disapproval, and moral objections. However, in nonclinical samples of younger and older adults, higher fear of suicide has been associated with higher suicidal ideation, suggesting this is not a deterrent to suicide in this population (Linehan et al., 1983; Marty et al., 2008; Osman et al., 1993). To further explore this phenomenon, this study examined relationships between reasons for living, dysfunctional attitudes, and hopelessness in community-dwelling older adults. Participants ($N = 108$; M age = 71.50 years; $SD = 8.20$) completed the RFL, Dysfunctional Attitudes Scale (measure of attitudes that predispose individuals to depression), and Geriatric Hopelessness Scale (measure of pessimism and hopelessness). Correlational analysis revealed positive relationships between dysfunctional attitudes and fear of suicide ($r = .34$) and fear of social disapproval ($r = .35$) and a negative relationship with survival and coping beliefs ($r = -.25$). Further analysis revealed negative relationships between hopelessness and survival and coping beliefs ($r = -.36$), responsibility to family ($r = -.39$), child-related concerns ($r = -.24$), moral objections ($r = -.42$) and total reasons for living ($r = -.36$). As expected, hopelessness is moderately negatively related to deterrents to suicide. In contrast, dysfunctional attitudes are positively related to two types of deterrents, signifying these two RFL scales may not be accurate depictions of deterrents among healthy older adults.

ALCOHOL ABUSE PREVENTION FOR OLDER ADULTS: A SYSTEMATIC REVIEW OF THE RESEARCH LITERATURE

C. Egan, *University of Rhode Island, Providence, Rhode Island*

Alcohol abuse among older adults is a significant yet often unacknowledged problem (Blow, 2004) that is projected to increase in magnitude (SAMHSA, 2002). In fact, the number of older adults in need of substance abuse treatment is expected to double from 1999 to 2020 (SAMHSA, 2002). Despite the current prevalence and projected increase, efforts to prevent alcohol abuse in the older adult population have been limited (Bartels et al., 2005). This presentation describes the current state of the research on alcohol abuse prevention for older adults as determined by a systematic literature search of published studies from 1988 through March 2009 in four databases (PsycINFO, CINAHL, Medline, and Ageline). Identified studies were organized according to the Institute of Medicine (IOM) classification of universal, selective and indicated prevention strategies (Schinke, Brounstein, & Gardner, 2002). This literature review indicates that a full spectrum of prevention interventions for older adult alcohol abuse across the three IOM categories is currently lacking. Alcohol screening for universal or selected populations with brief intervention was the most frequently studied approach. Universal educational approaches for substance abuse prevention among older adults were identified, but the studies conducted were small scale. Barriers to the development of alcohol abuse prevention among older adults will be discussed along with future directions.

PREDICTORS OF PREVENTABLE NURSING HOME HOSPITALIZATIONS: THE ROLE OF MENTAL DISORDERS AND DEMENTIA

M.A. Becker, T. Boaz, R. Andel, A. Gum, A.S. Papadopoulos, *Aging & Mental Health Disparities, University of South Florida, Tampa, Florida*

Preventable nursing home (NH) hospitalizations place an enormous economic burden on an already overtaxed American healthcare system. Hospitalizations for “ambulatory-care sensitive” (ACS) conditions are considered preventable, as these are physical health conditions that can potentially be treated safely in a NH. Despite concern about the frequency of these events the prevalence and risk factors for such hospitalizations among residents with and without serious mental illness (SMI) and/or dementia have not been investigated. This study examined the importance of risk factors for hospitalization of NH residents with ACS conditions during FY 2003-2006. Investigators merged Medicaid and Online Survey Certification and Reporting (OSCAR) data for 72,251 Medicaid-enrolled NH residents in 647 nursing homes in Florida. We identified 10,091 ACS hospitalizations (18.5% of all hospitalizations). In a fully-adjusted proportional hazard regression, younger age, non-White race, dementia and serious mental disorder were associated with a greater risk of ACS hospitalization. In addition, residents with a diagnosed mental disorder and no dementia incurred relatively high expenditures for ACS hospitalizations. Among facility characteristics, participants from for-profit facilities, facilities that were not a member of a chain, facilities with more Medicaid recipients and facilities of smaller size (less than 120 beds) had increased risk of ACS hospitalizations. Attention to the identified predictors of hospitalization for ACS conditions, which are potentially preventable, could reduce the risk and cost of these hospitalizations among Medicaid-enrolled nursing home residents. The need to reduce unnecessary hospitalization will become only more urgent as the population ages and healthcare expenses continue to escalate.

THE NEO FIVE FACTOR MODEL AS A PREDICTOR OF SUICIDE RESILIENCE IN OLDER ADULTS

W. Meyer, M. Marty, D. Segal, *Psychology, University of Colorado @ Colorado Springs, Colorado Springs, Colorado*

In 2005, older adults (65+ years) completed 14.3 suicides per 100,000 people (CDC, 2007). Since personality can impact various aspects of thought and behavior, exploring interactions between personality and reasons for living in older adults is worthwhile. Previous research found a negative relationship between depression and extraversion in older adults (Useda et al., 2004). The present study examined relationships between personality and suicide resilience. Participants (N = 109, M age = 71.21 years; range = 60-95 years) completed the Reasons for Living Inventory (RFL) and the NEO Five-Factor Inventory (NEO-FFI). Correlational analyses revealed positive relationships between extraversion and survival and coping beliefs ($r = .50$) and total reasons for living ($r = .36$). Neuroticism was positively related to fear of suicide ($r = .40$) and negatively related to survival and coping beliefs ($r = -.31$). Openness was negatively related to moral objections ($r = -.51$). Agreeableness was positively related to survival and coping beliefs ($r = .43$). Conscientiousness was positively related to survival and coping beliefs ($r = .44$) and total reasons for living ($r = .34$). Multiple regression revealed the NEO-FFI predicted RFL total score $F(5, 80) = 4.0, p < .01$. The overall model with gender accounted for 21% of the variance in reasons for living. Extraversion made the strongest contribution. Consistent with previous findings (Useda et al. 2004), results indicated extraversion was the most powerful predictor of suicide resilience. The significant effect of conscientiousness on RFL was unexpected and warrants replication.

WHAT INFLUENCES SUBJECTIVE WELL-BEING IN THE CHINESE ELDERLY? THE ROLE OF RESOURCES AND ACTIVITY

J. Li, B. Dai, Z. Wu, *Institute of Psychology, Chinese Academy of Sciences, Beijing, China*

This study examined the role resources and activity play for subjective well-being (SWB) in the Chinese elderly with a hypothesis that active participation is a mediator between stable resources and perceived well-being in later life. A national-wide representative Chinese sample of 3795 older adults (aged 60-101 years) were required to fill out Memorial University of Newfoundland Scale of Happiness (MUNSH) as outcome measure of SWB. Subjective health condition as personal resource, economic status and family relations as social resources and amount of activity were compiled from scores on self-design items. The results showed that all resource and activity factors were significantly related to SWB with a descending order of family relations, economic status, amount of activity and subjective health condition. The authors constructed a structural model in which subjective health condition, economic status, family relations and amount of activity all directly predict SWB, and moreover the effects of resources are mediated through active participation. Data were found to provide a satisfactory fit index of the model ($GFI=0.97$, $TLI=0.94$, $CFI=0.96$, $RMSEA=0.06$). Resources explained 33% of the variance in activity, and the total model explained 69.5% of the variance in SWB. The findings provide empirical backing for the assertion that health, participation and security are three important pillars for active aging. The most influential role of family relations for SWB was discussed in the context of Chinese culture compared to the western.

PREVALENCE AND CORRELATES OF SUICIDALITY IN COMMUNITY-DWELLING OLDER ADULTS: THE NATIONAL COMORBIDITY SURVEY REPLICATION

A.L. Byers^{1,2}, M.L. Bruce³, K. Yaffe^{1,2,4}, *1. Psychiatry, University of California, San Francisco, San Francisco, California, 2. San Francisco Veterans Affairs Medical Center, San Francisco, California, 3. Weill Cornell Medical College - Psychiatry, White Plains, New York, 4. University of California, San Francisco - Neurology and Epidemiology and Biostatistics, San Francisco, California*

Purpose: Little is known about suicide-related behavior in older adults. We determined nationally representative estimates of the prevalence and correlates of suicidality among older community-dwelling adults. **Methods:** The data are from a population-based probability sample, the National Comorbidity Survey Replication (NCS-R), a study of 9,282 participants 18 years and older. For this analysis, we examined 1,372 participants aged 55 and older [41% 55-64; 33% 65-74; 26% 75+]. Suicide-related behavior was assessed by self-report, including serious thoughts, plans, and attempts (i.e., gesture or intent to die). Mood and anxiety disorders were assessed by the WMH-CIDI, using DSM-IV criteria. Analyses included frequency measures and logistic regression using weights and complex design-corrected statistical tests. **Results:** Of respondents, 9.5% reported lifetime ideation, 2.4% a plan, 1.3% a gesture, and 1.2% an attempt (with intent to die). Most suicidality occurred in the youngest cohort (55-64), significantly declining with age ($p < 0.05$). Besides age, significant correlates included education, marital status, race/ethnicity, and regional differences. Gender differences were only significant for lifetime suicide attempts, where women had greater odds than men ($OR=4.8$, 95% $CI=1.5-15.0$). Of psychiatric disorders, dysthymia ($OR=6.6$, 95% $CI=3.7-12.0$), major depressive disorder ($OR=6.0$, 95% $CI=4.7-7.6$), and posttraumatic stress disorder ($OR=8.7$, 95% $CI=5.6-13.5$) had the highest association with suicide-related behavior. **Conclusions:** This is the first comprehensive study of prevalence rates of suicidality in older Americans based on a national sample. Sociodemographic and DSM-IV mood and anxiety disorder correlates of the occurrence of ideation, plans for committing suicide, and lethality of suicide attempts are discussed.

PROVISION OF MENTAL HEALTH SERVICES IN NURSING HOMES

V.A. Molinari¹, D.A. Chiriboga¹, L. Branch¹, S. Cho², K. Turner¹, J. Guo¹, K. Hyer¹, 1. *University of South Florida, Tampa, Florida, 2. CUNY/NYC College of Technology, New York City, New York*

Objectives: To examine mental health services provided to a whole population of newly admitted Florida nursing home (NH) residents (N=1049) over a one-year period. **Design:** Secondary analyses of selected variables from Medicaid and the On-line Survey and Certification and Reporting System. **Results:** Within 3 months of admission, nearly three quarters of all new NH residents received some form of mental health treatment. Approximately 12% received nonpsychopharmacological mental health care. On the other hand, 72% of new residents received at least one psychoactive medication, and more than 15% were taking four or more psychoactive medications. Most of those being treated with psychoactive medication had not received psychopharmacological treatment the year before admission (58%), and had not received a psychiatric diagnosis the year preceding admission (84%). Receipt of psychopharmacological and non-psychopharmacological mental health services was associated with younger age. **Conclusion:** Results expand on past research by identifying an increase in the amount of psychoactive medications prescribed to NH residents, a lack of prior psychiatric treatment and diagnoses for those currently receiving psychoactive medications, and only limited provision of non-psychopharmacological mental health care.

ASSESSING ANXIETY IN NURSING HOME RESIDENTS WITH DEMENTIA

L.S. Hess, S. Shah, S. Meeks, *Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*

Anxiety and agitation are common in older adults with dementia. Anxiety is often manifested in people with dementia as agitation, but agitation can be caused by multiple problems, increasing both the importance and the difficulty of assessment. Appropriate anxiety assessment instruments for older adults with dementia will result in more accurate assessment and improved direct treatment and symptom management. The purpose of this pilot study is to better understand anxiety in older adults with dementia residing in nursing homes and to examine the factor structure of the Rating Anxiety in Dementia (RAID) scale as used with this population. Nursing home residents age 65 and older with a dementia diagnosis as indicated in their charts and their primary Certified Nursing Assistants (CNAs) completed the RAID at baseline. At one-week follow-up, residents and CNAs completed the RAID. Preliminary reliability analyses for residents' responses (n=10) to the RAID indicate Cronbach's $\alpha = .496$, suggesting inadequate internal consistency when the RAID is administered to residents. Separate reliability analyses for CNAs' responses (n=17) to the RAID demonstrated acceptable internal consistency with Cronbach's $\alpha = .794$. These initial findings suggest there may be better reliability when administering the RAID to CNAs. When the sample is completed in August 2009, statistical analyses will include a larger sample size (N=100) from which the RAID's internal consistency, test-retest reliability, and correspondence between CNA and resident forms will be examined. Also, factor analyses will be conducted to explore and confirm item loadings onto factors representing anxiety and agitation within the RAID.

SESSION 170 (SYMPOSIUM)

MENTORING ACROSS THE GEROPSYCHOLOGY CAREER: PERSPECTIVES FROM THE EXPERTS

Chair: J.A. Zimmerman, *Department of Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky*
Discussant: A. Fiske, *West Virginia University, Morgantown, West Virginia*

Clinicians, researchers, medical professionals, and faculty alike generally find themselves as both mentor and mentee at some point throughout their training and professional careers. Being a mentor to students and junior colleagues can be a rewarding experience, although at times finding the best mentoring approach for the mentee's level of development can be challenging. Likewise, individuals in the mentee role often struggle to find appropriate mentors who can provide support, guidance, and information to help them navigate their current professional role. The goal of the current symposium is to provide information on mentoring, for mentors and mentees alike, from expert mentors in the field of geropsychology. Presenters will offer their perspectives on mentorship at various levels of training. Bob Knight, Ph.D. will discuss mentoring in the context of clinical psychology doctoral training, emphasizing a student-centered approach. Michele Karel, Ph.D. will draw on her role as a geropsychology internship and postdoctoral training supervisor to discuss issues that arise as students transition into independent professionals. Peter Lichtenberg, Ph.D., will discuss mentoring for junior faculty members, focusing on the tasks expected of junior faculty members and what a mentor to junior faculty has to offer. Keith Whitfield, Ph.D., will discuss the role of diversity in mentor-mentee relationships, providing guidance for both mentors and mentees when the mentoring involves members of ethnic minorities and other disadvantaged groups. Amy Fiske, Ph.D., of the Society of Clinical Geropsychology Mentoring Committee, will serve as discussant.

MENTORING SPECIAL POPULATIONS

K.E. Whitfield, C.L. Edwards, *Psychology and Neuroscience, Duke University, Durham, North Carolina*

Mentorship is critical for career development of junior scholars as well as seasoned professionals. Members of special populations are at increased risk of information shortfalls. In addition to the usual features of mentor/mentee relationships, there is special knowledge and skills needed to successfully mentor members of ethnic minorities and other disadvantaged groups. Midlevel and senior scientists need specialized mentoring on how to transition to the next levels of their career and on how to mentor the next generation of scientists. This presentation will focus on what mentors need to know to serve the needs of ethnic minorities in the new information age; how to navigate cross-group mentor/mentee relationships (e.g., cross race, cross gender); what mentees need to know in the selection of mentors; and how to be a good mentee. The pit falls of peers will also be discussed. The presentation will also discuss potential sources for mentorship opportunities.

MENTORING IN CLINICAL GEROPSYCHOLOGY AT THE DOCTORAL PROGRAM LEVEL

B.G. Knight, *U of Southern California, Los Angeles, California*

Mentoring at the doctoral program level includes assuring that the student gets the appropriate knowledge base, research experiences, and basic clinical skills to prepare for a career in clinical geropsychology. A student-centered approach to mentoring follows the student's career goals and life circumstances and builds on existing strengths. Challenges include guiding students to be confident in as yet unrecognized strengths and to become aware of and change unconscious ageism. Helping students publish, develop national connections in geropsychology, and think broadly about career options are key goals at this level of training.

THOUGHTS ON MENTORING PREDOCTORAL PSYCHOLOGY INTERNS AND POSTDOCTORAL FELLOWS

M.J. Karel, 1. VA Boston Healthcare System, Brockton, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts

Psychology internship and fellowship training years represent critical developmental and transitional times for clinical and counseling doctoral trainees. Interns and Fellows typically work with supervisors for one year, or less, yet may seek mentoring around a range of important professional developmental issues. These issues include finding one's voice in transitioning from a student to an independent professional psychologist, questions about career development (what do I really want to do and how shall I get there?), and concerns about work-life balance. This talk will address the experiences of one geropsychology internship and postdoctoral training supervisor, as she has navigated the roles of supervisor, teacher, mentor, role model, colleague, and friend, at the same time as she herself has been developing from an early- to mid-career psychologist. Comments will include reflection on feedback from past students, and colleagues, about mentoring at internship/postdoctoral levels, and consider that mentors also benefit from mentorship.

MENTORING JUNIOR FACULTY

P.A. Lichtenberg, Wayne State University, Detroit, Michigan

Junior faculty are full fledged members of the academy, with all of the credentials and training that can allow them to succeed as independent scholars. Nevertheless, mentoring can be especially impacting and meaningful for junior and senior faculty alike. Based on my experiences as a mentee and a mentor, unique aspects of junior faculty mentoring will be explored. Junior faculty undergo a major transition; from student to colleague. The ways in which they evaluate themselves and their progress changes dramatically. A mentor to junior faculty can offer practical, strategic and emotional guidance. Major tasks for the mentor include providing empowerment, support, a review of the fundamentals of an academic job and strategic decision making. Enhancing a junior scholar's comfort in charting their own research trajectory, as well as focusing on ways the junior scholar can connect with others in the field can assist with increased confidence and productivity.

SESSION 175 (SYMPOSIUM)

PERSON-ENVIRONMENT FIT: AN IMPORTANT EVALUATIVE DIMENSION FOR PRODUCTIVE AGING IN THE WORK CONTEXTS - FIRST RESULTS FROM THE DEMOPASS PROJECT

Chair: U.M. Staudinger, Jacobs Center, Jacobs University Bremen, Bremen, Germany

Discussant: R. Kanfer, Georgia Institute of Technology, Atlanta, Georgia

Demographic aging in modern industrialized nations has raised the question whether an aging workforce represents a risk for the productivity of individual companies and the economy as a whole. In the present symposium, first results from a large-scale interdisciplinary study of the aging workforce, called Demopass (demography + passung (engl. fit)), are presented. The central tenet of the study is that not only attitudes and competences of the employees, team attitudes, or attitudes of supervisors, and management strategies as such are important predictors for productivity and employees' health but also how those fit together. Using a multi-level data set, the studies presented in the Symposium provide examples for how the person-environment fit has predictive power over and above characteristics of employees, teams and management strategies. Thus, the symposium presents evidence on the relevance of person-environment fit for the productivity and health of older employees for the following areas: the fit between workplace requirements and workers' competencies had detrimental effects in for older workers but not only for them (Trautmann, Voelcker-Rehage &

Godde), the effect of the need-supply fit on training participation (Stamov-Rossnagel), the effect of the fit between self-other performance evaluations on training opportunities (Schömann, Baron), the effect of the fit between team characteristics and dispositional goal orientations (approach-avoidance) (Heidemeier), and the fit between age stereotypes and individual age attitudes proved to be predictive of work-related outcomes (Bowen & Staudinger). For all areas under study significant effects of the fit/misfit were identified. Results are discussed by Ruth Kanfer, an expert in the area of aging workforce management.

FIT FOR TRAINING? EFFECTS OF AGE-DIFFERENCES IN PERSON-ENVIRONMENT FIT STYLE ON TRAINING PARTICIPATION

C. Stamov-Rossnagel, Jacobs Centre on Lifelong Learning, Jacobs University, Bremen, Germany

Research on person-environment fit has reliably demonstrated associations of fit with attitudinal outcomes. Much less evidence is available, however, on the effects of fit on behavioral measures. Moreover, age-related differences in fit perceptions have only rarely been studied. Recent evidence suggests that the relative contributions of different fit dimensions might differ with worker age, creating age-specific "fit styles". In a survey of 746 workers from three companies in the automotive industry, we therefore assessed the contributions of workers' needs-supplies fit and demands-abilities fit perceptions on training-related goals and on training participation. To assess the role of age differences, we recruited workers from 18-65 years old. Perceived needs-supplies fit emerged as a predictor of training participation regardless of worker age, whilst demands-abilities fit was a strong predictor only for workers in the 51-65 years age bracket. Our results might be used to inform research into age-differentiated motivational interventions for job-related training.

FIT BETWEEN WORKERS' COMPETENCIES AND JOB DEMANDS AS PREDICTOR FOR JOB SATISFACTION AND PRODUCTIVITY OVER THE WORK CAREER

M. Trautmann, C. Voelcker-Rehage, B. Godde, Jacobs Center on Lifelong Learning, Jacobs University, Bremen, Germany

A fit between workers' competencies and demands clearly is a precondition for good job performance. A misfit may hamper job satisfaction and health and thus be a reason for less productivity. Reports on adaptive competency and work demands in sensory, motor, and cognitive abilities, and work quality were obtained from 105 employees of a production company and their respective supervisors. Based on these assessments, employees 30 years and younger, but not older workers, were found to be overly challenged by the complexity of their tasks. Furthermore older workers' (> 45 yrs.) abilities were strongly underestimated by their supervisors as compared to the self-ratings. Both types of misfit were strongly negatively correlated with work satisfaction. We conclude that a fit between work demands and self and supervisor ratings of adaptive competencies has to be constantly evaluated to maintain healthy and productive employees.

SITUATIONAL INFLUENCES ON ACHIEVEMENT GOALS: IMPLICATIONS FOR MANAGING AN AGING WORKFORCE

H. Heidemeier, Jacobs Center on Lifelong Learning and Institutional Development, Bremen, Germany

This study examines the influence that trait and state aspects of goal orientation have on learning self-efficacy. Dispositional learning- and performance-goal orientations had direct and mediated effects on learning self-efficacy. Two classes of state achievement goals (learning-approach and learning-avoid) acted as mediating states. The assumption is that depending on the fit or misfit between dispositional goal orientations and team characteristics, psychological consequences for the individual employee differ. Based on a sample of 81 work teams (742 employees, age: 21 to 62), multivariate multilevel regression con-

firmed that dispositional goal orientations interacted with team characteristics (competition, helping behavior, goal interdependence) in predicting achievement goals (states). That is, team characteristics and individual goal orientations were identified as relevant dimensions of a person-environment fit. The maladaptive consequences of learning-avoid achievement goals (state) were stronger among older adults. Implications of these findings for managing an aging workforce are discussed.

EXPLANATIONS FOR FITS AND MISFITS IN TRAINING EXPECTATION AND ITS CONSEQUENCES FOR THE AGEING WORKFORCE

S. Baron, K. Schömann, *Jacobs University Bremen, Bremen, Germany*

A better understanding of the influence of direct supervisors is essential for improving training participation of older employees. Since supervisors make the final decision for or against participation in training courses they have an active role in promoting training. However, decisions about whom to send to further training often relies on expected training benefits, employees' productivity, and career opportunities. We expect that age serves as a screening device to sort out individuals who are apparently 'not suitable' for training. Our dataset allows an integrated analysis of individuals' attitudes toward training and personalized appraisals by their supervisors. We develop a taxonomy of fits/misfits in three fields important for participation: the evaluation of employees' productivity, learning efficacy and the willingness to learn. The results of multinomial logit models of two levels show that the likelihood to be evaluated worse than colleagues increases with age, although individuals evaluate themselves better than colleagues.

AGING INTO THE MOLD: AGING WORKERS AND AGE STEREOTYPES WITHIN COMPANIES

C. Bowen, U.M. Staudinger, *Jacobs Center on Lifelong Learning and Institutional Development, Bremen, Germany*

Demographic change and an aging workforce have rendered the fit between employees, who age within a company, and the aging attitudes and age stereotypes within the company particularly important. We introduce the construct of *psychological age climate*, that is, employees' perceptions of the age stereotypes about older workers within their organization. Using multi-level data from two companies with a total of 355 employees nested in 36 work teams, we demonstrate the validity of the Psychological Age Climate Scale (PACS-10) (Noack, Bowen, & Staudinger, 2009) and demonstrate how the fit between aging employees, their own aging attitudes, and the age stereotypes salient within a company predict important job-related outcomes.

SESSION 180 (PAPER)

STIGMA AND "ISMS" ABOUT AGING

ATTITUDES TO AGEING AND THE EXPERIENCE OF AGEISM: EXPLORING THE VIEWS OF MID-LIFE AND OLDER ADULTS

O. Ann, J. Lynam, N. Gregory, P. McParland, *Nursing, Dundalk Institute of Technology, Dundalk, Ireland*

Introduction: Attitudes to ageing and the experience of ageism have both been shown to influence older people's quality of life and well-being. Surprisingly, no studies have examined attitudes to ageing among mid-life and older adults in Ireland. The aim of this study is to examine mid-life and older adults' attitudes to their own ageing, and to determine the prevalence and consequences of ageism on health and well-being. Methods: Participants are community based mid-life (aged 50+ years) and older adults (n=1000). Measures include the General Attitudes to Ageing Survey (GAAS), the Expectations Regarding Aging Survey (ERA-12), and the newly developed Experiences of Ageism Survey. Well-being was assessed using measures of pathology and well-being including the Hospital Anxiety and Depression Scale (HADS-A),

and psychological well-being (Ryff, 1998). Results: Results to date show that the measures have good psychometric properties. Furthermore, results indicated significant associations between attitudes to ageing and the experience of ageism, i.e. people who had the most negative attitudes about their own ageing, were those who perceived others as having negative towards them. Attitudes were also associated with poorer psychological health and well-being. Conclusion: Attitudes to ageing can impact adversely on health and well-being. The current study suggests that attitudes to ageing can be understood in the context of wider social relationships and perceptions about the ways others view the individual. Further research in this area can promote optimal well-being and quality of life for more people.

DISENTANGLING INDIVIDUAL VIEWS ON AGING AND HEALTH IN LATER LIFE: FINDINGS FROM A 12-YEAR LONGITUDINAL STUDY

S. Wurm, O. Huxhold, B. Schüz, C. Tesch-Roemer, *German Centre of Gerontology, Berlin, Germany*

Background: It is a long-standing assumption in aging research that individuals' attitudes towards their own aging influence the way people age. For quite some time, there was only sparse empirical evidence for this claim, but recent studies have shown that a positive view on aging affects health in later life. Cross-sectional and unidirectional studies, however, cannot rule out that individual views on aging have been formed by health experiences, which in turn causes the observed relations. Methods: This study tries to disentangle the multidirectional nature of the view on aging-health relation by applying dynamic lead-lag models to longitudinal data of the German Ageing Survey covering 12 years of time and three waves of measurement (n = 1000). Results: First findings suggest that both directions of causality are important. The impact of individual views of aging on health, however, seems to be stronger than the reciprocal effect, thus pointing to the potential of individual views on aging as target in health promotion programs in older people.

YOUNG ADULT ATTITUDES ABOUT ALZHEIMER'S DISEASE

T. Lundquist, R. Ready, *University of Massachusetts Amherst, Williamstown, Massachusetts*

The current generation of young adults will be greatly affected by Alzheimer's disease (AD), but little is known about their attitudes toward persons with Alzheimer's disease. The current study assessed attitudes about Alzheimer's disease in young adults with varying levels of contact with the disease. It was hypothesized that participants who had a high level of contact with someone with Alzheimer's disease previously, in the form of a close relationship, would report more positive attitudes than participants with a low level of contact or no contact. Results revealed that participants who had a high level of contact with persons with AD were more willing to make personal sacrifices for Alzheimer's disease than those who had no contact. Younger persons may realize a greater need to support persons with Alzheimer's disease if they have been personally affected by the disease through a close relationship.

INCREASING AWARENESS AND BUSTING STIGMA ABOUT OLDER ADULT DEPRESSION AND SUICIDE

D. Fuentes¹, S. Jaccard², D. Waugh², S. Shepherd^{2,3}, B. Reinhardt², M.C. Halpain³, 1. *School of Social Work, University of Southern California, Los Angeles, California*, 2. *NAMI San Diego, San Diego, California*, 3. *University of California, San Diego, San Diego, California*

In the United States, approximately 20% of older adults in the community and nearly 50% in nursing homes suffer from depression (APA, 2003). Older adults have the highest suicide rates of any age group, and depression has been found to be a leading risk factor (CDC, 2009; Conwell et al, 2000). Considering that older adults comprise 12.5% of the U.S. population (US Census, 2007), depression and suicide among

this growing population is of great concern. Yet, stigma, lack of awareness of depression symptoms, and the manner in which older adults perceive, present or express depression makes the detection and treatment of depression among older adults challenging (NIH, 2007). In San Diego, California, an educational video titled *More than Just the Blues* was developed by an academic-community partnership to increase community awareness and decrease stigma surrounding older adult depression and suicide. Using the principles of Community-based Participatory Research (Israel et al., 2001; Viswanathan et al., 2004), the Senior Mental Health Partnership has developed and utilized this video to spread the message that depression is not a normal part of aging, it is an illness like any other, and that there is help. Through personal testimonies from older adults with depression, their families, survivors of suicide, and mental health professionals depicted in the video, the audience learns about signs and symptoms of depression. This session provides process and outcome results from the development and utilization of this video as a tool to increase individuals' awareness of older adult depression and suicide and reduce related stigma.

SESSION 185 (SYMPOSIUM)

SUCCESSFUL AGING: LOOKING BACKWARD, LOOKING FORWARD

Chair: R.A. Pruchno, *New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey*

Discussant: L. Poon, *University of Georgia, Institute of Gerontology, College of Public Health, Athens, Georgia*

The term "successful aging" has been in our vernacular since the days of Cicero and has featured prominently in gerontological studies since 1987 when Rowe and Kahn published their landmark paper. Yet a host of conceptual and methodological problems remain regarding what successful aging is, who defines it, and how it should be measured. The most significant debate surrounding the concept of successful aging has centered around the extent to which it is objective; hence identified externally according to specific criteria, or subjective, based on individual perceptions. The Baby Boom generation's size alone brings the quest for successful aging to the fore of policy debates. The objectives of this session are to examine state-of-the-art issues regarding successful aging and to identify productive directions for future studies. A panel of scholars from disciplines including psychology, sociology, nursing, and medicine will examine the history of the concept, its measures, and salient findings. We will discuss theoretical models about successful aging that have developed from within each discipline and identify ways to increase cross-discipline dialogue. Our conversation will focus on the extent to which successful aging is conceptualized as objective, subjective, static or process-based, and the degree to which it is modifiable. Presentations will highlight the importance of increasing communication between scientists from different disciplines as they examine how age, health, and functional ability affect the extent to which people are viewed as aging successfully. Panelists will identify research questions and future directions for scholars of successful aging to pursue

SUCCESSFUL AGING: THE MACARTHUR FOUNDATION LEGACY

J. Rowe, *Columbia University Mailman School Public Health, New York, New York*

The term 'successful aging' (SA) has influenced the scientific literature for over 50 years. In 1984 The MacArthur Foundation established a National Research Network on Successful Aging. The major goals of the network were to identify the characteristics that were predictive of SA, determine the prevalence and course of SA over time, and elucidate the degree to which the determinants of SA were inherited. Several criticisms of the Network's formulation of SA have appeared and will be addressed. The Network, however, has had a significant impact

on the field. There have been hundreds of articles and scores of books on this topic as well as regular conferences and sessions at National meetings. The terms 'successful aging, Rowe and Kahn,' have received over 400,000 hits on Google and the broader term 'successful aging' has received millions. Eight universities have established formal research centers dedicated to the study of successful aging.

SUCCESSFUL AGING: IN THE EYE OF THE BEHOLDER OR NOT?

R.A. Pruchno¹, M. Rose², M. Wilson-Genderson¹, F.P. Cartwright¹, 1. *New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey*, 2. *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

Distinctions between people characterized as aging successfully according to objective and subjective criteria are examined using data from 5,688 persons aged 50-74 living in New Jersey. Four groups of people are contrasted using ANOVAs: (1) not successful according to both objective and subjective criteria (Unsuccessful), (2) successful according to subjective but not objective criteria (Resilient), (3) successful according to objective but not subjective criteria (Disenchanted), and (4) successful according to both criteria (Successful). Results revealed that the Unsuccessful were most likely to be divorced, have the lowest levels of social support, and highest rates of smoking; the Resilient were oldest, most likely to be female, and Black; the Disenchanted had the highest level of education; and the Successful were most likely to be married, and to exercise. Findings are used to suggest new conceptual directions for understanding successful aging.

SUCCESSFUL AGING AS PROCESS VS. PRODUCT: THE ROLE OF AGENCY

E. Kahana¹, B. Kahana², 1. *Sociology, Case Western Reserve, Cleveland, Ohio*, 2. *Cleveland State University, Cleveland, Ohio*

This paper traces the development of the Preventive and Corrective Proactivity (PCP) Model of Successful Aging (Kahana & Kahana, 1996) from initial formulation to recent elaborations. This model offers a process based orientation to successful aging, integrating the stress paradigm with the self regulation literature. The PCP model posits the important influence of proactive behaviors in addition to external resources and personal dispositions as factors which ameliorate adverse effects of normative stressors in late life, and thereby facilitate successful aging. Temporal and spatial contexts of successful aging were articulated subsequent to the original formulation, recognizing structural influences on human agency (Kahana & Kahana, 2003). Emergent adaptations, including technology use and health care consumerism were next incorporated in the model (Kahana, Kahana, & Kercher, 2003). Our latest formulation of Targeted Proactivity (TAD) (Kahana & Kahana, in press) specifies the value of tailoring proactive behavior to adaptive tasks posed by normative stressors.

SUCCESSFUL AGING IN THE CONTEXT OF NURSING-WHO, WHAT AND HOW

M.T. Flood, *School of Nursing, UNC Charlotte, Charlotte, North Carolina*

Although the phenomenon of successful aging has interested researchers for decades, it has caught the attention of nurse scientists more recently than this. The speaker's presentation will provide an overview of the research and theoretical literature on successful aging from the nursing perspective. Commonalities and differences in successful aging conceptualizations within nursing and between nursing and other disciplines will be presented, as well as an overview of findings from research on successful aging done by nurse scientists. Key questions about successful aging and the role of nurses will be discussed as well as future needs and directions related to research and clinical practice.

SESSION 190 (SYMPOSIUM)

THERE'S NO PLACE LIKE HOME: MEASURING CULTURE CHANGE IN NURSING HOMES

Chair: M.J. Bott, *School of Nursing, University of Kansas, Kansas City, Kansas*

Discussant: L. Grant, *University of Minnesota, Minneapolis, Minnesota*

Innovative models for living in nursing homes that focus on quality of life for residents and quality of work for staff are emerging. Models of culture change also referred to as resident-focused or resident-centered care are being implemented. Culture change focuses on creating "homes" for residents within the nursing home environment. Residents living in their "home" have choices about their daily activities, develop relationships with the staff that care for them, and maintain independence in decision making. Staff are empowered to make decisions about their work life and ways to improve resident care. Because of their interest in Kansas nursing homes adopting culture change models, the Kansas Department on Aging commissioned our interdisciplinary team of nurses, a biostatistician, an economist, and social scientists to develop, refine, and test the psychometric properties of a measure of culture change, the Kansas Culture Change Instrument (KCCI). The purpose of this symposium is to describe the development of the KCCI and the relationships among culture change with quality of care. The first presentation will include a description of the culture change movement that includes definitions along with different approaches to culture change. The second and third presentations will describe the development of the KCCI including pilot testing and the results of the psychometric testing. A biostatistician will follow with a description of a new method, integrated analysis, for combining expert data with participant data. Lastly, an economist will report the findings about the relationships of the elements of culture change with quality of care.

CULTURE CHANGE: WHAT IT IS AND IS NOT

A.M. Becker, V. Coffland, M.J. Bott, *School of Nursing, University of Kansas, Kansas City, Kansas*

The size of the elderly population has grown over the last two decades and will continue to rise rapidly in the coming years. The number of older adults residing in nursing homes is expected to increase from 1.6 million in 2000 to 4.6 million in 2030. Despite increased nursing home oversight in recent decades concerns about quality of care still exists in nursing homes. Culture change began as a grass roots movement in the 1990s and is an effort to make nursing homes less like institutions and more like homes while maintaining quality of life for those who live and work there. Core values include increasing resident choice and autonomy, staff empowerment, decentralized decision making, and creating a homelike setting. The purpose of this presentation is to provide an overview of what constitutes culture change including the Commonwealth Fund definition and different models for culture change.

DEVELOPMENT OF A NURSING HOME CULTURE CHANGE INSTRUMENT

V. Coffland, D.K. Boyle, A.M. Becker, M.J. Bott, *School of Nursing, University of Kansas Medical Center, Kansas City, Kansas*

The purpose of this study was to develop and refine an instrument of culture change. Following conversations with experts and a literature review for culture change measures, a decision was made to construct and test items for staff and leader versions of a culture change instrument. Using the 2006 Commonwealth Fund definition and 25 care practices from the Colorado Foundation for Medical Care as the theoretical framework, items for six culture change domains were proposed. Six content experts reviewed 85 items: 54 items exceeded the content validity index of 0.78; 20 items were deleted; 12 items were revised, and 23 new items were added. Staff and leadership versions of the tool were pilot tested in 12 nursing homes. Initial reliabilities across the seven

subscales were 0.75-0.96 (leaders) and 0.79-0.94 (staff). Correlations ($r = .17 - .75$) among the 7 subscales and known culture change measures provided beginning evidence of validity.

PSYCHOMETRIC TESTING OF THE KANSAS CULTURE CHANGE INSTRUMENT (KCCI)

M.J. Bott, B. Gajewski, D.K. Boyle, R.H. Lee, A.M. Becker, V. Coffland, N. Dunton, *School of Nursing, University of Kansas, Kansas City, Kansas*

The purpose of this study was to examine the psychometric properties of the leader and staff versions of the Kansas Culture Change Instrument (KCCI) that was developed using the Commonwealth Fund definition and the care practices established by the Colorado Foundation for Medical Care. Leaders ($n = 1,596$) and staff ($n = 2,260$) from 223 Kansas nursing homes (64% response rate) provided data on seven subscales of culture change. Across the seven subscales, coefficient alphas ranged from .74 - .94 (staff) and .75 - .94 (leaders). Confirmatory factor analysis provided evidence of validity of the internal structure with adequate model fit ($\chi^2 = 8,876.27$, $df = 1,802$, $p \leq .001$; CFI = 0.89; RMSEA = 0.04). Scores across the seven subscales were significantly ($p < .05$) higher between homes who had extensively implemented culture change and homes with limited culture change. Evidence of reliability and validity of the KCCI was demonstrated.

INTEGRATED ANALYSIS OF CONTENT AND CONSTRUCT VALIDITY OF A CULTURE CHANGE INSTRUMENT

B. Gajewski, V. Coffland, D.K. Boyle, M.J. Bott, *University of Kansas Medical Center, Kansas City, Kansas*

Psychometric evaluation of instruments entails evidence based on content and internal structure. Content validity evidence includes experts' evaluations of the extent to which items match the definition of the construct. Internal structure evidence includes factor analytic studies and examination of item interrelationships based on data from participants. The experts' and participants' data traditionally are analyzed separately. We propose to integrate the experts' and participants' data seamlessly to establish validity evidence. The challenge is placing both on the same metric. A framework for accomplishing this goal is via a fully Bayesian model that treats the expert data as a prior distribution that is updated to a posterior distribution using participants' data. The approach is applied to an instrument designed to measure nursing home culture change. The purpose of the presentation will be to demonstrate the method and show how this results in more stable estimates of usual psychometric parameters.

OUTCOMES OF NURSING HOME CULTURE CHANGE

R.H. Lee^{2,1}, N. Dunton^{1,2}, B. Gajewski^{2,1}, D.K. Boyle¹, V. Coffland¹, A.M. Becker¹, M.J. Bott¹, *1. University of Kansas School of Nursing, Kansas City, Kansas, 2. University of Kansas School of Medicine, Kansas City, Kansas*

The purpose of this study was to examine the relationship between the elements of culture change and quality of care in nursing homes. Leaders ($n = 1,596$) in 222 nursing homes in Kansas (63%) provided data. Using two questions from the Kansas Culture Change Instrument (KCCI)—how much had the nursing home been involved in culture change and for how long—three groups of nursing homes were identified: 18% had limited involvement in culture change; 52% had partial involvement; and 30% had extensive involvement. Measures of quality of care included turnover (2007 Medicaid cost reports), deficiencies (OSCAR), and quality indicators (MDS). The 30% of Kansas nursing homes with extensive involvement in culture change had below average turnover. Deficiencies were less common in homes with more involvement in culture change. No appreciable differences were noted for Quality Indicators. Implementation of culture change impacted the quality of care in Kansas nursing homes.

SESSION 195 (SYMPOSIUM)

AGING WITH GRACE IN THE HEALTH AGING BODY AND COMPOSITION STUDY

Chair: C. Rosano, University of Pittsburgh, Pittsburgh, Pennsylvania
Discussant: A.B. Newman, University of Pittsburgh, Pittsburgh, Pennsylvania

While aging is a universal human condition that typically leads to cognitive and mobility limitations in older adults, some older adults nevertheless age more gracefully than others. The reasons for these differences in the aging processes have received much attention but they remain largely unexplained. Identifying predictors of aging well is an important public health objective, because of the rapidly increasing number of older adults who are at risk of mobility disability and dementia. This symposium will address these questions using data from the Health, Aging and Body Composition Study (Health ABC). The Health ABC is an ongoing longitudinal cohort study of 3075 medicare-eligible adults in Pittsburgh, PA & Memphis, TN (52% Women, 42% Black) who were 70-79 years old when the study began, in 1997-98. Baseline exclusions were difficulty walking $\frac{1}{4}$ mile, climbing 10 steps without rest, or performing basic ADL and using mobility aids. The participants of this symposium will apply markers of the neuro-muscular system and of vascular and brain integrity, as well as lifestyle measures, to identify older adults who maintain greater physical and cognitive function late in life.

BRAIN INTEGRITY AND GRACEFUL MOBILITY CONTROL IN COMMUNITY-DWELLING OLDER ADULTS

C. Rosano, H. Aizenstein, R. Boudreau, V. Venkatraman, A.B. Newman, University of Pittsburgh, Pittsburgh, Pennsylvania

Through the use of brain magnetic resonance imaging (MRI) techniques, we have discovered important markers of the central control of mobility in community-dwelling older adults. Here we discuss the contribution of brain integrity to physical performance in the context of other health-related factors which are known to be associated with slower gait and in particular we will address intriguing gender differences. Brain integrity is measured through advanced MRI methods that provide highly detailed information of brain volume, cellular integrity, connectivity and blood flow. Specifically, we focus on the integrity of five functional domains, each associated with gait: motor and balance control, visuospatial attention, cognitive processing speed, memory and motor imagery. Mathematical methods based on partial least squares regression method and novel computational paradigms will be discussed to identify and characterize interrelationships between the MRI measures of brain integrity and gait speed, while accounting for covariates.

ACTIVITY AND COGNITIVE PERFORMANCE: IS IT JUST FITNESS? INSIGHT FROM THE COGNITIVE VITALITY SUBSTUDY

E. Simonsick¹, K. Yaffe², M. Carlson³, A.B. Newman⁴, 1. National Institute on Aging, Baltimore, Maryland, 2. University of California, San Francisco, San Francisco, California, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 4. University of Pittsburgh, Pittsburgh, Pennsylvania

Numerous studies find activity participation supports maintained cognitive function; whether this observation simply reflects greater health and capacity for activity engagement has not been adequately tested. In 927 Health ABC CVS participants (50% women, 49% black, mean age 75.2), we found cardio-respiratory fitness positively associated with 3MS score, verbal memory and motor and perceptual speed ($p < .001$). Independent of fitness (and age, sex, race, site, and education), participation in mental activities was positively associated with 3MS score, verbal memory and perceptual speed ($p < .001$); whereas recreational activity was associated with motor speed ($p < .01$). After two years, baseline fitness remained important only for maintaining motor perform-

ance ($p < .01$), with mental activity important for maintaining 3MS score and perceptual speed ($p < .01$ for both). Findings indicate that although cardio-respiratory health may condition cognitive function, engagement in domain specific activities may be critical for maintained cognitive performance in generally well-functioning persons in their seventies.

GREATER CUMULATIVE FUNCTION IN BRAIN, PERIPHERAL NERVES AND MUSCLES IS ASSOCIATED WITH FASTER GAIT: THE HEALTH, AGING AND BODY COMPOSITION (HEALTH ABC) STUDY

E.S. Strotmeyer¹, A.B. Newman^{1,6}, T. Harris², S. Satterfield³, H. Atkinson⁴, K. Yaffe⁵, C. Rosano¹, 1. Epidemiology, University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania, 2. National Institute on Aging, Bethesda, Maryland, 3. University of Tennessee, Memphis, Tennessee, 4. Wake Forest University, Winston-Salem, North Carolina, 5. University of California, San Francisco, San Francisco, California, 6. University of Pittsburgh, School of Medicine, Pittsburgh, Pennsylvania

Gait requires function of multiple physiological systems including the central and peripheral nervous system and the muscles. We investigated if a combination of these systems' function was more strongly related to gait than individual system function in older adults from Health ABC (N=1824). A variable was created using the Digit Symbol Substitution Test (central nervous system), peroneal motor nerve conduction amplitude (peripheral nervous system) and isokinetic quadriceps strength (muscle function): above median for none (severe impairment; 11%), 1 (moderate impairment; 35%), 2 (modest impairment; 39%) or all (minimal impairment; 15%). After multiple adjustments, participants with minimal impairment had 15% faster gait speed during a 20-m usual walk than those with severe impairment (1.21 ± 0.2 vs. 1.06 ± 0.18 m/s; $p < 0.001$). Results suggest that combinations of impairments in the brain, nerves and muscles are common in older adults and that their co-occurrence is more strongly associated with slower gait speed than impairment in one.

LOWER LEVELS OF SUBCLINICAL CARDIOVASCULAR DISEASE ARE ASSOCIATED WITH FASTER GAIT

N. Watson¹, A. Youk², K. Sutton-Tyrrell¹, R. Boudreau¹, E. Simonsick³, D.C. Bauer⁴, K.C. Johnson⁵, A.B. Newman¹, 1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Biostatistics, University of Pittsburgh, Pittsburgh, Pennsylvania, 3. National Institute on Aging, Baltimore, Maryland, 4. University of California, San Francisco, California, 5. University of Tennessee, Memphis, Tennessee

Low ankle-arm index (AAI), a marker of peripheral arterial disease (PAD), predicts disability in older adults. Elevated pulse wave velocity (PWV), a measure of arterial stiffness, increases mortality risk. We used random coefficient models to compare the associations of PWV and AAI with physical function over eight years in 2,066 participants in the Health, Aging and Body Composition Study (mean age (SD) 73.6 (2.8) years, 48.1% men, 37.8% black). Rates of gait speed decline per year were similar across levels of subclinical vascular disease. However, lower PWV and higher AAI were each associated with faster gait speed (m/s) at baseline and throughout the study period: Beta=-0.008, $p=0.03$ for PWV (SD); Beta=0.022, $p < 0.01$ for AAI (SD) after adjustment for demographics, risk factors and comorbidities and exclusion of those with high AAI (> 1.4) (n=26) or noncompressible arteries (n=40). Lower levels of subclinical cardiovascular disease were associated with faster gait in this cohort.

FATIGUE

FATIGUE IN DAILY ACTIVITIES: A NEW MEASURE OF FATIGABILITY FOR OLDER ADULTS

S.L. Murphy^{1,2}, D.M. Smith², 1. *Physical Medicine and Rehabilitation, University of Michigan, Ann Arbor, Michigan*, 2. *VA Ann Arbor Health System GRECC, Ann Arbor, Michigan*

Fatigue is a common problem among older adults and is associated with poor physical function and increased mortality. Unfortunately, measurement of fatigue is problematic because it is multifaceted and may reflect either a subjective experience or performance deficit. Recent initiatives at the National Institute on Aging have attempted to clarify how fatigue can be understood through the concept of "fatigability," the relationship between fatigue and activity performance. The purpose of this paper is to present a new methodology for measuring fatigability in older adults. Sixty female participants [40 with symptomatic knee or hip osteoarthritis (OA) and 20 age-matched controls] wore an enhanced wrist-worn accelerometer that measured physical activity continuously and inputted fatigue levels at several points in a day over the 5 day home period. Fatigability was operationalized as a fatigue increase during a specified time interval after a 'high' activity bout (individually calculated for each participant). Controlling for baseline fatigue, fatigability among OA participants was associated with OA severity, worse vitality scores on the SF-36, and increased body mass index. The results support the preliminary validity of this type of field-based measurement. Future directions for measurement will be discussed.

ORAL HEALTH AND FATIGUE IN OLDER ADULTS

K. Avlund¹, P. Holm-Pedersen², 1. *University of Copenhagen, Copenhagen K, Denmark*, 2. *Copenhagen Gerontological Oral Health Research Center, University of Copenhagen, Copenhagen, Denmark*

Purpose: To analyse whether tooth loss at age 70 is associated with fatigue cross-sectionally at age 70 and with onset of fatigue at 5-, 10-, and 15-year follow-up. Methods: A baseline study of a random sample of 70-year old people born in 1914 and follow-up 5, 10 and 15 years later. A total of 573 nondisabled individuals participated in the study of 70-year-olds in 1984. Oral health was measured according to number of teeth (0, 1-9, 10-19, ≥ 20). Fatigue was measured by the Avlund Mob-T scale on tiredness after performing six mobility activities. Covariates, all measured at baseline, were sex, education, income, comorbidity, and smoking. Results: Bivariate logistic regression analyses showed significant associations between number of teeth at age 70 and fatigue both cross-sectionally (OR=1.96, 95% CI=1.24-3.10) and longitudinally as onset of fatigue at 5-year follow-up (OR=2.47, 95% CI=1.45-4.23) and 10-year follow-up (OR=2.21, 95% CI=1.18-4.14) but not at 15-year follow-up. The associations between having no teeth and fatigue were attenuated by the covariates, but the associations remained marginally significant in most analyses, whereas the odds ratio at 10-year follow-up for onset of fatigue by having 1-9 teeth compared to persons with more than 20 teeth remained strong and statistically significant in all analyses (OR=2.93, 95% CI=1.23-7.02 in the final model). Conclusion: Tooth loss is independently associated with onset of fatigue in old age. The findings indicate that tooth loss may be an early indicator accelerated aging.

TIRED TO DEATH?: FATIGUE IN THE OLDER ADULT POPULATION

C. Cigolle^{1,2}, P. Lee^{3,2}, N. Alexander^{3,2}, Y. Lee³, C. Blaum^{3,2}, 1. *University of Michigan Department of Family Medicine, Ann Arbor, Michigan*, 2. *VA Ann Arbor Geriatrics Research, Education and Clinical Center (GRECC), Ann Arbor, Michigan*, 3. *University of Michigan Department of Internal Medicine, Ann Arbor, Michigan*

Fatigue is prevalent among older adults and predicts disability and mortality. Yet, research is lacking on the epidemiology of fatigue in older age subgroups (young-old vs. oldest-old) and on its possible confounding with depression. We hypothesized that fatigue predicts mortality across the older adult age range and that fatigue is distinct from depression in its outcomes. We analyzed waves 2000-2006 of the Health and Retirement Study, a nationally-representative longitudinal health interview survey. Our study sample included community-dwelling adults ≥ 65 years ($n=10,121$, representing 32.1 million) in 2000. Respondents were asked whether they had severe fatigue/exhaustion as a persistent/troublesome problem in the previous two years. Six-year mortality was determined using HRS data cross-referenced with the National Death Index. Covariates included six demographic characteristics, seven chronic diseases, and indicators of depression. We used Cox proportional hazards models and performed Kaplan-Meier survival analyses. 19.3% of respondents ($n=1,963$, representing 6.2 million) reported fatigue at baseline. Their six-year mortality rate was 40.9%. The association between fatigue and mortality (unadjusted hazard ratio [HR]=2.0, $p<0.0001$) persisted after adjusting for sociodemographic and disease covariates (HR=1.4, $p<0.0001$). Fatigue was associated with mortality across older age subgroups: 65-74: HR=1.5, $p<0.0001$; 75-84: HR=1.4, $p<0.0001$; ≥ 85 : HR=1.4, $p=0.001$. The association of fatigue with mortality persisted in analyses adjusting for self-reported depression, psychiatric problems, and Center for Epidemiologic Studies Depression Scale items. Older adults across the age spectrum who report fatigue have increased mortality. The pathophysiology of fatigue in this population remains incompletely elucidated and not fully explained by disease burden or depression.

PAIN, FATIGUE, AND SLEEP DISRUPTIONS IN OLDER ADULTS WITH OSTEOARTHRITIS

A.L. Horgas¹, M. Marsiske², 1. *University of Florida, College of Nursing, Gainesville, Florida*, 2. *University of Florida, Department of Clinical and Health Psychology, Gainesville, Florida*

Pain, fatigue, and sleep disruptions are common symptoms in adults with cancer and fibromyalgia. Little is known about how these symptoms interact in elders with osteoarthritis (OA), one of the most common chronic conditions in older adults. Thus, the purpose of this study was to investigate, in a sample of elders with OA, (a) the prevalence of self-reported symptoms of pain, fatigue, and sleep disruption, (b) whether these symptoms represent a symptom cluster, and (c) the relationship between these symptoms and cognitive, functional and emotional status. The sample consisted of 79 community-residing adults (mean age = 83 years; 75% female). Participants completed a comprehensive interview to assess self-reported pain (pain presence and intensity; 0-10 NRS), sleep disruption and fatigue (Symptom Checklist), functional status (Barthel Index), cognition (MMSE, Dementia-Rating Scale, and HVLT), and mood (Geriatric Depression Scale). Results indicated that 91% of participants experienced daily pain of moderate intensity (Mean = 4), 61% reported fatigue during the day, 39% reported difficulty falling asleep, and 53% reported waking at night. Pain, sleep disruptions, and fatigue formed a common symptom factor (all factor loadings $> .70$), and factor scores were significantly associated with cognitive functioning (composite of 3 cognition measures) ($r = -.30$) and depression ($r = .48$), but not with functional status. These findings indicate that pain, sleep disruption, and fatigue are common, inter-related symptoms in older adults with OA that are associated with more depression and

lower cognition. Discussion will focus on methodological issues in measuring symptoms and their impact.

SESSION 205 (PAPER)

HEART FAILURE

COGNITIVE IMPAIRMENT AND SELF-CARE IN PATIENTS WITH HEART FAILURE

J. Saczynski^{1,2}, P. Doherty², T. Meyer¹, M. Cabral¹, R.J. Goldberg¹, *1. University of Massachusetts Medical School, Worcester, Massachusetts, 2. Meyers Primary Care Institute, Worcester, Massachusetts*

As many as half of hospital readmissions among patients with heart failure (HF) are potentially preventable with improved self-care practices. However, many patients with HF are cognitively impaired and self-care activities may be more difficult in the setting of cognitive impairment (CI). In a sample that will include more than 100 patients >65 years enrolled in a Heart Failure Wellness Clinic, we are examining the prevalence of CI and the association of CI to three domains of HF self-care: prevention (e.g., diet, medication adherence); symptom monitoring (e.g., weight gain); and management of symptoms (e.g., care seeking behavior). Data on medical history, self-care practices, depression and cognitive function were obtained during a telephone interview. In preliminary data from 40 patients with chronic HF, 30% were impaired in global cognitive function, 65% in verbal fluency and 75% in executive function. Compared to participants who were not impaired, those with impaired global function were, on average, older (67 vs 71 years), were more often male (73% vs 62%) and were more likely to be depressed (19% vs 36%) and to receive assistance with self-care activities (19% vs 73%). Impaired patients also had poorer average performance (measured on a 5-point scale) in all domains of self-care: prevention (2.0 vs. 1.7), symptom monitoring (1.9 vs. 1.7), and management of symptoms (1.8 vs. 1.5). CI represents an important, yet underappreciated, condition in patients with HF, the understanding of which will inform the development of interventions to improve self-care practices that are tailored to patient's cognitive status.

MULTICOMPONENT HOME CARE INTERVENTION FOR HEART FAILURE PATIENTS: AN ACADEMIC CLINICAL PARTNERSHIP

C. Delaney¹, R. Fortinsky², *1. University of Connecticut, Storrs, Connecticut, 2. University of Connecticut Health Center, Center on Aging, Farmington, Connecticut*

Background- Heart Failure (HF) has clinically significant psychological and physical consequences for older persons, and hospitalization for HF is frequent and costly to the Medicare program. As HF is the most common primary Medicare home care diagnosis, there is a critical need to develop home care services that improve health-related outcomes for this population. **Objectives-** The primary aim of this pilot study was to test the feasibility and preliminary efficacy of a nurse-directed home care intervention for Medicare HF patients. **Observed outcomes** were 90-day hospitalization, depressive symptoms, and quality of life (QOL). **Methods-** 24 patients with a primary diagnosis of HF were assigned to the intervention (n = 12) or control group (n = 12) according to geographical location in a large multi-branch Medicare-certified home health agency. Intervention group patients received 8 structured nurse education visits using evidence-based protocols designed in previous trials to teach HF self-management and to prevent/reduce depression, and a telemonitoring system. Control group patients received usual care and telemonitoring. QOL was assessed using the Minnesota Living with Heart Failure questionnaire and depressive symptoms were assessed with Patient Health Questionnaire-9 at baseline and 90 day study endpoint. **Results-** The intervention group demonstrated significantly reduced depressive symptoms and significantly

improved QOL (both p = .05). There was a trend toward lower hospital readmission rates in the intervention group (16% vs. 25%) but this was not statistically significant. **Implications-** A nurse-directed home care intervention can improve QOL, reduce depression and holds promise in reducing hospital readmissions.

PHYSICAL PERFORMANCE MEASURES AND LONG TERM PROGNOSIS IN OLDER HEART FAILURE PATIENTS

D. Chiarantini¹, S. Volpato², F. Sioulis², F. Bartalucci¹, L. Del Bianco¹, G. Pepe³, N. Marchionni¹, M. Di Bari¹, *1. Department of Critical Care Medicine and Surgery, Unit of Gerontology and Geriatric Medicine, University of Florence and Azienda Ospedaliero-Universitaria Careggi, Florence, Italy, 2. Department of Clinical and Experimental Medicine, Ferrara, Italy, 3. Emergency Department, Azienda Ospedaliero-Universitaria Careggi, Florence, Italy*

Aim. To evaluate whether physical performance, assessed with the Short Physical Performance Battery (SPPB), predicts long-term prognosis of older subjects hospitalized for heart failure (HF). **Methods.** Subjects aged 65+ years were enrolled on discharge from hospital, after admission for decompensated HF. Participants underwent echocardiography, comprehensive geriatric assessment, and SPPB. Cox proportional hazards regression models were used to predict survival over a 30-month follow-up. **Results:** Of 157 participants (mean age 80 years, range 65-101; 50% men), 61 died. Mortality rate increased with worsening physical performance: compared with an SPPB score of 9+, scores of 0, 1-4, and 5-8 were associated with hazards of death of 6.06 (95% CI 2.19-16.76), 4.78 (1.63-14.02) and 1.95 (0.67-5.70), respectively, adjusted for demographics, ejection fraction, New York Heart Association classification, comorbidity, and other covariates. **Conclusion.** SPPB is an independent predictor of long-term survival of older subjects who leave the hospital after an episode of decompensated HF.

HEART FAILURE AND INCIDENT DRIVING CESSATION AMONG COMMUNITY-DWELLING OLDER ADULTS: FINDINGS FROM A PROSPECTIVE POPULATION-BASED STUDY

R.V. Sims^{1,2}, B. Liu², A. Ahmed^{2,1}, *1. VA Medical Center, Birmingham, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Background: Heart failure and driving cessation are common among older adults and associated with poor outcomes. However, the association between heart failure and incident driving cessation has not been previously reported. We studied the effect of baseline heart failure on incident driving cessation among community-dwelling older adults in the Cardiovascular Health Study (CHS). **Methods:** Of the 5795 CHS participants in the public-use copy of the database, data on driving at year 10 was available for 2780 subjects, of whom 2743 reported driving at baseline. Heart failure was centrally adjudicated at baseline. Logistic regression models were used to determine the association of heart failure with incident driving cessation at year 10 of the study. **Results:** Patients had a mean (\pm SD) age of 72 (\pm 4) years, 1540 (56.1%) were women, 394 (14.4%) were African Americans and 66 (2.4%) had baseline heart failure. Overall, 464 (16.9%) reported incident driving cessation. At the 10 year follow-up, 33.3% and 16.5% of participants with and without baseline heart failure were not driving (unadjusted odds ratio, 2.53; 95% confidence interval, 1.50-4.26; P<0.0001), respectively. This association remained significant after multivariable adjustment for age, gender, race, marital status, living alone, education, income, social support, depression, general health, vision problems, drivable vision, and common geriatric comorbidities at baseline (adjusted odds ratio, 2.05; 95% confidence interval, 1.13-3.73; P=0.018). **Conclusions:** Among community-dwelling older adults, baseline heart failure was associated with incident driving cessation. Further studies are needed to identify risk factors and implications of driving cessation in heart failure patients.

HOW TO DESIGN AN EFFECTIVE DISEASE MANAGEMENT PROGRAM FOR OLDER HEART FAILURE PATIENTS? A META-REGRESSION

D.S. Yu, *The Netherlands School of Nursing, The Chinese University of Hong Kong, Hong Kong, NA, China*

Background: Disease management program (DMP) have evolved to enhance discharge outcomes in older patients with heart failure (HF). Yet, randomized controlled trials (RCTs) examining their effectiveness report inconsistent findings, possibly due to variations in DMP design. **Aim:** A meta-analysis and meta-regression was conducted to identify the DMP characteristics which associated with a lower hospital readmission and mortality in older HF patients. **Methods:** We searched medical databases and a trials registry up to Sept (Week 1) 2007. Two reviewers independently selected the studies, extracted data and assessed study quality. Pooled relative risk (RR) estimates were calculated with random-effect models. Subgroup analysis and meta-regression analysis was conducted to identify the program characteristics which predicted hospital readmission and mortality. **Results:** The meta-analysis included 28 RCTs. The DMPs significantly reduced all-cause (RR=0.82; 95% CI 0.72-0.94) and cardiac-cause (RR=0.56; 95% CI 0.44-0.73) hospital readmissions and caused a trend towards lower mortality (RR=0.89; 95% CI 0.78-1.01). Subgroup analysis indicated that DMP team structure, care components, and follow-up method were associated with to the program outcomes. Multivariable meta-regression identified that DMPs run by a multi-disciplinary team or led by a cardiac nurse specialist was associated with a 32-37% reduction in risk of hospital readmission. The incorporation of drug titration as a care component to such team structure also associated with a 55-57% reduction in mortality risk. **Conclusion:** Comprehensive DMPs which involves a multi-disciplinary team or cardiac nurse and incorporates drug titration are most effective to improve the health outcomes of older patients with heart failure.

SESSION 210 (POSTER)

PHYSICAL ACTIVITY - HS POSTER SESSION

PHYSICAL ACTIVITY ASSESSMENT FOR INDIVIDUALS WITH EARLY ALZHEIMER'S DISEASE

S.L. Farr¹, E. Vidoni², N. Loskutova², R.A. Washburn³, J.M. Burns², *1. Health Policy & Management, The Johns Hopkins Bloomberg School of Public Health, Laurel, Maryland, 2. The University of Kansas Medical Center, Kansas City, Kansas, 3. The University of Kansas, Lawrence, Kansas*

Interest in the physical activity habits of those with Alzheimer's disease has made a valid survey tool necessary. We examined the validity of the Physical Activity Scale for the Elderly (PASE), a brief survey specifically developed for older adults, as compared to other measures of activity and function. Additionally, the self-rated PASE score was compared to that of an informant familiar with the participant's daily activity to examine validity of self-reporting by those with dementia. The PASE was sensitive to reduced physical activity by those with AD. We additionally found that the participant's report was generally similar to that of the informant. However, for those with early AD, the informant rating was more closely associated with objective physical measures. We conclude that PASE is a valid survey of physical activity for those in the early stages of AD and may be most accurate when administered to an informant on behalf of an individual with dementia.

TURN THAT FROWN UPSIDE DOWN: ASSOCIATIONS BETWEEN MOOD AND FUNCTIONAL FITNESS AMONG OLDER WOMEN

T. Lake, M. Tecmire, M. Powers, *University of Central Oklahoma, Edmond, Oklahoma*

The association between fitness and mood has shown to be positive among general populations. More specifically, as physical fitness

improves, positive mood will more likely be present. Despite advances in understanding the benefits of exercise with older adults, research utilizing the Visual Analog Mood Scales (VAMS) to understand this relationship is stagnant. The purpose of this preliminary study was to investigate the relationship between mood states and functional fitness among senior women (M = 82.56, SD = 6.94). Participants (n = 58) completed the VAMS, Senior Fitness Test (chair stand, 8 ft up-and-go, arm curl, 6-minute walk, back scratch, sit-and-reach), and hand-grip strength tests. Pearson's product moment correlation coefficients were used to examine the relationship in question. Results indicated that the strongest correlation (fair to moderate) was observed between tired and the chair stand test ($r = -0.476$, $p = .00$), followed by tired and the arm curl test ($r = -0.456$, $p = .00$). Tense and the sit-and-reach test also revealed a fair to moderate correlation ($r = -0.426$, $p = .01$). These findings show that as poorer functional scores were recorded, greater negative mood states were present. Clearly, sedentary lifestyles may lead to declines in mood state, ultimately leading to poor quality of life. Therefore, exercise to promote life-long physical and mental health is vital. Future research should include longitudinal studies to observe changes over time. Assessing mood states with the VAMS for consistency in the literature is also suggested.

A SPORTING CHANCE: EFFECTS OF ACTIVE VIDEO GAMES ON SENIOR ADULT FITNESS AND ACTIVITY LEVELS

D. Fent¹, C. Chrisman¹, C. Murray², *1. Kinesiology and Health Studies, University of Central Oklahoma, Edmond, Oklahoma, 2. University of Central Oklahoma, Edmond, Oklahoma*

Active video games as a means of physical activity have caught the attention of senior adults across America. However, the effects of active video games on physical fitness and activity levels in older populations are unclear. The aim of this investigation was to examine the effects of an intervention utilizing Wii™ Sports on senior adult fitness and activity levels. Eight senior (80.88 ± 5.33 years), community-dwelling adults recruited from a retirement center participated in 30 minute activity sessions twice a week for 6 weeks utilizing Wii™ Sports (bowling, golf, baseball, boxing and tennis). Pre and post functional performance measures (aerobic endurance, agility/dynamic balance, flexibility and strength) were evaluated via the Senior Fitness Test. Participants also completed the CHAMPS and PASE physical activity questionnaires before and after the intervention. Differences between pre and post measurements were analyzed using the nonparametric Wilcoxon signed-rank test. Shoulder flexibility measured by the back scratch test improved significantly after six weeks of Wii™ Sports participation (pre-mean: -7.38, post-mean: -4.69; $p = 0.012$). No significant differences ($p > .05$) in the other Senior Fitness Test measures or physical activity questionnaire scores were found. Findings can potentially be used to create senior adult activity programs incorporating active video games that may help increase fitness levels. However, future studies are needed to support and expand on the present findings.

WII-FIT FOR BALANCE AND GAIT IN SKILLED NURSING FACILITY: A RETROSPECTIVE STUDY

K.P. Padala¹, P. Padala^{1,2}, N. Stergiou^{1,2,3}, M.A. Bissell¹, S. Davis¹, T. Malloy¹, J. Potter¹, W.J. Burke¹, *1. University of Nebraska Medical Center, Omaha, Nebraska, 2. Veterans Affairs Medical Center, Omaha, Nebraska, 3. University of Nebraska at Omaha, Omaha, Nebraska*

Background: Falls in elderly are a major public health problem. Poor balance and gait abnormalities are risk factors for falls. Exercise improves gait and balance in elderly. However, it is difficult to engage patients in exercise programs. Wii-Fit might bridge this gap by providing high level of engagement at an affordable price. Wii-Fit is a Nintendo game used for balance, yoga, aerobics, and strength training. It is a TV based self-directed activity. Virtual trainers talk the user through the activity and track progress while visual and auditory feedback improve engagement. Anecdotal reports suggest improvement in bal-

ance and social benefits with Wii-Fit, but no systematic studies are available. Objective: To compare the effect of Wii-Fit augmentation to physical therapy alone in subjects undergoing rehabilitation in skilled nursing facility (SNF) using a retrospective chart review. Methods: 100 charts were reviewed of which seventeen patients were noted to have used Wii-Fit during their rehabilitation. These subjects were matched with seventeen controls who did physical therapy alone. Results: There were no baseline differences between the groups. The mean age was 77.7 years, with 11 females in each group. All the subjects were Caucasians. The average length of stay was 30 days in each group. Mean duration of the Wii-Fit use was 4-weeks. Wii-Fit augmentation group improved significantly in Activities of Daily Living ($p=0.008$), balance ($p=0.0001$), and assistance with gait ($p=0.05$) when compared to the control group. Conclusion: Wii-Fit can be used safely in a SNF, and it may improve balance, gait, and functional status.

RELATIONSHIP BETWEEN STEM CELL NUMBER AND PHYSICAL ACTIVITY IN OLDER ADULTS

L.D. Bilek¹, M. Lang¹, S. Brusnahan², B. O'Kane², T. McGuire⁴, J. Jackson⁵, A.M. Berger³, J. Sharp³, 1. Div of PT Education, UNMC, Omaha, Nebraska, 2. Genetics, Cell Biology and Anatomy, UNMC, Omaha, Nebraska, 3. College of Nursing, UNMC, Omaha, Nebraska, 4. College of Pharmacy, UNMC, Omaha, Nebraska, 5. Pathology and Microbiology, UNMC, Omaha, Nebraska

Purpose: The purpose of this pilot study was to evaluate the relationship between stem cell number and physical activity during aging. Methods: Our sample consisted of 39 community dwelling older adults (median age 70 years). At the first assessment, physical activity was assessed with a self-report questionnaire, the Human Activity Profile (HAP). Subjects were instructed to wear pedometers and accelerometers during waking hours for 1 week to measure physical activity. Blood was collected at the end of this time period and analyzed for side population (SP) and progenitor stem cells and IL-6. Results: The results show an inverse relationship between circulating stem cell number and physical activity. The correlation between SP cells and pedometer steps during the week prior was $r = -0.4$ ($p=0.05$), and the day prior was $r = -0.42$ ($p=0.03$). The correlation between SP cells and HAP-Adjusted Activity Score (AAS) was $r = -0.48$ ($p=0.01$). A similar relationship was seen with endothelial progenitor cells. The correlation with HAP-AAS was $r = -0.56$ ($p=0.02$) and the correlation with accelerometer counts was $r = -0.56$ ($p=0.03$). Although no correlation was found between IL-6 and the stem cells, there was a statistically significant negative correlation between IL-6 and all measures of physical activity. Conclusion: Subjects who were more physically active had lower levels of circulating stem cells. This finding is inconsistent with the acute effects of exercise on stem cells. Further studies may determine if this represents a physiologic adaption to physical activity.

DEMOGRAPHIC CORRELATES OF PHYSICAL ACTIVITY AMONG COMMUNITY-DWELLING OLDER ADULTS

E. Jadoon, A. Ahmed, UAB, Birmingham, Alabama

Background: Physical activity is associated with better outcomes in community-dwelling older adults. However, demographic correlates of physical activity in older adults have not been well studied. We studied demographic correlates of physical activity in community-dwelling older adults, using the public-use copy of the Cardiovascular Health Study (CHS). Methods: Data on kilocalories of energy expended per week in leisure-time physical activity were collected at baseline were available from 5775 CHS participants. We used student's t and Mann-Whitney tests to compare mean kilocalories of energy expended per week by various demographic subgroups. Results: Patients had a mean (\pm SD) age of 73 (± 6) years, 34% were 75 years and older, 58% were women, 16% were African Americans, 66% married, and 36% had 12 grade or higher education. Mean of energy expended per week was 1707 (± 2028) kilocalories. Mean of energy expended per week was significantly

higher among participants who were younger than 75 years (1878 versus 1377 for ≥ 75 years), men (1921 versus 1549 for women), whites (1832 versus 1026 for African Americans), married (1874 versus 1383 for unmarried), not living alone (1767 versus 1297 for living alone), college education or higher (1813 versus 1628 for lower education) and annual income \$25,00 or higher (1879 versus 1611 for lower income). All p values were <0.05 . Conclusions: Among community-dwelling older adults, a number of baseline patient characteristics correlated with kilocalories of energy expended per week, which may help identify candidates for targeted intervention to improve physical activity.

DEVELOPMENT OF CARE SYSTEM TO ACTIVATE FRAIL OLDER ADULTS' ACTIVITIES IN DAILY LIFE (NO2): EFFECTIVENESS OF WALKING EXERCISE BY SYNTHETIC TECHNIQUES OF CHROMA-KEY

Y. Lau¹, K. Yamauchi², A. Ogita³, S. Oshita⁴, T. Ichikawa⁴, 1. Keio University Institute of Physical Education, Kanagawa, Japan, 2. Keio University Faculty of Nursing and Medical Care, Kanagawa, Japan, 3. Izumi Junior College, Kanagawa, Japan, 4. Matsuyama Shinonome Junior College Department of Early Childhood Education and Care, Ehime, Japan

Introduction: Learning materials of walking exercise by audio visual system such as video tape, DVD, or internet is currently used among large number of older adults. However, learners can not be evaluated if they follow the model of exercise in screen correctly. Purpose: The purpose of this research was to investigate the effectiveness of audio visual system by synthetic techniques of Chroma-key as learning material of walking exercise for older adults. Methods: Two types of learning materials were provided to older adults as examinees who are living in the suburb of A prefecture in Japan for a trial. One type of learning materials was the video tape that the instructor was a model of exercise in screen and the learners watched the screen and followed the instructor. Another type of learning material was that pictures of learners were synthesized into the pictures of the instructor on the screen in real-time. After these trials, learners were asked about their impression by researchers in questionnaires and interviewed regarding these two types of learning materials. Results: Most learners stated that the latter method was effective not only could they evaluate their exercise in real-time but also they could experience virtually that the instructor was near them and they were in the same time and space. Cognitive difference among learners was also identified: they felt reality in bigger size using synthetic picture.

THE ASSOCIATION BETWEEN MIDLIFE PHYSICAL ACTIVITY AND DEPRESSIVE SYMPTOMS IN LATE LIFE: AGE GENE/ENVIRONMENT SUSCEPTIBILITY - REYKJAVIK STUDY

M. Chang¹, J. Snaedal^{1,2}, J. Saczynski³, T. Aspelund^{2,4}, T. Harris⁵, V. Gudnason^{2,4}, L.J. Launer⁵, P.V. Jonsson^{1,2}, 1. Landspítali University Hospital, Reykjavik, Iceland, 2. University of Iceland, Reykjavik, Iceland, 3. University of Massachusetts, Worcester, Massachusetts, 4. Icelandic Heart Association, Kopavogur, Iceland, 5. National Institute on Aging, Bethesda, Maryland

Background: Physical activity (PA) decreases risk of various health outcomes, but the long term impact of mid-life PA on depression in late-life has not been studied. Purpose: To examine the association between mid-life PA and late-life depression. Methods: A population-based cohort from the Age Gene/Environment Susceptibility - Reykjavik Study followed since 1967 as a part of the Reykjavik Study. Main outcome measures were greater depressive symptoms assessed by continuous GDS score (Geriatric Depression Scale, 15-item) or by threshold value of ≥ 6 in late life. Results: Data were available for 4902 participants (2158 men and 2744 women) (antidepressant users ($n=862$) excluded). Level of weekly PA (none, $n = 3424$; ≤ 5 hrs, $n = 1252$; and > 5 hrs, $n = 226$) was ascertained by questionnaire at mid-life (mean age=52 years).

Depressive symptoms were assessed an average of 26 years later. Compared to those who never exercised at midlife, after controlling for demographic and health risk factors, both active groups had significantly lower GDS score (≤ 5 hrs; $\beta = -0.17$, Confidence Interval (CI) $-0.29, -0.04$, $P < 0.01$, > 5 hrs; $\beta = -0.29$; CI $-0.55, -0.03$, $P < 0.05$) than the sedentary group. No relationship was seen using a threshold value of 6 for the GDS. Conclusion: Our study suggests that mid-life PA is associated with reduced depressive symptoms 26 years later. PA in midlife may contribute to maintenance of mental health and may reduce or delay the risk of developing depression in late life.

SESSION 215 (SYMPOSIUM)

PSYCHOTROPIC DRUG USE IN THE FRAIL NH ELDERLY: ISSUES AND CHALLENGES

Chair: J.A. Lucas, IHHPAR, Rutgers University, New Brunswick, New Jersey

Discussant: S. Crystal, IHHPAR, Rutgers University, New Brunswick, New Jersey

High rates of psychotropic drug use among the elderly raise important concerns. Vulnerability to side effects is substantial, due to aging-related pharmacodynamic and pharmacokinetic changes. Polypharmacy and complex patterns of medical and psychiatric comorbidity increase the risk of adverse reactions and drug interactions. Exclusion of older adults from many clinical trials means effectiveness and adverse effects are often poorly understood. In the nursing home setting, there is under-recognition and treatment for conditions such as depression, and inequities in access to antidepressant drugs. Antipsychotic medication (APM) rates may be different among minority groups and in resource dependent facilities with more minority residents, potentially increasing the mortality risk among these vulnerable subgroups. The extent and appropriateness of use of APMs among nursing home residents is also concerning. Use of APMs for behavioral symptoms of dementia raises particular safety and appropriateness concerns, in light of greater mortality and adverse event risks. Balancing benefits and risks poses an ongoing challenge. Access to therapies may also be adversely impacted by policy changes, such as NH prescribing guidelines restricting use and requiring dose reductions for psychoactive medications. Conversely, state regulatory policies, such as citing deficiencies for unnecessary drugs, Medicaid reimbursement rates, and staffing requirements, vary and may impact APM use through their overall effect on facility treatment patterns. Clinical and policy issues in treatment of the elderly with mental health conditions will be illustrated through these relevant studies.

ANTIPSYCHOTIC MEDICATION (APM) USE AMONG NH RESIDENTS: APPROPRIATE OR INAPPROPRIATE?

J.A. Lucas¹, J. Bowblis², T. Gerhard¹, S. Chakravarty¹, S. Crystal¹, 1. IHHPAR, Rutgers University, New Brunswick, New Jersey, 2. Miami University, Oxford, Ohio

Using clinical and facility indicators from 2003- 2004 MDS data merged with Medicaid drug and OSCAR data, we examined extent and appropriateness of APM among NH residents and associated resident and facility characteristics in a study sample of 65+ NH Medicaid residents ($N=224,338$) from 5 states. Using CMS guidelines, APM use was categorized as appropriate, potentially appropriate (dementia), and inappropriate. Multivariate logistic regression analysis predicted inappropriate APM use based on resident and facility characteristics. Of 18.4% residents using APMs, 39.0% were appropriate, 10.2% potentially appropriate, while 50.8% had no appropriate indication. Controlling for resident demographics and clinical characteristics, odds of inappropriate APM increased with size (OR=1.10; 95% CI=1.06-1.13) and higher proportion of Medicaid funding (OR=1.44; 95% CI=1.39-1.48); odds decreased for non-profits (OR=0.91; 95% CI=0.87-0.94), and with higher RN (OR=0.86; 95% CI=0.83-0.88) and CNA (OR=0.68; 95%

CI=0.66-0.70) staffing. APMs are commonly prescribed lacking CMS appropriate indications. Facility structure and resources are associated with inappropriate APM use.

THE IMPACT OF STATE REGULATION ON THE RATE OF ANTIPSYCHOTIC DRUG USE IN NURSING HOMES

J. Bowblis¹, S. Crystal², O. Intrator³, J.A. Lucas², 1. Economics, Miami University, Oxford, Ohio, 2. Rutgers University, New Brunswick, New Jersey, 3. Brown University, Providence, Rhode Island

This research studies the variation in antipsychotic use by nursing homes (NHs) and assesses the impact of state policies on this variation using a retrospective observational design. The sample is a panel of 14,743 non-hospital NHs from 1999 to 2005. Data is obtained from the Online Survey and Certification Reporting System (OSCAR) and linked with state policy variables. Antipsychotic use steadily increased from 19.9% to 27.3% of all residents. There is significant variation in the rate of use by region and state policies. States that cite more drug-specific deficiencies or provide more generous Medicaid reimbursement have subsequent lower AP use rates while direct care staffing requirements did not have an effect. This study provides insight into how state policies such as survey deficiencies and reimbursement explain variation in AP use, and how states might influence treatment patterns through these policies.

TRENDS IN DIAGNOSIS AND TREATMENT OF DEPRESSION IN ELDERLY LONG TERM CARE NURSING HOME RESIDENTS

D. Gaboda, J.A. Lucas, M.J. Siegel, E. Kalay, S. Crystal, Rutgers University, New Brunswick, New Jersey

We examined cross-sectional changes in identification and treatment of depression among 65+ NH residents in 8 states ($N=2,804,289$), using clinical and facility indicators from 1999-2006 merged MDS and OSCAR data. Multivariate logistic regression described the effect of resident and facility characteristics on the probability of being diagnosed with depression and, for those who received a diagnosis, on the probability of receiving any treatment. The percentage of all residents diagnosed with depression increased steadily, from 33.8% to 50.6%; and, among those diagnosed, treatment with antidepressant medication increased from 71.2% to 83.1%. Non-Hispanic Black residents were consistently diagnosed at lower rates than both non-Hispanic Whites and Hispanics and were least likely to receive an antidepressant in all years. In 2006, non-Hispanic Black residents were less likely to be diagnosed than non-Hispanic Whites (OR=0.49; 95% CI=0.47-0.50) and also less likely to receive any treatment (OR=0.71; 95% CI=0.68-0.74), after controlling for other characteristics.

ANTIPSYCHOTIC USE IN NURSING HOMES: DIFFERENCES BY RACE AND ETHNICITY

M.J. Siegel, J.A. Lucas, E. Kalay, S. Crystal, Institute of Health, Rutgers University, New Brunswick, New Jersey

Antipsychotic drug use in nursing homes (NH) has become widespread, particularly for treating neuropsychiatric and behavioral symptoms of dementia. However, these drugs may increase the risk of death among frail elderly patients. This study examines the effects of resident race/ethnicity and facility racial/ethnic composition on antipsychotic use among NH residents, using 2006 individual-level data from the Minimum Data Set merged with facility-level data from OSCAR for NH residents in 8 states. Among residents with dementia, 31.2% of whites, 29.9% of blacks, and 36.8% of Hispanics used antipsychotics ($p<.0001$). Logistic regression results indicate black race was associated with lower odds of antipsychotic use (OR=.884, CI .852-.918); Hispanic ethnicity was associated with greater odds of use (OR=1.126, CI 1.075-1.180). Residing in a facility with a higher proportion of black (OR=1.166, CI 1.039-1.308) or Hispanic (OR=1.690, CI 1.469-1.945)

residents was associated with higher odds of antipsychotic use. These facilities may have fewer resources.

USE OF ATYPICAL ANTIPSYCHOTIC MEDICATIONS AMONG NURSING HOME RESIDENTS WITHOUT PSYCHOSIS: CHALLENGES FOR LONG-TERM CARE STAKEHOLDERS

S. Crystal, J.A. Lucas, T. Gerhard, E. Kalay, *Rutgers, The State University of New Jersey, New Brunswick, New Jersey*

Increased use of atypical antipsychotic medications (AAP) in the frail elderly has raised a range of policy challenges for payers, patients and clinicians. Balancing risks and benefits is challenging. In the nursing home (NH) population, widespread AAP use to manage behavioral problems associated with dementia has been controversial in recent years as new safety evidence has accrued. The Minimum Data Set for 1999 and 2006 was used to calculate prevalent antipsychotic use rates among NH residents age 65+ across hierarchical diagnostic subgroups. Compared to 1999, AP use among long-term residents with a full, non-admission MDS assessment increased from 20.2% to 27.6%, despite new, significant safety concerns about the use of antipsychotics for treatment of behavioral symptoms of dementia. Among residents with dementia and non-aggressive behavioral symptoms, treatment prevalence was almost 40%. Even after modest declines following FDA black box warnings in 2005, use remained above levels of the early 2000s.

SESSION 220 (SYMPOSIUM)

THE BERLIN AGING STUDY

Chair: *E. Steinhagen-Thiessen, Charité University Medicine Berlin, Berlin, Berlin, Germany*

Discussant: *J. Smith, University of Michigan, Ann Arbor, Michigan*

In this symposium we will present data from BASE-I and the design and research goals of BASE-II in comparison and in contrast to BASE-I. BASE-I: The multidisciplinary Berlin Aging Study I has been terminated recently. The study focussed on the very old (70-105 years). Participants were stratified by age and sex. A core sample of 516 out of 2000 total elderly Berlin citizens were closely examined in 14 sessions. We examined their mental and physical health, their psychological functioning and their social and economic situation. Since 1990 the study has been continued as a longitudinal study and the surviving participants have been reexamined seven times over a mean follow-up of 18 years. Meanwhile the Berlin population has changed (opening of the Berlin wall, unification of Germany, less single households etc.). Also, aspects of health, social-economic conditions and diseases in the aging population of Berlin changed, leading to initiating the Berlin Aging Study II. BASE-II: A total of 2200 Berlin citizens have been recruited for BASE-II, 50% of which are 20-30 years of age and the other 50% 60 years and older. These participants are the basis for long-term follow-up. Besides focussing on prevalent diseases, psycho-social aspects and economic conditions, we have special interest in evaluating predictors for disease development, functional loss during aging and the aging process as a systemic phenomenon. Both studies have a broadly based multidisciplinary approach. Therefore BASE-II will again be executed in collaboration between Max-Planck-Institute for Human Development and the Charité University Medicine Berlin Research Group on Geriatrics.

18-YEARS-LASTING LONGITUDINAL FOLLOW-UP OF THE PARTICIPANTS OF THE BERLIN AGING STUDY I (BASE-I)

V. Moskiou, H.K. Berthold, E. Steinhagen-Thiessen, *Research Group on Geriatrics, Charité University Medicine Berlin, Berlin, Germany*

As age simultaneously constitutes a biological, psychological, social and institutional phenomenon, the core sample of the Berlin Aging Study I, representatively selected and stratified by age and gender, has been

monitored for up to 18 years with a broad range of interdisciplinarity (internal medicine, geriatrics, psychiatry, psychology, sociology, social policy) regarding its long-term survival and mortality characteristics. Since 1990 seven follow-ups of the participants have been completed (1993-1994, 1995-1996, 1997-1998, 2000, 2004, 2005, 2008) focusing both on the present situation of young-old and oldest-old individuals as well as on the correlates and determinants of the aging process. During the period May – December 2008 22 survivors, aged 86-102 years, were thoroughly examined at their place of residence spending 6-11 sessions. Special emphasis was laid on objective and subjective physical and mental health, risk profiles, reference values (blood-sampling, functional diagnosis), medication, functional capacity and everyday competence.

LATE-LIFE DECLINE IN WELL-BEING: REPLICATING AND EXTENDING EVIDENCE FROM THE BERLIN AGING STUDY USING NATIONAL SURVEYS FROM GERMANY, THE UK, AND THE US

D. Gerstorf^{1,2,3}, N. Ram^{1,2,3}, J. Schupp³, U. Lindenberg², G.G. Wagner^{3,2}, *1. Department of Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania, 2. Max Planck Institute for Human Development, Berlin, Germany, 3. German Institute for Economic Research, Berlin, Germany*

Throughout adulthood and old age, levels of well-being remain relatively stable. However, initial evidence from old and very old adults in the Berlin Aging Study suggests that late in life well-being declines considerably. Using long-term longitudinal data of deceased participants in national samples from Germany, the UK, and the US, we examine how long this miserable period lasts. In all three nations and across the entire adult age range, well-being was relatively stable over age, but declined rapidly with impending death. We identified prototypical transition points in each study between three and five years prior to death, after which normative rates of decline steepened by a factor of three or more. These across-nation analyses replicate and generalize initial evidence that rapid end-of-life declines in well-being and psychological health may indeed be a normative experience, and thus illustrate how large national surveys can complement and extend findings from intensive assessment studies.

THE BERLIN AGING STUDY II (BASE-II)—PHYSICAL AND MENTAL HEALTH ACROSS THE LIFESPAN

H.K. Berthold¹, V. Moskiou¹, G.G. Wagner³, U. Lindenberg², E. Steinhagen-Thiessen¹, *1. Research Group on Geriatrics, Charité University Medicine Berlin, Berlin, Germany, 2. Max Planck Institute for Human Development, Berlin, Germany, 3. The German Socio-Economic Panel Study (SOEP), Berlin, Germany*

A total of 2200 subjects have been recruited from the Berlin population (20-30 years or 60 years and older). Cross-sectional evaluation of medical, psychological, and socio-economic aspects will be concluded in 2010. There will be longitudinal follow-up of the cohort. Medical items include medical history, physical exam and laboratory analyses including a whole genome screening. Further examinations focus on cardiovascular and cardio-metabolic risks, nutrition, body composition, bone metabolism and bone density, degenerative diseases of the central nervous system, depression and anxiety disorders, musculoskeletal diseases, motion and mobility analyses, eye and hearing exams, quality of life, sex life questionnaire, and drug therapy. Furthermore, standard geriatric assessment scales will be documented. The primary goal of the study is to document the major burden of disease in an elderly urban cohort at the beginning of the 21st century and compare these data with the data of young adults and with the respective results from BASE-I. Scientific collaborations are explicitly warranted (base@charite.de).

INTERACTIONS BETWEEN AGING AND GENES: A GENOMIC APPROACH TO NEUROMODULATION OF MEMORY AGING IN BASE II

S. Li¹, U. Lindenberger¹, I. Nagel¹, C. Preuschhof², C. Chicherio³, L. Nyberg⁴, H. Heekeren⁵, L. Bäckman⁵, 1. *Center for Lifespan Psychology, Max Planck Institute for Human Development, Berlin, Germany*, 2. *Free University of Berlin, Berlin, Germany*, 3. *University of Geneva, Geneva, Switzerland*, 4. *Umeå University, Umeå, Sweden*, 5. *Karolinska Institute, Stockholm, Sweden*

During the course of usual aging various neurotransmitter systems undergo declines. Some of these systems (e.g., dopamine and acetylcholine) are known to affect memory functions. The advent of molecular genetics has opened up possibilities for casting new lights on aging. In a large sample of younger (20 to 30 years) and older (60 to 70 years) Berlin residents we assessed working memory and episodic memory functions along with genetic data relevant for individual differences in transmitter functions (e.g., COMT, DAT) and other genetic factors related to memory functions (e.g., KIBRA and DBNF). We found that genetic effects on working memory and episodic memory were magnified in older adults, indicating interactions between genetic factors and aging. We plan to follow-up these individuals in the BASE II study with more comprehensive assessments of genetic, socio-economical, and brain measures to investigate interactions between neurobiological, lifestyle, and sociocultural factors in affecting cognitive and brain aging.

INTEGRATING LABORATORY SAMPLES INTO HOUSEHOLD PANELS: SELECTIVITY ANALYSES WITH THE COGITO SAMPLE

J.K. Wolff¹, A. Brose¹, F. Schmiedek^{1,2}, U. Lindenberger¹, G.G. Wagner^{3,4}, 1. *Max-Planck-Institute for Human Development, Berlin, Germany*, 2. *Humboldt University Berlin, Berlin, Germany*, 3. *German Institute for Economic Research, Berlin, Germany*, 4. *Technical University Berlin, Berlin, Germany*

The COGITO sample, a subsample of BASE II, comprises 101 younger adults aged 20-31 and 103 older adults aged 65-80 who were assessed on 12 cognitive tasks for 100 daily sessions. Intensive and extensive laboratory studies such as COGITO provide unique information on individuals' functioning but are prone to selectivity bias. To estimate the size of selection effects, 87% of the older and 51% of younger adults of the COGITO sample were integrated into the German Socio-Economic Panel Study (SOEP). Preliminary comparisons to SOEP data indicate that the amount and the pattern of selectivity differed by age group. For instance, older adults were more selective on psychological constructs such as life satisfaction, whereas younger adults were more selective on demographic characteristics such as household income.

SESSION 225 (SYMPOSIUM)

THE GERIATRIC NURSING LEADERSHIP ACADEMY: NURSE FELLOWS PREPARE TO LEAD BEST PRACTICES

Chair: D. Cleeter, *Sawgrass Leadership Institute, Ponte Vedra Beach, Florida, Sigma Theta Tau International, Indianapolis, Indiana*
Discussant: C. Fagin, *Hartford Centers for Geriatric Nursing Excellence, New York, New York*

The Geriatric Nursing Leadership Academy (GNLA) was initiated by an award from the John A. Hartford Foundation to Sigma Theta Tau International (STTI), the Honor Society of Nursing. A partnership was created between STTI and the five original Hartford Centers for Geriatric Nursing Excellence for the design and implementation of the Academy. This intensive eighteen month mentored leadership development program provides a rigorous intellectual and experiential learning opportunity which benefits the individual participants, their sponsoring institutions, communities, and the older adult population of the United States. The GNLA prepares and positions nurses in leadership roles in various health care settings to lead inter-professional teams in the improve-

ment of health care quality and outcomes for older adults and their families. As a measure of the increased organizational influence and community impact of the fellow, a professional activities evaluation related to changes in professional roles, policy and advocacy endeavors, research and education pursuits, and new leadership positions is conducted at mid-point and completion of the Academy. Subsequently, a nationwide network of geriatric nursing leadership mentors has been formalized and knowledge resources for geriatric nursing leadership and scholarship are being developed. The symposium will present both the educational model and outcomes for: the leadership program curriculum and teaching methodology, the fellow's interdisciplinary leadership project, the fellow-mentor-faculty relationship, and the organizational and community impact of the Academy.

JOHN A HARTFORD CENTERS OF GERIATRIC NURSING EXCELLENCE PARTNERSHIP WITH SIGMA THETA TAU INTERNATIONAL

M. Hurley, *Sigma Theta Tau International, Indianapolis, Indiana*

The John A. Hartford Foundation's significant and sustained commitment to nursing paralleled the decision of The Honor Society of Nursing, Sigma Theta Tau International (STTI) to focus efforts on the development of geriatric nurse leaders across practice settings. The Hartford Centers for Geriatric Nursing Excellence have contributed to the advancement of best practices in geriatric nursing since 2001. Throughout these eight years, a resounding theme of the need to develop a critical mass of geriatric nurse leaders exists. STTI was well positioned to partner in these efforts and utilize their developed infrastructure and eighty seven years of nursing leadership experience. Outcomes from the Hartford Centers of Geriatric Nursing Excellence and Sigma Theta Tau International partnership to increase the number of geriatric nurse leaders in the country will be presented.

MENTORING: KEY TO LEADERSHIP DEVELOPMENT

M. Maas, *College of Nursing, University of Iowa, Iowa City, Iowa*

Mentoring of GNLA Fellows is a key strategy of the leadership academy. Mentoring occurs at two levels: 1) each Fellow has a local mentor, and 2) a faculty mentor is also assigned to each Fellow/local Mentor dyad. This presentation will briefly describe the purpose and objectives of each level of mentoring. Expectations of mentors and mentees and the mentoring process and activities will be discussed. One or two examples of relationships between Fellows and Mentors and between local and faculty mentors and how mentoring contributed to leadership development outcomes will be presented. Results of Fellow and Mentor evaluations will be briefly summarized. Finally, lessons learned and how the lessons are contributing to planning for the next leadership academy will be shared.

THE LEADERSHIP PROJECT: IMPLEMENTATION AND EVALUATION

G. Pepper¹, T.A. Harvath², 1. *College of Nursing, University of Utah, Salt Lake City, Utah*, 2. *Oregon Health & Science University, Portland, Oregon*

Each fellow develops a project centered on improving quality of health care for older adults and their families. Projects serve as a platform for enacting leadership competency and skill, integrating the didactic and experiential content of the workshops and assignments. Fellows form an interdisciplinary project team in their practice settings or communities, with the support and guidance of the local mentor. Site visits by faculty facilitators, who are national leaders in gerontologic nursing, provide both functional assistance and enhanced local recognition for the projects and fellows. Examples of diverse projects and impact evaluation for the initial cohort included enhancing medication self-management skills; initiating an adult day care facility; enhancing staff's geriatric knowledge in diverse settings (emergency department, 900-bed hospital, LTC); implementing novel models in interdisciplinary

teams; NICHE certification; fall prevention without auditory alarms; improving collaboration among LTC surveyors and staff; and enhanced interdisciplinary and intradisciplinary communication and leadership.

PREPARING GERIATRIC NURSE LEADERS TO TRANSFORM HEALTH CARE DELIVERY

C.J. Beverly¹, K. Burke², 1. *Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*

The Geriatric Nursing Leadership Academy was created to address the dearth of geriatric nurse leaders in this country. This transformational leadership program is designed to equip geriatric nurses with the requisite knowledge and skill to implement system change in diverse health care settings. Participants are mid-career level with most being employed in health care settings in mid-management positions. During the Academy, fellows are provided opportunities to examine organizational behavior, strategies to influence and implement policy and strategically effect health care delivery in diverse settings. Fellows also examine the importance of navigating the political world within their organization as well as the larger health care arena. Results of ways in which policy and organizational behavior has been influenced by fellows will be presented. A synthesis of critical lessons learned by fellows will be summarized.

SESSION 230 (SYMPOSIUM)

UNDERSTANDING AGING PROCESSES: NOVEL STATISTICAL APPLICATIONS

Chair: R. Boudreau, *Univ of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*

Discussant: K. Bandeen-Roche, *Johns Hopkins University, Baltimore, Maryland*

Distilling a better understanding of aging processes, especially longitudinal change, poses interesting statistical modeling challenges. The usual toolbox includes multiple regression with change-scores, multivariate regression including mixed models, repeated measures, GEE and survival analysis. This symposium will present 4 illuminating applications involving new or novel statistical methods not widely used in the analysis of aging processes. Models predicting the onset of cognitive or mobility decline, called a “change point”, incorporate the natural history before and after such a change. Examples of the use of change point models in longitudinal aging will be presented and show how results from such models can inform clinical practice. In a cohort aged 75-85, a cluster analysis of 5 year changes in physiologic systems will be presented that identifies groupings of co-stable systems and also individuals with the highest stability – those with the healthiest aging. Many scientific investigations collect both longitudinal and survival data. Using data from the Women’s Health and Aging Study II, a joint model will be presented of the trajectories of change in hip and knee strength while simultaneously evaluating the impact of such change on incident falls and disability. Longitudinal cohort studies of aging face intermittent missed visits and increasing rates of home or phone contacts replacing clinic visits as the cohort ages. Recent developments in imputation and comparative sensitivity analysis will be presented designed to assess and overcome these limitations. These approaches are useful methods for understanding aspects of aging otherwise missed using the usual methods.

APPLICATIONS OF CHANGEPOINT METHODS IN AGING FOR IDENTIFYING OR PREDICTING TIME OF ONSET OF COGNITIVE DECLINE, MOTOR DECLINE AND DISABILITY

C.B. Hall, *Epidemiology and Population Health, Albert Einstein College of Medicine, Bronx, New York*

In longitudinal studies of aging, repeated observations over time are collected on such outcomes as memory and other cognitive domains, mobility, ability to perform activities of daily living, bone density, and mood. In some individuals, the natural history of the aging process, as manifested by such measures, undergoes a change, which can signal incipient disease, disability, or mortality. Change point models may be used to model the time at which such a change occurs along with the natural history before and after such a change. Furthermore, the change point itself may depend on risk factors that could possibly be targets of intervention studies to prolong healthy aging. In this talk we will give examples of the use of change point models in longitudinal aging and show how results from such models can inform clinical practice.

JOINT MODELING OF LONGITUDINAL AND SURVIVAL DATA: ASSESSING THE IMPACT OF CHANGE IN LOWER EXTREMITY MUSCLE STRENGTH ON INCIDENT FALLS, ADL, AND IADL DISABILITY IN OLDER WOMEN

Q. Xue¹, B.A. Beamer², K. Bandeen-Roche¹, L.P. Fried³, 1. *Medicine, Johns Hopkins University, Baltimore, Maryland*, 2. *University of Maryland School of Medicine, Baltimore, Maryland*, 3. *Columbia University Mailman School of Public Health, New York, New York*

Many scientific investigations collect both longitudinal and survival data, aiming to assess the prognostic value of a longitudinal process on the natural history of an incident event. Well-established methods exist for analyzing longitudinal and survival data separately. However, when the availability of the longitudinal measurement depends on the survival endpoint, a joint modeling approach is warranted for unbiased and efficient statistical inferences. Using data from the Women’s Health and Aging Study, we characterized trajectories of change in knee strength over time and simultaneously evaluated their associations with incident falls and disability. We found that every one SD (0.2 kg/year) increase in the rate of decline in knee strength was associated with 2.0 and 2.5-fold increased risk of incident IADL and walking disability, respectively, after adjusting for knee strength at age 70 ($p < 0.01$). These data are in support of monitoring change in knee strength as a precursor to adverse health outcomes.

MAKING SENSE OF LONGITUDINAL TRAJECTORIES IN AGING COHORTS: WHAT ABOUT BIAS DUE TO INFORMATIVE DROPOUT AND DEATH?: IMPUTATION METHODS TO THE RESCUE

B. Yu¹, R. Boudreau², F. Thomas³, M. Garcia¹, T. Harris¹, 1. *National Institute on Aging, Bethesda, Maryland*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *University of Tennessee Health Science Center, Memphis, Tennessee*

The problem of analyzing longitudinal data has been an active area of aging research. Two types of approaches have been used to describe the longitudinal trajectories of biological markers: the marginal approach and the conditional subject-specific approach. The analysis of longitudinal data may be biased because of missing data due to dropout or death of study participants, which should be treated differently. A common research questions is the distribution of outcomes that we would have hypothetically observed if the participants had not dropped out but conditional on not dying. In aging studies, multiple imputation is an effective method to deal with missing data. However, in aging epidemiology the method is not widely used and its performance has not been investigated. We discuss the use the multiple imputation to account for possibly informative missing data. For illustration, we analyze the trajectories of cognitive function from a longitudinal aging study.

RANDOM SPAGHETTI OR CLUMPS?: A CLUSTER ANALYSIS OF LONGITUDINAL CHANGES IN PHYSIOLOGIC SYSTEMS IN THE ELDERLY TO IDENTIFY CO-STABLE SUBGROUPS OF SYSTEMS AND INDIVIDUALS EXHIBITING THE HEALTHIEST AGING

R. Boudreau, A.B. Newman, *Dept of Epidemiology, Univ of Pittsburgh, Pittsburgh, Pennsylvania*

A considerable amount of research is devoted to the characterization of healthy aging and the identification of markers and phenotypes related to healthy aging. Longitudinal data on individuals from the Cardiovascular Health Study on concurrent changes over 5 years were inter-related for several physiologic systems including endocrine, brain, lean and fat mass, pulmonary and arterial wall thickness. Each individual's physiologic systems were evaluated as relatively stable or declining. Stability was defined as minimal change over time, but also maintenance within a relatively normal range of adult values. A between-system similarity matrix was calculated using kappa statistics to measure the degree of co-stability. An analysis of this longitudinal data will be presented using cluster analysis which identified groupings of co-stable systems, systems with uncorrelated patterns of change, and also identified those individuals with the highest stability – those with the healthiest aging.

SESSION 235 (SYMPOSIUM)

CIVIC ENGAGEMENT IN AN OLDER AMERICA

Chair: G. O'Neill, *The Gerontological Society of America, Washington, District of Columbia*

This symposium will explore how the current economic crisis coupled with the new national service legislation (the Edward M. Kennedy National Service Act) will redefine and reinvent civic engagement in later life.

SESSION 240 (PAPER)

HEALTH INSURANCE

PROVIDING HEALTH INSURANCE COVERAGE TO LONG-TERM CARE WORKERS IN MINNESOTA

C. Gruman¹, L. Knatterud², B. Wright¹, L. Alecxih¹, *1. The Lewin Group, Falls Church, Virginia, 2. Minnesota Dept. of Human Services, Minneapolis, Minnesota*

Through its many programs that fund long-term supports and services, the Minnesota Department of Human Services (DHS) has an enormous investment in the workforce that provides hands-on, day-to-day, direct services for individuals with disabilities. To meet its obligation to the thousands of Minnesotans who rely on these services, DHS must ensure the availability of a strong, well-qualified direct service workforce across the many settings in which support is provided. High staff turnover and vacancies in the long-term services field are urgent concerns to many states. A growing number of studies indicate that health coverage plays a powerful role in recruitment and retention. In 2007, the Minnesota Health Care for Long-Term Care Workers workgroup recommended that the legislature study the costs and provide a rate increase to long-term care providers designed for the purchase of employee health insurance. In response to this mandate, the Lewin Group surveyed 5,200 LTC providers and 5,500 long-term care workers from across Minnesota. Topical areas included: current health coverage (public vs private vs none), length of time in the LTC field, demographic information, potential insurance take-up rates, and experiences with the health care system. Results indicate that 68% of agencies/providers operated with a net profit in FY 08. The majority (51%) operate as for-profit corporations. The typical PCA/DCW salary is \$10.75/hr. Approximately one-half of providers do not offer benefits to full-time direct service workers. Three insurance models along with costs will be presented.

THE EFFECT OF UNIVERSAL HEALTH INSURANCE ON THE HEALTH OF OLDER ADULTS IN TAIWAN

A. Prakash, M. Ofstedal, A. Hermlin, Y. Lin, *University of Michigan, Ann Arbor, Michigan*

Health is one of the most important assets for an individual which depreciates with age. Over the life course, the rate of depreciation could be minimized with the help of individual and public actions. In 1995, the government of Taiwan took action to provide health care to all its citizens by implementing a universal health insurance program (UHIP). In this study, we examine the effect of the acquisition of health insurance under UHIP on the health of older adults in Taiwan. Analyses are based on longitudinal data from the Survey of Health and Living Status of the Middle-Aged and Elderly in Taiwan (1989-2003). We use multivariate regression to examine trajectories in self-rated health over the study period as a function of prior health insurance status, controlling for sociodemographic and health indicators. Preliminary results suggest that the gap in self-rated health between those who did and did not have health insurance prior to UHIP was eliminated after the introduction of UHIP. Implications of these results provide potential guidelines for designing and implementing similar policies in other developing countries.

PREDICTING ENROLLMENT INTO THE MEDICARE PART D LOW INCOME SUBSIDY PROGRAM USING ENHANCED FINANCIAL INDICATORS

J. Shoemaker^{1,2}, B. Stuart^{1,2}, A.J. Davidoff^{1,2}, T. Shaffer^{1,2}, J. Lloyd^{1,2}, *1. Pharmaceutical Health Services Research Department, University of Maryland, Baltimore, Baltimore, Maryland, 2. The Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland*

The Medicare Part D Low Income Subsidy (LIS) was created to eliminate financial barriers to drug coverage for vulnerable beneficiaries. Most eligible beneficiaries must apply before enrolling into the program and there is concern of low take-up. The Medicare Current Beneficiary Survey (MCBS), which contains administrative Medicare enrollment data, would seem to provide an ideal resource for evaluating determinants of LIS take-up among eligible beneficiaries. Limitations of the MCBS include under-reporting of income and lack of explicit asset information, both essential to determine eligibility. This study enhances the reliability of MCBS financial information using unique data on sources of income and assets for MCBS participants, and an income prediction model based on the Current Population Survey (CPS). Determinants of LIS enrollment among eligible beneficiaries were examined utilizing these new measures to identify the eligible cohort. When introducing CPS-based predicted income and MCBS self-reported asset levels, preliminary analysis show that 17% of beneficiaries were eligible for LIS, 58% of whom enrolled by the end of 2006. The proportion of ineligible enrollees decreased from 3.2% to 1.7% when considering the enhanced eligibility criteria. Similarly, the prediction method shows that unadjusted, the MCBS overestimates the proportion of eligible beneficiaries who are married, employed, white, more educated and of excellent health status ($p < .05$). Multivariate logistic regression estimates that among eligible beneficiaries, the probability of enrolling into LIS is positively associated with being female, under the age of 75, of poor health and additional monthly prescription fills ($p < .05$).

HEALTH STATUS DIVERSITY IN THE RHODE ISLAND COMMUNITY-DWELLING ELDERLY DUAL ELIGIBLE POPULATION

S.M. Allen, J. Lima, M. Clark, *Community Health, Brown University, Providence, Rhode Island*

Little is known about the characteristics of the community dwelling elderly population who are "dual eligible," i.e., covered by both Medicare and Medicaid. As states seek to balance long term care by expanding community-based options, a better understanding of the current health status of this population is warranted. For purposes of program plan-

ning, we conducted a needs assessment survey commissioned by the RI Medicaid program, to determine the extent of diversity in health status, disability, service needs and social support of a random sample (n=612) of the community-based dual eligible population. Interviews were conducted by phone, with a response rate of 33.8% of those contacted. We categorized respondents into categories of “risk” for Medicaid community-based waiver status. A total of 15% of respondents were current Waiver Participants, and an additional 11% were classified as Waiver Eligible, based on self-report of need for assistance with activities of daily living (ADLs). Thirty five percent were classified as being at High Risk for Waiver Eligibility, based on self report of need for help with Instrumental Activities of Daily Living (IADLs) but not ADLs, and 39% were classified as Low Risk for Waiver Eligibility, based on the absence of need for help with ADLs and IADLs. Survey results are reported by these categories, thus providing a useful tool for projecting service need in the dual eligible population for service development and expansion.

THE POLICY IMPACT OF MEDICARE PART D: ARE SENIORS WITH THE HIGHEST LEVELS OF PRE-PART D OUT-OF-POCKET DRUG SPENDING IMPACTED MOST?

D. Mott^{1,3}, J.M. Thorpe^{1,3}, C. Thorpe², D.H. Kreling^{1,3}, A. Gadkari^{1,3}, 1. University of Wisconsin School of Pharmacy, Madison, Wisconsin, 2. University of Wisconsin Population Health Sciences, Madison, Wisconsin, 3. Sonderregger Research Center, Madison, Wisconsin

The data source was a database of prescriptions (n=1,230,612) dispensed between January 1, 2005 and December 31, 2007 for patients age 60 or older (n = 51,305) as of January 1, 2005. A quasi-experimental, pretest-posttest, nonequivalent control group design was used. The pre-period was calendar year 2005 and the post-period was calendar years 2006 and 2007. Dependent variables included total drug spending, out-of-pocket (OOP) drug spending, and pill-days of medication. Study subjects were placed into one of three (high, moderate, low) pre-Part D out-of-pocket drug spending categories. Other covariates included patient age and gender. Difference-in-difference regression models were estimated. Individuals eligible for Part D (n = 11,133) had significantly higher OOP drug costs and drug utilization in 2005 compared to individuals ineligible for Part D (n = 1,625). Adjusted means showed the policy effect included a significant 17% decrease in OOP drug spending and a significant 4% increase in drug use for Part D eligible individuals. Individuals with the highest pre-Part D OOP drug spending experienced a significant 17.6% decrease in OOP drug spending and a significant 4% increase in drug use. Individuals in the moderate pre-Part D OOP drug spending category experienced a significant 7% increase in drug use, but no significant decrease in OOP drug spending. Not all seniors responded equally to Part D, and the modest increases in drug use suggest unmet demand for prescription drugs existed prior to Part D. The significant changes in OOP drug spending suggest drugs became more affordable for eligible seniors.

SESSION 245 (SYMPOSIUM)

MEASURING END-OF-LIFE CARE AND OUTCOMES IN NURSING HOMES AND RESIDENTIAL CARE/ASSISTED LIVING SETTINGS: EMERGING FINDINGS REGARDING MEASUREMENT AND QUALITY IN THE UNITED STATES AND THE NETHERLANDS

Chair: S. Zimmerman, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

Discussant: D.R. Mehr, University of Missouri, Columbia, Missouri

Long-term care (LTC) settings have become a common site for end-of-life care. In both the United States and the Netherlands, 20-25% of all deaths occur in nursing homes and other residential LTC settings. As the prevalence of dying in LTC has increased, so too has the amount and breadth of research focused on end-of-life care and outcomes. However,

almost all LTC research relies on measures that were not developed specifically for this population, and most of the measures assess care structures, processes, and outcomes without differentiating one from the other. The lack of distinct measures that are targeted to LTC settings complicates quality improvement in this growing area. This symposium will present the results of an international collaborative that critically evaluated measures related to the quality of end-of-life care and the quality of dying in LTC in the United States and the Netherlands. The same nine measures were used in both countries, and in both countries data were obtained from family members of individuals who died in LTC settings; in the Netherlands, data also were collected from health care providers. This symposium will present conceptual findings related to a model that differentiated items of care quality from care outcomes; psychometric findings related to a factor analysis that used items from all measures to develop separate measures of care and outcomes; and descriptive findings that present, compare, and contrast care and outcomes in the U.S. and the Netherlands.

A CONCEPTUAL FRAMEWORK FOR EVALUATING MEASURES OF END-OF-LIFE IN LONG-TERM CARE

M. van Soest-Poortvliet¹, S. Zimmerman², R. de Vet¹, J. Munn³, J.T. van der Steen¹, L.W. Cohen², 1. VU University Medical Center, EMGO Institute, Amsterdam, Netherlands, 2. Sheps Center for Health Services Research, University of North Carolina, Chapel Hill, North Carolina, 3. Florida State University, Tallahassee, Florida

This study evaluated nine publicly available measures that have been used to assess the quality of end-of-life care and the quality of dying in long-term care settings: for example The End-of-Life in Dementia scales and the Quality of Dying in Long-term Care. Using qualitative content analysis, we classified all individual scale items into a previously developed conceptual model, separating patient factors, the structure and process of care, and outcomes of care. This evaluation indicated that some existent measures of end-of-life that have been used in long-term care settings do not measure one single concept.

END-OF-LIFE IN LONG-TERM CARE IN THE NETHERLANDS: NEW FINDINGS AND MEASUREMENT ISSUES

J.T. van der Steen¹, M. van Soest-Poortvliet¹, W. Achterberg¹, M. Ribbe¹, R. de Vet¹, S. Zimmerman², L.W. Cohen², 1. VU University Medical Center, EMGO Institute, Amsterdam, Netherlands, 2. Cecil G. Sheps Center for Health Services Research, University of North Carolina, Chapel Hill, North Carolina

Similar as the parallel US study, we retrospectively collected data from family caregivers of nursing home and residential care patients with dementia who were deceased. Additionally, we retrospectively collected data from professional caregivers and prospectively professional caregivers observed nursing home patients with dementia having a life expectancy of one week or less. Data collection involved both surveys and interviews. Measures addressed issues relevant to end-of-life and palliative care. So as to evaluate the reliability and validity of the measures, we performed standard tests, and asked respondents to report perceptions of perceived relevance and ease of answering. We observed differences in relevance and difficulty between the measures, and specifically found that measures not developed for dementia patients were perceived as less relevant.

END-OF-LIFE IN LONG-TERM CARE IN THE UNITED STATES: NEW FINDINGS AND MEASUREMENT ISSUES

S. Zimmerman¹, L.W. Cohen¹, D. Reed¹, P. Sloane¹, L. Hanson¹, J. Cagle¹, J.T. van der Steen², M. van Soest-Poortvliet², *1. Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. VU University Medical Center, EMGO Institute, Amsterdam, Netherlands*

This project administered nine measures of care and dying to 264 family caregivers of decedents from 118 nursing homes and residential care/assisted living communities in four states. One-third of residents were unconscious before death; one quarter were alone when they died; and almost one-half were on hospice. When rating the relevance and ease of use of items from the existing measures, those that captured a longer period of time (e.g., three months) were generally thought to be more relevant although more difficult to answer than those that captured a shorter period (e.g., three days before death). Also, it was challenging to respond to questions about healthcare providers due to the many such individuals who provide care. In addition to providing scores for each individual scale, the results of an “omnibus” factor analysis of all items that is grounded on a conceptual framework that separates care from outcomes will be presented.

DIFFERENCES IN THE END-OF-LIFE EXPERIENCE IN THE UNITED STATES AND NETHERLANDS

L.W. Cohen¹, M. Van Soest-Poortvliet², J.T. van der Steen², H. de Vet², D. Reed¹, S. Zimmerman¹, *1. Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. VU University Medical Center, EMGO Institute, Amsterdam, Netherlands*

We administered nine measures of end-of-life care and outcomes to family and other respondents of LTC decedents in the U.S. and Netherlands, and also asked these respondents to rate the perceived difficulty and relevance of the items. Overall, U.S. and Dutch respondents reported high quality of care and quality of dying, although there was a general tendency for U.S. respondents to rate all areas more favourably. It is possible that sampling differences, translation effects, and social desirability influenced this response pattern. However, it may also be that country-specific differences in the health care systems and care provision contributed to the observed differences. These interpretations and their implications for policy, practice, and further research will be discussed.

SESSION 250 (SYMPOSIUM)

REPORTS FROM STATE UNITS ON AGING: SHIFTING THE BALANCE TO HOME- AND COMMUNITY-BASED SERVICES (HCBS)

Chair: L. Noelker, *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

Discussant: R. Browdie, *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

This symposium reports on progress made by the states to shift the balance of Medicaid dollars from nursing homes to Home and Community Based Services (HCBS) programs. The Benjamin Rose Institute sought to gather information from 50 State Units on Aging (SUAs) and the District of Columbia (DC) and profile HCBS programs targeted to the elderly and adults with physical disabilities. In contrast to previous studies examining a smaller number of states or HCBS funded under a specific source, this study provides a broader understanding of each state's infrastructure for HCBS. Included are the role of SUAs in HCBS programs and the scope and components of HCBS under multiple funding streams. Information was collected from 48 SUAs and DC in two phases to create the individual state profiles and conduct cross-state comparisons of HCBS programs. An overview of the project is presented detailing its design and methods, followed by findings on services offered under Medicaid waivers, Title III, state-funded programs, state Medi-

caid plan, and CMS grants and demonstrations. Findings on features of Single Entry Points (ADRCs) and consumer-directed programs are presented along with their role in balancing HCBS. Key policy-related findings and recommendations are discussed, such as the complex structures states have developed to manage the broad range of programs and funding streams and infrequent reports about some services (e.g., mental health, employment) in HCBS programs. The discussants address the salience of the findings and policy recommendations for helping states in their efforts to balance long term care options.

AGING STRATEGIC ALIGNMENT PROJECT: OVERVIEW AND DESIGN

M. Castora, *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

The goal of this presentation is to provide a reference for the overall symposium. First, the notion of rebalancing will be discussed; what does rebalancing mean, why rebalance? Next, the presentation will focus on introducing the Aging Strategic Alignment Project, including the purpose of the project which was to obtain information from the State Units on Aging (SUAs) about all HCBS programs for the elderly and adults with physical disabilities and then profile each state. The discussion will include how participants were recruited and how the information was collected (i.e. online questionnaire, interview and verification process). The overall participation includes 49 out of 51 SUAs. Reaching this goal required 694 total contacts with 157 informants. The methodological challenges faced in regards the scope of information collected as well as the challenges faced in regards to the methods of data collection will shed light for future national state-level projects.

HOME- AND COMMUNITY-BASED SERVICES OFFERED TO ELDERS AND PHYSICALLY DISABLED ADULTS NATIONWIDE

M. Rose, *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

A broad array of home- and community-based services (HCBS) are offered to elders and to adults with physical disabilities under programs funded by Medicaid waivers (104 programs), CMS (42), and states (71), and through state Medicaid plans and Title III of the Older Americans Act. Data regarding 21 categories of services offered in 48 states and Washington, DC, were collected. The most frequently reported services included home health and personal care under state Medicaid plans (84% of the states), Medicaid waivers (80%), and state funding (61%); chore and homemaking services under state funding (61%); caregiver services, respite and education under CMS funding (39%); and information and referral under Title III (96%). Yet the least frequently reported, e.g., mental and behavioral health, employment support and health promotion services, may also be critical to shifting the balance of Medicaid expenditures from institutional to community-based care.

ISSUES RELATED TO REBALANCING LONG-TERM CARE: DEVELOPMENT OF SINGLE POINTS OF ENTRY AND CONSUMER DIRECTION

F. Ejaz, *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

This presentation draws on data describing how HCBS are provided in 48 states and D.C. We focused on two key issues related to rebalancing long-term care (LTC) in favor of increasing HCBS to help consumers avoid institutionalization: a) the creation of Aging and Disability Resource Centers (ADRCs) or Single Entry Points (SEPs) to coordinate access to information and referral; and, b) the extent to which HCBS allow consumer direction to help consumers choose providers, including family members. Fourteen states reported having statewide ADRCs/SEPs, and eight indicated that they planned to become statewide. Twenty-six states reported using consumer directed options in two-thirds of their HCBS programs. Eleven states reported that all of their HCBS programs offered consumer direction. Such findings indicate that some

states are making important strides towards rebalancing LTC by coordinating information and providing consumers with more choices.

POLICY APPROACHES TO HELP STATES STRENGTHEN INFRASTRUCTURE FOR HCBS

L. Noelker, *Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

Information was obtained from 157 persons (a total of 694 contacts) with the 48 states and DC to compile HCBS profiles because the programs crosscut multiple agencies and employees had specific areas of expertise. The results underscore the complexity of state structures for managing HCBS programs, raising issues about resource expenditures and operational efficiencies. They suggest federal agencies might consider both financial incentives and program requirements that encourage states to coordinate and streamline their systems. While states offer a broad array of HCBS services for elderly and adults with disabilities under the five funding streams, certain services were infrequently reported. These include mental and behavioral health, employment, and health promotion services. Some policy recommendations to help states broaden the availability of these services include having the ADRCs screen, assess and refer for these services and advocacy for legislation that promotes work opportunities for older adults.

SESSION 255 (SYMPOSIUM)

THE CREATIVE USE OF QUALITATIVE RESEARCH METHODS

Chair: A.B. Kydd, *Health Nursing and Midwifery, University of the West of Scotland, Hamilton, Lanarkshire, United Kingdom*

Discussant: L.K. Donorfio, *University of Connecticut, Waterbury, Connecticut*

Qualitative research, to the uninitiated, may appear to consist of interviews with a small number of participants, either as individuals or in focus groups. However, there are a wealth of creative qualitative data collection strategies used to explore and uncover meanings and understandings in context. This symposium presents a wide variety of exciting and creative qualitative methods by experienced UK researchers. The speakers will outline the methods they used and the challenges they faced. The first study outlines an eight partner EU project consisting of 560 interviews in 7 languages. Biographies coupled with visual aids is presented in the second study, case studies on life intersections and clothing in the third study, interviewing couples - together and individually on the management of household money in the fourth study, and finally, the fifth study looks at the use of spider diagrams to show the relevance and importance of social support during transitions. The symposium illustrates the opportunities and possibilities open to qualitative researchers.

RESEARCHING THE DRESSED BODY: CLOTHING, AGE AND THE BODY

J. Twigg, *Sociology and Social Policy, University of Kent, Canterbury, United Kingdom*

The paper discusses the methodological issues raised by attempting to explore older women's views and experiences of dress. The research is located in debates on identity, the body and the changing nature of old age in late modernity. Clothes mediate between the body and the social world. They thus offer fertile territory in which to discuss the constitution of age and the possible role of cultural artefacts in it. The main part of the study was based on qualitative interviews with older women, aged 55 and upwards. But clothing is an inherently visual and concrete subject. In order to reflect this, photographs were taken of the respondents in their own homes, who were then asked to comment on what they were wearing. Garments discussed in the interviews were also photographed. The paper will address the methodological and practical issues raised by this aspect of the study.

QUALITATIVE METHODOLOGY IN A MULTI-LINGUAL, MULTI-CULTURAL CONTEXT: THE CHALLENGES AND REWARDS

K. Davidson, S. Arber, *Sociology, University of Surrey, Guildford, United Kingdom*

This paper describes the complexities of co-ordinating qualitative methodology for the eight partner, European Union research project "Senior Food - QOL". The authors led a WorkPackage which examined the role of food in formal and informal networks in later life. Semi-structured interview schedules and coding trees were created and then translated into the language of the participating countries: Germany, Italy, Poland, Portugal, Spain and Sweden. Eighty interviews were carried out and initially analysed in each country: a total of 560 in 7 languages. With the aid of the software package MAXqda, the principal themes and concepts were identified, translated into English and sent to the authors for cross-cultural analyses. We found the greatest challenge was in trying to measure linguistic and cultural equivalence in such rich and diverse data. However, excellent communication and dedication of all the research partners allowed us invaluable insight into multi-cultural similarities and differences in Europe.

THE USE OF VISUAL IMAGES TO ELICIT INSIGHTS INTO AGEING BODIES

W. Martin, *School of Health and Social Care, University of Reading, Reading, United Kingdom*

The aim of this paper is to explore how the development of a visual methodology can elicit insights into social identities, ageing bodies and daily lives. With illustrations from data, this paper will first report findings from a study that explored visual images associated with health, risk and well-being targeted at people aged 50 years and over. It will be shown that two themes emerged: 'active ageing' and 'health, risk and dependency'. Perceptions of risk were heightened by intersecting images of domesticity with symbols of risk, danger and alarm. Gender, ageing and the body were further intertwined within these visual images. Second, the paper will show how visual images can be incorporated into biographical interviews. The method of photo-elicitation not only facilitated participants to reflect on their own meanings and identities associated with ageing and bodies, but highlighted the significance of their biographies to the interpretation of visual images.

INTERVIEWING OLDER COUPLES: PRESENTATION OF SELF AND COUPLEDOM IN JOINT AND SEPARATE INTERVIEWS

D. Price, D. Bisdee, T.I. Daly, *Institute of Gerontology, King's College London, London, United Kingdom*

Interviews are understood by qualitative researchers as a site for the construction of identity, and as a site of collaborative co-production of data between interviewer and interviewee concerned as much with the present and future as the past. As part of a multi-methods ESRC project 'Behind Closed Doors: Older Couples and the Management of Household Money', 45 older couples were interviewed about money practices, jointly by a male and female researcher together, and then separately by the researchers in individual interviews. This paper considers the significance and meaning of the presentation of 'coupledom' by older people in these interview contexts. We reflect on how older couples use their descriptions of money practices within the interviews as a means by which they create a joint narrative to the outside world (in the form of the researchers) of successful coupledom, and the extent to which these narratives constrain accounts of money practices.

INVESTIGATING CHANGES IN SOCIAL NETWORKS IN MARITAL STATUS TRANSITIONS USING QUALITATIVE METHODS

K.M. Bennett, L.K. Soulsby, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Social networks, social relationships and sources of social support are known to change as a consequence of transitions into and out of marriage. However, the challenge in investigating these is to avoid a boring, repetitive interview. We retrospectively interviewed twenty men and women who experienced transitions into marriage and out of marriage through widowhood and divorce, with married controls. Participants drew a spider diagram highlighting the members of their social networks and providers of social support before transition. Interviews focussed on social relationships, support and wellbeing. Next, participants were asked to redraw the diagram to represent post transition and were interviewed about the changes that had occurred. The whole process was recorded and transcribed. The transcribed interviews combined with the before and after diagrams provided fruitful data. The results demonstrated that those entering marriage increased their social networks whilst those leaving marriage found their networks to shrink.

SESSION 260 (SYMPOSIUM)

THE GREENHOUSE MODEL : AN OVERVIEW WITH INSIGHTS INTO WORKFLOW AND THE ROLE OF THE NURSE

Chair: *B.J. Bowers, Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

Discussant: *R. Stone, Institute for the Future of Aging Services, American Association of Homes and Services for the Aging, Washington DC, District of Columbia*

In an effort to increase both quality of care and quality of life for nursing home residents while also creating an environment that supports and nurtures the staff, culture change initiatives have been widely developed and embraced. Although adopted widely throughout the industry, little is known about how these models differ from one another, the processes used to implement culture change initiatives, their impact on resident care and quality of life, and how the work might differ from that in traditional nursing home settings. This symposium will present an overview of The GREENHOUSE Model of nursing home culture change and the findings from two recent studies of GREENHOUSE HOMES. Both studies were supported by the Robert Wood Johnson Foundation. Both studies included extensive interviews and site visits to 14 skilled level GREENHOUSE Homes around the country. The first paper presents an overview of the GREENHOUSE Model, including the history, philosophy and special features of the GREENHOUSE Model. The second paper presents a workflow study. It provides a comparative analysis of traditional nursing homes with GREENHOUSE HOMES on the same campus. The third paper presents a study of the nurse's role in the GREENHOUSE Model, including how the nurse's role has evolved, how it compares with more traditional nursing home work, and the implications for resident quality of care and quality of life. Our discussant will focus on the implications of findings from these studies for the development of national and state level public policy.

THE ROLE OF THE NURSE IN THE GREENHOUSE MODEL

B.J. Bowers, K. Nolet, *Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

THE GREEN HOUSE® model is designed to create a nurturing environment for both residents and workers in nursing homes while also providing high quality care. One of the most interesting and significant GREEN HOUSE® innovations is the shift in the nurse's role from general unit manager and supervisor of front line staff to that of a clinical care consultant. This project explored the role of the nurse in current THE GREEN HOUSE® skilled nursing homes, including variations in

how the nursing role has been implemented across sites, and how these variations relate to resident care and quality of work life. Over 80 staff were interviewed. This discussion includes: a description of four different models used to implement the GREENHOUSE model and a discussion of the implications of each model for: care practices, staff development, staffing, communication between nurses and Shahbazim resident quality of life and work life quality.

THE GREEN HOUSE PROJECT: TRUE TALES OF TRANSFORMATION

A. Ortigara, *THE GREEN HOUSE Project, NCB Capital Impact, Tinley Park, Illinois*

THE GREEN HOUSE® model is a de-institutionalization effort that restores individuals to a home in the community. It combines small homes with the full range of personal care and clinical services expected in high-quality nursing homes. Green House® homes typically are licensed as nursing homes but may be created under assisted living or other residential care regulations under certain circumstances. The Green House model of elder care is a total re-envisioning of a skilled nursing home creating an intentional community to support the most positive elderhood and work life possible. To achieve these goals, the model changes the philosophy of care, staffing assumptions, organizational configuration, and architecture.

ANALYSIS OF NURSE AIDE WORKFLOW AND ASSOCIATED COSTS AMONG GREEN HOUSE SITES

S. Sharkey, *Health Management Strategies, Austin, Texas*

The principal objective of this Workflow study was to understand how workflow in the Green House model compares to workflow in the traditional nursing home. Specifically, the study focused on several core processes related to daily direct and indirect care for the elderly, the variation in workflow across Green House sites, and cost differences based on workflow findings. Data were collected from 14 Green Homes and 13 traditional nursing facilities. Findings related to nurse aide direct care time per elder, elder meal process experience, and staff feedback will be shared.

SESSION 265 (POSTER)

TRAINING STUDENTS AND CHANGING ATTITUDES - POSTER

EVALUATION OF A MODEL RETIREMENT COMMUNITY THAT TRAINS GERONTOLOGY STUDENTS IN A RESIDENTIAL PROGRAM

A. Chandra, *1. UC Berkeley, Berkeley, California, 2. UCSF, San Francisco, California*

Objectives The goal of this study was to qualitatively evaluate the extent to which a residential working student program, hosted by the retirement community of interest, met its stated objectives, such as social interaction, gerontology training, increased research on-site, cost effectiveness, and sustainability. This student program is the oldest of two such in the nation, and had never been systematically studied. **Methods** Fifty interviews were conducted with residents, working students, employees, and key informants. Interviews were supplemented by direct participant observation and document analysis of historical and financial data. Using organizational theory and adapted grounded theory methodologies, data were analyzed to determine whether program goals were being met, and to identify the ways in which the program affected the working students and residents on a daily basis. **Findings** Four goals for the student program were identified by the retirement community and its partner university: improving residents' social interactions, bringing in research, increasing publicity, and training future gerontologists. All four goals were at least partially met; however, those concerning residents' social interaction and students' training were better met than

those stemming from partnership with the university. In addition, the program was both financially feasible and sustainable. **Discussion** Given that our aging society has prompted gerontology educators to focus on experiential learning, and that intergenerational relationships can address elders' social isolation and lack of support, this working student program is a promising model for sustainable learning and positive interactions between residents and students. It may be applicable to other, similar retirement settings.

TRAINING GERIATRIC SOCIAL WORKERS FOR NEW MARKET REALITIES

L. Vinton, J. Hinterlong, *Florida State University, Tallahassee, Florida*

The need for geriatric social workers to meet demographically-related new market realities is well-documented. The Live Oak Geriatric Practicum Partnership Program ("Program") is a Hartford Partnership Program for Aging Education. Over three years, the Program provided 34 students with intensive preparation for positions in health, mental health, and social services agencies that serve elders and caregivers. The Program employed two models: 1) alternating—students alternated between at least two sites; and 2) consecutive—one after the other. An objective was to expose students to elders with various functional levels. Two professors specializing in geriatric social work provided instruction and field supervision. The Geriatric Competency Scale II was administered as a pre-posttest. It measures knowledge of aging for geriatric social work, knowledge of services for older adults, and skills. Results after two years showed that overall pre-posttest change in terms of knowledge was not significant, but almost all students had taken aging courses prior to their internships. On the other hand, on a scale of 1 to 5 (1=not skilled; 2=beginning; 3=moderate; 4=advanced; 5=expert skill), increases in self-rated competency scores were seen for all domains: values, ethics and theoretical perspectives (2.81-3.64); assessment (2.53-3.62); intervention (2.31-3.40); and aging services, programs and policies (1.72-2.55). Success was also evidenced by employment. Students went on to work in hospice, hospital, nursing home, respite, community-based agency, and state and area agency on aging settings; thus, it appears that an intensive, rotational geriatric training program was effective in training social workers for new market realities.

WHAT DO BOOMERS WANT? A NATURALISTIC ANALYSIS OF WEBSITE BLOG TRAFFIC

D. Heiser¹, R.F. Bornstein², L. Heiser³, A. Goldman⁴, B. Pierson⁵, *1. Research, Thinkscan, Kew Gardens, New York, 2. Adelphi University, Garden City, New York, 3. Hei-Res, Inc., Conyers, Georgia, 4. ImagineAge Blog, New York, New York, 5. ImagineAge Blog, New York, New York*

To determine what issues are of greatest concern to members of the post World War II ("Boomer") generation we conducted a naturalistic analysis of website traffic during the first 44 days following launch of a Boomer-oriented website: ImagineAge.com. Blogs were posted in five broad categories: Healthy, Wealthy, Wise, Trends, and Workshops. During the initial 44-day period there were 7,280 page visits, and more than 3,954 visits to the blogs in these five categories, with an average of 165 page visits per day. The most widely-accessed blogs were in the Healthy category (49%); these included discussions of stress, caregiving, psychotherapy, and medical tests (i.e., mammograms). The Wise and Trend Categories each had about 15% of the visits (blog topics in these areas included social networking, email management, and new technology trends). Next, 12% of the visits were to the Wealthy category, which included topics such as 401ks, the current state of the economy, and money management. Finally, 9% of visits were to the Workshops category (e.g., computer basics for boomers). Visits increased steadily over time for all categories. These findings suggest that there is strong interest among boomers in learning about psychology, finance, technology, and health related topics. Future analyses will examine differences in

topic-specific interest as a function of gender and other demographic variables.

YOU GO GIRL: WOMEN'S EMERGING POSITIVE ATTITUDES TOWARD AGING

C. Clark¹, P.W. Foos², I.M. Wright², *1. Psychology, Queens University of Charlotte, Charlotte, North Carolina, 2. University of North Carolina at Charlotte, Charlotte, North Carolina*

Attitudes toward aging have continued to evolve as society changes. How we feel about our own aging has changed as longevity and the older population have increased. Recent work has suggested that fear of aging is influenced by education, income, race, age, and locus of control. Less clear is the role of gender in outlook on aging. Some research has found that men and women differ in their views of old age (women more negative than men) while others have found no differences. The present report, part of a larger study on attitudes toward aging, sampled 633 women and 345 men (N = 978) on a number of variables related to aging attitudes. Both men and women were more likely to say that old age is a happy rather than unhappy time, $X^2(2) = 5.91, p = .05$. There were no significant differences in answers to the direct question of fearing growing old. However, women were less likely to dread looking old ($F(1, 952) = 7.05, p = .008$) and more likely to expect to feel good about life when old ($F(1, 958) = 4.34, p = .038$). These findings contradict both previous findings and popular opinion that women see themselves aging negatively. Findings are discussed in relation to family social ties (stronger in women) and experiences caring for older persons (higher in women) reported in the survey. Perhaps, these and other experiences are encouraging women to embrace their futures more than they did in the past.

EXPOSURE TO DEMENTIA: CAPTURING STUDENTS' ATTITUDES ABOUT OLDER ADULTS WITH DEMENTIA

L.K. Manning, H.M. Gibbons, *Sociology/Gerontology, Miami University, Oxford, Ohio*

This paper explores and examines the impact of intergenerational interaction between individuals with dementia and college students. A mixed-method study was conducted examining and exploring college students' attitudes toward community service, as well as their attitudes toward working with cognitively impaired older adults. Students in introductory gerontology courses participated in a service-learning course with cognitively impaired older adults for a period of ten weeks. All students in this introductory gerontology course were surveyed to test their attitudes and perceptions of older adults and cognitively impaired older adults prior to service. At the end of twelve weeks, students were given a post-test to assess their level of attitudinal change regarding aging and older adults with dementia. In addition, students were interviewed to further explore their attitudes and perceptions about aging and service learning with cognitively impaired older adults. The findings of this study explore and examine the extent to which exposure to service learning and cognitively impaired older adults changes college students' attitude and perceptions of aging.

ASSESSING ATTITUDES TOWARD OLDER ADULTS: ASSESSMENT OF THE REFINED AGING SEMANTIC DIFFERENTIAL

E. Gonzales, J. Tan, N. Morrow-Howell, *George Warren Brown School of Social Work, Washington University in St. Louis, St. Louis, Missouri*

PURPOSE: The Aging Semantic Differential (ASD) by Rosencrantz and McNevin (1969) is the most widely used instrument to assess stereotypic attitudes toward older adults. Polizzi (2002, 2003) updated the ASD with current adjectives and reduced the instrument to 24-observed variables for a single latent factor, Attitude (i.e. friendly, nice, patient). Consequently, factors Autonomous-Dependent (i.e. independent, secure, organized, certain) and Instrumental-Ineffective (i.e. productive, busy, active) were removed. We examine the psychometric properties of this

major instrument in an intervention. **DESIGN AND METHODS:** The instrument was administered to 208 medical students (average age 24, 61% female, 63% Caucasian) that participated in a national pilot project, Vital Visionaries, funded by NIA and sponsored by OASIS. Confirmatory factor analysis using structural equation modeling was used. We also gathered qualitative data that captured medical students' stereotypes of older adults. **RESULTS:** The instrument had good internal consistency, Cronbach Alpha of .89. However, SEM indices suggest a one-factor structure to have poor fit. Further, qualitative analysis suggests that medical students evaluated older adults on the two excluded latent factors, Autonomous-Dependent and Instrumental-Ineffective. A general rule of thumb in SEM suggests that three observed variables are needed for one latent factor. Thus, we suggest that the latent factor Attitude can be assessed with fewer observed items, thereby creating room for the addition of the two other latent factors and their associated observed items. The resulting instrument could be just as short but offer a more comprehensive assessment of the stereotypic attitudes toward the aged.

SESSION 270 (PAPER)

TRANSPORTATION

CAN YOU GET A RIDE WHEN YOU NEED ONE? MEASUREMENT OF COMMUNITY MOBILITY SELF-EFFICACY

R. Fortinsky¹, J. Vine², L. Hennig², K. Freund², 1. Center on Aging, University of Connecticut Health Center, Farmington, Connecticut, 2. ITNAmerica®, Westbrook, Maine

Background: When age-associated disabilities or visual impairments in adulthood prevent or limit driving, individuals must arrange personal transportation to support community mobility. Although community mobility for a variety of purposes is essential to independent living, no known measurement strategy taps self-reported confidence, or self-efficacy, in arranging rides for common specific purposes. **Objective:** We report on the development and psychometric properties of a new multi-item community mobility self-efficacy (CMSE) measure for use as a research and evaluation tool. **Methods:** We developed the CMSE measure as part of a larger study evaluating effects of subscribing to the Independent Transportation Network®, an automobile-based, demand-response transportation service, on older adults and younger adults with visual impairment in five U.S. communities. Subjects were asked items in telephone interviews about degree of confidence in arranging rides for purposes including grocery shopping, medical appointments, social activities, and to "go somewhere at night or after dark"; item confidence was reported on a 1-10 scale. **Results:** 75 subjects completing 8 CMSE items are included (83% female; mean age=76+13.3 years; >90% White). Item means ranged from 5.0+3.0 for arranging rides at night to 7.4+2.7 for arranging medical appointments. Internal consistency of the 8 items was high (Cronbach's alpha=0.93) and a single factor solution was obtained. Total CMSE score mean was 52.7+19.3. Mean scores for current drivers (58.4) and non-drivers (49.7) differed considerably ($p=.06$). **Conclusions:** The CMSE measure shows promising psychometric properties and could be used as an outcome measure among older driving-impaired or non-driving individuals exposed to alternative transportation options.

AGING AND DISABILITY AWARENESS TRAINING FOR DRIVERS OF A METROPOLITAN TAXI COMPANY

L. Reynolds, Occupational Therapy, Spalding University, Louisville, Kentucky

With the population of those 50 and older expected to double by the year 2030, and many aging with disabilities, it is clear that transportation for seniors is an important issue. As age increases and health status declines, elders seek alternatives to driving in order to maintain their

connection with the community, socialization, and regular doctor visits. Of those seniors no longer driving, 19% report using public transportation and 10% using taxi cabs (AARP, 2002). In the US, 84% of older individuals report one or more incidents of ageism (Palmore, 2004). With the increasing need for public transportation among seniors, and the prevalence of ageism, it is important that public transportation companies are educated in how best to serve seniors and those aging with disabilities. A scholarship received from the National Center on Senior Transportation allowed the development of a training program to address the educational need of local taxi drivers. The Aging and Disability Awareness Training (ADAT) program was developed for drivers of Louisville Transportation Company in Louisville, Kentucky. ADAT consists of three training modules, provided over 3 separate one and a half hour sessions, using learning methods noted in the research as most successful in promoting disability awareness. Master's level occupational therapy students in the Auerbach School of Occupational Therapy, as an experiential learning component of a course on Aging and Community Practice, along with the project director, provided these trainings. Pre-test, post-test measures along with a course evaluation were used to determine training effectiveness.

MAPPING THE OLDER DRIVER EVALUATION PROCESS: A PILOT STUDY OF TRANSPORTATION OPTIONS AND COMMUNICATION

J. Vine¹, K. Freund¹, G. Odenheimer², R. Fortinsky³, N.M. Silverstein⁴, 1. Research & Evaluation, ITNAmerica, Westbrook, Maine, 2. University of Oklahoma Health Sciences Center, Donald W Reynolds Dept of Geriatric Medicine, Oklahoma City, Oklahoma, 3. Center on Aging, University of Connecticut Health Center, Farmington, Connecticut, 4. University of Massachusetts Boston, College of Public and Community Service, Boston, Massachusetts

Driving is such a powerful symbol of independence, driving retirement can be a difficult and emotional discussion for older people. Typically, any communication about alternatives to driving takes place at the end of the driver evaluation process if it is determined that the older person can no longer drive. Researchers conducted a pilot study to document the older driver evaluation process with a focus on how alternative transportation might impact the older adult's transition from driving. They interviewed seven driving evaluation specialists in Maine and gathered data from one physician from July-December 2008 during routine physical exams of 16 patients (9 male, 7 female; 67-89 years); from two occupational therapists from October 2007-June 2008 during driving evaluations of 18 patients (14 male, 4 female; 61-91 years); and from one classroom driving instructor during 10 Mature Operators classes from October 2007-April 2008. Occupational therapists, physicians, and driving instructors incorporated alternative transportation information into their routine driving evaluation and documented those discussions using uniform reporting forms. In-depth interviews were conducted with each evaluation specialist before and after alternative transportation information was incorporated into their driving evaluation. Researchers found that the driving evaluation specialists discussed transportation alternatives more often and earlier than they did prior to the intervention, that older drivers are more receptive to the discussion when it occurs early in the process and before they are told they must stop driving entirely and that the presence of a family member provides support and facilitates the transportation plan the evaluation specialist recommends.

WELL-BEING AND MENTAL HEALTH

RELIGIOSITY AND PSYCHOLOGICAL WELL-BEING AMONG ASIAN AMERICAN ELDERS

A. Mui, E. Lee, I. Mui, *Columbia University School of Social Work, New York, New York*

This study examines the association among religiosity, depressive symptoms, and life satisfaction in a regional probability sample ($n = 305$) of three groups of Asian immigrant elders (Chinese, Indian, and Korean) in the East Coast. Findings suggest that 100% of the sample were immigrants, their mean age was about 73 years, and approximately 85% of them reported an affiliation with an organized religion. The study found support for the importance of religion within the Asian immigrant communities, as a majority of surveyed Asian immigrant elders believed that religion was very important in their lives. Data also suggest that religion was a powerful spiritual coping resource for them. Multiple regression analyses indicated that the Asian immigrant elderly respondents' sense of religiosity was associated with a lower level of depressive symptoms and a higher level of life satisfaction. The link between religiosity and depression suggests that most immigrants continue or rebuild their spiritual lives in the new country. Religious interpretation of stressful life events may have power to bring believers to a state of inner peace or acceptance of a situation beyond their control and stressful life events associated with aging process. The finding points to the importance of carefully considering the spiritual needs of Chinese, Indian, and Korean and other Asian elderly populations when planning social and mental health support services.

THREE DIMENSIONS OF PROMOTING VITAL INVOLVEMENT (PVI)

H.Q. Kivnick, R. Kilabera, *University of Minnesota, Minneapolis, Minnesota*

Vital Involvement Practice is an approach to direct practice with elders, in which the goal of intervention shifts away from accomplishing a particular task for the elder client. The goal becomes supporting the elder to experience a meaningful daily life – including exercising personal strengths, engaging in mutually satisfying relationships, and intentionally contributing to others. The essential “atom” of Vital Involvement Practice is the construct of vital involvement (VI), i.e., meaningful engagement with the world outside the self (Erikson et al., 1986; Kivnick & Stoffel, 2005). Vital involvement is enacted whenever a person participates in meaningful activity or interaction with any element(s) of the environment. The “molecule” of Vital Involvement Practice is an instance of Promoting Vital Involvement (PVI) – in which a practitioner takes some action that enables an elder to engage in vital involvement. The researchers collected 155 written reports of PVI instances, personally practiced or observed, from staff in a sixty-bed ALF. Using a thematic analytic strategy derived from the grounded theory approach to qualitative analysis (Corbin & Strauss, 2007), the researchers have identified three separate dimensions of PVI instances: Intricacy; Inertia; Time span. These dimensions help clarify the interpersonal dynamics of promoting vital involvement. Their internal variabilities offer the possibility of greatly enhanced understanding of such practice aspects of PVI as staff training and supervising; facility design; client training and participation; client outcome. The poster exemplifies PVI instances, describes the conceptual structure of each dimension, and illustrates different positions on each dimension's range of variability.

EMBODIED GENDERED AGEING: ON (AGE) CODED BODIES

C. Krekula, *Dept. of Social Studies, Karlstad University, Karlstad, Sweden*

In this paper I will discuss how embodied experiences construct gendered conditions for healthy aging. The data consist of three focus group

interviews and twelve individual interviews with women in ages 70 years and older. I will draw attention to a body-related paradox on old women's relation to their bodies. On the one hand, we have the assumption that women's aging is influenced by beauty norms that praise youth, and on the other, studies showing that older women's attitudes towards their bodies are far more positive than has been suggested. I will illustrate the presence of double bodily dimensions, that are used to a greater or less extent in performances of identities. I will also discuss the body as a process interpreted over time and space and double perspectives on bodies, e.g. the presence of many different reference groups. Analyses with the concept of age coding – practices of distinction that are based on and preserve representations of actions, phenomena and characteristics as associated with and applicable to defined ages – shed the light on how individuals take advantage of manifold and ambivalent norms and reference groups in order to construct embodied gendered aged identities.

DIMENSIONS OF RELIGIOSITY: IMPACT ON DEPRESSION AMONG LOW INCOME PERSONS WITH DIABETES

S.M. Cummings¹, B. Kilbourne², *1. Social Work, University of Tennessee, Nashville, Tennessee, 2. Tennessee State University, Nashville, Tennessee*

Persons with diabetes experience depression at a significantly higher rate than do their non-diabetic counterparts. The stress process model posits that chronic and acute stressors (e.g. chronic illness) and various protective factors, such as social support, influence psychological status (Turner & Lloyd, 1999). Measures of religiosity have also been incorporated into this model as protective resources. Religiosity, however, is a complex construct containing multiple dimensions. Scholars have called for a systematic examination of the separate roles that various dimensions of religiosity play on individuals' mental health and health functioning (Idler et al., 2003). The purpose of this research study was to examine the impact of multiple dimensions of religiosity on depression among a lower income population of persons with diabetes. Employing a cross-sectional design, the study focuses on a sample of diabetics from low-income neighborhoods ($n=222$). The majority was African American. The impact of five distinct dimensions of religiosity (religious belief, religious reading, prayer, religious attendance and religious discourse) on depressive symptoms was analyzed. Hierarchical linear regression revealed robust and inverse associations between four out of five dimensions of religiosity and depression. Prayer ($b = -3.49$, $B = -0.15$), religious reading ($b = -0.96$, $B = -0.15$), religious attendance ($b = -1.31$, $B = -0.17$) and religious belief ($b = -0.42$, $B = -0.21$) proved protective against depressive symptoms. The analyses suggest that religious resources increase psychological resiliency among those managing the chronic stress of diabetes. Pedagogical and practice implications are discussed.

ASSESSING INTERPERSONAL TRAUMA IN OLDER WOMEN

C.L. Bright¹, S.E. Bowland², *1. University of Maryland, Baltimore, Maryland, 2. Social Work, University of Louisville, Louisville, Kentucky*

Interpersonal traumatic experiences (childhood abuse, sexual assault, and intimate partner violence) are common in older adult women and associated with negative short-term and long-term health and mental health outcomes. Thus, assessing trauma symptoms is essential to providing adequate services. This paper describes the Posttraumatic Diagnostic Scale (Foa, 1995), the challenges of measuring trauma in older women, and reports data about the appropriateness of this instrument for use in this population. The data was drawn from a small sample of adult women ($n = 33$) who took the PDS as part of a larger intervention study. Symptom severity scores are examined and discussed, as they did not consistently reflect the experiences of the sample. Eschewing a clinical interview to assess the impact of interpersonal trauma in older adult women may be a mistake.

THOUGHTS OF SUICIDE OF ELDERLY : MEDIATING EFFECT OF DEPRESSION AND MODERATING EFFECT OF SELF-ESTEEM

E. Park, S.U. Kim, *Yonsei University, Seoul, Korea, South*

As Korea is undergoing rapid demographic change where there are more elderly than ever before, percentage of elderly committing suicide has reached a critical level. Following the trend where elderly is moving to small and medium-sized cities, this research, with the aim of increasing the quality of life for elderly living in cities, examines the elements that can prevent suicide. This research used “an examination on the actual condition of depression of elderly and thoughts of suicides,” a study conducted in January 2009 targeting 800 (over 50 of Seongnam city in Korea). DV was thoughts of suicide and measured using Suicidal Ideation Questionnaire (SIQ) scale. IVs were social activity involvement level, abuse level, IADL level and economic satisfaction. MV was depression level and for moderating variable, self-esteem. CVs were gender, age, education, religion, marriage status, type of household, residential type and length of residence. We used SPSS 12.0 Package and performed multi-regression. First, the result concerning mediation effect of depression level, we found that length of residence, IADL level, abuse level, and economic satisfaction had direct influences on thoughts of suicides and, whereas, higher the level of depression, the higher the frequency of suicide thoughts, verifying the partial mediation effect of depression level. Second, the result concerning moderating effect of self-esteem, IADL level, abuse level and economic satisfaction had direct influences on thoughts of suicides, and as interaction of self-esteem and economic satisfaction caused reduction in the frequency of suicide thoughts, it verified the moderating effect of self-esteem.

SESSION 277 (SYMPOSIUM)

NIA SYMPOSIUM: WHERE RESEARCH COMES OF AGE - ADVANCES, INITIATIVES & TRAINING OPPORTUNITIES

Chair: *R.J. Hodes, National Institute on Aging, Bethesda, Maryland*

Discussant: *J. Harden, National Institute on Aging, Bethesda, Maryland*

This interactive symposium will provide an overview of recent research advances to include creative strategies for healthy aging, initiatives, funding and training opportunities at the National Institute on Aging. The NIA conducts and supports biomedical and behavioral research with a focus on understanding basic processes of aging, improving prevention and treatment of diseases and conditions common in later years, and improving the health of older persons. The NIA also supports the training and career development of scientists focusing on aging research and the development of research resources. This symposium is devoted to interactive roundtable discussions with leaders and representatives of relevant NIA divisions. Participants will have an opportunity to comment on research goals, training activities, and other related topics.

NIA SYMPOSIUM: CREATIVE & INTERACTIVE ROUNDTABLE DISCUSSIONS ON AGING

R.J. Hodes, J. Harden, F. Sierra, E. Hadley, R. Suzman, M. Morrison-Bogorad, C. Hunter, R. Barr, *National Institute on Aging, Bethesda, Maryland*

This interactive symposium affords participants the opportunity to interact with the leadership and staff of NIA extramural research divisions. The round-table discussions may focus on latest advances in research at the NIA, career development plans and issues, questions about review, and pre/post award management. Participants may prepare a one-page abstract to discuss and leave with staff for follow-up or use the time for mini-mentoring sessions as many of the leaders in extramural research communities attend this symposium. We anticipate attendance by NIA's current and last two full-time Deputy Directors: Dr. Marie Bernard, Dr. Terrie Fox Wetle and Dr. Judith Salerno. The NIA conducts and supports biomedical and behavioral research with a focus on understanding basic processes of aging, improving prevention and treatment of diseases and

conditions common in later years, and improving the health of older persons. Come join the fun and talk about creative next steps in your career.

THE CHANGING LANDSCAPE AT NIA: NAVIGATION AIDS FOR GRANT APPLICANTS

R. Barr, *National Institute on Aging, Bethesda, Maryland*

The National Institute on Aging (part of the National Institutes of Health and of the Department of Health and Human Services) continues to offer a range of programs and grant opportunities tailored to students and investigators across a broad range of research fields. Human resource priorities include particular consideration for Early Stage Investigators while scientific priorities are captured in initiatives published in the NIH Guide. Although these priorities do help to shape the directions of research on aging, most of our funding is for investigator-initiated applications that compete well in peer review. Against this relative constant of funding opportunities, NIA, as part of NIH, has participated in several Recovery Act initiatives, is reshaping how peer review is conducted, and is changing the length and structure of applications submitted. These changes will be detailed in this presentation, and guidance will be provided on how and when to submit applications for funding consideration. The presentation will also identify all open competitions for research funds in which NIA is a primary sponsor.

SESSION 280 (SYMPOSIUM)

GRECC SYMPOSIUM: SKELETAL MUSCLE REGENERATIVE FUNCTION IN AGING AND DISEASE

Chair: *M.M. Bamman, GRECC and Physiology and Biophysics,*

Birmingham VA Medical Center and University of Alabama at Birmingham, Birmingham, Alabama

Sarcopenia, which results from motor unit loss and type II myofiber atrophy, is a universal consequence of aging. The onset and progression of sarcopenia among old may largely result from age-related impairments in muscle regenerative capacity—a widely known phenomenon that has been demonstrated with advancing age in both human and animal model systems. Regeneration impairment is a significant problem for veterans transitioning toward frailty or attempting to recover from joint repair/replacement surgery, as muscle atrophy is exacerbated in these patients and they are unable to restore muscle mass to pre-surgery levels despite intensive physical efforts. Further, disease states such as cancer, rheumatoid arthritis, HIV, COPD, and diabetes compound age-related atrophy by inducing varying degrees of muscle metabolic dysfunction and cachexia. The goal of this symposium is to provide the attendee with an overview of cellular and molecular mechanisms causing muscle regeneration impairment with increasing age in both healthy and diseased. Dr. Richardson will begin the symposium by describing the metabolic and angiogenic limitations of aging muscle to a standardized stress (i.e. endurance exercise). Dr. Dennis will then describe components of the aging muscle transcriptome that may be important indices of the muscle's ability to adapt to exogenous stress or damage. Dr. Clemens will discuss key molecular processes controlling muscle atrophy during cancer cachexia as well as a novel treatment strategy. Dr. Bamman will close the session with a discussion of satellite cell (SC) function during muscle regeneration and key factors that influence SC function in aging muscle.

MOLECULAR PATHOGENESIS OF AND NOVEL TREATMENT APPROACHES TO CANCER CACHEXIA IN MURINE MODELS

P. Clemens^{1,2}, P. Sae-Chew^{1,2}, G. Niizawa^{1,2}, *1. VA Pittsburgh Healthcare System, Pittsburgh, Pennsylvania, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Cachexia accounts for 40% of morbidity and 20% of mortality in cancer patients. In a novel mouse model of cachexia induced by PC-3

prostate adenocarcinoma cells in BALB/c nude mice we observed weight loss, a 50% reduction in muscle weights and decreased muscle fiber diameters. Elevated levels of activated nuclear factor of κ B (NF- κ B) were found in tibialis anterior and quadriceps muscles, but not in gastrocnemius muscle. In contrast, elevated levels of the phosphorylated eukaryotic initiation factor 2 α in gastrocnemius muscle suggested a greater component of cachexia was due to decreased protein synthesis in this muscle. The I κ B superrepressor (IkBSR) and the cellular caspase-8-like inhibitory protein (cFLIP) genes decreased NF- κ B activation and prevented inhibition of muscle cell differentiation induced by cancer cells in vitro. Delivery of these genes by adeno-associated viral vectors to murine cachexia models in vivo show potential to ameliorate cancer cachexia in a murine model.

MUSCLE GENE EXPRESSION IS STRONGLY CORRELATED IN OLDER ADULTS WITH RESISTANCE TRAINING OUTCOMES

R.A. Dennis^{1,2}, H. Zhu³, P. Kortebein^{1,2}, H. Bush³, J. Harvey², D.H. Sullivan^{1,2}, C. Peterson³, 1. GRECC, Central Arkansas Veterans Healthcare System, North Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 3. University of Kentucky, Lexington, Kentucky

The loss of muscle mass and strength during aging may be greater for individuals whose muscle has a diminished ability to adapt to physical demands. In order to identify candidate genes involved, quantitative mRNA analysis compared muscle of young and older adults pre and post-acute resistance exercise. Differences were seen for genes that function in tissue inflammation, growth, and remodeling. Older adults (N=8, 68 \pm 6yrs) then participated in resistance exercise training to determine if expression of the candidates was related to training outcomes. Strength gain was correlated ($P \leq 0.003$, $R \geq 0.89$) with baseline levels of insulin-like growth factor-1, matrix metalloproteinase-2, and ciliary neurotrophic factor. These results suggest that key genes in muscle can convey an adaptive advantage to certain older adults. Their function in muscle remains to be determined; however, these genes hold promise as predictive markers of training outcomes that may enable more effective design of exercise programs for older adults.

ROLE OF SATELLITE CELLS IN AGE-RELATED MUSCLE REGENERATION IMPAIRMENT

M.M. Bamman, GRECC and Physiology and Biophysics, Birmingham VA Medical Center and University of Alabama at Birmingham, Birmingham, Alabama

There is general consensus that the complex array of coordinated activities guiding developmental myogenesis—principally muscle progenitor cell (satellite cell, SC) recruitment and net muscle protein synthesis—is largely recapitulated during postnatal muscle regeneration. Identifying key mechanisms that disrupt one or both of these processes in aging muscle is essential to improve regenerative responses among old. The focus of this presentation will be on age differences in SC function during muscle regeneration following damage and during muscle “re-growth”. SCs are influenced by a host of locally expressed factors as well as endocrine factors; thus both will be discussed. Conclusions presented will be drawn from studies on humans as well as lower animals, while highlighting key similarities and differences between model systems.

SESSION 285 (SYMPOSIUM)

NONHUMAN PRIMATES: THE LEADING TRANSLATIONAL MODEL FOR INVESTIGATIONS INTO THE BIOLOGY OF HEALTHY AGING

Chair: K. Kavanagh, Pathology, Wake Forest University, Winston-Salem, North Carolina

Discussant: J.G. Herndon, Yerkes National Primate Research Center, Atlanta, Georgia

Old world monkeys are closely related to hominoids (humans and apes). This symposium will explore the potential of these primates to serve as a translational model for human aging research. Participants will discuss programming of late-life behavior and biology, the effect of age on herpes viremia, age-related metabolic derangements, changes in cognition and physical functionality. Few animal models provide opportunities to evaluate such diverse endpoints. Primate models of human aging are superior to rodents based on their genetic and biologic similarity. Comorbidity patterns in aging monkeys closely mirror that seen in humans including the spontaneous development of diabetes, hypertension, pancreatic and neurologic amyloid deposition and atherosclerosis. These are not seen in rodents without genetic manipulation, which typically is monogenic in contrast to the polygenic nature of these diseases in people and monkeys. Other advantages of monkeys include a larger size that allows more assessments; characteristics and functional sequelae of disease replicates that seen in humans; reproductive systems that model sex differences in disease development or expression; a developed central nervous system; complex social systems; and an omnivorous nature and physiology. Specific advantages of using primates to investigate aging biology and interventions includes the availability of pedigree in many colonies which allows heritability and gene-environment interaction calculations, the ability to experimentally control exposures, and cognitive assessments of complex behavior and memory. As aged primates are becoming more available for such investigations, researchers can both understand and test creative solutions to promote health during the aging process.

AGING AND COGNITION IN MONKEYS, APES, AND PEOPLE: IMPLICATIONS OF EVOLUTIONARY THEORIES OF AGING

J.G. Herndon, Yerkes National Primate Research Center, Emory University, Atlanta, Georgia

Is the long lifespan of *Homo sapiens* explained by the societal and medical progress of the past century, or is it the result of an evolutionary selection process? One idea supporting the latter view is the “Grandmother Hypothesis.” Originally proposed as an explanation of menopause, this construct has been revised to explain humans’ extreme longevity. Data from our lab suggests that long post-menopausal life is a uniquely human trait. Cognitive traits such as language and social cognitive functions may have evolved as mechanisms to compensate for age-related decline in our species in particular. This has significant implications for research in which nonhuman primates are considered as models of human cognitive aging; it also means that some processes can be studied only in humans.

A PRIMATE MODEL OF PHYSICAL FUNCTION

C.A. Shively, T.C. Register, S. Kritchevsky, J.J. Carr, J.R. Kaplan, M.J. Jorgensen, A.J. Bennett, Wake Forest University, Winston-Salem, North Carolina

Decline in physical function is a prevalent multi-system process involving changes in physical activity, and fat and muscle mass and function. Understanding the factors which lead to physical decline is essential to reducing health care costs and improving quality of life in later years. Heterogeneity of populations, and constraints on the number and type of assessments that can be done in older adults hamper our understanding of this problem. An appropriate animal model would

greatly enhance controlled studies of the factors that contribute to physical decline. A series of studies are underway with the goal of developing and validating a nonhuman primate model of functional aging. The model includes a battery of tests to evaluate body composition and physical mobility and function in old and young adult monkeys. Preliminary data from these studies describing measures of physical functioning in monkeys and their relation to body composition will be presented.

T CELL SENESENCE RESULTS IN PERSISTENT SIMIAN VARICELLA VIRUS INFECTION IN AGED RHESUS MACAQUES; A MODEL FOR HERPES ZOSTER

I. Messaoudi¹, A. Barron¹, M. Wellish², F. Engelmann¹, S. Wong¹, D.H. Gilden², R. Mahalingam², 1. *Oregon National Primate Research Center, Beaverton, Oregon*, 2. *University of Colorado Health Sciences, Denver, Colorado*

Herpes zoster (HZ, shingles) is caused by the reactivation of latent varicella zoster virus (VZV) and causes significant morbidity and sometimes mortality in the elderly. The immunological deficiencies that result in HZ remain poorly understood since VZV infection of laboratory animals does not cause disease. Our studies show that inoculation of rhesus macaques with the closely related simian varicella virus (SVV) accurately recapitulates VZV infection in humans including: generalized varicella; the development of cellular and humoral immunity; and the establishment of latency in sensory ganglia. More importantly, whereas adult rhesus macaques resolve acute SVV infection, aged animals remain persistently viremic. Whereas the SVV-specific antibody response was comparable in adult and aged animals, the SVV-specific T cell response in aged animals was delayed and reduced in magnitude. Thus, similar to clinical observations about VZV, the inability of aged animals to control SVV viremia is due to a reduced T cell response.

DIFFERENTIATING THE AGING VS. PREDIABETIC TRAJECTORIES IN MIDDLE-AGED/AGING NON HUMAN PRIMATES

B. Hansen, *University of South Florida, Tampa, Florida*

Diabetes and cardiovascular disease are preceded by a long prodrome of metabolic changes that are early manifestations of the developing diseases. Some of the features of this longitudinal transition period, when clustered together with increased adiposity, have been termed the Metabolic Syndrome, and include the earliest changes in glucose tolerance, insulin resistance, dyslipidemia, and sometimes hypertension. Additional features should also be considered to be part of this period of progressive disease development. The longitudinal trajectories of each feature in non human primates, maintained under environmentally constant conditions, clearly separate them as diseases of aging, separable from normal processes of aging. When defining the characteristics of aging per se, it is important to identify such disease related trajectories and their characteristics that are associated with but not part of normal aging processes.

TRANSLATIONAL STUDY OF THE CONSEQUENCES OF EARLY LIFE IMPOVERISHMENT ON HEALTH ACROSS THE LIFESPAN

A. Bennett¹, P.J. Pierre¹, C.J. Lees¹, W.D. Hopkins^{2,3}, C.A. Corcoran¹, 1. *Wake Forest University Department of Physiology and Pharmacology, Winston-Salem, North Carolina*, 2. *Agnes Scott College, Decatur, Georgia*, 3. *Yerkes National Primate Research Center, Emory University, Atlanta, Georgia*

Childhood impoverishment, stress, and adversity are part of a risk pathway for a broad range of deleterious health outcomes across the lifespan. Understanding how early experiences alter the trajectory of healthy development is critically important to research on human health. Our research uses a long-standing nonhuman primate model of early childhood impoverishment to evaluate the consequences of adversity early in life on health across the lifespan. Our current studies are focused

on the consequences of early impoverishment on neurobiological, behavioral, and cognitive outcomes, as well its role in risk for alcoholism and affective disorders. This animal model can be used to shed light on how early experience alters health trajectories across the lifespan and how we might develop better treatment, prevention, and intervention strategies to promote human health.

SESSION 290 (PAPER)

COGNITIVE AGING IN CONTEXT

AGING SPARES THE ACCURACY OF METACOGNITIVE MONITORING: EVIDENCE FROM A CROSS-SECTIONAL STUDY

C. Hertzog¹, J. Dunlosky², S. Sinclair¹, 1. *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*, 2. *Kent State University, Kent, Ohio*

A cross-sectional sample of 282 adults, ages 18 to 85, participated in a study of cognition and metacognition. We report data on a paired-associate (PA) learning task that included unrelated and related pairs of common nouns. Individuals studied each pair and then gave a judgment of learning (JOL) that rated confidence on a 0-100% scale that the second word could be recalled when cued by the first word in the pair. Polynomial regression analysis showed robust linear age differences in PA cued recall and in JOLs. Both recall and JOLs were influenced by relatedness, with higher actual recall and predicted recall for related items. Relative accuracy (resolution) of the JOLs was measured by intraindividual gamma correlations of JOLs with item recall (failure, success). In the aggregate, increasing age was associated with small but reliable increases in gamma correlations across the adult life span. Older adults' JOLs were sensitive to relatedness, accounting for the small increase in gamma correlations for the entire list. When separated into relatedness classes, gamma correlations for unrelated items were reliably higher than the correlations for unrelated items, but there were no age differences in the resolution of JOLs for either type of item. These findings replicate and extend earlier studies comparing older and younger groups by indicating no age-related decline in the accuracy of monitoring learning across the adult life span, despite age changes in level of PA learning itself.

PROPOSITIONAL DENSITY AND COGNITIVE FUNCTION IN LATER LIFE: FINDINGS FROM THE PRECURSORS STUDY

M. Engelman, E. Agree, *Population, Family, and Reproductive Health, Johns Hopkins University, Baltimore, Maryland*

Introduction: Snowdon et al. (1996) showed an intriguing association between the density of ideas in autobiographies written in young adulthood and Alzheimer's disease. This study re-examines this relationship using an unusually rich source of longitudinal data –The Precursors Study –which follows members of the Johns Hopkins medical school classes of 1948-1964. Data include both recent measures of cognitive functioning and biographical admission essays offering an unprecedented chance to re-examine the hypothesis that early written propositional density is lower for people who develop cognitive impairment. Methods: Forty-one cases with cognitive impairment were identified in the Precursors cohorts. Using cumulative incidence sampling, each case was assigned 2 controls matched on sex and age. Propositional density was assessed using the novel CPIDR 3 (Computerized Propositional Idea Density Rater) computer program (Brown et al. 2008). Adjusted odds ratios were calculated using conditional (fixed effects) logistic regression, maximizing the power of the analysis to detect statistically significant differences in propositional density scores between cases and controls. Results: Average ages at the time of writing and during cognitive assessment were similar for participants in the Nun Study and Precursors Study. Propositional density scores for Precursors Study participants were lower and showed considerably less variation than

scores for the Nuns. Conditional logistic regression did not indicate an association between propositional density and case status. Discussion: Findings from the Nun Study were not replicated in this highly-educated and mostly-male population. Differences in gender and cognitive reserve may explain the discrepant results across the two studies.

SUBJECTIVE MEMORY AS A MEDIATOR OF THE ASSOCIATION BETWEEN AGE AND MEMORY FUNCTION: RESULTS FROM THE ACTIVE STUDY

A.L. Gross¹, J.M. Parisi¹, G. Rebok¹, F.W. Unverzagt², 1. *Mental Health, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Indiana University School of Medicine, Indianapolis, Maryland*

Age-related declines in memory performance may be attenuated by beliefs individuals hold about their own memory. Findings about this relationship have been inconsistent, however. The present investigation explored the extent to which subjective memory, i.e., self-perceptions about one's memory abilities, mediate the association between age and objective memory performance. Data from the Advanced Training for Independent and Vital Elderly (ACTIVE) trial were used to investigate this question in a longitudinal setting. Community-dwelling, older adults (N = 2,802, M = 74 years of age) were randomized into one of three cognitive training interventions (memory, reasoning, and processing speed) or a no-contact control condition. Participants were administered the Memory Functioning Questionnaire (MFQ), as well as objective memory tasks (Hopkins Verbal Learning Test, Rey Auditory Verbal Learning Test, Rivermead Behavioral Memory Test) at baseline, immediate posttest, and annually at 1, 2, 3, and 5 years. Using a longitudinal autoregressive order-1 structural equation model for participants in the control group, we found that subjective memory was significantly positively associated with objective memory performance prospectively measured 1 year later, and that subjective memory explained a sizable and statistically significant proportion of total effect of age on objective memory. This research suggests that age-related declines in memory performance are mediated by subjective memory beliefs. These results suggest that modifying one's beliefs about their memory may yield changes in objectively measured memory performance, and so incorporating subjective memory components into existing memory training platforms may benefit older adults.

OLDER HUSBANDS' LOWER COGNITIVE FUNCTION AFFECTS WIVES' COGNITIVE FUNCTION OVER 5 YEARS BUT NOT THE REVERSE

W. Strawbridge¹, M.I. Wallhagen², J. Thai², S. Shema³, 1. *Institute for Health and Aging, San Francisco, California*, 2. *University of California, San Francisco, California*, 3. *Northern California Cancer Center, Fremont, California*

We analyzed longitudinal relationships between older spouses' lower cognitive function and the subsequent cognitive function of their partners. We also assessed gender differences as well as the moderating role of marital quality. Subjects were 410 Alameda County Study community-dwelling older couples cognitively capable of completing extensive questionnaires. Baseline cognitive function was measured with a scale assessing problems remembering names, finding the right word, misplacing things, and paying attention. Baseline marital quality was assessed by asking the frequency of marital problems. Cognitive function outcomes were measured 5 years later. Multiple regression statistical models adjusted for partners' own baseline cognitive function, age, ethnicity, and financial problems. We used separate models to examine gender differences, while moderating effects of marital problems were assessed with interaction terms. We found that husbands' lower cognitive function negatively affected their wives' cognitive function five years later, but wives' lower cognitive function had no effect on their husbands' subsequent cognitive function. Marital quality moderated effects for wives – only those in problem marriages seemed to be

impacted by their husbands' cognitive impairment. Thus even apparently mild forms of diminished cognitive function for husbands affect subsequent cognitive function of their wives. The one-way nature of this relationship is consistent with a communication framework. Why the results are limited to wives in baseline problem marriages is puzzling but possibly consistent with a caregiving framework.

COGNITIVE DECLINE IN THE COMMUNITY SETTING: THE IMPACT OF NEIGHBORHOOD SOCIAL AND PHYSICAL DISORDER

P. Clarke, *University of Michigan, Ann Arbor, Michigan*

A growing body of literature has examined factors associated with cognitive function. Findings suggest that education, a marker of "cognitive reserve", can buffer the brain against cognitive decline in later life. A smaller parallel body of work has found associations between community characteristics and cognitive function suggesting that opportunities for activity and interaction in one's local environment may reduce cognitive decline. However, we know very little about the community characteristics that can moderate the negative association between education and cognitive impairment. Using data from the Chicago Community Adult Health Study (2002), we examined the role of the built physical and social environment on cognitive function among adults age 45+ (N=1195). Cognitive function was assessed using 5 items (attention, concentration, long and short term memory, orientation to time). Built environment characteristics were assessed using systematic social observation to independently rate indicators of crime and social disorder in the block surrounding each respondent's residence. Using linear regression we found that cognitive function was negatively associated with advanced age, black or Hispanic, lower education, and lower income. Indicators of neighborhood crime were negatively associated with cognitive function ($p < .03$), but indicators of neighborhood social disorder (e.g. abandoned cars, graffiti, garbage) were only associated with cognitive decline among adults with less than a high school education ($p < .05$). Older adults with more limited "cognitive reserve" may be more vulnerable to cognitive decline when living in neighborhoods characterized by social and physical disorder. Improvements in community contexts may prevent cognitive decline amongst the most vulnerable older adults.

SESSION 295 (SYMPOSIUM)

CREATIVE APPROACHES TO HEALTHY LGBT AGING

Chair: C. Gustason, *University of Massachusetts Amherst, Amherst, Massachusetts*

Discussant: B. Grossman, *University of California, San Francisco, California*

Members of the LGBT community experience unique challenges as they age. Many of these challenges stem from the intersection of aging, socioeconomic status, and the co-morbidities associated with advancing age. Providers are obligated to understand the challenges their LGBT clients face and implement creative strategies to help meet the needs of this population. This symposium will offer a variety of research to inform the practice of multidisciplinary providers who work with this group of elders. Research will be presented exploring the invisibility of LGBT elders within queer and gerontological theories. Challenges associated with one's role as a lesbian or gay step-grandparent will be discussed. Study results indicating how programming preferences of older MSM may differ based upon HIV sero-status will be presented. Health promotion activities and preferences of elder lesbians will be reviewed. Finally, research investigating the creative ways in which MSM deal with aging, prostate health, and prostate cancer will be considered. Please join us for what promises to be an informative, exciting symposium.

THE INTERSECTION OF AGING, SEXUALITY, AND THE PROSTATE: GAY AND BISEXUAL MEN'S PERSPECTIVES

T. Blank¹, L. Descartes², M. Asencio¹, A. Crawford¹, *1. Human Development and Family Studies, University of Connecticut, Storrs, Connecticut, 2. Brescia University College, London, Ontario, Canada*

Because cancer is so age related, all aging persons must deal with its prospect in their lives. For men, prostate cancer is the most common cancer challenge. It is crucial to recognize the diversity of experiences affecting both aging and cancer, including sexual identity. This study focused on gay middle aged and older men's attitudes toward and knowledge of prostate cancer and its treatments. The sample included 36 men (age range 40-70), diverse in terms of race/ethnicity, education, SES, and relationship status, in five focus groups. Even though the discussion was not explicitly focused on aging, considerable discussion addressed the role of aging in how prostate cancer might affect gay men's lives. Specifically, the impact of potential sexual dysfunction was regularly framed as less critical as one ages, while the role of stable relationships in dealing with both aging and prostate cancer in effective and creative ways was emphasized.

OLDER LESBIAN WOMEN – HEALTH PRACTICES AND CHALLENGES TO HEALTH PROMOTION

H. Petry, *Nursing, University of Washington, Bothell, Bothell, Washington*

This presentation discusses health care practices of older lesbian women and the challenges they face when engaging in activities to promote healthy aging. Eighteen older lesbian women participated in this pilot study. Data were generated through a demographic questionnaire and semi-structured interviews. Conventional content analysis combined with constant comparative analysis method was applied to the interview data. Results show that older lesbian women have many of the same concerns and challenges regarding aging and health as their heterosexual counterparts. These include issues around income, health insurance, access to services, loneliness and social support. However, findings also show that older lesbian women have unique challenges due to their sexual orientation. These findings underscore the need for nurses to be aware that sexual orientation has an impact on health practices and health promotion and work with their clients to develop strategies to alleviate these challenges.

THE SILENCING OF LGBT AGING IN GERONTOLOGICAL AND QUEER THEORY

M. Brown, *Center for Policy Research, Syracuse University, Syracuse, New York*

The exclusion of lesbian, gay, bisexual and transgender (LGBT) elders from queer and gerontological theories has resulted in the silencing of LGBT older adults and their lived experiences. This silencing has historically left LGBT elders without adequate social or material supports, and isolates them from the LGBT and elderly communities and the human service agencies serving those communities. I define this silencing as a rhetorical move, rendering elders invisible in queer theory and queerness invisible in gerontological theory. I argue that the producers of queer and gerontological theory, from a position of power within these discourses, silence and ignore the rhetorical activities of older LGBT adults. I further argue that, while many LGBT elders have worked for some time to arrange material and social supports for themselves and their peers, their activities have only become audible relatively recently, due to the activism of middle-aged and older LGBT members of human service and academic networks.

EXPLORING PROGRAMS TO BENEFIT MIDLIFE AND OLDER MSM

D.W. Coon¹, M. Keaveny¹, B. Jauregui¹, M. O'Connor¹, A. Grove¹, J. Catania², *1. College of Nursing & Healthcare Innovation, Arizona State University, Phoenix, Arizona, 2. Oregon State University, Corvallis, Oregon*

This study explores healthy aging program preferences for men who have sex with men (MSM) age 50 and older ($M = 58.15$; $SD = 7.52$). Subjects ($N = 179$) were recruited from San Francisco participants of the Urban Men's Health Study, a probability-based telephone survey. Program formatting (e.g. discussion groups vs. presentations), mentoring (e.g. group or individuals), target population (e.g. only MSM age 50+ vs. everyone), design source (e.g. by professionals), information distribution (e.g. print vs. online media), and content (e.g. social or health concerns) were analyzed based on participant demographics and serostatus (36.3% HIV+). For instance, significant differences ($ps < .05$) were found between HIV+ and HIV- MSM on the likelihood of attending programs that a) chronicle life experiences of 50+ MSM, b) have discussion groups on older MSM concerns and interests, c) presented by professionals, d) utilize group mentoring, and e) designed by gay men of all ages.

THE FAMILY RELATIONSHIPS OF OLDER LESBIAN AND GAY STEPGRANDPARENTS

D. Jenkins, *Social Work, Texas Christian University, Fort Worth, Texas*

Older gays and lesbians remain an invisible minority in society and are underrepresented in literature on aging. Specifically, much of the diversity that exists among the family relationships of lesbians and gay men is overlooked in the academic literature. Given that more than fifty percent of Americans live a portion of their lives in some form of blended family relationship, one would expect gays and lesbians to be part of this experience. However, a discussion of the blended family experiences of gays and lesbians has not been thoroughly examined. Understanding the experiences of lesbian and gay stepgrandparents enables us to better understand the complex nature of blended family relationships. A phenomenological approach of qualitative research was used to interview lesbian and gay stepgrandparents. Eighteen in-depth interviews were completed with older stepgrandparents in two different major metropolitan areas of the United States. All of the participants were in same-sex relationship with a partner who became a parent in a previous heterosexual relationship. The analysis began by the researcher immersing himself in the data. Inductive and deductive coding was used and the researcher established categories from the data. Three of the major themes that emerged are presented. Lesbian and gay stepgrandparents identify three important issues in their family relationships. These three issues include: role and membership ambiguity, familial relationship security, and intergenerational consequences. Themes and quotes are discussed in order for participants to have a better understanding of the family relationships of older lesbian and gay stepgrandparents.

SESSION 300 (POSTER)

DEMOGRAPHY

THE OLDEST OLD IN THE 2000 US CENSUS BY GENDER AND POVERTY STATUS

S. Bould, *1. University of Delaware, Newark, Delaware, 2. The Gerontology Institute, Boston, Massachusetts*

This paper will present an analysis of the oldest old, persons who are over the age of eighty-five, based on the 2000 U. S. Census. This unique group, although small, is predicted to grow as a result of increasing life expectancy at age 65. Special issues are presented due to the prevalence of chronic diseases, including Alzheimer's and the risks of loss of mobility, functional ability and independence. In addition this age group has a high risk of a poverty level income as well as the loss

of family, friends, and even adult children. Women's longer life expectancy results in this group being composed of predominantly women. Due to the small numbers as well as the tendency to group these individuals with earlier cohorts of persons in their 70s, there is limited information specifically on this age group. This paper will use the individual data from the U.S. Census of 2000 micro files, analyzed by the author, to provide an overview of the diversity of this group in terms of race and ethnicity, functional ability and living arrangements as well as gender and poverty status. A key objective is to understand the intersection of a functional disability and poverty. Poverty will be discussed both in terms of income poverty, that is income below 125% of the official United States poverty level, and special needs poverty, based on additional income needs of those living alone with a disability. This latter group is predominantly women.

SPATIAL PATTERNS AND SOCIO-ECONOMIC CHARACTERISTICS OF GRANDPARENTS

F. Yong¹, M. Kim², 1. *East Carolina University, Greenville, North Carolina*, 2. *SUNY - Brockport, Brockport, New York*

Objective: While much work has been done about individual characteristics associated with grandparents who raise grandchildren, relatively little work has been done to examine contextual characteristics that may also affect this. To fill this gap, this study investigates contextual characteristics of grandparents in 50 states. Three specific aims examine (1) a geographical pattern of grandparents who raise grandchildren; (2) whether the geographical pattern is associated with grandparents' county-level socioeconomic characteristics; and (3) whether the associations vary across 50 states. Major county-level characteristics include race, education, poverty, and population density. **Methods:** Using Census 2000, Geographic Information System (GIS) and multivariate spatial regression are employed. GIS explores spatial patterns of county-level socioeconomic variables and grandparents in all 50 states. Spatial regression identifies spatial dependence of grandparents who raise grandchildren by estimating a relationship between the county-level variables and grandparents. **Results:** The GIS findings clearly show that there is an uneven geographical distribution among grandparents. The Spatial regression shows that poverty level and Non-White American status are strong predictors for grandparents who raise grandchildren. However, the estimations of these variables vary in each of the 50 states. **Discussion:** This study addresses the need for a further investigation of why such spatial patterns occur and how contextual level socioeconomic factors contribute to grandparents who raise grandchildren.

REGIONAL DIFFERENCES IN FUNCTIONAL DOMAINS: A COMPARISON BETWEEN GEORGIA AND IOWA CENTENARIANS

A.Y. Branscum¹, P. Martin¹, M. MacDonald¹, J. Margrett¹, L. Poon², 1. *Human Development and Family Studies, Iowa State University, Ames, Iowa*, 2. *The University of Georgia, Athens, Georgia*

As delay in mortality increases in the oldest-old population, it is expected that more people will become centenarians (Andersen-Ranberg, Schroll, & Jeune, 2001). Although previous research has been presented on regional health differences and mortality rates of centenarians, few studies have focused on depression, activities of daily living, cognitive function, and economic burden. Therefore, there needs to a better understanding of this age group by region. The purpose of this study was to compare centenarians from the Georgia Centenarian Study (GCS, n=239) and the Iowa Centenarian Study (ICS, n=121) on cognitive functioning, activities of daily living (ADL), depression, and economic burden measures. The Georgia and the Iowa centenarians were compared on each item of the four scales of the Short Portable Mental Status Questionnaire (SPMSQ), ADL items, Geriatric Depression Scale (GDS), and five economic burden items using mean scores. Total scores for the scales were also compared using t- and chi-square tests. Results indicate that there were significant differences on several items on the

SPMSQ, ADL items, depression, and economic burden scales. The GCS participants scored significantly lower on the depression total score, significantly higher on ADL items, significantly higher in perceived economic status items; however, there was no significant difference in total number of errors on the SPMSQ. Possible explanation for the differences between the two groups could be selection effects of region, culture, or ethnicity. It is recommended that these variables are further evaluated among centenarians in different geographic regions.

FORECASTING FLORIDA'S LONG-TERM CARE POPULATION THROUGH 2030

Y. Ji, G. Mitchell, D.A. Chiriboga, L. Polivka, S. Wang, *School of Aging Studies, University of South Florida, Tampa, Florida*

Background: The rapidly increasing long-term care (LTC) demand and cost has been an urgent issue for Florida, the state with the highest percentage of population aged 65 and over. The present study presents a forecast of Florida's publicly subsidized LTC population, with a focus on the adult Florida Medicaid population receiving long-term care service. The study may provide great interest to researchers in LTC cost-effectiveness and the state policymakers. **Methods:** Time-series analysis, more specifically ARIMA modeling, was used to generate the forecasts. Population estimates used age, gender, race/ethnicity crossings at the county-level from the National Center for Health Statistics (NCHS). Medicaid population estimates further used Florida Medicaid claims data and non-Medicaid LTC services assessment data. Overall state estimates were aggregated from county estimates. **Findings:** Florida's aged and disabled adult Medicaid population is projected to see a 6.6% annual growth through 2030, more than three times that of Florida's general population. The long-term care populations include both Medicaid and GR program populations are projected to grow faster than the general population but not as fast as the overall Medicaid population. The growth in home- and community-based services (HCBS) participation mirrors the growth of the overall Medicaid population in Florida. The disabled adult fraction is expected to grow faster than the aged fraction of these populations.

DOES URBAN MIGRATION WITHIN MEXICO RESULT IN BETTER HEALTH FOR OLDER MEXICANS FROM RURAL AREAS?

F.V. Wheaton, E. Crimmins, *University of Southern California, Los Angeles, California*

The impact of internal migration on health and well-being in later life has received little attention. Understanding the effects of domestic migration, however, is particularly relevant in the context of Mexico's rapidly declining fertility, decreasing mortality, and an almost 50% increase in life expectancy at birth in a little over five decades. Data from the first wave of the Mexican Family Life Survey (MxFLS), collected in 2002, reveal that 41.5% of respondents aged 50+ migrated for at least one year (N=4,762). The dominant migratory pattern has been from rural to urban areas, paralleling Mexico's economic development. T-test results indicate that, among older Mexicans who lived in a rural locality at age 12, domestic urban migrants are significantly more likely to have health insurance: 53% were insured, compared to 32% of their rural peers who never migrated (t= -8.26, N=1,686). Yet, urban migrants also have significantly higher systolic blood pressure and a higher average body mass index (BMI). Finally, OLS regression results do not show statistically significant differences in depression, functional limitations, and self-reported health between urban migrants and non-migrants from rural areas when age, sex, marital status, and education were controlled for. Thus, while domestic urban migration is associated with a greater probability of possessing health insurance among rural-origin older Mexicans, such migration does not translate into later-life health advantages.

THE IMPACT OF POPULATION AGING ON KOREA LABOR MARKET

J. Lim, J. Kim, *Food and Resource Economics, Korea University, Seoul, Korea, South*

According to OECD 2009 Health Data, Korea is already an aging society and will become an aged society in less than two decades. The seriousness of Population aging cannot be overemphasized because it leads to an increase in the number of aged people and a shortage of labor. Coupled with a falling birthrate, this demographic change is likely to have a wide-ranging impact on every aspect of Korean society. This paper is a study on the impact of population aging on Korea labor market by using Korea Labor and Income Panel Data. There has been a wide belief that there is a negative effect of population aging on labor market due to lack of labor force. The results of this empirical study, however, cast two suggestions. Firstly, in the short run, the population aging has a statistically negative effect on labor supply as expected, but in the long run, we confirmed the positive effect on labor force. The reason for that might be thought that the prolonged life year makes the elderly remain in the labor market in order to support themselves and their children. These findings, therefore, show that population aging lead to a mixed effect on labor supply.

PUBLIC VS. PRIVATE SPENDING: WHO'S MORE EFFICIENT IN REDUCING MORTALITY AMONG THE U.S. ELDERLY

E. Reyes, *Wayne State University, Detroit, Michigan*

This study analyses how efficient is public and private health spending in terms of reducing the three main causes of mortality among the U.S. elderly. Data comes from the OECD Health Data File 2008 and the NCHS from the CDC statistics. The period analyzed is from 1970 to 2004. The study analyses the patterns on mortality rates and the effect of different measures of expenditure on the main causes of mortality for the 65 years and older American population. To evaluate the efficiency of spending in reducing mortality a production of health model is estimated. This part of the model is established to measure the efficiency of public and private spending in seven different categories of spending. In the second part of the study a dynamic model analyzes a desirable long run rate of mortality for the three most important causes of death. The effect of higher education, life expectancy at age 65, income, and hospital discharges measured as days of care showed a favorable effect on reducing mortality among the U.S. elderly. Public spending has a larger effect on heart disease mortality rate, and private spending has the major effect on stroke and cancer rates. On the second part of the analysis, higher costs are associated with heart disease, and lower costs are associated with stroke and cancer respectively.

WHO CAN AFFORD PRIVATE LONG-TERM CARE INSURANCE?

N. Kim, G.A. Jensen, *Institute of Gerontology, WSU, Detroit, Michigan*

Nationwide there are fewer than 7 million long-term care (LTC) insurance policies in force. Why so few? Several explanations have been offered, including the availability of Medicaid, misperceptions that Medicare or other policies cover LTC, beliefs that one's own risk of needing LTC services is small, or desires to simply rely on children and spouses for LTC. This paper explores another possibility – that private LTC insurance is simply “unaffordable” for most older Americans. We begin by investigating the meaning of affordability in the context of private LTC insurance. We propose alternative definitions for affordability, drawing on concepts recently developed to gauge the affordability of acute-care health insurance and housing. Then using nationally representative data from the Health and Retirement Study (HRS) we apply each definition and examine who can and cannot afford LTC coverage among Americans over age 50. We consider definitions based on simple normative standards, such as whether remaining household income after paying LTC premiums is above a reasonable threshold, as

well as ratio definition, such as whether the ratio of premiums to income is less than some target amount. In each case, we take into account the steep positive relationship between LTC premiums and age-at-purchase. This analysis offers an operational framework for defining affordability, insights regarding its relevance as an explanation for non-purchase, and an appreciation for who can and cannot afford private LTC insurance in the U.S. The study builds on and extends earlier research on this subject by the authors.

LONG-TERM CARE PLANNING: INDIVIDUAL RESPONSIBILITY AND LONG-TERM CARE PLANNING BEHAVIOR OF EMPLOYED BABY-BOOM AGED ADULTS

K. Kimbell, *School of Social Work, The University of Texas at Austin, Austin, Texas*

The population is aging, with the number of elderly expected to climb to 72 million by 2030. Most of these individuals will need some form of long-term care (LTC) at some point in their older adult lives. Our current LTC system is burdensome to state and federal governments, to family members (who provide the bulk of care), and to individuals' pocket books. The system is not expected to endure the weight of the baby boom generation (CWF, 2006). Total national spending for long-term care in 2004 was \$194 billion (GULTCFP, 2007) and is only expected to rise. High cost of private pay services, very limited related coverage under Medicare, restrictive access to Medicaid long-term care services, and changing family patterns beg the question: How will the average American afford LTC care in the near future? This pilot study was conducted using a 77- item survey. This study examines views of benefit-eligible baby-boom aged University employees on individual responsibility for planning/providing/cost of long-term care, whether or not they avail themselves of employer-offered long-term care insurance, and whether or not they save specifically with potential long-term care needs in mind. Preliminary analysis of pilot test results indicate that baby boom aged adults believe individuals have a “great deal” of responsibility for planning, providing, and paying for long-term care. Yet, few are purchasing the employer offered long-term care insurance, and only about half are saving specifically with potential long-term care needs in mind. Full data results expected by summer 2009.

THE EFFECTS OF SENSE OF CONTROL ON THE FINANCIAL SATISFACTION OF OLDER ADULTS

K.A. Zurlo, *Rutgers University, New Brunswick, New Jersey*

Older adults are asked to take greater responsibility and control of their financial situation, but often are not equipped to assume that responsibility. This lack of control of one's finances exposes individuals to financial risk in retirement, potentially resulting in insufficient income to maintain an existing standard of living and increasing the current level of poverty among older adults. With origins in social learning theory, a general measure of control was advanced by Rotter (1966). Lachman (1986) augmented the general research on the psychology of control by supporting the use of domain-specific assessments of control in aging research (i.e. control over an aspect of one's life, such as work, finances, or health). Two components of the Health and Retirement Study (HRS), the core survey and a psycho-social leave behind questionnaire (LBQ) in 2006, were used to relate the general and domain-specific sense of control to the financial satisfaction of older adults. Results of this study indicated that there is a spurious effect of sense of control on financial satisfaction. Domain-specific control beliefs have an effect on the financial satisfaction of a stratified segment of the older adult population. As a result, appropriately designed interventions that affect control over one's finances can improve the financial satisfaction of older adults who risk financial insecurity in old age. The results of this study enhance the research on financial satisfaction of the older American population as they face financial challenges in their current and later years.

HIDDEN MEANING? A COMPARISON OF THE DIRECT AND INDIRECT EFFECTS OF BACKGROUND CHARACTERISTICS ON FINANCIAL SATISFACTION ACROSS GENDER

B. McIntosh, N. Danigelis, *University of Vermont, Burlington, Vermont*

Previous research has highlighted the significantly different direct effects that income and other predictors of financial satisfaction have for female and male elders (e.g. Danigelis & McIntosh, 2001; Hansen, et.al. 2008). Still unanswered, however, is whether or not the reasons for the overall associations between these predictors and financial satisfaction may differ by gender. This paper uses data from the 1972 – 2006 General Social Surveys (Female N=2,992; Male N=2,276). Our approach is based on a path analytic strategy (see Liang and Fairchild, 1979) complemented by Structural Equation Modeling (SEM) and Ordinary Least Squares (OLS) multivariate regression analysis using difference of slopes comparisons (Hardy, 1993). Financial satisfaction is treated as a latent variable based on questions asking respondents' financial satisfaction (1) in general, (2) over time, and (3) relative to others (Cronbach's alphas > 0.63). The analysis compares background determinants of financial satisfaction for individuals 65+ separately for women and men (model fits are reasonable – e.g. CFI > .900 and RMSEA < .10 for each model). While past and present job prestige and current household income and health operate in the expected ways for both men and women, there are significantly larger direct age, education, and "married" effects for women. Interestingly, most indirect effects are quite similar across gender, although some differences exist: Noteworthy is that household income is more important for men in explaining education's effect on financial satisfaction. Results are discussed in terms of George's (1993) ideas of control and illusion of control and Moen's (1996) life course perspective.

ARE OBESE ELDERS WORKING MORE OR LESS? LONGITUDINAL EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

B. MacInnis, *University of Michigan, Ann Arbor, Michigan*

I examine the relationship between obesity and employment in the elderly population. Later-life labor force participation is important for the economic well-being of aging individuals to maintain adequate incomes. Old-age obesity is prevalent and increasing. Obese older Americans are a particularly vulnerable subpopulation and understanding their labor market outcomes is of great relevance to many aging policies. Economic theory provides ambiguous predictions of the effect of old-age obesity on labor supply. On one hand, obesity is a strong biomarker for poor health, and poor health has been found to be associated with reduced labor force participation. On the other hand, obesity and poor health are associated with fewer socioeconomic resources, necessitating prolonged employment or re-entrance into the labor force post-retirement to augment the often low retirement incomes. I focus on white men aged 70-79 using the Health and Retirement Study and multivariate regression analysis with individual fixed-effects to account for unobserved factors that influence health and work decisions. My preliminary results show that the overweight and mildly obese men are about 2.2 (95% CI: -0.002 – 0.046) and 3.5 (95% CI: -0.003 – 0.074) percentage points more likely to work than those with normal weight, amounting to about 10% and 15% increases respectively in their labor force participation rates; and that the severely obese men are nearly 10 (95% CI: -0.237 – 0.037) percentage points less likely to work, equivalent to about 45% reduction in labor force participation. I then explore the potential pathways that may mediate the old-age obesity-work relationship.

SESSION 305 (POSTER)

ELDER ABUSE

DEVELOPMENT AND TESTING OF AN INSTRUMENT FOR ELDER ABUSE SCREENING

K.R. Plitnick, *Byrdine F. Lewis School of Nursing, Georgia State University, Atlanta, Georgia*

Study purpose was to develop a clinically relevant instrument for use in an emergency department for screening of elder abuse. Yearly, 2.1 million elderly Americans fall victim to abuse. One in 14 incidents comes before authorities. Incidence/prevalence is unclear and underreported. Factors include lack of recognition of signs and symptoms, victim reluctance in reporting, lack of reporting laws, and elderly cognitive impairment. Major barrier to detection is lack of reliable, valid and clinically feasible instruments. Screening instruments should apply to all elders whether chief complaint is related to abuse or not. Study consisted of nonrandom convenience sample of 68 patient's age 65+, who were able to read/write English, and resided with a family member/responsible adult providing assistance with daily living activities. Subjects recruited from a northwest Georgia ER with written informed consent. Instruments consisted of MMSE, Elder Abuse Instrument and Demographic/Clinical Information Form. Subjects were African-Americans, 65-88 years. Mean score for MMSE was 21.4. Internal Consistency for Item to Total Correlations showed 5 of 17 items demonstrated variability within sample (Cronbach's Alpha = .73). 2 subjects reported elder abuse. More variability among the elder abuse items expected if more positive responses to elder abuse were obtained. No variability was found to exist on general questions, physical abuse, sexual abuse or abandonment. Future study would focus on expanding areas of psychological abuse to examine verbal threats, humiliation, harassment, intimidation and social isolation; financial exploitation to examine property, assets and possessions; neglect to examine personal safety, shelter, comfort, and personal hygiene.

INTIMATE PARTNER VIOLENCE AMONG OLDER ADULTS: BRIDGING THE DISCIPLINARY DIVIDE

M.C. McPherson¹, N. Brossoie¹, K.A. Roberto¹, M. Pulsifer², P.N. Brown², *1. Center for Gerontology at Virginia Tech, Blacksburg, Virginia, 2. Women's Resource Center of the New River Valley, Inc., Radford, Virginia*

With the aging of the baby boom generation, intimate partner violence (IPV) among older adults will likely increase. The limited research findings and publications that address IPV in late life are scattered across a variety of disciplines, often making them difficult to ascertain. The purpose of this project, the initial phase of a multidisciplinary community-based collaboration, was to evaluate the literature on IPV among older adults. Limiting our sample to information published from 1999 to 2009, we used 10 primary terms to search 5 multidisciplinary databases that index scientific journals, web-based resources and professional reports. Within the resultant library of 297 records, we identified 89 entries in the domestic violence (DV) literature that focus on older adults and 24 entries in the elder abuse (EA) literature that explicitly address IPV. Content analyses of these 113 sources revealed frequent use of an ecological framework to guide IPV research, feminist critiques of the caregiver stress model as an explanation of IPV, data collection and pilot program innovations, and methodologically diverse exploration of victim perspectives. We also discerned disciplinary bias and gaps. For example, EA researchers addressed the policies and laws that drive IPV system responses whereas DV scholars dealt with abuse dynamics, services for women, and victim health. To advance understanding of the complex intersection between age and power dynamics in intimate relationships our findings suggest the need for interdisciplinary dialogue to develop future investigations of IPV among older

adults that support more effective risk factor identification, preventative measures, and intervention strategies.

NON STAFF ABUSE OF OLDER ADULTS IN NURSING HOMES: A RANDOM SAMPLE TELEPHONE SURVEY OF ADULTS WITH AN ELDER FAMILY MEMBER IN A NURSING HOME

L.B. Schiamberg¹, L. von Heydrich¹, L. Post², 1. *Family and Child Ecology, Michigan State University, East Lansing, Michigan*, 2. *Yale University, New Haven, Connecticut*

Few empirical investigations of elder abuse in nursing homes address prevalence and risk factors of non staff,or resident-to-resident,mistreatment. A random sample of 452 adults with an older adult relative,≥ 65 years of age,in a nursing home completed a telephone survey regarding elder abuse experienced by that older family member. Family member respondents reported that that 16.8% of older adult nursing home residents experienced one or more incidents of non staff abuse during their residence. SEM was used to estimate the importance of risk factors for non staff abuse, including: 1)older adult characteristics, such as demographics(e.g.age,gender)and health status(e.g. diagnosis of dementia); 2)contextual factors, such as the family/older adult relationship(e.g. family member visits to the nursing home,family member satisfaction with the nursing home)and staff caregiver/older adult relationships, including types of staff abuse(e.g. physical abuse, emotional abuse. Statistically significant risk factors were gender,or being a female nursing home resident($\beta=.15$, $t=2.21$, $p=.001$),diagnosis of dementia ($\beta=-0.12$, $t=-1.98$, $p=.001$),family context—family member visits to the nursing home($\beta=.18$, $t=2.45$, $p=.001$)and family member satisfaction with the nursing home($\beta=-.06$, $t=-3.08$, $p=.001$),and staff abuse—physical abuse ($\beta=0.40$, $t=3.47$, $p=.001$) and emotional abuse($\beta=.11$, $t=3.35$, $p=.001$). Findings suggest the value of an ecological or contextual perspective to identifying risk factors and interventions for non staff abuse in nursing homes.

DECISION MAKING IN DETECTING FINANCIAL ELDER ABUSE: A COMPARISON OF PROFESSIONALS IN BANKING AND SOCIAL WORK

M.L. Gilhooly, P. Harries, M. Davies, L. Notley, D. Cairns, *Brunel University, Uxbridge, England, United Kingdom*

There are growing challenges in the United Kingdom associated with money handling. Although financial abuse of older people is of increasing concern, few professional bodies have guidance in relation to what must be done when financial elder abuse is suspected or detected. Moreover, little is known as to the nature of the cues that lead social workers or banking professionals to suspect financial abuse, or what factors influence the decisions that professionals make in relation to suspicions. The aim of this study is to examine decision making in relation to the detection of financial elder abuse. In this paper comparisons will be made between social workers and banking professionals. There are three phases to this study: Phase I - In-depth interviews, using critical incident methodology; Phase II - Experiments aimed at testing hypotheses about decision making using case scenarios; Phase III - Examination of policy documents. The findings from Phase I will be presented, along with preliminary results from the policy analysis. This project is funded by the UK cross-council research programme, New Dynamics of Ageing.

KOREAN ELDERLY IMMIGRANTS' VIEW OF AND RESPONSE TO ELDER MISTREATMENT: A TYPE-SPECIFIC APPROACH

H.Y. Lee, N. Shin, *School of Social Work, University of Minnesota, Twin Cities, St. Paul, Minnesota*

This study aims to assess whether and how social and cultural forces influence elderly Korean immigrants' view on and response to four types of elder mistreatment. By using a quota sampling strategy, 124 elderly Korean immigrants were recruited in Los Angeles County, CA. With a

mixed method approach, participants were interviewed with four hypothetical scenarios consisting of physical abuse, financial abuse, psychological abuse and neglect. Also, they were asked (1) whether they perceive each of the four scenarios as elder mistreatment and (2) whether they would seek help in the face of elder mistreatment if described scenarios happened to them. The findings indicate that while a large number of participants perceived the majority of scenarios as abuse, a smaller portion of them actually intended to seek help, particularly in scenarios of financial and psychological abuse and neglect. Age, gender, education, income, years in the U.S. and exposure to elder mistreatment were associated with participants' help-seeking intention, but perceiving a situation as abusive was not necessarily related to help-seeking intention except in the physical abuse scenario. It is critical to understand how each type of elder mistreatment is viewed and responded to by the ethnic minority elderly and to develop a type-specific approach in designing elder mistreatment prevention and intervention programs and policies.

TOCOPHEROL IN ELDER SELF-NEGLECT

K. Aung^{1,2}, J. Burnett³, S.M. Smith⁴, C. Dyer³, 1. *University of Texas Health Science Center at San Antonio, San Antonio, Texas*, 2. *San Antonio Regional Campus, University of Texas School of Public Health, Houston, Texas*, 3. *University of Texas Health Science Center at Houston, Houston, Texas*, 4. *NASA Johnson Space Center, Houston, Texas*

Pathophysiology of self-neglect, the most common form of elder mistreatment, is not well understood. Association between tocopherol and cognitive impairment in older adults prompted us to explore its role in elder self-neglect. OBJECTIVE: (1) To determine whether serum tocopherol levels are associated with elder self-neglect, and (2) to assess the association of serum tocopherol levels and cognitive function in elder self-neglect. METHODS: Serum tocopherol levels were measured in a cohort of 67 self-neglecting elders and 67 matched controls, recruited for the Consortium for Research in Elder Self-neglect of Texas. Pearson's correlation tests were performed to assess bivariate associations between serum tocopherol levels and cognitive function. RESULTS: Mean serum alpha-tocopherol levels were 10.8 +/- 4.7 ug/mL in self-neglect group and 13.0 +/- 4.9 ug/mL in control group ($p=0.006$, unpaired student's t-test). Mean serum gamma-tocopherol levels were 2.0 +/- 1.0 ug/mL in self-neglect group and 2.0 +/- 1.1 in control group ($p=0.83$). Among the self-neglecting elders, no association was found between serum alpha-tocopherol levels and the Mini-Mental State Examination (MMSE) or the Wolf-Klein Clock Drawing Test (CDT) scores ($r=-0.42$, $p=0.75$ for MMSE; $r=0.08$, $p=0.54$ for CDT). No association was found between serum gamma-tocopherol levels and the MMSE or the CDT ($r=-0.12$, $p=0.35$ for MMSE; $r=0.05$, $p=0.68$ for CDT). CONCLUSION: Alpha-tocopherol may be implicated in development of self neglect behavior, affecting the areas of cognitive function not captured by conventional screening. Further research is warranted to identify specific areas of cognitive impairment in elder self-neglect and its relation to alpha-tocopherol.

SESSION 310 (PAPER)

FALLING DOWN AND GETTING BACK UP

VARIATION IN THE RATE OF DIFFICULTY IN IADL AND ADL AMONG OLDER AMERICANS ACROSS COMMUNITIES

M. LaPlante, *Social & Behavioral Sciences, Univ. of California, San Francisco, California*

The American Community Survey (ACS), being the nation's largest survey, allows exploration of how the rate of functional disability varies geographically among persons ages 65 and older. The latest data is for the period 2005-2007 and provides a sample of 3.5 million older Amer-

icans living in 2,089 communities. The geographies are essentially counties, groups of counties, or cities with total populations over 100,000 persons of all ages, or larger cities subdivided into populations of about 100,000 persons. Two measures provide proxies for IADL and ADL disabilities respectively. Among older persons living in households, the lowest rate of any IADL or ADL disability is 7.2 percent and occurs in Kansas while the highest rate is 45.4 percent and occurs in New York. Of the 10 areas with the lowest rate of disability, all below 10%, half are in Colorado. Of the 10 highest areas, all above 35%, three are in Texas, two in California, and two are in Michigan. The rate of disability among persons living in households is unrelated to the age distribution of the population (pearson $r=.16$), but the rate of institutionalization is more highly related to age (pearson $r=.45$). This suggests that age, rather than level of disability, is involved in variation in rates of institutionalization across geographic areas.

OLDER ADULTS' ATTITUDES TOWARDS HOME MODIFICATIONS FOR PREVENTING FALLS

R.L. Kruse¹, D.R. Mehr¹, C.M. Moore¹, M. Aud², R.B. Tofle³, 1. *Family & Community Medicine, University of Missouri School of Medicine, Columbia, Missouri*, 2. *Sinclair School of Nursing, Columbia, Missouri*, 3. *University of Missouri, Columbia, Missouri*

Background – Approximately half of all falls occur in and around the home, and some type of environmental hazard is involved in half of these falls. However, our experience with the difficulty of implementing an intervention to reduce falls with home assessments and exercise led us to explore why older adults might lack interest in simple measures that could reduce falls and potentially prevent injuries. **Methods** – We completed an environmental assessment of participants' homes, and used semi-structured interviews to explore participants' fall history, fall risk, and attitudes toward home modifications and exercise. Interviews were recorded and transcribed. Transcripts were coded line-by-line by three investigators, and analyzed inductively in keeping with grounded theory techniques. **Results** – We interviewed ten individuals ranging in age from 60 to 90. All but one participant fell in the previous year. We identified several themes related to participants' reluctance to modify their homes to improve safety. In general, participants did not see falls as a problem, did not believe that they needed assistance with preventing falls, did not believe that home modifications would prevent falls, and resented others telling them to change their homes. Lack of resources was rarely mentioned. **Discussion** – Our identities may be intricately tied to the places we live. Fall prevention programs must support and reinforce individuals' sense-of-self, even as aging calls into question conventional cornerstones of identity such as home and health. Individuals must feel that they are in control of their activities and environment, and that the program can provide benefits.

RISK FACTORS FOR HIP FRACTURE IN JAPANESE OLDER ADULTS

T. Yamashita^{1,2}, A. Bailer¹, 1. *Miami University, Oxford, Ohio*, 2. *Scripps Gerontology Center, Oxford, Ohio*

Hip fracture is a major cause of disabilities that often leads to loss of independence in older adults. The prevalence of hip fracture in Japan is lower than in Western nations. However, hip fracture incidence in Japan is expected to increase along with the rapidly growing older population. The risk factors of hip fracture in Japanese older adults are understudied, particularly at the population level. Using data from the 1999 Nihon University Japanese Longitudinal Study of Aging, this study examines risk factors of hip fracture separately for men and women reflecting the gender differences reported in the previous studies. Logistic regression was used to model the probability of hip fracture as a function of a number of factors including demographic & socio-economic, medical condition, functional limitation & physical health, life style, and environmental factors. The predictive accuracy was evaluated using the area under an ROC curve (AUC). Significant risk factors for hip

fractures in older Japanese women (AUC=0.70) included: difficulty to bend knee (OR = 1.9), difficulty with ADL (OR = 1.1), diabetes (OR = 1.6) and use of prescribed external medicines (OR = 1.2). Significant risk factors for hip fractures in older Japanese men (AUC=0.66) included: difficulty to bend knee (OR = 2.6), cancer (OR = 1.9) and use of prescribed external medicines (OR = 1.4). The discussion explores the potential reasons why these risk factors are associated with hip fracture while other risk factors in previous studies such as osteoporosis and visual impairments were not.

CHINESE EXERCISE TO PREVENT PARKINSON-RELATED FALLS

S. Loftus, 1. *Neurology, Beth Israel, Pleasantville, New York*, 2. *University of MA, Amherst, Massachusetts*

People with Parkinson disease have twice the risk of falls as their age matched peers. Medication and surgery have not ameliorated Parkinson's-related falls, which are characteristic of disease progression, leading to considerable morbidity and mortality. Exercise can improve postural stability and decrease risk of falls. Chinese and allopathic interventions for decreasing falls were reviewed. The purpose of this study was to evaluate the therapeutic effects of Qi Gong exercise on balance and falls for individuals with Parkinson's. A pre-test post-test repeated measures design was used to demonstrate changes in balance score and number of falls after three months of therapeutic Qi Gong. The sample included males and females with Hoehn & Yahr rating scale stage I-IV Parkinson disease who were 55 years old and older. Instruments included the Berg Balance Scale, the Parkinson Disease Fall Profile, and the Mini-Mental State Exam. The number of falls before Qi Gong at evaluation 1 was compared to the number of falls one month after the course of Qi Gong at evaluation 3. The result for the matched pairs t-test for mean number of falls at evaluation 3 (1.53) was less than the mean number of falls at evaluation 1 (4.35), and the difference was statistically significant ($p = .004$). The Berg Balance Scale mean score at evaluation 1 (32.79) was less than the mean score at evaluation 3 (37.06), and the difference is statistically significant ($p = .001$). People with Parkinson disease who participated in Qi Gong significantly decreased falls and improved balance.

A NURSING HOME QUALITY MEASURE FOR SERIOUS FALL-RELATED INJURIES

C. Williams¹, T. Moore¹, W. Spector², R. Limcangco², 1. *Abt Associates Inc, Durham, North Carolina*, 2. *Agency for Healthcare Research and Quality, Rockville, Maryland*

Falls among nursing home (NH) residents have serious mortality, morbidity and cost implications, and many are preventable. We demonstrate a method for a new quality measure (QM) for incidence of serious falls-related injuries among NH residents. In a 10% random sample of U.S. NHs, we identified fall-related injuries by linking hospital and emergency room claims over a one-year period; resident risk factors were derived from the Minimum Data Set, and individual time-at-risk was determined as days in the NH during the year. Our analytic sample comprised 1,638 facilities with 38.9 million resident-days at risk. We used a hierarchical generalized linear model for individual injury rates to generate casemix-adjusted expected rates and then computed a facility-level QM as the difference between observed and expected injury rates. To generate an empirical distribution for this QM and identify statistically high- and low-performing facilities, we performed a two-level bootstrapping procedure, resampling both residents within NHs and NHs from our original sample. Overall, 6.6 percent of residents had at least one injury, over an average 160-day NH stay. Substantial variability among facilities persisted after risk-adjustment, with the standardized number of excess injuries ranging from -6.5 to +8.9 between the 10th and 90th percentile. Using the bootstrapped distribution, 5.7% of facilities were identified as poor performers and 3.8% as high performers. This approach shows promise for identifying facilities

with high and low rates of key sentinel events, such as injurious falls, and could be considered for future public reporting and quality improvement initiatives.

SESSION 315 (SYMPOSIUM)

FAMILY DYNAMICS AND INTERDEPENDENCE WITHIN CUSTODIAL GRANDPARENT FAMILIES

Chair: *M.L. Dolbin-MacNab, Human Development, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Discussant: *F. Strieder, University of Maryland, Baltimore, Maryland*

Despite continued growth in the number of families in which grandparents are raising grandchildren, the majority of research has focused on grandparent needs and well-being. Yet, grandfamilies are complex family systems that include interactions among custodial grandparents, their grandchildren, and other family members. The purpose of this symposium is to expand the understanding of grandfamilies by considering how grandparent well-being and characteristics of the family context intersect with grandchild adjustment and behavior problems. The paper by Smith and Hancock examines how the quality of grandparents' marital relationship and level of psychological distress mediate the relationship between family contextual factors and grandchild psychological adjustment. Kelley and Whitley investigate how characteristics of the caregiving context, such as caregiver psychological distress, family resources, social support, and quality of the home environment predict grandchild behavior problems. The paper by Dolbin-MacNab examines adolescent grandchildren's behavior problems, analyzes the extent to which custodial grandmothers and their grandchildren agree on the grandchild's behavior problems, and investigates demographic predictors of their agreement. Finally, Hayslip and colleagues examine the role of resilience/hardiness as a potential mediator of the relationship between grandchild-specific caregiving demands and parenting stress as well as the relationship between caregiving role-specific changes and grandparent adjustment. Taken together, the papers in this symposium further the understanding of the dynamic interplay between custodial grandparents, their grandchildren, and the caregiving environment. As discussant, Streider will focus on how findings from these papers have implications for improving the well-being of grandparents and grandchildren alike.

ANTECEDENTS AND CONSEQUENCES OF MARITAL QUALITY WITHIN CUSTODIAL GRANDPARENT FAMILIES

G.C. Smith¹, G.R. Hancock², 1. *Education, Health & Human Services, Kent State University, Kent, Ohio*, 2. *University of Maryland, College Park, Maryland*

Although over one half of all custodial grandparents are married, scant research has examined how quality of their marital relationship is linked to key family circumstances. We tested via structural equation modeling an adaptation of the Family Stress Model with data from 193 married custodial grandmother-grandfather (GM-GF) dyads. Consistent with past findings from the parenting literature, it was hypothesized that the linkages between family contextual forces and psychological adjustment of custodial grandchildren would be mediated by the quality of the GM-GF relationship and the level of psychological distress reported by GM and GF alike. The observed data fit the model well for GM (CFI = .95) and GF (CFI = .91), and both the measurement and structural components were largely invariant by grandparent gender. We conclude that assessing the quality of the GM-GF relationship is critical to intervening successfully with custodial grandparent families. [Funded by: R01MH66851]

BEHAVIORAL PROBLEMS IN CHILDREN RAISED BY GRANDMOTHERS: THE ROLE OF THE CAREGIVING ENVIRONMENT

S. Kelley, D.M. Whitley, *Georgia State University, Atlanta, Georgia*

The purpose of this study was to identify factors in the caregiving environment that predict increased behavior problems in children raised by grandparents. The sample comprised 511 children aged 2 to 16 years, with a mean age of 8.53. The families were predominantly low income, African American, and residing in an urban area. The mean age of the custodial grandmothers was 56 years, with a range of 37 to 80 years. Increased child behaviors problems, as measured by the Child Behavior Checklist, were significantly predicted by six of the eight independent variables, with caregiver psychological distress being most predictive. Other predictors included fewer family resources, less social support, home environments less conducive to child development, younger grandmothers, and fewer grandchildren in care. Interventions focusing on reducing stress in custodial custodial grandparents and improving the economic and social resources needed to effectively raise grandchildren will be discussed.

ADOLESCENTS AND THEIR CUSTODIAL GRANDMOTHERS: AGREEMENT ABOUT GRANDCHILD BEHAVIOR PROBLEMS

M.L. Dolbin-MacNab, *Human Development, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

This study examined the nature of custodial grandmother-grandchild agreement regarding adolescent (ages 11 to 18) grandchildren's behavior problems. Within a sample of 129 custodial grandmother-grandchild dyads, behavior problems were assessed using the Child Behavior Checklist and Youth Self-Report. Grandchildren's behavior problems were significantly worse than normative samples, and 33% of grandchildren and 43% of grandmothers provided borderline/clinical ratings. Granddaughters reported significantly more internalizing and total problems than grandsons. Problem behavior scores were significantly correlated for grandmother-grandson dyads, but not for grandmothers and granddaughters. Granddaughters reported significantly more internalizing and total problems than their grandmothers and the degree of agreement about these problems was significantly worse than for grandmother-grandson dyads. Agreement was not associated with socioeconomic status, grandmother age or marital status, grandchild age, or length of care. Agreement regarding internalizing problems was significantly better for White grandmothers. Findings highlight the need to address grandchild behavior problems, particularly among granddaughters.

RESILIENCE AMONG CUSTODIAL GRANDPARENTS

B. Hayslip¹, S.L. Davis¹, C.C. Goodman², G.C. Smith³, 1. *Psychology, University of North Texas, Denton, Texas*, 2. *California State University-Long Beach, Long Beach, California*, 3. *Kent State University, Kent, Ohio*

The role of resilience/hardiness in mediating relationships between 1) grandchild-specific caregiving demands and parental stress/strain and 2) caregiving role-specific changes and personal adjustment was explored among 240 grandparent caregivers (M age = 58.1; 82% women) who had been raising a grandchild for an average of 6 years. Based upon measures of 1) grandchildren's emotional and behavioral difficulties, 2) parental strain/stress/efficacy, 3) personal adjustment, life disruption, and well being, and 4) resilience/hardiness, hierarchical regression analyses suggested the mediating role of resilience in explaining relationships between child-specific demands and parental stress to be substantial ($p < .01$), but varying somewhat across measures of parenting stress. The role of resilience was also substantial ($p < .01$) in explaining life disruption-personal adjustment relationships; these varied little across measures of adjustment. These findings were confirmed utilizing latent constructs, suggesting that resilience is key to understanding the impact of parental and role demands on grandparent caregivers.

FAMILY I

WHAT ECONOMIC CRISIS?: LATE-LIFE FAMILY RELUCTANCE TO DISCUSS FINANCES

B. Carpenter, E. Sakai, S. Zoller, *Psychology, Washington University, St. Louis, Missouri*

The recent global financial crisis has left many older adults financially vulnerable. Consequently, now may be a particularly important time for family members to talk with each other about their financial resources and plans. We conducted a national U.S. survey of 1,201 adults that addressed their likelihood of talking with family about finances during an upcoming holiday gathering and the perceived barriers to financial conversations. Only 36% thought financial matters would be discussed during the holiday. Of 10 potential conversation topics, respondents thought finances was the least likely to be addressed, far behind expected discussions about health (71%), television (70%), or sports (60%). Common perceived barriers to financial conversations included concerns about privacy and the belief that family already knew what was necessary about their financial circumstances and preferences, despite having had few conversations to date. A substantial number of respondents were uncertain how to initiate financial conversations, were afraid of hurting family members' feelings, or had tried to initiate a conversation but had found their family unwilling. Multivariate analysis suggested that younger, White respondents with fewer financial resources were least likely to have financial conversations with family. These results suggest that late-life family financial conversations are uncommon, yet could be facilitated with targeted educational interventions to enhance communication skills.

A LOOK AT PARENTHOOD AND GRANDPARENTHOOD AS PREDICTORS OF LIFE SATISFACTION

M. Laroco, S. Adams, R. Bryant, *Case Western Reserve University, Cleveland, Ohio*

A myriad of factors are used to assess life satisfaction. However, little research examines predictors of life satisfaction within an aging population. This paper looks at parenting and grandparenting and the impact these roles have on reported life satisfaction. The position of parent and grandparent is pertinent in understanding changing social roles and how this will affect life satisfaction. This study uses data from Wave I of Americans' Changing Lives, which focus on persons in middle and late life. Key assessments will examine reported life satisfaction among parents with varying ages of children. Subsequently, we will measure life satisfaction of grandparents and the roles they play in their grandchildren's life. Eighty-four percent of adults report having children, while 51% report having grandchildren. Fifty percent of parents state being completely satisfied with parenthood; however, life satisfaction and parenthood yielded no significance. Conversely a strong relationship was found between grandparenthood and life satisfaction. Ordered logistic regression was used to examine a multivariate model of overall life satisfaction. The strongest correlates were grandparenthood (OR=.85 95% CI=.77-.95) and marital satisfaction (OR=.44 95% CI=.41-.48). Over half of parents report being satisfied as parents. However, this did not translate to overall life satisfaction. Interestingly, grandparenthood is related to reported life satisfaction. Understanding changing social roles and identifying predictors of life satisfaction will lend much information to parents, grandparents, and policymakers as we better understand population aging and its relationship to social roles.

USING AN INTERGENERATIONAL VIDEO GAME EXPERIENCE TO ENHANCE UNDERGRADUATE LEARNING IN GERONTOLOGY

S.J. Kohn, M. Freitag, J. Carter, B. Wright, M. Wood, *Valdosta State University, Valdosta, Georgia*

A key strategy for successfully teaching undergraduate gerontology courses often involves the selective use of intergenerational curricular activities. This was one rationale for developing a long-term project involving both gerontology and developmental-psychology students and community-dwelling older members (N=15) of a campus-wide continuing-education program. Our main project objective is to gather participants from different generations in a relaxed, informal setting to share a mutual recreational experience (playing Nintendo's Wii video-game) as a way to promote intergenerational communication, while reducing ageist stereotypes. This study addresses the project's impact on students' (N=62) personal perceptions of aging and older people over a semester-long (5-month) interval. Objective and subjective pre-test measures taken at the semester's start showed many students having naïve and myopic views of aging issues and older people. For example, analyses of student narratives showed that their general views of aging and older adults were typically based on societal and media stereotypes portraying the elderly as frail and needy. Students also reported that their intergenerational experiences were mostly limited to grandparent interactions. At semester's end, post-test effect-sizes showed moderate-to-high changes in objective measures (e.g., Fraboni Ageism-Scale). Post-test analyses of subjective measures revealed that most student narratives on aging and older people were now more descriptive, and articulated concrete experiences taken from playing Wii with the older participants to illustrate their views about aging. A few students (21-percent) also reported that they had developed friendships with the older participants that extended to socializing and communication (including Email and cell phones) outside of the project.

THE LONG-TERM IMPACT OF PARENTAL SUBSTANCE USE ON PARENT-CHILD SOLIDARITY IN LATER LIFE

M. Uchida, D. Feng, Z. Cong, J.P. Scott, *Texas Tech University, Lubbock, Texas*

The present study examined the long-term effects of parental substance use on the domains of parent-child solidarity by using a subsample of 593 parent-child dyads from the Longitudinal Study of Generations (LSOG) who participated between 1985 to 2000/2001 studies. A structural equation modeling technique was utilized in order to construct the mediational models of association of which the final outcome of expressive and instrumental support were examined separately for full sample, parent-daughter, and parent-son dyads. The results revealed an indirect effect of parental substance use/misuse on later expressive support through affectual solidarity among parent-daughter dyads, but not among parent-son dyads. Further, affectual solidarity was the most prominent predictor of later provision of expressive support by adult children, whereas associational solidarity was the most prominent factor for predicting later instrumental support. Findings on the gender difference in the models of association are also discussed.

DOES GENDER MODERATE THE FACTORS ASSOCIATED WITH THE SPOUSE'S ROLE IN CAREGIVER NETWORKS?

S. Feld¹, R. Dunkle¹, T. Schroepfer², H. Shen¹, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *University of Wisconsin, Madison, Wisconsin*

Solo spousal caregiving may be influenced by the spouse's gender, the care recipient's (CR's) and spouse's health, availability of spouse and other caregivers, and sociodemographic characteristics of couples. Using two frameworks, gender perspectives on caregiving and the task-specific model of caregiving, we explored whether and how gender moderated the effects of other factors on solo spousal IADL caregiving. We used a subsample of the AHEAD representative national sample (ages 70+) including couples (381 White and 71 Black) in which the CR

received IADL assistance. Logistic regression tested interactions between gender and variables related to: Health (CR's and spouse's IADLs and ADLs, CR's health conditions and cognitive functioning, spouse's – CR's age); Availability (spousal employment, # of proximate daughters and of sons, poverty ratio, and CR's Medicaid coverage); and Sociodemographic Characteristics (race, years married, and summed ages). As number of CR's IADLs and couple's proximate daughters increased, husbands were less often solo IADL caregivers, whereas these variables did not influence solo caregiving by wives. Additionally, when the spouse was younger or slightly older than the CR, husbands were more likely and wives were less likely to be solo caregivers. Regardless of gender, solo caregiving was reduced by CR's number of ADL limitations and the presence of spousal IADL or ADL limitations. Gender sensitive service provision can be facilitated by identifying circumstances influencing spousal solo caregiving differently in couples with a frail wife and those with a frail husband.

GRANDMOTHER CAREGIVING TO GRANDCHILDREN: EFFECTS OF TIME AND CHANGES IN CAREGIVING RESPONSIBILITY ON SF-36 RATED HEALTH

C. Musil, N. Gordon, C. Warner, *School of Nursing, Case Western Reserve University, Cleveland OH, Ohio*

A number of studies suggest that grandmothers raising grandchildren have worse health than grandmothers who do not have primary responsibility for grandchildren, but there is limited longitudinal data about how change or stability in caregiving status affects health outcomes. This study used SF-36 (Ware) data to examine the physical and mental health of grandmothers, as grouped according to their caregiving status to grandchildren (165 grandmothers raising grandchildren, 114 in multi-generational homes, and 156 grandmothers not living with their grandchildren) to evaluate the effects of 1) initial caregiving group and 2) increases, decreases or stability in caregiving responsibility over time. This sample of 435 Ohio grandmothers was recruited using random digit dialing with some supplemental convenience sampling. Participants completed three mailed questionnaires one year apart. Data were analyzed using SAS Repeated Measures Analysis of Covariance to examine differences between caregiving groups in the eight SF- subscales and summary physical and mental health scores, controlling for group by time interactions and increases, decreases or stability in caregiving status over 24 months, with additional covariates of age, education, race, marital status and employment status. There were statistically significant differences between caregiving groups in all eight subscales and summary scores, with grandmothers not living with grandchildren reporting better health and well being, with several group-by time effects. Changes in caregiving responsibility affected general health, pain, vitality, and social functioning but not overall physical or mental health. Employment, race and marital status had more limited effects. The implications of these findings will be discussed.

GRANDCHILDREN'S EXPERIENCES WITH CHANGES IN CAREGIVING ARRANGEMENTS

T.S. Standing, C. Musil, C. Warner, *School of Nursing, Case Western Reserve University, Cleveland, Ohio*

Transitions in caregiving to grandchildren are increasingly common today as grandparents assume more or less responsibility for grandchildren as parents deal with life issues, e.g., substance abuse, mental health issues, relationship problems or military deployment. Recently studies have examined grandparents' experiences with caregiving changes; however, little attention has been devoted to the grandchild's experience with changes in caregiving and living arrangements. A Hermeneutic Phenomenological approach is being used in this qualitative study to learn about these transitions from the child's perspective. As part of a larger, longitudinal study on grandmother caregivers and family health, semi-structured telephone interviews are being conducted with grandchildren who have experienced a change in caregiving, e.g.,

having a move into or away from the grandmother's home – or having their parent(s) leave or return to the grandparent's home. To date 9 interviews have been conducted with 8 to 17 (M=11.5) year old, white and non-white grandchildren. A modified Giorgi approach is guiding the analysis of the interview transcripts. Data collection and qualitative analysis are ongoing. Preliminary analysis has identified a strong emergent theme of Resilience as children take these caregiving changes in stride and offer advice for other children with similar transitions. In addition, the meanings of these caregiving transitions for the grandchildren are related to the reasons for the transitions. Findings of this study have implications for health care providers and social workers who care for children experiencing family and caregiver changes. The importance and dynamic nature of intergenerational relationships in families will be addressed.

SAFETY VS. AUTONOMY: THE STRUGGLES OF ADULT CHILDREN ASSISTING PARENTS WITH MILD COGNITIVE IMPAIRMENT

K.B. Pujari¹, R. Blieszner², K.A. Roberto², *1. Counselor Education, Virginia Polytechnic Institute and State University, Blacksburg, VA, 2. Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Adult children are likely to become involved as secondary care partners when parents experience mild cognitive impairment (MCI). The purposes of this qualitative analysis were to understand when, why, and how adult children decide to provide more intense support when a parent has MCI and to identify gender similarities and differences in their responses to the new challenges they face. We interviewed 46 adult children (33 daughters; aged 27-65) by phone using semi-structured questions. Analyses revealed perceived risks to parental safety as the main reason adult children stepped in to assist both parents in new ways. Adult children struggled with balancing parental autonomy vs. safety needs. They were uncertain how much to intervene when the parent with MCI developed problems with routine independent living activities such as driving, financial decision-making, household maintenance, medication management, functional limitations, or meal preparation. Sons typically provided indirect support relating to financial planning and household maintenance, laterally supporting parents while focused on promoting long-term independence. Sons also tended to receive information about the elder's condition through the parent assisting the person with MCI. In contrast, daughters provided more direct nurturing support such as daily visits or phone calls to both parents as well as more immediate chores such as grocery shopping and transportation. Findings confirm that gendered patterns of assisting with MCI are similar to those found in other care situations. In this situation, adult children struggle with transitioning into care partner roles and balancing parental independence while actively adhering to safety concerns.

FEASIBILITY OF 24-HOUR URINE COLLECTION TO MEASURE BIOMARKERS IN OLDER CAREGIVERS AND NON-CAREGIVERS

S.O. Stuver¹, L. Fredman¹, T.C. Chen², A.D. Coviello², *1. Epidemiology, Boston University School of Public Health, Boston, Massachusetts, 2. Boston University School of Medicine, Boston, Massachusetts*

Neuroendocrine biomarkers are important for understanding the health effects of stress among older caregivers. Most endocrinologists advocate 24-hour urine for these measures; however, there is little information on the feasibility of obtaining 24-hour specimens in community-dwelling older adults. Anticipated challenges include acceptability, fitting collection into participants' schedules, convenience of specimen retrieval, and usability of specimens. As part of an ongoing cohort study of elderly dementia caregivers and non-caregivers living in the Boston metropolitan area, we are collecting a fasting blood sample (for dehydroepiandrosterone-sulfate [DHEA-S] and interleukin-6 [IL-6]) and a 24-hour urine specimen (for cortisol, epinephrine, and nor-

epinephrine). Blood samples are obtained during the participant's interview at a general clinical research center. At the interview, a nurse instructs the participant on the correct method to collect and store a 24-hour urine sample. As incentives, the participant selects a day for urine collection within five days of the interview and receives a \$20 reimbursement; study staff also travel to the participant's home to retrieve the specimen. Through the first 7.5 months of the study, 15 caregivers and 90 non-caregivers enrolled; mean age is 75.6 years; 57% are female. Nearly all participants provided a blood sample (97%) and a urine specimen (98%). The sample medians (interquartile ranges) of the biomarkers measured were: DHEA-S, 54 (28-94) $\mu\text{g/dL}$; IL-6, 4.1 (2.1-5.0) pg/ml ; cortisol, 40 (24-70) ng/ml ; epinephrine, 2.9 (1.1-7.7) ng/ml ; norepinephrine, 39.0 (25.0-60.0) ng/ml . Our high success rate indicates the feasibility of collecting 24-hour urine to measure neuroendocrine biomarkers in an active community-dwelling older population.

A LONG-TERM CARE DECISION-MAKING INSTRUMENT FOR RURAL AFRICAN AMERICAN FAMILY CAREGIVERS

Y.D. Eaves, D. Vance, *School of Nursing, University of Alabama at Birmingham, Birmingham, Alabama*

Few instruments exist that measure knowledge, what role patients want in their own health care and treatment decisions, and who they wish to allocate authority to make decisions for them. Moreover, no long-term care decision-making tools have been developed or adapted for rural persons or African Americans. The purpose of this study was to develop a valid, reliable, and culturally relevant instrument, derived from ethnographic qualitative data, to measure decision-making for rural African American family caregivers and care recipients. Inductively generated data was used to define and operationalize concepts and items. The new instrument was pilot-tested with 60 rural African American families consisting of older care recipients, and primary and secondary caregivers. A participant rating panel of 5 families and a content expert panel of 5 researchers were sought to review the new instrument for cultural relevancy, and item content, style, and comprehensiveness. Psychometric testing is ongoing and includes calculation of: content validity index (CVI) of items across expert scores and the CVI of the total scale, Cronbach's alpha coefficient to determine internal consistency reliability, and stability reliability with a 2-week test-retest and measured with percent agreement, and factor analysis to determine item loadings and subscales. Reliability measurements will be analyzed so that comparisons can be made across the three types of family members (care recipient, primary caregiver, and secondary caregiver). Administering the instrument to care recipients and primary and secondary caregivers will provide insight into how different members in the caregiving family view and participate in decisions.

UTILIZATION OF A COMMUNITY CAREGIVER INTERVENTION PROGRAM: WHO COMES AND WHY?

L.N. Anderson, S. Qualls, K. Hiroto, L. Starr, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Caregiver programs are encouraged to tailor interventions to meet the unique needs of individual clients. Although the literature on caregiving interventions is becoming well established, profiles of caregivers who seek therapy in community settings may differ markedly from those described in research contexts. Thus, an understanding of individuals who seek caregiver services is vital for clinicians who wish to provide caregiving interventions. The present research describes characteristics of 297 caregivers who sought therapy in an established Aging Families and Caregiver Program embedded within a community-based clinic. Two major questions were addressed: (1) Who seeks caregiver family therapy, and (2) What difficulties prompt this decision to seek help. Results show that, unlike many research samples, our clinic draws larger numbers of caregivers who are adult children (61%, $n = 180$) than spouses (31%, $n = 91$). Help is sought at various points throughout the caregiving career ($M = 2$ years, $SD = 27.15$; range: 1 month - 14 years)

and length of treatment varied tremendously based on individual needs ($M = 4$ sessions, $SD = 4.89$; range: 1 - 48 sessions). Moreover, family caregivers are often concerned about navigating important transitions and decision-making (89% of our sample was involved in decision-making for their loved one) in addition to distress and burden. Given that subsamples of caregivers (e.g., adult children vs. spouses) may have distinct concerns and needs, our findings support that service providers embedded within community settings should account for population characteristics when deciding on intervention approaches.

PREDICTORS OF ANTICIPATORY GRIEF IN DEMENTIA CAREGIVERS

C. Holley, B. Mast, *University of Louisville, Louisville, Kentucky*

Background: Recent research has demonstrated that anticipatory grief (AG) contributes to the level of burden experienced by dementia caregivers. However, it is unclear what aspects of the caregiving situation prompt the experience of anticipatory grief. **This study examined the relationship between these primary stressors and AG.** It was hypothesized that greater levels of impairments, behavior problems, disease stage, and more hours of weekly care would be associated with higher levels of AG. **Methods:** Eighty dementia caregivers completed a survey related to their caregiving experiences. Regression analyses were used to examine the relationship between primary stressors (disease stage, hours of weekly care, ADL and IADL impairments and behavior problems) and AG. **Results:** Behavior problems were the only primary stressor variable which significantly predicted AG as measured by the Marwit-Meuser Caregiver Grief Inventory ($\beta = .38$, $p < .01$) and the Anticipatory Grief Scale ($\beta = .27$, $p < .05$). Follow-up analyses revealed that disruptive behavior problems were significantly associated with greater AG in spouses, whereas only depression-related behavior problems were significantly associated with AG in adult children. **Conclusions:** The grief experiences of dementia caregivers appeared to be more strongly related to behavioral problems than other indicators of disease severity. However, grief is triggered in spousal caregivers by disruptive behaviors, whereas in child caregivers grief is associated with depression-related behaviors such as crying and tearfulness, suggesting that the experiences which trigger grief may differ between spousal and adult-child caregivers.

INFLUENCE OF PARENTAL ABUSE IN CHILDHOOD ON CAREGIVERS' DISTRESS IN MIDLIFE AND BEYOND

C. Poon, B.G. Knight, *University of Southern California, Los Angeles, California*

Research on childhood abuse highlights an intergenerational transfer of violence, influencing how abused individuals treat their offspring. Few have examined if childhood abuse also affects those who are providing care to other family members and friends. Two separate bodies of literature have documented the negative consequences of childhood abuse and caregiving. This study investigated how parental abuse in childhood predicted negative affect and somatic symptoms among 289 individuals aged 33 to 84 (Mean: 55.55), who provided at least one month of personal care to a family member or friend with physical or mental illness or disability in the past year. Data were drawn from the 1995-2005 National Survey of Midlife Development in the United States (MIDUS). Regression analyses revealed significant main effects of parental abuse on physical and psychological distress, after controlling for demographic and other caregiving related variables. Identity of the care recipient significantly moderated the association between childhood parental abuse and current level of negative affect. Parental abuse predicted more negative affect among individuals caring for their parents but not other family members or friends. Results highlighted the lasting influence of childhood abuse on physical and psychological distress in a sample of caregivers, as well as the need to assess adverse childhood family experiences when working with adult children caregivers, in an attempt to reduce their emotional distress.

DEVELOPMENT OF A NEW INSTRUMENT TO ASSESS DEMENTIA CAREGIVER GUILT FOLLOWING NURSING HOME PLACEMENT

P. Steadman-Wood^{1,2}, J. Davis^{2,3}, G. Tremont^{2,3}, *1. HBPC, Providence VAMC, Portsmouth, Rhode Island, 2. Warren Alpert Medical School of Brown University, Providence, Rhode Island, 3. Rhode Island Hospital, Providence, Rhode Island*

Psychological experiences appear to differ between dementia caregivers pre- and post-nursing home placement. The majority of studies examining caregiver distress following placement rely on community measures of stress and burden (e.g., Zarit Burden Interview). These measures may not, however, adequately capture the post-placement psychological experience. To address this issue, we systematically created a new measure to assess caregiver adjustment following nursing home placement. A total of 46-items were generated and pilot tested with 53 dementia caregivers who were within one month of placement (M age = 60.26, SD = 11.42; 76% female; 66% adult child). Caregivers were also administered other mood and health questionnaires as part of a larger caregiver study. Caregivers were asked to rate their post-placement experience on a 4-point likert scale. Items addressed ambivalence and guilt about the decision to place. The measure was optimized to 21-items by omitting items with inter-item correlations $> .50$. Reliability of the measure was within optimal range (Cronbach alpha α = .80). Construct validity was shown with measures of depression (r = 0.40), perceived burden (r = 0.54), ZBI guilt factor (r = 0.59), and ZBI psychological burden factor (r = 0.48). Divergent validity was demonstrated with measures of social support (r = 0.02), conflict with staff (r = 0.21), and physical health (r = -0.06). Overall, the results suggest that the Caregiver Guilt Questionnaire for Nursing Home Placement is a reliable and psychometrically sound instrument for assessing one aspect of post-placement emotional adjustment in dementia caregivers.

THE DYNAMIC INTERRELATIONSHIP BETWEEN MOTHERS AND DAUGHTERS ON A MEASURE OF DEPRESSIVE SYMPTOMS

R. Reyes, *University of Southern California, Los Angeles, California*

It is important to analyze a reciprocal dynamic relationship between older parents and their adult children. Mothers are generally more invested in their children's lives and the relationship between mother and adult daughter has been shown to have more emotional ties than that between a mother and her adult son. The goals of this study were to longitudinally explore the dynamic interrelationship between mother and daughter on depressive symptomatology, to adjust and examine models taking mother/daughter age differences and education into account, and to develop dynamic structural equation model hypotheses for future research. Mothers (average age = 68) and daughters (average age = 48) from the University of Southern California's Longitudinal Study of Generations were included in analyses (190 total dyads). Depressive symptoms were measured at two time points using CES-D subscale scores. Model fits of varying dynamic cross-lagged regression SEMs were compared using M+ software. The best fitting model suggested an adult daughter's depressive symptomatology to be a leading indicator of her older mother's depressive symptoms (standardized coefficient = .16). Mothers' depressive symptoms did not show any effect on daughters' symptoms over time. Examination of difference in age and education covariates demonstrated that the strength of influence could vary slightly, although not change the relationship or model fit in a statistically significant way. The direction of this adult relationship is different than the unidirectional mother to daughter influence adolescent research suggests. Further analyses will focus on including more time points to explore how the relationship might vary across time.

THE FORMAL SERVICE NEEDS OF GRANDMOTHER CAREGIVERS AND FAMILIES

C. Warner, C. Musil, C. Harmon, *Case Western Reserve University, Cleveland, Ohio*

The importance of formal service need and use among older adults has been well documented; however, the specific service needs of grandmother caregivers and their families warrant more attention. In the fourth wave of a longitudinal study on grandmothers, caregiving and families, 370 grandmothers, categorized according to their caregiving status (grandmothers raising grandchildren (n =133), grandmothers in multigenerational homes (n =53), and grandmothers living in a separate residence from grandchildren (n =184)), completed mailed questionnaires. The grandmothers were asked to identify services and resources that would benefit them in their current situation; they completed a checklist with sixteen services/resources applicable to many older adults and families, and included resources such as financial, health, legal, and transportation services. Items were summed to create a composite score. ANOVA revealed statistically significant differences between the grandmother groups in service need, with grandmothers raising grandchildren reporting the need for more services (M =3.3, SD =2.8) as compared to the other groups (multigenerational grandmothers M =2.9, SD =2.3; non-custodial grandmothers M =2.1, SD =2.2). Fifty-one percent of the entire grandmother sample indicated the need for services related to exercise and fitness, followed by information on personal health and financial services. Similar patterns were consistent among the specific caregiving groups. The findings underscore that grandmothers raising grandchildren are the group with the most need and demonstrate the challenging and complex nature of this family caregiving situation. Regardless of caregiving status, grandmothers report financial and health services among their greatest needs. The social policy implications for this unique population will be discussed.

A MULTILEVEL ANALYSIS OF CHILDREN'S RESIDENCE IN THREE-GENERATION FAMILIES

J. Mutchler¹, L.A. Martin¹, L. Baker², S. Lee¹, *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. University of Southern California, Los Angeles, California*

At least 6 million children in the U.S. live in a household that includes a grandparent. For three-quarters of these children, the child's parent also lives in the household, forming a three-generation coresident family. In many of these households, the grandparents serve as primary supports and/or caregivers for their grandchildren, but in others, the grandparent is receiving support and care from the younger generations. Limited financial and other resources are commonly cited as factors leading parents and their children to form three-generation households. Environmental influences, such as housing availability, costs of living, and other spatially-defined factors, have not been examined. In this study we use multilevel regression techniques to examine data from the 2000 Census on intergenerational living. We find that characteristics of the child's parents—specifically, age, gender, marital status, socioeconomic status, work status, and race—are powerful predictors of living in a three-generation household. Characteristics of the community in which the family lives also shape the chances that a three-generation family is formed. For example, living in communities that have a high cost of living promotes the formation of three-generation families. We also identify important differences in the process resulting in three-generation families that are headed by the grandparent, and three-generation families that are headed by the middle generation. Our findings expand conventional explanations of the mechanisms through which grandparent families are formed, and contribute to a greater understanding of why three-generation families are more prevalent in some communities than in others.

THE IMPACT OF THE TAILORED CAREGIVER ASSESSMENT AND REFERRAL PROCESS ON CAREGIVER OUTCOMES: FINDINGS FROM A DEMONSTRATION PROJECT IN THE STATE OF GEORGIA

R. Montgomery¹, J. Rowe¹, J. Kwak¹, C. Burt², S. Dickol³, M. Brondino¹, 1. UW-Milwaukee, Milwaukee, Wisconsin, 2. Georgia Division of Aging Services, Atlanta, Georgia, 3. Coastal Georgia RDC Area Agency on Aging, Brunswick, Georgia

Initial findings are reported from a demonstration project undertaken by the Georgia Division of Aging Services and researchers at University of Wisconsin-Milwaukee to implement and evaluate the impact of a caregiver assessment and referral protocol. The Tailored Caregiver Assessment and Referral (TCARE) protocol was designed to enable care managers to more effectively support family caregivers by targeting services to meet their specific needs. It was hypothesized that the TCARE protocol would lead to lower levels of caregiver depression, burden, and identity discrepancy and lower costs of services by altering patterns of service use. A 12-month longitudinal randomized trial was conducted in three regions of the state. Half of the 12 care managers participating in the study used TCARE to serve caregivers who were randomly assigned to the treatment group (n=41) and the other six followed usual practices to serve caregivers assigned to the control group (n=34). A process evaluation documented fidelity with the TCARE protocol. Data were collected at three month intervals. Findings are reported here for outcomes at T2 and T3. Findings from data analyses using hierarchical level modeling (HLM) procedures revealed a significant interaction between group and time on stress burden, depression, and identity discrepancy. Caregivers in the treatment group had lower levels of identity discrepancy, stress burden, and depression at the three and six-month follow-up periods. Similar, but statistically non-significant patterns were found for measures of relationship burden and caregiver uplifts. The findings provide evidence that TCARE is an effective service to support family caregivers.

A TELEPHONE-DELIVERED PSYCHOSOCIAL INTERVENTION IMPROVES DEMENTIA CAREGIVER ADJUSTMENT FOLLOWING NURSING HOME PLACEMENT

J. Davis^{1,2}, G. Tremont^{1,2}, D. Bishop^{1,2}, R. Fortinsky³, 1. Rhode Island Hospital, Providence, Rhode Island, 2. Warren Alpert Medical School of Brown University, Providence, Rhode Island, 3. Center on Aging, University of Connecticut Health Center, Farmington, Connecticut

Nursing home placement is a stressful transition point in dementia caregiving. Despite a decrease in caregiver demands, placement does not fully relieve caregiver distress. We examined the preliminary efficacy of Family Intervention: Telephone Tracking-Nursing Home (FITT-NH) for facilitating caregiver adjustment following placement. FITT-NH is a multi-component telephone intervention that was delivered within one month of placement. Caregivers received 10 telephone contacts over 3 months. Treatment strategies were based on assessment of caregiver emotional adjustment, family functioning, staff-caregiver interactions, health, and social support and tailored to ensure individualized application of interventions. Care recipient mood and behavior were monitored. Caregivers (N = 46; M age = 59.20, SD = 10.65; 76% female; 78% adult child) were randomly assigned to FITT-NH (n = 24) or standard care (n = 22) using urn randomization to balance the groups on caregiver gender, relationship type (spouse versus other), and facility type (special care unit versus general). Inclusion criteria included dementia diagnosis, caregiving for at least 6 months, permanent placement, and not designated for hospice care. Outcomes included burden, depression, guilt, staff-caregiver interactions, and health-related quality of life at baseline and 3 months (end of treatment). Caregivers in both groups showed a reduction in perceived burden and depressive symptoms. Caregivers receiving FITT-NH, however, showed fewer feelings of guilt, more positive interactions with staff, and a tendency toward returning to pre-

caregiving activities compared to caregivers receiving standard care. Findings provide preliminary evidence for FITT-NH as a potentially efficacious intervention for improving caregiver emotional adjustment following nursing home placement.

DISCUSSING DEMENTIA-RELATED BEHAVIORS DURING HEALTHCARE VISITS FOR PERSONS WITH ALZHEIMER'S DISEASE

A. Hunsaker¹, K. Schmidt², J. Lingler^{3,4,5}, 1. University of Pittsburgh School of Social Work, Pittsburgh, Pennsylvania, 2. University of Pittsburgh, Department of Psychology, Pittsburgh, Pennsylvania, 3. University of Pittsburgh School of Nursing, Department of Health and Community Systems, Pittsburgh, Pennsylvania, 4. University of Pittsburgh School of Medicine, Department of Psychiatry, Pittsburgh, Pennsylvania, 5. University of Pittsburgh Alzheimer Disease Research Center, Pittsburgh, Pennsylvania

Behavioral changes are a common symptom of dementia that can create significant burden for family caregivers. Research suggests that caregivers have an active interest in receiving support from healthcare professionals regarding dementia care. Yet, little is understood of how caregivers work with patients' primary care providers (PCPs) to manage dementia-related (DR) behaviors. This study analyzes the discussions of DR behaviors during 25 primary care visits of people with Alzheimer's disease that were co-attended by a family caregiver. We examine whether caregivers who report DR behaviors on an independent assessment, using the Revised Memory and Behavior Problem Checklist (RMBPC), discuss those behaviors with the PCP. Each visit was audio-recorded and coded for the frequency and type of behaviors discussed. DR behaviors were discussed in over 75% of the visits and memory-related behaviors were more often discussed than disruptive behaviors (69.2% versus 23.1%). Discussion of DR behaviors was positively correlated with caregiver report of behavior frequency and behavior-related burden. Although 32% of caregivers endorsed the RMBPC item "waking you or others at night" and 20% endorsed, "engaging in behavior that is potentially dangerous" and "verbally aggressive," none of these symptoms were conveyed to care recipients' PCPs. These findings suggest the need to educate family caregivers on the value of, and approaches to, reporting clinically actionable DR behaviors to PCPs. Implications of findings for ways the PCP can assist the caregiver in behavior management are discussed.

HEALTH BEHAVIORS AMONG FAMILY CAREGIVERS: PREDICTORS OF CHANGES OVER TIME

S. Schneider¹, K. Kim², S.H. Zarit², 1. Department of Developmental Psychology, Friedrich-Schiller-University of Jena, Jena, Thuringia, Germany, 2. Department of Human Development and Family Studies, Pennsylvania State University, University Park, Pennsylvania

It is widely recognized the caregiving can place extensive demands on family members that can lead to an erosion of personal and social resources. Health behaviors are important for sustaining good health in the face of chronic stress, but the time and effort expended on care responsibilities may lead family members to cut down on preventive health efforts such as exercise or to engage in potentially harmful behaviors such as poor diet or use of alcohol. Prior research has used cross-sectional data to examine predictors of health behavior of family caregivers. In this study, we look both at cross-sectional findings as well as predictors of changes in health behavior. The sample consisted of 141 caregivers of persons with dementia who were followed over a 6 month period. Using a regression analysis on baseline data, we found that older caregivers had better health behaviors, and that greater overload and depression were associated with lower health behaviors. Surprisingly, care stressors such as behavior problems and emotional support were not related to health behavior. At 6 months, about half the sample showed improved health behavior and half showed worsening health behavior. After controlling for baseline levels of health behavior, we found that better health

behavior at 6 months was associated with decreases in depressive symptoms. No other changes affected health behavior at 6 months. These results suggest that interventions designed to improve health behavior among caregivers should also address depressive feelings.

WHO ARE OLDER PARENTS' PREFERRED CAREGIVERS: THE CONSEQUENCES OF CHILDREN'S MIGRATION AND INTERGENERATIONAL EXCHANGES WITH THEIR PARENTS IN RURAL CHINA

Z. Cong¹, M. Silverstein², *1. Texas Tech University, Lubbock, Texas, 2. University of Southern California, Los Angeles, California*

This paper examined how rural to urban migration of adult children and intergenerational support influenced elder parents' choice of their preferred caregivers when they were sick in rural China. We also directed attention to gender differences in this process. Based on a three-wave longitudinal study in Anhui Province, China, with data collected in 2001, 2003, and 2006, we used fixed effects logistic regression to predict the likelihood of a child being chosen as the most preferred care givers. Results showed that children who were physically farther away and emotionally detached were less likely to be chosen as preferred caregivers both by older fathers and mothers. For an older father, receiving financial support from a child increased his expectations of that child as the most preferred care givers, and providing grandchildren care to a migrant child predicted his choice of that child as the most desirable caregiver. For an older mother, providing grandchildren care to a child also increased her expectations of the child to be the preferred caregiver, but this was not influenced by whether the child was a migrant. Daughters and sons are equally preferred even when most rural Chinese families followed the patrilineal family tradition. Although migration increases children's physical distance to their parents and reduced children's likelihood of being chosen as preferred caregivers, it strengthened intergenerational exchanges and consequently increased children's likelihood of being chosen as the most preferred caregivers at the same time.

DIFFERENCES BETWEEN MIDDLE AGE FATHERS' AND MOTHERS' SUPPORT TOWARDS ADULT CHILDREN: WHAT DO THEY GIVE AND WHY

Y. Cheng, K.L. Fingerma, *Purdue University, West Lafayette, Indiana*

Previous research examining parent/offspring ties has focused primarily on mothers, excluding fathers. This study compared middle-aged mothers' and fathers' provision of different types of support to their grown children. We asked two questions: (a) do mothers provide greater support than fathers across all types of support? (b) do emotional and normative solidarity contribute to both parents' support? Participants (302 fathers, 331 mothers) indicated how often they helped each grown child ($n = 1,384$) with seven types of support. Findings from a 2 (between-subject, gender) by 7 (within-subject, types of support) repeated measures ANOVA revealed that mothers provided more total support to each child than fathers ($F(1, 630) = 5.48, p < .05$). Regarding different types of support, mothers provided more advice, emotional support, socializing, and listening to the child talk about daily life than fathers. Fathers provided more technological assistance and similar amounts of practical and financial support as mothers. Next, separate hierarchical regressions by parent gender tested whether affectional and normative solidarity explained total support to grown offspring, controlling for child's gender, age, distance from parents, and number of siblings. Relationship quality (affectional solidarity) significantly contributed to both parents' support. For normative solidarity, mothers' familism explained more help to offspring, but fathers' obligation explained more help to offspring. Findings suggested that fathers contribute less to offspring than mothers for socioemotional support, but not with regard to practical types of help. Findings supported solidarity theory but also indicated that solidarity may have different implications for mothers' and fathers' support behaviors.

HOW MIGHT RECEIVING CARE INFLUENCE THE OLDER PARENT-ADULT CHILD RELATIONSHIP?

J.P. Lendon, M. Silverstein, *Gerontology, University of Southern California, Los Angeles, California*

The purpose of this longitudinal research was to explore the possible mutual effects of older parents' affectual solidarity (closeness, understanding, communication, getting along) and conflict with a child and receiving care from that child. Social exchange theory, which posits a reciprocal exchange of support between caregiver and care receiver, suggests care receivers exchange emotional support, such as love. If so, might parents receiving care also feel more solidarity towards the caregiving child? A sample of 581 older adults from the 1994 and 2000 waves of the Longitudinal Study of Generations analyzed measures of solidarity, conflict, and receiving care (the number of types of instrumental care received) from the parents' perspective about their child. T-tests showed a simple relationship of higher 1994 solidarity for parents being cared for in 2000 ($t = -2.5, p < .05$), but no relationship with conflict. An exploratory cross-lagged model also showed significant effects of solidarity ($\gamma = .025$), as well as conflict ($\gamma = .048$), on receiving later care. Notably, there was a significant effect of receiving care ($\gamma = .29$) on later conflict, but no effect of care on solidarity. These results indicated increased levels of solidarity and conflict earlier in the relationship may influence receiving care later; however, it seems receiving care may lead to increased conflict with their child, but not solidarity. It is important to understand how parent-child relationships may be influenced by caregiving, as family caregiving is invaluable to long-term care. If older care recipients are experiencing more conflict, how might it impact their care and well-being?

ROLE STRAIN, PERSONAL STRAIN, AND WORRY ABOUT PERFORMANCE AMONG CAREGIVERS OF PEOPLE WITH LEWY BODY DEMENTIA

A.N. Leggett¹, S.H. Zarit¹, J.E. Duda², J.E. Galvin³, D.I. Kaufer⁴, C.F. Lippa⁵, A. Taylor⁶, *1. Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania, 2. University of Pennsylvania and Veterans Affairs Medical Center, Philadelphia, Pennsylvania, 3. Washington University, St. Louis, Missouri, 4. University of North Carolina, Chapel Hill, North Carolina, 5. Drexel University College of Medicine, Philadelphia, Pennsylvania, 6. Lewy Body Dementia Association, Atlanta, Georgia*

People with Lewy Body Dementia (LBD) present a unique set of symptoms and challenges to family caregivers compared to other types of dementia. Prominent difficulties include motor impairment, which leads to greater ADL disability, and recurrent behavioral and emotional problems (BEP), including visual hallucinations, delusions, and sleep disorders. These problems are likely to impact caregivers' subjective burden. The present study used data from an internet survey conducted by the Lewy Body Dementia Association (LBDA). Respondents were 737 people who indicated they were currently involved in the care of their relative with LBD. Average age was 56 for caregivers and 75 for patients. Women comprised 87% of caregivers 39% of patients. Patients had been symptomatic on average for 6 years. Subjective burden was assessed with an 11-item short version of the Zarit Burden Interview (BI). A factor analysis revealed three dimensions: role strain, personal strain, and worry about performance. Multiple regressions were used to examine predictors of the three burden factors, including social characteristics of patient and caregiver, formal service use, ADL disability and BEP. We found that BEP was significantly associated with all three factors. ADL disability was related only to role strain. Age and gender contributed in different ways to the three factors. Formal service use had no significant associations with burden, but levels of use were low. These findings highlight the impact of BEP on subjective burden. BEP may be especially pivotal in disorders like LBD which have elevated rates of these problems.

GIVING AND RECEIVING AMONG ADULT FAMILY GENERATIONS: THE BALANCE OF INTERGENERATIONAL EXCHANGE ACROSS EUROPE

M. Kohli¹, H. Kuenemund², C. Vogel², *1. European University Institute, San Domenico di Fiesole, Italy, 2. University of Vechta, Vechta, Germany*

Transfers of money and time among aging parents and their adult children are an important source of social protection and a key part of the 'generational contract'. In our previous research, we have shown that the usual direction of these transfers is downward, from parents to children, and that they vary systematically across welfare and family regimes in Europe. In the present paper, we compute a net outcome measure by converting the value of time transfers into wage equivalents, thus creating a unified account of transfer balances between parents and children. This allows us to describe (1) to what extent total intergenerational transfers are unidirectional or reciprocal, and (2) to what extent monetary transfers (inter vivos) and time transfers (practical help and support) balance or complement each other. In a third step, we analyze the factors that determine transfer balances both at the level of parent-child dyads and at the level of country-specific contexts. The analysis is based on the Survey of Health, Ageing and Retirement in Europe (SHARE).

SESSION 325 (PAPER)

HOW SERVICES AND INTERVENTIONS CHANGE LIVES

MAKING THE MOST OF YOUR HEALTHCARE APPOINTMENTS INTERVENTION FOR OLDER ADULTS

A. Hochhalter, J. Rush, L. Sklar, J. Song, A. Stevens, *Scott & White Healthcare, Temple, Texas*

Active engagement in healthcare can foster healthy behaviors and promote health, especially among older adults dealing with the complexities of managing comorbid chronic illnesses. This study tested the efficacy of an intervention for increasing patient engagement and improving health-related quality of life among older adults with multiple chronic illnesses. The intervention, Making the Most of Your Healthcare, uses evidence-based behavior change techniques to deliver publicly available patient education materials. We report the results of a three-group randomized controlled study conducted in a primary care setting. Seventy-nine participants were assigned to the intervention group, an attention control group, or usual care. The intervention and attention control groups attended a two-hour workshop and participated in two phone calls; one before and one after a naturally-occurring medical encounter. The intervention group's contacts were on patient engagement and the attention control group contacts were on general safety. Self-report measures were gathered by telephone interviews at baseline and six-months following baseline. The treatment group showed improved self-efficacy for self-management following intervention. Contrary to expectations, patient activation scores improved for both the treatment and usual care groups but not the attention control group. These initial findings suggest potential benefits for short-term, low-intensity patient engagement interventions.

PREVENTIVE HOME VISITS: TESTING A SOCIAL MODEL OF CARE IN THE UNITED STATES

J. Svihula¹, M. Cutchin², S. Coppola³, V. Talley⁴, M.H. Palmer⁵, *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 4. Orange County Department on Aging, Chapel Hill, North Carolina, 5. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Most older adults wish to remain at home the rest of their life. Yet factors such as increasing frailty, social isolation and reduced commu-

nity mobility may lead to declines in well-being that in turn result in moves, hospitalization, or institutionalization. A successful preventive approach for at-risk older adults could mitigate the problems and unwanted outcomes as well as save costs. This paper presents a research project wherein occupational therapists are implementing an innovative non-medical Preventive Home Visits (PHV) protocol similar to what has been utilized in Denmark. The study, funded by the National Institute on Aging, is being conducted in three North Carolina counties with an effort to establish evidence of feasibility and effectiveness. Therapists provide infrequent but regular visits to older adults in their homes to assess needs, the environmental, social and occupational situation, and to provide recommendations to optimize function and well-being. Using an experimental, repeated measures design, investigators are collecting function, health, healthcare utilization, and quality of life measures on a population of potentially vulnerable community-dwelling older (75+ years) adults. Feasibility in both data collection and intervention delivery is very good to date with little missing data or attrition. The most frequent recommendations by therapists to participants include affirmation of healthy habits, referrals to exercise regimens and senior center activities, and incorporating safety features in the home environment. While the model's effectiveness is yet to be determined, we have learned valuable lessons about how to design and implement such a program.

WHO USES BEREAVEMENT SERVICES? AN EXAMINATION OF SERVICE USE BY BEREAVED DEMENTIA CAREGIVERS

E.J. Bergman¹, W.E. Haley², B. Small², *1. Gerontology Institute, Ithaca College, Ithaca, New York, 2. University of South Florida, Tampa, Florida*

Despite the availability of a wide range of services and interventions for bereaved family caregivers, little is known about the characteristics of those who use them. The current study employed Andersen's Behavioral Model of Health Services Use in an examination of bereavement service utilization among dementia caregiver participants (N=224) in the Resources for Enhancing Alzheimer's Caregiver Health (REACH) study. Approximately one in three participants utilized bereavement services, primarily during the first 9 months after the death of the care recipient. Support groups, counseling, and psychotropic medications were used across individuals. Depressive symptomatology and complicated grief served as need factors, with higher levels resulting in higher probability of service utilization. Race/ethnicity served as a predisposing characteristic, with Black caregivers less likely and Hispanic caregivers more likely than White caregivers to utilize support groups. Future research should focus on interventions designed to assure timely access to those bereaved family caregivers who are most in need.

RURAL COMMUNITY DWELLING OLDER ADULTS: CREATIVE OUTREACH IN BEHAVIORAL HEALTH INTEGRATED SERVICES

N. Rowan¹, A.C. Faul¹, P.A. Yankeelov¹, P. Gillette³, D. Rattle², L. Paris¹, B. Gordon⁴, *1. Kent School of Social Work, University of Louisville, Louisville, Kentucky, 2. Seven Counties Services, Louisville, Kentucky, 3. Bellarmine University, Louisville, Kentucky, 4. KIPDA Area Agency on Aging, Louisville, Kentucky*

Integrating behavioral health services is uncommon especially in rural communities of Kentucky. A federally funded project with an emphasis on evidence-based services to older adults in medically underserved areas of Kentucky provided the basis of this outreach. Two service delivery models were tested using an experimental, longitudinal, pre-post test design. Social work students and professionals worked in tandem with physical therapy students and professionals to provide comprehensive health and mental health assessments and wellness plans to improve health outcomes. Collaborative efforts were made through another grant funded by Kentucky Department for Mental Health and

Substance Abuse specific for rural community dwelling elderly that combined social work, physical therapy, nursing, case managers, and a prevention specialist to create services that were otherwise not available. Results include service to 38 rural dwelling clients after the federal funding ended. The behavioral health rural project created an environment in which the regional Area Agency on Aging, the regional community mental health center, and university partners identified common interests and goals in expanding and extending a wider array of services to older people. Results indicate significant gains for all participants in viewing their health more positively, improving their self-efficacy to manage their health, experiencing less pain and depression, improving their lower extremity muscle strength, reducing fracture and fall risk, and removing fall hazards in and around their home.

TRANSLATING AN EVIDENCE-BASED PROGRAM TO THE COMMUNITY: REDUCING DISABILITY IN ALZHEIMER'S DISEASE

H. Menne¹, S. Bollin², L. Teri³, D. Bass¹, 1. Margaret Blenkner Research Institute, Benjamin Rose Institute, Cleveland, Ohio, 2. Alzheimer's Association, Toledo, Ohio, 3. University of Washington, Seattle, Washington

The evidence-based program "Reducing Disability in Alzheimer's Disease (RDAD)" was developed and tested in a rigorous randomized control trial and now is considered an evidence-based practice that benefits both persons with dementia and their caregivers. RDAD teaches persons with dementia simple exercises to improve health and functioning, and provides caregivers with behavior management skills to address problem behaviors related to dementia. Replications of evidence-based practices in community-based service organizations are important additions to the network of aging services. However, implementation involves many unique challenges in the process of translating research to practice. This presentation uses the RE-AIM framework to address and analyze the challenges and strategies of implementing RDAD in a local Alzheimer's Association chapter. The analysis contrasts four major components of a controlled research protocol with the realities of a naturally occurring service-agency environment. One component was developing a system to guide projections for the number of families who could be served and approaches to recruitment. A second component related to a methodology for assuring the fidelity of the intervention and evaluating quality assurance. Third was determining appropriate professionals to implement the intervention including the required educational background, work experience, and extent of training on the intervention. Fourth was adaptation of the intervention itself to accommodate the realities of an agency environment without damaging the integrity of evidence-base. Discussion of these components guides further program enhancement in additional settings.

SESSION 330 (PAPER)

JUST DO IT: CIVIC ENGAGEMENT

SOCIAL CAPITAL, FAITH-BASED ENGAGEMENT AND PERCEIVED HEALTH OF OLDER ADULTS: A STRUCTURAL APPROACH

D. Mukherjee, *Social Work, Southern Illinois University Carbondale, Carbondale, Illinois*

Purpose: The purpose of this study was to understand aging and health from the social capital perspective. This is done by coalescing together variables, such as social support, social networks, social trust and faith-based social engagement that have been used in existing literature to construct a 'social context' that supposedly could influence perceptions about health among older adults. **Methods:** Secondary data analysis was conducted using data from the Social Capital Community Benchmark Survey (SCCBS, 2001). The final sample consisted of 471

responses. Structural equation modeling with maximum likelihood estimation was used to examine the direct and indirect effects of the variables. Missing data has been imputed using the Maximum likelihood estimation. Results: According to the fit indices, the model provided a very good fit to the data. As predicted, the result indicated that friendship network was a significant variable in influencing social support. Faith-based social engagement and social support also significantly influenced social trust, and social trust significantly influenced reported health. Implications: These findings underline the importance of social capital in perception of health and self-rated health outcomes for older adults. The authors discussed the findings in the context of baby-boomer retirement and the challenges it poses to the healthcare system.

WHY OLDER AMERICANS ARE INVOLVED IN PRODUCTIVE ACTIVITIES: EXPLANATIONS FROM THE RESOURCE AND STRATEGIC MOBILIZATION MODEL (RSM)

H. Shen, *School of Social Work, University of Michigan, Ann Arbor, Ann Arbor, Michigan*

Older people involve themselves in productive activities with different reasons, but the theoretical frameworks examining their engagement in productive activities are limited. This study introduces and tests a theoretical model, the Resource and Strategic Mobilization model (RSM) to systematically examine how personal resources and social networks influence older persons' participation in three major productive activities: employment, volunteering, and family caregiving. Using nationally representative data from the 2004 Health and Retirement Study, this study included 15,990 community-dwelling older adults (55 and above). Predicted variables included personal resources (financial resources and physical resources), and social networks (family demands and social events). Sociodemographic characteristics were controlled to obtain accurate impacts from resources and social networks. Three logistic regression models were applied to elucidate whether older persons' personal resources and social networks influenced their engagement in employment, volunteering and caregiving. Four additional logistic regression models were used to understand if mediation effects existed among employment, volunteering and caregiving. Findings showed that personal resources influenced whether older people worked, volunteered or provided care. Older people were more likely to be volunteers if they attended more social events (e.g. religious services). It was also found that older workers were less likely to be caregivers, and being caregivers decreased their chances to work or to volunteer. As the RSM predicts, the diverse contexts of older persons, as indicated by personal resources and social networks, matter. Further implementation of the RSM on understanding productive activities in which older people engage will also be addressed.

REACHING FOR TRANSCENDENCE: OLDER ADULTS IN SERVICE TO HUMANKIND

K. Piercy¹, C. Cheek², 1. *Utah State University, Logan, Utah*, 2. *Penn State Mont Alto, Mont Alto, Pennsylvania*

Although religious organizations attract the largest number of volunteers (Bureau of Labor Statistics, 2009), little is known about the efforts of their senior volunteers, particularly those with time-intensive or lengthy service commitments. A qualitative study explored motivations for service; the ways in which volunteers were affected by their experiences, and perceived personal gains from service. Nineteen men and 19 women over age 50 who participated in humanitarian or disaster relief missions responded to semi-structured interviews. The Latter-day Saint, Mennonite, and Lutheran participants had an average age of 56.24 (SD = 6.22), were mostly married (86.8%), and had served an average of 81.95 weeks (SD = 61.2). Using McCracken's 5 step method for analyzing long interviews, results suggested that participants served because of a desire to help others, the influence of significant others who were role models, and/or active recruitment by friends. Most perceived that they had changed in positive ways. Increased awareness

of global issues, human suffering, and living simply prompted many to become less materialistic, more compassionate, authentic, and tolerant of other races, cultures, and beliefs. Among the gains reported were spiritual growth, expanded social networks, increased closeness to spouses, and greater acceptance of what one could not control. Respondents also stated that after serving, it was challenging to return home and perform “normal” routines of focusing on themselves again. Findings support Erikson’s concept of ego integrity in the volunteers’ ability to transcend personal ego development in favor of embracing personal and social responsibility for the welfare of others.

FORMAL PRODUCTIVE ENGAGEMENT IN THE YEARS PRECEDING THE THIRD AGE

D.C. Carr, L.K. Manning, *Miami University, Oxford, Ohio*

Productive aging initiatives have been systematically linked with the period of old age commonly referred to as the “third age.” However, no previous research about the third age has examined engagement in formal productive activities during the period preceding the third age of life, the period when activity patterns during the early years of the third age are likely to develop. This paper examines the total amount of time spent engaging in productive activities (paid work and formal volunteering) and the ratio between time spent engaging in formal volunteering and time engaging in paid work activities among adults 55 to 65 years old. The data are from the 1996 wave of the Health and Retirement Study, which provides detailed information about engagement in formal volunteer activities. Linear regression models are used to predict 1) the total amount of time spent engaging in formal productive activities and 2) the ratio of formal volunteer to paid work activities, controlling for age, income, employment status, health status, education, race, and gender. Preliminary results indicate that in the decade preceding the third age, the total amount of time engaged in formal productive activities declines and the ratio of volunteer to work hours increase. In this presentation, we argue that in order to understand the factors shaping productive engagement in the third age, it is essential that researchers examine the patterns of productive activity in the period preceding this period of life.

SESSION 335 (SYMPOSIUM)

LINKING ACTIVITY, HEALTH AND BUILT ENVIRONMENT

Chair: *H. Chaudhury, Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Discussant: *J.A. Sanford, Georgia Tech, Atlanta, Georgia*

There is a growing research and public policy interest in understanding the relationships among health, activity and built environment. Current challenges in this area include: a) better understanding of the pathways in which built environmental aspects (e.g., mixed land-use, high density) influence individual and collective physical activity levels, b) the interrelationship between the built and social environments in effecting and sustaining health behaviours, c) valid and reliable measures of the built environment effecting activity and mobility addressing a wide range of built forms, and d) sustainable interdisciplinary mechanism linking planners, design professionals and public health professionals to make meaningful and effective planning and policy decisions. This session will present four individual studies addressing some of these challenges representing diverse geographical regions, populations and research methods. The first study demonstrates the ability of trans-institutional (government, university) cooperation to affect changes in the built environment to improve walkability. The second study is based on development of an environmental audit tool for older adults (SWEAT-R) and use of photovoice method as a participatory approach of engaging older adults in identifying physical and social environmental enhancers and barriers in their neighborhoods. The third paper is based on a study examining walkability of government-subsidized housing in North America and East Asia using SWEAT-R tool. The final study

reports from an interdisciplinary project measuring outdoor mobility among urban living persons with dementia (PWD), mildly cognitively impaired (MCI) and healthy individuals, aged 61-89 in Israel and Germany based on interviews and tracking protocols.

NEIGHBORHOOD ENVIRONMENT AND PHYSICAL ACTIVITY OF OLDER ADULTS: DEVELOPMENT OF AN AUDIT TOOL AND USE OF PHOTOVOICE

H. Chaudhury¹, A. Mahmood², Y. Michael³, A. Sarte¹, *1. Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada, 2. Oregon State University, Corvallis, Oregon, 3. Oregon Health & Science University, Portland, Oregon*

The goal of this study was to examine the effect of neighborhood physical environment and social capital on the physical activity of older adults. Eight neighborhoods were selected across Vancouver, British Columbia and Portland, Oregon that represent variation in residential density and mixed land-use. An environmental audit tool “SWEAT-R” (Seniors Walking Environmental Audit Tool – Revised) was developed and 357 street segments in Portland and Vancouver neighborhoods were assessed. Also, photovoice technique engaged older adults in the research process by photographing and journaling their perceptions of their neighborhood environment in relation to physical and social barriers and facilitators to being physically active. Inter-rater reliability of the SWEAT-R indicate that percent agreement between paired observers was 95% or higher for more than 80% of SWEAT-R items. Photovoice-based themes identify neighborhood settings that are multipurpose and that attract older adults for socialization, shopping, walking etc., and importance of transportation options.

TIME OUT-OF-HOME AND COGNITIVE IMPAIRMENT IN OLDER ADULTS: WHAT A FOUR-WEEK WINDOW CAN TELL

F. Oswald¹, H. Wahl¹, N. Shoval², G. Auslander³, T. Freytag⁴, O.K. Schilling¹, E. Voss¹, U. Seidl⁵, *1. University of Heidelberg, Institute of Psychology, Heidelberg, Germany, 2. Hebrew University of Jerusalem, Dept. of Geography, Jerusalem, Israel, 3. Hebrew University of Jerusalem, School of Social Work, Jerusalem, Israel, 4. University of Heidelberg, Institute of Geography, Heidelberg, Germany, 5. University of Heidelberg, Dept. of General Psychiatry, Heidelberg, Germany*

The interdisciplinary project SenTra measures outdoor mobility by means of tracking technology among urban living persons with dementia (PWD), mildly cognitively impaired (MCI) and healthy individuals, aged 61-89 in Israel and Germany. The aim of this presentation is (1) to describe differences between healthy, MCI and PWD in time out-of-home and (2) to analyze relationships between personal (age, gender, health) and environmental predictors (living alone) and time out-of-home, as well as between time out-of-home and well-being outcomes (life satisfaction, affect). Findings are based on interviews and tracking protocols over 4 weeks from 104 participants in both countries (50 healthy, 39 MCI, 15 PWD). On the mean level time out-of-home differences were observed between healthy (5.26h), MCI (3.79h), and PWD (3.18h). However, regression analyses showed that differences diminish when considering other predictors (age, gender, health). Forthcoming analyses will differentiate findings in relation to average pace of mobility or number of trips.

WALKABILITY AT GOVERNMENT-SUBSIDIZED HOUSING IN NORTH AMERICA AND EAST ASIA

E. Hwang¹, G. Gutman¹, A. Sixsmith¹, E. Cress², E. Chui⁴, A. Ziebarth³, *1. Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada, 2. University of Georgia, Athens, Georgia, 3. University of Minnesota, St. Paul, Minnesota, 4. University of Hong Kong, Hong Kong, Kwaloon, China*

The purpose of this study was to examine the walkability at government-subsidized housing in Canada, USA, China, and Korea. In each country, we selected two sites (or total eight sites) based on their par-

ticular interests in making the sites more “age friendly” as the residents became aging in place. The Senior Walking Environmental Assessment Tool – Revised (SWEAT-R) was used to evaluate the street-level segments. Items on the SWEAT-R include four topic areas: 1) functionality (i.e., land use, building types, sidewalks); 2) safety; 3) aesthetics (i.e., quality of micro-scale urban design, visual appeal of streetscape); and 4) destinations (i.e., availability of local amenities and transportation). In all the sites, sidewalks were presented, but buffer zones were presented at only three sites. At northwest and southeast corners at each segment, safety was emphasized; however, the most problematic area was at mid-block crossing area. In terms of availability of local amenities, restaurants and drug stores were the most frequently presented and facilities for leisure activities (i.e., parks, bookstore, fitness) were the least frequently presented. Overall, there was lack of road signs to protect pedestrians (i.e., stop, yield and pedestrian crossing signs).

A TRANSINSTITUTIONAL APPROACH TO IMPROVING WALKABILITY

E. Cress, R. Mullis, *University of Georgia, Athens, Georgia*

Walkability to businesses within 20 min increases physical activity and translates to 30-60 minutes of persistent physical activity. Citizens and visitors (n=22) to town (population 2,825) provided information on the safety, accessibility and aesthetic appeal of 4 routes connecting the city limits to the business town center (1 mile radius). 31% indicated that the route was pleasant to walk, 25% indicated the need for signal for crossing and need for repair of sidewalks, the need for increased connectivity of neighborhoods and more sidewalks. Summary, analysis and suggested solutions were presented to the city council. Since the survey priority is given to connectivity that impacts the most people. A traffic light was installed, sidewalks have been repaired, curb and gutter (approximately \$24,000). New monies include grant (\$530,000) and special assessment tax (\$650,000). Elevated awareness of the importance to walkability, citizen input, and a dedicated city council has combined to improve walkability.

SESSION 340 (SYMPOSIUM)

NOBODY’S BURDEN: OLD AGE IN THE GREAT DEPRESSION

Chair: R. Ray, *Wayne State University, Detroit, Michigan*

In this symposium, we take a historical look at the experience of old age during the Great Depression. We draw on the case files of a charitable organization in Detroit, Michigan, the Luella Hannan Memorial Fund (LHMF), which provided pensions to men and women from 1929 until their deaths. We will show how local and national government, the charitable organization, its case workers, its clients and their families struggled to overcome the stigma of old age as a “burden.” Our objective is to explore what “healthy aging” means during times of personal and social crisis. The five panelists will try to reconstruct the look and feel of the Great Depression as experienced by people over 60. Thomas Jankowski will explain national and local old-age policy during this time, as well as the specter of the poor house, which casts its shadow over all of the case files. Heather Dillaway will show how one formerly wealthy woman maintained her social status, although “newly poor.” Toni Calasanti and Jill Harrison-Rexrode will explain how African-Americans worked to prove and sustain their “worthiness” for a pension from a predominantly white organization, and Faith Pratt Hopp will discuss how one woman first accommodated to and then resisted the scientific charity practiced by the social workers. Ruth Ray will conclude by examining the themes of healthy aging reflected in the files and their relevance today.

EVERYBODY’S BURDEN: POOR LAWS, PUBLIC WELFARE, AND THE POORHOUSE IN DEPRESSION-ERA DETROIT

T.B. Jankowski, *Institute of Gerontology, Wayne State University, Detroit, Michigan*

When savings ran out, health faltered, and work was not available, older Detroiters were forced to rely upon friends, family, and private charity for support. When those avenues were exhausted, they turned to a meager system of outdoor public relief. When outdoor relief failed, they were faced with the prospect of going to the poorhouse. That prospect, and the fear and dread associated with it, suffuse many of the Hannan case files and represented a significant barrier to healthy aging at the time. This presentation will address the conditions faced by Detroit’s older residents during the economic catastrophe of the Great Depression. It will explore the state poor laws and the inadequate local public welfare system in pre-New Deal Detroit, and it will pay particular attention to the county poorhouse, known as the Eloise Infirmary, and the role of Eloise as a source of trepidation for the old poor.

ACCOMMODATION OR HEALTHY AGING? AN EXAMINATION OF ONE WOMAN’S STRUGGLE TO SUSTAIN PRIVILEGE WHILE RECEIVING AN OLD AGE PENSION

H.E. Dillaway¹, C. Bailey-Fakhoury², *1. Sociology, Wayne State University, Detroit, Michigan, 2. Wayne State University, Detroit, Michigan*

In this presentation, we document how the process of receiving an old age pension might seemingly take privilege away from and “burden” formally privileged women, and how aid recipients might resist this loss of privilege. We explore how one client served by the Luella Hannan Memorial Home resists the loss of privilege when interacting with LHMF staff, landlords, doctors, and family members, and attempts to reify her sense of self despite poverty. We argue that this client sustains the important part of her former privilege – i.e., her identity or sense of self. Thus, economic and social privileges are separate entities, and losing social privileges may burden individuals, especially aging women, more than poverty. This case highlights how privilege is sustained at the micro-level, and differences between social and economic privilege. We also suggest that, in sustaining a privileged identity, this woman engages in “healthy aging” and protects herself from “burden.”

SOCIAL LOCATION AND THE SOCIAL CONSTRUCTION OF ‘DESERVINGNESS’ IN OLD AGE

T. Calasanti, J. Harrison-Rexrode, *Virginia Tech, Blacksburg, Virginia*

We focus on the two African American clients—one man and one woman—funded by Hannan Foundation and explore the ways in which race, class, and gender contributed the negotiation process by which case workers (Visitors) designated old people as deserving of aid. By looking at their case histories over time, and comparing them with selected white clients, we argue that, first, the presentation of self as an old person “worthy” of funding varied in particular gendered, racialized, and class-based ways. Second, continued funding involved maintaining one’s image as deserving, a negotiation process that both varies by social location and becomes more difficult for clients as they age and become potentially subject to ageism. Overall, we find that their class, race, and gender circumscribed the African American clients’ behaviors more narrowly, such that they could be depicted as no longer worthy of funding much more quickly than whites.

SOCIAL CASE WORK, BURDENHOOD, AND THE CHALLENGES OF HEALTHY AGING IN THE GREAT DEPRESSION: THE STORY OF MRS. LOVELL

F.P. Hopp, N. Thornton, *Social Work, Wayne State University, Detroit, Michigan*

In this presentation, we will recount the challenges faced by “Mrs. Lovell” as she attempts to engage in healthy aging amidst progressive

illness and the economic limitations imposed by the Great Depression. During this time period, the emerging profession of social casework faced immense challenges in meeting the needs of the growing number of people facing economic hardship, while developing and maintaining the systematic, investigative model of Scientific Charity. Within this context, Mrs. Lovell exerts self-determination and personal power by both accommodating and resisting case work principles. We will describe how Mrs. Lovell's evolving and changing relationships with her case worker are influenced by her need to maintain dignity, preserve independence, and avoid burdenhood as she faces poverty and progressively severe illness.

SESSION 345 (PAPER)

QUESTIONS ABOUT OLDER DIVERSE POPULATIONS

EXAMINING ACCULTURATION AND ITS MECHANISMS ON HEALTH AMONG OLDER LATINO ADULTS

A. Afable-Munsuz, S. Gregorich, E. Perez-Stable, *Division of General Internal Medicine, University of California, San Francisco, San Francisco, California*

Background: Acculturation has been linked to the likelihood of chronic health conditions among older Latino adults. We examined whether greater stress and lower social support mediated the association between acculturation and co-morbidity. Methods: We analyzed data from three waves of the Hispanic Established Population for the Epidemiologic Studies of the Elderly (H-EPESE), a representative sample of community-dwelling older (age >65) Mexican Americans in Southwestern U.S. (baseline N= 3,050). Acculturation was measured by a 5-item acculturation scale and language of interview. A binary co-morbidity outcome (self-report of 3 or more conditions i.e. diabetes, hypertension, hip fractures, arthritis) was modeled with logistic regression adjusting for age, sex and education. Whether social support (2-items measuring respondent's perception of family support in times of trouble) and life stressors (8-items measuring personal/family illness, financial stress, crime) mediated the association between acculturation and co-morbidity was tested with a series of regression models. Results: Using the 1993 wave, English language interview (vs. Spanish) was associated with an increased likelihood of co-morbidity (OR:1.9; 95% CI: 1.3-2.6). After the addition of life stressors (OR:2.7; 95% CI: 1.8-4.0) and social support (OR:0.6; 95% CI: 0.3-0.9), both significant predictors of co-morbidity, English language effect decreased but remained significant (OR:1.7; 95% CI: 1.2-2.4). Further, acculturation had a significant indirect effect via life stressors (but not social support) on co-morbidity (p-value <0.05), suggesting mediation. Conclusion: Addressing life stressors of acculturating Latinos can potentially reduce the burden of chronic disease. More research is needed, however, to understand other mechanisms that link acculturation to health.

ASSESSING ELDER'S HEALTH AND INSURANCE STATUS: THE EFFECTS OF RACE AND MARRIAGE

C. Shieh, *National Institutes of Health, Bethesda, Maryland*

The unprecedented trend in demographic aging and the unmet need in health insurance coverage have a profound impact on the medical-care service utilization and quality of life of U.S. elderly. Although population age 65 and above are covered by Medicare, identifying vulnerable groups with elevated health-care needs yet unable to acquire additional insurance is important for the purpose of improving contemporary healthcare policy. Using the 2006 Health and Retirement Study, this project examines how elders' race and marital status affects their health and additional insurance acquisition. Outcomes of self-rated health, signing up for a Medicare prescription plan, being covered by Medicaid, having any private insurance, and having long-term care coverage, are investigated. Factors of socio-demographic characteristics,

economic constraints, and social support, are included in the regression models for statistical control. Holding key variables constant, race and marital status were significantly associated with elders' health and insurance status. African American elders were less likely than Whites to have good health ($p<.01$). Minority seniors also have higher propensities than Whites to be covered by Medicaid, and have lower likelihoods to acquire private health insurance and long-term care plans ($p<.001$). Marriage has a beneficial effect on elder's health status and access to health insurances. Divorce and widowhood provide a different dynamic in shaping later-life health-care strategies and therefore, influencing insurance possession. Policy recommendations include implementing racial-specific health interventions, providing insurance knowledge and participation incentives, and educational programs helping minority elders to identify the most useful insurance plans, are discussed in the study.

HEALTH SERVICES UTILIZATION OF SOUTH ASIAN OLDER ADULTS LIVING IN THE UNITED STATES

S.S. Jesmin, I. Amin, *Sociology, University of Louisiana at Monroe, Monroe, Louisiana*

The purpose of this study was to understand ambulatory health care utilization of South Asian Older Adults living in the United States. Research on older minority populations' health care access and utilization is limited although demographic projections indicate that US elder population is becoming racially and ethnically diverse. This study focused on the health status, medical needs, utilization pattern and predictors of South Asian older adults in US, most of whom are foreign-born. Specific research questions were: what are the challenges the South Asian American elderly population face as they age? What kind of services do need? Are culturally sensitive services available to them? Andersen's behavioral model for health care utilization was used as theoretical framework for this study. The dependent variable was the number of visits to physicians for health related reasons such check up or consultation. Data were collected from 200 Asian Americans over age 60 identified through snow-ball sampling technique. Multivariate regression analyses were conducted to test the hypotheses. Results show that the length of stay in the United States is a significant predictor of health services utilization. This research identified several barriers to care utilization, and indicates that most of the South Asian older adults' health behavior is heavily influenced by their ethnic cultural beliefs and practices. This study provides baseline information on use of health services by South Asian American older adults. Understanding of the health services utilization determinants and patterns can help program developers to design culturally sensitive interventions for older South Asian Americans.

DOES A RECRUITMENT BROCHURE AID IN THE RECRUITMENT OF OLDER LATINOS FOR A TELEPHONE SURVEY?

J. Santoyo-Olsson, G. Moreno-John, C. Kaplan, A. Napoles, *University of California, San Francisco, San Francisco, California*

Background: Evidence-based recruitment methods are needed to address Latinos' under-representation in clinical research. Objective: Assess the effects of an English/Spanish recruitment brochure on telephone survey participation rates. Participants: Latino primary care patients aged ≥ 50 with ≥ 1 visit during the preceding year ($N=1,339$) were sampled from four clinics. Design: Patients were randomly assigned to receive or not receive a brochure published by the Office for Human Research Protections in the initial mailing introducing a survey of cultural factors and colorectal cancer screening. Survey participation rates were compared across brochure groups. Results: Of 1,339 patients, 99 were known to be ineligible. Of the remaining 1,240, 473 (38%) completed the survey; 450 (36%) were unable to be contacted; and 317 (26%) refused. Although the proportion of respondents who participated was higher among those receiving the brochure, the difference was not statistically significant (54% vs. 46%, $p=0.18$). In the multivariate model,

women (OR=1.6; 95% CI 1.2, 2.2) were more likely, and English-speakers (OR=0.51; 95% CI 0.4, 0.7), those aged 65+ (vs. aged 50-54; OR=0.5; 95% CI 0.3, 0.8), and those with private insurance (vs. no insurance; OR=0.4, 95% CI 0.3, 0.6) were less likely to participate; there was no significant difference by brochure group (OR=0.9, 95% CI 0.7, 1.1). Participants who recalled receiving the brochure were more likely to participate (OR=4.0; 95% CI 1.7, 9.4), and tended to be women and aged 50-54. Conclusions: Recruitment methods that are more intensive than a brochure may be needed to enhance survey participation rates of Latinos.

ARE MIDDLE-AGED AND OLDER IMMIGRANTS MORE LIKELY TO USE COMPLEMENTARY AND ALTERNATIVE MEDICINE THAN THE U.S.-BORN?

J. Treas, G. Bostean, *Sociology, University of California, Irvine, Irvine, California*

Complementary and alternative medicine (CAM), a diverse group of health care practices and products that is distinct from conventional medicine, is gaining in popularity in the U.S. With pooled data from the 2002 and 2007 Alternative Health Supplement & Persons-file of the National Health Interview Survey (NHIS), this paper hypothesizes that middle-aged and older immigrants will be more likely to use CAM than are their U.S.-born counterparts due to limited acculturation to U.S. health practices as well as income and insurance barriers to conventional care. Using weighted logit models, we consider the likelihood of adults ages 45 and older ever having used CAM and using it in the past 12 months before the survey. All things considered, older immigrants are about 20% less likely ($p < .001$) than the U.S.-born older population to report ever having used any form of CAM. Older immigrants' significantly lower rates of CAM usage persist even with controls for age, although interactions between age and immigration status are only statistically significant for more recent immigrants (less than 15 years in the U.S.). Independently, age and foreign-born status both are negatively related to CAM use. When considered together, they seem to have a compound effect on CAM use, such that recent, older immigrants are much less likely to have used CAM than younger, more established immigrants and U.S.-born persons. Consistent with previous research, women are more likely than men, and whites more likely than minorities (black, Hispanic, Asian), to report CAM usage.

SESSION 350 (PAPER)

SUBSTANCE ABUSE AMONG OLDER ADULTS

ALCOHOL USE AND DEPRESSIVE SYMPTOMS: RESULTS FROM A 9-YEAR FOLLOW-UP STUDY

M. Aartsen¹, D. Van Etten², H. Comijs³, P. Cuijpers¹, D.J. Deeg³, *1. Sociology, VU University Amsterdam, Amsterdam, Netherlands, 2. Knowledge Centre of Elderly Psychiatry, Zeist, Netherlands, 3. EMGO Institute, Amsterdam, Netherlands*

Aims: To describe the longitudinal pattern of alcohol use among older men and women, and understand the often observed complex relationship with depressive symptoms. **Design:** A nine-year longitudinal and prospective study with measures in 1992, 1995, 1998 and 2001. **Setting:** Population study **Participants:** 2,119 participants of the Longitudinal Aging Study Amsterdam, aged 65 to 85 years at baseline. **Measurements:** The interview included the Centre for Epidemiologic Studies Depression Scale (CES-D) and questions about the frequency and quantities of alcohol use. **Findings:** Eight percent of the older women and five percent of the older men drink in excess of the limits recommended by the National Institute on Alcohol Abuse and Alcoholism. Alcohol drinking does not increase the level of depressive symptoms, nor vice versa. The only significant effect observed was that older, excessively drinking men with poor mental and physical health reduced alcohol drinking over time. **Conclusions:** A relation between depressive symp-

toms and alcohol use could not be observed in a population based sample of older adults. Excessively drinking men, who are in relatively good health, stick to their drinking habits, whereas excessively drinking men with mental and physical health problems are inclined to cut down alcohol drinking when becoming older. Public prevention strategies are needed to make older heavily drinking men who are still in relatively good health aware of the potential risks of excessive alcohol use.

TESTING THE CO-OCCURRENCE OF DEPRESSIVE SYMPTOMS AND MULTIPLE ILLICIT DRUG USE AMONG A COHORT OF MIDDLE-AGED AND OLDER MEN WHO HAVE SEX WITH MEN (MSM)

S. Lim, K. Kim, J. Burke, N. Markovic, A. Silvestre, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Introduction: Mental disorders and substance use disorders are known to co-occur in MSM. Older MSM reported unique challenges to aging and may be vulnerable to substance abuse and depression. We examined the trajectories of illicit drug use and depressive symptoms among MSM over the age of 50 and tested if the trajectories co-occur. **Method:** Within 10-year (1996-2006), Pitt Men's Study data (N=273), we examined the trajectories of multiple illicit drug use and depressive symptoms for men within the age range of 43 and 63 by using the semi-parametric, group-based approach (Nagin, 2005) **Results:** The best-fitting model yielded three distinct trajectory groups with respect to multiple illicit drug use. The majority of the participants (44.5%) did not use illicit drugs at any age, while 36.7% consistently used one drug across the age range of the study. A smaller yet substantial group (18.9%) used multiple drugs at middle age and declined to using one drug by age 63. Depressive symptoms, antidepressant use, smoking, binge drinking, and risky sexual behaviors at any age were differentially associated with the trajectory groups. However, the trajectories of multiple illicit drug use were not associated with trajectories of depressive symptoms. **Conclusion:** Although the prevalence of any illicit drug use appears to decline among MSM with aging, it is much higher than the estimate among the older adults in the general population. Future research needs to replicate the test of co-occurrence of depression and illicit drug use with consideration of potential confounders.

SUBJECTIVE DEFINITIONS OF SUBSTANCE ABUSE PROBLEMS: DOES AGE MATTER?

E.K. Bozzelli, *Research, Miami University, West Chester, Ohio*

Alcohol and other drug abuse are becoming increasingly salient topics concerning the health of older adults, and the language associated with the behavior is not clearly defined. Therefore, this study examined perceptions of two age groups regarding what constitutes a "substance abuse problem." Making a contribution to research on the life course, findings reveal that there are definite age norms associated with substance use behavior. Study respondents were college students aged 18 through 26 (N=101) and Baby Boomers aged 43 through 62 (N=113) in a small mid-western college town. In completing vignette-based questionnaires, respondents rated the degree to which three hypothetical individuals of different ages had "a substance abuse problem" on a scale ranging from 1 (no problem at all) to 5 (very severe problem). Results indicate that both college students and Baby Boomers share the belief that heavy substance use is significantly less problematic for a 21-year old than for a Baby Boomer or for an adult in their 70's ($p < .000$). However, college student respondents consistently rated all 3 of the targets to have less of a problem in comparison to ratings assigned by Baby Boomers ($p < 0.05$). These findings support the idea that "partying" during college years is a rite of passage in our society and indicate that beliefs about acceptable alcohol and other drug use change as a function of life experience (i.e., a "growing up" effect).

ALCOHOL CONSUMPTION PATTERN, PROBLEM DRINKING, AND MENTAL HEALTH OUTCOMES AMONG OLDER ADULTS IN CONGREGATE LIVING

O. Baik, K.B. Adams, *Mandel School of Applied Social Sciences, Case Western Reserve University, Cleveland, Ohio*

Alcohol misuse or abuse among older adults is a growing public health concern. The association between older adults' alcohol consumption patterns and mental health outcomes remains arguable, especially in the case of moderate drinkers. We sought to describe alcohol consumption patterns and identify mental health parameters associated with drinking characteristics. Cross-sectional data were collected from 178 congregate housing residents aged 64 to 96, including quantity and frequency of alcohol use, the Short Michigan Alcoholism Screening Test - Geriatric version (S-MAST-G), demographics, health status, and measures of depression and anxiety. Among the participants, 35.9% reported no consumption of alcohol, 36.5% were minimal drinkers (<1 drink/week), 12.9% were moderate drinkers (1-7 drinks/week), and 5.6% were at-risk drinkers (8-14 drinks/week). Additionally, 6.7% of those actively using alcohol were defined as "problem drinkers" based on S-MAST-G scores of two or more affirmative answers. In this sample, heavier current drinking was associated with older age, white race, female gender, living alone, and adequate income. In bivariate logistic regression analyses on 166 of these respondents controlling for age, gender, race, relationship status, education, and health and functioning measures, S-MAST-G-defined problem drinkers showed significant positive association with subthreshold or criterion depression {Odds ratio (OR) (95%CI): 4.890 (1.173, 20.387)}, but non-significant association with anxiety status. Current alcohol consumption categories were not associated with either outcome. Problem drinkers were significantly more likely to be depressed than non-problem drinkers. Findings have implications for identification of older adults with problematic drinking and the linkages between alcohol misuse and mental health outcomes.

SESSION 355 (SYMPOSIUM)

TRANSITIONS IN COGNITIVE IMPAIRMENT, ALZHEIMER'S DISEASE AND OTHER DEMENTIAS

Chair: J. Bond, *Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

Discussant: R. Fortinsky, *University of Connecticut, Farmington, Connecticut*

The focus of this symposium is the experience of people who live with cognitive impairment, their family members and informal caregivers of the journey from early signs of cognitive impairment to end of life with a particular emphasis on the transitions between the different 'medicalised' stages of mild cognitive impairment, Alzheimer's disease and other dementias in Canada, the United Kingdom and United States. From a social constructionist perspective, Bond will review the clinical stages of cognitive impairment highlighting boundary issues and the social significance of transitions along the impairment journey. Manthorpe and Samsi will describe the UK Mental Capacity Act and report the views of older people about personal planning for transitions in cognitive impairment in later life. Using epidemiological data from the New York tri-ethnic study Albert and colleagues will review transitions along the impairment journey. The focus of this analysis will be on changes in functional ability in relation to base-line assessment of cognitive function. Drummond and colleagues will report on a Canadian study that provides a cross-cultural perspective on the transition around the diagnosis of Alzheimer's disease from the perspective of people with cognitive impairment. Together these papers will define and critique the different clinical stages of cognitive impairment, describe and compare the impact of the transition between different stages on the person with the condition and their family caregivers and highlight policy issues that need to be addressed in the different countries.

STAGES IN COGNITIVE IMPAIRMENT: BOUNDARY ISSUES AND THE BIOMEDICALISATION OF LATER LIFE

J. Bond, *Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

This paper describes different stages of cognitive impairment as routinely used in clinical settings and biomedical research. From a social constructionist perspective the biomedicalisation of cognitive impairment, Alzheimer's disease and other dementias highlights 'boundary' issues between different stages of the 'condition'. The paper will focus on the meanings of transition between stages from the perspective of different stakeholders focusing on the early stages: normal age-related cognitive impairment ('normal ageing'), pre-MCI, MCI and a formal diagnosis of Alzheimer's disease or other dementia. The impact of labelling different stages along the clinical pathway has psychosocial and political consequences for people with cognitive impairment, their family members, and formal and informal caregivers, particularly at the point of transition between stages. Using insights from qualitative interviews from studies of early cognitive impairment in the UK, the importance of recognising different perspectives and identifying positive as well as negative consequences will be discussed.

MAKING PLANS FOR THE UNKNOWN: OLDER PEOPLE'S VIEWS OF MAKING PLANS FOR LATER LIFE IN ENGLAND UNDER THE FRAMEWORK OF THE MENTAL CAPACITY ACT

J. Manthorpe, K. Samsi, *Social Care Workforce Research Unit, Kings College London, London, United Kingdom*

The Mental Capacity Act 2005 implemented in England and Wales in 2007 provided a new framework for consideration of decisions if mental or physical capacity were affected. Options exist for choices of substitute decision-makers for welfare and financial matters, for the drawing up of statements of wishes and for the production of advance decisions about refusal of care and treatment. Little is known about older people's views and knowledge of these mechanisms and their experiences. This paper draws on a set of interviews with 40 community-dwelling older people from a range of diverse backgrounds living in the London area to explore their perceptions and intentions. Findings reveal that knowledge is limited, that there is reluctance among some to making arrangements in advance and that professional information and guidance have only partial impact. Theoretically 'good ideas' do not always translate into personal belief systems and contexts.

PATHWAYS TO DIAGNOSIS: CANADIAN CROSS-CULTURAL EXPERIENCES OF THE PREDIAGNOSIS PERIOD OF ALZHEIMER'S DISEASE

N. Drummond¹, S. Koehn², C. Cohen³, V. Emerson⁴, L. Garcia⁵, K. Leung¹, M. Persaud⁶, L. McCleary⁷, 1. *University of Calgary, Calgary, Alberta, Canada*, 2. *Centre for Healthy Aging at Providence, Vancouver, Alberta, Canada*, 3. *Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada*, 4. *Acuity Research Group Inc, Ottawa, Ontario, Canada*, 5. *University of Ottawa, Ottawa, Ontario, Canada*, 6. *University of Toronto, Toronto, Ontario, Canada*, 7. *Brock University, St Catherine's, Ontario, Canada*

Cultural influences are important when patients encounter their health system. There is some evidence that the early diagnosis and management of Alzheimer's disease may lead to improvements in health status and quality of life, but there is also anecdotal evidence suggesting that some cultural groups may view memory and cognitive function loss as not requiring treatment. We report a comparative retrospective study of four Canadian cultural/linguistic groups (Euro-Canadian English speakers, Euro-Canadian French speakers, Indo-Canadians and Chinese-Canadians) to identify how Alzheimer's disease is experienced and responded to in the period preceding diagnosis. Open-ended, ethnographic interviews in the appropriate languages were undertaken with people recently diagnosed with Alzheimer's disease and their main caregivers. Knowl-

edge of beliefs about, and approaches to, the pre-diagnostic period of Alzheimer's disease across different Canadian cultural/linguistic groups will contribute to professional education, health system, and health and social policy changes aimed at improving pre-diagnostic management and diagnostic procedures.

COGNITIVE STATUS AND TRANSITIONS IN FUNCTION OVER 1 YEAR IN A TRI-ETHNIC URBAN COHORT

S.M. Albert¹, J. Bear-Lehman², A. Burkhardt³, *1. Behavioral & Community Health Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. New York University, New York, New York, 3. Long Island University, New York, New York*

Objective: To examine whether white, African-American, and Hispanic elderly face a similar risk of functional decline over 1 year, adjusting for initial cognitive status. **Sample:** 300 Medicare beneficiaries with mild disability drawn from a population-based study in New York City. **Measures:** Participants were assessed twice, one year apart. Cognitive assessment at baseline (bilingual battery) assigned participants to normal (79%) or mild cognitive impairment/mild dementia (21%) status. Disability status was based on occupational therapist (OT) ratings of whether respondents were able to live alone or needed minimal-to-moderate help (29.2% at baseline, 34.2% at 1 year). OT's were blind to respondent cognitive status. **Results:** The sociocultural groups did not differ in age or gender; the mean age of respondents was 78.8 and 71% were women. OT ratings across ethnic groups did not differ in ANOVA models that adjusted for age and cognitive status. However, minority elderly were at increased risk of greater OT-rated disability at follow-up in logistic regression models that adjusted for cognitive status, age, gender, and initial OT-rated disability status (OR 2.7, African-American; OR 2.1, Hispanic). **Discussion:** Minority elderly are at increased risk of disability transition even in models that adjust for cognitive status.

SESSION 360 (SYMPOSIUM)

TRANSPORTATION & MOBILITY AS A CREATIVE APPROACH TO HEALTHY AGING

Chair: S. Classen, *University of Florida, Gainesville, Florida*

Discussant: D.W. Eby, *University of Michigan Transportation Research Institute, Detroit, Michigan*

Transportation mobility is a basic human need for people of all ages and it underlies most aspects of healthy aging for older adults. It is essential to their independence, autonomy, and quality of life as it provides an opportunity to stay engaged in their community and participate in activities that enhance their well being. Thus, it is not surprising that the 'identification of older adult transportation options' was voted the third highest priority by delegates at the recent White House Conference on Aging, with only reauthorization of the Older Americans Act and the development of a comprehensive and coordinated strategy for affordable and accessible long term care rating higher. Two complementary but interdependent goals have emerged with respect to transportation mobility for older adults: to help those who are able to drive safely continue to do so; and to identify and provide community mobility support to those who are no longer able to or choose not to drive. This symposium explores several important topics that have significance for achieving these goals including: (1) the impact of aging on driver safety and the adverse consequences associated with stopping driving; (2) the transitioning process from driving to non-driving and how it can be facilitated to reduce the burden on older adults and their families; (3) promising initiatives for promoting safe driving for those who are still able and choose to continue driving; and (4) promising initiatives for mobility management of other community transportation options when driving is no longer possible or desired.

DRIVING MOBILITY AND SAFETY AMONG OLDER ADULTS

L.J. Molnar, *Transportation Research Institute, University of Michigan, Ann Arbor, Michigan*

In American society and elsewhere, transportation mobility has become synonymous with being able to operate an automobile. In fact, driving is so embedded into the fabric of contemporary life that the idea of losing one's driving privileges is inconceivable for many older adults. Thus, it is not surprising that many older adults are reluctant to stop driving and few plan for the time when they will no longer be able to drive. Yet declines in functional abilities associated with medical conditions that become more prevalent with age, and the medications used to treat these conditions, may compromise the ability to drive safely. This presentation explores issues related to the importance of transportation mobility in the lives of older adults, as well as the implications of aging on driving safety. Of particular interest are the risks of crash involvement and injury of older drivers relative to younger drivers.

PROMISING INITIATIVES FOR PROMOTING SAFE DRIVING

S. Classen, *University of Florida, Gainesville, Florida*

As the U.S. population ages, older driver safety may evoke public health concern. Older drivers however are generally safe as a group, but they may need interventions or adaptations (e.g. on the person, vehicle, environment or systems level) to keep them on the road longer and safer. Recent studies have shown that promising initiatives exist to promote safe driving for those who are still able and choose to continue to drive. This presentation will highlight some of these promising approaches by focusing on four main areas, which include: (1) the person (e.g., the safety benefits of driver evaluation and rehabilitation programs); (2) the vehicle (e.g. use of in-vehicle technologies to promote safety on the road); (3) the roadway system (e.g. enhanced intersection and roadway design to promote safer driving); as well as (4) the system (e.g., licensing policies and model federal and state programs to enhance older driver safety).

PROMISING INITIATIVES FOR MOBILITY MANAGEMENT

J.E. Burkhardt, *Westat, Rockville, Maryland*

The need to develop and support transportation options for older persons who are no longer able to or choose not to drive is widely recognized. Each year, an estimated 600,000 adults age 70 and older stop driving in the US and become dependent on others to meet their transportation needs. Study findings suggest that older adult men will need about 7 years of transportation support compared to about 10 years for women. Alternate transportation options available for older adults include public and para-transit services, private and specialized transportation services, and agency transportation services. A broad array of transportation options is needed in most communities. This presentation will explore promising initiatives for the mobility management of these transportation options, an innovative approach for managing and delivering coordinated transportation services to older adults.

THE TRANSITIONING PROCESS FROM DRIVING TO NON-DRIVING

B.M. Dobbs, *Family Medicine, University of Alberta, Edmonton, Alberta, Canada*

At some point in the life course, many older adults will be faced with the necessity of having to reduce or stop driving. Due to the saliency of driving, restrictions in driving and particularly driving cessation, often are very difficult for the individual and are frequently an ongoing and emotional stressor for family members. Other adverse outcomes include reductions in mobility, a loss of independence, as well as reductions in quality of life and well-being. This presentation examines the reasons that older drivers reduce or stop driving, the process they go through, and current and promising new approaches available to assist older adults

transition smoothly from driving themselves to relying on other community mobility options.

SESSION 365 (PAPER)

WORKING FOR WELL-BEING

ECONOMIC CRISES: IMPACT ON OLDER WORKERS' HEALTH AND WELL-BEING

M. Pitt-Catsouphes, C. Matz-Costa, *Boston College, Chestnut Hill, Massachusetts*

Paid work has been recognized as one dimension of productive aging and there is evidence supporting the positive relationship between health/well-being and employment in older adults. The importance of paid work is particularly salient during today's economic downturn when financial constraints can lead to a downward spiral in older adults' quality of life, both in terms of financial resources as well as access to important benefits and social supports. We used data from the Age & Generations Study gathered before and after the onset of the 2008 economic crisis to examine the quality of employment experienced by older workers in 9 different organizations. A repeated measures analysis of variance was used to examine differences between 650 participants' survey responses collected at Time 1 (November 2007 to March 2008) and at Time 2 (May to September 2008), including approximately 150 workers age 53 and older (older Boomers/ Traditionalists). Overall, we found that employee engagement and job security decreased between Time 1 and Time 2, however physical and mental health were found to be relatively stable. There was a significant interaction effect between engagement and age, however, such that as employees got older the differences between their engagement scores across the two time points became smaller. Findings suggest that the economic crisis has indeed had an impact on the employment experiences of workers—even in its very early stages—and in some cases, the degree of this impact differs across age/generation.

THE PREVALENCE, DISTRIBUTION, AND MENTAL HEALTH CORRELATES OF PERCEIVED JOB DISCRIMINATION AMONG OLDER WORKERS IN THE UNITED STATES

R.J. Chou¹, N.G. Choi², 1. *Social Work, University of South Carolina, Columbia, South Carolina*, 2. *University of Texas, Austin, Texas*

Although job discrimination negatively impacts on health and mental health, very little attention has been given to job discrimination perceived by older workers and how job discrimination affects their mental health. Based on a sample of 1,386 workers age 50 and older from "Midlife in the United States II" (MIDUS II), this paper intends to bridge the gap in existing literature. First, this paper provides a descriptive analysis of the prevalence and distribution of job discrimination in terms of age, gender, race/ethnicity, education, industry, and occupation. Secondly, this paper looks into: (1) effects of job discrimination on mental health (depression and well-being) and (2) how social support from spouse, other family members, friends, supervisors, and coworkers alleviate the effects of job discrimination on mental health. It is hypothesized that (1) job discrimination negatively affects mental health, and (2) social support from spouse, other family members, friends, supervisors, and coworkers help to alleviate the effects of job discrimination on mental health. Hypothesis 1 was fully supported by results from regression analyses. Hypothesis 2 received mixed support. Spouse support turned out to be the strongest in alleviating the effects of job discrimination on mental health, followed by support from other family members and friends, whereas supervisor support and coworker support have no effects. This study represents a first study using a national random sample to study job discrimination perceived by older workers. The findings contribute to advancing our knowledge. Recommendations for social policy and social work practice are also discussed.

PRODUCTIVE AGING AT WORK: UNDERSTANDING FACTORS THAT PROMOTE OR IMPEDE ENGAGEMENT IN WORK ROLES

C. Matz-Costa, M. Pitt-Catsouphes, *Boston College, Sloan Center on Aging & Work, Chestnut Hill, Massachusetts*

The recent economic recession, among other factors, has led to the reality that many older people will have to remain in the paid labor force longer than what they had planned—perhaps much longer. Vestiges of 20th century employment structures and biased attitudes, however, can make it difficult for older workers to secure employment that meets their needs and priorities. As the productive aging paradigm argues, in order for adults to fully and meaningfully engage in productive activities as they age, it is of critical importance that we gain a better understanding of the various factors (age-related and contextual) that may be promoting or impeding individuals' ability to engage in productive roles, including paid work roles. In this presentation I will share findings from the 2007/2008 Age & Generations Study that explore the impact of various age-related and workplace-related factors on the work engagement of 2,210 employees within 9 US organizations. Given the nested nature of the data, multi-level modeling was used. Among other findings that will be presented, we found that having access to a greater number of flexible work options was positively related to engagement, after controlling for several personal, family, and job characteristics, however this effect became weaker as employees got older. The results indicate that having access to a variety of flexible work options may be an important driver of work engagement for employees in general, but it may become less of a driver as workers get older.

LET EXPERIENCE WORK: DETERMINANTS OF RETAINMENT AND RE-EMPLOYMENT OF OLDER WORKERS IN THE NETHERLANDS

K. Karpinska¹, K. Henkens², J. Schippers¹, 1. *Utrecht University, Utrecht, Netherlands*, 2. *NIDI (The Netherlands Interdisciplinary Demographic Institute), The Hague, Netherlands*

Many Western societies face aging of the labor force and consequently, shortages on the labor market. The question arises as to which extent older employees would be given the chance to remain on the labor market or to return to the professional career. Various studies on the Dutch labor market show that employers value older workers' experience and reliability. Yet, not many decide to retain or re-employ them. In this study we aim at explaining which individual and organizational characteristics affect the chances of the older employee to remain active on the labor market. To answer this question, a vignette study among Dutch employers was conducted. Profiles of hypothetical employees and retired job applicants were presented to the employers who were asked to make a specific employment decision (retention or hiring, respectively). The results show an asymmetry in factors influencing retaining and hiring of older workers. Human capital and older workers' motivation are important predictors of retention. Hiring older workers depends to a large extent on organizational forces such as personnel shortages and the age of the retiree.

SESSION 375 (SYMPOSIUM)

CAN WE MEASURE BIOLOGICAL AGE?

Chair: A. Mitnitski, *Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

Discussant: K. Rockwood, *Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

Aging is fundamentally a biological process, which can be measured on a calendar scale. Despite the lack of a clear definition, the concept of biological age – as distinct from the simple passage of time (chronological age) – is very appealing. Biological age is like a clock that ticks at different rates among different individuals and likely too at different rates over different observation periods, even for the same individuals.

Although the concept of biological age is attractive, how to measure biological age is controversial. One possible approach uses age-specific trajectories of biomarkers. Any individual's biological age can be assessed by comparing that individual's biomarker value with some standard reference. But the trajectories of different biomarkers vary significantly from each other, so that none can be considered as the criterion referent (sometimes called the "gold standard"). In this symposium, we discuss how to integrate various biomarkers rather than to focus on just one, or even a few. "Biomarkers" are considered broadly, and can even include routinely collected clinical data, as long as they conform to certain characteristics. The symposium will consider what such characteristics might be, and which determinants (including early determinants) influence the expression of biomarkers. More broadly, we will consider how biological age is related to physical laws (e.g. increasing entropy). Even tentative conclusions about the reliable measurement of biological age have broad health care and social implications. One of these – standard versus individual retirement ages – will be discussed, in a session that invites audience participation.

BIOLOGICAL AGE IN RELATION TO THE FRAILTY INDEX

K. Rockwood, A. Mitnitski, *Medicine, Dalhousie University, Halifax, Nova Scotia, Canada*

The Frailty Index integrates many symptoms, signs, laboratory measurements, etc. called deficits. Its mean value changes characteristically with age and is strongly associated with mortality. It also shows the Markov property - knowledge of the most recent value of the Frailty Index allows accurate prediction of death, and knowledge of its prior values does not improve the accuracy of that prediction. Using the age specific trajectory of the mean value Frailty Index as a reference, in principle, an individual's biological age can be calculated as the chronological age at which the mean value of the Frailty Index corresponds to their observed value. Frailty Index measures developed to date typically have employed a relatively small number (<40) of health characteristics. Including more characteristics (e.g. biological measures) might increase the power of the Frailty Index to predict an individual's chance of death, a key requirement of any estimate of biological age.

BIOLOGICAL AGE AND EXCEPTIONAL LONGEVITY

L. Gavrilov, N. Gavrilova, *NORC, University of Chicago, Chicago, Illinois*

The concept of biological age implies that it is very promising to study individuals with slow aging, which allows them to survive to exceptional age of 100 years and above. The study is based on statistical analysis of life histories of American centenarians, taken from the U.S. Social Security database and recorded family histories, and then validated through cross-checking with U.S. early censuses, military draft registration cards and other data resources. Persons with exceptional longevity are then compared to 'normal' individuals with average lifespan, using method of conditional logistic regression, to see which characteristics are predictive for exceptional longevity. Special attention is paid to the role of early-life and mid-life events and conditions in shaping the pattern of human resilience and exceptional longevity. The role of familial longevity for survival to age 100 is also explored. Overall, more than 500 centenarians are studied, with predictor variables including body height, body weight, parental age at person's birth, occupation and race/ethnicity.

PHYSIOLOGICAL CHANGES DURING THE LIFE COURSE: INSIGHTS FOR AGING, HEALTH, AND LONGEVITY

A.I. Yashin, K.G. Arbeev, I. Akushevich, S.V. Ukraintseva, A. Kulminski, L. Arbeeveva, I. Culminskaya, *Sociology, Durham, North Carolina*

Indices describing individuals' physiological states change with age and modulate morbidity and mortality risks. In this paper we investigate regularities of changes in a number of such indices measured in the Framingham Heart Study. The structure of available data allows for com-

parison of cross-sectional and longitudinal average age patterns of respective indices. Such a comparison reveals the presence of substantial cohort effects in the age trajectories of physiological state. The analyses of longitudinal data allows for evaluating dynamic properties of risk functions. The new approach to statistical analyses of such data allows for using information about aging obtained in other studies. We found that interpretation of physiological age trajectories, minimizing mortality risk as age dependent physiological norms is useful for indirect evaluation of the effects of persistent external disturbances on morbidity and mortality risks. The role of physiological indices in manifesting the aging process is discussed.

SYSTEMIC BIOLOGICAL ROLE OF THE BETA2-ADRENERGIC RECEPTOR GENE POLYMORPHISMS IN HEALTHY AGING

A. Kulminski, I. Culminskaya, S.V. Ukraintseva, K.G. Arbeev, K. Land, A.I. Yashin, *Center for Population Health and Aging, Duke University, Durham, North Carolina*

Genetic diversity is one of the most important sources limiting practical significance of biomarkers of aging. On the other hand, aging phenotypes are not yet well-defined. To better understand the process of biological aging systemic analyses of genetic and non-genetic markers of aging are required. We studied associations of two common polymorphisms of the beta2-adrenergic receptor (ADRB2) gene, Arg16Gly and Gln27Glu, with risks of broad range of aging-related phenotypes including cancer, selected cardiovascular diseases, and longevity, in the Framingham Heart Study Offspring cohort. We show that the Gln27Glu polymorphism appears to be a genetic marker of broad range of these complex aging phenotypes. We discuss systemic role of these two polymorphisms, as well as their haplotypes and compound genotypes, along with physiological biomarkers (e.g., blood pressure, serum cholesterol) in healthy life. We also discuss modes of inheritance of aging phenotypes for the ADRB2 gene polymorphisms.

SESSION 380 (POSTER)

COGNITION/DEMENTIA

EMERGING EVIDENCE FOR MEMORY TRAINING WITH COMMUNITY-RESIDING MINORITY OLDER ADULTS

G.J. McDougall, H.A. Becker, K. Pituch, T.W. Acee, P.W. Vaughan, C.L. Delville, *School of Nursing, University of Texas at Austin, Austin, Texas*

Research Objective. To evaluate whether a memory training intervention would produce differential benefits in older adults with age-associated cognitive decline. Design: A Phase III randomized trial between 2001-2006. Of those eligible, 265 older adults were assigned to either twelve hours of a memory training or general health training. Randomization occurred within the eleven separate groups, which met at nine different sites in the community, such as senior centers. Findings: The sample was 79% female, 71% Caucasian, 17% Hispanic and 12% African-American. On memory performance, 47% of the participants scored Poor, 28% Normal and 25% in the impaired range, even though none had dementia. Memory performance changed differently over time based on the demographic characteristics of the participants regardless of whether they were in the memory or health training groups. Compared to Whites, both Hispanics and Blacks performed better on visual memory; Blacks performed better overtime on instrumental functional abilities and Hispanics performed better on global cognition. Conclusion: Both interventions facilitated the maintenance of cognitive and functional ability. Given the body of compelling evidence on memory training with Caucasian samples, for translation to occur across settings numerous conditions must be satisfied. Specifically, the distinctive characteristics of reach (representative sample), effectiveness (feasibility), adoption (multiple settings), implementation (variety of staff) and main-

tenance and cost (setting-level vs. individual-level) would need further elaboration. Before the translation of memory training could be implemented in the community with a minority population, a large homogeneous and highly motivated sample would need to be recruited for a Phase III randomized clinical trial.

ILLNESS PERCEPTIONS IN OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT: A FEASIBILITY STUDY

F. Lin¹, C. Gleason², S.M. Heidrich¹, 1. School of Nursing, University of Wisconsin-Madison, Madison, Wisconsin, 2. School of Medicine and Public Health, University of Wisconsin-Madison, Madison, Wisconsin

Mild Cognitive Impairment (MCI) is defined as the transitional stage between the cognitive decline of normal aging and fully developed dementia. Little is known about patients' understanding of a diagnosis of MCI. The Leventhal's Common Sense Model (CSM) posits that people have specific beliefs about an illness and that these beliefs drive their coping behaviors. The purposes of this descriptive, pilot study were to 1) explore the feasibility of using structured, self-report scales to measure beliefs about MCI (illness perceptions) in MCI patients, 2) describe their illness perceptions, and 3) explore the relationships between illness perceptions and awareness of cognitive deficits. Eleven MCI patients (age: 71 – 86, MMSE: 23 – 30) completed self-report scales measuring 7 domains of illness perceptions (Illness Perception Questionnaire-MCI) and awareness of cognitive deficits (IQCODE). Five participants conducted a 15-minute cognitive interview to explore responses to the IPQ-MCI. Participants spent average 30 minutes on completing the IPQ-MCI. All participants felt the instruments were "somewhat" or "very" easy to understand and covered important topics. Results of the cognitive interviews suggested that participants understood the items. Participants correctly identified most of the symptoms related to MCI, attributed MCI to aging, perceived that MCI was chronic, predictable, has negative consequence, but is controllable, understandable and did not cause psychological distress. 4/11 participants were categorized into having low level of awareness. Future research should examine the relationship between illness beliefs and coping with MCI.

COLLABORATIVE DEMENTIA TREATMENT MONITORING PROGRAM IN HOME BASED PRIMARY CARE

B. Hicken^{1,2}, L. Dixon¹, P. Kithas^{1,2}, B. Bair^{1,2}, 1. George E. Wahlen Department of Veterans Affairs Medical Center, Salt Lake City, Utah, 2. University of Utah, Salt Lake City, Utah

Four medications are routinely used for dementia: donepezil, memantine, galantamine, and rivastigmine. The clinical significance of these medications on the symptoms of dementia are hotly debated. There are no standardized, practical methods to help clinicians monitor treatment effectiveness in the clinic setting. This demonstration project evaluated a program to monitor the clinical efficacy of anti-dementia medications in patients enrolled in the VA's Home Based Primary Care Program. Eligible patients were taking ≥ 1 anti-dementia medication and had a reliable caregiver. The staff clinical psychologist interviewed the caregiver using a modified form of the Clinical Impression of Global Change (CIBIC) Plus Care Giver Input tool. With caregiver consent, and in consultation with the patient's primary care provider, patients underwent a trial of monitored medication discontinuation consisting of 1-2 weeks off the targeted anti-dementia drug while being monitored with the CIBIC Plus. If a noticeable decline occurred, the medication was restarted. Sixteen monitored medication discontinuations were attempted in 14 patients. Ten (63%) patients had no noticeable decline in cognition after discontinuing the medication. Six (37%) experienced a noticeable decline in cognition and resumed taking the discontinued medication. Estimated annual savings based on ten successful trials was \$9,734.55. Outcomes suggest that effectiveness anti-dementia medications can be determined from short-term discontinuation in individual patients. Since these medications are FDA-approved for relief of symptoms of dementia, tracking symptoms from a caregiver perspective pro-

vided reliable information concerning patient benefit. A structured approach to monitoring patient response to these medications results in improved care and cost savings.

GENDER DIFFERENCES IN NEUROCOGNITIVE RESERVE IN ELDERLY

B. Carlson^{1,2}, V.J. Neelon^{1,2}, J. Carlson¹, M. Hartman³, 1. School of Nursing, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. Biobehavioral Laboratory, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 3. Institute on Aging, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

Purpose: Neurocognitive reserve refers to physiological mechanisms which allow the brain to cope with neuropathology. Studies suggest that women are at greater risk for cognitive decline because they have less reserve than men. In this study, we examined how respiratory periodicity, a marker of neurocognitive reserve, moderates the relationship between cerebral oxygenation during sleep and cognitive function in men and women, age 70+ years. **Methods:** Subjects (74F, 41M) underwent standard polysomnography including cerebral oximetry (percent cerebral oxyhemoglobin saturation- $rcSO_2$) and inductance plethysmography (respiratory periodicity). A cognitive test battery was administered 1 week prior to each study and included tests of delayed memory (logical memory [LM], visual reproduction [VR]) and executive control (Stroop Color Word [SCW] and the Digit Symbol Modalities test [DSMT]). Student t tests and correlational analyses examined how respiratory periodicity and $rcSO_2$ during sleep, and cognitive function differed in men and women. **Findings:** Compared to men, women had lower $rcSO_2$ levels ($58.2\% \pm 7.4\%$ vs. $65.3\% \pm 6.3\%$, $F_{(1,114)} = 26.35$, $p < .0001$) and have less respiratory periodicity (35% vs. 59% , $F_{(1,114)} = 10.7$, $p < .005$) during sleep. While no significant relationships were found in men, lower $rcSO_2$ levels in women was associated ($p < .01$) with lower cognitive function ($r_{LM} = .32$; $r_{VR} = .31$; $r_{SCW} = -.31$; $r_{DSMT} = .38$). However, the relationship between $rcSO_2$ and cognitive function was only significant in women with low respiratory periodicity during sleep ($r_{LM} = .37$; $r_{VR} = .31$; $r_{SCW} = -.42$; $r_{DSMT} = .42$). **Conclusions:** In women, lower cognitive function was associated with lower $rcSO_2$ and low respiratory periodicity during sleep, suggesting that women may have lower neurocognitive reserves than men. **Support:** NRO8032, R00046

EFFECTS OF DUAL MOTOR AND COGNITIVE TASKS WITH GRASP IN YOUNG AND OLDER ADULTS

G.E. Conti, Wayne State University, Detroit, Michigan

The ability to maintain grasp force in one hand while performing other tasks is frequently required in daily tasks, such as tying a shoelace or unscrewing a jar lid. Older adults show difficulty processing dual visual and cognitive tasks (Hein & Schubert, 2004). However, there is limited information about how older adults perform dual motor tasks or motor-cognitive tasks. 15 young and 15 older adults participated in this study. Participants produced a firm force with either hand for approximately 12 seconds. During the middle 4 seconds of this period the participant was asked to perform either a simple or complex cognitive or motor task on command. A significant decrease in grasp force during concurrent complex motor but not cognitive tasks was shown in both young and older adults.

KNOWLEDGE AND IMAGE OF DEMENTIA AMONG COMMUNITY-DWELLING ELDERLY PEOPLE

H. Kukihara^{1,2}, M. Min², S. Baba¹, K. Sugimoto¹, M. Nagae¹, E. Yamaguchi¹, E. Horikawa¹, 1. Graduate School of Medicine, Saga University, Saga, Japan, 2. St. Mary's College Nursing, Fukuoka, Japan

Purpose: In 2008, the elderly constituted approximately 22.0% of the Japanese population, and the prevalence of dementia is anticipated to increase along with the elderly population. However, there is inadequate information regarding dementia. The purpose of this study was

to examine the general images about dementia, Method: Questionnaires were administered to 182 participants among community dwelling elderly people in Japan. The questionnaire consisted of questions on demographic characteristics, images of dementia, knowledge about dementia, anxiety toward developing dementia. Result: A total of 68.1% of respondents had the image that dementia was a natural part of the aging process, and that it was a severe disease (68.2%), that it was sorrowful disease (65.4%), and that it was incurable disease (57.1%). Moreover, 46.7% of respondents felt resistance to visiting a clinic, although 40 % of these respondents did not know about memory clinics. The reason they gave for not going was that they thought that dementia was natural and inevitable part of the aging process (χ^2 test, $p = 0.009$) and that it was an incurable disease ($p < 0.001$). They also felt anxiety toward developing dementia ($p = 0.038$). Conclusions: The results of this study suggest that appropriate education to the elderly regarding dementia may contribute to early treatment and care of the disease, thereby maximizing the effect of therapeutic interventions. Accurate information concerning dementia and of the disease should be provided to relieve anxiety about the disease.

CURRENT SCIENTIFIC UNDERSTANDING OF RESISTIVENESS TO CARE: A CONCEPT ANALYSIS

P.C. Spigelmyer, *School of Nursing, The Pennsylvania State University, University Park, Pennsylvania*

Alzheimer's disease affects the lives of millions of people, progressively diminishing the person's cognitive capacities which prompt resistance and refusal of care. To gain foundational understanding of this concept a principle-based concept analysis method was utilized applying the four analytic principles based in the philosophy of science: epistemological, pragmatic, linguistic, and logical. Data consisted of 35 articles published in the scientific literature. Findings revealed gaps in scientific understanding, including inconsistencies in definition and close associations with the concepts of agitation and aggression. Most often, only those resistive behaviors that escalated to agitated or aggressive responses were addressed in the current literature. In addition, a paucity of literature was found examining resistive behaviors in the context of home-based care. By understanding the concept of resistiveness to care and its impact on family caregivers, nurses will be better prepared to offer supportive interventions to sustain family caregivers-our instrumental partners in care.

THE ASSOCIATION OF PERSONALITY DOMAINS AND COGNITIVE FUNCTION: FINDINGS FROM THE HEALTH ABC STUDY

A.L. Weston^{1,5}, P. Costa², E. Simonsick², H.N. Ayonayon⁶, T. Harris², C. Rosano³, S. Satterfield⁴, K. Yaffe^{1,6,7}, 1. *Psychiatry, University of California San Francisco, San Francisco, California*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *University of Pittsburgh, School of Public Health, Pittsburgh, Pennsylvania*, 4. *University of Tennessee Health Science Center, Memphis, Tennessee*, 5. *San Francisco VA Medical Center, San Francisco, California*, 6. *University of California San Francisco - Epidemiology and Biostatistics, San Francisco, California*, 7. *University of California San Francisco - Neurology, San Francisco, California*

Background: Personality is known to affect several aspects of health and functioning, but its relationship to cognitive functioning in late life is not well understood. This study prospectively examined the association between openness to experience and conscientiousness, two personality traits that we hypothesized would be associated with better cognitive function and less decline over time. Methods: We studied 924 well-functioning elderly with personality measures on openness and conscientiousness (analyzed by low, mid, and high scores) from the Health ABC Cognitive Vitality substudy. Random effects repeated measures models assessed whether each personality trait was associated with baseline cognitive function and 5-year change in cognitive function.

Logistic regression models were used to examine the association between each trait and clinically significant cognitive decline, and the joint effects of both traits on cognitive decline. Results: At baseline, the mean age was 75.2 (± 2.7) years, 446 (48.3%) participants were black, and 464 (50.2%) were female. For conscientiousness, 244 people (26.4%) had low, 338 (36.6%) had mid and 342 (37.0%) had high scores; for openness, 288 people (31.2%) had low, 323 (35.0%) had mid and 298 (32.3%) had high scores. Conscientiousness and openness were individually associated with baseline cognitive function, as measured by the Modified Mini Mental State Examination (3MS) (p -value = 0.05 and < 0.01). Those with high conscientiousness or high openness had decreased risk of cognitive decline (Odds ratio [OR]=0.60; 95% Confidence Interval [CI]=0.37, 0.97 and OR=0.61; 95% CI=0.38, 1.00). Those with high scores on both traits had an even greater decreased risk of cognitive decline (OR=0.42; 95% CI=0.19, 0.92). Conclusions: Conscientiousness and openness associated with higher baseline cognitive function and a decreased risk of cognitive decline over five years. Further research is needed to assess possible mechanisms of this association. NIA contract #: N01-AG-6-2101, N01-AG-6-2103, N01-AG-6-2106 This research was supported in part by the Intramural Research Program of the NIH, National Institute on Aging.

NON-PHARMACOLOGICAL APPROACHES TO BEHAVIORAL SYMPTOMS IN NURSING HOME RESIDENTS: STAFF PERSPECTIVES

A.M. Kolanowski, D. Fick, C. Frazer, J. Penrod, *School of Nursing, Penn State University, University Park, Pennsylvania*

PURPOSE: To obtain nursing home staffs' perspectives on the types of behavioral symptoms they find dangerous or difficult to manage in nursing home residents with dementia, the approaches they find effective for managing these behaviors, and the barriers they identify to use of non-pharmacological interventions. METHODS: six focus groups conducted with a mix of medical directors ($n=5$), licensed nurses ($n=10$), activity personnel ($n=8$), nursing assistants ($n=7$) and others ($n=5$) from sites in North Carolina and Pennsylvania. A structured interview guide was used. Sessions were audio-recorded and transcribed verbatim. Data were analyzed using content and thematic analysis. RESULTS: Staff identified wandering and confusion as the most dangerous behaviors encountered. The changing landscape is a significant contextual factor influencing care in nursing homes. Major goals for care were to calm the resident and to control the behavior. Staff voiced that knowing the resident can help "normalize the environment." They used interpersonal approaches and drugs for aggressive behaviors, and recreational activities for passive behaviors. Strategies were implemented in a trial and error fashion. Staff identified their need for more education on non-pharmacological approaches to care. CONCLUSIONS: Consensus statements urge the use of non-pharmacological interventions for behavioral symptoms but there is a lack of theory to guide practice. Staff continues to identify behavioral control as a major goal of care and feels ill equipped to implement non-pharmacological measures. A framework for the study of vulnerable populations is proposed that supports the types of behaviors for which these interventions are most effective and the conditions under which they produce positive outcomes.

THE FEELING TONE QUESTIONNAIRE (FTQ) AND ITS PSYCHOMETRIC PROPERTIES: ASSESSING DEPRESSIVE SYMPTOMS IN DEMENTIA AND IN COMMUNICATION-IMPAIRED OLDER PERSONS IN LONG TERM CARE FACILITIES

J. Toner, J. Teresi, B. Gurland, F. Tirumalasetti, *Columbia University Stroud Center and New York State Psychiatric Institute, New York, New York*

This research aimed at developing a means of uncovering the subjective inner life of persons who are seriously limited in their ability to communicate feelings of distress associated with depression and other affective disorders. These analyses further developed a reliable and valid

measure of affective disorder in communication-impaired elderly demented patients. The FTQ builds upon the existing knowledge in the field of assessment of depression in dementia by combining a direct assessment focus and clinical observation method and adding behaviorally anchored ratings of affect, or feeling-tone. It consists of 16 questions and 16 corresponding observation ratings of affect and was specifically designed for use with the communication impaired demented patient. The FTQ uses standardized questions with simple wording. The total sample size was 764 respondents from four samples of respondents in New York City and upstate New York nursing homes and a psychiatric hospital. The mean age of the combined sample was 84. Internal consistency reliability and interrater reliability were good across all four samples, as was test-retest reliability. Concurrent convergent construct validity and discriminant validity coefficients were generally high. Criterion-related validity was provided in two samples utilizing DSM ratings by geriatric psychiatrists. These findings provide support for the view that the FTQ works well as a method of facilitating the recognition of depressive signs in the more severely communication impaired group of demented older persons.

BRIEF SCREENING TOOL FOR MILD COGNITIVE IMPAIRMENT IN OLDER JAPANESE: VALIDATION OF THE JAPANESE VERSION OF THE MONTREAL COGNITIVE ASSESSMENT

Y. Fujiwara, H. Suzuki, M. Yasunaga, M. Sugiyama, M. Ijuin, N. Sakuma, H. Iwasa, S. Shinkai, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

[Purpose] The Montreal Cognitive Assessment (MoCA), developed by Nasreddine, et al (2005) is a brief cognitive screening tool for detecting older people with mild cognitive impairment (MCI). We examined the validity and reliability of the Japanese version of the MoCA (MoCA-J) in older Japanese. [Subjects & Method] Subjects were recruited from the outpatient memory clinic of Tokyo Metropolitan Geriatric Hospital or community-based medical health check-ups in 2008. The MoCA-J, a Japanese version of the Mini-Mental State Examination (MMSE-J), Clinical Dementia Rating (CDR) scale, and routine neuropsychological batteries were conducted to 133 older subjects: mild Alzheimer's disease = 29; MCI = 27; normal controls = 77. [Results] Internal consistency of MoCA-J scores, using Cronbach's alpha was 0.65. Test-retest reliability of MoCA-J scores, using intraclass correlation coefficient between the baseline survey and follow-up at 8 week intervals was 0.71 ($p < 0.001$). MoCA-J scores were found to be highly correlated with MMSE-J scores ($r = 0.759$, $p < 0.001$) and CDR scores ($r = -0.658$, $p < 0.001$). The areas under the receiver operating characteristic (ROC) curves were 0.90 (95% CI, 0.84-0.96) and 0.84 (95% CI, 0.73-0.94) for MoCA-J and MMSE-J groups, respectively. Using a cutoff score of 24/25, the MoCA-J demonstrated a good sensitivity of 86% and a good specificity of 82% for screening MCI. [Conclusion] The MoCA-J could be a useful screening tool for detecting MCI at primary clinical settings or community-based medical health check-ups.

ATTITUDES AND EXPECTATIONS OF TECHNOLOGIES TO MANAGE HIGH RISK WANDERING AND ELOPEMENT IN PERSONS WITH DEMENTIA: AN AUSTRALIAN PERSPECTIVE

E. Beattie^{1,2}, J.M. McCrow¹, W.D. Kearns², S.P. Applegarth³, 1. *Queensland University of Technology, Brisbane, Queensland, Australia*, 2. *University of South Florida, Tampa, Florida*, 3. *VA Patient Safety Center, Tampa, Florida*

Wandering is aimless and repetitive locomotion that may expose persons with dementia (PWD) to elopement, getting lost and death. This study is an Australian replication of a US study. Cross-disciplinary consensus-based analysis was applied to data from five focus groups (N = 47: cognitively intact LTC residents (5), carers of PWD (11), home care workers (13) allied health professionals and health-focused engi-

neers (7) and RNs (11). Groups received briefing about wandering monitoring and elopement management systems. Consistent with US attitudes, participants in all groups agreed on what a wandering technology should do, how it should do it, and necessary technical specifications. Within each group participants raised the need for a continuum of care for PWD and the imperative for early recognition of potentially dangerous wandering and getting lost when they occur. Global Positioning System elopement management was the preferred option. Interestingly, the prospective value of GPS to recover a lost or eloped wanderer far outweighed privacy concerns, as in the US. A pervasive theme was that technologies need to augment, but cannot replace, attentive, compassionate caregiver presence. A significant theme raised only by Australian carers of PWD was the potential for development of implantable GPS technologies and the need for public debate about attendant ethical issues. Given that 60% or more of over 200,000 Australians and 4.5 million Americans with dementia will develop wandering, there is a pressing need to develop effective locator systems that may delay institutionalization, help allay carer concern and enhance PWD safety.

THE NEUROLOGICAL IMPACT OF ART THERAPY ON DEMENTIA PATIENTS

A.V. Fahr, *Capella University, Mound, Minnesota*

This session will connect Neuropsychology, Neuroscience, and Art Therapy in the treatment of Alzheimer's Disease. Neuropsychology is just beginning to identify modalities that may not only slow down the progression of Alzheimer's Disease, but possibly prevent the onset of a dementia. Certain regions of the brain that are responsible for memory, learning, communication, expression, and language, can be accessed through specific neuropsychological interventions and assessments. Neuroscience is seeking to identify how the brain is capable of creating different neurological pathways as an individual is learning a new skill and/or altering a daily routine. Art therapy is working to find therapeutic ways to assist the dementia patient in maintaining cognitive functioning for as long as possible. In addition, art therapy is attempting to help individuals with dementia to express their emotions through the expressive arts. This session will combine the current findings of neuropsychology, neuroscience, and art therapy to discuss the neurological and psychological results of using art therapy with dementia patients who are suffering from various stages of the disease. It just may be possible for the brain to develop new neuropathways through the use of the imagination in creating art and allow the individual with dementia to find alternative methods of emotional expression, communication, and cognitive processing.

PILOT STUDY OF THE IMPACT OF A NOVEL LIGHTING IN A LONGTERM CARE UNIT DEDICATED TO CARING FOR OLDER ADULTS WITH DEMENTIA

P.A. Higgins^{1,2}, T. Hornick^{1,2}, M. Figueiro³, M.E. Duffy⁴, W. Beers⁴, 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *Cleveland VAMC GRECC, Cleveland, Ohio*, 3. *Rensselaer Polytechnic Institute, Troy, New York*, 4. *GE Consumer & Industrial Lighting, Cleveland, Ohio*

AIMS: Sleep disturbances due to circadian disruption are a significant challenge for demented older adults living in nursing homes. The purpose of this pilot study was to test an unattended nursing home lighting intervention designed to deliver high circadian stimulation (CS) during the day and low CS at night, thus promoting less circadian disruption, improved nighttime sleep, increased daytime wakefulness, and decreased behavior and mood disturbances. INTERVENTION AND METHODS: Our interdisciplinary team installed blue-white lights (specially developed by GE Lighting) that provided high CS in some of the existing ceiling fixtures in the unit's dayroom where all meals and most activities occurred. A timer ensured that the blue-white lighting was on from 8am-6pm, with low CS lighting on the remainder of the time. DATA ANALYSES: Using a pre-post design, actigraph data were analyzed for rest-activity patterns for three male residents, the Neuropsychiatric

Inventory-Nursing Home Version (NPI-NH) measured resident behavior as assessed by nurses, and interviews provided feasibility and acceptance data. RESULTS: Blue-white lighting in the dayroom was well accepted and increased perceived brightness but not glare while increasing CS. There was wide intra-individual and inter-individual variations among the subjects for behavioral indicators of circadian entrainment (sleep/wake, NPI-NH scores). Mean actigraphy data suggest small improvements in nighttime sleep consolidation and inter-daily stability (a measure of coupling between 24-hour light-dark and rest-activity cycles), but they must be interpreted with caution. CONCLUSION: Findings show promise for the development of lighting interventions that increase circadian entrainment and decrease sleep disturbances in nursing home residents.

SESSION 385 (SYMPOSIUM)

EXTENSION OF THE NEED-DRIVEN DEMENTIA-COMPROMISED BEHAVIOR MODEL (NDB) FOR USAGE IN MULTIPLE SETTINGS WITH DIVERSE POPULATIONS

Chair: A.L. Whall, *Oakland University, Rochester, Michigan, University of Michigan, Ann Arbor, Michigan*

Discussant: C. Kovach, *University of Milwaukee, Milwaukee, Wisconsin*

The Need-driven Dementia-compromised Behavior Model (NDB) developed by Algaese, Beck, Kolanowski and Whall, et al, in 1996, has significantly predicted which persons with dementia will develop aggression (Whall, et al, 2008). Recently, however, studies based upon the NDB model, have begun to use it to address persons who are otherwise cognitively compromised. The objective of this symposium is to highlight this expansion of the NDB model, and to identify questions and issues related to such extension and revision. Dunn discusses her program of research on Spirituality as it relates to an extension of the NDB model. Harrison and Ferrari present their research findings on falls in hospitalized older adults due to impulsivity as related to the NDB model expansion. Riley-Doucet presents her research findings on multi-sensory stimulation as it relates to use of the model with persons with dementia in various settings. Whall summarizes her 2008 research findings that were used to develop the WARP II as one outcome and expansion of the NDB Model.

USING THE WARP II TO MODIFY THE NDB MMODEL

A.L. Whall, *School Of Nursing, Oakland University, Rochester, Michigan*

The WARP II (Whall Aggressive Risk Profile) was derived from the Whall, et al (2008) study that tested the NDB model. Taken together the WRAP II uses six Background Factors and two Proximal Factors of the NDB model to target behavioral interventions for aggression in persons with dementia. The WARP II is described along with its usage with Harrison's Preserved Implicit Memory treatment and Riley-Doucet's Multiple Environmental Stimulation approach.

SPIRITUALITY AS A BACKGROUND FACTOR

K.S. Dunn, *Oakland University, Rochester, Michigan*

Holistic models that encompass bio-psycho-social and spiritual factors have been found to be effective in meeting the health care needs of older adults. Although comprehensive in nature, the Needs-Driven Behavior (NDB) model is lacking in spiritual background factors that may explain disruptive behaviors among patients with dementia (PWD). These spiritual factors may include the need to feel connected and loved. There is a growing body of empirical evidence that suggest religious activities, which have been practiced repetitively over the lifespan, can elicit comforting, emotional responses and increase meaningful environmental interactions among people with moderate to severe dementia. Therefore, emotions that are connected to religious activities can act as a primer and be an implicit source of comfort and joy for

PWD and therefore, decrease NDBs. Thus, the purpose of this presentation is to build a more holistic NDB model by adding spirituality as a background factor.

EXTENSION OF THE NDB MODEL THROUGH MULTISENSORY ENVIRONMENT INTERVENTIONS

C.K. Riley-Doucet, *Nursing, Oakland University, Rochester, Michigan*

Sensory deprivation is a significant problem among patients with dementia. An inevitable consequence of dementia is functional impairment, which can often lead to increased disorientation, anxiety, dependence in self-care activities, and loss of the ability to use the physical environment to satisfy the basic need for sensory stimulation. The Needs Driven Behavioral (NDB) model integrates the antecedents from the pathophysiological, psycho-behavioral, and environmental perspectives to explain agitated behavior in persons with dementia (PWD) as a symptom of an unmet need. Due to their dementia-related cognitive impairment, the PWD has limited decision-making capabilities and therefore may suffer the loss of environmental control to meet their need for sensory stimulation. This presentation outlines how multisensory environment (MSE) interventions offer PWD a balance between sensory deprivation and sensory overload. Aspects of Riley-Doucet's research and how MSE can be used as an extension of the NDB model will be discussed.

PREDICTIVE FACTORS ASSOCIATED WITH IMPULSIVITY RELATED FALLS IN HOSPITALIZED, OLDER ADULTS

M. Ferrari¹, B.E. Harrison¹, J. Wulfr³, C. Campbell², M.E. Maddens², A.L. Whall¹, *I. Nursing, Oakland University, Rochester, Michigan, 2. William Beaumont Hospital-Royal Oak, Royal Oak, Michigan*

Fall prevention for hospitalized older adults needs to be tailored to risk profile. The purpose of this study was to determine predictive factors for impulsivity related falls (IRF) in hospitalized, older adults in a large suburban hospital. A previous study found a significant relationship between inattention and IRF among older adults. This retrospective study sample (N = 395) included patients age 65 years and older who had a documented in-patient fall in 2008. Measures included Confusion Assessment Method (CAM) and Safety Assessment scores, current fall assessment measures. Thirty-one percent (31%) of falls were classified as IRF. Mean patient age was 78.1 years and median day of fall was Day 5 of hospitalization. Logistic regression of six fall risk factors found that inattention ($p=.00$, OR = 16.1) and mobility ($p=.00$, OR = 3.3) were significant predictors of IRF. Implications for assessment of IRF will be discussed within the NDB model.

SESSION 390 (PAPER)

GAIT - HS PAPER SESSION

ONE WALK A YEAR TO 1000 WITHIN A YEAR: THE VALUE OF CONTINUOUS IN-HOME UNOBTRUSIVE GAIT ASSESSMENT

J. Kaye, N. Mattek, D. Austin, S. Hagler, M. Pavel, T. Hayes, *Oregon Center for Aging & Technology, Oregon Health & Science University, Portland, Oregon*

BACKGROUND: Physical performance measures predict health and function in older populations. Walking speed in particular has consistently predicted morbidity and mortality. However, single brief walking measures may not reliably reflect a person's typical ability. Using a system that unobtrusively measures walking activity over time in a person's home we examined walking speed metrics over multiple time scales and their relation to function. METHODS: In 91 persons living independently (mean age 85, 86% women) we measured every instance of walking past a line of passive infra-red motion sensors placed strategically in their home for a mean of 319 ± 127 days. Daily, weekly and periodic (morning vs evening; seasonal) walking speeds and the vari-

ance in these measures were calculated and compared to conventional measures of gait, motor function and cognition. **RESULTS:** A total of 350,000 walks were recorded. Median number of walks per day was 13 ± 10 . Overall mean walking speed was 0.6 ± 0.3 m/sec. Fast walking (10th percentile of walks) was 1.0 m/sec. Men walked as frequently and fast as women. Slower walking speed correlated with increasing age. Within-subjects morning speeds were significantly faster and more variable than afternoons or evenings ($p < 0.0001$). In-home walking speeds were correlated with clinical gait measurements ($p = 0.001$). Subjects with executive function impairment ($n = 11$) had slower walking speed (0.54 m/s vs 0.62 m/s) and greater variability. **CONCLUSION:** Unobtrusive home walking assessments are ecologically valid measures of walking function. They provide previously unattainable metrics (periodicity measures, variability, range of minimum and maximum speeds) of everyday motor function.

IS VESTIBULAR DYSFUNCTION AN UNDERLYING FACTOR IN GAIT ABNORMALITY?

T. Kauffman^{1,2}, B.E. Kauffman², M. Laughlin², M. Bolton², A. Leggett^{2,3}, 1. Columbia University, New York, New York, 2. Kauffman Gamber Physical Therapy, Lancaster, Pennsylvania, 3. Duquesne University, Pittsburgh, Pennsylvania

Gait abnormality is an ill-defined condition with symptoms involving 2 or more diseases or body systems, according to International Classification of Diseases. It is commonly associated with neuromuscular and musculoskeletal pathology. Abnormal gait may increase falls risk and reduce mobility and quality of life. The purpose of retrospective study was to determine the percentage of patients with gait abnormality who also have vestibular dysfunction. The sample included 87 patients over 65 years of age with diagnosis of gait abnormality and was evaluated for vestibular dysfunction on the Balance Master™ (NeuroCom, Clackamas, OR). The age range was 66-93 years; mean 78.2 with 54 females and 33 males. The five most common co-morbidities were hypertension (57%), vision (37%), knee pathology (31%), lumbar pathology (29%), and hearing loss (24%). 80% of the entire sample had vestibular dysfunction. In each age group, 65-74; 75-84; and 85+ years, the females showed higher percentages having abnormal vestibular systems and the percentages in both genders increased as age progressed. Chi-square was significant at .05 level for vestibular dysfunction in 70% of males (23/33) and 85% of females (46/54). Only one of 23 persons (96%) over age 85 had normal vestibular function. Vestibular dysfunction increases with age, often is not assessed and appears to be an important underlying factor in gait abnormality. When evaluating persons over 65 years of age with an abnormal gait, not attributable to specific pathology like stroke or joint replacement, vestibular function should be tested. Compensatory interventions are possible.

THE ABILITY OF AGE, GENDER, AND ANTHROPOMETRIC MEASURES TO PREDICT SELF-SELECTED AND FAST WALKING SPEEDS IN HEALTHY COMMUNITY LIVING ADULTS AGED 72-98 YEARS

K. Chui, M. Lusardi, Sacred Heart University, Fairfield, Connecticut

Introduction: There is limited normative data for self-selected (SSWS) and fast (FWS) walking speeds for adults older than 70 years. Less is known about how age, gender and anthropometric characteristics correlate with and predict SSWS and FWS in this population. Understanding such relationships and ability of these variables to predict SSWS and FWS would assist health professionals in designing and assessing interventions. **Methods:** Participants were residents of a retirement community ($n = 118$, mean age 84.67 ± 5.3 years, 70.3% female) involved in a longitudinal study. Walking data were collected using the GAITRite, an instrumented walkway system. Descriptive statistics were calculated for independent variables: age, gender, and anthropometric measures (height, leg length, weight, body mass index [BMI]). Correlations were used to examine the relationships between independent and dependent

variables. Stepwise Multiple Regression was used to examine the ability of independent variables to predict dependent variables. **Results:** Significant ($p < .01$) correlations were found between SSWS and age ($r = -.49$), gender ($r = -.35$), height ($r = .32$), leg length ($r = .30$), and weight ($r = .29$). Regression analyses identified age and gender as the only significant predictors of SSWS ($r = .60$, $r^2 = .36$, $p < .000$). Similar significant ($p < .01$) correlations were found between FWS and age ($r = -.48$), gender ($r = -.38$), height ($r = .30$), leg length ($r = .28$), and weight ($r = .28$). Regression analyses identified age and gender as the only significant predictors of FWS ($r = .61$, $r^2 = .37$, $p < .000$). **Conclusions:** Age, gender, and anthropometric measures correlated with SSWS and FWS. Only age and gender predicted SSWS and FWS.

MAXIMAL GAIT SPEED VERSUS ALLOTTED CROSSING TIME AT SIGNALIZED INTERSECTIONS AMONG TWO COHORTS OF OLDER DRIVERS

R.A. Marottoli^{1,2}, K. Araujo¹, P. Peduzzi^{2,1}, 1. Internal Medicine, Yale University, New Haven, Connecticut, 2. VA Connecticut, West Haven, Connecticut

Background: As people transition from driving to other forms of transportation and walking, concern is raised about their safety as pedestrians. To explore this issue we utilized two large community-based cohorts of older drivers, comparing maximal gait speed of these healthy older persons to allotted crossing times at signalized intersections in New Haven, CT. **Methods:** The time allotted to cross intersections was obtained from the New Haven Traffic and Parking Department. Maximal gait speed was assessed by rapid pace walk: participants walked 10 feet up and back as fast as possible. **Results:** 1359 participants with mean age 78 years, 24% women, mean MMSE score 27.5, and 78% health excellent/good. Mean rapid pace walk time was 7.0 (2.1) seconds to cover 20 feet, the median was 6.6 seconds, and the range 3.7-29.4 seconds. These translated to maximal gait speeds of 3.0 ft/sec (mean), 3.0 ft/sec (median), range 0.7-5.4 ft/sec. Only 7% had maximal gait speeds sufficiently fast to cross typical signalized intersections where presumed gait speed is 4 ft/sec; 51% had maximal gait speeds sufficiently fast to cross intersections near high concentrations of older people with 3 ft/sec allotted. **Conclusion:** In earlier studies including frail older persons, <7% had usual walking speeds too slow to cross intersections in the allotted time. Even in the current group of healthy individuals, few had sufficient maximal gait speed to cross at typical intersections and only half at intersections with more older people. These findings suggest that intersection crossing times should be adjusted to better accommodate the gait speeds of even healthy older persons.

SESSION 395 (SYMPOSIUM)

MEDIA TAKES: REFRAMING THE NEW OLD AGE

Chair: D. Sheets, Health Sciences, CSU Northridge, Pine Mountain Club, California

Discussant: J. Hendricks, Oregon State University, Corvallis, Oregon

As media has become aware of the "graying" of the population, more attention has been given to aging and age-related issues. Images of aging have an important impact on society and on the way we see and treat older individuals. This symposium examines the content and social effects of media on mainstream cultural perceptions of aging. Presenters use critical analyses of traditional and contemporary media to examine how aging is conceptualized, framed and presented. A cultural anthropologist/journalist focuses on the production of print and broadcast news imagery to identify the influence of the baby boom generation in pushing the boundaries of "old age" as a social category. A cultural critic and playwright uses a framework of disability studies and performance theory to analyze how social networking and new media are depicting late life. A humanist/nurse applies a critical social/feminist perspective to examine aging in online media, including blogs and YouTube, assessing their potential to reframe old age.

THE LIFE COURSE AS A 21ST CENTURY NEWS STORY: CONTEMPORARY IMAGES OF AGING IN MEDIA

M. Vesperi, *Division of Social Sciences, New College of Florida, Sarasota, Florida*

Focusing on the production of print and broadcast news imagery rather than its consumption, this presentation is designed to help researchers identify the influence of the baby boom generation in pushing the boundaries of "old age" as a social category. Marketing experts predict that future discretionary spending will be controlled by older, healthier, more demanding consumers who are already sensitive to stereotypes and prepared to resist them. Yet advertisers continue to seek youth markets, an economically damaging trend for traditional news media which face steadily aging audiences and decreased attention to news among post-baby-boom generations. The aging of traditional media producers themselves and the downsizing of contemporary newsrooms are additional factors that affect how the topic of aging is conceptualized, framed and presented.

DOES "NEW MEDIA" CHANGE ANYTHING?

A. Basting, *University of Wisconsin Milwaukee, Milwaukee, Wisconsin*

Built on a foundation of her extensive research into cultural images of memory loss in her 2009 book *Forget Memory: Creating better lives for people with dementia*, Basting expands her reading of film and television images to include second life, twitter, Facebook, and short videos on Youtube to analyze how social networking and new media are depicting late life. Using a framework of disability studies and performance theory, Basting suggests that old stereotypes of aging persist, while some new media does offer a new way to look at aging that might usher us beyond our current youthful frame of reference.

VIRTUAL REALITY: REDEFINING THE IMAGE OF AGING

D. Sheets, *Health Sciences, CSU Northridge, Pine Mountain Club, California*

Despite an aging population, contemporary mass media such as journalism, entertainment and advertising, continues to reflect an obsession with youth. Ageist stereotypes in mass media influence the opportunities that older adults have to participate socially in society and the ways in which younger people imagine their future. New media online such as blogging, twittering and You-Tube can empower older adults to represent themselves realistically and thus alter attitudes and beliefs toward older people and old age. This presentation uses a critical social/feminist perspective to examine how older adults and aging issues are conceptualized, framed and presented in new media online. The analysis suggests that online media is powerful tool for transforming static perceptions of aging into a more dynamic and realistic representation that reflects the heterogeneity and diversity of older adults.

SESSION 400 (SYMPOSIUM)

ROLE OF MONOCYTES/MACROPHAGES IN AGE-RELATED IMMUNE DECLINE, ANEMIA, AND FRAILTY

Chair: S.X. Leng, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Discussant: E.J. Kovacs, *Loyola University Medical Center, Maywood, Illinois*

The objective of this symposium is to describe recent development in characterization of the aging monocytes/macrophages and their activation biomarkers, focusing on their relationships with age-related decline in the innate and adaptive immunity, anemia, and the geriatric syndrome of frailty. After attending this session, participants will be able to define potential role of monocytes/macrophages and their activation in age-related immune decline, anemia, and frailty. This symposium will include 4 speakers who are experts in the field. Dr. Albert Shaw from Yale University will present his work on age-related decrease in monocytic and dendritic cell (DC) TLR function and its impact on

influenza vaccine response in older adults. Dr. Cindy Roy from Johns Hopkins University will report the association of elevated monocyte counts with decreased RBC counts and hemoglobin concentration in her mouse model of anemia of inflammation and aging. Dr. Neal Fedarko from Johns Hopkins University will present data on biomarkers of macrophage activation including serum neopterin levels and chitotriosidase activity, and their relationship with aging and frailty. Dr. Sean Leng from Johns Hopkins University will describe his work on monocytic expression of stress responsive inflammatory pathway genes in community-dwelling frail older adults. Dr. Elizabeth Kovacs from Loyola University is the discussant who will provide her insight into the latest development presented by the speakers as well as her perspective for future directions.

UPREGULATION OF STRESS RESPONSIVE INFLAMMATORY PATHWAY GENES BY PURIFIED MONOCYTES IN THE GERIATRIC SYNDROME OF FRAILTY

S.X. Leng, T. Qu, H. Yang, N. Fedarko, J. Walston, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Frailty is an important geriatric syndrome that predicts morbidity and mortality. Substantial evidence suggests inflammation marked by elevated IL-6 levels as a key pathophysiologic factor that contributes to frailty. To explore its molecular mechanisms, we conducted pathway-specific gene array and quantitative RT-PCR analyses evaluating unstimulated and lipopolysaccharide (LPS)-induced expression of inflammatory pathway genes by purified CD14+ monocytes in 16 pairs of age, race, and sex-matched frail and non-frail older adults. The results showed significant upregulation in unstimulated monocytic expression of chemokine CXCL10 in frail older adults compared to non-frail controls and CXCL10 upregulation is highly correlated with frailty-associated elevation in IL-6 levels. Upon LPS stimulation, monocytic expression of 6 additional stress responsive inflammatory pathway genes was upregulated, compared to non-frail controls. These findings demonstrate upregulated monocytic gene expression in frailty and provide a basis for further investigations into monocytic activation and potentially dysregulated innate immunity in frail older adults

SERUM MARKERS OF MACROPHAGE ACTIVITY REFLECT AGE- AND FRAILTY-RELATED CHRONIC IMMUNE ACTIVATION

S.X. Leng, N. Fedarko, R. Ramanathan, A. Jain, M. Spencer, X. Tian, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Immune activation is a sentinel maintenance/homeostatic mechanism. Macrophages, key components in immune activation, are involved in phagocytosis, destruction of microorganisms, and production of cytokines that regulate other cells involved in innate immune response. Chronically activated macrophages produce and release neopterin, a small GTP metabolite, and chitotriosidase, an enzyme, which can be measured in blood. Serum neopterin levels and chitotriosidase activity were positively associated with donor age in a study of 161 normal subjects. Neopterin levels also differ by gender and BMI. These biomarkers were employed to characterize the immune activation status in the geriatric syndrome of frailty. Both neopterin and chitotriosidase were significantly elevated in the frail group, after adjusting for gender and BMI. Chronic immune activation, through its cytokine production and tissue repair program alters the cellular microenvironment which can contribute to the altered cell phenotype and function underlying aging and age-related diseases.

AGE-ASSOCIATED ALTERATIONS IN TOLL-LIKE RECEPTOR FUNCTION IN HUMAN MONOCYTES AND DENDRITIC CELLS

A. Shaw, A. Panda, D. van Duin, F. Qian, S. Mohanty, H. Allore, R. Montgomery, *Yale University School of Medicine, New Haven, Connecticut*

Toll-like receptors (TLRs) recognize conserved elements in pathogens, and by activating antigen-presenting cells such as monocytes and dendritic cells (DCs) play a crucial role in the immune response to infection and vaccination. We determined age-associated changes in TLR function in human monocytes and DCs from young (21-30 years of age) and older (≥ 65) individuals receiving the influenza vaccine, using flow cytometry and intracellular cytokine staining. In monocytes ($n=159$), we observed an age-associated defect in TLR1/2-induced cytokine production, and a generalized defect in TLR-induced CD80 upregulation. In both myeloid and plasmacytoid DC populations ($n=104$), a more extensive defect in TLR-induced cytokine production was present (compared to monocytes), and a generalized defect in TLR-induced costimulatory molecule expression was also present. Our results provide evidence for immunosenescence of the TLR pathway in monocytes and dendritic cells; functional consequences of impaired TLR function for influenza vaccine response will be discussed.

NORMOCYTIC ANEMIA IN 18 MONTH C57BL/6 MICE IS ASSOCIATED WITH ACTIVATION OF INNATE IMMUNE RESPONSE

C. Roy, O. Prince, I. Prince, Q. Yu, C. Civan, J.D. Walston, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Anemia is common in older adults and closely associated with morbidity and mortality. At least 1/3 of anemia in older adults is associated with chronic disease. To assess potential mechanisms driving anemia in the elderly, we investigated erythropoiesis in 18-month old (aged) C57BL/6 female mice. We found that aged mice had a normocytic anemia compared to 2-month old (young) C57BL/6 female mice ($p<0.001$). The anemia of aged mice resembled the anemia found in young mice with chronic sterile abscess ($p=0.001$) and was not explained by iron restriction. Aged mice also had increased circulating monocytes ($p<0.0001$), consistent with anemia driven by innate immune response. Flow cytometric analysis of bone marrow revealed a greater proportion of Ter119+CD71+ precursors are less mature in aged mice and mice with abscess. Together, these data support the hypothesis that mild inflammation in aged mice may inhibit the maturation of erythroid precursors, resulting in anemia.

SESSION 405 (PAPER)

AGING IN CHINA

ARE CHINESE OLDER PEOPLE LIVING ALONE AT RISK OF POOR HEALTH AND WELL-BEING?

D.S. Yu, *The Nethersole School of Nursing, The Chinese University of Hong Kong, Hong Kong, NA, China*

Background: Living alone in later life is regarded as a risk factor for deprived social support and poor health status. Yet, various demographic and social changes aggravate such living arrangement even in the Chinese society which emphasises family cohesiveness. Aim: This study aims at compare the socio-demographic characteristics and health status of the Chinese community-dwelling older people who were living alone and those who were not. Methods: This population-based survey interviewed 405 community-dwelling older people with the Short-Form 36 Health Survey, the Medical Outcomes Study Social Support Survey, and the Mental Health Inventory. Other socio-demographic and clinical data also collected. Result: Among the sample, 30.4% of them lived alone and the others either lived with spouse (31.1%) or lived intergenerationally (38.5%). By comparing older people of different liv-

ing arrangements, we found that older people who lived alone were characterized by more advanced age, more financial strain, shrunken social network and lower perceived social support. Although there was no difference in the number of stressful life events and chronic illnesses between the three groups, older people who lived alone reported higher psychological distress, poorer mental health, poorer physical function, less vitality, and more somatic symptoms including insomnia, joint pain and stiffness, dizziness, loss of appetite and activity intolerance. Living alone was an independent risk factor for poor HRQL. Conclusion: Living alone is associated with higher social and health care needs among Chinese older people. The findings have important implications on the planning of social and health services.

PROJECTING THE DEMOGRAPHIC AND POLICY IMPACTS ON ANNUAL PENSION DEFICITS: A SIMPLE METHOD AND ILLUSTRATIVE APPLICATION TO CHINA

Y. Zeng, *Center for Study of Aging and Human Development, Duke University, Durham, North Carolina*

Objectives: Policymakers, scholars and public are very concerned about possible annual pension deficit in future years induced by unavoidable population aging. This issue will be addressed in present study by methodological development and illustratively application to China. Method: I propose a simple method for projecting the annual pension deficit rate which is defined as percent of the total wages based on a few demographic and pension program policy parameters. The method can also be used to estimate the adjusted replacement rate and contribution rate necessary to achieve zero annual pension deficit, while assuming equal or differential changes in relative incomes of the workers and retirees. Results: The illustrative application to China demonstrates that if the average age at retirement gradually increases from the current very low level to the international standard in 2040, the annual pension deficit would be much smaller than that under the constant retirement age. With everything else being equal, the annual pension deficit in the two scenarios of medium fertility (smooth transition to two-child policy) and low fertility (current fertility policy unchanged) will not differ significantly before 2030, but the differences will become increasingly larger after 2030. The impact of possible mortality changes is likely moderate. Conclusion: A gradual increase in the average age at retirement plus medium fertility associated with a smooth transition to the two-child policy and viable reforms in pension system management may help China to avoid the big troubles of annual pension deficit.

FAMILY COMPOSITIONS AND MULTIPLE PARENT-ADULT CHILD RELATIONSHIPS AMONG CHINESE RURAL ELDERS

M. Guo, I. Chi, M. Silverstein, *School of Social Work, University of Southern California, Los Angeles, California*

Most existing studies on intergenerational relations have relied almost exclusively on single parent-child dyads. Little research has investigated the patterns of multiple parent-adult child relationships and determinants of within-family differences in parent-child relations. This study explores the relationships between family compositions and multiple parent-child relations among older adults in rural China. The sample for this investigation consisted of 1,529 Chinese aged 60 and above with at least two adult children in rural Anhui province, China, in 2001. Multiple parent-child relations were assessed by three collective measures of parent-child relations in a family: the highest, lowest and range in older adults' reported quality of relations across all children. Family compositions were measured by number of sons and daughters in a family, average distance between the houses of parents and all children, and the geographic dispersion among family members. The results of OLS regressions showed that having more sons and daughters is associated with positive (highest quality) but not negative (lowest quality) parent-child relations for both mothers and fathers. Having more sons and daughters also increases mothers' differentiations in relations across

all children (range). Only the number of sons affects fathers' differentiation in parent-child relations within families. An average greater household distance between parents and children enhances the positive parent-child relations among mothers. Geographic dispersion of family members is associated with negative parent-child relations among parents of both genders. The results of this study yield a more complete view of family dynamics in later life than the single parent-child dyad explanations.

ECONOMIC DEVELOPMENT AND HOUSEHOLD ECONOMIC WELL-BEING OF OLDER PEOPLE IN URBAN CHINA

T.Y. Lum¹, Y. Xu², X. Zhang², 1. *University of Minnesota, St. Paul, Minnesota*, 2. *Beijing Normal University, Beijing, Beijing, China*

Objective: China has achieved a spectacular success in its economic development since it started to reform its centrally-planned economy in 1978. However, economic reform also led to a wide array of social problems, including widening gaps between the rich and poor, unemployment, and wide-spread urban poverty. Elderly people are particularly vulnerable to these negative impacts of social and economic developments. The objective of this study was to understand how economic development in China affected the economic well-being of urban elderly residents. **Methods:** Data for this study came from the 2004 China Urban Household Survey. 2,823 survey participants were selected from eight large urban cities using stratified sampling method. 1,335 participants were 65 years or older. Data collection was done by trained interviewers through face to face interviews. Outcome measures included household income, economic hardship index, household economic buffering capacity, subjective economic satisfaction and Gini coefficient for income inequality across cities. Multivariate analyses, including OLS regression and ordered logit regression, were used. **Findings:** Household income was directly associated with levels of economic development. Highly developed cities, like Beijing and Guangzhou, had significantly higher household income than other cities. However, differences in household income did not translate into differences in economic hardship experience. Residents in cities with significantly lower household income reported neither more hardship experience nor lower subjective economic well-being. Our analysis of Gini coefficient showed that inequality was more severe in middle range cities than in well-developed cities, indicating that high economic development does not necessarily lead to high inequality.

SESSION 410 (SYMPOSIUM)

AN OBAMA EFFECT? EXAMINING CHANGES IN PARTICIPATION, ENGAGEMENT, AND POLITICS

Chair: *F.L. Cook, Institute for Policy Research, Northwestern University, Evanston, Illinois*

Discussant: *R. Hudson, Boston University, Boston, Massachusetts*

Political commentators report that there has been an "Obama effect" in terms of political participation and politics but rarely try to differentiate whether this impact (to the extent it actually exists) differs by age group. This symposium examines the extent to which the Presidential campaign and election of Barack Obama affected voting patterns and political participation among older Americans in comparison to younger age groups and the extent to which the politics of aging has been altered. Regarding voting, older Americans were the only age group to vote for John McCain. Robert Binstock uses 2008 exit poll data to examine three factors that shaped that outcome: cohort effects, identification, and a "Bradley effect." Regarding political participation beyond voting, Fay Lomax Cook and Meredith Czapslewski use NES election year data since 1992 to examine the extent to which 2008 was different for Americans by age in terms of levels of campaign work, donating money, influencing others, and discussing politics. Although they find a rather complicated pattern of participation by age group across all these domains, one

finding is clear: all age groups age 30 and over were more interested in the 2008 election than in the elections from 1992 to 2004. Finally, Polivka steps back with a broad perspective to ask whether a new politics of aging will emerge. He concludes that emerging threats to retirement security, continuing neo-liberal attacks on entitlement programs, and large projected budget deficits will shape the politics of aging in new ways for decades to come.

OBAMA AND THE NEW POLITICS OF AGING

L. Polivka, *Florida Policy Exchange Center on Aging, Tampa, Florida*

The Obama administration's proposed budget for 2001 represents an ambitious and broadly progressive policy agenda and a qualitative departure from the neoliberal priorities of the Reagan/Bush era. This agenda, however, does not explicitly address a range of emerging threats to the retirement security of the next generation of retirees, the baby boomers. Simultaneous with these developments, the decades-long neoliberal attack on the entitlement programs (Social Security and Medicare) is likely to be renewed in response to the huge budget deficits projected over the next ten years. These conflicting forces will shape the politics of aging for decades to come. The presentation will conclude with an analysis of the options available to the Obama Administration in addressing these conflicts in the new political economy of aging.

THE 2008 PRESIDENTIAL ELECTION: OBAMA, MCCAIN, AND COHORT EFFECTS

R. Binstock, *Case Western Reserve University, Cleveland, Ohio*

In the 2008 presidential election, older voters were the only age group to vote for John McCain. Overall, Barack Obama won by a margin of 53 percent to 46 percent. Yet, persons aged 60 and older gave 51 percent of their votes to McCain and 47 percent to Obama. Among voters aged 65 and older, McCain was favored even more; he received 53 percent of their votes compared with Obama's 45 percent. This presentation draws on exit polls to examine why older voters favored McCain. One factor was that an "Eisenhower cohort" of Republicans had joined the ranks of older voters. A second factor appears to have been positive identification with McCain's age by voters aged 65-74. A third factor was a "Bradley effect," or in this case an Obama effect: White voters aged 65 and older joined White voters aged 30-44 in voting heavily for McCain.

AN OBAMA EFFECT? OLDER AMERICANS AND CHANGES IN POLITICAL PARTICIPATION ACROSS AGE GROUPS, 1992-2008

F.L. Cook, M. Czapslewski, *Institute for Policy Research, Northwestern University, Evanston, Illinois*

Political commentators report that there has been an "Obama effect" in terms of political participation and political interest but rarely try to differentiate whether this impact (to the extent that it actually exists) differs by age group. This paper uses the NES election year data from 1992 to 2008 to go beyond examining voting as a measure of political participation to investigate how other forms of political participation (e.g., persuading others, donating money, attending political events, and displaying candidate support) and political interest (political discussion, campaign interest, and media and Internet usage) changed in 2008 compared to earlier elections. Traditionally, older Americans have participated in different ways than younger Americans. However, the election of 2008 saw more older Americans embrace new participatory behaviors that have traditionally been utilized by younger generations, narrowing the gap by which we differentiate the political participation of the old and young.

CAREGIVING: INFORMAL AND FORMAL

NEIGHBORHOOD CONTEXTS IN SERVICE UTILIZATION AND PERCEIVED BURDEN FOR CAREGIVERS OF PERSONS WITH ALZHEIMER'S DISEASE: AN ANALYSIS OF ADULT PROTECTIVE SERVICE CASE FILES

B. Payne², N.P. Kropf¹, R. Gainey³, 1. *Social Work, Georgia State Univ., Atlanta, Georgia*, 2. *Georgia State Univ, Atlanta, Georgia*, 3. *Old Dominion University, Norfolk, Virginia*

Research on caregiving in Alzheimer's Disease (AD) has rarely considered the community context. Using a conceptual framework that integrated service utilization, burden, and elder maltreatment literatures, four hypotheses were tested in this study: 1) Caregivers in more disadvantaged neighborhoods would use fewer formal services 2) Caregivers in more disadvantaged neighborhoods would experience higher caregiver burden, 3) Caregiver burden would be more strongly related to caregiver burden than individual characteristics of care provider and recipient, and 4) The relationship between burden and abuse is mediated and potentially moderated by neighborhood dynamics. This study analyzed data from 751 Adult Protective Service (APS) case files from three cities within a Mid Atlantic state. To measure neighborhood characteristics, several variables were extracted including percent of population living within poverty, unemployment, population turnover, percentage of vacant homes. Additional characteristics included sociodemographics of care recipient and care provider, diagnosis of AD, and type of residential setting. Results indicate that there is partial support for the hypotheses. APS case reports indicated higher level of both burden and abuse in more disadvantaged neighborhoods regardless of individual level factors. However, the type of abuse did not differ across the various locations. Rates of service utilization were significantly different, with lower rates found in disadvantaged neighborhoods. These results recast ways to initiate elder maltreatment services. The typical model focuses on the characteristics of caregiver and provider such as relationship status and functional abilities. These findings suggest that community level variables are crucial and are relevant for decreasing elder maltreatment rates.

THE QUANTITY OF ACTIVE HELP AND SUPERVISION PROVIDED TO OLDER ADULTS WITH NEUROPSYCHIATRIC SYMPTOMS: THE AGING, DEMOGRAPHICS, AND MEMORY STUDY (ADAMS)

T. Okura^{1,2}, B.L. Plassman³, D.C. Steffens³, D.J. Llewellyn⁴, K.M. Langa^{1,2}, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *VA Ann Arbor Healthcare System, Ann Arbor, Michigan*, 3. *Duke University Medical Center, Durham, North Carolina*, 4. *University of Cambridge, Cambridge, United Kingdom*

(Background) We estimated the quantity of active help and supervision provided to older adults with neuropsychiatric symptoms in a nationally representative sample in the U.S. (Methods) We used data from the ADAMS, a sub-study of the Health and Retirement Study focused on cognitive impairment. We obtained the presence of neuropsychiatric symptoms (delusions, hallucinations, agitation, depression, apathy, elation, anxiety, disinhibition, irritation, and aberrant motor behaviors) using the Neuropsychiatric Inventory. The hours per week of active help with ADL/IADL limitations, and supervision to ensure safety were ascertained by informant questionnaire. (Results) After adjusting for sociodemographics, use of paid help, cognitive function, and chronic medical conditions, those with no neuropsychiatric symptoms received an average of 5.1 hours of active help and 4.6 hours of supervision per week from informal caregivers. Those with 1 or 2 neuropsychiatric symptoms received an additional 2.2 hours of active help and 3.0 hours of supervision per week ($p < .001$), while those with 3 or more symptoms received an additional 6.2 hours of active help and 11.2

hours of supervision per week ($p < .001$). Among those with cognitive impairment without dementia (CIND) and dementia, the presence of disinhibition (16.8 additional hours) and irritation (15.8 additional hours) were associated with greatest number of additional hours of supervision. (Conclusions) Neuropsychiatric symptoms among those with CIND and dementia are associated with a significant increase in the provision of informal care, especially supervisory care. This care represents a significant time commitment for families and a significant economic cost to society.

FORMAL AND INFORMAL CARE USE AMONG COMMUNITY DWELLING OLDER PEOPLE: COMPARING THOSE WHO DIED AND SURVIVED

Y. Rhee¹, H. Degenholtz², N. Muramatsu³, D. Lau⁴, 1. *Northwestern University, Chicago, Illinois*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *University of Illinois, Chicago, Illinois*, 4. *Northwestern University, Chicago, Illinois*

Objective: To investigate the patterns of formal paid and informal unpaid care use among two groups of community-dwelling older people- decedents and survivors- over a two-year period. Methods: We used data from the 2002 Health and Retirement Study (HRS); N= 19,668 persons aged 50 and older. The quantity of caregiving is the number of hours per week. Separate multivariate logistic regressions were performed to examine the probability of informal and formal care use among two groups. Among decedents and survivors with any helpers, ordinary linear regression models were performed to examine factors associated with greater hours of formal and informal care. Results: Controlling for age, physical and cognitive disability and other factors, the probability of receiving formal and informal care was higher for decedents than for survivors. The amount of care provided was also significantly higher for decedents than survivors. Effect of number of Instrumental Activity of Daily Living (IADL) for survivors on probability of informal care use and receiving greater hours was higher than for decedents while effect of number of ADL on probability of use of formal care and receiving greater hours was higher for decedents than survivors. Conclusion: Prior to death, there is an increased demand for assistance from both family members and paid caregivers. Even after adjusting for physical and cognitive disability, vital status is associated with greater likelihood of receiving care and greater hours of care. This suggests that taking care of dying older people places additional burdens beyond what can be explained on the basis of health status alone.

WHOSE CHOICE? THE MOTIVATIONS AND WELL-BEING OF CONSUMER-DIRECTED FAMILY AND FRIEND CAREGIVERS

K.G. Kietzman¹, A. Benjamin², R.E. Matthias², 1. *Health and Aging Policy Fellow, Atlantic Philanthropies, Washington, District of Columbia*, 2. *University of California, Los Angeles, Los Angeles, California*

Given the growing demand for long-term care services and a well documented direct care workforce shortage, it is important to understand what attracts people to engage in personal care work. This study examines the motivations and well-being of family members and friends paid to provide in-home personal care services to Medicaid-eligible disabled and elderly. Drawing from tenets of Self-Determination Theory, we also investigate whether caregivers perceive they have a choice in assuming the paid role and how much importance they attribute to being paid. Hierarchical regression analyses of survey data collected from 383 "related" caregivers hired directly by consumers through California's In-Home Supportive Services program indicate that those who report less choice experience more caregiver-related stress (.210, $p < .001$), less job fit (.124, $p < .05$), and less overall caregiver well-being (.149, $p < .01$). Caregivers stating they would definitely not provide care without pay are less likely to feel rewarded by (.285, $p < .001$) or attribute value to (.194, $p < .001$) the caregiving experience. While recent studies of consumer-directed home care offer evidence of positive outcomes

for both caregivers and care recipients, we must be careful not to assume that family members and friends are always the most appropriate candidates for these roles. Social workers and other health care professionals working with caregiving families may be well advised to consider how perceived choice and importance of payment may affect efforts to find a caregiving arrangement that serves the best interests of both caregiver and care recipient.

SESSION 420 (PAPER)

NURSING HOME ORGANIZATION AND PERFORMANCE

QUALITY OF CARE: IMPACT OF ORGANIZATIONAL CHARACTERISTICS ON NURSING HOME DEFICIENCIES

H. Lee, M.A. Blegen, C. Harrington, *UCSF School of Nursing, San Francisco, California*

Poor quality of care in nursing homes has been a persistent problem in the United States for over 40 years. In 2000, 23.5 percent of facilities received at least one deficiency rating serious enough to cause harm or immediate jeopardy to residents. Despite government oversight within this sector, there are significant variations in quality of nursing home care within states. The main purpose of this study was to better understand the impact of nursing home characteristics on quality of care. This paper focused on the third aim of the main study, which examined multidimensional associations between organizational characteristics, nurse staffing levels, and nursing home deficiencies, controlling for resources, resident, and market characteristics. This study used secondary data from Online Survey Certification and Reporting (OSCAR) data, Minimum Data Set (MDS) 2.0, quarterly staffing data from the state inspections, and Area Resource File (ARF). The population of 195 nursing homes out of 199 Colorado freestanding homes in 2000 was analyzed. Negative binomial regression models were used for data analysis. There was a significant effect of for-profit status only on quality-of-life citations. Nursing homes affiliated with chains had more total, substandard-care, and quality-of-care citations. Considering different staffing decisions, regulatory systems need to be designed carefully and systematically to improve quality of care. To improve overall quality of care within a state, nurse staffing levels as a target need to be increased by instituting higher state staffing standards and health policies that enable nursing homes to increase nurse staffing levels.

HUMAN AND ORGANIZATIONAL CHARACTERISTICS OF HIGH AND LOW PERFORMING NURSING HOMES: A COMPARATIVE STUDY USING MIXED METHODS

D. McMaughan Moudouni, B. Kash, *PHPM, TAMHSC SRPH, College Station, Texas*

Research Objective: To identify, from the perspective of long-term care consumers, adaptive and maladaptive nursing home care practices related to human and organizational characteristics in high and low performing nursing homes. Study Design: A mixed method study design was utilized. Quantitative data of performance measures related to people, processes, quality, service, and finance were retrieved from secondary data sources to create selection criteria identifying high and low performing nursing homes in a Southwestern state. Qualitative data on six high and low performing facilities collected through focus groups with 45 long term care consumers were analyzed based on an inductive methodology. Principal Findings: High and low performing facilities differed in residents' and families' perspectives of human and organizational factors. Prominent themes related to staffing, management practices, and physical environment emerged from the comparative focus group analysis. Participants from low performing homes expressed fear and concerns for safety, lack of attention by staff to basic needs, and chronic low staffing levels. Participants from high performing homes expressed comfort with their surroundings and fulfillment of basic and

higher needs by staff. Conclusions: Long-term care consumers can provide valuable insight into work and organizational practices affecting perceived quality of nursing home care. These insights point to differences between high and low performing facilities amenable to change, rather than traditional classifications of homes not easily changed (such as profit status or geographic location). Recommendations for nursing home management and long term care policy makers include efforts to improve communication between staff and consumers, attention to food preferences, attention to interior facility aesthetics as experienced by residents and development of a sense of ownership in the facility.

TRENDS IN NURSING HOME OWNERSHIP AND CORPORATE STRUCTURE

D.G. Stevenson, D. Grabowski, *Health Care Policy, Harvard Medical School, Boston, Massachusetts*

Policymakers recently have focused attention on issues of corporate oversight and accountability in the nursing home sector. A key lynchpin in researching and enforcing policy directives around nursing home ownership is having timely, detailed data about ownership structures and management arrangements, something current federal datasets are not able to facilitate. Through its Ownership, Management, and Tracking (OMT) System, the State of Texas has collected detailed information on nursing home ownership structures and management arrangements since 2000. Using these data, we found various elements of corporate restructuring between 2000-2007, a trend likely driven in part by the state's liability climate. We found that the use of limited liability company (LLC) and limited partnership (LP) structures increased considerably over the study period, from 12-23% of facilities for LLCs and from 13-33% of facilities for LPs. The use of management companies by Texas nursing homes also increased considerably between 2000-2007, growing from 6-36% of all facilities. Importantly, nearly half of these management companies were corporate entities that had the same owner as the nursing home itself. Finally, we observed an overall increased complexity of nursing home ownership structures in the state, with the percent of final owners at least 5 layers deep increasing from 0.6-11% between 2000-2007, and the percent of final owners at 1-2 levels deep decreasing from 90-70% over the same time period. In addition to describing these changes, we will assess the potential implications of these changes for quality of care and discuss their ramifications for public policy.

SESSION 425 (PAPER)

PROMOTING GERONTOLOGY TRAINING AND RESEARCH

PROMOTING MULTI- AND INTERDISCIPLINARY AGEING RESEARCH IN THE UNITED KINGDOM

C. Hennessy¹, A. Walker², *1. School of Nursing and Community Studies, University of Plymouth, Plymouth, United Kingdom, 2. University of Sheffield, Sheffield, United Kingdom*

Despite the growing awareness of the value of discipline spanning research on ageing, many common but significant barriers to interdisciplinary collaboration persist. In view of these barriers, government and other scientific funding bodies worldwide are actively involved in establishing the methods and means to promote cross-disciplinary cooperation in the field. In the United Kingdom, since the late 1990s, national Research Councils with key interests in ageing and older people have been actively pursuing the development of programmes of research which feature multi- and interdisciplinarity. This presentation reviews key developments in the promotion of multidisciplinary science on ageing in the United Kingdom including Research Council programmes and other strategic initiatives. It details the approach to multi- and interdisciplinary research developed by the authors in the National Collaboration on Ageing Research, a partnership among four of the Research

Councils to stimulate cross-disciplinary collaboration through working with scientists, funding bodies, and research end users. The presentation highlights how this approach is being pursued in the New Dynamics of Ageing (NDA) Programme (2005-2012), the largest programme of multidisciplinary ageing research to date (£20 million) in the United Kingdom which spans the social, medical, biological, and engineering sciences, and the arts and humanities. Examples of how cross-disciplinary working is being stimulated in the NDA are provided including the incubation of interdisciplinary research teams under the programme's Preparatory Networks scheme.

CHANGING MEDICAL STUDENTS' ATTITUDES TOWARD OLDER ADULTS AND CAREER PLANS: OUTCOMES OF VITAL VISIONARIES PROGRAM

E. Gonzales¹, N. Morrow-Howell¹, P. Gilbert², 1. George Warren Brown School of Social Work, Washington University in St. Louis, St. Louis, Missouri, 2. The OASIS Institute, St. Louis, Missouri

PURPOSE: To examine if partnering healthy older adults with first/second year medical students in an art program can counter negative stereotypes, enhance their attitude toward older adults, and influence their likelihood of becoming geriatricians. **DESIGN AND METHODS:** Two hundred and eight (208) medical students (112 treatment; 96 comparison group) and 120 older adults participated in a national pilot project, Vital Visionaries, funded by NIA, and sponsored by OASIS in six of the eight cities from 2007-08. Participants typically met for two hours on a Saturday for four sessions at a local art museum to discuss and/or create art in small groups or pairs. Pre-post surveys captured attitudes towards older adults and career plans. Changes in attitudes across groups and time were analyzed using Generalized Estimating Equation; effect sizes were calculated using Hedge's G. Reflection homework, focus groups and telephone interviews (program directors) served as qualitative data. **RESULTS:** Attitudes towards old adults were positive for both groups at pre-test; however the treatment group became even more positive in their attitudes toward older adults at post-test ($p < .001$) with a moderate-high effect size, .58. Treatment group felt they had more in common with older adults at post-test ($p < .001$), with a moderate-high effect size, .62. The program did not influence their career plans ($p = .43$). However, students spoke of their limited exposure to non-familial, healthy older adults. Some reported that they gained personal understanding/professional skills to interact with older adults; they saw the individual rather than their age; and the program reduced their levels of fear in interacting with older adults.

WHAT DOES IT MEAN TO BE A GERONTOLOGIST?: REFLECTIONS FROM FACULTY AND STUDENTS IN GERONTOLOGY DOCTORAL PROGRAMS

H. Ewen, D.C. Carr, P.P. Brown, S. Kunkel, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Until recently, "gerontologists" have been trained in traditional disciplines. Over the last two decades, a growing numbers of scholars have begun to enter the field with doctoral degrees in gerontology. The introduction of a new variety of "gerontologists" to the field suggests that the goals of the field itself are changing and expectations of gerontologist's contributions are being redefined. At a time when aging research is gaining broader attention and the need for research is increasing, it seems timely for the field of gerontology to examine these issues. This study reports results from the 2009 wave of the Gerontology Education Longitudinal Study (GELS) survey, using responses from third year gerontology doctoral students and faculty in gerontology doctoral programs in the United States. Specifically, this presentation examines faculty and student responses to the following question: "Briefly describe, in your own words, what it means to be a gerontologist." Students and faculty describe the knowledge gerontologists should have, the way knowledge is applied, and the ways in which knowledge should be used. Through the description of these three aspects of gerontological knowl-

edge, two dominant types of definitions of gerontologists emerge segmented along social and biological domains. We will discuss these two types of gerontologists and implications for how these perspectives may be useful in identifying common goals for the field of gerontology and examining the implications for how gerontology doctoral programs are preparing scholars to become "gerontologists."

AGING-COMPETENCE AND EXCELLENCE: LEARNING FROM SOCIAL WORK TO PREPARE THE HEALTHCARE WORKFORCE

P. Volland, *The New York Academy of Medicine, New York, New York*

The number of Americans aged 65 and older will almost double and grow to comprise nearly 20% of the U.S. population by 2030. This shift in the age distribution places accelerating demands upon a health-care workforce already too small and critically unprepared to meet their health needs, (IOM, 2008). The Institute of Medicine's (IOM) 2008 report, Retooling for an Aging America: Building a Health Care Workforce, calls for immediate investments in preparing our healthcare system to provide the services needed by older Americans and their families. These are the IOM's recommendations for action – ensure an aging-competent workforce, recruit specialists to the workforce, and redesign systems and models of care. Pioneering educational initiatives is one solution to address IOM's recommendations and help health-care professions meet the demands of the rapidly aging population and anticipated workforce needs. An example of such an initiative is the Hartford Partnership Program for Aging Education (HPPAE) which is funded by the John A. Hartford Foundation and administered by The New York Academy of Medicine. This model has successfully trained aging-competent social workers by providing students with practical experiences working with older people through exposure to a range of community services across the continuum of care. An innovative model such as the HPPAE provides strategies that other healthcare professions can learn from and adapt into their education programs. This presentation will give a brief overview of the model and then discuss the opportunities and challenges that such a model presents for other professional training programs.

SESSION 430 (POSTER)

RESIDENTIAL CARE

AGEING AND HEALTH RELATED CHANGES OF PEOPLE WITH INTELLECTUAL DISABILITY LIVING IN GROUP HOMES IN AUSTRALIA

B.J. Bowers¹, R. Webber², C. Bigby³, 1. Nursing, University of Wisconsin-Madison, Madison, Wisconsin, 2. Australian Catholic University, Melbourne, Victoria, Australia, 3. LaTrobe University, Melbourne, Victoria, Australia

As people with intellectual disability live longer, they are beginning to experience the health changes associated with general ageing. Group homes for people with intellectual disability are based on social models, emphasizing inclusion, engagement in community and quality of life. As age related changes occur, group home staff are challenged to support people experiencing health problems to remain in the group homes. This longitudinal study was conducted in Victoria, Australia to explore how group home staff respond to age related health conditions of residents and to identify factors that put people at risk of premature relocation. Consistent with the exploratory purpose of the study and the general lack of data on the topic, we chose a theory generating methodology, Grounded Theory, to conduct the study. In depth interviews were conducted with 18 family, staff, resident clusters, at three points in time, at 6 month intervals. A total of XX interviews have been completed. In keeping with the theory-generating approach, early interviews were open and exploratory, evolving over time to facilitate comparative analysis across groups, strategies, conditions and care issues. Findings: Con-

cerns over the challenges created for the affected resident, staff and other residents were common. Issues included: inability of residents to retire despite age and health status, significant negative hospital experiences, premature moves to nursing homes, disruption to general house activities and routines of other residents, altered work routines, inadequate staffing, lack of awareness about local services, philosophies of care that could not accommodate ageing in place.

FACTOR ANALYSIS OF END-OF-LIFE CARE BEHAVIORS EXECUTED BY NURSES AND CARE-WORKERS WORKING IN NURSING HOMES

I. Kitamura¹, K. Ishii², Y. Maki¹, *1. Nihon Fukushi University, Mihama-cho, Aichi, Japan, 2. Osaka City University School of Nursing, Osaka, Japan*

The number of residents who died in nursing homes doubled from 1995 to 2007 in Japan. Quality assurance for end-of-life care is one of the main issues for professionals working with the frail elderly living in nursing homes. Both nurses and care-workers are mainly responsible for care in nursing homes, but the division of support executed by the two kinds of professionals as end-of-life care is not clear. A survey was conducted, and 255 care-workers and 85 nurses working in 41 nursing homes in Osaka prefecture cooperated. The results of factor analysis indicated that both kinds of professionals executed activities connected to 4 factors among supporting behaviors: (1) medical care; (2) support for the residents regarding self determination and providing information to their families; (3) personal care; (4) care for the families who are confronting the death and dying of a resident. More nurses reported carrying out factors of care (1) ($t=25.84$, $p<.001$) and (4) ($t=8.12$, $p<.001$), and more care-workers reported carrying out factor of care (3) ($t=11.62$, $p<.001$). Execution of factor of care (2) was not differentiated (ns) between the two kinds of professionals. Detailed analysis of factor (2) indicates that more care-workers try to assess residents' will than nurses. Nurses think they are responsible for both medical and psychosocial end-of-life care, but they do not think they are executing psychosocial end-of-life care. Comments from the respondents were also analyzed and care-workers expressed their need to be able to support residents regarding psychosocial needs.

TAILORING SENSOR TECHNOLOGY TO MEMORY IMPAIRED RESIDENTS IN INDEPENDENT LIVING RESIDENCES

D.F. Mahoney, E.L. Mahoney, *MGH Institute of Health Professions, Charlestown, Massachusetts*

Older adults and their family members are rapidly embracing Independent Living Residences (ILRs). ILRs are less expensive than traditional assisted living residences because few professional and supportive services are offered since residents are "independent". Evidence is accruing that some elders appear appropriate during application interviews but upon relocation and/or over time exhibit confusion. Mentally impaired residents raises individual and collective safety concerns. Can home monitoring technology help? Based on input from eight focus groups ($n=26$) in ILRs, we developed and tested a passive sensor based unobtrusive apartment monitoring system. It uniquely tailored the type of sensor and activities monitored to the residents'/family/ staff particular concern(s) and for the first time securely triaged sensor alert information to multiple parties. For the intervention there were 10 residents, 10 family caregivers, 8 building staff, and 4 consulting nurse practitioner participants across 2 ILRs. Findings revealed that all participants expressed concerns about resident safety and well-being. Specific issues varied and included movement/falls, medications, meals, and bathroom water overflows. Family members "worry" rate dropped significantly from 50% to 20% post intervention. Staff (60%) rated the system as very much addressing their concerns and (80%) would highly recommend. Most residents underestimated their personal vulnerability. Key to acceptance was the residents' perceived need and usefulness of the system to

maintain independence and prevent being relocated to a more restrictive environment. Users favored passive alert notices, (over proactively monitoring the website for residents' status) that were few in number, and valid. Recommendations for developers and ILR staff are outlined.

SAME-SEX COUPLES IN LONG-TERM CARE: CONCERNS AND PERCEPTIONS REGARDING FUTURE CARE

J. Gladstone, C. van Berkel, R. Cosby, K. Fitzgerald, *Social Work, McMaster University, Hamilton, Ontario, Canada*

Studies have documented homophobia and heterosexism in health care services, yet little is known about how older gay men or lesbians experience the long-term care system. Our qualitative study explored the concerns that aging same-sex couples have in terms of accessing home care services and entering long-term care facilities. Data were gathered from 12 same-sex couples. In-depth, active interviews were conducted with 18 older lesbians and 6 older gay men. Data were analyzed using a grounded theory approach. Findings were organized around 4 major categories: (1) Stigmatization. Participants were concerned about the discriminatory attitudes of formal caregivers and how their ability to advocate for themselves might diminish as their health deteriorated; (2) Identity. Participants wanted formal caregivers to appreciate their personhood as encompassing more than their sexual identity. Participants also wanted recognition that they were partners in a coupled relationship, and were similar to any other married person; (3) Expenditure of Energy. Participants felt that their involvement with the long-term care system would require them to expend energy that a heterosexual would not have to do. They referred, for example, to "hiding" their identity, "assessing" for discrimination, and "educating" others; (4) Nuanced Care. Participants wanted caregivers to form a meaningful connection with them that reflected a deepened acceptance and which went beyond being "a fake liberal." Policy implications at the institutional level include the need to properly screen staff and provide them with sensitivity training, incorporate inclusive language in organizational policies, and offer social programs that reflect gay/lesbian cultures.

A PDA-BASED MEASUREMENT OF PRESSURE ULCER PREVENTION BY NURSING ASSISTANTS IN 2 VA-AFFILIATED COMMUNITY NURSING HOMES

M.E. Dellefield, *Research, VASDHS, San Diego, California*

Objectives: (1) To determine percentages of observed certified nursing assistant (CNA) care processes associated with pressure ulcer prevention (PUP) using a PDA-based measure and (2) to determine percentages of direct, indirect, and unproductive processes observed. Method: A descriptive observational study using work-sampling, 2 VA-affiliated community nursing homes (174-bed and 158-bed), and a convenience sample were used, including 4 and 9 CNAs, respectively. The unit of analysis was each care process, out of 93 possible. Final samples included 783 and 577 observations at each site, totaling 1,360 care processes observed. The sample size exceeded that required for a 95% confidence level ($p < .05$). Reliability testing of 10% of total observations by 2 data collectors resulted in reliability scores of at least 90% reliability of occurrence and non occurrence of observed processes. Descriptive statistics were used. Findings: Facility characteristics were similar: ownership, size, average census, case mix index, average hourly wages, and nurse staffing levels. Staff at site 1 was older; more experienced, and had longer tenure. Most were female, ethnically diverse, and worked day shift. Categories of care observed included direct (88% vs. 93%); indirect (5% vs. 4%); unproductive (7% vs. 4%). Percentages of clinical domains associated with PUP included general work (65% vs. 66%); incontinence (2% vs. 5%); nutrition (22% vs. 16%); pain .5% vs. 0%); and pressure ulcer/mobility (11% vs. 13%). Conclusions: Using a PDA to observe CNA care processes associated with PUP is feasible. Generic processes (general work) were frequently observed. Few care processes addressed pain management.

THE NURSING HOME DINING ASSISTANT PROGRAM: A DEMONSTRATION PROJECT

R.M. Bertrand¹, T. Porchak², T. Moore¹, D.T. Hurd¹, R. Sweetland¹, S.F. Simmons², 1. *Domestic Health, Abt Associates, Inc., Cambridge, Massachusetts*, 2. *Vanderbilt University, Nashville, Tennessee*

The intent of this project was to replicate and extend a previous Centers for Medicare and Medicaid Services and Agency for Healthcare Research and Quality funded Dining Assistant (DA) evaluation study through the implementation and evaluation of a new DA program in two nursing homes (NH) that were selected using convenience sampling. Indigenous non-nursing staff received a minimum of eight hours of DA training following the federal and state requirements. Subsequent to training and skills assessments, DAs provided assistance to qualified residents during at least one scheduled meal per week. Standardized protocols were used by research staff to conduct observations during all three meals at baseline and 6-months post-implementation. Additional observations were conducted throughout the program targeting meals where DAs were providing assistance. Twelve-month post-implementation observations were conducted to assess program sustainability. Face-to-face interviews were conducted with staff post-implementation. Results replicated previous findings that DAs spend more time assisting residents, and that the quality of feeding assistance provided by DAs is comparable to, or better than, that provided by their nurse aide counterparts. Staff interviews also replicated previous findings with the majority of indigenous staff at all levels reporting positive benefits of the DA program for both staff and residents. Further, findings revealed a significant increase in social stimulation from baseline to 6-months and confirmed the continuation of the DA program at 12-month follow-up. DA programs that augment existing staffing levels offer a feasible way to improve nutritional care for residents within the constraints of existing staffing resources.

MINNESOTA'S NURSING HOME PERFORMANCE-BASED INCENTIVE PAYMENT PROGRAM: AN INNOVATIVE MODEL TO PROMOTE CARE QUALITY

T. Lewis¹, V. Cooke¹, G. Arling², C. Mueller³, L. Edstrom⁴, 1. *MN Department of Human Services, St. Paul, Minnesota*, 2. *Indiana University Center for Aging Research, Indianapolis, Indiana*, 3. *University of Minnesota School of Nursing, Minneapolis, Minnesota*, 4. *University of Minnesota Center on Aging, Minneapolis, Minnesota*

Minnesota's Nursing Home Performance-Based Incentive Payment Program (PIPP) supports provider-initiated projects aimed at improving the quality and efficiency of nursing home care. PIPP takes a broader approach than a conventional pay-for-performance program. It seeks to promote implementation of evidence-based practices, encourage innovation and risk taking, foster collaboration and shared learning, and establish a solid case for investing in better quality from the perspective of the state, nursing homes, and consumers. Provider-initiated projects lasting from 1-3 years are selected through a competitive application process and are funded for up to 5% of the daily per diem Medicaid rate. Providers are at risk of losing up to 20% of their project funding if they fail to achieve measurable outcomes which are tied to state nursing home performance measures, i.e., nursing home quality indicators and results of Minnesota's annual resident quality of life survey. Minnesota has made a major investment in PIPP by supporting 45 individual or collaborative projects, representing approximately 160 facilities and total funding of over \$23 million. Projects involve a wide range of interventions, such as fall reduction, wound prevention, exercise, improved continence, pain management, resident-centered care and culture change, and transitions from nursing home to community. We explain the PIPP program rationale and design, describe projects and participating facilities, and discuss future directions. PIPP can be a model for other states seeking to promote nursing home quality either in combination or in place of conventional pay for performance efforts.

THE RELATIONSHIP BETWEEN THE APPROACH OF HOME NURSING SUPPORT OFFICES AND MANAGING AGENCIES IN JAPAN

K. Masuda, R. Hata, M. Shirasawa, *Graduate School of Social Welfare, Osaka City University, Osaka-shi, Japan*

Since home nursing care agencies that case managers are associated with are managed by various kinds of institutions, the approaches of home nursing care agencies are different according to the management institutions in Japan. The purpose of this study is to clarify how the approaches of the home nursing care agencies are different according to the management institutions. The research design is a cross-sectional survey using mailed questionnaires. Participants in the study were 436 administrators. As the result of factor analysis of the approaches of the home nursing care agencies, 3 factors were extracted as follows, (1) establishing a good working environment, (2) improving case management practices, and (3) improving working conditions. By designating those three extracted factors as dependent variables and those managing institutions as independent variables, an F-test was performed. As the results of conducting the F-test, there was a significant difference in two factors, "improving management practices" and "improving working conditions," between Corporations and Social Welfare Corporations. Following are F-test results for the approach for improving case management practices between Corporations and Social Welfare Corporations, $F(2,373) = 4.24, P < .05$; and improving working conditions between Corporations and Social Welfare Corporations, $F(2,380) = 3.80, P < .05$. From the above results, it became obvious that Corporations, which are managing the majority of home nursing care agencies, need to make efforts to improve their case management practices and the working conditions of their staffs in order to provide high quality home nursing care services.

THE LONG TERM CARE OMBUDSMAN PROGRAM 15 YEARS LATER: WHAT DOES THE REPORTING SYSTEM TELL US?

K. Borders¹, F. Netting³, H. Nelson⁴, R. Huber², 1. *School of Social Work, Spalding University, Louisville, Kentucky*, 2. *University of Louisville, Louisville, Kentucky*, 3. *Virginia Commonwealth University, Richmond, Virginia*, 4. *Towson University, Towson, Maryland*

In 1992 The Gerontologist published a national survey of state long term care ombudsman offices in which it was revealed that no standardized reporting form was required and that there was tremendous unevenness across states in what data were collected. Over 15 years much has happened to address the concerns raised. A standardized reporting form is required, reporting systems are computerized, and the potential exists for a comprehensive reporting system as required by the Older Americans Act. Yet, with so much progress in the capacity of state and local programs to collect and report data, a recent study of ombudsman websites reveals that most states do not make their data easily accessible, and the ones that do report different aspects of their work. Collection of critical variables such as client characteristics is not required, leaving gaps in what is known about the vulnerable persons for whom and by whom complaints are lodged. Data reported to the Administration on Aging are still aggregated and sent to the Congress, leaving no capacity for anyone to nationally analyze those data in a meaningful way. Using Kingdom's (1984) Multiple-Streams policy analysis framework, we examine the diverse forces that have (and continue to) influencing the reporting system. We statistically analyze those ombudsman public domain data to reveal what is known at the national level (e.g. types of abuse reported) to make strong recommendations for what changes need to occur in order to continue movement toward a meaningful comprehensive reporting system and accessible database.

STATE AND REGIONAL LONG TERM CARE OMBUDSMAN (LTCO) LEADERS' PERCEPTIONS OF PROGRAM CAPACITY AND CAPABILITY TO PROTECT ELDER CARE RESIDENTS IN A DISASTER

H. Nelson¹, F. Netting², K. Borders³, R. Huber⁴, D. Agley¹, 1. *Health Science, Towson University, Towson, Maryland*, 2. *Virginia Commonwealth University, Richmond, Virginia*, 3. *Spaulding University, Richmond, Virginia*, 4. *University Louisville, Louisville, Kentucky*

Recent Hurricanes show that older people suffer and die at higher rates than other groups due to acute disaster phase effects and recovery phase privation. Researchers used two phone survey instruments to assess state LTCO (N = 43, 48 items) and local/regional LTCO leaders' (N = 104, 28 items) perceptions of programs' readiness to handle a range of LTCO disaster roles/functions, integration with emergency planners, and familiarity with elder care disaster resources, laws, rules and protocols. Descriptive data reveal that state/sub-state leaders are moderately to fairly familiar with relevant emergency laws, government disaster checklists, and resources, and that they also feel moderately to fairly well prepared to assist residents during crises. We also examine the LTCOP's experience with disasters, their disaster training record, and perceived training needs. F statistic analysis of variances between the parallel state/regional resource familiarity constructs revealed no significant differences between state and regional LTCOP leaders. Linear regressions revealed multiple variables making significant contributions to seven preparedness dependents with cumulative R-squares ranging from R2 .50 to R2 .78. Important findings included how leader familiarity with the CMS Emergency Planning Checklist for ombudsmen (2007) is strongly tied to knowledge about state emergency plans for LTCOP involvement (Q5, $r = .71$, $p < .01$), familiarity with the checklist for LTC facility disaster planning (Q8, $r = .76$, $p < .01$), and with the state ombudsman's perceived ability to help their sub-state coordinators know where to begin in the event of an actual disaster (Q11, $r = .54$, $p < .01$).

USING ORGANIZATIONAL THEORY TO EXPLAIN DIFFERENTIAL RESPONSE TO NURSING HOME COMPARE

J. Meagher¹, C.E. Bishop¹, M. Fennell², L. Nsiah-Jefferson¹, J. Perloff¹, 1. *Brandeis University, Waltham, Massachusetts*, 2. *Brown University, Providence, Rhode Island*

Nursing Home Compare (NHC) was initiated by CMS with the goal of improving the quality of US nursing homes. Although research suggests that the policy has resulted in quality measure improvements, not all nursing homes have increased quality in response to the policy. One way to understand variation in response to NHC is to consider the organizational contexts in which nursing homes operate. Drawing from organizational theory, this poster will present a theoretical framework and conceptual model that is being used to predict nursing home quality improvement in response to the NHC policy. The framework integrates Resource Dependency and Institutional theories to identify key predictors of organizational response to the policy. Resource Dependency stipulates that the environment in which an organization operates and the dependencies therein influences strategic action. Institutional theory posits that although organizations compete for resources and power, they also compete for legitimacy and social acceptance and face normative pressures to adopt and conform to certain behaviors. The integrated framework suggests institutional conditions can mediate the strength of dependencies. Applying these concepts to the study of organizational response to NHC will allow the researcher to identify patterns of organizational response, as predicted by differing environmental, institutional, and internal factors and the interactions therein.

ACTIVITY AND HOUSEKEEPING STAFFING LEVELS INFLUENCE THE PROBABILITY OF RECEIVING A QUALITY OF LIFE DEFICIENCY CITATION

K.S. Thomas¹, M. Machac-Burleson², M.J. Norton², K. Hyer¹, 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *The University of Alabama, Tuscaloosa, Alabama*

A growing body of evidence links higher nursing staff levels with better quality of care in nursing homes. However, the relationship between non-nursing staff levels and quality of life remains largely unexamined. The purpose of this study is to determine if a positive relationship exists between quality of life deficiency citations and activities staffing levels or housekeeping staffing levels. Using the 2007 Online, Survey, and Certification Database (OSCAR) and the Area Resource File (ARF) data of 14,731 U.S. nursing homes, we examined whether housekeeping and activities staff ratios are associated with receiving a quality of life deficiency citation while controlling for market variables (Herfindahl index and unemployment rate) and organizational characteristics (for profit status, chain membership, nursing assistant staffing levels, size, occupancy, percentage of Medicaid residents). Results from fully adjusted logistic regression models indicated that a one unit increase in activities staff (OR=0.46; 95% CI [0.33-0.64]) and housekeeping staff (OR= 0.82; 95% CI [0.73-0.92]) were significantly associated with a decreased likelihood of receiving a quality of life deficiency. Our findings support the hypothesis that higher staffing levels of activities and housekeeping staff can decrease the likelihood of receiving a quality of life deficiency citation. Despite increased costs associated with employing greater numbers of staff, incentives to avoid deficiency citations in combination with increasing the quality of life of nursing home residents may make efforts to increase staffing worthwhile.

NURSING ASSISTANT EXPERIENCES WITH NURSING HOME ANNUAL INSPECTION: THE IMPACT OF NURSING HOME REGULATION IN THEIR DAILY WORK-LIVES AND THE CULTURE OF NURSING HOMES

G. Chung, *UCLA, Los Angeles, California*

This paper addresses nursing assistants' familiarity with traditional criteria for quality of care in nursing homes by listening to their direct experience with nursing home inspection. A grounded theory approach is taken to explore their own experiences with annual nursing home inspections. In-depth and semi-structured interviews were conducted with study participants recruited from local long term care workers' union in Los Angeles, California. The textual level analysis of coding transcribed interviews and conceptual level analysis of extracting concepts and linking codes are performed complementing each other. Nursing assistants identify some discrepancies between the original intention of nursing home regulation and its consequences at the level of their direct interaction with residents. The nursing home survey fails to get down to the care process but mainly focuses on what can be visually examined. Workers think that as long as residents are presented as clean and free of any unnecessary restraints, they have done what is required by the inspection. Nursing assistants interpret the unusual eagerness of nurses and the administrator to help them out during inspections as a way of minimizing the risk of being the object of further investigation. Thus, nursing home inspections deepen the chasm between nursing assistants and the "head department" instead of encouraging more team work and unified efforts to improve quality of care. It is necessary to reframe the nursing home inspection through which state surveyors could provide the strategies to build up more competent direct care workers instead of prescribing highly detailed regulatory standards.

SESSION 435 (SYMPOSIUM)

RESQCARE FORMAL INTEREST GROUP SYMPOSIUM: TECHNOLOGY USE, IMPLICATIONS, AND BENEFITS IN LONG-TERM CARE

Chair: N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Upcoming healthcare reform efforts provide an opportunity to improve the quality of long-term-care services. Technology will be a key tool in this endeavor. However, more needs to be known about technology in long-term care. Accounts of use of health information technology, integrated data systems, electronic medical records, and telemedicine exist, but are fragmented. In this symposium, the scope and scale of health information technology is examined. First, use of technology across multiple long-term care settings is examined in greater detail. This includes specific technologies such as types of telemedicine in home health settings and MDS data systems in nursing homes. Second, implications of technology use in long-term care are also examined in greater detail. Implementation issues such as integration of data systems, reimbursement issues, and availability of technology with the capability to cut across multiple provider settings is discussed. Third, the benefit of technology use in long-term care is also examined in greater detail. This includes issues of cost savings, safety, efficiency, and quality of care.

HEALTH INFORMATION TECHNOLOGY EVALUATION IN NURSING HOMES: RESIDENT OUTCOMES

K. Pillemer¹, R. Meador¹, J.A. Teresi², C. Henderson¹, 1. *Cornell University, Ithaca, NY*, 2. *Hebrew Home at Riverdale, New York, New York*

In this project, a resident outcome evaluation was to determine the impact of health information technology (HIT) introduction on nursing home residents, using a prospective, quasi-experimental design that derives information from multiple sources. To evaluate the impact on residents, five nursing homes were selected that received the HIT intervention, and five nursing homes were selected to serve as a control group against which results from the HIT nursing homes could be compared. To address the research questions regarding resident outcomes, the CITRA team used recognized instruments that have been found to be reliable and valid in long term care settings with similar populations. Assessments of the participating residents occurred at baseline, before the technology was installed, and nine months after the baseline assessment. Overall, no significant outcomes of introduction of HIT were found, including such outcomes as mortality, falls, affect, and satisfaction with care.

INFORMATION TECHNOLOGY AND QUALITY OF NURSING HOME CARE

N. Castle, D. Liu, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Nursing homes are required to electronically submit resident assessments. This occurs via commercial Minimum Data Set (MDS) software. However, many different software features can be used. This research examines whether more extensive use of this type of Information Technology (IT) is associated with quality of care. Data from a national survey of nursing home administrators (N= 2,397) and Quality Measures from Nursing Home Compare were used. Advanced use of IT was significantly associated with 9 of the 14 Quality Measures, even after controlling for the prior years quality as well as facility characteristics. The use of IT in MDS software packages appears to have some potential for improving quality of care.

WWW.TECHFORLTC.ORG: DEVELOPMENT & EVALUATION OF A WEBSITE RESOURCE FOR LONG-TERM CARE

M. Calkins¹, K. Van Haitsma², 1. *IDEAS, Kirtland, Ohio*, 2. *Polisher Research Institute, North Wales, Pennsylvania*

This paper will review the multiple methods used to develop and evaluate a website resource directed at helping care providers make informed decisions about purchasing technology products to improve quality of life and care for people in long-term care settings such as nursing homes, assisted living, boarding care, and adult day care programs. The selection of categories of products included in the website and some aspects of website design were driven judgments by a technical advisory group. Care issues include assistance / nurse call, falls, wandering, incontinence, bathing, medication management, and resident lifts and transfers. Formal evaluation of the website, conducted using both heuristic and survey approach with over 100 website users, demonstrated highly positive results. Results of evaluation methods will be presented and discussed as they relate to the burgeoning arena of evaluating resources used to educate long-term care providers about technologies.

SESSION 440 (SYMPOSIUM)

THE INTERSECTION OF BUSINESS & AGING: THE ROLE OF GERONTOLOGICAL EDUCATION IN BUSINESS SCHOOLS

Chair: E. Brucker, *Widener University, Chester, Pennsylvania*

Discussant: L.J. Clark, *Center for Aging Studies, UMBC, Baltimore, Maryland*

Today's business students will be faced with growing challenges and opportunities of working alongside, employing, and retaining older workers. For example, with the recent recession and the market value of 401(k) savings falling, many workers are expecting, and/or needing, to continue working longer. In addition, full social security benefits are now scheduled to be paid at older ages and retirement health costs will increase. Higher elder employment participation rates are likely to help offset an anticipated decline in labor supply growth, yet also increase the challenge of working in a more age-diverse workforce. AGHE is committed to helping to prepare business students by (1) identifying gerontological issues and concepts that will strengthen business students' and professors' awareness of how business will be impacted by the aging society, and (2) developing materials to facilitate the infusion of these topics across the disciplines in business education. This symposium presents the most recent work of the AGHE Task Force on Business and Aging. First, we provide an overview of pertinent issues relevant to business education, based on research and insight conducted by the Task Force. This includes the heterogeneity of older adults, the market share represented by the over 55 population, current and projected trends in employment, and survey data on older workers currently in the labor force. Second, an expert panel discusses strategies to integrate aging topics into business school curricula. We will explicitly focus on integration in existing business courses in human resources, financial services, marketing, and strategic management/entrepreneurship.

SESSION 445 (SYMPOSIUM)

ADAPTATION TO VISION LOSS: A SYNTHESIS OF RECENT EMPIRICAL WORK

Chair: H. Wahl, *University of Heidelberg, Heidelberg, Baden-Wuerttemberg, Germany*

Discussant: S. Sorensen, *University of Rochester, Rochester, Michigan*

There is robust evidence that age-related vision loss is linked with a heightened rate of depression as well as lowered well-being and autonomy. This symposium argues that outcome-oriented research targeting visually impaired older adults deserves a more dynamic view in order

to better understand the interplay of different resources and constraints in the maintenance or loss of adaptation. The symposium's objective is to address different mechanisms assumed to play a key role in terms of adjustment to vision loss: First, findings on the regulation of control strategies underscore the richness of day-to-day adaptation and at the same time support the usefulness of the lifespan theory of control. Second, data on the role of cognitive and personality resources for autonomy and well-being underline that resource allocation is different in age-related vision loss as compared to visually unimpaired older adults. For example, visually impaired older adults more strongly rely on their cognitive resources, whereas the impact of personality of affective outcomes may be weaker as compared to visually unimpaired older adults. Third, results based on a joint German and North American data platform underscore the minor importance of objective vision loss for adaptation to vision loss, whereas remaining functional ability is critical. A fourth presentation addresses fundamental challenges of adaptation in the light of findings on problem solving strategies in visually impaired older adults. The symposium is directly linked with a second symposium (chaired by S. Sorenson), in which psychosocial intervention research with visually impaired older adults will be the target.

COGNITION AND PERSONALITY AS RESOURCES FOR AUTONOMY AND WELL-BEING: THE IMPACT OF VISION STATUS

V. Heyl¹, H. Wahl², 1. Institute of Special Needs Education, University of Education, Heidelberg, Germany, 2. University of Heidelberg, Heidelberg, Germany

This paper investigates the role of cognitive and personality resources for autonomy and well-being, contrasting visually impaired (VI) unimpaired (UI) older adults. We hypothesize that (1) resource allocation is different depending on vision status and that (2) there are consistent as well as differential relationships between resources and outcomes when comparing VI and UI individuals. Findings are based on samples of 121 VI and 150 UI older adults ($M = 82$ years). Assessment relied on established instruments (e.g., WAIS-R, NEO-FFI, PANAS). VI participants were found to be significantly less extraverted than UI participants. Cognitive resources and autonomy, in particular subjective autonomy, were more strongly related in the visually impaired group as compared to the UI group. Higher extraversion predicted less negative affect only in the VI group. It is concluded that interventions should consider the resource status of clients in order to enhance outcomes.

SELF-REPORTED STRATEGY USE BY DISABILITY LEVEL: AN APPLICATION OF THE LIFE-SPAN THEORY OF CONTROL USING NARRATIVE DATA

K. Boerner¹, M. Brennan², A. Horowitz¹, J.P. Reinhardt¹, 1. Jewish Home Lifecare/Mount Sinai School of Medicine, New York, New York, 2. AIDS Community Research Initiative of America (ACRIA), New York, New York

This study applies the life-span theory of control (Heckhausen & Schulz, 1995) to examining daily challenges (e.g., problems reading) and coping strategies of 364 older adults with macular degeneration using narrative data. Almost all participants reported using compensatory strategies that provided alternatives (e.g., human or technical assistance) for dealing with current challenges (Compensatory Primary Control); and most used self-protective compensatory strategies (e.g., downward social comparisons; Compensatory Secondary Control). Strategies involving time and effort (Selective Primary Control) were used by half of the participants, while motivational strategies (Selective Secondary Control) were the least reported. Differences in strategy use by vision impairment level were identified for individual strategies within the main categories; for example, greater use of strategies involving help from others and maintaining a positive outlook were associated with greater disability, whereas attempts not to dwell on vision-

related problems were associated with lower impairment levels. Conceptual and empirical implications are discussed.

PSYCHOLOGICAL ADAPTATION TO ACCUMULATING VISION LOSS: ADAPTING OF OR ADAPTING TO CHANGE IN FUNCTIONAL ABILITIES?

O.K. Schilling¹, H. Wahl¹, A. Horowitz², J.P. Reinhardt², K. Boerner², 1. Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany, 2. Jewish Home Lifecare and Brookdale Department of Geriatrics and Adult Development, New York, New York

To investigate psychological adaptation to age-related vision loss (AVL), data from two longitudinal samples of elders suffering from age-related macular degeneration (AMD) from New York ($N=361$) and Heidelberg ($N=90$) were analyzed. The psychological outcome was operationalized in terms of Horowitz and Reinhardt's (1998) AVL concept. We hypothesized that impacts of objective visual acuity losses on the AVL outcome are largely mediated by perceived functional vision losses (FVL) and functional abilities to conduct activities of daily living (ADL). Structural equation modeling was used in cross-sectional analysis of baseline relationships, as well as in longitudinal analyses of latent one-year change scores. Results confirmed the hypothesized mediation effects. Moreover, we found evidence of an adaptive reduction of psychological responsiveness to vision losses and ADL decline with ongoing advancement of AMD, weakening the impact of vision losses on the AVL outcome when higher levels of vision loss have been "reached".

SOCIAL PROBLEM SOLVING AND PREPARATION FOR FUTURE CARE AMONG OLDER ADULTS WITH LOW VISION

J. Point-Du-Jour, S. Sorensen, *Psychiatry, University of Rochester School of Medicine and Dentistry, Rochester, New York*

Both Social problem solving (SPS), a cognitive-behavioral process used to cope with everyday problems, and Preparation for Future Care, a process of anticipating and planning for future care needs (PFC), are often impaired in people with vision loss. We piloted a Preventive Problem Solving Intervention to teach older adults to (1) generate and implement solutions for current problems and (2) develop risk and options exploration, preference formation, and concrete future planning. Twenty patients aged 69-94, 67% female, received in-home training. In paired t-tests, Positive Problem Orientation increased and Negative Problem Orientation and Impulsiveness-Carelessness Style decreased during the intervention. Global Preparation for Future Care (PFC) and Decision Making increased, whereas Avoidance of future needs decreased; psychological well-being improved. Both SPS and PFC can be improved through training. The association of changes in PFC with well-being improvements point to the importance of focusing both on current and future-oriented problem solving.

SESSION 450 (PAPER)

ALL IN THE FAMILY: INTERGENERATIONAL RESOURCES

GRANDPARENT RESOURCES AND INEQUALITY AMONG CHILDREN

P. Uhlenberg, M. Monserud, *Sociology, Univ. North Carolina, Chapel Hill, North Carolina*

The potential contribution of grandparents to the well being of children in the U.S. probably is greater now than at any previous time in history. However, this aggregate picture of increasing grandparent resources obscures the heterogeneity in access to grandparent resources among children. While some children have four healthy, well-educated, affluent grandparents, others have fewer and/or less resourceful grandparents. This study contributes to our understanding of how grandparents may differentially affect the well-being of children and thereby accen-

tuate inequality. In particular, it explores the relationship between family environment of children and the resources of their grandparents. Inequality in children's resources has always existed, but disparities have grown larger in recent decades. Measures of children's resources generally focus on parental resources and ignore contributions from grandparents. Data could be collected to carefully assess the net contribution of grandparents to the well-being of their grandchildren, but no such data exist. It is possible, however, to use existing data to partially examine this issue. The strategy in this paper is to use data from wave 2 of the National Survey of Families and Households to examine how grandparent resources are related to characteristics of the family within which children are living. Indicators of family resources for children are parent's education, marital status, and income. Measures of grandparent resources that can potentially benefit their grandchildren are: grandparent's education, health, financial well-being, marital status, and number of grandchildren. Logistic regression results show that grandparents tend to increase inequality among children. Implications of this are discussed.

FAMILY MATTERS: FINANCIAL AND TIME TRANSFERS BETWEEN GENERATIONS

C. Lennartsson¹, M. Silverstein², J. Fritzell^{3,4}, *1. Aging Research Center (ARC) Karolinska Institutet/Stockholm University, Stockholm, Sweden, 2. Davis School of Gerontology, Ethel Percy Andrus Gerontology Center, University of Southern California, Los Angeles, California, 3. Centre for Health Equity Studies (CHESS), Stockholm University/Karolinska Institutet, Stockholm, Sweden, 4. Institute for Futures Studies, Stockholm, Sweden*

Access to social and material resources and welfare services are important conditions for family transfers of economic and social support. Financial transfers are usually passed from older to younger generations at the same time transfers in terms of instrumental support go in both directions. This paper presents findings about intergenerational transfers in Sweden. The Swedish case is interesting because private transfers within the family relate both to welfare state provisions and the family as an evolving social institution. In Sweden almost all intergenerational transfers are downward, from older to younger generations. In higher social class families, parents who earlier had more frequent contact with their children were more likely than those having less contact to later provide financial transfers, demonstrating that children who invested time in their elderly parents were more likely to be financially rewarded by them. However, analyses show that children who earlier received financial transfers from parents were no more likely than those who did not receive such transfers to later have frequent contact with their parents. In regards to needs of the younger generation, we found that among higher social class families single parents and students more often were beneficiaries of financial support. But children who were unemployed, lacked a cashmargin or reported poor health were not more likely to receive transfers. Additionally, children who experienced adverse childhood conditions were less often recipients of financial support. We will discuss these findings from a class and gender perspective in the context of the Swedish welfare state.

THE IMPACT OF RURAL-URBAN MIGRATION ON FAMILIAL ELDER CARE IN RURAL CHINA

B. Luo, *1. Honors College, Western Kentucky University, Bowling Green, Kentucky, 2. Georgia State University, Atlanta, Georgia*

Currently in China, tens of millions of rural young laborers have been migrating to urban areas to meet the demand for cheap labor, whereas large numbers of elderly parents (the Chinese baby boomers) are left behind in the impoverished villages. This study took a systematic look at how the increasing rural-urban migration shaped the elder care practices in rural Chinese families and how rural elders respond and adapt to this social transformation. Using data from a rural household survey conducted by Renming University in 2004 in three in-land

migrant-exporting provinces, this study explored three aspects of elder-care dynamics in China: 1. The patterns of financial care for rural elders whose adult children had migrated to urban areas. 2. Rural elders' perceptions of filial piety at this time of social change. 3. Rural elders' self-evaluation of life satisfaction at this historical period of time. Findings from this study revealed that financial care by migrated children was mainly based on an exchange-based model; rural elders who took care of grandchildren received more financial support. With the continued provision of financial care and emotional care, rural elders continued to hold relatively positive evaluation of their migrated children's filial piety, even though physical care was absent. Finally this study found that the exchange-based pattern of financial care and the continuation of filial piety had a positive impact on rural elders' life satisfaction. This study contributes to the knowledge body of elder care in China and provides insightful policy suggestions for the Chinese government.

COMPETITION BETWEEN GRANDPARENTS AND GRANDCHILDREN: A VIGNETTE STUDY ON ELDERS' BELIEFS IN FILIAL OBLIGATION IN RURAL CHINA

Z. Cong¹, M. Silverstein², *1. Texas Tech University, Lubbock, Texas, 2. University of Southern California, Los Angeles, Texas*

This paper used vignette design to study how elders evaluate the priority of grandparents and grandchildren when they compete for limited financial resources of the middle generation. Particularly, we examined how migration from rural and urban area influenced elders' beliefs. Based on a three-wave longitudinal study in Anhui Province, China, with data collected in 2001, 2003, and 2006, we used multinomial logistic regression to predict how elders evaluated the priority of the vignette grandparent and grandchildren to get help from their children. We found that grandparents got higher priority when they need to have an operation for bone fracture instead of paying for medication for arthritis, and grandchildren got higher priority when they need an operation for bone fracture instead of paying for tuitions. Grandparents get higher priority in their claim to sons' resources. Whether grandchildren are male or female did not make a difference. However, grandsons got higher priority when they competed with their paternal grandparents. Elders who lived in skipped-generation households with grandchildren tended to give priorities to grandchildren in the vignette, elders who received more financial support from children were more likely to give grandparents higher priority, and those who did not have a child in the village ranked grandparents' priority higher.

HEALTH OF THE ELDERLY IN INDIA: DO LIVING ARRANGEMENTS PLAY A ROLE?

S. Rajan, *Duke University, Durham, North Carolina*

Population aging has long been identified as a critical problem in many developed countries. Indeed, the phenomenon of aging is more recent in developing countries due to their historically high fertility and mortality rates, and it is only in the past few decades that they are beginning to witness the demographic transition. In India, the population of the elderly and the oldest-old is projected to rise remarkably in the coming decades. In the absence of any public social security in the country, a large proportion of the elderly co-reside with their adult children. However, an increase in the number as well as the longevity of elders might create pressures on their traditional sources of support. Even as they continue to live in extended households, it is not clear whether they are adequately taken care of by their adult children; or if their health needs are sufficiently met. Using three waves of a repeated cross-section survey, the National Sample Survey (NSS), spread over three decades, I examine the differential impact of various living arrangements on the health outcomes of the elderly. I also examine whether the relationship varies significantly among religious and caste groups. Preliminary analyses using a single wave of a different cross-section survey, the Indian Human Development Survey, 2005 (IHDS), show that

controlling for all relevant variables, living with at least one adult child decreases the probability of both short-term and long-term morbidity.

SESSION 455 (PAPER)

BIOMARKERS AND COGNITIVE FUNCTIONING

AGE-RELATED DIFFERENTIAL ITEM FUNCTIONING ON THE TEST OF FUNCTIONAL HEALTH LITERACY IN HIV-POSITIVE OLDER ADULTS

R. Ownby¹, D. Waldrop-Valverde², 1. *Psychiatry and Public Health, Nova Southeastern University, Fort Lauderdale, Florida*, 2. *University of Miami, Miami, Florida*

The Test of Functional Health Literacy in Adults (TOFHLA) is a widely used health literacy measure. The TOFHLA evaluates health-related reading comprehension by requiring the person assessed to supply words missing in passages of health-related prose (cloze procedure). Older persons may be more affected by this testing strategy compared to younger persons because of its demands on working memory and working memory load of text has been shown to negatively affect older persons' reading comprehension. Adults over 50 living with HIV may have infection-related deficits in working memory as well. We hypothesized that these factors might result in age-related differential item functioning (DIF) on the TOFHLA among older persons living with HIV. DIF is said to exist for a test item when correct responses on it depend on something other than the ability assessed, such as gender, ethnicity, or age. Thirty-eight persons aged 23 to 30 and 57 persons 50 to 67 years of age contributed scores on the TOFHLA. Nonparametric item response theory (IRT) methods were used to evaluate age-related DIF. Based on established cutoffs, 25 of the 50 TOFHLA reading comprehension items showed evidence of significant age-related DIF. In several instances in these data DIF could clearly be related to an item's demands on working memory. Our results suggest that results from the TOFHLA should be interpreted with caution in older persons living with HIV and that cut-off scores based on younger persons' performance may be inappropriate for them.

OBESITY AND COGNITION AT OLDER ADULTHOOD: CROSS-SECTIONAL AND LONGITUDINAL EVIDENCE

B. MacInnis, *University of Michigan, Ann Arbor, Michigan*

Cognitive performance declines with aging, and impaired cognition is a major health problem that imposes substantial economic burdens, and that has become a key concern in national health and economic policies. Old-age obesity is prevalent and increasing. Despite the well-documented adverse health effects of obesity, studies on the consequences of obesity on cognition at old-age are limited, but they suggest that obesity might have a deleterious effect on cognition. The old-age frailty literature shows that body weight declines with age, and that involuntary weight loss is a strong risk factor for health deterioration and mortality. The relationships between body weight and cognitive functioning are largely unexplored. We explore the effects of excessive body weight on cognition among older Americans using the Health and Retirement Study (1992-2006). Cognitive performance measures are test scores in multiple domains of cognitive evaluations: mental status, working memory, verbal memory (immediate and delayed word recall). We find a strong positive cross-sectional relationship between body weight and cognitive performance. Adjusting for unobserved individual heterogeneity with an individual fixed effect model and the first-difference estimation, we find a strong negative longitudinal relationship between excessive body weight and cognitive performance. This finding is robust to the adjustment for the potential endogenous nature of excessive body weight with a linear dynamic model with the Generalized Method of Moments estimation. A host of robustness checks are performed and potential mechanisms and policy implications are discussed.

OXIDATIVE STRESS, COGNITIVE FUNCTION AND MEDICATION ADHERENCE AMONG INDIVIDUALS WITH HYPERTENSION

K. Insel¹, A.N. Vidrine¹, C. Hsiao², D.W. Montgomery^{3,1}, 1. *University of Arizona, Tucson, Arizona*, 2. *National Institute of Nursing Research, Washington, D.C., Alabama*, 3. *Southern Arizona Veterans Administration Health Care System, Tucson, Arizona*

The purpose of this study was to examine the associations between oxidative stress, performance on a battery of age sensitive cognitive assessments and medication adherence among individuals prescribed at least one daily antihypertensive agent for the treatment of hypertension. Forty-two participants (M = 69 years of age) completed a 12-hour urine collection for urinary isoprostanes, which was used as an indicator of oxidative stress. Participants completed a battery of cognitive assessments and 8 weeks of electronic medication monitoring to one antihypertensive agent. Oxidative stress was significantly and inversely associated with logical memory both immediate ($r = -.38, p < .01$) and delayed recall ($r = -.42, p < .01$), and recognition memory ($r = -.42, p < .01$) from the Wechsler Memory Scale III. Oxidative stress was also associated with increased perseveration errors ($r = .26, p < .05$) and fewer categories achieved in the Wisconsin Card Sorting Test (WCST) ($r = -.26, p < .01$). Importantly, oxidative stress was associated with medication adherence ($r = -.34, p < .05$). These findings suggest a potential causal mechanism for age-associated cognitive decline and consequent effects on a functional outcome, in this case taking medications as prescribed.

C-REACTIVE PROTEIN (CRP) IN LATE ADULTHOOD: AN INFLAMMATORY MARKER OF COGNITIVE DECLINE?

A.B. Balasubramanian¹, C.A. Reynolds¹, U. Eriksson², M. Gatz^{3,2}, B. Johansson⁴, B. Malmberg⁵, N.L. Pedersen^{2,3}, 1. *Psychology, University of California, Riverside, Riverside, California*, 2. *Karolinska Institutet, Stockholm, Sweden*, 3. *University of Southern California, Los Angeles, California*, 4. *Göteborg University, Gothenburg, Sweden*, 5. *Jönköping University, Jönköping, Sweden*

C-Reactive Protein (CRP) is a protein implicated in immune response. Increased levels of CRP have been recognized as a marker of inflammation. Some studies suggest that higher levels of inflammatory proteins may be associated with cognitive change in late adulthood, but overall prior findings are mixed. The association of a single measurement of CRP and longitudinal changes in cognitive performance in late life was examined in a sample of Swedish twins ($n=871$) belonging to one of three studies: the Swedish Adoption/Twin Study of Aging (SATSA), the Sex Differences in Health and Aging Study (GENDER), and the Origins of Variance in the Oldest-Old (OCTO-Twin). Spline growth curve models with two linear growth rates were used to examine the relationship between CRP levels measured from stored serum samples taken between the ages of 53 and 94 with cognitive performance measured up to five occasions between the ages of 52 and 100. The four cognitive tasks considered (Synonyms, Block Design, Symbol Digit, and Thurston Picture Memory) represented verbal ability, spatial ability, perceptual speed, and episodic memory domains. Initial growth curve analyses suggested no significant associations between CRP levels and longitudinal performance for perceptual speed or episodic memory. However, higher serum CRP levels were associated with worse performance on verbal and spatial ability and with change in verbal ability prior to age 65. These associations stay the same excluding those with dementia diagnoses. The current results provide limited support for the role of inflammation on cognitive aging in late life.

BEHAVIORAL HEALTH CHOICES AND THEIR EFFECTS ON COGNITION OVER TIME

K.E. Brueck, *Gerontology, University of Massachusetts- Boston, West Bridgewater, Massachusetts*

This study explored the effect of behavioral health choices (exercise, smoking, and alcohol use) on cognition over a 12 year period. Data from

the Health and Retirement Survey (1992 & 2004) was utilized to examine whether engaging in these health choices affected measures of fluid and crystallized intelligence similarly. Further, it was hypothesized that an overall measure of cognitive ability would not adequately measure effects observed in fluid and crystallized abilities. A multinomial logistical regression was used to account for five binary outcomes: three levels of ability, proxy, and vital status. Individuals that reported exercising often at baseline have decreased odds of 43% for a low fluid intelligence score twelve years later. Those who never smoked or quit smoking have decreased odds (27% and 29%) of a moderate versus a high fluid intelligence score. The odds of requiring a proxy versus a high fluid score decrease 48% those having never smoked and 54% for those who quit smoking. Behavioral health choices had effects on fluid intelligence scores that were not captured by an overall cognition score. Tests of cognition that are heavily weighted with crystallized intelligence items may mask changes in ability over time.

SESSION 460 (PAPER)

DECIDING TO INSTITUTIONALIZE

I MIGHT BE AHEAD TO GO TO THE NURSING HOME: ANTICIPATED RELOCATION OF AN OLD HOMEBOUND RURAL WOMAN

E.J. Porter, *University of Missouri, Columbia, Missouri*

Relocation is typically studied from the epidemiological perspective of population transitions in living arrangements or qualitatively, by interviewing older persons who have relocated to a residential facility. Little is known about what it is like to contemplate relocation; anticipated relocation has not been viewed as a chronic stressor. During an 18-month study of the experience of reaching help quickly with 40 women, one 90-year old woman spontaneously reflected about a long-contemplated move to the only nursing home in her town. A phenomenological method was used to describe facets of life-world the woman associated with anticipated relocation. Data revealed a remarkable collection of dialectics: *detecting my deterioration/ pointing out my progress since that surgery, acknowledging that I do not have that much time left/ foreseeing a time when I might not be able to do that, and continuing to live at home alone/ having had reasons for thinking about moving out of this house.* Her residential career in the community, her deceased husband's involvement with the nursing home, and her financial stake in it were factors, as was the physician's repeated suggestion that she relocate there. Reasons offered for *staying at home yet this winter* revealed what she would give up and what she might have to endure if she relocated. As she grew ever older while living alone, anticipated relocation to a residential facility became a chronic stressor. Researchers should explore the extent to which others older persons experience that stressor and describe its health and social implications.

ALZHEIMER'S CAREGIVERS' DESIRE TO INSTITUTIONALIZE AS A MEDIATOR OF QUALITY CARE AT 6-MONTHS

M.M. Hilgeman¹, D.W. Durkin¹, F. Sun², J. DeCoster¹, R.S. Allen¹, L. Burgio³,
1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *Arizona State University, Glendale, Arizona*, 3. *University of Michigan, Ann Arbor, Michigan*

Predicting institutionalization has been an important focus of dementia caregiving research. The caregiver's (CG) desire to institutionalize (DTI) the care recipient (CR) is increasingly accepted as a precipitating factor for future placement. However, the impact of DTI on the quality of care (QOC) being provided in the home has not been examined. We hypothesized that baseline DTI would mediate the relation between traditional indicators of psychosocial caregiving burden/distress (e.g., depression, behavioral bother, burden, absence of positive aspects of caregiving) and the QOC [i.e., exemplary care, potential for harm (PFH)]

provided at 6-month follow-up. Data from minimal-support control group CGs (N = 319) in the Resources for Enhancing Alzheimer's Caregiver Health-II (REACH-II) clinical trial were included in a series of regressions (Baron & Kenny, 1986) that controlled for CG demographics, subjective health, and CR cognitive impairment. Results indicated that DTI partially mediated the relation between behavioral bother, burden, and absence of positive aspects of caregiving and PFH. Sobel test statistics indicated significant mediation for each predictor except CG depression. Interestingly, the mediation was not evidenced for exemplary care (although main effects of DTI and indicators of burden/distress were observed). Based on these analyses, DTI should be considered more than a proxy for future placement. It may also be an important predictor of the QOC being provided in the home. Researchers and practitioners should consider assessing DTI when working with families in the transition from home care to placement, particularly for those at risk for potentially harmful or compromised care.

ADULT CAREGIVING AMONG AMERICAN INDIANS: THE ROLE OF CULTURAL INDICATORS

R. Goins¹, S. Spencer², L.C. McGuire³, J.A. Henderson⁴, Y. Wen⁴, J. Goldberg⁵,
1. *West Virginia University Health Sciences Center, Center on Aging, Department of Community Medicine, Morgantown, West Virginia*, 2. *University of South Carolina, Department of Health Promotion, Education, and Behavior, Columbia, South Carolina*, 3. *Centers for Disease Control and Prevention, Healthy Aging Program, Atlanta, Georgia*, 4. *Black Hills Center for American Indian Health, Rapid City, South Dakota*, 5. *University of Washington and Seattle Department of Veterans Affairs, Epidemiologic Research and Information Center, Seattle, Washington*

Little is known about caregiving issues among American Indians. We conducted a study on adult caregiving with a large sample of American Indians, including an examination of the role of cultural indicators in the propensity to be a caregiver. To our knowledge, this is the first such study conducted among American Indians. Data come from a cross-sectional study of 5,207 American Indian adults residing on two closely related Lakota Sioux reservations in the Northern Plains and one American Indian community in the Southwest (Arizona). Cultural indicators include measures of cultural identity and traditional healing practices. Seventeen percent of our sample reported being caregivers, and a larger proportion of participants in the Northern Plains were more likely to be caregivers than those in the Southwest. Compared to noncaregivers, caregivers were younger and more likely to be female and married. Unadjusted analyses indicated that a larger percent of caregivers compared to noncaregivers attended and participated in Native events ($p < 0.01$) and engaged in all three traditional medicine healing practices ($p < 0.01$). Adjusted analyses showed that caregivers compared to noncaregivers had a 30% increased odds of speaking at least some Native language at home and a 2.5-increased odds of engaging in traditional medicine practices. Regional stratification of analyses indicated sex differences in caregiving odds ratios in the Northern Plains but not in the Southwest. Our findings support the notion that greater cultural identity is related to caregiving in our sample, and that future studies and interventions should pay special attention to this dynamic.

PREDICTING INSTITUTIONAL PLACEMENT AMONG DEMENTIA CAREGIVERS

D.W. Durkin¹, F. Sun³, M.M. Hilgeman¹, J. DeCoster¹, L.D. Burgio²,
1. *Social Work, University of Alabama Center for Mental Health and Aging, Tuscaloosa, Alabama*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *Arizona State University, Phoenix, Arizona*

The early institutionalization of older adults is of concern to practitioners, researchers and policymakers alike. Although research has identified both caregiver (CG) and care recipient (CR) predictors of institutionalization, little research has focused on measures for use in the clinical setting that may help practitioners identify and intervene with

CGs considering institutionalizing their CR. One such measure is the Desire to Institutionalize scale (DTI) developed by Morycz (1985). This brief scale asks CGs to answer 6 yes/no questions related to how soon they expect to place their CR in an institution. The DTI scale has been found to be predictive of actual placement in previous studies. Using secondary data from the NIH-funded Resources for Enhancing Alzheimer's Caregiver Health (REACH) II study (N = 640), we examined the relations between predictors of institutionalization identified in previous research, DTI and actual institutional placement during the course of the study. Correlation analyses were initially conducted to determine variables that were significantly related to Placement and only those that were significantly related to Placement were included in the analyses. Using logistic regression analyses both CG Burden and DTI were found to be significantly related to Placement when controlling for CG race/ethnicity, income, and ADL/IADL need. However, when Burden and DTI were entered into the same regression model, only DTI remained significant. Results support previous studies that indicate the DTI scale is a reliable predictor of institutional placement and suggest that this predictive ability extends beyond predictors previously identified in the literature (e.g., burden).

SESSION 465 (SYMPOSIUM)

FAMILY CAREGIVERS' INVOLVEMENT: A CREATIVE FUTURE DIRECTION IN CANCER CARE

Chair: Y. Kim, *Psychology, University of Miami, Coral Gables, Florida*
Discussant: T. Blank, *University of Connecticut, Storrs, Connecticut*

Cancer touches not only cancer patients but also their family caregivers, influencing diverse aspects of their quality of life. This symposium deals with these concerns from a family system's perspective, to provide comprehensive views related to the quality of life of cancer patients and caregivers. Dr. Hendrix illustrates the efficacy of individualized bedside training for family caregivers of older cancer patients in improving the quality of life of both patients and caregivers. Dr. Rose identifies patterns and predictors of family caregivers' engagement in supportive communication resulting from a tailored intervention targeted for advanced cancer patients and caregivers. Dr. Given highlights the significance of family caregivers' involvement in patients' symptom management and the effectiveness of this involvement in reducing depression of patients and caregivers. Dr. Kim further pinpoints the importance of lifestyle behaviors (healthy diet and physical activity) in the quality of life of each person in a cancer survivor-spousal caregiver dyad, which has significant implications for developing lifestyle behavioral interventions targeted to cancer patients and family caregivers. In his discussion, Dr. Blank identifies the unique challenges each person in the family deals with, as a cancer patient or caregiver. He also contrasts and compares the findings from diverse subpopulations of cancer patients. He discusses the implications of these findings as a creative approach to improving overall quality of life of patients and family caregivers, suggesting future directions for research.

INDIVIDUAL AND DYADIC EFFECTS OF HEALTHY LIFESTYLE BEHAVIORS ON QUALITY OF LIFE AMONG CANCER SURVIVORS AND THEIR SPOUSES

Y. Kim, *Psychology, University of Miami, Coral Gables, Florida*

One ultimate goal of survivorship would be preventing from major illnesses of the survivor and their family members by fostering healthy lifestyle behaviors. This study examined the extent to which healthy lifestyle behaviors, namely, fruit and vegetable consumption (FVC) and duration of physical activity (DPA), cancer survivors and their spousal caregivers were engaging in was related to the quality of life of each person as well as partner. APIM results using data of 320 survivor-caregiver dyads from a national survey revealed that survivors' FVC related to their better mental health and caregivers' FVC related to their better mental and physical health. In addition, survivors' DPA related

to their better mental and physical health and caregivers' DPA related to their better physical health. Results suggest that longer duration of physical activity for survivors and more servings of FVC for caregivers should be encouraged to improve their quality of life.

HOW DOES CAREGIVER DEPRESSION INTERACT WITH INTERVENTIONS TO INCREASE CAREGIVER INVOLVEMENT IN MANAGING SYMPTOMS AMONG THEIR PATIENTS RECEIVING CHEMOTHERAPY

B.A. Given, C.W. Given, *College of Nursing, Michigan State University, East Lansing, Michigan*

Two hundred and five caregivers and their patients with cancer undergoing chemotherapy, were enrolled into a two arm trial. All caregivers received interventions to assist patients. We examined factors related to caregivers offering assistance to help their patients manage symptoms. Patients with symptoms over a pre-set threshold at baseline received help from their caregivers. Non-spouses offered more assistance than spouse caregivers. When interactions between caregiver depression and numbers of interventions delivered was examined, we found that among caregivers with high levels of depression, the delivery of interventions had no impact on the amount of assistance offered. However, when caregivers with low levels of depression received interventions to manage patients symptoms, those who received interventions were significantly more likely to assist their patients. The implications are strong, depressed caregivers are much less likely to implement interventions to assist family members to manage cancer related symptoms.

PROMOTING SELF-EFFICACY AND PREPAREDNESS IN CAREGIVERS OF OLDER CANCER PATIENTS BEFORE HOSPITAL DISCHARGE

C.C. Hendrix, A. Abernethy, L.R. Landerman, *School of Nursing, Duke University, Durham, North Carolina*

Many family cancer caregivers lack confidence and are ill-prepared to assist their loved ones after hospital discharge because of limited preparation. Based on Bandura's self-efficacy framework, we hypothesized that an individualized, experiential training can increase self-efficacy and preparedness among caregivers. Therefore, the specific aim of this study was to examine the effects of this training on self-efficacy and preparedness in symptom management and home care of informal caregivers, and on symptom distress of cancer patients. Data analysis revealed that there was a significant improvement in caregiver self-efficacy immediately after training ($t = -7.24, p < .0001$) and was sustained at 1, 2, and 4 weeks of hospital discharge ($t = -5.31, p < .0001$; $t = -4.81, p < .0001$, and $t = -4.45, p < .0001$, respectively). Similar trend was observed in the levels of caregiving preparedness. Further analysis will look at the correlation between caregiver and patient variables.

PREDICTORS OF CAREGIVER ENGAGEMENT IN A COPING AND COMMUNICATION SUPPORT INTERVENTION FOR ADVANCED CANCER PATIENTS

J.H. Rose^{1,2,3}, K. Bowman¹, R. Radziewicz², 1. *Medicine, Case Western Reserve University, Cleveland, OH, Ohio*, 2. *MetroHealth Medical Center, Cleveland, Ohio*, 3. *Louis Stokes Cleveland VAMC, Cleveland, Ohio*

We examined patterns and predictors of family caregiver (FCG) engagement and problems raised in a coping and communication support (CCS) intervention tailored to preferences of advanced cancer patients and FCGs. FCGs (N=158) were identified by study patients being treated in two cancer clinics providing care for underserved populations. Baseline FCG data were used in negative binomial regression analysis to predict FCG contacts with CCS practitioners (CCSPs) and problems raised with CCSPs over the first two months of intervention. FCGs living with patients had greater engagement (more contacts). More psychological issues were raised by FCGs who were male and/or had more needs met by the patient's health care providers (HCPs). FCGs

with a lower blunting style raised more existential issues. Less depressed FCGs mentioned more problems with HCPs. More practical issues were cited by FCGs who had lower incomes, lower blunting styles, and/or more needs met by the patient's HCPs.

SESSION 470 (SYMPOSIUM)

GENDER AND AGING: OLDER MINORITY WOMEN'S HEALTH, INCOME SECURITY, AND FAMILY RELATIONS

Chair: L. Mjelde-Mossey, *Gerontology Center, The University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Discussant: C.M. Mehrotra, *The College of St. Scholastica, Duluth, Minnesota*

The objective of this symposium is to highlight some of the unique gendered circumstances associated with being an older minority woman in the United States. Whether U.S. or foreign-born the women share some of the same challenges. Older minority women are more likely to be poor, have more health limitations, and experience cultural shifts in their traditional family roles. Even though the most recent U.S. census reported that 82% of those over age 55 are white, the proportion of older minorities is increasing and, since women outlive men in all ethnic and racial groups, there is a growing need to know more about the specific concerns of older minority women. The invited papers in this symposium focus on health, income security, and family relations. One paper reports on Chinese grandmothers who have immigrated to the U.S. and ways in which the grandmothers maintain positive relations with their grandchildren who remain in China. Another paper reports the structural, educational and language barriers to life-long income for older Mexican-origin women and their effects upon income security in old age. Two other papers focus on disability and oral health. One reports gender differences in the onset of limitations in ADLs for Black, Hispanic and White older adults. The oral health study presents the effects that culture, oral health beliefs, and oral health practices have upon the oral health of older Chinese, East Indian, Black, and white women.

CAN OLDER HISPANIC WOMEN AFFORD TO GROW OLD? INFLUENCES OF MARRIAGE, WORK, AND IMMIGRATION

J.L. Angel, J. Montez, R. Angel, *Department of Sociology and LBJ School, University of Texas at Austin, Austin, Texas*

For women, and especially for those whose culture places great value on the family and defines a woman's core roles as those of wife and mother, dependency on a male partner is common. Yet given limited earnings and the lack of benefits among Hispanic males, for many Hispanic women marriage is no guarantee of economic security or access to health insurance or retirement income. As is the case for lower class African-American women, for a large fraction of Hispanic women the traditional male breadwinner model of family economic security no longer operates, if indeed it ever did, and the future marriage market for Hispanic females may operate very differently than it has in the past. Yet even as employment becomes the norm for women, as is the case for men, race and ethnicity structure employment opportunities unequally, a situation that results in unequal access to material and social resources including retirement plans and health insurance. In this study, we examine the situation of adult Hispanic women and ask how their access to benefits is affected by marriage, as well as their own employment as they age. We combine Current Population Survey data from several years to produce reliable estimates of the financial vulnerability of Mexican-origin women. The results show that older foreign-born Mexican-origin women face multiple employment barriers including low educational levels, low levels of English proficiency, the nature of the jobs they hold and the number of hours they work, as well as the labor market opportunities in the region, state, and locality in which they live. The analyses also reveal that a large fraction of these women may outlive their resources and find themselves dependent on children

or the state. The research findings are discussed in relation to their implications for providing income support in old age for Hispanics.

GENDER VARIATIONS IN THE ONSET OF FUNCTIONAL LIMITATIONS: DO BLACK, HISPANIC, AND WHITE AMERICANS DIFFER?

B. Wu¹, L. Wei³, J. Liang², 1. *Gerontology, University of North Carolina at Greensboro, Greensboro, North Carolina*, 2. *University of Michigan, School of Public Health, Ann Arbor, Michigan*, 3. *Centers for Disease Control and Prevention, Atlanta, Georgia*

This study examined gender differences in the onset of lower body disability (LBD) and limitations of Activity of Daily Living (ADL) across Black, Hispanic, and White Americans. Data came from six waves of the Health and Retirement Study (HRS 1996-2006) including 6,673 persons aged 51 and above with no functional limitations at baseline in 1996. Generalized Estimating Equation (GEE) models were used in the study. We found that females were more likely to develop onset of LBD for all three ethnic groups. In addition, white and Hispanic females were more likely to develop ADL limitations. But the association did not find among blacks. On the other hand, the results from survival analysis showed that women had 48% lower mortality risk than male counterparts. This study suggests the importance of reducing risk of developing functional limitation and increasing active life expectancy for women across ethnic groups.

GRANDMOTHERS-GRANDCHILDREN RELATIONSHIP AMONG OLDER CHINESE IMMIGRANTS IN LOS ANGELES

L. Xu, I. Chi, *USC, Monterey Park, California*

Being a grandmother is an important social role to older woman and her grandchildren in Chinese families. This present study explores whether older Chinese women could maintain this relationship with their grandchildren after they migrated to the United States. Four focus groups of Chinese immigrant women, aged 65 or above residing in Los Angeles who have grandchildren under 25 years old, were conducted in 2008. The results showed that grandmothers maintained close relationship with their grandchildren. Most grandmothers considered that grandchildren are very important to them. They either talked on the phone or met their grandmothers weekly or monthly. Even though communication barriers existed, most grandmothers coped with them by either changing their behaviors or lowering their expectations. Grandmothers thought that their grandchildren were filial to them. In conclusion, the immigrant Chinese grandmothers still played an important role in their families by keeping cohesive relationship with their grandchildren.

CULTURE, ORAL HEALTH STATUS, AND QUALITY OF LIFE AMONG OLDER MAJORITY AND ETHNIC MINORITY WOMEN

A. Kiyak, *Institute on Aging, University of Washington, Seattle, Washington*

Objective: To assess the relationship between ethnicity, oral health status, perceived well-being among older women in Canada and U.S. enrolled in a clinical trial. Methods: Older Canadian or U.S.-born women in the U.S., China or India-born women in Canada were interviewed re: oral health behaviors, perceived risk for diseases, oral health-related quality of life, depression, and examined re: OH status. Results: Chinese women reported the lowest QoL among Canadian ($p < .04$) and U.S. women ($p > .001$), and scored highest on depression ($p < .04$ in Canada, $p < .02$ in U.S.). They had more teeth ($p < .03$ in U.S., $p = .06$ in Canada), more root decay ($p < .04$) than Indian women in Canada, and more than Caucasians and Blacks in the U.S. ($p < .003$). Discussion: Results suggest that health beliefs, behavior, and oral health status vary among cultural and immigrant groups; older Chinese women are at greatest risk.

SESSION 475 (SYMPOSIUM)

GENDER AND CARE UTILIZATION: DIFFERENT PATTERNS FOR DIFFERENT PROVIDERS

Chair: M.G. Parker, *NVS, Aging Research Center, Stockholm, Sweden*
Discussant: P. Rieker, *Boston University, Boston, Massachusetts*

Care utilization is the result of a complex process involving need, behavior and access. These three elements have both individual and societal dimensions, and all three are strongly influenced by gender. The elements also differ depending on the kind of service provided. This symposium will describe and analyze gender differences in a variety of elder care services. Patterns emerging from different providers may help us understand the roots of gender differences. A Dutch study shows that women are twice as likely as men to use professional home care, a difference that remains when controlling for numerous factors including health, living situation, personality and care preferences. A U.S. based study shows that women with Stage I/II lung cancer are significantly less likely to receive timely and appropriate treatment as compared to men. A Swedish study used a national dispensed drug register to look at gender differences in inappropriate drug use (IDU). Women are more likely to have IDU when adjusting for age, education and number of drugs. Another study from Sweden finds no gender difference in physician visits. However, elderly men visit dentists more often than women even when adjusting for age, marital status, education and health. The symposium will include a discussion of the challenges of investigating gender differences in care utilization among elderly people and how the intersection of needs, behavior and access may differ for men and women, and that gender patterns may differ by provider.

RACE AND SEX DIFFERENCES IN THE TIMELY AND APPROPRIATE TREATMENT OF LUNG CANCER

L.R. Shugarman¹, K. Mack¹, M. Sorbero², H. Tian¹, A. Jain³, J. Ashwood², S.M. Asch¹, 1. *RAND Corporation, Santa Monica, California*, 2. *RAND Corporation, Pittsburgh, Pennsylvania*, 3. *RAND Corporation, Washington, District of Columbia*

This study aimed to evaluate the relationship of sex and race with the receipt of timely and clinically appropriate non-small cell lung cancer (NSCLC) treatment for each stage of diagnosis. SEER cancer registry data were linked to Medicare claims for beneficiaries diagnosed with NSCLC between 1995-1999 to examine disparities in treatment while controlling for other demographic characteristics, comorbidities, SES, and provider supply (N=22,145). Among Stage I/II patients, women were 25% less likely to receive timely surgical resection than men. Although race disparities were found for treatment of later-staged NSCLC, we found no evidence of continued negative effects for women. Variations in appropriate, timely treatment were found within and across stages of diagnosis, confirming that sex and race differences in NSCLC treatment exist. However, these differences are not consistent, suggesting different approaches may be needed for addressing disparities in NSCLC treatment.

GENDER DIFFERENCES IN THE USE OF PROFESSIONAL HOME CARE: THE IMPACT OF HEALTH, PERSONALITY AND SOCIAL FACTORS

M. Broese Van Groenou¹, D.J. Deeg², 1. *VU University, Amsterdam, Netherlands*, 2. *VU Medical Center, Amsterdam, Netherlands*

The behavioural model of Andersen and Newman predicts that gender differences in need (health), disposition (personality and care preferences) and enabling factors (social context) explain why women more often use professional home care than men. Data from the 2001/2002 wave of the Longitudinal Aging Study Amsterdam show that women, compared to men, are in worse health, have less strong personalities, more often prefer professional care over informal care, are more often single and with low income. Logistic regression analyses show that older women are twice as likely as men to use home care (OR=2.19). The odds

are decreased only slightly when adjusting for dispositional factors or social context. Adjusting for all factors still leaves a statistical significant gender difference in the use of home care. It is discussed what other factors may explain that older women use professional home care more often than men.

GENDER DIFFERENCES IN VISITS TO THE DOCTOR AND DENTIST

M.G. Parker, P. Schön, I. Gripe, *NVS, Aging Research Center, Stockholm, Sweden*

This study investigates gender differences in visits to the doctor and the dentist in the past 12 months. The study was based on SWEOLD, a nationally representative interview survey of persons aged 77+ in 1992 and 2002 (n= 973). Logistic regression analysis showed no significant gender difference in visits to the doctor, after controlling for age, education, civil status, time period and care need. Poor self-rated health (SRH) and other health indicators were associated with visits to the doctor. On the other hand, the OR for dental visits was significantly lower (0.736) for women and this difference persisted when controlling for age, education, civil status, time period and dental status. Poor SRH was negatively associated with dental visits. Our results suggest that there are different mechanisms behind the propensity to seek medical care versus dental care and that women may be at a disadvantage in regards to dental care.

GENDER DIFFERENCES IN INAPPROPRIATE DRUG USE: A REGISTER-BASED STUDY OF OVER 600 000 OLDER PEOPLE

K. Johnell¹, G. Ringbäck Weitof², J. Fastbom¹, 1. *Aging Research Center, Karolinska Institutet, Stockholm, Sweden*, 2. *The National Board of Health and Welfare, Stockholm, Sweden*

We aimed to investigate whether gender is associated with inappropriate drug use (IDU, e.g., drug-drug interactions, 3+ psychotropic drugs), after adjustment for age, socioeconomic status (i.e. educational level) and co-morbidity (i.e. number of drugs) in a large general population of older people. We analyzed data on gender, age, dispensed drugs, and education from people aged 75-89 years registered in the Swedish Prescribed Drug Register during July-October 2005 (n= 645 429). IDU was more common in women (24.6%) than men (19.3%). Logistic regression analysis also showed that women were more likely to be exposed to IDU than men (OR=1.24; 95% CI 1.23-1.26), after adjustment for age, education and number of drugs. In particular, female gender was highly associated with inappropriate psychotropic use. Our results indicate that IDU should be monitored separately for women and men. Neither socioeconomic status nor co-morbidity could explain the gender differences found in this study.

SESSION 480 (POSTER)

HEALTH PROMOTION AND DISEASE PREVENTION

AGING IN A CONFINED PLACE: THE HEALTHCARE EXPERIENCE OF THE AGING INMATE

L.K. Jennings, *School of Social Work, University of Alabama, Austin, Texas*

It is critical to understand the importance of health in the older prisoner's life. The health of this population not only affects the individual - but the prison system, the family, the institutional caregivers and the larger community. The older inmate population continues to grow, however, changes in the system (funding, resources, support) have not kept pace at the same level. Over one half of these prisoners report their health as poor, and there is a prevalence of chronic health concerns: hypertension, diabetes, arthritis, cancer, and heart problems. This study provides a unique opportunity to explore inmate healthcare in a prison that provides care for the aged/infirm. Method: Qualitative data were collected via semi-structured, in-depth interviews with four older male prisoners (50 and up), and 12 collateral participants. Individual cases were

designed around each inmate's healthcare story. Prominent themes were derived using a constant comparative approach. Key themes included: healthcare challenges; the healthcare process; family; health communication; policy issues; and community involvement. Conclusions and Implications: Interviews reveal critical healthcare issues faced by older inmates. Some participants ignored health problems until they became health crises. The healthcare process routinely involved much time standing in line waiting for care. Similarly, healthcare providers face challenges in providing quality care in a heavily monitored, secure environment. Can appropriate care for chronic medical conditions be provided within the limits of a prison budget? On a larger level, policy issues need to be addressed at the state level to provide avenues for change in prison healthcare.

KNOWLEDGE AND ATTITUDES ABOUT AGING AMONG HEALTHCARE PROFESSIONALS IN EMERGENCY MEDICINE: IMPORTANT DISTINCTIONS

C.E. Boozer, A.P. Glass, *Institute of Gerontology, University of Georgia, Athens, Georgia*

The rapid aging of our population, coupled with the fact that the majority of older adults have one or more chronic diseases, makes it essential for our healthcare system to gear up to be better prepared to treat their older patients. Research suggests that most nurses who graduated as recently as five to 10 years ago received little or no education relating to gerontological nursing (Berman et al., 2005). Our study sought to examine the knowledge and attitudes that various staff members of the Emergency Department in one mid-sized hospital hold pertaining to aging and older patients. Data were collected by utilization of a survey administered through required staff meetings. The sample ($n = 37$, 35.2%) voluntarily completed the survey, which consisted of questions pertaining to older patients (70+) and the staff members' perceptions and attitudes regarding these patients. An adapted version of the "Facts on Aging Quiz" by Breyspraak, Kendall, and Halpert (n.d.) was administered to the staff as well. Data analyses indicated the mean score on the quiz was 65.9%. No significant trends were found when analyzing the scores by respondents' age, sex, length in the field, position held, or education. However, when comparing responses to health-related questions versus general aging questions, the results revealed an interesting distinction. On the questions that focused more towards health, the mean score was 68.4%, versus 51.5% on the more general aging questions was. These results indicate a need for more training and education of the hospital staff.

AN EVALUATION OF AN ACTIVITY PROJECT FOR COMMUNITY DWELLING OLDER ADULTS

Y. Nishimura, *Health and Social Services, Hiroshima International University, Higashi-Hiroshima, Japan*

Objectives: To demonstrate that activity and social participation by older adults dwelling in the community will influence their independent living. A community care center in Ube, Japan in cooperation with the residents' association leaders and the district welfare commission provided for the elderly residents a program with physical exercise and a lunch program for over three years. **Methods:** The activity program consisted of physical exercises and lunch held monthly from 2004 to 2006 (3 years) hosted 44 participants with an average age 78 years old; 29 (65.9%) participated in both programs. **Tools:** Self Efficacy for Health Promotion Scale (Yokokawa, 2001); IADL (Instrumental Activity of Daily Living); LSNS (Lubben Social Network Scale) and MMS (Mini-Mental State Examination); Demographic Questionnaire. **Results:** (1) The average self-efficacy scores: 1 year (23.4 ± 5.8 , $n = 10$), 2 years (28.2 ± 4.1 , $n = 6$), and 3 years (32.9 ± 9.2 , $n = 13$). The 3 year group demonstrated a significant score ($p < .05$). Duration of participation increased interests in health promotion, but no significant relationship to IADL, LSNS and MMSE. (2) Self-efficacy ($n = 44$) significantly related to demographic factors of age, household, IADL, LSNS ($p <$

.01) perceived health and education ($p < .05$). (3) IADL significantly related to LSNS ($p < .01$). (4) Concerning inactive status ($n = 44$), activity and social participation were raised significantly during the participation from 2004 to 2006 ($p < .05$), but physical function showed no relationship. **Conclusion:** Activity program and lunch increased motivation for health promotion and social participation, but did not improve physical function.

THE INFLUENCE OF PSYCHOSOCIAL FACTORS ON MEDICATION MANAGEMENT AND ADHERENCE IN VISUAL IMPAIRMENT

L.P. Nadel, K.V. Echt, W.R. De l'Aune, M.D. Williams, C.L. Jasien, T. Munir, S. Lynch, *Atlanta VA Rehabilitation Research & Development Center, Atlanta, Georgia*

Medication non-adherence is a risk factor for patient morbidity and mortality, particularly in aging. Psychosocial factors are known determinants of medication-taking behaviors. The role of psychosocial factors in visually impaired persons' medication management and adherence, however, is not well-understood. Participants included 25 visually impaired (corrected acuity of 20/60 or worse) and 25 non-visually impaired (corrected acuity of 20/40 or better) veterans age 34 to 94 years ($M=64$, $SD=14$). Psychosocial measures included social support (MOS), patient activation (PAM-13), medication taking self-efficacy, and medication management assistance. Measures of medication management and adherence included the Hopkins Medication Schedule (HMS), Drug Regimen Unassisted Grading Scale (DRUGS), self-reported adherence (Morisky), and an index of refill-adherence (Cumulative Medication Gap; CMG). Participants in both groups demonstrated similar patient activation, medication taking self-efficacy and social support scores and these were associated with aspects of medication management and adherence ($r's > .29$). Findings specific to the medication management assistance items suggest that the odds of reporting medication management assistance is 5 times greater for the visually impaired participants than the non-visually impaired participants ($OR=5.09$, $CI\ 95\% 1.28, 20.28$). Furthermore, visually impaired participants receiving caregiver support demonstrated less capacity to perform the medication management tasks (DRUGS, HMS) compared to the non-visually impaired participants. These findings suggest that psychosocial factors may be differentially influential on aspects of medication management and adherence and may provide important targets for intervention approaches.

THE EFFECTS OF JOB CREATION PROJECTS FOR THE ELDERLY ON HEALTH PROMOTION: THE CASE OF KOREA

J. Lim, E. Shin, *Food and Resource Economics, Korea University, Seoul, Korea, South*

Job creation project for the elderly has been supported by Korean government since 2004 to promote employment of the old so as to prepare for the aging society in Korea. Besides providing economic stability through suitable jobs, this project is expected to produce positive side-effects in which the elderly can boost their self-esteem and have better access to various resources for health. This paper aims to empirically examine the effects of reduced medical costs and changes in health promotion behaviors for the participants of the project. Estimating these effects can be exposed to selection bias of "Healthy Worker Effect (HWE)" which states that healthier workers are more likely to be employed. Thus, in order to exclude the probability of overestimation, this paper adopted cohort sequential design to effectively control problems caused by participating time gap as well as maturation effect and spurious causal effect which are also associated with time problems. Concerning the effects of medical cost reduction, the participated old tend to pay less amount of money, specifically \$194 less than the non-participants annually. The reduced costs amount to \$30,412,375 for 2.5 years from 2004 to the first half of 2006, which account for 16.2% of the total budget (\$188,453,608). As to health promotion behaviors, the elderly improve health-related behaviors in area of smoking, alcohol

consumption, exercises, weight management, and ordinary activities after participation in the project. Therefore, the empirical results indicate that job creation project plays an important role in enhancing health status of the elderly.

DOING THE CONDOM DANCE: INTRODUCING SEXUAL SCRIPTING INTO OLDER ADULTS' SAFE SEX EDUCATION PROGRAMS

P.P. Brown, H. Ewen, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Sexual scripting is based on learned gendered norms and dictates what role men and women are to play during sexual behaviors. These scripts are based on an accumulation of cultural and societal expectations, including the historical and structural changes during their cohort aging process. In a recent World Health Organization bulletin, researchers noted current studies indicated that older adults do not practice safe sex as often as younger adults. The use of condoms in the over-fifty age groups is around 15%, and with a marked increase of HIV/AIDS in the older ages, sexual education is imperative to prevent high-risk behaviors. Previous research shows that condom use increases with the inclusion in sexual scripts. The use of condoms for "safe sex" requires that both partners be participants in the prevention and condoms must be included in both of their sexual scripts. This paper reviews the role that sexual scripting plays in gender construction and outlines current research that includes sexual scripting. "Safe sex" programs, literature and videos available in the United States are reviewed and analyzed for sexual scripting content. A discussion also supports the inclusion of sexual scripting into "safe sex for seniors" education programs in the United States, including practical suggestions for sex educators.

MOTIVATORS AND THE LEVEL OF SELF-READINESS FOR LEISURE TIME PHYSICAL ACTIVITY AMONG SEDENTARY OLDER KOREAN AMERICANS

H. Yeom, J. Fleury, C. Keller, *College of Nursing & Healthcare Innovation, Arizona State University, Phoenix, Arizona*

Although physical inactivity is one of the most prevalent risky health behaviors in older Korean Americans, little is known about their motivators to the initiation and maintenance of leisure time physical activity (LTPA). This study is aimed at exploring perceived psychosocial and environmental motivators and the levels of self-readiness for LTPA among sedentary older Korean Americans residing metropolitan Phoenix area. Narrative information was collected from 60 older Korean Americans through an open-ended format interviews to identify perceived motivators to physical activity maintenance. Self-readiness for LTPA was measured using Index of Self-Readiness. The data will be analyzed using content analysis and descriptive statistics; data will be coded and categorized to identify themes. A social ecological perspective will be used for secondary coding and categorization. The association between sedentary behaviors and general characteristics (i.e. education, gender, marital status) will also be tested using χ^2 analysis. Results are currently under exploration. The open-ended format is expected to provide rich narrative data regarding barriers to the maintenance of physical activity. The acknowledgment of motivators, particularly from a social ecologic perspective, will guide culturally-relevant community-based interventions for promoting LTPA among sedentary older Korean Americans, a consistently growing ethnic subgroup.

WHY DO OLDER ADULTS USE COMPLEMENTARY AND ALTERNATIVE MEDICINE? RESULTS OF A NATIONAL SURVEY

E.M. Tait, S.B. Laditka, J.N. Laditka, M.M. Tsulukidze, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Half of U.S. adults ages 50+ use complementary and alternative medicine (CAM). Little is known about reasons for CAM use, which we examined with data from the 2007 National Health Interview Survey

and its CAM supplement (n=10,104). Analyses, including chi-square and logistic regression, accounted for the survey design and were weighted for national representativeness. Controls included age, education, marital status, health insurance, comorbidities, body mass index, and region. Among adults 50+, 75% used CAM for general wellness/disease prevention; 36% following health provider recommendations; 31% for immune function; 29% following family/friend recommendations; 11% for memory. Nearly 8% used CAM because medical treatments failed, 6% because they were too expensive. More women than men used CAM because it was recommended by a provider (41%, 29%, $p<.0001$), or to enhance energy (16%, 11%) (both $p<.0001$). African Americans were less likely than whites to use CAM because it was recommended by a provider (29%, 38%), or because medical treatments failed (4%, 8%) (both $p<.0001$). Asians most often used CAM for general wellness and immune function, Hispanics for general wellness and following provider recommendations. Age was not a factor. In adjusted results, African Americans and Hispanics were less likely than non-Hispanic whites to report using CAM following health provider recommendations (respectively, odds ratio 0.63, 95% confidence interval 0.54-0.75; 0.72, 0.57-0.91). A notable number of older adults use CAM because medical treatments do not help or are too expensive. Many CAM users, particularly women and non-Hispanic whites, say they use CAM following health provider recommendations.

PREVALENCE OF HIV TESTING AMONG MIDDLE AND OLDER-AGED ADULT FLORIDIANS

B. Rahim-Williams, *University of Florida, College of Public Health & Health Professions, Department of Behavioral Science & Community Health, Gainesville, Florida*

Objective: Testing is important for the prevention of the spread of the Human Immunodeficiency virus among middle and older adults. The aim of this study was to identify the prevalence of HIV testing among adults 45-64 years of age in Florida, and to determine the difference in the incidence of testing between 2002 and 2007. Methods: Secondary data analysis conducted of the Florida Behavioral Risk Factor Surveillance System (BRFSS) survey utilizing the Community Health Assessment Resource Tool (CHART). The BRFSS assesses personal health behaviors contributing to morbidity and mortality. Analysis examined the State-wide prevalence of HIV testing of adults between the ages of 45-64 at two points in time; 2002 and 2007. Results: Year 2007 prevalence of HIV testing was 35.9 (95% CI: 34.2-37.7) for adults ages 45-64 compared to HIV testing in 2002; 33.2 (95% CI: 31.2-35.4). Results revealed a 2.7% increase. A decrease occurred in the number of adults ages 45-64 who had tested in the past 12 months for data comparing prevalence in year 2002, 12.6 (95% CI: 11.1-14.3) with testing results in 2007; 10.8 (95% CI: 9.6-12.1). Conclusion: A need exists for ongoing age, gender, and ethnic/racial group appropriate, health education and health promotion efforts to increase HIV testing and promote disease prevention among middle and older aged adults; a population that may perceive itself at low-risk for HIV infection.

THE IMPACT OF THE WII ON SELF-RATED HEALTH, COGNITION AND DEPRESSION IN THE ELDERLY

E. Ayers, *The College of Wooster, Hillsborough, New Jersey*

Increasing activity levels in older adults has a positive impact on depression, cognitive functioning, and self-rated health. This study tested whether playing a competitive, physically active video game called Wii would improve mental and physical health in nursing home and assisted living patients. Seventeen elderly residents of a nursing home and an assisted living facility were tested with a Stroop Test and Letter Digit Substitution Task to indicate cognitive functioning, a Self-rated Health Test for overall perceived health, and the Geriatric Depression Scale for depression. They were assigned to either a Wii program or control group. The Wii group played for a few hours a week for a month and completed the tests, and the control group just completed the tests. Fol-

lowing the month intervention the same tests were given again, but no before-after or intervention-control comparisons were found to be significantly different. However, all results showed positive trends, indicating that the Wii decreased reaction time, improved self-rated health, and lowered depression scores. The Wii appears to be a positive addition to nursing homes and assisted living facilities based on current results.

THE ASSOCIATIONS AMONG MIDDLE-AGED AND OLDER ADULTS' BODY MASS INDEX, PERCEPTIONS OF GENERAL HEALTH STATUS, AND PARTICIPATION IN HEALTH PROMOTING BEHAVIORS

S. Stahl, J. Patrick, *West Virginia University, Morgantown, West Virginia*

Despite public health efforts to promote engagement in health promoting behaviors (e.g., physical activity), a majority of middle-aged and older adults remain sedentary (Prohaska, 2006). Moreover, more than one third of U.S. adults are obese ($BMI > 30$), which is considered a major risk factor for many chronic illnesses. Recent research has indicated that engagement in health promotion may be associated with individuals' health status (Zanjani, Schaie, & Willis, 2006). Therefore, we examined the associations among body mass index (BMI), chronic health condition severity, future time perspective, perceptions of general health status, and participation in health promoting behaviors. Participants were 124 (male = 38; female = 86) middle-aged and older adults (mean age = 53.17; mean BMI = 27.87) who supplied self-report data. We proposed that BMI and perceived limitations due to chronic health conditions would relate to adults' future time perspective and perceptions of their general health status. Moreover, we hypothesized that adults' future time perspective and perceptions of their general health status would relate to engagement in health promoting behaviors. Results of a path analysis suggest that BMI, perceived limitations due to chronic health conditions, and future time perspective were related to adults' perceptions of the general health status. Furthermore, general health status was related to engagement in health promotion. Model fit indices also suggest a good fit between the data and the tested model. Results are discussed within a lifespan perspective and focus on ways to better inform health promotion programs in mid- to late life.

GOAL FRAMING OF HEALTH RELATED BEHAVIORS: WHAT FACTORS CONTRIBUTE TO THE PERSUASIVENESS OF A MESSAGE?

S. Stoner, *West Virginia University, Morgantown, West Virginia*

A person's decision to engage in healthy behaviors should ideally be based on facts supporting that decision. However, there is evidence that how relevant information is framed (positive: describing benefits gained from engaging in behaviors; negative: describing benefits lost from not engaging in behaviors) can influence decisions. The effect of information frame on older adults' compliance with health behavior recommendations is unclear due to a paucity of research. In an attempt to understand factors that influence older adult healthy behavior decision making, the current study examined variables that might predict whether positively or negatively framed information elicits greater compliance with health recommendations. Positively and negatively framed messages promoting skin cancer prevention and detection were distributed to older ($N=68$, mean age=75.95; $SD=8.08$) and younger adults ($N=68$; mean age=19.93; $SD=2.42$). Participants rated their intentions to engage in prevention and detection behaviors. Intentions to engage in prevention behaviors were stronger among older adults ($M=4.5$, $SD=1.13$) than younger adults ($M=2.85$, $SD=1.18$; $F(1,132)=66.02$, $p<0.001$). There was not a significant difference across age groups in intentions to engage in detection behaviors. Among participants exposed to the positive frame, history of engaging in prevention behaviors was related to intentions to engage in future prevention behaviors ($R^2=.67$, $F(1,60)=119.3$, $p<0.01$, $\beta=.82$, $t=10.92$, $p<0.01$). A weaker, though significant, relation between history of prevention behaviors and intentions to engage in future pre-

vention behaviors was found in the negative frame ($R^2=.50$, $F(1,58)=58.74$, $p<0.01$, $\beta=.71$, $t=7.66$, $p<0.01$). The implications of these results for developing effective health-promoting messages are discussed in further detail.

FATIGUE AND PHYSICAL FUNCTIONING AMONG OCTOGENARIANS AND CENTENARIANS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

J. Cho¹, P. Martin¹, M. MacDonald¹, J. Margrett¹, L. Poon², 1. *Iowa State University, Ames, Iowa*, 2. *University of Georgia, Athens, Georgia*

This study examined the relationship between physical functioning and fatigue for 321 octogenarians and centenarians of Phase III of the Georgia Centenarian Study. Five subscales of fatigue (i.e., general fatigue, physical fatigue, reduced motivation, reduced activity, and mental fatigue), and two activities of daily living subscales (ADL, physical and instrumental) were used. Preliminary analyses showed that there were significant differences in subscales of fatigue for age, residence, level of self-rated health, and level of cognitive functioning. Participants who were older, lived in nursing home, rated their health as poor, and had lower cognitive functioning felt more fatigued when compared to their counterparts. Two confirmatory factor analyses supported a five-factor model for fatigue and a two-factor model of activity of daily living. Structural equation modeling (SEM) of two latent variables (Fatigue and ADL) using LISREL 8.71 was computed to examine how fatigue influenced physical functioning among octogenarians and centenarians. The model fitted the data quite well, $\chi^2(df=249)=315.46$, $CFI=0.98$, $RMSEA=0.036$. Results showed that general fatigue, physical fatigue, reduced activity, and mental fatigue significantly influenced IADL, whereas physical fatigue, reduced activity, and mental fatigue were significantly associated with PADL. The results suggest that fatigue or tiredness is not just an unpleasant symptom, but a critical factor for functional ability in later life. In conclusion, this study contributes to our understanding of physical and mental fatigue.

FACTORS AFFECTING HEALTH PROMOTING BEHAVIORS OF COMMUNITY-DWELLING ELDERLY WOMEN IN KOREA

Y. Lim¹, M. Sung², K. Joo³, 1. *Department of Nursing, Yonsei University, Wonju, Kangwon-do, Korea, South*, 2. *Inje University, Pusan, Pusan, Korea, South*, 3. *Munkyeong College, Munkyeong, Kyung-Sang Buk-Do, Korea, South*

The purpose of this study was to examine a theoretical staged causal model on health promoting behaviors of community-dwelling elderly women in Korea. The model contained three stages including antecedents (Stage 1), interpersonal influence (Stage 2) and outcome behavior (stage 3). The antecedents included perception variables (e.g., perceived health status, self-efficacy, and self-control) and individual characteristics (e.g., age, education, spouse, and religion). Stage 2 focused on social support. In stage 3, the outcome behavior variable was health promoting behavior. A total of 438 community-dwelling elderly women participated. The instruments used in this study were Health Promotion Lifestyle Profile (HPLP), Hardiness Scale (HS), Perceived Health Status Scale (PHSS), Self-Efficacy Scale (SES), and Interpersonal Support Evaluation List (ISEL). Sixty-two percent of the variance in the health promoting behaviors of elderly women was explained by the direct effect of social support ($\beta=.53$), self-efficacy ($\beta=.18$), perceived health status ($\beta=.16$), education ($\beta=.12$), and spouse ($\beta=.10$). Twenty-nine percent of the variance in the social support was explained by the direct effect of self-efficacy ($\beta=.31$), self-control ($\beta=.10$), and perceived health status ($\beta=.16$). The results indicate that self-efficacy, self-control, and perceived health status had an indirect influence on health promoting behavior through social support. The findings of this study suggest that social support is a mediating variable on health promoting behavior of community-dwelling elderly women, and further refinement of the underlying model is warranted.

IDENTIFYING FACTORS TO HELP CREATE HEALTHY SEXUALITY PROGRAMS FOR OLDER MSM

D.W. Coon¹, M. Keaveny¹, G. Velez¹, M. O'Connor¹, C. Smith¹, J. Catania², 1. College of Nursing & Healthcare Innovation, Arizona State University, Phoenix, Arizona, 2. Oregon State University, Corvallis, Oregon

The sexual behavior, including HIV/STD risk behavior, of midlife/older men who have sex with men (MSM) is relatively unexplored. This study first examines differences between MSM age 50+ ($M = 58.15$; $SD = 7.52$) who reported no vs. at least one sexual partner in the past 12 months. San Francisco participants of the Urban Men's Health Study, a probability-based telephone survey, were recruited to participate ($N = 179$; 29.6% HIV+). Findings suggest differences in several key domains. MSM with no sexual partner identified lower engagement in social activities, less connections with others, and poorer emotional well-being, while conveying higher ageist attitudes ($ps < .05$). MSM without sexual partners also reported poorer physical health and erectile functioning, yet stated fewer concerns regarding their physical and sexual health ($ps < .05$). Secondly, the current study examined high risk behavior among MSM age 50 and older who reported having at least one sexual partner in the last 12 months. The following factors were associated with higher risk behavior: having a main partner, having more recently received HIV test results, an increased use of sexual performance enhancers, higher sense of isolation, and more positive beliefs about barebacking. Increased risk was also associated with poorer life satisfaction ($ps < .05$). Results suggest that providers and researchers interested in creating healthy sexuality programs for midlife and older MSM need to tailor interventions to address key differences (e.g., social engagement, ageism, emotional well-being, and physical/sexual health functioning) between MSM that are vs. are not currently sexually active.

AN EXAMINATION OF CHEMICAL DEPENDENCY SERVICES FOR SENIORS IN NYS

N.S. MacFarland, *SUNY Albany, Albany, New York*

The prevalence of alcoholism among the elderly is of growing concern in New York State and nationally. As the population of seniors continues to expand, the need to develop innovative approaches to prevention and intervention will require increased attention. The literature supports the premise that elder-specific approaches to late-life addictions can be very helpful with this specialized population. In order to gain greater insight into the treatment practices employed by providers of geriatric addictions treatment in New York State, an exploratory-descriptive, quantitative study was conducted utilizing data from the New York State Office of Alcoholism and Substance Abuse Services (OASAS). A survey of 34 programs (65 % response rate), found that treatment approaches and practices for older adults dramatically differed between programs. 69% of the programs surveyed provided heterogeneous services to seniors (meaning mixed-age groups). The emphasis in programs and services targeting seniors inclusive of all programs was on psycho education, psychiatric care, and family services. Of nine community service resources for seniors, senior centers were found to be the most utilized (45%). Of the programs surveyed, 80% acknowledged that the needs of seniors are minimally met or not met at all. Though there seems to be consensus about what works and what is important within the field, there is a lack of research addressing the numerous and varied components of addiction treatment revealed in this study. Going forward, it will be important to evaluate the degree to which services tailored specifically to seniors will foster improved treatment outcomes.

DAILY HEALTH BEHAVIORS AND STRESSOR REACTIVITY AMONG AGING ADULTS: FINDINGS FROM THE NATIONAL STUDY OF DAILY EXPERIENCES (NSDE)

M. Horn Mallers¹, S. Neupert², 1. Human Services, CSU Fullerton, Fullerton, California, 2. North Carolina State University, Raleigh, North Carolina

The present study extends current scientific understanding of the role of health behaviors, such as exercise and diet, on chronic and acute health conditions by examining how older adults' health habits are related to overall well being at the daily level. Specifically, the present study examines the relationship between daily health behaviors, stressor exposure, including arguments and overloads, and emotional and physical reactivity (risk of being in a bad mood, getting a cold). An examination of these daily experiences is critical for a more meaningful portrait of overall health and well-being. Further, by assessing intra-individual variability via hierarchical linear modeling, we are able to better tap into factors contributing to individual coping mechanisms and patterns. The present study utilizes adults aged 25-74 ($N=1031$) from the National Study of Daily Experiences (NSDE), a sub-sample taken from the Midlife in United States (MIDUS) study. Reactivity was estimated by fitting a within-person model that assesses the covariation of daily health behaviors, symptoms, mood and the occurrence of daily stressors. Analyses indicate that health behaviors play a significant role in the interrelationships between age, stressor exposure and reactivity. For example, increased amounts of daily stressors are associated with both physical symptoms and negative mood, but are moderated by sleep behaviors, as well as by age. Implications for increasing coping responses and health education efforts for older adults are discussed.

MEDICATION MANAGEMENT STRATEGIES AND BARRIERS AMONG INDIVIDUALS WITH AND WITHOUT VISUAL IMPAIRMENT

T. Munir¹, K.V. Echt^{1,2,3}, W.R. De l'Aune¹, M.D. Williams¹, C.L. Jasien⁴, L.P. Nadel¹, S. Lynch¹, 1. Atlanta VA Rehabilitation Research & Development Center, Decatur, Georgia, 2. Birmingham/ Atlanta VA GRECC, Atlanta, Georgia, 3. Emory University School of Medicine Geriatrics and Gerontology, Atlanta, Georgia, 4. Atlanta VA Health Services Research & Development, Decatur, Georgia

Effective medication management and adherence is a critical component of patient health maintenance, particularly among older adults. In this study the medication taking barriers and strategies of visually impaired and non-impaired individuals are investigated. Fifty veterans (25 visually impaired, 25 non-visually impaired), age 34 to 94 years old ($M = 64$, $SD = 14$) completed interview-based measures of demographics and medication taking barriers and strategies. Four indicators of medication management and adherence included skill for managing one's own regimen (Drug Regimen Unassisted Grading Scale; DRUGS), a novel regimen (Hopkins Medication Scale; HMS), self-reported adherence (Morisky) and an index of refill-adherence (Cumulative Medication Gap; CMG). Findings revealed that participants in both groups reported similar numbers of barriers to medication taking; however the odds of using three or more strategies for managing medications was six times greater for the visually impaired than the non-visually impaired individuals ($OR=6.0$, $CI 95\% 1.53, 23.51$). Patterns of barriers and supports emerged. For instance, visually impaired participants cited identifying pills, information on the label and consumer information as barriers to medication taking; however, assistive device use to support medication management was low (8% medication label readers, 12% CCTVs, and 32% magnifiers). The number of medication management strategies used was directly related to the DRUGS ($r = .33$) and Morisky ($r = .29$) measures and to age ($r = .29$). Greater knowledge of the barriers and strategies that facilitate effective medication management and adherence among individuals with and without visual impairment can be used to target intervention approaches.

LIFESTYLE UNIVERSITY IMPROVES CHRONIC CONDITIONS FOR OLDER SOUTH CAROLINIANS

J.B. Porth^{1,3}, V. Hirth^{1,2}, 1. Palmetto Health Geriatric Services, Columbia, South Carolina, 2. University of South Carolina School of Medicine, Columbia, South Carolina, 3. University of South Carolina College of Social Work, Columbia, South Carolina

Introduction: South Carolina (SC) is ranked fifth in the nation for rates of diabetes, fifth for obesity, and sixth for hypertension. Heart attack and stroke are the first and third leading causes of death in SC. A multi-faceted, interdisciplinary educational intervention designed for older adults with diabetes, obesity, and hypertension was instituted in urban Richland County and rural Orangeburg, Bamberg, & Calhoun Counties, SC with goal of risk factor reduction. **Methods:** 630 multiple risk factor individuals, mean age 66.63 (83% female, 74% AA) were recruited to intensive 10-week program (Lifestyle University) of didactics, small group sessions, and self-monitoring to better understand contribution of diet, physical activity, stress, social support, and medications on cardiovascular risk factor control. **Results:** Program participants demonstrated decline of 2.8 mm Hg in systolic BP ($p=0.002$) and of 3.12 mm Hg in diastolic BP ($p<0.001$). Weight decreased by 1.25 lbs. ($p<0.001$). Physical activity measures and fruits and vegetables consumption improved post-intervention (both $p<0.001$). Participants' perception of stress and stress coping also improved post-intervention by .73 points ($p=0.040$). Participants' self-rating of their health improved as well ($p<0.001$). **Conclusion:** This study suggests that behavioral change is possible and is associated with improved quality of life, BP reduction, and improved diet and physical activity in both urban and rural settings for older adults. Lifestyle University has proven itself to be a creative and successful approach to healthy aging.

SCREENING, BRIEF INTERVENTION, AND REFERRAL TO TREATMENT FOR SUBSTANCE MISUSE IN OLDER ADULTS

L. Schonfeld¹, D. Hedgecock¹, V. Burns², R. Hazlett², J. Balser², D. Duchene², 1. University of South Florida, Florida Mental Health Institute, Tampa, Florida, 2. Florida Department of Children and Families Substance Abuse Program Office, Tallahassee, Florida

Older adults misusing alcohol, medications, or other substances are vastly underserved. This presentation describes the Florida BRITE Project (BRief Intervention and Treatment for Elders), developed to address this issue by screening large numbers of older adults and providing brief interventions for those demonstrating risky use. Funded by a five-year federal grant from SAMHSA's Center for Substance Abuse Treatment under its Screening Brief Intervention and Referral to Treatment (SBIRT) initiative, elders are provided: screening and feedback if screening indicates none to low risk, brief intervention or brief treatment for moderate risk, or referral to treatment program for high risk. Unlike SBIRT grants in other states, the Florida BRITE Project is elder-specific. BRITE health educators conduct screenings at hospitals, medical clinics, health fairs, senior centers, retirement communities, and senior housing. Operating in 22 sites in 15 counties, results showed that 11,483 elders were screened in the first two years. The sample was mostly female (60%), and diverse (26% African American, 18% Hispanic/Latino), with a mean age of 71 years. Most (75%) received screening and feedback only, 19% received brief intervention (motivational interviewing, brief advice), 2% received more intensive counseling (brief treatment), and 2% were referred to substance abuse treatment due to serious problems. The primary problems were alcohol (15.6%) and prescription medications (20.7%) and most of these reported moderate to serious levels of depression. BRITE has substantially increased the number of older adults receiving services and may be sustainable beyond the life of the grant through Medicare, Medicaid and insurance payments.

AGE AND THE SOCIAL STRATIFICATION OF LONG-TERM TRAJECTORIES OF PHYSICAL ACTIVITY

B. Shaw¹, J. Liang², N. Krause², M. Gallant¹, K. McGeever¹, 1. University at Albany, Rensselaer, New York, 2. University of Michigan, Ann Arbor, Michigan

Objectives. This study assessed age-, race-, gender-, and education-based differences in trajectories of leisure time physical activity. The extent to which these differences persisted after accounting for by changing health status, social relationships, and psychological resources was also examined. **Methods.** A series of multilevel regression models were run using longitudinal data from the Americans' Changing Lives study, a national sample of over 3,000 adults, aged 25-96 at baseline, who were followed for up to 16 years. A physical activity scale was constructed to reflect how often respondents participated in activities such as gardening, exercise, and walking. **Results.** On average, rates of physical activity increased within younger adults, and decreased within middle aged and older adults, throughout the study period. Age differences in the trajectories of physical activity persisted after accounting for time-varying health, social relationships, and psychosocial resources. Also, while whites reported higher levels of activity than blacks, race differences in activity converged over time, particularly during middle and later life. Regarding gender, men reported more activity than women, and these gender differences widened over time during later life. Gender-based differences did not remain after accounting for differences in health, as well as social and psychological resources; however, race differences in the trajectories of physical activity persisted. **Discussion.** While declines in leisure time physical activity during later life were largely accounted for by aging-related changes in health, substantial race-based differences in the trajectories of physical activity during later life remained unaccounted for, perhaps indicating the influence of cultural forces.

PERSONALITY AND PHYSICAL HEALTH AMONG CENTENARIANS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

R.B. Hensley¹, P. Martin², M. MacDonald², J. Margrett², L. Poon³, 1. Psychology, The College of Saint Scholastica, Duluth, Minnesota, 2. Iowa State University, Ames, Iowa, 3. University of Georgia, Athens, Georgia

The purpose of this study was to analyze the role that personality- (Neuroticism, Extraversion, Hostility, Vulnerability, Trust, Competence, and Ideas) played in participants of the Georgia Centenarian Study. These variables were analyzed to determine whether they predicted critical physical health outcome areas such as number of hospitalizations, number of current health problems, current number of diseases, and lifetime diseases. Analyses indicated that Neuroticism was a significant predictor of current diseases, $\beta = .240$, $p < .05$. In essence, the higher the level of Neuroticism, the larger the number of current diseases. Results also indicated a statistical trend regarding Neuroticism and current health problems, $\beta = .199$, $p = .069$. The higher the level of Neuroticism, the larger the number of current health problems. In addition, Trust significantly predicted the number of current diseases, $\beta = -.322$, $p < .05$. The lower the level of trust, the higher the number current diseases. These results not only add to our understanding of the link between personality and physical health, but also provide further insight into how the relationship between these two variables affects centenarians. Future research needs to address the role of coping as a mediating variable between personality and physical health.

USING FOOD TO COPE WITH STRESS PREDICTS WEIGHT-RELATED HEALTH PROBLEMS

M.E. Ward, D. Almeida, Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania

Overweight and obesity contribute to a number of major health care concerns as people age, such as hypertension, diabetes, stroke,

osteoarthritis, respiratory problems and cancer (National Institutes of Health, 1998). Obesity is the result of a long term energy imbalance in which an individual consumes more calories than they burn. Genetics, increased availability of fast and packaged foods and decreased physical activity are the main causes of obesity (National Institutes of Health, 1998). Another potential source of obesity is how individuals cope with stressors. Problem focused and emotion focused coping have been linked to poor physical health (Aldwin & Park, 2004; Folkman, Lazarus, Gruen & DeLongis, 1986). There is a lack of research, however, linking food focused coping to physical health. This study will use 1038 participants from Projects 1 and 4 of MIDUS II to examine how using food to cope is related to weight related health, including BMI, perception of weight, the number of times one has lost 10 or more pounds in the last 10 years, and metabolic functioning. Participants are aged 34-84 ($M = 56$). Controlling for age and gender, regression analyses revealed that using food to cope is associated with higher BMI ($p < .0001$), perceiving your weight as higher than it is (controlling for BMI) ($p < .01$), losing 10 or more pounds in the last 10 years more frequently ($p < .01$), and higher HbA1c (glycosylated hemoglobin) ($p < .01$). Implications of coping for health during adulthood, including obesity, will be discussed.

TRAJECTORY CLASSES OF BODY MASS INDEX IN A REPRESENTATIVE ELDERLY COMMUNITY SAMPLE

M. Kuchibhatla¹, G. Fillenbaum^{1,2}, D. Blazer¹, H. Cohen¹, I. DUMC, Durham, North Carolina, 2. VAMC, Durham, North Carolina

Little information is available on trajectories of body mass index (BMI: weight (kgs)/height (m)²) in the elderly, although high BMI has been associated with chronic disease in younger persons. (BMI is typically categorized as underweight [<18.5], normal weight [$18.5-25$], overweight [$25-30$], obese [$30+$]). Data came from the 10-year (1986-1996) longitudinal Duke Established Populations for Epidemiologic Studies of the Elderly (D-EPESE). D-EPESE is a race-stratified random sample ($N=4,162$; 54% Black, 65% female, median education 8th grade), of persons age 65 and over in five counties (one urban, four rural) in the Piedmont area of North Carolina. In-person information was gathered at baseline, three, six and ten years later on a broad range of health and social characteristics, including self-reported weight and height. We modeled trajectory classes of BMI over 4 waves using latent class models (growth mixture models — GMM) using the statistical software M-plus. The analysis yielded 3 classes of trajectories of BMI: overweight, stable over 10 years, mean baseline BMI ~ 35 (7.7%); overweight, decreasing, mean baseline BMI ~ 35 (2.4%); and normal weight, stable over 10 years, mean baseline BMI ~ 25 (89.9%). These findings suggest 2 distinct classes among those seriously overweight at baseline, with one class at greater risk for health decline over the decade than the other. Further analyses will be carried out to identify the characteristics associated with each latent class, and in particular whether in this sample of older people, overweight is associated with incident disease, and thus decline in weight. P30AG028716, 2P50-MH60451

SESSION 485 (SYMPOSIUM)

PSYCHOLOGICAL ADJUSTMENT, WELL-BEING, AND COGNITIVE FUNCTIONING AMONG THE ELDERLY: THE WISCONSIN LONGITUDINAL STUDY

Chair: R.M. Hauser, Sociology, University of Wisconsin-Madison, Madison, Wisconsin

These five papers bring together several sources of well-being or distress and cognitive functioning among the elderly, drawing in common on a single, rich longitudinal set of data from the Wisconsin Longitudinal Study (WLS). The Wisconsin Longitudinal Study (WLS) is a long-term study of a random sample of 10,317 men and women who graduated from Wisconsin high schools in 1957 and who have been followed for more than half a century. The WLS provides an opportunity to study

the life course, intergenerational transfers and relationships, family functioning, physical and mental health and well-being, and morbidity and mortality from late adolescence through the retirement years. WLS data also cover social background, youthful aspirations, schooling, military service, labor market experiences, family characteristics and events, social participation, psychological characteristics, and retirement. The papers in this session address diverse sources of well-being — income security of widows, pre-retirement work and family trajectories, smoking behavior and cessation, religious involvement, and socioeconomic origins. Thus, they cover a range of social influences, both proximate to and distant from the post-retirement years.

SMOKING, ABSTINENCE, AND COGNITIVE FUNCTION AT AGE 65

D. Kuo, University of Wisconsin-Madison, Madison, Wisconsin

Past findings on the relationships between smoking and cognitive functions in later adulthood were inconsistent. Cognitive function in early life was not controlled in most studies. Socioeconomic status was often measured poorly. Using multivariate regression analysis to analyze cognition data collected in 2004 Wisconsin Longitudinal Study, my early study showed that current smoking status was only modestly associated with cognitive ability at age 65. However, the length of abstinence was positively related to the reasoning ability and letter fluency for all ever smokers. In the current study, I will employ structural equation models to pool all measures of cognitive ability together in order to take into account of measurement error and the latent structure of cognitive ability. The dependent variables measure cognitive functions of verbal comprehension, letter fluency, word recall, and digit ordering at age 65 in 2004. The key explanatory variables include current smoking, ever smoking, and years of smoking or abstinence. Socioeconomic status (education, occupational status, and income), drinking behaviors, major chronic diseases, growing up with smokers, and other demographic characteristics are to be controlled. The cognitive ability in adolescence was measured by the Henmon-Nelson test at freshman and junior years in high school. I attempt to answer the following questions, 1) Are the cognitive abilities significantly different between smokers, non-smokers and former smokers? 2) Do the relationships between smoking behaviors and cognitive ability depend on the dimension of cognitive ability? 3) Does the early intelligence explain the association between smoking and later cognitive ability?

RELIGIOUS INVOLVEMENT AND HEALTHY COGNITIVE AGING - ANALYSIS OF THE WISCONSIN LONGITUDINAL STUDY

K. Tanaka, J. Ho, Sociology, University of Wisconsin-Madison, Madison, Wisconsin

The link between religion and health has been studied by sociologists, epidemiologists, and clinicians, and a great deal of academic work now appears in the gerontology journals. The reason for this current interest includes the role religion continues to play in the lives of many people despite the advance of education and medicine, and the great potential that religion might play in reducing the growing financial costs of health care, and the important criticism towards the overemphasis of impersonal and routinized nature of modern health care over spiritual support. Numerous studies show the positive relationship between socially engaged lifestyles and healthy cognitive aging. However, many questions remain unanswered in understanding the relationship between religious involvement as one form of social engagement and health in later life. Van Ness and Kasl (2003) used a sample of community-dwelling men and women in New Haven and found that frequent church attendance reduced the odds of cognitive dysfunction. Hill et al. (2006) reported that older Mexican Americans who attended church more frequently showed a slower rate of cognitive dysfunction. Since most of what we know about religious involvement and cognitive functioning in later life are limited only to these studies, Hill (2008) emphasized

the importance of further research to test the association between religious involvement and healthy cognitive aging in other regions. To extend the research of church attendance and healthy cognitive function, this study uses the Wisconsin Longitudinal Study to examine whether the association holds among non-Hispanic Whites in Wisconsin.

INCOME SOURCE AND SECURITY AND PSYCHOLOGICAL ADJUSTMENT TO WIDOWHOOD AND DIVORCE IN THE U.S

K. Holden, B. Novak, *Consumer Science, Univ. of Wisconsin-Madison, Madison, Wisconsin*

This paper examines the roll of levels and characteristics of financial assets in predicting levels of psychological wellbeing among widowed and divorced older women. From the Wisconsin Longitudinal Survey (WLS) and the Health and Retirement Survey (HRS) we have a sample of women observed from marriage into widowhood and divorce. There is an extensive literature on the changes in income and assets that occur as marital status changes and another literature on the effect of marital status on psychological wellbeing. Little literature distinguishes the effects of companionship change from changes in economic resources that result from the death of an income recipient. This paper seeks to understand the separate consequences to psychological wellbeing of financial resource loss and marital status change and how financial security may modify the psychological consequences of a spouse's death or separation.

THE IMPACT OF WORK AND FAMILY TRAJECTORIES ON FINANCIAL WELL-BEING AT OLDER AGES

J. Raymo¹, J. Warren², *1. Sociology, University of Wisconsin, Madison, Wisconsin, 2. University of Minnesota, Minneapolis, Minnesota*

Using data from the Wisconsin Longitudinal Study, we examine relationships between trajectories of work and family experiences across the life course and four measures of financial well-being at ages 64-65: (a) total personal income, (b) total household income, (c) health insurance coverage, and (d) household net worth. We construct work and family trajectories using group-based trajectory modeling techniques (finite mixture models) to characterize the trajectories of family circumstances and transitions from birth through age 65 and trajectories of labor force experiences from age 36 through age 65. Preliminary estimates (conducted separately for men and women) indicate that latent work and family trajectories are significantly associated with multiple measures of financial well-being net of more temporally proximate correlates, including work and family circumstances at age 53-54. Trajectories characterized by stable full-time employment and stable marriage across the life course are particularly predictive of more favorable economic circumstances at older ages.

FATHERS' EDUCATION AND OFFSPRING'S PSYCHOLOGICAL WELL-BEING AT MIDLIFE

T. Pudrovska, J.O. Ebot, *Sociology, University of Texas, Austin, Texas*

From a life course perspective, psychological well-being of older adults cannot be fully understood without considering early-life factors that may have important implications for mental health decades later. Using data from the Wisconsin Longitudinal Study, we examine whether fathers' educational attainment is associated with offspring's sense of purpose in life at midlife. Our findings reveal that fathers' education is positively related to purpose in life among middle-aged adults. Yet, this effect of fathers' education is completely explained by offspring's own educational attainment. Individuals with well-educated fathers were more likely to obtain higher levels of education than their less advantaged peers. In turn, one's achieved education is strongly and positively associated with purpose in life even decades after the schooling was completed. Thus, our results suggest that higher socioeconomic status in the family of origin may lead directly to higher status attainment and indirectly to better mental health at midlife.

SESSION 490 (SYMPOSIUM)

SAMPLING AND RECRUITMENT ISSUES IN FAMILY CAREGIVING RESEARCH

Chair: G.C. Smith, *Education, Health & Human Services, Kent State University, Kent, Ohio*

Discussant: B.G. Knight, *University of Southern California, Los Angeles, California*

Multiple challenges and barriers exist in recruiting samples of family caregivers and care receivers for applied and basic research studies. This symposium will examine a wide range of sampling issues that investigators have currently encountered in their research, and suggestions for avoiding potential problems and facilitating the recruitment of caregiving families will be offered. Based on his experience with the REACH I and II trials with over 1,800 caregiver-care recipient dyads, Burgio identifies unique barriers and strategies to sampling and recruitment in multi-site, multi-ethnic clinical trials. Special emphasis is placed on the RE-AIM Model for translating theory to practice. McCallum and Stevens note that researchers and clinicians are failing to reach a large percentage of their target populations. In turn, they focus on the cultural, social, and individual characteristics that influence a caregiver's willingness to participate in intervention research. Pruchno, Brill, and Shands compare caregivers recruited by either a listed telephone approach or random digit dialing. They recommend the use of age-targeted listed samples as a cost-effective means for assembling representative samples of rare caregiver populations. Nanna, Smith, Egbert, and Dellman-Jenkins draw upon their randomized clinical trial investigation of an online psychoeducational support program for stroke caregivers, and present evidence on how caregiver recruitment via the Internet may be superior to direct interpersonal approaches. As discussant, Bob Knight will comment on each presentation and discuss key implications for future research and practice with family caregiver populations

USING LISTED TELEPHONE HOUSEHOLDS TO GENERATE REPRESENTATIVE SAMPLES OF RARE OLDER ADULT POPULATIONS

R.A. Pruchno, J. Brill, Y. Shands, *New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey*

Cost effective strategies for identifying representative samples of rare populations are critical for ensuring that results are valid. We examined whether a sample of women aged 50 -64 who both work and provide care to an older person generated using a listed telephone approach would generate findings similar to a sample identified using random digit dialing (RDD) procedures. Respondents identified using these two strategies were similar in terms of age, marital status, education, income, race, employment status, occupation, and supervisory status. There were no differences in caregiver burden and affect, care recipient's capacities, caregiver's role conflicts, and work experiences between the groups. Differences included care recipient's age (RDD younger) and hours of help provided (RDD more). Age-targeted listed samples are suggested as a cost-effective solution to the problem of assembling a sizeable and representative sample of respondents who are members of rare populations.

CAREGIVER RECRUITMENT CHALLENGES: HOW CAN WE HELP THE HELPERS?

E.K. Stevens, T.J. McCallum, *Psychology, Case Western Reserve University, Cleveland, Ohio*

Increasing numbers of aging persons rely on informal caregivers, and many caregivers are requesting additional support and training. However, literature review suggests that many caregivers choose not to participate in available interventions. The large numbers of caregivers who do not respond to either direct intervention referrals or general outreach attempts suggest that we, as researchers and clinicians, are failing to reach a large percentage of our target audience. What are the pri-

mary needs of the caregivers who are not participating in interventions? What are the cultural, social, and individual characteristics that influence a caregiver's help-seeking tendencies or willingness to participate in interventions? Only when professionals understand the barriers to participation can we begin to tailor our interventions to best suit those whom we aim to serve. Key factors for consideration when designing caregiving interventions and potential strategies for maximizing the effects of caregiver recruitment will be discussed.

SAMPLING AND RECRUITING ISSUES IN THE REACH TRIALS AND THE REACH OUT TRANSLATION PROJECT

L.D. Burgio, *University of Michigan, Ann Arbor, Michigan*

In The REACH I And II Trials, Over 1,800 Caregiver-Care Recipient Dyads Were Recruited Across Multiple Sites For Testing Caregiver Interventions. Equal Numbers Of Caucasians, African Americans, And Hispanics Were Entered Into These Projects. A Variety Of Recruitment Strategies Were Used, And Special Sampling Techniques Were Implemented Because Not All Sites Had Access To The Three Racial/Ethnic Groups. The REACH OUT Translation Trial Presented Special Challenges Because All Recruitment Was Done By Community Agency Personnel. Sampling And Recruitment Issues For This Translation Trial Will Be Discussed Within The RE-AIM Model For Translating Theory To Practice. After Attending This Symposium, Participants Will Be Able To Identify Strategies And Barriers To Sampling And Recruitment In Multi-Site, Multi-Ethnic Clinical Trials, And The Unique Issues Presented By Translational Trials.

RECRUITING CAREGIVING FAMILIES INTO ONLINE INTERVENTION STUDIES

K.M. Nanna, G.C. Smith, N. Egbert, M. Dellmann-Jenkins, C.A. Tomko, *Kent State University, Kent, Ohio*

A growing number of family caregiving interventions are being conducted online, however there is little information published on the best way to recruit eligible participants. Our intent was to recruit 36 dyads (male stroke survivor and female caregiver) with elevated depression and anxiety for a clinical trial of an online psychoeducational program. Initially, our strategy was to approach health care providers and organizations directly to assist us in recruiting eligible dyads. A number of barriers slowed this process considerably, and the participant yield was extremely low. We were successful in recruiting our sample, however, through online messages posted through the National Stroke Association and similar organizations (83% of eligible dyads). Advantages of Internet recruiting included: no additional IRB processes, cost-effectiveness, consistency in the recruitment message, and a wider targeted audience. Recommendations for successful recruitment using online methods will be discussed. [Funded by NINR: 5 R21 NR010189-02] * Corresponding author

SESSION 495 (PAPER)

SERVICE NEEDS OF OLDER ADULTS

ASSOCIATIONS BETWEEN CARE PLANNING INTEGRITY AND NURSING HOME RESIDENT OUTCOMES

M.J. Bott¹, B. Gajewski², R.H. Lee², U. Piamjariyakul¹, R. Taunton¹, *1. University of Kansas School of Nursing, Kansas City, Kansas, 2. University of Kansas School of Medicine, Kansas City, Kansas*

Comprehensive, individualized care plans are essential in meeting the needs of elderly residents. However, care planning processes differ in coordination, integration, interdisciplinary team, restorative perspective and quality (care planning integrity). Using Wan's paradigm for the analysis of healthcare systems as the conceptual framework, we have explored the associations between the characteristics of care planning integrity and resident physical and behavioral outcomes (weight loss, pressure ulcers, urinary tract infections, behavior that affects oth-

ers, and depression without anti-depressants). An ex post facto correlational design guided the study. Minimum Data Set (MDS) coordinators and care planning staff from 96 randomly selected nursing homes in two Midwestern states provided primary data about care planning integrity subconstructs via structured telephone interviews. Resident outcome and quality variables were obtained from MDS and OSCAR databases, respectively. Resident outcomes represented incidence or prevalence estimates using the Center for Health Services Research & Analysis formulas. Quality of the care planning process incorporated deficiency citations for 9 F-Tag regulations related to resident assessment and care planning. Structural equation modeling procedures were used to evaluate the fit of the hypothesized model to the data. Revising the proposed model using theoretical and empirical evidence resulted in a model with acceptable fit to the data (CFI = 0.92; RMSEA = 0.04, RMSEA 90% CI = 0.01-0.06). Direct relationships were demonstrated between care planning integrity and resident behavioral outcomes (behavior that affects others and depression without anti-depressants). Findings can inform the development of interventions to improve resident outcomes through the care planning process.

MENTAL HEALTH TRAINING NEEDS WITHIN ASSISTED LIVING FACILITIES: FINAL RESULTS OF A NEEDS ASSESSMENT

E.K. Dakin, L.M. Quijano, *School of Social Work, Colorado State University, Fort Collins, Colorado*

In addition to already high rates of depression, a Medicaid Mental Illness waiver in Colorado has led to a rising number of persons with mental illness as a primary diagnosis residing within assisted living facilities (ALFs). Reflective of changes such as Medicaid waivers providing for non-nursing home placements, it is believed that ALFs will increasingly be serving a resident population contending with complex mental health diagnoses such as depression, dementia complications, various anxiety disorders, and schizophrenia (Bartels, 2001). The growing level of mental health concerns and the co-housing of frail elders and persons with severe mental illness creates many challenges for assisted living staff. A needs assessment was completed to examine the education and training history and perceptions of mental health training needs among ALF administrators and direct care staff in Larimer County, CO. Results indicated that administrators largely lack the educational and professional backgrounds to adequately support staff in the growing mental health needs within ALFs, and that direct care staff possess limited educational attainment and training related to mental health issues. Despite low levels of formal education and training related to mental health, administrators and direct care staff reported an interest in mental health training for direct care staff. It also appears that administrators greatly underestimate the prevalence of mental illness within ALFs, providing further evidence of the value of such training. Therefore, the needs assessment supported the desire and need for targeted mental health training for direct care ALF staff, the next step for this project.

SURVEY OF ASSESSMENTS USED BY DRIVER REHABILITATION SPECIALISTS FOR OLDER ADULTS

A.E. Dickerson, *Occupational Therapy, East Carolina University, Greenville, North Carolina*

Over 600 surveys listing all available and known visual, perceptual, physical, and cognitive assessments used to evaluate and/screen for driving abilities were mailed to two national databases of driver rehabilitation specialists. The survey asked for respondents to indicate which assessment are used for general categories of client groups (i.e., neurological, orthopedic, older, etc.). Respondents also were asked to describe their reasoning process for decision making as well as which assessments they consider most valuable. Descriptive statistics is used to describe the frequencies of assessment use with older adults as well as specified individuals with disabilities common to older adults. Qual-

itative analysis is used to explain the clinical reasoning process of the recommendations by the driver rehabilitation specialists. Finally, demographics analysis will also yield what differences between the specialists who have different credentials (occupational therapist versus driving instructor) as well as the different types of driving evaluation programs (hospital based versus community based).

TRAVEL MODES USED BY SOUTH FLORIDA ELDERS

D.P. McCarthy, 1. *Occupational Therapy, Florida International University, Miami, Florida*, 2. *South Florida Community Mobility Research Lab, Lehman Center for Transportation Research, Miami, Florida*

Background: Young and old alike, we are dependent on transportation for accessing needed and desired goods and services, including medical and health related travel, socialization, and participation in leisure and recreational activities. As a nation, we are dependent upon the automobile as our primary mode of transportation. How elders transition from driver to passenger is an area of concern for clinicians, planners, and policy makers. Study Objective: The purpose of this study was to gather preliminary information about the driving habits and transportation alternatives knowledge and use by South Florida elders. Method: Participants aged 65 and over were recruited throughout the Miami-Dade community. Surveys were conducted to obtain information about driving status, destinations, and use of public transportation and walking as a form of transportation. Results: Eighty-one participants completed the survey. The presence of medical conditions affected the travel patterns of over 40% of the sample. Driving was the preferred method of travel and public transportation was used by 19.8%. Family and friends provided a significant number of rides, indicating a need for social supports. Food shopping, socialization, medical visits, and leisure activities were the most frequently cited destinations. Conclusion: Transportation is essential for participation in favored activities and role fulfillment. Clinicians have an obligation to address their clients' driving and transportation issues and provide referrals, interventions, and/or their involvement in the development, modification, and coordination of transportation services.

MENTAL HEALTH CONCERNS WITHIN ASSISTED LIVING FACILITIES: FINAL RESULTS OF A NEEDS ASSESSMENT

L.M. Quijano, E.K. Dakin, *School of Social Work, Colorado State University, Fort Collins, Colorado*

In addition to already high rates of depression, a Medicaid Mental Illness waiver in Colorado has led to a rising number of persons with mental illness as a primary diagnosis residing within assisted living facilities (ALFs). It is believed that ALFs will increasingly be serving a resident population contending with complex mental health diagnoses such as depression, dementia complications, various anxiety disorders, and schizophrenia (Bartels, 2001). A community needs assessment project was completed to examine administrator and staff perceptions of the nature and extent of mental health concerns within ALFs in Larimer County, CO. Overall, administrators indicated that fewer than 5% of their residents experienced mental illness, and this is inclusive of facilities in which 100% of residents have mental illness as a primary diagnosis (Quijano & Dakin, 2008). Based on prevalence data concerning rates of depression within ALFs, it is likely that this report is a drastic under-representation of true rates of mental illness within Larimer County assisted living facilities; for example, estimates of depression rates among assisted living facility residents range from 13% to 24% (Chapin & Dobbs, 2004; Watson & Lyketsos, 2006; Watson & Zimmerman, 2003). The three mental health concerns or challenging behaviors most frequently identified by direct care staff were argumentativeness (49%), angry or violent behavior (47%), and memory loss (45%), whereas the three most frequently identified by administrators were manipulative behaviors (62%), argumentativeness (57%), and agita-

tion (52%). Implications for future research and community education will be discussed.

SESSION 500 (SYMPOSIUM)

THE INFLUENCE OF NURSING HOME TOP MANAGEMENT ON FACILITY EFFECTIVENESS

Chair: N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Recent research has begun to demonstrate that top managers in nursing homes have an enormous influence on the effectiveness of their organizations. Past research, for example, has demonstrated that top management turnover is associated with poor quality of care and with high caregiver turnover. The top managers most often examined are nursing home administrators (NHA) and Directors of Nursing (DON). Further understanding the relationship between characteristics of top management and organizational effectiveness may be important because it represents a potential means of improving the care and operations of nursing homes. In this symposium, we further examine the relationship between nursing home top management characteristics and various outcomes. This includes examining: 1. job tenure of top managers and resident outcomes; 2. leadership characteristics of top managers and quality; 3. how top management turnover influences the performance of nursing homes; and, 4. the influence top managers have on resident safety culture.

TOP MANAGEMENT LEADERSHIP CHARACTERISTICS AND QUALITY

N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

The association between leadership strategies of Nursing Home Administrators (NHAs) and Directors of Nursing (DON) on quality of care is examined. The Bonoma-Slevin leadership model is used, that defines leaders as Consensus Managers, Consultative Autocrats, Shareholder Managers, or Autocrats. Leadership information came from primary data collected from more than 2,000 top managers. This data was linked to Nursing Home Compare Quality Measures, OSCAR and ARF data. The multivariate results show that leadership style was associated with several Quality Measures. Moreover, an interaction influence existed, whereby similar leadership strategies for both NHA and DON were most beneficial. This analysis shows the importance of leadership on quality in nursing homes. Moreover, unlike many organizational or environmental conditions, leadership strategies are amenable to change.

JOB TENURE OF NURSING HOME TOP MANAGEMENT, PRESSURE SORES, PAIN MANAGEMENT, AND RESTRAINT USE

F.H. Decker¹, N. Castle², 1. *National Center for Health Statistics, Hyattsville, Maryland*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

We investigated the association between quality of care and the job tenure of nursing home administrators (NHAs) and directors of nursing (DONs). Data sources were the 2004 National Nursing Home Survey and quality measures from resident assessment data. Our study focused on NHAs and DONs with one year or more tenure. Dependent variables were pressure sores, pain management, and restraint use. Each regression model included a one-year lagged variable of the dependent variable as well as other relevant control variables (including staffing, facility, and resident characteristics). Among NHAs (n=787), increasing tenure was associated with a decrease in residents experiencing pain (p=.014) and marginally decreased pressure sores (p=.060). Among DONs (n = 703), increasing tenure was associated with a decrease in pressure sores (p=.008) and pain (p=.025) and marginally decreased restraint use (p=.057). Increasing job stability among NHAs and DONs is important, and may be associated with better quality outcomes.

RESIDENT SAFETY CULTURE IN NURSING HOMES: ASSESSMENT OF DIRECTORS OF NURSING

N. Castle, J. Ferguson, *University of Pittsburgh, Pittsburgh, Pennsylvania*

In this research, we examine the responses of more than 2,000 Directors of Nursing (DON) to a newly developed nursing home specific survey instrument to assess patient safety culture (PSC) in nursing homes. The Nursing Home Survey on Patient Safety Culture (NHSPSC) was used to assess PSC. The DON response rate to this survey was 62%. The aggregate NHSPSC scores for the 12 domains show that most DON report a poor PSC in their facilities. Organizational characteristics, such as staffing levels and occupancy were associated with PSC scores. Characteristics of DONs were also associated with PSC scores, such as tenure and training. Although not causal, some of these characteristics may represent an opportunity to influence PSC. Moreover, influencing PSC may be important as the PSC scores were also associated with several quality indicators. PSC may have a significant impact on quality of care and quality of life for residents.

TOP MANAGEMENT TURNOVER AND QUALITY IN NURSING HOMES

M.K. Lin, N. Castle, *Health Policy and Management, University of Pittsburgh, Pittsburgh, Pennsylvania*

To examine the relationship between top management (i.e., Nursing Home Administrator [NHA] and Director of Nursing [DON]) turnover and quality of care in nursing homes, we collected 2003 staffing data from 2,840 facilities and linked them to fourteen Nursing Home Compare quality measures. We developed structural equation models to assess the direct and indirect relationships among turnover, the number of staff, the types of staff, and the quality measures. Our results indicate top management turnover systematically affects quality through nurse staffing levels and the use of agency staff. Across all 14 quality measures, an increase in DON turnover is associated with a decrease in registered nurse (RN) staffing levels and an increase in the use of nurse aide (NA) agency staff, while an increase in NHA turnover is associated with an increase in both RN staffing levels and NA agency staff. Across all quality measures, the use of NA agency staff is associated with an increase in quality of care concerns. Similarly, increased nurse staffing levels are associated with a decrease in the use of NA agency staff. For several quality measures higher NHA turnover is associated with poorer quality. In contrast, higher DON turnover is associated with better quality for several quality measures.

SESSION 505 (SYMPOSIUM)

THE SEATTLE LONGITUDINAL STUDY: UNIQUE OPPORTUNITIES FOR DEVELOPMENTAL INQUIRY

Chair: D. Gerstorf, *Department of Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

Discussant: K. Schaie, *Department of Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

The Seattle Longitudinal Study (SLS) is one of the longest ongoing studies in the social and behavioral sciences. The study has revealed key insights into a large variety of developmental phenomena and contributed tremendously to our understanding of the structure, sequencing, and mechanisms underlying developmental change. The major objective of this symposium is to highlight how the many unique features of the study continue to provide a highly important source for contemporary and future inquiry. N. Ram provides an overview of the study's design, highlighting some of the unique strengths of the study that have and shall provide for unique opportunities for developmental research. D. Gerstorf draws from the cohort feature of the study and moves the typical study of cohort differences from cognitive aging to

aging in other domains (well-being, personality) and to examining cohort differences in the experience of dying. C. Hoppman illustrates use of the dyadic aspects of the study and reports considerable spousal similarities in well-being both for level and 35-year change. M. Martin utilizes the multi-occasion feature of the study and demonstrates similarities and differences in within-person and between-person structures of cognitive development across adulthood. The discussion by Warner Schaie will integrate the four empirical papers and discuss various types of research with the SLS that promise further understanding of lifespan development.

THE SEATTLE LONGITUDINAL STUDY: CLASSIC, EFFICIENT DESIGN – ELEGANTLY HIP AND GETTING BETTER WITH AGE

N. Ram, D. Gerstorf, *Pennsylvania State University, University Park, Pennsylvania*

The SLS began in 1956 as a cross-sectional study examining differential patterns of intellectual functioning across age. Inspired by the longitudinal studies of early life, a second wave was conducted – for replication and to obtain the benefits of short-term longitudinal data. The classic, efficient, cohort-sequential design emerged as a theoretical model to explain discrepant results. As the short-term longitudinal study grew into a long-term one, its scope was continuously expanded. Pioneering efforts in recruiting multiple cohorts, spousal dyads and several generations of family members as well as genotyping and obtaining health histories and neuropsychological measures, among other factors, make the SLS an even more sophisticated, hip, and increasingly valuable resource for the study of adult development and aging. In this paper, we highlight how, as the study and its participants continue to develop, unique aspects of the design and data collections will allow for elegant articulations, testing, and understanding of aging.

THE MULTIDIMENSIONAL NATURE OF PSYCHOLOGICAL CHANGE ACROSS ADULTHOOD AND OLD AGE: COHORT DIFFERENCES IN AGING AND DYING

D. Gerstorf, N. Ram, *Department of Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

Lifespan and gerontological research has long been interested in better understanding how and why successive cohorts differ in key functional characteristics. Typically, later-born cohorts have been found to be cognitively and physically fitter than earlier-born cohorts when being examined at the same age range, although noteworthy exceptions have been documented as well. Much less is known, however, about cohort differences in other functional domains such as personality or whether the rate of change is altered between successive cohorts. We replicate and extend earlier reports from the SLS (Schaie, 2005) by using growth curve analyses to demonstrate that later-born cohorts (born 1914-1941) show consistently shallower age-related declines between 50 and 80 years of age on measure of fluid and crystallized abilities as well as personality than do earlier-born cohorts (1886-1913). We will also report initial evidence to suggest that cohort differences exist in the experience of dying.

THE WITHIN- AND BETWEEN-PERSON STRUCTURE OF INTELLECTUAL DEVELOPMENT ACROSS THE LIFESPAN

M. Martin, D. Zimprich, *University of Zurich, Zurich, Switzerland*

Individuals' cognitive aging is a lifelong process, but even longitudinal studies examining aging typically span shorter timespans than the phenomenon of interest. Thus, although the aim of many developmental models is to describe and explain within-person changes across the lifespan, empirical findings are mainly based on interindividual differences data or the between-person age-range is substantially larger than the within-person age range. The SLS (Schaie, 2005) is unique in allowing to compare within- and between-person structures of longitu-

dinal change over several decades. We present results from multilevel factor analyses comparing the structure of change in intellectual functioning over 28 to 42 years within and across individuals. The results suggest that these structures are not identical and shed new light on common cause and dedifferentiation theories of intellectual aging.

SPOUSAL INTERRELATIONS IN LIFE SATISFACTION WITHIN THE SLS: HIGH SIMILARITIES IN LEVELS AND CHANGE OVER TIME

C. Hoppmann¹, D. Gerstorff², S.L. Willis³, W. Schaie³, *1. Psychology, University of British Columbia, Vancouver, British Columbia, Canada, 2. The Pennsylvania State University, University Park, Pennsylvania, 3. University of Washington, Seattle, Washington*

Development does not take place in isolation and is often interrelated with close others such as marital partners. This may be particularly true in old age when networks decrease and spouses attempt to optimize the emotional climate in their relationships. The present study uses 35-year longitudinal information from both members of the couple to address interrelations among spousal life-satisfaction trajectories across midlife and into old age. Latent growth curve models show moderate associations in spousal life satisfaction levels. Interestingly, findings further demonstrate high spousal similarities in life satisfaction changes over time. Results are in line with propositions by lifespan scholars emphasizing an interactive minds perspective by showing that adult life satisfaction waxes and wanes in close association with the respective spouse. These findings complement past individual-centered work on age-related changes in wellbeing by pointing to the importance of using the couple as the unit of analysis.

SESSION 510 (SYMPOSIUM)

ALTERNATIVE AND COMPLEMENTARY THERAPIES FOR HEALTHY AGING

Chair: *N.E. Richeson, College of Nursing and Health Professions, University of Southern Maine, Portland, Maine*

Discussant: *S.C. Burgener, University of Illinois Urbana Champaign, Urbana Champaign, Illinois*

The purpose of the symposia is to examine complementary and alternative therapies (non-traditional methods of treatment) for healthy aging. The National Center for Complementary and Alternative Medicine reports that 38% of adults in the United States utilize complementary and alternative medicine (CAM). CAMs offer an alternative or adjunct therapy that has lower risk of adverse side effects, and offer a new perspective: healing the patient rather than simply treating them. Quality of life must be considered; more medications and medical interventions do not always equal increased quality of life. The interventions presented in these symposiums promote a holistic approach (mind, body, and spirit) to wellness. The symposia will highlight four interventions. Reiki, an energy medicine intervention has been shown to effect of pain, depression, and anxiety in community-dwelling older adults. An Animal Assisted Therapy intervention was tested and found to have positive effects on passivity and mood for difficult to engage residents in a rural nursing home. A bedside Brain Fitness intervention was used with nursing home residents and found to positively effect functional outcomes of attention, organized thinking, and cognition for nursing home residents with delirium. Lastly, a cranial electrical stimulation intervention was used to lessen sleep disturbances and depressive symptoms in older adult caregivers for persons with dementia. In all interventions the effectiveness of complementary and alternative therapies on the lives of older adults will be emphasized.

A PILOT STUDY OF THE USE OF REIKI IN COMMUNITY DWELLING OLDER ADULTS

N.E. Richeson, J.A. Spross, K. Lutz, *College of Nursing and Health Professions, University of Southern Maine, Portland, Maine*

The purpose of this research study was to evaluate the effect of Reiki as an alternative and complimentary approach to treating community dwelling older adults who experience pain, depression, and/or anxiety ($M = 63.8$, $SD = 4.9$). The subjects ($N=20$; 12 females and 8 males) were randomly assigned to an experimental or waitlisted control group. The pre and posttest measures included the Hamilton Anxiety Scale (HAM-A), Geriatric Depression Scale – Short Form (GDS-15), Faces Pain Scale (FPS), and heart rate and blood pressure. The eight week intervention is based on the transactional model of stress and coping. A mixed method research design using experimental as well as qualitative methods was used to examine the effects the Reiki intervention on outcomes. Significant changes post-treatment were found for pain, depression, and anxiety, while no changes in heart rate and blood pressure were noted. The qualitative findings reported the emergence of four broad themes: relaxation; improved physical symptoms, mood and well-being; curiosity and a desire to learn more, enhanced self-care, and sensory and cognitive responses to Reiki.

ANIMAL ASSISTED THERAPY: RESULTS FROM A RURAL NURSING HOME RECREATION THERAPY OUTREACH PROJECT

L. Buettner, *University of North Carolina at Greensboro, Greensboro, North Carolina*

Animal Assisted Therapy (AAT) draws on the bond between animals and humans in order to aid in the improvement of an individual's function and is being increasingly used in various therapeutic environments. Many nursing care, assisted living, and retirement living facilities incorporate pet visitation programs as social visits but the purpose of this intervention study was to provide a head to head pilot clinical trial of AAT as compared to recreation therapy without an animal to "difficult to engage" nursing home residents in a rural NC. Twenty consenting participants were assigned to either an AAT experimental group or a Recreational Therapy (RT) control group. AAT and RT were conducted for the respective groups during six weekly visits over a six week period. AAT was shown to significantly decrease passive behaviors and significantly improve mood. The traditional recreation therapy control group did show improvements but none were significant.

CRANIAL ELECTRICAL STIMULATION: POTENTIAL USE FOR DISTRESSING SYMPTOMS IN OLDER ADULT CAREGIVERS

K. Rose, *University of Virginia, Charlottesville, Virginia*

Family members provide the majority of care to persons with dementia. Unpaid family caregivers will likely continue to be the largest source of long-term care services in the U.S. and are estimated to reach 37 million caregivers by 2050, an increase of 85% from 2000 (Health and Human Services, 2003). Yet, effective interventions for sleep disturbances and depressive symptoms that family caregivers routinely experience are limited. This study tested the effects of cranial electrical stimulation (CES) in lessening sleep disturbances and depressive symptoms in community-dwelling older adult caregivers of persons with dementia (Rose, Taylor, Bourguignon, Utz, & Goehler, 2009). Results from this double-blind, randomized, controlled trial ($n = 38$) will be presented, as will a review of CES, its proposed mechanism of action, and potential uses in persons with dementia. Data from this study suggest that CES may be an effective treatment strategy for older adult caregivers.

COG-RT: IMPACT OF BEDSIDE BRAIN FITNESS ON FOCUS AND FUNCTIONAL OUTCOMES IN REHABILITATION PARTICIPANTS

L. Buettner, S. Fitzsimmons, *University of North Carolina at Greensboro, Greensboro, North Carolina*

With MDS 3.0 offering Medicare eligible clients the opportunity for physician ordered, time limited, recreation therapy the aim of this study was to produce and evaluate a specific cognitive protocol for use with older adults with delirium upon entering the nursing home for rehabilitation. This study explored the potential use of 36 specific structured brain fitness exercises (Fitzsimmons, 2008) provided bedside for improving the attention, organized thinking, cognition, and overall function. In this randomized pilot of 20 older adults 10 participants received usual care and 10 participants received a daily 30-minute brain fitness session until confusion was resolved. Detailed data was collected on engagement levels, cognitive and functional outcomes for both groups. Measures included the MMSE, CAM, Barthel Index, and a variety of rehabilitation outcomes. Evidence suggests that challenging and evidence based cognitive exercises should be a key component of every nursing home rehabilitation program.

SESSION 515 (PAPER)

CHRONIC DISEASE MANAGEMENT AND OUTCOMES

THE SYMPTOM OF HEARING LOSS: EXPLANATORY POTENTIAL OF THE SYMPTOM MANAGEMENT THEORY

M.I. Wallhagen, W. Strawbridge, *Physiological Nursing, University of California, San Francisco, San Francisco, California*

Purpose: Hearing loss (HL), the subjective experience of hearing impairment, is a common symptom affecting approximately 50% of individuals 75 and older, and associated with negative outcomes. Few data are available on this experience and how it affects and is affected by close relationships. This information could inform interventions to maximize healthy, engaged aging. Method: 4 year longitudinal qualitative study explored the experience of HL in older adults and their communication partners (CP) (spouse, adult child, close friend). Individuals with untreated HL were recruited and identified a CP. Interviews occurred concurrent with a hearing evaluation (baseline), 3 months, and 12 months, were audio-tape recorded, transcribed verbatim, and analyzed using grounded theory techniques. Evolved concepts and themes were explored within the Symptom Management Theory (SMT) to assess whether the theory facilitated further understanding to guide interventions. Results: 91 dyads were interviewed at baseline. Emerging themes and concepts included perceived stigma, perceived severity, expectations of hearing aids and treatment, prior experiences, strategies to deal with HL, motivators, impact, and external factors. Themes and concepts fit within the three major components of the SMT, although the "components of management strategies" was less well defined. Conclusions: The SMT provided a valuable conceptual frame for parsing and organizing emerging concepts and themes, and providing insights into potential relationships. Limitations identified included how to incorporate the contextual embeddedness of the experience and how to capture changing experiences across time. Identified limitations provide insights into how the theory might be revised.

TIGHT GLYCEMIC CONTROL CONFERS ENHANCED SURVIVAL IN ELDERLY INTENSIVE CARE UNIT (ICU) PATIENTS

A. Rabiee^{2,1}, P. Galiatsatos¹, V.M. Andreasik¹, B.R. Gibson¹, D.K. Andersen¹, C. Christmas², D. Elahi^{1,2}, *1. Johns Hopkins Bayview Medical center, Department of Surgery, Baltimore, Maryland, 2. Johns Hopkins Bayview Medical center, Department of Medicine, Baltimore, Maryland*

Objective: Intensive insulin therapy (IIT) in critically ill ICU patients has been shown to normalize blood glucose and reduce mortality in most studies, but glycemic control in elderly ICU patients has received little attention. We examined the efficacy of IIT in elderly Surgical (SICU) and Burn ICU (BICU) patients with respect to sepsis and mortality. Methods: 2252 patients were admitted to our SICU/BICU during an 18 month period; 650 (29%) were 65 years of age or older. Of the 2252 patients, we studied 58 who received IIT for at least 72 hours, of which 27 were ≥ 65 years. The subjects were dichotomized to tight control (mean blood glucose (BG) <150 mg/dl on day 3) and poor control (BG >150 mg/dl). Results: Mortality in the SICU was higher in the elderly compared to young (43% vs. 7%, $p<.03$), despite similar rates of sepsis (56 % vs 48%). In the elderly only 44% of patients achieved tight glycemic control vs 71% in the young, but mortality in the elderly who achieved tight glycemic control was only 8% compared to 67% in the poorly controlled group ($p=.007$). Sepsis was associated with 77% of deaths overall, but tight glycemic control was associated with a reduction in the mortality from sepsis, which was especially pronounced in elderly patients. Conclusions: Tight glycemic control is harder to achieve in elderly ICU patient than in the young, perhaps due to insulin resistance, but the survival from septic events is increased in elderly critically ill patients when tight glycemic control is achieved.

LONELINESS, DEPRESSION, SOCIAL SUPPORT, AND QUALITY OF LIFE IN CHRONICALLY ILL OLDER APPALACHIANS

L.A. Theeke, *Health Restoration, WVU School of Nursing, Morgantown, West Virginia*

The purpose of this cross-sectional pilot study is to understand the relationship between psychosocial factors and chronic illness indicators in older Appalachians. A sample of 60 older Appalachian adults was interviewed using the UCLA Loneliness scale, the Geriatric Depression Scale, the Katz ADL Scale, the MMSE, the MOS Social Support Scale, the CASP-12 quality of life assessment, a demographic data collection form and the SF-36. Medical record data was then obtained for chronic illness diagnoses, medication use, fasting glucose, Hgb A1C, Blood Pressure, Pulse, Height Weight, lipid panels, creatinine, and estimatedGFR,. Descriptive and bivariate analyses were conducted using SPSS to evaluate for relationships between loneliness, depression, social support, and quality of life and these specific chronic illnesses and their control indicators. Results of this study further our knowledge regarding the incidence of loneliness and depression, self-reported perceptions of quality of life, and the importance of functional ability to older Appalachians when the sample experienced very high incidences of multiple chronic illnesses and complicated medication regimens. Future research plans include the design and testing of an individualized intervention for loneliness, future study of the effect of an online chronic disease self-management program on chronic illness control indicators, loneliness and social support; and the contribution of interacting psychosocial factors to depression and suicidal ideation.

THE ROLE OF METABOLIC CONTROL ON COGNITION IN OLDER DIABETICS WITH MILD COGNITIVE IMPAIRMENT

A.M. Abbatecola, G. Paolisso, *Geriatric Medicine & Metabolic Disease, Second University of Naples, Italy, Naples, Italy*

Type 2 diabetes mellitus (T2DM) has been consistently associated with a higher risk of cognitive decline, especially Mild Cognitive Impairment (MCI). Such findings suggest that T2DM can predict cognitive impairment through mechanisms affecting the amyloid accumulation or indirect mechanisms, namely cerebrovascular disease. Considering that insulin resistance (IR) is a critical component in the causal pathway to cognitive impairment, the objective of our study was to test the association of IR on the variation of cognitive performance in older person with T2DM in poor metabolic control and MCI (n=97) in diverse anti-diabetic oral treatments: metformin (1000mg/day) (n=30), metformin (500mg/day) + rosiglitazone (4mg/day) (n=32) or in diet therapy (n=35), over a 36 observation week period. The neuropsychological battery consisted of the mini mental state examination (MMSE), rey verbal auditory learning total recall (RAVLT), trail making tests (TMT) which was performed at baseline and every 12 weeks for 36 weeks along with biochemical and clinical testing. Metabolic control parameters (fasting plasma insulin (FPI), fasting plasma glucose, HbA1c) significantly improved in metformin and the metformin+rosiglitazone groups only. Metformin+rosiglitazone group maintained cognitive stability on all cognitive tests, while the other groups (metformin and diet) showed a significant decline in TMTB and RAVLT over time. Using linear mixed effects models the decline FPI levels was independently associated with cognitive stability in the memory test in the group in treatment with metformin + rosiglitazone. Conclusion: These findings suggest that an improvement in IR in older persons with T2DM and MCI may protect against cognitive decline.

NONVERBAL COMMUNICATION ACCURACY: PARKINSON DISEASE COUPLES COMPARED TO MATCHED, WELL-ELDER COUPLES

T. Deshefy-Longhi^{1,2}, L.L. Davis², *1. Center for the Study of Aging and Human Development, Duke University Medical Center, Durham, North Carolina, 2. Duke University School of Nursing, Durham, North Carolina*

Nonverbal (NV) communication is critical to expressing and interpreting emotional intentions, leading to social competency and caring relationships. It may be especially important for elders given the potential for reduced sensory acuities and chronic progressive illnesses like Parkinson disease (PD). Our aim was to compare nonverbal communication accuracy of PD couples to that of matched well-elder couples. The Marital Communication Scale for PD (MCS-PD) was administered to 33 PD and 23 well-elder couples in their homes. PD elders and matched well-elders were filmed sending their partners 27 messages (9 messages each with 3 emotional intentions—positive, neutral, negative). Verbal content was controlled. Partners assessed emotional intention using mates' NV cues. Data also were collected on relationship length and satisfaction. PD partners' mean MCS-PD scores (12.9, SD=3.1) were significantly lower than well-elder partners' scores (18.4, SD=3.6; $p < .001$). PD partners also identified significantly fewer positive and negative messages compared to neutral messages ($p < .001$). Both PD and Well-Elder partners evidenced a significant negative correlation ($p < .05$) between MCS-PD scores and relationship length. PD partners' lower overall accuracy and reduced accuracy in identifying positive and negative messages compared to well-elders suggest a critical limiting effect of PD on nonverbal communication, putting the couple at risk for consequential miscommunication and social isolation. Furthermore, the association of lower accuracy with longer relationships may compound PD care partner fatigue or distancing. If risk of compromised NV communication can be identified, PD couples can be coached in alternative expressions of communication.

SESSION 520 (PAPER)

COGNITION - HS PAPER SESSION

FACTORS ASSOCIATED WITH COGNITION IN ADULTS USING DATA FROM THE SEATTLE LONGITUDINAL STUDY

F. Yu¹, L. Ryan², K. Schaie³, S. Willis³, A.M. Kolanowski³, *1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. University of Michigan, Ann Arbor, Michigan, 3. The Pennsylvania State University, University Park, Pennsylvania*

Cognition is critical for maintaining activities of daily living and independence in older adults who are at increased risk for cognitive impairment and dementia. Understanding factors that affect cognition will likely facilitate intervention development to prevent cognitive decline and its associated health and social consequences, e.g., functional disability, loss of independence, poor quality of life, increased risks for hospitalization and institutionalization, and high health care expenditure. The purpose of this study was to examine the association of four factors (leisure-time physical activity, leisure-time cognitive activity, work control, and hypertension) with changes in two aspects of cognition (verbal memory and inductive reasoning). This study is a secondary analysis of data generated from the Seattle Longitudinal Study (SLS). The SLS uses a successive cohort design, with the first cohort recruited in 1956. Follow-ups occurred every seven years with new samples added at each follow-up. Using multi-level modeling, data for 626 eligible adults who were followed from 1984 to 1998 were analyzed in this study: average age of 53 years in 1984, 15 years of education, 95% white, 56% female, and 50% with income of $\geq \$28,000$ ($= \$73,360$ in 2008). Higher work control was associated with better verbal memory ($p < .05$) and inductive reasoning ($p < .01$), while leisure-time physical activity, cognitive activity and hypertension were not. There were no significant interactions among the four factors. The findings imply that even for people who are socioeconomically advantaged, a strong sense of work control may be protective for cognition in old age.

VITAMIN D DEFICIENCY AND COGNITIVE DYSFUNCTION IN OLDER ADULTS

D.J. Llewellyn¹, K.M. Langa², I. Lang³, *1. Institute of Public Health, University of Cambridge, Cambridge, Cambridgeshire, United Kingdom, 2. University of Michigan, Ann Arbor, Michigan, 3. Peninsula Medical School, Exeter, United Kingdom*

Background: Vitamin D deficiency is highly prevalent in older adults and is associated with fractures, various chronic conditions and mortality. Cognitive dysfunction and dementia are also common in older adults, although their etiology remains unclear. Vitamin D may help to prevent neurodegeneration as it plays an important role in the expression of neurotrophic factors, neurogenesis, calcium homeostasis, and detoxification. Findings: Small clinical studies provide equivocal evidence linking low serum 25-hydroxyvitamin D [25(OH)D] to cognitive dysfunction. McGrath and colleagues observed no linear association between serum 25(OH)D and verbal memory in 4809 noninstitutionalized older adults from the Third National Health and Nutrition Examination Survey (NHANES III). However, Llewellyn and colleagues recently observed a significant association between low 25(OH)D and increased odds of cognitive impairment in 1766 older adults from the Health Survey for England (HSE). Dhese and colleagues found that vitamin D supplementation was associated with improved choice reaction times after 6 months in 139 ambulatory participants with a history of falls. Similarly, Przybelski and colleagues observed a small improvement in clock drawing performance following vitamin D supplementation, though not verbal fluency, over 4 weeks in 25 nursing home residents who were 25(OH)D deficient at baseline. Conclusions: No prospective population-based studies have examined vitamin D status in relation to cognitive decline or dementia. Further evidence from well-designed trials is also needed. If vitamin D deficiency is causally

related to cognitive dysfunction then this would be of major public health significance as oral vitamin D supplementation is well tolerated, effective and economical.

TARGETED INTERVENTIONS IN OLDER ADULTS EXPERIENCING MILD COGNITIVE IMPAIRMENT

M.S. Anderson¹, D.L. Morris², G.J. McDougall², M. Wykle², 1. *Carilion Clinic Center for Healthy Aging, Roanoke, Virginia*, 2. *Case Western Reserve University, Cleveland, Ohio*

The purpose of this descriptive, correlational study was to describe three domains of function (physical, affective, cognitive), and the targeted interventions of an interdisciplinary team in outpatient MCI patients in a Center for Healthy Aging in Virginia at intake, 12, and 24 months. This secondary analysis evaluated patterns of change in function and interventions over time utilizing established criteria for MCI (Peterson, 2001; Winblad et al., 2004) emphasizing self-management and delay of decline. Interventions are described within categories of functional performance on 3 measures. Measures included the IADL (Lawton and Brody, 1969), the GDS (Yesavage et al., 1983), and memory and cognitive function with subscales of the Rey Auditory Verbal Learning Test (AVL), the Wechsler Memory Scale-Revised (WMS-R) for Logical Memory, and the CLOX 1 (Royall, 1998) drawing. Interventions targeted to MCI patients were categorized from chart audit to physical, affective, or cognitive domain of function and interventions categorized as primary, secondary, or tertiary levels of prevention. The sample of 36 patients (mean age 73.08) had a 16.7% conversion to dementia within the 24 months. The remaining 30 patients demonstrated significant changes in affective function; depression improved at 12 months. Cognitive function showed significant change on 1 of the 3 measures, the CLOX 1 demonstrated significance in the pairwise comparisons between intake and 12 months. Implications for practice include routine screening for memory and mood in older adults. The targeted interventions provide potentially beneficial care in preventing or delaying conversion to dementia and offer opportunities for self management.

ARTERIAL STIFFNESS AND DOMAIN-SPECIFIC COGNITIVE DECLINE IN WELL-FUNCTIONING OLDER ADULTS

N. Watson¹, K. Sutton-Tyrrell¹, C. Rosano¹, R. Boudreau¹, E. Simonsick², K. Yaffe³, S. Satterfield⁴, A.B. Newman¹, 1. *Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *University of California, San Francisco, California*, 4. *University of Tennessee, Memphis, Tennessee*

Some regions of the brain are particularly sensitive to hypertension, suggesting that central arterial stiffness as measured directly may affect some cognitive domains more than others. We evaluated the relationships of pulse wave velocity (PWV), a measure of arterial stiffness, with cognitive function and decline in the Health, Aging and Body Composition Study Cognitive Vitality Substudy (mean age \pm SD 75.3 \pm 2.7 years, 48% men, 49% black). Cross-sectional analyses included 552 participants with baseline PWV and cognitive data at Year 3 after excluding those with evidence of cognitive impairment (N = 75) or decline (N = 100). Of the 552 participants, 406 completed cognitive testing at Year 9 and were included in analyses of cognitive decline. PWV (cm/s) was measured at baseline via Doppler-recorded carotid and femoral pulse waveforms. Multiple cognitive domains were evaluated over six years. Each 1-SD higher PWV was cross-sectionally associated with lower cognitive function: -0.11 SD for global function (p = 0.003); -0.08 SD for psychomotor speed (p = 0.04), and -0.10 SD for perceptual speed (p = 0.009) after adjustment for demographics, BMI, physical activity, smoking, heart rate, systolic blood pressure and comorbidities. Higher PWV was further associated with greater decline in psychomotor speed, defined as >1 SD from the mean change: OR 1.34 (95% CI 1.03, 1.75). PWV was not associated with verbal memory cross-sectionally or decline in global function, verbal memory or perceptual speed. Arterial stiff-

ness may preferentially affect frontal-subcortical regions that mediate psychomotor speed.

TARGETED MEMORY TRAINING FOR FRAIL ASSISTED LIVING RESIDENTS

K.N. Williams, *School of Nursing, Kansas University Medical Center, Kansas City, Kansas*

Targeted interventions are critical to efficiently achieving desired clinical outcomes. This pilot study interviewed frail assisted living (AL) residents to elicit their specific memory challenges and concerns. A 6-session tailored intervention targeting memory skills important for AL living, emphasizing remembering names was developed and pilot tested with seven volunteer residents. Participant responses on the Memory Complaint in Age-Associated Memory Impairment Questionnaire (MAC-Q) were significantly higher after the training program (paired t-tests ranged from $t=2.67-7.906$, $p = .001-.043$) for self-efficacy in remembering names, phone numbers, lists of items, and facts. Objective memory improvement measured using the Rivermead Behavioral Memory Test was not statistically significant. However, 43% of participants improved in remembering first and/or last names. Ongoing testing on larger samples should assess the maintenance of memory abilities over time as well as effects on daily functioning and length of stay in AL.

SESSION 525 (PAPER)

CULTURES OF CARE

HOW NURSING HOME CULTURE INFLUENCES FEEDING TUBE USE FOR RESIDENTS WITH ADVANCED DEMENTIA

R. Lopez¹, E. Amella², N. Strumpf³, S.L. Mitchell⁴, 1. *MGH Institute of Health Professions, Boston, Massachusetts*, 2. *College of Nursing Medical University of South Carolina, Charleston, South Carolina*, 3. *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*, 4. *Hebrew SeniorLife Institute for Aging Research and Department of Medicine of the Beth Israel Deaconess Medical Center, Boston, Massachusetts*

There is no evidence supporting the use of feeding tubes for individuals with advanced dementia, yet one-third of nursing home (NH) residents with advanced dementia have feeding tubes. Researchers found large geographic and racial variability as well as clinical and facility factors associated with feeding tube use. Less is known about why they are used in some NHs and not others. The purpose of this ethnographic study was to explore the culture of two NHs in a southern state where rates of feeding tubes are high. Two NHs were purposefully selected with high ($>40\%$) and low ($<10\%$) rates of feeding tube use. Data describing physical structure, mealtime and decision making processes, and explicit, as well as implicit, views were collected through 80 hours of direct observation, semi-structured interviews with 24 key stakeholders, and document review. Qualitative analysis revealed differences in each category. In the low rate NH, the physical environment was pleasant; mealtime processes were well staffed; families were involved early in feeding decisions; the explicit and implicit views were family centered, and the organization valued hand feeding residents with advanced dementia. In contrast, the physical environment in the high rate NH was unpleasant; mealtimes were poorly staffed; families were involved late in feeding decisions; the implicit value was recovery, and the organization implicitly valued feeding tubes to prevent aspiration and meet regulations. Findings hold important implications for practice, policy, and future research.

BUILDING A MODEL OF QUALITY CARE FOR THE HOSPITALIZED OLDER ADULT

M. Boltz, E. Capezuti, N. Shabbat, *New York University College of Nursing, New York, New York*

Despite the fact that older adults constitute the majority of patients in the acute care setting, very few hospitals have implemented system-wide initiatives designed to meet their specialized needs. These organizational shortfalls compound the older patient's vulnerability to hospital-associated complications. The development of a comprehensive organizational model is an essential step toward disseminating measurable, effective, and replicable organizational best practices around care of older adult patients. Web-based concept mapping techniques were used to engage hospital staff in multiple levels and disciplines, national experts, researchers, and consumers (a total sample of 458) in defining the core components of a comprehensive system-wide program designed to improve the quality of care provided to hospitalized older adults. Multidimensional scaling and hierarchical cluster analysis yielded an outcome logic model which described the following components of quality: aging-responsive leadership, an aging-sensitive social and physical environment, gerontologic-specific interdisciplinary staff development, and a multi-focal approach to measuring quality.

PROMOTING PERSONHOOD AMONG NURSING HOME RESIDENTS LIVING WITH DEMENTIA

B. Buron, *1. Nursing, University of Arkansas, Fayetteville, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, AR, Arkansas*

The purpose of this pretest-posttest, quasi-experimental study was to evaluate the effect of individualized, or person-centered life history collages on nursing staff knowledge about individual residents living with dementia (RLWD) and subsequently, nursing staff perceptions of person-centered care (PCC) practices. Based on Kitwood's Theory of Personhood, improved knowledge and perceptions of RLWD may lead to improved personhood status. The principal investigator (PI) recruited a convenience sample of 36 nursing staff members (18 experimental and 18 control), who cared for 5 RLWD in two similar nursing homes (NHs). Open-ended questionnaires were utilized to assess three categories of nursing staff knowledge about individual RLWD: 1) family, 2) jobs/career, and 3) past and current likes, dislikes, and interests. In addition, nursing staff perceptions of PCC practices were assessed with the "Staff-based Measures of Individualized Care" (SBMIC) instrument. The SBMIC includes Likert-type scales to measure the following perceptions of PCC practices: 1) knowing the person/resident, 2) staff-to-resident communication, and 3) staff-to-staff communication. Intervention staff members were exposed to Life History Collages for a period of 4 weeks. Pre-test, post-test, and 3 weeks post-intervention data were analyzed with multivariate analysis of covariance (MANCOVA) and analysis of covariance (ANCOVA) statistical methods. Although overall NH staff knowledge of RLWD improved significantly in the treatment group, compared to the control group, at post-test ($p < .01$) and 3 weeks post-intervention ($p < .001$), perceptions of individualized care/PCC practices did not. Potential reasons for insignificant findings in perceptions of PCC practices are explored and suggestions for future research are discussed.

IMPROVING CARE TRANSITION OF OLDER ADULTS WITH COMMUNITY HEALTH ADVISORS

C.J. Dye^{1,2}, D. Willoughby², B.Z. Aybar-Damali², *1. Public Health Sciences, Clemson University, Clemson, South Carolina, 2. Institute for Engaged Aging, Clemson, South Carolina*

A considerable body of research indicates that community health workers/advisors are an important component of programs addressing the health care needs of communities (HRSA, 2007). Much of the related research documents that involving CHWs in health care delivery is a cost-effective strategy as they have contributed to enhancement of indi-

viduals' adherence to recommended health behavior changes, self-control of their health conditions, and their access to health care (Brownstein, Bone, Dennison, Hill, Kim, & Levine, 2005). The CHW workforce is among the most rapidly growing lines of work (HRSA, 2007) and is projected to continue growing. The addition of CHWs into the health care team is a creative approach to prevention and control of many health conditions. However, an understanding of the role of CHWs and their incorporation into the health care delivery system remain a major challenge. This presentation will report the results of a three-year program in which trained CHWs were placed with older adults to assist them in learning how to manage their chronic condition and in accessing the health and social services they need. The presentation will also present opportunities, challenges and solutions to the institutionalization of CHWs. After attending this presentation, participants will be able to define CHWs, identify appropriate uses of CHWs, discuss the challenges of institutionalization of CHWs, and gain knowledge of the key issues of incorporating CHWs into healthcare services.

PROMOTING READINESS AND INTEREST IN PATIENT SELF MANAGEMENT: A QUALITATIVE STUDY

M. Ryvicker¹, E. Henriquez¹, J. Mongoven¹, L.M. Gerber², P.H. Feldman¹, *1. Center for Home Care Policy & Research, Visiting Nurse Service of New York, New York, New York, 2. Weill Cornell Medical College, New York, New York*

Patient-centered interventions focused on self-management can improve patient outcomes among chronically ill patients. However, relatively little research has been done to investigate patients' perspectives on potential barriers, motivators, and facilitators of self-management. Building on a study assessing the effects of a hypertension support program on patients' self-management, this study examined the factors influencing changes in patients' confidence/readiness to manage their chronic conditions measured by the Patient Activation Measure (PAM). Open-ended qualitative interviews were conducted with a sample of 60 African American patients, including 30 patients with an increase of 4 or more points in PAM score from baseline to 12-month follow-up, and 30 patients with a 4-point decrease. Interviews focused on participants' views on: managing their health and medications; their relationships with their doctors; and their social support networks. Interviews were voice-recorded and transcribed verbatim. The investigators coded the transcripts using a hierarchical coding system developed from the initial 20 interviews and used NVIVO 7 to facilitate analysis of emergent themes. Two key motivators for self-management emerged: (1) the potential loss of mobility due to worsening of chronic conditions; and (2) awareness of the potential illness trajectory, often heightened by "cautionary tales" from relatives and friends. Patients with a decline in activation were more likely to name their physician as the primary person responsible for managing their health. Findings suggest that motivational interviewing should emphasize the relationship between self-management, patients' mobility, and quality of life to encourage patients to take an active role in their care.

SESSION 530 (POSTER)

DENTAL CARE AND SPIRITUALITY FOR SPECIAL POPULATIONS

IMPACT OF CHAPLAIN SERVICES ON SPIRITUAL WELL-BEING AND FORGIVENESS OF REHABILITATION PATIENTS

G.M. Workman^{1,2}, K. Ruroede², M.M. Lee¹, P. Roberts², *1. Behavioral Medicine, Midwestern University, Downers Grove, Illinois, 2. Marianjoy Rehabilitation Hospital, Wheaton, Illinois*

Spirituality and religious beliefs have been identified as possible protective factors for patients coping with disabling medical illness (Chally & Carlson, 2004; Giaquinto, et al, 2007). This pilot study

assessed the spiritual well-being and dispositional forgiveness of older rehabilitation patients who received spiritual care services from hospital chaplains. Participating older individuals ($n = 25$) were assessed following admission to a rehabilitation hospital and again at hospital discharge. The impact of receiving chaplain services on diverse aspects of spiritual well-being and forgiveness was explored. Paired samples t -tests were used to compare participants' pretest and posttest scores. Significant differences were found in pre to posttest scores on existential well-being ($t(24) = 2.29, p < .05$). Although a significant change was not found in pre to posttest scores on the forgiveness of others subscale, significance was approached ($t(24) = -1.72, p < .10$). Paired samples t -tests for specific forgiveness items revealed participants were less likely to punish others for wrongdoings at posttest ($t(24) = -2.19, p < .05$). No significant differences were found in global spiritual well-being, religious well-being or other components of forgiveness. Results of this pilot study support a favorable association between chaplain services, increased sense of life meaning and greater forgiveness of others in specific domains among rehabilitation patients. While preliminary, findings provide the rehabilitation community with insight into the potential benefits of integrating spiritual/religious interventions into holistic patient care. Future research should focus on the relationship between specific spiritual care methods, spiritual well-being, forgiveness, and physical health in rehabilitation patients.

DENTAL CARE AND ASSOCIATED FACTORS AMONG OLDER ADULTS WITH SCHIZOPHRENIA

T. Janardhanan¹, S. Kim¹, J. Desrosiers¹, N. Palekar¹, J. Singh¹, B.F. Rizvi¹, P.M. Ramirez², C. Cohen¹, *1. Psychiatry, SUNY Downstate Medical Center; Brooklyn, New York, New York, 2. Long Island University, Brooklyn, New York, New York*

Objectives: There are little data on dental care among older adults with schizophrenia. This study examines the prevalence of dental care and factors related to dental treatment in this population. **Methods:** The sample consisted of 198 community dwelling persons aged >55 with schizophrenia and a matched group of 113 persons in the community. Subjects received a 2 1/2 hour interview that included various instruments assessing psychiatric, physical, cognitive, social, and functional status. We used an adaptation of Krause's Model of Illness Behavior in Later Life as the basis to select 18 predictor variables. **Results:** There were no differences between the schizophrenia and community comparison groups in the percentage with at least one dental visit annually (48% and 54%, respectively). However, there were significant differences in the percentage of persons who stated that they had problems with their teeth/dentures (41% and 23%, respectively). When separately examining the schizophrenia group, we found that 8 variables were significant in bivariate analysis. However, only 3 variables—financial well-being ($OR = 1.12$), better executive cognitive functioning ($OR = 1.11$) and fewer perceived problems with teeth/dentures ($OR = 0.33$)—were significantly associated with dental visits at least once annually; fewer oral dyskinesia attained near significance. **Conclusions:** Older adults with schizophrenia do not receive the recommended level of dental care, although they are no worse than their age peers; however, they report more problems with their teeth/dentures. Further exploration is needed as to why the latter group is not seeking care. Also, identifying persons with more cognitive difficulties may increase dental visits.

SESSION 535 (PAPER)

DISABILITY

DIFFICULTY WALKING 1/4 MILE PREDICTS SUBSEQUENT DISABILITY AND DEATH

S.E. Hardy¹, D. McGurl³, H.B. Degenholz², *1. University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, 2. University of Pittsburgh School of Public Health, Pittsburgh, Pennsylvania, 3. Federal Drug Administration, Rockville, Maryland*

The ability to walk 1/4 mile is often used to measure the outcome of mobility disability, but less is known about 1/4m walk ability as a risk factor for subsequent disability. The objective of this study was to determine if 1/4m walk ability predicts subsequent mortality and disability among Medicare beneficiaries aged ≥ 65 years. Disability in instrumental and basic activities of daily living (I/ADLs) was categorized as none, 1-2, or 3+ limitations. We used data from the 2003 and 2004 Medicare Current Beneficiary Survey, a nationally representative survey. Our longitudinal sample ($N = 5598$) had a weighted mean age 75.5 and was 81% white and 57% female. At baseline 56% were able to walk 1/4 mile without difficulty, 28% had difficulty, and 17% were unable. After adjusting for sociodemographics, chronic conditions, smoking, body mass index, and baseline I/ADLs, 1/4m walk difficulty or inability was associated with increased risks of IADL difficulty, ADL difficulty, and mortality at one year. Adjusted OR (95% CI) for 1/4m walk difficulty were: 1-2 IADLs: 1.77 (1.45-2.16); 3+ IADLs: 2.74 (1.91-3.93); 1-2 ADLs: 2.57 (2.08-3.18); 3+ ADLs: 3.06 (1.98-4.73); death 1.95 (1.33-2.85). Results for 1/4m walk inability were: 1-2 IADLs: 2.18 (1.64-2.90); 3+ IADLs: 4.40 (2.91-6.65); 1-2 ADLs: 3.30 (2.49-4.37); 3+ ADLs: 4.85 (2.74-8.59); death 3.71 (2.37-5.80). Among Medicare beneficiaries, 1/4m walk difficulty or inability is independently associated with substantially increased risk of disability and death one year later, and may serve as a simple clinical indicator of risk for future morbidity.

MOBILITY DISABILITY IN NONAGENARIANS FROM 1999 TO 2007: THE VITALITY 90+ STUDY

M. Jylha, T. Sarkeala, A. Hervonen, *University of Tampere, Tampere, Finland*

Mortality rates for people aged 90 and over are decreasing, but little is known about the trends in disability prevalence. In the Vitality 90+ Study we compared mobility disability among population aged 90 and over in the city of Tampere, Finland, between the years 1996, 1998, 2001, 2003, and 2007. In 1996 and 1998 all home-dwelling and in 2001, 2003 and 2007 also all institutionalized people in this age group were included. Population numbers ranged from 550 to 1,146 and the response rate from 79% to 91%. The respondents were asked whether they were able to move indoors, walk 400 meters and use stairs. Among home-dwelling people, the percentage of those without mobility difficulty was lowest in 1998 (47%) and highest in 2001 (58%); among the whole population aged 90 and over the figure was 42 % in all three study years. The proportion of those disabled in all three mobility tasks decreased slightly. In all, there were no major changes and no clear trends in mobility disability in eleven years, although mortality deceased and life expectancy at the age of 90 increased.

PERSONAL MASTERY AND INCIDENT DISABILITY OVER SIX YEARS IN OLDER PERSONS: THE INCHIANTI STUDY

Y. Milaneschi^{1,2}, S. Bandinelli³, A. Corsi¹, R. Vazzana⁴, B. Penninx⁵, L. Ferrucci⁶, J. Guralnik⁷, 1. *InCHIANTI Study Group, Florence, Italy*, 2. *Health Psychology School, Department of Psychology, University of Bologna, Bologna, Italy*, 3. *Geriatric Unit, ASF, Florence, Italy*, 4. *University "G. D'Annunzio", Chieti, Italy*, 5. *Psychiatry and the EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands*, 6. *Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*, 7. *Laboratory of Epidemiology Demography and Biometry, National Institute on Aging, Bethesda, Maryland*

Introduction: We tested the hypothesis that in older persons low sense of personal mastery, defined as the extent to which one regards one's life chance as being under one's own control, predicts disability during a 6-year follow-up. **Method:** This study is part of the InCHIANTI Study, a prospective population-based study of older persons. The sample consisted of 1079 participants aged 65 years and older. Personal mastery was assessed at baseline using Pearlin's mastery scale. Disabilities defined as the inability or needing help in activities of daily living (ADL), were assessed at baseline and at 3- and 6-years follow-up. **Results:** At baseline, participants with at least one ADL disability had significantly lower mean personal mastery scores compared to non disabled participants (15.6 ± 3.8 vs 19.7 ± 4.0 ; $p < .0001$). Among 990 participants without disabilities at enrollment, 121 (12.2%) developed at least one ADL disability during the follow-up. After adjustment for age, sex, MMSE, physical activity, IADL, number of chronic diseases and medications, CES-D and SPPB, participants in the third and fourth quartiles of personal mastery, compared to those in the highest quartile, had, respectively, a 2.9 (95%CI = 1.1–8.1) and 3.7 (95%CI = 1.4–10.2) higher risk of developing disability during a 6 year follow-up. **Conclusions:** In old age, persons with low sense of personal mastery had a higher risk of developing disability over time. Pathways linking personal mastery to disability, such as decreased mobility function, need to be studied.

THE IMPACT OF DIABETES AND HEART FAILURE ON LIFE-SPACE TRAJECTORIES

D. Roth^{1,2}, P. Sawyer², A. Ahmed^{1,2}, C. Ritchie^{1,2}, M. Perkins², J.M. Roseman², R. Allman^{1,2}, 1. *Birmingham Atlanta VA GRECC, Birmingham, Alabama*, 2. *University of Alabama at Birmingham, Birmingham, Alabama*

The purpose of the study was to examine the impact of diabetes and heart failure on trajectories of life-space mobility among older adults. The UAB Study of Aging is a prospective longitudinal study of a random sample of 1000 Medicare beneficiaries from Alabama, stratified by gender, race, and urban-rural residence, recruited 1999-2001. Life-space, a measure of mobility, is based on distance, frequency, and independence of travel over a 4-week period (scores 0-120, higher scores indicating greater mobility). An analysis of variance of baseline life-space indicated significantly lower scores for persons with diabetes only ($M = 60.1$, $N = 207$), heart failure only ($M = 51.5$, $N = 85$), and both conditions ($M = 47.9$, $N = 45$) compared to persons with neither condition ($M = 68.0$, $N = 663$). Using data from six years of follow-up, longitudinal trajectories of life-space mobility were estimated using random-effects regression models. Linear models, controlling for race, age, gender, and rural residence, showed that persons with diabetes or heart failure had significantly greater declines across time than persons with neither condition. Significantly accelerated rates of decline in these two conditions were observed both before and after adjusting for baseline differences in life-space. For persons with both diabetes and heart failure, the rate of life-space decline across time more than doubled compared to persons with neither condition. Diabetes and heart failure independently contribute to life-space mobility declines.

SESSION 540 (PAPER)

ELDER ABUSE AND ETHICS

ANALYSIS OF RESPONSES IN AN ELDER ABUSE STUDY USING COMPUTER-ASSISTED VS. INTERVIEW TECHNIQUES

T. Fulmer, S.M. Strauss, S. Russell, *NYU College of Nursing, New York, New York*

Screening for elder mistreatment is extremely important in eradicating this serious public health problem. Research involving older adults is complex due to the variability in function and cognitive capacity with aging. Cohort and SES differences add to that complexity. Finally, the sensitive nature of elder mistreatment and family violence further complicates research strategies. We compared data from two studies using the Childhood Trauma Questionnaire (CTQ) to examine differences in responses based on modality of the interviews. Data from an elder neglect study ($N=162$) using interview-administered surveys were compared with data collected in another elder mistreatment study ($N=152$) using audio-assisted computer self-interview (ACASI). T-tests for continuous variables and chi-square tests for categorical variables were performed to examine whether differences between subject characteristics and subject scores on the CTQ and its subscales differed significantly. **Results:** The two study samples differed significantly on age, marital status, work status, financial background, and disease burden. Scores on the CTQ were significantly different with individuals in Study 2 (ACASI sample) scoring higher than those using the interviewer-administered instrument (Study 1). **Conclusion:** This is very important due to the dearth of information related to older adults and their willingness and capacity to use computer-assisted approaches for data collection. Further, it is important because elder mistreatment includes extremely sensitive questions, and is an understudied topic. These data suggest that the use of ACASI may provide the opportunity for fuller disclosure than interviewer-administered surveys.

SCREENING FOR ELDER MISTREATMENT IN A DENTAL CLINIC POPULATION

S. Russell, T. Fulmer, S.M. Strauss, G. Singh, R. Vemula, *NYU College of Nursing, New York, New York*

Increasing screening in non-traditional settings (dental clinics) is likely to increase the number of cases of elder mistreatment (EM) ultimately identified and referred for social services. **METHODS:** We used the HS-EAST, (Hwalek et. al., 1996) a 15-item instrument which identifies those at high risk for EM, to screen adults over the age of 65 presenting for dental care at a large urban clinic. We chose the HS-EAST because it is brief, easily self-administered, and requires no physical examination. **RESULTS:** Using HS-EAST data from previous studies that have demonstrated that specific questions are likely to discriminate between those at risk and those not at risk, we report on the proportion of those (of 124 persons screened) who answered positively to seven questions. We found that 20.5% reported being uncomfortable with a family member, 11.3% reported that they feel nobody wants them around, 3.2% reported that someone in their family makes them stay in bed and tells them they are sick when they are not, 4.8% reported that someone has forced them to do things they didn't want to do, 11.3% reported that someone has taken things that belonged to them without permission, 2.4% reported that someone told them they give them too much trouble, and 2.4% reported that someone close to them has tried to hurt them recently. **CONCLUSIONS:** Screening for those at risk for EM in a community dental clinic is feasible and is likely to identify those at increased risk for EM.

ADULT ABUSE PREVENTION TRAINING: EVALUATION AND EVIDENCE OF SUSTAINED IMPACT ON DIRECT CARE

C. Luz¹, M. Mickus², C. Macomber¹, K. Ibrahim¹, O. Rostant¹, B. Aslani¹, I. Michigan State University, East Lansing, Michigan, 2. Western Michigan University, Kalamazoo, Michigan

A pilot research project of a new curriculum to train long-term care staff on adult abuse and neglect has demonstrated increased knowledge among participants. However, the question has persisted as to whether or not this knowledge actually translates into improved workplace recognition, reporting, and prevention of abuse. A subsample (n=303) of training participants was recruited to participate in a post-training anonymous telephone survey using a novel interactive voice response (IVR) system that automatically captures data. The survey focused on whether participants had witnessed adult abuse at their workplace and reasons for or barriers to reporting these events. Common barriers for not reporting suspected abuse included that it would not make a difference or that it would have a negative impact on them. Results indicated that 21% of the participants witnessed abuse since the training. Data were collected related to types of abuse, suspected offenders, and reasons for reporting or not reporting events. Qualitative data indicated direct care worker perspectives on how to reduce abuse in long-term care. All results indicated need for ongoing education that emphasizes prevention strategies that empower direct care workers. Further, this research demonstrated the ability of IVR technology to capture information from hard-to-reach populations on sensitive topics that might otherwise be difficult to attain. Specifically, it was critical to establishing a method in which to 1) provide a mechanism for workers fearful of retribution to confidentially share their experiences and 2) establish that knowledge of abuse was sustained over time and translated into actual workplace behavior.

SESSION 545 (POSTER)

LONG TERM CARE - HS POSTER SESSION

IDENTIFICATION OF POTENTIALLY REVERSIBLE RESIDENT FACTORS ASSOCIATED WITH REJECTION OF CARE BEHAVIORS

S. Ishii¹, J. Streim^{5,6}, D. Saliba^{2,3,4}, 1. VA GRECC, Los Angeles, California, 2. VA GRECC and COE, Los Angeles, California, 3. UCLA/Jewish Home Borun Center, Los Angeles, California, 4. RAND Health, Santa Monica, California, 5. University of Pennsylvania, Philadelphia, Pennsylvania, 6. VA MIRECC, Philadelphia, Pennsylvania

[Background] Rejection of care behaviors can strain caregiver and nursing home (NH) resident interaction. Such behaviors can frustrate caregivers, leading to reduced interactions, withdrawal from the resident or ongoing confrontation. This strained relationship also frustrates residents and families. [Objective] We aimed to identify potentially reversible resident characteristics associated with rejection of care. [Methods] Primary data were obtained on 3230 residents scheduled for MDS assessments in 71 NHs across 8 states. Nurses identified residents who exhibited "reject evaluation or care (e.g., bloodwork, taking medications, ADL assistance) that is necessary to achieve the resident's goals for health and well-being". Measures of resident characteristics included mood (PHQ-9), cognition (structured cognitive testing or cognitive performance scale), delirium (Confusion Assessment Method). Data were analyzed via multiple logistic regression models that accounted for clustering by NH. [Results] Rejection of care was seen in 9.7%. Analyses identified male sex (OR 1.82, 95%CI 1.32-2.51), moderate and severe cognitive impairment (OR 1.59 95%CI 1.07-2.37, OR 2.71, 95%CI 1.80-4.08, respectively), presence of delirium (OR 2.15, 95%CI 1.32-3.51), minor and major depression (OR 1.58, 95%CI 1.09-2.30, OR 1.91, 95%CI 1.17-3.11, respectively), presence of delusion (OR 2.98, 95%CI 1.73-5.10), severe to horrible pain (OR 2.16, 95%CI 1.49-3.13) as associated factors. [Implications] In this large geographically diverse sam-

ple, six resident-level factors were associated with rejection of care. Four of these factors (delirium, depression, delusion and pain) are potentially treatable, implying that care rejection behaviors are modifiable and may resolve with appropriate, targeted interventions.

EXCEPTIONAL CARE PLANNING

D.A. Buzanowski¹, C. Hegeman¹, D. Dewar², 1. Foundation for Long Term Care, Albany, New York, 2. SUNY Albany Department of Health Policy, Management and Behavior School of Public Health and Department of Economics, Albany, New York

This presentation will discuss the training, implementation and results of a project using a new care planning technique with the goal of replacing the existing wasteful care planning process with an efficient and cost-saving one. The new care planning technique uses facility generated standards of care to replace the often inefficient, lengthy and repetitive care plans that most facilities currently use. Exceptional care planning uses standards of care (SOCs) as a baseline for care. The SOCs are universal and complement the care plan. The individual care plan then spells out specific needs of the individual resident that supplement and/or differ from the SOCs. Therefore, the care plan process is transformed from one that involves developing and using lengthy, repetitive, non-resident specific care plans for documenting care to one that uses highly personalized individualized care plans that take less time to write and implement, i.e., more quality in less time. The project was evaluated on the expected outcomes of (a) successful use of intervention and knowledge of implementation issues, (b) increased nurse and CNA efficiency, (c) improvement in resident outcomes, (d) increased staff retention, (e) documented cost savings within participating nursing homes. Results of the twelve nursing home study, including data on the above outcomes will be presented.

BREAKING THE ROUTINE: HOW RESIDENTS FIND RESPITE FROM THE WORLD OF THE NURSING HOME

R.J. Walent, University of California, San Francisco, San Francisco, California

This qualitative study explores how residents achieve respite from nursing home (NH) routines to support personal wellbeing. Specific aims are: (1) to identify, describe and analyze processes residents use to actually or virtually leave the world of the NH; (2) to document structural, social and personal facilitators and barriers to breaking away from facility routines. As part of an ethnographic study of "doing well" among older residents, this research examined 17 participants' experiences and perceptions of respite from NH routine. Study sites were a for-profit chain facility and a large public NH. Data included interviews on participants' perceptions of what it meant to do well, with probes to obtain information on trips out of the NH and on favorite activities. Participant observation focused on participants' daily activities and on environmental features that affected the ability to break from facility routines. Ongoing interpretive data analysis resulted in three themes related to respite from NH routines: actual getting out, virtual getting away, and leaving for good. Findings suggest selected respite strategies are rooted in preferences and values developed across the life span. Interestingly, virtual getting away was often achieved through reading, which also increased a sense of control. Participants' attitudes toward NH life were ambivalent. Thus, even participants who were exceptionally involved and committed to facility activities, reflected on the desire to leave for good. This research suggests that understanding how individual residents seek and achieve respite is a vital precursor to supporting well being.

LINKING TECHNOLOGY IMPLEMENTATION TO RESIDENT CENTERED CARE IN NURSING HOMES

R. Meador, BLCC, Cornell University, Ithaca, New York

This presentation will report on the findings from one component of a multi-component evaluation measuring the effects of electronic

medical records in long-term care. The demonstration project examined a variety of outcomes resulting from the installation of the technology in 22 participating nursing homes. Specifically, the results shed light on the linkage between the installation of electronic medical records and resident-centered care in two important ways. The study examined resident-centered care as an outcome variable and assessed the manner in which the adoption of digital medical records technology affected the level of resident-centered care provided by each of the fifteen participating nursing homes, and assessed resident-centered care as an independent variable in order to examine the effect of variance in the degree of resident centered care on the success or failure of the technology adoption. Thus, results provide an understanding of ways that technological change affects the degree to which nursing homes practice resident-centeredness and how resident-centered practices influences the adoption of technology.

PREVALENCE OF PSYCHOTROPIC DRUGS IN RESIDENTS OF GERMAN AND AUSTRIAN NURSING HOMES

T. Richter¹, G. Meyer³, E. Mann², S. Köpke¹, 1. *University of Hamburg, Unit of Health Sciences and Education, Hamburg, Germany*, 2. *General practice and Institute for Health Services Research, Rankweil, Austria*, 3. *University Witten/Herdecke, Faculty of Medicine, Institute of Nursing Science, Witten, Germany*

Background: Data from international studies show that psychotropic medications are frequently prescribed in nursing home residents throughout Western countries. Adverse effects of these substances are well known. We aimed to assess and compare psychotropic medications in nursing home residents in Germany and Austria. Characteristics associated with prescription were also explored. Method: Data on psychotropic medications were collected in three studies in Hamburg, Germany (cross-sectional study including 2367 residents of 30 nursing homes; baseline assessment of a randomised-controlled trial including 1125 residents of 58 nursing homes), and Vorarlberg, Austria (cross-sectional study including 1844 residents of 48 nursing homes). Psychotropic medication was coded according to the ATC-Classification. Prevalence rates of psychotropic and antipsychotic medication were compared. Cluster-adjusted multiple logistic regression analyses were performed investigating associations with psychotropic medication. Results: Institutional and residents' characteristics were comparable between the studies. Mean cluster-adjusted prevalences of residents with 1 or more psychotropic medication were 51.8% (95% CI 48.3-55.2) and 52.4% (48.4-56.1) in Germany and 74.6% (72.0-77.2) in Austria. Prevalences of residents with 1 or more prescription of an antipsychotic medication were 28.4% (25.2-31.7), 28.4% (24.2-32.7), and 45.9% (42.7-49.1), respectively. No nursing home and only few residents' characteristics were associated with psychotropic medication prescription, with only slight differences between studies. Conclusion: Frequencies of psychotropic drug prescription are substantial, highlighting the urgent need of reduction approaches. Currently, we are preparing a Cochrane Review on psychosocial interventions to reduce antipsychotic medication in nursing homes.

THE RELATIONSHIP BETWEEN PROPORTIONS OF LPN AND RN STAFFING AND NURSING HOME SURVEY DEFICIENCIES

M. Toles, *Duke University, Durham, North Carolina*

Background: Professional staff mix is theorized to be a significant component in the quality of nursing home outcomes. Since 2000, nursing facility use of LPN hours per resident per day are essentially unchanged, while RN hours are reduced by 25%. Because of the interdependent nature of LPN and RN collaboration, this change in staff mix may impact nursing home quality. Specific Aims: The purpose of this longitudinal study was to explore the relationship between proportions of LPNs in nursing staff mix (LPN / LPN + RN) and the quality of nursing home performance, as measured by survey deficiencies in U.S. nursing

homes between 2003 and 2007. Method: Using data from the Online Survey Certification of Automated Records (OSCAR), a mixed model was constructed 1) to control for structural characteristics of nursing homes and 2) to determine whether counts of survey health deficiencies vary over time with changes in proportions of nursing staff. Results: In a sample of U.S. nursing homes (n=14,930), our results indicate that greater proportions of LPNs in the LPN and RN staffing mix are associated with significantly greater (p=0.0001) counts of nursing home health survey deficiencies. Discussion: These results suggest that optimal nursing home performance may require special attention to staffing mix. Specifically, attention to the non-substitutability of LPNs for RNs in clinical nursing expertise is essential to avoid poorer quality of care.

SESSION 550 (SYMPOSIUM)

NURSING CARE OF OLDER ADULTS INTEREST GROUP SYMPOSIUM: CREATIVE APPROACHES TO HEALTHY AGING

Chair: C. Beel-Bates, *Kirkhof College of Nursing, Grand Valley State University, Grand Rapids, Michigan*

Discussant: M. Mezey, *New York University College of Nursing Hartford Institute, New York, New York*

Mounting evidence supports the premise that high total energy expenditure leads to greater longevity and that regular physical activity is associated with vitality. Physical activity should include aerobic activity, resistance exercise, balance, and flexibility exercises. Unfortunately, the majority of older adults do not engage in regular physical activity. This symposium will explore how creative exercise programs contribute to successful aging and what are the specific interventions that can be used to optimize adherence to regular physical activities over time. The Nursing Care of Older Adults Interest Group Symposium will: 1) Increase knowledge about the effects of exercise on physical and psychological well being for healthy aging; 2) Explore personal and organizational factors that promote or impede the implementation and sustainability of creative approaches to adherence to physical activity; and 3) Experience Tai Chi as a creative approach that contributes to aspects of healthy aging.

CREATIVE APPROACHES TO CHALLENGING PROBLEMS: USE OF THE SOCIAL ECOLOGICAL MODEL TO CHANGE BEHAVIOR AMONG OLDER ADULTS

B. Resnick, *University of Maryland School of Nursing, Baltimore, Maryland*

Changing behavior to optimize function and physical activity among older adults is challenging across all care settings. Challenges arise at the individual level as well as those that occur due to the facilities, systems, or communities in which they live. The social ecological model suggests that an individual's behavior is affected by a wide sphere of influences: intrapersonal, interpersonal, environmental, and policy, and the approach to changing behavior extends traditional motivational and behavioral theory to address all components that influence behavior. Multiple interventions have been developed using this model to change behavior of residents in long term care facilities, their direct care workers and nurses, and minority and low income older adults in the community. The Res-Care Intervention and the PRAISEDD Interventions are examples of interventions and will be described in detail to serve as guides for how such work can be developed and implemented in real world settings.

HEALTH BENEFITS OF TAI CHI FOR OLDER PERSONS

F. Li, *Oregon Research Institute, Eugene, Oregon*

As an alternative exercise, Tai Chi has drawn increasing research interest, with accumulating evidence showing the therapeutic value of Tai Chi on overall health and well-being for the elderly. Therefore, promoting Tai Chi as an exercise modality has considerable potential for

maintaining optimal physical and psychological function for older adults. The objectives of this presentation are to (a) summarize current research findings with a particular focus on geriatric populations, (b) discuss findings with respect to their practical implications, and (c) demonstrate an evidence-based Eight-Form Tai Chi routine.

SESSION 555 (POSTER)

WOMEN'S HEALTH - HS POSTER SESSION

RELATIONSHIPS BETWEEN HANDGRIP STRENGTH, FUNCTIONAL FITNESS, AND BODY COMPOSITION AMONG ELDER WOMEN

M. Tecmire, T. Lake, M. Powers, *University of Central Oklahoma, Edmond, Oklahoma*

Handgrip strength is often used to estimate total body strength, although it is unclear if this relationship extends to functional fitness and body composition. The primary purpose of this study was to explore the relationship between handgrip strength and functional fitness among older adults. A secondary focus of this study was to examine the relationships between handgrip strength and total body lean tissue mass (LTM), arm LTM, and leg LTM. The participants were women over the age of 75 ($n = 33$) who completed a session of Senior Fitness Testing along with an iDXA scan. Handgrip strength was assessed using a T.K.K. 5401 digital handgrip strength dynamometer. Functional fitness was assessed using the chair stand test and arm curl test, with LTM measurements coming from an iDXA total body scan. Data were analyzed using a Pearson's Product Moment Correlation Coefficient test. The results indicated a significant correlation between handgrip strength and the arm curl test ($r = .52, p = .00$) as well as hand grip strength and the chair stand test ($r = .45, p = .01$). The secondary focus suggested the strongest correlation between handgrip strength and arm LTM ($r = .63, p = .00$) although significant correlations were also found with total LTM and leg LTM ($p < .05$). These results support that handgrip strength is not only a fair indicator of functional fitness but also LTM.

FOOD INSECURITY AMONG OLDER WOMEN

L. Turner¹, L. Wallace², M. Umstatt¹, A. Gaines¹, *1. Health Science, The University of Alabama, Tuscaloosa, Alabama, 2. The University of Tennessee, Knoxville, Tennessee*

Background: Food insecurity (lacking or uncertain access to adequate food by socially acceptable means) is experienced by older women more than others. Food insecure vulnerable women suffer from chronic health problems, poor nutritional status and functional decline at rates disproportionate to the general population. Food insecurity among older women has not received adequate research attention. Purpose: The purpose of this study was to examine factors and outcomes associated with food insecurity in community-living older women, and to explore potential strategies for enhancing food security and nutritional status among older women. Methods: A literature search was conducted using PubMed and the terms aging, elderly, older women, food security, nutrition, and poverty as keywords. The search was limited to peer-reviewed publications, both books and journal articles. Results: Addressing the harmful effects of this complex problem is challenging. Current assistance programs have limitations including insufficient funding. Older women may be eligible for, but not participate in, some programs. This is due to being unaware about the existence of programs, perceiving that they are not eligible, having lack of access, experiencing feelings of embarrassment, and perceiving a distain for relying on the government. Conclusions: Enhancing food security includes reaching out to older women in efforts to increase participation in effective food distribution programs. Making sure older women are informed regarding existing programs and developing accessible and convenient places for program delivery may enhance utilization. Strategies should emphasize

physical access to nutritious foods while maintaining dignity in food dissemination.

SESSION 560 (SYMPOSIUM)

ADVANCING NURSING HOME EXCELLENCE: A COLLABORATIVE FORMULA THAT WORKS

Chair: D. Bakerjian, *School of Nursing, University of California, San Francisco, Novato, California*

Discussant: C. Gunther-Murphey, *Institute of Healthcare Improvement, Cambridge, Massachusetts*

The Advancing Excellence in America's Nursing Homes Campaign (Campaign) was started in October 2006 by a broad coalition of nursing home stakeholders as a unique effort to help nursing homes improve quality of care and life for our nation's nursing home residents. The Campaign includes representatives from nursing home associations, government agencies, advocacy organizations, foundations and professional organizations. This strategic partnership guided the Campaign to establish eight measureable goals to improve nursing home outcomes in four clinical and four operational areas. These goals were selected based on Centers for Medicare and Medicaid Services work in the National Nursing Home Quality Initiative. The Campaign fostered the formation of statewide coalitions, also called Local Area Networks of Excellence (LANEs), in 49 states to provide the local infrastructure to support the national Campaign. Through regular communications, an emphasis on quality improvement and evidenced-based technical assistance tools, the Campaign has demonstrated significant success in the selected clinical outcomes. This presentation will discuss the innovative structure of the Campaign and its emphasis on the importance of coalitions and public and private partnerships. During the presentation, national data will be presented that demonstrate nursing home improvements over the initial two-year phase of the Campaign. Based on extensive evaluation of these results, the Campaign revised and updated the goals for the second phase. A state case study will be used to demonstrate AE implementation and to illustrate use of evidence-based care tools that were developed by the Campaign.

AN OVERVIEW OF ADVANCING EXCELLENCE IN AMERICA'S NURSING HOMES: A COLLABORATIVE FORMULA THAT WORKS

M. Koren¹, D. Bakerjian², *1. The Commonwealth Fund, New York, New York, 2. School of Nursing, University of California, San Francisco, Novato, California*

The Advancing Excellence in America's Nursing Home campaign consists of a coalition of stakeholder groups representing for profit and not for profit nursing home provider associations, consumer advocacy groups, foundations, healthcare professional organizations, and government agencies included the Centers for Medicare and Medicaid Services. This innovative and growing all-volunteer coalition has met monthly for over three years to collaboratively tackle quality of care and quality of life challenges for both residents in and workers of America's nursing homes. The broad stakeholder-based volunteer-driven nature of the campaign has had several remarkable outcomes attributed to it. The unique structure of the steering committee involves all members of the steering committee with equal voices to discuss issues and solutions to common problems for common goals. This structure and process has facilitated quality improvements in the industry by expanding understanding, changing attitudes and integrating differing positions of the committee members.

STRONG STATEWIDE COALITIONS WITH NATIONAL SUPPORT PROVIDE EFFECTIVE ENVIRONMENT FOR NURSING HOME QUALITY IMPROVEMENT

C. Benner, *American Association of Homes and Services for the Aging, Washington, District of Columbia*

The Advancing Excellence in America's Nursing Homes Campaign brings together, and keeps together, nursing home stakeholders with various backgrounds and frequently disparate perspectives. For the first time, government, provider organizations and advocacy organizations have consolidated efforts to improve quality in the nursing home. The national Coalition has translated this foundation and principal of strong partnerships into a national learning community of Local Area Networks of Excellence (LANEs) in 49 states. These statewide organizations of nursing home stakeholders have created a positive synergy and environment for change and sharing of best practices. The national Campaign provides regularly updated evidence-based technical assistance materials and other communications to support, encourage and promote the work of the LANEs. This presentation explores core characteristics of the LANEs and describes key components that promote and increase effectiveness.

EFFECTIVE ARKANSAS PARTNERSHIPS LEAD TO POSITIVE TREND IN NURSING HOME QUALITY OUTCOMES

C.J. Beverly, *Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

The Arkansas Coalition for Nursing Home Excellence (ACNHE) leads the implementation of the Advancing Excellence Campaign in Arkansas. The ACNHE was established in 2005 to bring stakeholders together from government agencies, academia, professional and quality improvement organizations for the purpose of improving quality of care in nursing homes in the state. Led by the Arkansas John A. Hartford Center of Nursing Excellence, this partnership was awarded Civil Money Penalty approved by the Arkansas State Legislature to support the work of the ACNHE. This presentation will describe the activities of the ACNHE with respect to implementation of the activities of the Advancing Excellence Campaign and provide results of work from 2007-2009 in selected clinical goals and one operational goal as defined by the Campaign. Critical processes germane to successful change in quality outcomes will be examined

KNOW YOUR NUMBER, SET YOUR TARGET!

S. Gravenstein^{1,2}, D. Bakerjian⁴, R. Baier^{1,2}, C. Benner⁶, C.J. Beverly³, M. Koren⁵, 1. *Quality Partners of Rhode Island, Alpert Medical School of Brown University, Providence, Rhode Island*, 2. *Quality Partners of Rhode Island, Providence, Rhode Island*, 3. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 4. *University of California, San Francisco, California*, 5. *Commonwealth Fund, New York, New York*, 6. *American Association of Homes and Services for the Aging, Washington, District of Columbia*

Nursing home staff signing on to join the Advancing Excellence Campaign had to select three goals from one or more of four clinical and four operational goals. For the clinical goals selected, they were also offered the opportunity to set a target. The Centers for Medicare and Medicaid Services collects data on these clinical goals, allowing us to track progress over the ensuing two years. We compared facilities that did not join the Campaign to facilities that joined but did not set a target for improvement for their goals, and facilities that joined and set targets. Each experienced progressively greater improvement, but those facilities that set targets and joined the campaign had the greatest improvement with fewer pressure ulcers, restraints used, and fewer reports of moderate to severe pain. Greater quality improvement can be realized through evidence-based care and data-driven decisions, including through target setting and with national infrastructure support.

IMPROVING QUALITY IN NURSING HOMES THROUGH NATIONAL TARGET SETTING

D. Bakerjian^{1,3}, C. Benner⁶, S. Gravenstein^{4,5}, C.J. Beverly⁷, M. Koren², 1. *University of California, San Francisco, San Francisco, California*, 2. *The Commonwealth Fund, New York, New York*, 3. *Gerontological Advanced Practice Nurses Association, Pensacola, Florida*, 4. *Quality Partners of Rhode Island, Providence, Rhode Island*, 5. *Brown University, Providence, Rhode Island*, 6. *AAHSA, Washington, District of Columbia*, 7. *University of Arkansas, Little Rock, Arkansas*

Advancing Excellence in America's Nursing Home started the first phase of the Campaign with four clinical and four organizational goals. Based on measured improvements in nursing homes and lessons learned in the first two years, the steering committee assembled a Goals Task Force (GTF) to revise and update the goals for the next phase of the Campaign. The GTF, comprised of a multidisciplinary group of representatives from the steering committee, met regularly over several months to develop new and revised goals for phase two of the Campaign. We used the Achievable Benchmarks of Care, Undesirable Benchmarks of Care and the improvement trends experienced from the first phase of the Campaign to set national targets for each goal. Similar to target setting at the facility level, this measurable process contributes validity to the targeted objectives set by the Campaign.

SESSION 565 (SYMPOSIUM)

AGING WITH A DISABILITY: OPTIMIZING ABILITY AND PARTICIPATION THROUGH TECHNOLOGY AND LIFESTYLE

Chair: E. Crimmins, *University of Southern California, Los Angeles, California*

Discussant: M.L. Campbell, *The National Institute on Disability and Rehabilitation Research, Washington, District of Columbia*

Technological developments can enhance the lives of individuals aging with and into disability. This symposium provides three examples of the use of cutting-edge technology and lifestyle redesign to promote rehabilitation of motor processes that facilitate functional performance, and prevent development of secondary consequences of immobility. These projects join multiple disciplines under the auspices of a Rehabilitation Engineering Research Center for Technologies for Successful Aging with Disability to develop technology to delay, prevent, and diminish the disability linked to a number of important conditions related to aging. The Virtual Reality and Gaming for Home-Based Motor Assessment and Training Project has developed low cost, home-based Virtual Reality toolkits for motor assessment and rehabilitation. Examples of the use of this technology to improve and maintain balance will be demonstrated. The Neuromuscular Electrical Stimulation for Mobility Project has developed implantable wireless micro-stimulators to prevent recurrences of debilitating pressure ulcers among persons using wheelchairs. Results from applications of this technology with patients will be shown. Research results from the Pressure Ulcer Prevention Study will clarify the importance of understanding the lifestyle factors affecting the development of pressure ulcers. This study is a randomized control trial with an intervention, developed to encourage participants to take a variety of health-promoting measures to prevent pressure ulcer formation. These projects demonstrate how advanced technologies and multidisciplinary interventions can increase functional ability and meaningful rehabilitation and promote successful aging.

BALANCE IN 'AGE' OF TECHNOLOGY: DEVELOPMENT OF VIRTUAL REALITY GAMING APPLICATIONS TO IMPROVE BALANCE

B. Lange, S. Flynn, A." Rizzo, *Institute for Creative Technologies, Marina Del Rey, California*

The recent release and world wide acceptance and enjoyment of Nintendo's WiiFit™ has provided significant evidence for the notion that

exercise can be fun, provided it is presented in a manner that is entertaining, motivating and distracting. The Nintendo WiiFit™ challenges balance and preliminary evidence suggests the device has potential to be used as a therapeutic tool. The Sony PlayStation EyeToy™ has demonstrated promising results as a low-cost tool for balance rehabilitation. This symposium will present an overview of the use of these off-the-shelf games for balance rehabilitation in a range of populations aging with and into a disability. The rationale for the use of games in rehabilitation will be presented and issues associated with the use of these games will also be discussed. Demonstrations of virtual reality and video game applications that have been specifically developed for rehabilitation will be presented, including preliminary usability data.

NEW TECHNOLOGIES IN LIFESTYLE INTERVENTION FOR DECREASING PRESSURE ULCER RISK

F. Clark, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

Emerging technologies and innovative interventions are needed to address widening gaps in the quality and affordability of health care for individuals who are aging with disabilities. Adults with spinal cord injury (SCI) are particularly at increased risk to develop advanced stage pressure ulcers. Based on a NIDRR funded study of the contextual factors that lead to pressure ulcers in real life circumstances, our research group developed an innovative lifestyle-based pressure ulcer prevention program that incorporates online resources and the use of an interactive CD-ROM. Currently, through NIH funding we are conducting a randomized clinical trial to investigate the intervention's ability to prevent pressure ulcers and related surgeries, generate health care cost savings, and enhance quality of life. In this presentation, we will emphasize the blueprint for intervention manualization and the creative technologies that the intervention incorporates.

PRESSURE ULCER PREVENTIONS USING IMPLANTED ELECTRICAL STIMULATORS

H. Kaplan, L. Baker, G. Loeb, F. Richmond, *University of Southern California, Los Angeles, California*

Pressure ulcers in persons who sit for long periods of time, especially in the absence of sensation, are relatively common and uniformly catastrophic to participation in society. Presently, seated individuals are required to use cognitive strategies because 'automatic weight shifting' is not automatic in the presence of decreased of sensation and/or limited motor function. A preliminary study of three individuals undergoing gluteal rotation flap surgery to correct chronic pressure ulcers is reported here. Two individuals successfully completed the one year program of stimulation for muscle bulking. One year follow-up of these patients, both over the age of forty, showed improved skin quality as measured by the Braden Scale and reperfusion times, and improved average pressure distribution when measured through pressure mapping. These promising outcomes have lead to further evaluation of the implanted systems for long term management of individuals who are at a high risk for developing pressure ulcers.

SESSION 570 (SYMPOSIUM)

BUILDING HEALTHY COMMUNITIES FOR ACTIVE AGING — THE EXPERIENCE

Chair: K.E. Sykes, *OCHPEE, US EPA, Washington, DC, District of Columbia*

Discussant: L.W. Kaye, *U of Maine, Center on Aging, Bangor, Maine*

Place matters and community matters for our health and our well-being. Designing communities that promote active living is a public health strategy that is easier to identify than to implement. Results from CDC research will be presented on evidence of environmental and policy approaches to promote physical activity in terms of community-scale and street-scale urban design, and on the planning and design issues

facing communities today. The Atlanta Regional Commission (ARC) developed a health and wellness plan to meet the needs of its rapidly aging population. ARC will discuss its framework and early results from a 9-day charrette. Small towns and rural areas face significant challenges in building healthy communities for active aging especially for older adults with functional limitations. This presentation will provide a conceptual approach to building healthy non-metropolitan communities. It will draw upon work of the Healthy Aging Research Network, the UNC Highway Safety Research Center and community partners. Key topics include framing the issues, assessment, community collaboration and strategies for environmental and policy change. The Maine Senior Environmental Leadership Corps provides leadership and civic engagement training with a special focus on rural environmental stewardship and smart growth planning for older adults in the state of Maine. Examples of customized, community setting-specific, delegate action plans will be presented and measurable criteria for assessing and evaluating program effectiveness and impact offered. Finally, case studies of communities who have been recognized by EPA thru an awards program "Building Healthy Communities for Active Aging" will show how change can happen.

OVERCOMING CHALLENGES TO ACTIVE AGING IN RURAL AND SMALL TOWN AMERICA

R. Hunter¹, J. Sharkey³, L.L. Bryant², W.W. Hunter⁴, M. Skeele⁵, 1. *UNC Center for Aging and Health, Chapel Hill, North Carolina*, 2. *University of Colorado, Denver, Colorado*, 3. *Texas A&M University, College Station, Texas*, 4. *UNC Highway Safety Research Center, Chapel Hill, North Carolina*, 5. *Council on Aging for Henderson County, Hendersonville, North Carolina*

Objective: Describe a conceptual framework and strategies to foster active aging in small towns and rural communities Small towns and rural areas face significant challenges in building healthy communities for active aging. As compared with metropolitan areas, these communities typically have fewer transportation resources, relatively greater distances to traverse, aging or minimal pedestrian infrastructure, and in some instances, environmental hazards from agricultural or industrial applications. These challenges are especially problematic for older adults with functional limitations. To address the challenges successfully requires somewhat different approaches than those employed in urban settings. This presentation will include a conceptual approach to building healthy non-metropolitan communities. It will draw upon lessons learned from the work of the Healthy Aging Research Network, the UNC Highway Safety Research Center and community partners. Key topics include framing the issues, assessment, community collaboration and strategies for environmental and policy change.

TRAINING OLDER ADULTS TO SERVE AS LOCAL RURAL LEADERS IN SMART AND GREEN GROWTH PLANNING

L.W. Kaye, J. Crittenden, *Center on Aging, University of Maine, Bangor, Maine*

The Maine Senior Environmental Leadership Corps provides leadership and civic engagement training with a special focus on environmental stewardship and smart growth planning for older adults. This unique initiative entails the nomination of individuals 50 years and older to serve as delegates to local and state governments and community organizations. More than 150 indigenous delegates participate in an intensive skills building and leadership development summit on environmental planning. The project is charged with: 1) maximizing citizen participation in local, county, and state planning; 2) raising awareness of the link between the built environment and public health; 3) reducing environmental impacts of rural development; and 4) increasing the number of smart growth planning activities statewide. Examples of customized, community setting-specific, delegate action plans will be presented along with measurable criteria for assessing and eval-

uating program effectiveness and impact. This project is supported by a grant from the U.S. EPA Aging Initiative.

HEALTHY OLDER ADULTS IN HEALTHY COMMUNITY ENVIRONMENTS

J. Kruger, *PAHB, CDC, Atlanta, Georgia*

Community design can support or discourage physical activity and there is growing evidence showing access to parks and recreation facilities have beneficial effects of physical activity. Data from the Trust for Public Land shows that on average there are 4 parks per 10,000 residents, and 1 recreation facility per 20,000 residents. Designing communities that promote active living is a public health strategy that is easier to identify than to implement. This session will present evidence of environmental and policy approaches to promote physical activity in terms of community-scale and street-scale urban design, and on the planning and design issues facing communities today

BUILDING HEALTHY COMMUNITIES FOR ACTIVE AGING AWARD PROGRAM: LEADING BY EXAMPLE

K.E. Sykes, *OCHPEE, US EPA, Washington, DC, District of Columbia*

Aging today is about more than medical care. Social and environmental factors significantly affect health such as housing, transportation, and access to evidence-based health promotion programs and opportunities for healthy living. Communities built for healthy aging throughout our lives are characterized by development patterns that emphasize ease of getting around, with convenient housing options, abundant walking and biking paths, and green space to create an attractive environment. EPA and its partners including CDC, the NCOA, the National Blueprint and others, recognize communities that demonstrate excellence in "Building Healthy Communities for Active Aging." ate the best and most inclusive approach to implementing Smart Growth and Active Aging at the neighborhood and county levels. Portland, OR a recent award winner's achievements will be described on how they are meeting the needs of elders and the changes they have made to the built environment to promote active aging and walkable communities.

SESSION 575 (SYMPOSIUM)

CREATIVE APPROACHES TO THE STUDY OF SPIRITUALITY IN LATER LIFE

Chair: *M. Brennan, Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York*

Discussant: *R.C. Atchley, Naropa University, Boulder, Colorado*

In recent years, gerontologists have begun to study both creativity and spirituality, but rarely have they addressed the connections between these phenomena. Both draw on the inner, nonverbal, and holistic aspects of the human psyche and rely on the language of symbol and metaphor rather than logical expressions of human reason. Both spirituality and creative activity can infuse the lives of older adults with a sense of purpose and meaning as they face the developmental tasks of growing older. The presentations in this session will address the connections between the creative and the spiritual in older adults by showing how creativity can be a pathway to spirituality and by examining how openness to spirituality can nurture creativity. The first presenter will describe the advantages and disadvantages of using film documentaries to capture the holistic and humanistic aspects of aging and spirituality. Our second presentation will describe qualitative research examining connections between spirituality and cognition, as well as the inter-connectedness of spirituality, cognition and creative activity in older adults. Next we will explore how creative expression through the arts reveals spiritual intelligence among older adults living with dementia. The final paper will describe how older adults can strengthen their spiritual connections through the creation of "dooryard gardens" giving them a heightened awareness of the natural world. The discussion will focus on the implications of this work for practice and research.

AGING AND SPIRITUALITY: PRODUCTION OF DOCUMENTARY FILMS

M. Takahashi, *Northeastern Illinois University, Chicago, Illinois*

Documenting spiritual experience requires techniques that capture the highly visual aspects of spirituality: ceremonies, customs, artifacts, clothing, etc. One such technique is film and video. Although for many years social scientists have used visual images as scientific data in an effort to establish facts about psychological and/or social phenomena, there has been the development of a new trend that uses visual documentation as an end in and of itself. This approach portrays human experience through holistic and humanistic film narratives. By incorporating a short clip from one of my previous cross-cultural work on longevity and spirituality in Okinawa, I will present pros and cons of using visual documentation in terms of the following dimensions: funding sources, grant proposal requirements, human resources, technical expertise, ethical guidelines, post production, and the final products (publication vs. distribution).

'IT'S A BLESSING TO BE SHARP' CREATIVE EXPRESSIONS OF SPIRITUALITY AND COGNITIVE HEALTH

S.B. Laditka¹, M. Brennan⁵, J.N. Laditka¹, D.B. Friedman², D.J. Fetterman³, R. Liu², S.L. Ivey⁴, L.L. Bryant⁶, 1. *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*, 2. *University of South Carolina, Columbia, South Carolina*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *University of California at Berkeley, Berkeley, California*, 5. *ACRIA, New York, New York*, 6. *University of Colorado, Denver, Colorado*

Spirituality may play a role in successful aging. We studied diverse older adults' perceptions about spirituality in the context of cognitive health and health behaviors, with thematic analysis of 53 focus groups (n=450, mean age=78) representing African Americans, Native Americans, Chinese Americans, Latinos, Vietnamese Americans, and non-Hispanic whites. Receiving support and/or blessings from God were described more frequently by African Americans, Whites, and Vietnamese. Participants spoke of being inspired by those with faith, and of connections between faith and positive attitudes. Participants described the importance of spirituality and/or religion for cognitive well-being; activities included participating in church events, creative pursuits (e.g., church choir), teaching Sunday school, Bible study, and participating in church-sponsored social and health-promotion activities. Participants stressed the importance of churches for informing the public about behaviors associated with cognitive health, typically commenting, "churches are very powerful." Findings underscore the importance of spiritual and religious expression for cognitive health.

CREATIVE EXPRESSION REVEALS THE SPIRITUAL INTELLIGENCE OF PERSONS LIVING WITH DEMENTIA

S.H. McFadden, *Psychology, University of Wisconsin Oshkosh, Oshkosh, Wisconsin*

Emmons (1999) proposed five components of spiritual intelligence: capacity for transcendence, experience of heightened states of consciousness, sanctification of everyday experience, spiritual resources used for problem-solving, and virtuous behavior. "Intelligence" is a word rarely associated with persons living with dementia. However, observations of 12 one-hour sessions of an arts group involving 10 persons with advanced dementia revealed that in the process of making art together, they showed spiritual intelligence. A theoretical perspective on spirituality and creative expression that views both as fundamentally relational guides the interpretation of the observations. Applying Thomas Merton's metaphor of "seeds of contemplation" to creative expression programs for persons with advanced dementia enables us to see that through these activities, seeds of contemplation can be nurtured in persons with dementia as well as in staff members and volunteers. Examples of the art works created by members of the group will be shown and described.

THE GREENING OF CREATIVITY AND SPIRITUALITY IN 'DOORYARD' GARDENERS

S.A. Eisenhandler, *University of Connecticut, Waterbury, Connecticut*

Creativity finds expression in many aspects of social life. Gardening is a creative activity that offers greening or rejuvenation to gardeners [in the lingua franca of gardening, greening refers to the budding and renewal of plant life each spring]. Another derivative of gardening is heightened spirituality. For some gardeners a transcendent awareness is disclosed in a deeper sense of connection to the natural world or in a concern for the welfare proximate and distal others. Such awareness moves individuals beyond mere self-interest in the outcome of gardening, closer, if not precisely into the domain of gerotranscendence. Qualitative research [2005-2009] in a retirement community where residents have gardened for nearly seventeen years, establishes the empirical base for analysis of these relationships. Small spaces adjacent to front or back doors filled with plant life - dooryard gardens - provide much more than fragrant flowers and the freshest of vegetables; they renew the spirit.

SESSION 580 (SYMPOSIUM)

ESPO PRESIDENTIAL SYMPOSIUM - EARLY CAREER CHALLENGES: ISSUES AND PERSPECTIVES ON PROFESSIONAL CAREERS AND FAMILY PLANNING

Chair: *S.N. Munk, Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Discussant: *S.N. Munk, Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Membership in the Emerging Scholars and Professionals Organization (ESPO) within the Gerontological Society of America (GSA) tends to overlap with the stage of life that often includes life partner establishment (through marriage or other significant relationship commitments) and the expansion of family (through having, acquiring, or adopting children). Discussions regarding this topic typically focus on issues of balancing work/school and family while overlooking the planning and logistics involved in women and men beginning and adding to their families all while pursuing higher education, transitioning from student to career professional, or during their early professional career. This symposium seeks to begin a discussion regarding family planning issues and needs in relation to higher education completion and early career transitions and success. The four presentations within this symposium investigate family planning balanced with academia and career completion/planning through a series of lenses including traditional birth and adoption. In addition, the challenges of working abroad in relation to family planning will be presented along with current and anticipated family status and issues among ESPO members. The primary objective of this symposium is to identify and discuss family planning challenges faced by today's emerging scholars and professionals in the field of gerontology in order to better allow ESPO to develop pertinent programs, symposia, and interest groups to its members.

PRACTICAL LESSONS FROM NEW MOM, PH.D.: FROM COMMENCEMENT TO POST-DOC TO TENURE TRACK

H. Ewen, *Sociology and Gerontology, Miami University, Oxford, Ohio*

The decision to pursue a career in academia while also creating a family is a balancing act of emotion, finances, time, and patience. Women striving for a place in academia often feel the pressures of time—in completion of their degrees, the tenure clock, and their biological clocks. The focus of this presentation is to discuss the issues facing career women during times of professional transition, commencement through post-doctoral fellowships and the early stages on the tenure track while also navigating the early stages of parenthood. The session will include an overview of the job search process, issues with childcare and healthcare benefits, time management, and managing competing demands and emotions. The session will end with questions and discussion.

THE CHALLENGES OF AN INTERNATIONAL CAREER: CAN I MEET MY OWN CAREER AND PERSONAL ASPIRATIONS WHILE WORKING ABROAD?

K. Fitzgerald, *Swansea University, Swansea, United Kingdom*

Balancing family and career is difficult enough without adding the element of working abroad. This presentation is about the challenges of making the decision to work and live abroad early in your gerontological career. Meeting your personal goals and career aspirations while supporting your partner's needs and goals, determining if starting your own family while living abroad is feasible, and nurturing family ties with members in your home country make the decision to work abroad even more complex. Cultural differences, living standards, and distance to 'home' can make living abroad challenging but it can also be a very exciting adventure. Sacrifices may have to be made or plans put on hold, but working abroad can be a very rewarding experience that can make the delay in other parts of your life well worth the challenge.

CAREER AND FAMILY PLANNING: ESPO MEMBERS' PERSPECTIVES

K.B. Dassel, *Barrow Neurological Institute, Phoenix, Arizona*

Successful navigation through the labyrinth of graduate school, early career transitions, and family planning can be quite challenging for members of the Emerging Scholars and Professionals Organization (ESPO) section of GSA; a diverse group of students, post-docs, and young professionals. In order to better address the concerns and meet the educational, professional, and supportive needs of ESPO members in this area, it is imperative that we identify the specific challenges faced by our members as they endeavor to find balance between their personal and professional lives. Therefore, the purpose of this presentation is to present results from a survey completed by ESPO members regarding members' current and anticipated family composition as well as experienced impediments to their family and/or career development. This information will be utilized for the future development of interest groups, symposia, and mentorship opportunities for ESPO members with the goal of reducing stress during this life transition.

SESSION 585 (PAPER)

END OF LIFE CARE

MEDICATION USE BY COMMUNITY DWELLING MEDICARE BENEFICIARIES AT THE END OF LIFE

T. Shaffer^{1,3,2}, L. Simoni-Wastila^{2,3}, W. Toler², B. Stuart^{2,3}, J.A. Doshi⁴, 1. *University of Maryland, Doctoral Program in Gerontology, UMB/UMBC, Baltimore, Maryland*, 2. *University of Maryland, School of Pharmacy, Department of Pharmaceutical Health Services Research, Baltimore, Maryland*, 3. *University of Maryland, The Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland*, 4. *University of Pennsylvania, School of Medicine, Leonard Davis Institute of Health Economics, Philadelphia, Pennsylvania*

Background: While numerous studies have examined the use of medical services at the end of life, much less is known about medication use at this stage of life, and virtually nothing has been quantified. Frameworks for medication use during the end of life are only now starting to be formulated and described. Objectives: To describe the use of select palliative and chronic medications for aged Medicare beneficiaries stratified by probability of death. Participants: Community-dwelling fee-for-service Medicare beneficiaries aged 65 years or older (N=41,493) and a subset of beneficiaries with malignant cancer (ICD-9-CM 140.xx-208.xx, N=1,532) drawn from the Medicare Current Beneficiary Surveys (2000 – 2005). Methods: Probability of death was modeled using a logistic regression and beneficiaries were stratified into 5 groups by predicted probabilities (<5%, 5-10%, 10-20%, 20-30%, >30%). Prevalence and use of palliative and chronic medications were calculated for each group. Results: Utilization of palliative care medications increased

with predicted probability of death. For chronic medications, use of osteoporotics and statins declined as probability of death increased, however, rates of use were still high among those with the highest probability of death, and mean fills per month remained relatively constant across all beneficiary groups. Conclusion: Increased use of palliative medications as death becomes more probable was expected and is consistent with new medication guidelines for dying individuals. For select chronic medications where time-to-benefit exceeds life expectancy, their continued use could be re-considered as long as therapeutic aims are not compromised.

BENEFITS AND CHALLENGES IN USE OF A STANDARDIZED SYMPTOM ASSESSMENT INSTRUMENT IN HOSPICE

D.J. Schulman-Green¹, E. Cherlin², R. McCorkle¹, M.D. Carlson³, M. Hennessy², R. Johnson-Hurzel⁴, E. Bradley², *1. Yale University School of Nursing, New Haven, Connecticut, 2. Yale University School of Public Health, New Haven, Connecticut, 3. Mount Sinai School of Medicine, New York, New York, 4. The Connecticut Hospice and John D. Thompson Institute for Education, Training and Research, Inc., Branford, Connecticut*

Hospices are now mandated to perform routine quality assessment under the final Medicare Hospice Conditions of Participation, calling for standardized approaches to monitoring hospice quality. How will hospices, which are rooted in individualized care, implement standardized quality monitoring systems? We report hospice staff experiences using a standardized symptom assessment instrument, the Edmonton Symptom Assessment System (ESAS), to monitor hospice quality. The ESAS illustrates the benefits and challenges arising with standardized symptom assessment for quality monitoring in the hospice setting. We conducted in-depth telephone interviews with 24 individuals representing 9 hospices involved with the National Association for Home Care & Hospice Quality Assessment and Performance Improvement Collaborative, which pilot tested the ESAS for quality assessment. Transcripts were analyzed using the constant comparative method. Participants reported benefits and challenges with the ESAS. Benefits were that the ESAS was a brief and easy tool that identified areas of concern, engaged patients in symptom assessments, and monitored symptom changes over time. In addition, the ESAS was viewed as a useful teaching tool for less experienced staff. Challenges included lack of clarity about inclusion rules and frequency of assessments; difficulty interpreting the numeric symptom rating scale, difficulty incorporating patient preferences with symptoms, and a sense that the use of standard assessment instruments was "unnatural." Recommendations to promote effective use of the ESAS for quality monitoring of hospice care include standardizing implementation procedures, modifying the ESAS to capture patients' preferences for addressing symptoms, and staff education to enhance comfort levels with the instrument before implementing widely.

END OF LIFE CARE AND DEATH RITUALS: A COMPARISON OF HINDU AND MUSLIM CULTURAL BELIEFS

R. Gupta, *School of Social Work, San Francisco State University, San Francisco, CA, California*

The purpose of this study is to examine Hindu and Muslim cultural beliefs as related to end of life care and death rituals. The population of Hindus and Muslims worldwide has grown in large proportions, and especially in the United States. For example there are about 2 million Hindus and 7 million Muslim Americans in North America. A large proportion of this population is the baby boom generation that is aging and requiring end of life care. However research on end of life care is limited to the majority population or ethnic minorities. Service providers are often faced with the challenge of not having enough knowledge about end of life care for Hindu and Muslim Americans. This study was con-

ducted using four focus groups with 8-10 participants. Focus groups comprised of Hindu population at 3 different stages of life: a) older adults who had immigrated to the US after retirement; b) middle aged immigrated in young adulthood; c) US born young adults. Muslim sample consisted of a focus group of ten middle aged immigrants. The data was tape recorded and transcribed and coded by two independent reviewers. Five themes emerged from data reveal variations in end of life care and death rituals by cultural group and by length of time in the US. The themes are related to meaning of death, and disposal of the body. Other themes are related to after death rituals, organ donation; and prolongation of life that vary between the cultural groups and by cohort. US born Hindus were closer in the adherence to Judeo-Christian beliefs compared to other groups. Results suggest some similarities and differences among these groups.

RECOGNIZING AND SUPPORTING LOSS: OLDER ADULTS WITH DEVELOPMENTAL DISABILITIES

M. Clute, *1. Social Work, Eastern Washington University, Cheney, Washington, 2. Hospice of Spokane, Spokane, Washington*

As life spans increase for adults with developmental disabilities (DD), they experience more loss and bereavement events. Adult children with DD are now outliving their parents (Ansello, 1992; Seltzer, Greenburg, Krauss & Hong, 1997). Paid staff, practitioners and families are expected to prepare, support and sometimes counsel these adults. Practitioners, especially grief counselors, are finding it critical for them to understand best practice principles for working with bereaved adults with DD. Limited information is available for families, support staff and counselors. The focus of this session is to first help participants understand the experience of grief for older adults with DD. Comparisons of the grief experience will be made between the older adult with DD and those without disabilities. Second, the presenter will review effective interventions with adults with DD reported in the literature. Two levels of intervention, informal and formal support are discussed. Effective interventions for bereaved adults with DD exist at both the informal and formal levels. They include: acknowledgement of loss, supportive listening, and involvement in ritual, memorialization, bibliotherapy, addressing spiritual beliefs, life story work, and varied concrete activities. At the level of formal intervention, counselors may build on these techniques, and then may focus on attachment work, coping mechanisms, and guidance and education of home staff, as well as coordination with home staff. Third, suggestions will be made for interventions with older adults with DD, based on the presenter's own research and practice. Existing resources will be shared and examples provided.

HOSPICE RESIDENCE: AN UNDERSTUDIED AREA OF HOSPICE RESEARCH

K. Chung, E.L. Essex, L.F. Samson, *Governors State University, University Park, Illinois*

A hospice residence (HR), a home-like setting where hospice staff provides hospice care 24 hours 7 days, has become an increasingly popular alternative to those who cannot afford to die at their own home. However, the availability of HR is likely to vary by state. Some states have not yet enacted any legislation authorizing HR. We hypothesize that the variation in the availability of HR reflects state HR policies. Selecting five states that allow hospice residence (New York, Wisconsin, North Carolina, Florida and California) and reviewing their laws and regulations, we identified a wide variability in the following policies: 1) permission to convert bed use; 2) room and board payment for Medicaid eligibles; 3) restriction to resident eligibility, geographical area of patient residence and the number of beds allowed to an HR. New York is the only state that provides financial assistance to Medicaid eligibles. North Carolina and Florida have a formal Certificate of Need law of regulating the number of beds allowed to HR. North Carolina allow residential beds only that are paid at the routine care rate; other states permit an HR to convert beds from residential use to inpatient

care use for the provision of general acute care; yet Florida allow dual beds that are licensed for the provision of both acute and routine (residential) care. Among other policies, the ability of an HR to provide all levels of care within the same walls appears to affect HR availability to state residents.

SESSION 590 (SYMPOSIUM)

LONG-TERM CARE RESEARCH AND POLICY IN THE 21ST CENTURY

Chair: L. Polivka, *Florida Policy Exchange Center on Aging, Tampa, Florida*

Discussant: S. Reinhard, *AARP, Washington, District of Columbia*

The body of long-term care research has grown steadily for the last 20 years. Much of this research has focused on the relative effectiveness of home- and community-based programs in meeting the needs of seriously impaired persons in reducing the use of nursing home care. This session will include three presentations providing summary assessments of research findings regarding the capacity of community-based care to provide comprehensive long-term care and the implication of these findings for the future of LTC policy and practice. The three presentations will focus on different dimensions of community-based vs. institutional LTC issues beginning with a review of several years' worth of data demonstrating the capacity of community-based care to contain LTC costs over the long-term. The second presentation will focus on the organizational factors that appear to be most critical in determining a state's ability to create a more balanced LTC system featuring an expansive array of community-based programs. The third presentation will provide the findings on the relative cost-effectiveness of several home- and community-based programs in a single state over a period of eight years. The panel will also include two discussants with extensive backgrounds in long-term care research, policy analysis, and implementation.

THE RELATIVE COST-EFFECTIVENESS OF HOME- AND COMMUNITY-BASED PROGRAMS IN FLORIDA

L. Polivka, *Florida Policy Exchange Center on Aging, Tampa, Florida*

The Florida Policy Exchange Center on Aging has conducted comparative cost-effectiveness studies of the state's major HCBS programs on an annual basis since 2003. This research is methodologically unique in that it is based on the linkage of Medicaid claims and Department of Elder Affairs client assessment data, which allows researchers to control for a wide range of client and service variables in measuring comparative program outcomes. The results across four studies have remained stable, in terms of the relative cost-effectiveness of each of the five programs. The presentation will conclude with discussion of how the stability of these findings enhance their value in shaping long-term care policy, especially in terms of for-profit HMO-organized LTC vs. non-profit aging network administered LTC.

DO HOME- AND COMMUNITY-BASED LTC PROGRAMS INCREASED CHOICE AND CONTAIN COSTS IN STATE LTC PROGRAMS

C. Harrington, *University of California, San Francisco, California*

Home- and community-based care has increased at a much slower rate for the impaired elderly than for the developmentally disabled population over the last 20 years. By 2008, a relatively small, but growing, number of states are now serving more impaired elderly in community-based programs than in nursing homes, but most states were still spending over 70 percent of their public LTC dollars on nursing home care. What do we now know about the capacity of community-based programs to substitute for institutional care of the impaired elderly and to increase the cost-effectiveness of state LTC systems? This presentation will use spending data collected from states to show that the expansion of community-based programs does appear to contain LTC costs fol-

lowing an initial increase in spending required to establish a sufficient infrastructure of community-based care that can serve as an alternative to nursing home care.

RESEARCH AND POLICY IN THE AGING NETWORK

R. Browdie, *Benjamin Rose Institute, Cleveland, Ohio*

This presentation will discuss the policy implications of what we now know about the cost-effectiveness of home- and community-based LTC services for the future of the non-profit aging network, which has provided the bulk of publicly funded community care for 25 years. The presentation will describe how these research findings can be used to formulate national performance standards for the aging network organizations as part of a comprehensive reform effort to create balanced LTC systems in all the states and improve the overall quality of LTC services.

STRATEGIES THAT PERMIT STATES TO RE-DIRECT THEIR LONG-TERMS CARE SYSTEMS TO COMMUNITY CARE

R.A. Kane, *Health Policy & Management, School of Public Health, University of Minnesota, Minneapolis, Minnesota*

States and the federal government have become increasingly interested in creating a better balance in their LTC systems by expanding community-based programs and reducing their reliance on nursing home care. This presentation addresses the at organizational/administrative factors that seem to be most important in permitting states to make substantial progress in achieving balanced LTC systems. The presentation is based on findings from repeated in-depth case studies of LTC systems in 8 states and cross-cutting topical studies across those states. The research presented dealt with all populations served under Medicaid; this presentation concentrates on seniors and illustrates that effective strategies for seniors can be derived from principles developed for and by persons with physical or developmental disability. The future of the nursing home in a rebalanced system is discussed as is the challenge of making sure that community residential settings do not themselves become institutional in nature.

SESSION 595 (POSTER)

MINORITY AND DIVERSE POPULATIONS

LGBT ELDERS AND SENIOR SERVICES: ARE WE EQUIPPED TO MEET THE NEEDS OF THIS UNIQUE POPULATION?

A.M. Fosnacht, *School of Public Health, University of Illinois, Chicago, Illinois*

Background: There may be 2–6 million older LGBT adults by 2030 who have unique needs related to social support, informal care, stigmatization, and homophobia. Existing services may be inadequate in recognizing and meeting their needs. Purpose: This is an exploration of the extent to which professionals at senior-service organizations report the existence of policies supporting older LGBT clients and to examine differences in terms of facility type, religious affiliation, and payment sources. Methods: Howard Brown Health Center of Chicago conducted a survey among professionals in aging services who attended a meeting by the Chicago Department on Aging in November 2007. This dataset was analyzed (N=69) to address the research questions above, focusing on the existence of eight specific policies/programs. Results: Respondents reported an average of 2.8 LGBT-sensitive policies. The most prevalent was the inclusion of nondiscriminatory written policy. The least was required employee training. Religious organizations were 1.81 times more likely to report the existence of policies/programs (.64 - 2.8). Medicaid-accepting/free service providers were 1.96 times more likely to report the existence of policies/programs (.76 - 3.78). Social service organizations were more likely to report policies (44%) than medical facilities (33%), home health agencies (33%), elder service manag-

ing/marketing businesses (consulting) (25%), and living communities (11%). Discussion: Results suggest need for development of LGBT-sensitive policies. The most commonly reported policies do not include staff training or LGBT-specific programs. We should be concerned about the lack of LGBT-sensitive policies in living communities, among non-religious organizations and among private pay organizations.

USE OF RESTRAINTS ON OLDER PATIENTS WITH DEMENTIA: REPORTS FROM NURSES AND NURSING ASSISTANTS IN HONG KONG

E. Yan¹, T. Kwok², 1. *Social Work and Social Administration, University of Hong Kong, Hong Kong SAR, China*, 2. *The Chinese University of Hong Kong, Hong Kong SAR, China*

Physical Restraint is a Common Method of Behavior Control in Elder Care. The Most Frequently Cited Reason for the Use of Restraint is to Protect the Safety of Older Persons. However, there is Ample Evidence that the Use of Restraint is Not Only Ineffective in Achieving this Goal but Also Causes a Great Deal of Physical and Psychological Suffering. This Study Examines the Prevalence and Correlates of the Use of Restraint on Older Patients with Dementia in the Hospital Setting in Hong Kong. A Total of 187 Nursing Staff was Recruited through Convenient Sampling. Participants Provided Information on their Demographic Characteristics, Coworker Emotional Support, Burnout Symptoms, Attitudes toward Patients with Dementia, and their Experience of Restraint Use in Dementia Care. Results Showed that Restraint Use is Common among Nurses in Hospital Medical Wards in Hong Kong - More than Two-Thirds (69%) of the Participants Reported Using Physical Restraint in the Past 3 Months. Pearson Correlation Analysis Results Show that Use of Physical Restraint was Negatively Correlated with the Age of Participants ($r = -.44, p < .01$) and Coworker Emotional Support ($r = -.20, p < .05$), but Positively Correlated with Emotional Exhaustion ($r = .21, p < .01$). Attitudes towards Patients with Dementia, Depersonalization and Lack of Personal Achievement were Not Related to Restraint Use ($p > .05$). To Reduce the Use of Restraint in Dementia Care, We Should Cultivate a Supportive Environment and Reduce Job Stress among Nursing Staff.

"QUITE FRANKLY, I HAVE DOUBTS ABOUT REMAINING": HEALTH AND SUPPORT CONCERNS OF RURAL OLDER GLB ADULTS

S.D. King, H. Dabelko-Schoeny, *Social Work, Ohio State University, Columbus, Ohio*

For older adults living in rural communities, the ability to age-in-place is influenced by one's physical health status and access to both formal and informal support. Aging-in-place supports individual choice and autonomy and is often fiscally prudent. This study used a qualitative approach to explore health care service utilization and social support networks of 20 older gay, lesbian, and bi-sexual participants living in rural communities. The ages of the participants ranged from 40 to 68. There were 3 lesbians, 15 gays, 1 bi-sexual man and 1 bi-sexual woman from 13 states. Fifteen of the participants had several chronic health conditions. Themes emerging from this study included transportation difficulties to receive care, lack of choices for care, affordability of care, and the lack of connection and sense of belonging to a community. Ten participants did not have family they could depend upon for support, nine did not have friends who they could depend upon for support, and five indicated they did not have either for support. Seven of the participants had not disclosed their sexual identity to their health care providers. The lack of inclusion within the community, along with the lack of support options was a concern to be able to age-in-place. This presentation will outline several important factors health care service providers should be aware of when working with this population and areas where further research is needed to better understand the obstacles that effect aging-in-place for older gay, lesbian and bi-sexual individuals living in rural communities.

HEALTH STATUS, HEALTH INSURANCE AND SERVICE UTILIZATION PATTERNS AMONG CHINESE, FILIPINO, ASIAN INDIAN, AND OTHER ASIAN/PACIFIC ISLANDER OLDER ADULTS IN THE UNITED STATES

J. Tan, *Washington University in St. Louis, Saint Louis, Missouri*

Purpose of the study This study examined the health status, health insurance, and health service utilization patterns of US Chinese, Filipino, Asian Indian, other Asian/Pacific Islander (API), and non-Hispanic white older adults by using nationally representative data. Design and Methods Aggregated data file from the National Health Interview Survey from 1998 to 2006 was analyzed. Sample included 625 Chinese, 582 Filipino, 213 Asian Indian, 1124 "other API", and 72207 non-Hispanic white older adults aged 65 and older. Bivariate and multivariate analyses were used to examine the relationship between Asian ethnicities and health status and health service utilization. Results The descriptive statistics show that there are significant differences of sociodemographic characteristics, health status, health insurance, and health service utilization patterns among different groups of Asian older adults. Logistic regression reveals that compared to non-Hispanic whites, other API older adults were more likely to have poor self-reported health; while Chinese, Filipino and other API older adults were less likely to have activity limitations. In terms of health service utilization, all Asian American older adults are less likely to have hospital overnight stays than non-Hispanic whites, and there is no difference of health professional visit among ethnic groups. Age, marital status, education, live arrangement, citizenship and health insurance status are all significant factors related to health status and health service utilization. Implications Understanding of similarity and difference of health needs and health service utilization patterns among different groups can help health professionals provide best services to these populations.

SUCCESSFUL AGING THROUGH THE EYES OF ALASKA NATIVES: THE HEALTH AND WELLBEING OF ALASKA NATIVES IN BRISTOL BAY, AK

J. Lewis, *Psychology, University of Alaska Fairbanks, Fairbanks, Alaska*

There is very little research on Alaska Native elders and how they subjectively define a successful older age. The lack of a minority definition risks portraying them as aging less successful than their non-minority counterparts. This research explores the concept of successful aging from an Alaska Native perspective and what it means to age well in Alaska. The Explanatory Model (EM) was used to gain a sense of the cultural beliefs about aging from Alaska Native elders in Bristol Bay. Research findings indicate that a set of cultural beliefs exist about successful aging, health status is related to successful aging, passing down knowledge is critical to becoming an elder, and aging successfully is based on personal responsibility and cognitions. Most elders stated that reaching a certain age (e.g. 65) does not determine their status as an elder, but rather the wisdom and experiences they gain throughout life.

THE EFFECT OF UNIVERSAL HEALTH INSURANCE ON ETHNIC MORTALITY DIFFERENTIAL AMONG THE ELDERLY IN TAIWAN

H. Tung, *Asia University, Wufeng, Taichung County, Taiwan*

Health disparities research has shifted from documenting disparities to focusing more on identifying the underlying causes of health disparities. It is argued that the access, utilization, and quality of health care might explain why ethnic health disparities persist between older African Americans and whites. Before launching the National Health Insurance (NHI) program in 1995, significant health disparities have been documented across different ethnic groups of elders in Taiwan. After the introduction of NHI, surveys have confirmed that the program has greatly improved the accessibility and utilization of health care services among the newly insured. However, it is not clear if the program has contributed to narrowing the mortality gaps across different ethnic groups of elder. Starting from 1989, a longitudinal survey has followed

a national representative sample of elders through 2006. By linking the survey data to the National Death Index, comparisons on mortality differentials were made for the before and after-NHI periods and across three major ethnic groups of elders. Results showed that, before the NHI, 700 deaths (out of 3817) were recorded and 795 deaths (out of 2380) were recorded for the after-NHI period. During both of the two periods, Mainlander elders were significantly less likely to die, when compared to their Min-nan and Hakka counterparts and these ethnic mortality disparities could be explained away by Mainlanders' higher socio-economic standings. It seems that, for this cohort of elders, a universal health insurance program has played a limited role in narrowing ethnic mortality differentials among the elderly in Taiwan.

ENGLISH LANGUAGE PROFICIENCY AND DEPRESSIVE SYMPTOMS AMONG CHINESE AMERICAN ELDERS IN ARIZONA

S. Kang, S. Moon, R. Basham, *School of Social Work, The University of Texas at Arlington, Arlington, Texas*

Introduction. The effects of English language proficiency and social support on depressive symptoms among 120 Chinese American elders in Arizona were examined using the frameworks of the stress coping theory. Despite the rapid growth in the number of Chinese American residents aged 65 or older in Arizona in the last decade, policy makers and gerontology practitioners have no empirical data on which to design programs aimed at the specific needs of this elderly population. **Methods.** The reliability of Chinese version of GDS with this sample was .81. A snowball sample of 120 Chinese American elders aged 65+ ($M = 75.9$; $SD = 7.2$; 62.5% female) completed one and half hour survey. Due to the lack of ethnic enclave resources, the quality of life experience of Chinese American elders in Arizona- which was calculated by Geriatric Depression Scale (GDS) - might differ from that of their counterparts living in or near ethnic enclaves in major metropolitan areas. **Results.** Contrary to this assumption, the proportion of Chinese elders with depressive symptoms was 15% of the sample which is similar to mainstream American elderly population (The standard cutoff point for depression in the total GDS score is > 11). Based on multiple regression analyses, the models ($R^2 = .478$) indicate that English language proficiency, health, family social network were significant correlates in explaining depression scores. The family responsibility expectation factor and the perception of these family value differences between generations did not make any significant impact on depression levels.

THE DIFFICULTY OF LATER STAGE LIFE OF THE ABORIGINAL OLDER ADULTS IN TAIWAN

M. Lin, *Philosophy and Religion, Chang Jung Christian University, Gueiren, Tainan, Taiwan*

Little research on aging in Taiwan is focused on aboriginal older adults reside in remote or mountain area and whose life style and culture are very different from the majority of Taiwanese. This study explores the difficulty of later stages of life in the community-dwelling older aboriginal people. Data collection includes in-depth interviews and community observation. Participants involved with 12 persons aged over 65, including 8 females and 4 males, from two different tribes of aborigines in Taiwan. There are four themes discovered on the study. First theme is longing for connection. The participants feel very much isolated and lonely because their children are forced to work in the city to earn a living and rarely visit. Second theme is lacking of financial resources. The older adults rely on government small pension to support themselves and health care expenses. They often need to seek for financial assistance from churches and charity organizations. Third theme is accessibility to health care. They face difficulties in transportation due to distance from the health care institutions, excluded from the modern medical technology, and short of money to take care of multiple chronic illnesses. Fourth theme is spiritual distress. Most partici-

pants yearn to chat with their peers, visit other tribes, travel beyond their villages, even find something meaningful activities; however, it seems little chance to fulfill these wishes. The aborigines have the right for life development, it is urgent to meet the need of those marginalized older adults in Taiwan.

AGE DIFFERENTIAL EFFECTS OF ACCULTURATION ON MENTAL HEALTH STATUS AMONG KOREAN AMERICAN MIDDLE-AGED AND OLDER ADULTS

J. Min, E. Ko, *SDSU, San Diego, California*

Acculturation is a crucial variable in mental health research and practice with racial/ethnic minority populations.. Its effect on mental health outcomes, however, may vary by age groups and the different indicators of acculturation. Therefore, the main purpose of this study is to examine the effects of acculturation on psychological distress by age groups among Korean Americans. Data for this study were pooled from the 2005 and 2007 California Health Interview Survey (CHIS) of a statewide representative sample of Korean Americans aged 30 and over. The level of psychological distress was assessed by Kessler K-6 scale. Three age groups were used: 30-49, 50-64, and 65+. Three indicators of acculturation included English language proficiency, the length of stay in U.S., and percent of life in U.S. Gender, education, income, poverty, and disable status were controlled for in the analysis. The ordinary least square regression with Jackknife replicative sampling weights applied. Results showed that the effects of acculturation on psychological distress varied by age groups. English proficiency and the percent of life in U.S. were significantly associated with the psychological distress for 65+ group. The lack of English proficiency appeared to increase the distress ($b = .66$, $p < .01$), while the higher percent of life in U.S. decreased the distress ($b = -.46$, $p < .01$). The length of stay in U.S. was significant only for 30-49 group. Results suggested that psychological distress varies by three different indicators of acculturation among the age groups. The services or interventions should take into consideration the age group and each dimension of acculturation, rather than treating them as homogeneous.

ETHNIC DISPARITIES IN ORAL HEALTH STATUS AND ACCESS TO CARE AMONG OLDER ADULTS IN NYC

D. Shelley¹, M.S. Wolff¹, M.C. Fahs², *1. New York University, New York, New York, 2. Hunter College, New York, New York*

Oral health is essential to older adults' general health and well-being. Poor oral health is associated with pain, loss of teeth, poor nutrition, and chronic diseases such as diabetes. Despite the growing problem, little is known about oral health status and access to dental care among minority populations particularly Asian Americans. The CDC has emphasized the need to test population-based approaches to oral health promotion and disease prevention in the elderly. Senior centers represent a promising setting for these activities. To define the oral health status and access to care among older, lower income, community dwelling adults we conducted a survey of 1,870 randomly selected adults over the age of 60 attending one of a representative sample of 56 senior centers in NYC. Compared with Whites, Hispanics and African Americans, Asian Americans were more likely to report problems with eating or chewing solid foods because of problems with their teeth, to have lost permanent teeth, to report never having seen a dentist, and less likely to report having dental insurance. We will present additional data on the association between oral health status and chronic health conditions, high risk health behaviors, level of education, income and immigration status. The projected aging of the US population heightens the urgency of addressing oral health needs for the elderly yet data on high risk immigrant populations is lacking. This study fills gaps on oral health data among Asian Americans and helps define risks and opportunities for interventions among minority older adults.

ACCULTURATION AND PERCEIVED MENTAL HEALTH NEED AMONG OLDER ASIAN AMERICANS

D. Nguyen, *New York University, New York, New York*

Researchers note the crucial role the perception of mental health need plays in help-seeking behavior among the general population. Gerontologists studying Korean American elders have noted the cultural influences on perceived mental health need. To shed light on an understudied topic, this study explored the role that culture and acculturation play in the report of perceived mental health need among older Asian Americans. Data on 979 Chinese, Filipino, and Vietnamese American respondents over the age of 50 were extracted from the 2001 California Health Interview Survey. A logistic regression model was tested to identify the unique influence of culture and acculturation on the report of perceived mental health need. Controlling for other factors, logistic regression analyses revealed the independent effects of age, ethnic background, and nativity on the likelihood of perceiving a mental health need. Asian Americans over 65 were less likely than those between 50-64 to report perceiving a mental health need. In addition, Chinese Americans were less likely than Vietnamese Americans to perceive having a mental health need. The foreign born were less likely than those born in the U.S. The results suggest that culture influences the perception of mental health need among older Asian Americans. A deeper understanding of perceived mental health need will inform the development of interventions to reduce health disparities.

RACIAL AND ETHNIC DIFFERENCE IN HEALTH AND MENTAL TRAJECTORIES OF OLDER PEOPLE

T.Y. Lum, K. Danso, *University of Minnesota, St. Paul, Minnesota*

Objective: Although racial and ethnic disparities in health and mental health outcomes are well documented, very little has been known on how race and ethnicity interact with other variables to affect the trajectories of health and mental health as people age. The objective of this study were to understand the differences in health and mental health trajectories among older people in difference racial and ethnic groups and how these trajectories were shaped by other socioeconomic factors. **Methods:** Data for this study come from 1994 to 2006 longitudinal data from the HRS and AHEAD studies. Outcome variables included whether the respondents were still alive or not, self-reported health, number of ADL and IADL difficulties, and CESD depression level in each survey year. The sample included 21,454 individuals, among them, 77% were non-Hispanic White; 15% were non-Hispanic Africans, and 8% were Hispanics. Random effect model and growth curve model were used for data analyses. **Findings:** there were significant health and mental health disparities across racial and ethnic groups and these disparities persisted as people aged. Members of different racial and ethnic groups and of different age cohorts (AHEAD vs HRS) showed different patterns of health and mental health trajectories as they aged. The health and mental health trajectories across racial and ethnic groups diverged (e.g. stayed alive) or converged (e.g. levels of depression) as people aged, depending on the health measures.

SESSION 600 (PAPER)

RECENT ADVANCEMENTS IN THE BIOLOGY OF AGING

DATE OF ECLOSION AS A DETERMINANT OF LONG LIFE IN THE MEXFLY ANASTREPHA LUDENS: INSIGHTS ACROSS DIET, CALORIC RESTRICTION AND REPRODUCTION

A. Kulminski¹, F. Molleman², I. Culminskaya¹, K. Arbeev¹, S. Ukraintseva¹, J. Carey², A.I. Yashin¹, *1. Center for Population Health and Aging, Duke University, Durham, North Carolina, 2. University of California, Davis, Davis, California*

Diet and reproduction are among the most important modifiable factors which extend life span in various model organisms, but interrelationships between them are not yet clear. We use unique experimental data on daily reproduction and survival of individual fruit flies from eight cohorts eclosed at different dates in 2004 and 2005 who were treated with varying proportions of sugar and yeast and subject to different caloric restrictions (CR). We investigate the relationship between eclosion date and longevity across diet, CR, and reproduction in *A. ludens*. We show that date of eclosion can be associated with uncontrolled external or internal factor(s) which can modulate longevity of males and females independently of diet and reproduction to the extent similar to the effect of diet on longevity. The effect of diet manipulation on longevity is sensitive to date of eclosion with the role of CR in life extension ranging from beneficial to harmful. Interaction of date of eclosion with compositional changes of sugar and yeast but not with CR is responsible for real life extension. In contrast, we show that highly protein-enriched diets reliably maximize reproduction but not life span. Decreased longevity of flies treated with high-protein diets may be associated with harmful consequences of protein ingestion but is unlikely a result of high reproduction rates. Eclosion cohorts that typically have short life spans have the greatest potential to benefit from diet manipulations. Finally, we present evidence for the presence of two frailty-sensitive weakly interacting mechanisms of longevity in female flies.

AGE-RELATED DECLINES IN PARATHYROID HORMONE RECEPTOR EXPRESSION IN MAMMALIAN SKELETAL MUSCLE

D. Russ¹, B. Clark², M. Hans¹, J. Gau³, *1. Ohio University School of Physical Therapy, Athens, Ohio, 2. OU College of Osteopathic Medicine, Department of Biological Sciences, Athens, Ohio, 3. Ohio University College of Osteopathic Medicine, Athens, Ohio*

Objective: To determine parathyroid hormone receptor (PTH1R) expression in young and aged rat plantarflexor muscles (medial & lateral gastroneurii, plantaris and soleus). **Background:** Although chronic, sustained elevations of parathyroid hormone (PTH) are known to be catabolic with regard to bone, daily injections of recombinant PTH are used as an anabolic (bone-forming) agent in the treatment of osteoporosis. Anecdotal reports of reduced muscle fatigue and improved physical function with PTH treatment suggest a potential anabolic effect of PTH on skeletal muscle. PTH1R is expressed in cardiac muscle, where PTH has been shown to exert a positive inotropic effect. However, expression of PTH1R in skeletal muscle has only been reported at the transcript level. **Method:** Plantarflexor muscle samples from 7 adult (6-8 months) and 7 aged (24 months) male F344/BN rats were processed for immunoblotting for the PTH1R. Following immunodetection, bands were quantified with laser scanning densitometry. **Results:** A 2-way ANOVA (age X muscle) revealed significant effects of muscle ($P<0.01$), age ($P<0.01$) and an age X muscle interaction ($P=0.04$). All plantarflexor muscles exhibited significant age-related declines in PTH1R (24-33%), except the soleus (2%). Overall PTH1R expression in the soleus was $>20\%$ of that in the other muscles. **CONCLUSION:** These results indicate that PTH1R is expressed in skeletal muscle, and that the greatest

expression occurs in skeletal muscle with faster phenotypic profiles. Accordingly, these results provide an avenue for a direct PTH action on skeletal muscle. Further research is needed to determine the extent of PTH effects in young and old subjects.

MIMETIC ACTIVATION OF ANCIENT STRESS-RESISTANCE PATHWAYS TO INTERVENE IN AGE AND DISEASE

J. Smith-Sonneborn, *Zoology & Physiology Emeritus, University of Wyoming, Laramie, Wyoming*

Objectives: To assess the ability of hibernation mimetics, Deltorphins, to tolerate ischemic stress of hemorrhage. **Background:** Molecular mimics of the environmental cues have emerged as triggers of the protective and rejuvenating molecular pathways from the studies from this laboratory* and from numerous other investigators. **Methods:** Rats were fitted with femoral arterial and venous catheters for measurements of mean arterial pressure (MAP), heart rate (HR), and intravenous (i.v.) injections of isotonic saline, 1 mg/kg Delt-Dvar, or 2 mg/kg Delt-Dvar. During hemorrhaging, 30% (5 mL) of total blood volume was collected from the arterial catheter. **Results:** Saline and 1 mg/kg Delt-Dvar rats treated post hemorrhage had similar MAP and HR after hemorrhage. In contrast, 2 mg/kg Delt-Dvar administered after hemorrhaging led to a faster and more complete recovery of MAP than compared with the other groups. In hemorrhaged rats, the average HR gain (bpm/mmHg) after 2 mg/kg Delt-Dvar treatment was greater and the BP50 (BP at one-half the HR range) was significantly lower than after saline treatment. **Conclusion:** After hemorrhage, 1) stimulation of Delt Dvar opioid receptors leads to improved MAP, and this recovery may involve a change in baroreflex sensitivity. 2) In our other studies, using, DeltE, another peptide, significant extension of survival without fluid resuscitation was found. 3) Since deltorphins preserve function during stress, and strength muscles during hibernation, agonists of the delta opioid receptor may stimulate type 2 muscles in the absence of exercise. *Shawna McBride and Mikal Rutten graduate studies.

EFFECTS OF ACE-INHIBITORS AND ANGIOTENSIN RECEPTOR BLOCKERS ON MITOCHONDRIA-DRIVEN APOPTOSIS IN RAT GASTROCNEMIUS MUSCLE

C. Carter, E. Marzetti, J. DuPree, D. Seo, D. Morgan, S. Giovannini, *University of Florida, Gainesville, Florida*

Mitochondrial apoptotic signaling is suggested to play a role in age-related muscle loss and functional decline. We have previously shown that treating aged rats with angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) improves physical function. Recently published data indicate that this effect may be mediated by attenuation of age-related loss in mitochondrial number and function. However, no studies have yet investigated the effect of ACEIs or ARBs on the extent of skeletal muscle apoptosis. In the present study, we investigated whether 3-month treatment with ACEI (enalapril, 20 and 40 mg/kg) or ARB, (losartan, 30mg/kg) impacts the extent of apoptosis and mitochondrial apoptotic signaling in gastrocnemius muscle of male Fischer 344xBrown Norway rats (n=10/group). Treatments were started at 24 months and rats were sacrificed at 27 months of age. Rats receiving high-dose enalapril displayed decreased gastrocnemius apoptotic DNA fragmentation compared to placebo. Conversely, no changes in the extent of apoptosis were detected in losartan-treated rats. Bax-to-Bcl2 ratio was decreased in all treatment arms compared to placebo, indicative of a lower apoptotic potential. However, increased content of Bcl-2 and decreased levels of Bax, cytosolic cytochrome c, active caspase-9 and 3 were only detected in the enalapril groups. The magnitude of those changes was greater in the high-dose arm. In contrast, nuclear translocation of endonuclease G and apoptosis inducing factor was not affected by either treatment. Our findings indicate that 3-month enalapril treatment selectively down-regulates, in a dose-dependent fashion, the

mitochondrial caspase-dependent apoptotic pathway in gastrocnemius muscle of old rats.

SESSION 605 (SYMPOSIUM)

THE PATHOBIOLOGY OF DEMENTIAS OF THE ALZHEIMER TYPE: RECENT ADVANCES

Chair: G.M. Martin, *Pathology, University of Washington, Seattle, Washington*

Discussant: S.A. Small, *Columbia University, New York, New York*

“Dementias of the Alzheimer Type” (DAT) is a terminology which reminds us that “Alzheimer’s disease”, while having certain common histopathological and clinical features, may yet prove to reflect several pathogenetic subsets. Scott Small and Karen Duff have recently suggested a “dual pathway” model of causality, whereby the neurotoxic Abeta peptide and abnormal forms of tau can be linked by separate mechanisms driven by a common upstream driver (Neuron 60:534, 2008). Todd Golde will then bring us up-to-date on the genesis of the family of Abeta molecules and current views on which species are the toxic moieties. Synapses seem to be a major target of such toxicity, but some of us may have more to spare than others; John Morris will give us the latest evidence of this “synaptic reserve” hypothesis. Frank La Ferla will conclude by turning to some good news – the possibility of developing a novel therapy based upon modulations of histone deacetylase activities. Remarkably, this story finally provides a bridge to current research on the basic biology of aging.

TARGETING “TOXIC” A β PEPTIDES IN ALZHEIMER’S DISEASE

T.E. Golde, *Mayo Clinic Florida, Jacksonville, Florida*

Amyloid β peptide (A β) accumulation within the brain is a hallmark of Alzheimer’s disease. The accumulation of aggregated A β is thought to initiate a pathological cascade that results in cognitive decline. A β is generated from the amyloid β protein precursor (APP) through sequential proteolysis by the β - and γ -secretases. A 40 amino acid form of Abeta is the major secreted A β species, whereas the minor 42 amino acid form of A β has been implicated as the initiating molecule in the pathogenesis of AD. Though monomeric A β is not toxic, various A β aggregates show “toxic” properties. In this talk I will provide both an overview of the rationale for, and the methods being used to, develop therapies targeting A β , A β aggregates or both. I will also highlight 1) the controversies regarding the composition of the toxic species of A β , and 2) the challenges of developing disease modifying therapies for AD.

STEM CELL THERAPY AND ALZHEIMER’S DISEASE

F.M. LaFerla, *Neurobiology and Behavior, University of California, Irvine, Irvine, California*

Neural stem cell transplantation represents an unexplored approach for treating neurodegenerative disorders associated with cognitive decline. In Alzheimer disease, beta-amyloid plaques and tau-laden neurofibrillary tangles accumulate in several brain regions, leading to synaptic dysfunction and cognitive deficits. Here we show that neural stem cells transplanted into the hippocampus of Alzheimer transgenic mice rescue spatial learning and memory deficits. Remarkably, cognitive function is improved without altering Abeta or tau pathology. Instead, the mechanism underlying the improved cognition involves a robust enhancement of hippocampal synaptic plasticity, mediated by brain-derived neurotrophic factor (BDNF). Gain-of-function studies show that delivery of recombinant BDNF mimics the beneficial effects of NSC transplantation. Furthermore, loss-of-function studies show that depletion of NSC-derived BDNF fails to improve cognition or restore synaptic plasticity. Taken together, our findings demonstrate that neural stem cells can ameliorate complex behavioral deficits associated with widespread Alzheimer disease pathology via BDNF.

LINKING A β AND TAU IN LATE-ONSET ALZHEIMER'S DISEASE

S.A. Small, *Columbia University, New York, New York*

Alzheimer's disease is characterized by abnormal elevation of A β peptide and abnormal hyperphosphorylation of the tau protein. The 'amyloid hypothesis', which is based on molecular defects observed in autosomal-dominant early-onset Alzheimer's disease (EAD), suggests a serial model of causality, whereby elevation of A β drives other disease features including tau hyperphosphorylation. Here, we review recent evidence that suggests that an alternative model might exist in late-onset AD (LOAD), the complex and more common form of the disease. Specifically, based on recent molecular findings it is possible to hypothesize a 'dual pathway' model of causality, whereby A β and tau can be linked by separate mechanisms driven by a common upstream driver. This model may account for the results of recent drug trials and, if confirmed, may guide future drug development.

SESSION 610 (PAPER)

ATTITUDES, HEALTH, AND WELL BEING IN FAMILIES

A STUDY ON THE QUALITY OF RELATIONSHIP BETWEEN PARENTS-IN-LAW AND FOREIGN DAUGHTERS-IN-LAW IN SOUTH KOREA

S. Chung, H. Park, *Ewha Womans University, Seoul, Korea, South*

The purposes of this study were to explore the quality of relationship between parents-in-law and their foreign daughters-in-law and to examine factors influencing the quality of relationship. For the study, the data were collected from 193 elderly people aged 60 and over who have foreign daughter-in-law in Seoul, Kyunggi-do, and Chonla-do of South Korea. The quality of relationship with foreign daughters-in-law was measured by subjective evaluation about the degree of the family member interaction such as love, care, acceptance, and respect perceived by parents-in-law. Demographic variables of the elderly and foreign daughters-in-law and characteristics of the relationship were included in the analysis. Results showed that the quality of relationship between parents-in-law and foreign daughters-in-law was relatively good, compared to Koran daughters-in-law. Cultural competency, level of education of daughters-in-law, and marital relationship were associated with greater perception of quality of relationship. This study was meaningful because it examined firstly the relationship between parents-in-law and foreign daughters-in-law in Korean society.

THE IMPACT OF CHRONIC ILLNESS WITHIN GRANDFATHER-GRANDCHILD RELATIONSHIPS

A. Taylor², J. Bates¹, *1. Syracuse University, Syracuse, NY, 2. East Carolina University, Greenville, North Carolina*

Little is known specifically about grandfathers and their relationships with their grandchildren, particularly in regard to grandfathers who are experiencing a chronic illness. The findings from this study help fill gaps in our understanding of grandfather-grandchild relationships by testing a conceptual model of grandfather involvement as it relates to chronic illness. The following research questions were asked: (1) Does grandfather involvement (frequency of contact, level of commitment, and performance of role related activities) differ among grandfathers suffering from chronic illnesses when compared to more healthy grandfathers? (2) Do grandfathers with diabetes, heart disease, and/or hypertension differ in their involvement with their grandchildren? Three hundred and forty-three grandfathers completed a questionnaire assessing perceptions of involvement with a target grandchild (2 months-27 years old). Of the 343 participants with complete data, 175 had at least one chronic illness (i.e., diabetes, heart disease, and/or hypertension). Analysis of variance was used to examine differences among healthy and chronically ill grandfathers. Findings indicate that grandfathers with

a chronic illness were not significantly different from grandfathers without a chronic illness in regards to their contact, commitment and types of role activities. Sixty-one grandfathers reported having diabetes, and fifty-two reported having heart disease, while one hundred and thirty reported having hypertension. ANOVA results indicate that there were no significant differences among grandfathers having these distinct chronic illnesses. These results were somewhat surprising, as they indicate that grandparents with the above mentioned chronic illnesses are equally involved with their grandchildren when compared to their non-chronically ill grandfather counterparts.

FATHER'S TRADITIONAL ATTITUDES: THEIR ROLE IN THE FLOW OF SUPPORT FROM ADULT CHILDREN

M.W. Steinhour¹, J. Suitor¹, K. Pillemer², *1. Purdue University, West Lafayette, Indiana, 2. Cornell University, Ithaca, New York*

The study of exchanges between parents and adult child has been a major focus of research on intergenerational relations across the past half century. Studies that have included both mothers and fathers have found substantial gender differences between the flow of support from children to parents, but few differences in the predictors of support to mothers and fathers. We contend that there is one important predictor of support from children to fathers that has received no attention in the literature: fathers' traditionalism. In this paper, we explore the role fathers' traditionalism plays in their receipt of advice, expressive and instrumental support from their adult children, using quantitative and qualitative data from 130 older fathers collected as part of the Within-Family Differences Study. Specifically, we test the hypothesis that fathers who hold more traditional values are less likely to receive all three types of support from their adult children. Preliminary analysis suggests that the more traditional values fathers' hold, particularly regarding gender, the less likely they are to receive support from their adult children. Further, more traditional fathers are less likely to solicit, as well as actually receive, support from their children.

SKIPPED-GENERATION HOUSEHOLDS IN RURAL CHINA: INFLUENCES ON THE WELL-BEING OF OLDER ADULTS

L. Baker, M. Guo, M. Silverstein, *Andrus Gerontology Center, University of Southern California, Los Angeles, California*

The past few decades have seen a large increase in multigenerational coresidence in the United States, particularly of the number of children living with grandparents in the absence of both parents. Raising a grandchild in a skipped-generation household is often associated with high levels of burden, depression, and poor health outcomes among older adults. These households are also on the rise in rural China, primarily due to work-related migration among the working age population. However, given the strong norms of filial piety among older adults in China, combined with the more reciprocal nature of support within these families (given high levels of financial support provided by migrant children), it is unclear what effect these skipped-generation households have on the health and well-being of older Chinese adults. This research examines the influence of transitions into the caregiving role on the well-being of older adults in rural Anhui Province. A series of pooled multivariate regression models (N=1956) suggest that living in a skipped generation household in China is associated with enhanced well-being among grandparents. This is explained in part by an initial selection of healthy grandparents with more resources into the caregiver role. However, the well-being of these grandparent caregivers is also enhanced by an increase in financial support from migrant children upon the assumption of care. These results suggest that this household structure may in fact be beneficial for many older adults in China.

PREDICTORS OF GENERATIVE GRANDFATHERING

J. Bates¹, A. Taylor², 1. Syracuse University, Syracuse, NY, 2. East Carolina, Greenville, North Carolina

Over the past 40 years, scholars who study grandparents have amassed an impressive body of information about grandparental roles, grandparenting styles, and possible relationship outcomes. Nevertheless, two major criticisms of the literature remain; the lack of theory development regarding grandparenting and the absence of any systematic investigation of grandfathers. Recent theorizing about grandfathering has attempted to address these criticisms. Author (2009) suggests that grandfathering is generative work where grandfathers are involved in caring for and nurturing offspring (Erikson, 1982) based on the developmental and contextual needs of grandchildren. Thus, in generative grandfathering, grandfathers perform lineage work, mentoring work, spiritual work, recreation work, family identity work, and investment work. Previous research suggests that participation in generative grandfathering activities with grandchildren has a positive and statistically significant effect on grandchild-grandfather relationship quality and satisfaction (Authors, 2008). However, the purpose of this paper was to explore factors that predict participation in generative grandfathering. Data were collected from 349 grandfathers regarding a particular grandfather-grandchild relationship. The results of six hierarchical multiple regressions, where various background, family, and demographic characteristics were regressed onto each of the generative work ethics (DVs) mentioned above, indicate that each regression model was statistically significant (Adj. R-square = .21 to .41, $p < .0001$). Factors such as grandchild age, grandfather age, grandfather subjective physical health, grandfather personality, support from spouse, support from grandchild's father and mother, as well as the frequency of contact, and level of commitment were all significant contributors (IVs) to participation in generative grandfathering activities.

SESSION 615 (SYMPOSIUM)

CHANGE AND DIVERSITY IN NEIGHBOURHOOD EFFECTS ON HEALTH AND WELLBEING

Chair: F. Thomese, *Sociology, VU University, Amsterdam, Netherlands*

Discussant: K. Cagney, *University of Chicago, Chicago, Illinois*

The neighborhood is considered an important social environment in later life. Various neighbourhood characteristics may stimulate or inhibit social participation and health behaviours. This symposium looks at people and their local environments in a dynamic way, by taking into account the personal and wider historical context of the mechanisms under consideration. In the local living environment personal history meets society, and both are in constant change. Such changes challenge our understanding of neighborhood effects on health and wellbeing, which is mainly based on more static approaches of neighbourhoods and people. A conceptual elaboration by Prof. dr. Chris Phillipson from Keele (UK) first focuses on globalization, and neighborhood inequalities. Three empirical papers subsequently deal with consequences of neighbourhood and personal change in Germany around the turn of the century (Tesch-Roemer at al.); absolute and relative inequalities among White and Black Americans (Dr. Jessica Kelley-Moore from CASE); and the interactions between neighbourhood characteristics and internet use (Dr. Fleur Thomese from VU University (NL)).

CHANGING LIVES IN CHANGING NEIGHBOURHOODS: RESULTS FROM THE GERMAN AGEING SURVEY (DEAS)

C. Tesch-Roemer, A. Motel-Klingebiel, O. Huxhold, *German Centre of Gerontology, Berlin, Germany*

Quality of life in the second half of life is influenced by contexts on different societal levels. Districts and neighborhoods have a substantial, but often neglected contextual impact on quality of life in old age. Cross-sectional and longitudinal analyses of data from two waves (1996, 2002) of the German Aging Survey (DEAS) showed a threefold impact

of a district's prosperity on the individual's perception of living standard: Direct effects on resources, direct effects on evaluations and a moderating effect on their interaction. We will extend our analyses to a variety of contextual factors and other dimensions of quality of life. Multilevel analyses, which will include new longitudinal data of the DEAS from 2008, explore to what extent individual changes in quality of life interact with social contexts. They also show the impact of policy interventions on the community level on quality of life in the second half of life.

INEQUALITIES IN INTERNET USE, NEIGHBOURHOOD INTEGRATION, AND LONELINESS: FINDINGS FROM THE LONGITUDINAL AGING STUDY AMSTERDAM (LASA)

F. Thomese, *Sociology, VU University, Amsterdam, Netherlands*

The past decade has witnessed increasing use of the Internet for maintaining personal relationships among older adults. Especially the higher educated men have become familiar with their computers as a means of communication. It is unclear how this change affects the integration in the neighbourhood and its effect on loneliness. In other age groups both a deepening, and a loss of personal relationships and wellbeing has been demonstrated. Data from 999 LASA respondents collected in 2005-2006 show that internet users and non-users have the same neighbor network size. Only among the non-users do these networks alleviate loneliness, controlling for sex, age, sex and neighbourhood indicators. Men and those with a partner have benefits of both internet use and neighbor network size for loneliness reduction. Only the vulnerability of men to loneliness seems to decrease, whereas other inequalities remain the same or are deepened.

URBANIZATION AND AGING: SOCIAL DIVISIONS AND NEIGHBOURHOOD CHANGE

C. Phillipson, *Centre for Social Gerontology, Keele University, Newcastle-under-Lyme, United Kingdom*

The 21st century has been defined as the 'urban age', with the spread of urbanization illustrated by the rise of global cities. The scale of urbanization raises significant challenges for improving the quality of life of older people. Aging on the one side, and urbanization on the other, are key drivers influencing public policy. Focusing on research from the United Kingdom, this paper reviews findings about the impact of urbanization on older people, with particular reference to neighbourhood and community change. The main issues examined in the paper will be: first, the relationship between urbanization and new forms of inequality operating within communities; second, the impact of urban change on the networks of older people; third, the relationship between urban change and community cohesion. The paper will conclude with a research agenda linking theories and empirical findings from work in urban sociology with that in gerontology.

SOCIAL HIERARCHY AND MENTAL HEALTH AMONG OLDER ADULTS: DOES RELATIVE SOCIAL POSITION IN THE NEIGHBORHOOD MATTER?

J. Kelley-Moore¹, K. Cagney², K.A. Skarupski³, S.A. Everson-Rose³, C.F. Mendes de Leon³, 1. *Sociology, Case Western Reserve University, Cleveland, Ohio*, 2. *University of Chicago, Chicago, Illinois*, 3. *Rush University Medical Center, Chicago, Illinois*

There is a well-established association between relative social position and health. Although previous work has focused primarily on social hierarchies in population contexts, stratification occurs at different levels of social organization with potentially varying consequences for health. Using data from the Chicago Health and Aging Project, we examine the relationship between relative social position in the neighborhood and mental health, marked by depressive symptoms. Neighborhood relative social position was ascertained for two social domains: income and social reputation, indexed by the number of neighbors visiting in one's home. After adjustment for absolute levels on each social domain,

higher neighborhood relative rankings on income and neighbors visiting were significantly associated (p 's < .05) with fewer depressive symptoms. However, the magnitude of these associations varied by absolute levels on each social domain. Neighborhood-level social processes may generate micro-level social hierarchies that are associated with distinguishable psychosocial benefits for those higher in the social hierarchy.

SESSION 620 (SYMPOSIUM)

CREATIVE APPROACHES TO HEALTHY AGING: USING THE ARTS TO HELP PERSONS LIVE WITH DEMENTIA

Chair: R. Roush, *Baylor College of Medicine, Houston, Texas*

Discussant: J. Winakur, *University of Texas - HSC, San Antonio, Texas*

In *The Republic*, Socrates tells Plato's brother, Glaucon, "musical training is a more potent instrument than any other because rhythm and harmony find their way into the inward places of the soul on which they mightily fasten, imparting grace, and making the soul of him who is rightly educated graceful." Over time, the creative arts' role in healing our minds and bodies has become increasingly viewed by health professionals as being important. This symposium explores how using various art forms help persons with dementia and their caregivers cope with that circumstance. Jerry Winakur, MD, will present "My Father, My Patients, Myself: Writing My Medical Life." Based on his book, *Memory Lessons: A Doctor's Story*, geriatrician Winakur will describe how the literary device of composing and using narrative medicine helps him and his patients on the "stage of life." Neuropsychologist Michelle Braun, PhD, will follow with an explication of how the plasticity of the brain and the arts complement neurobiology, allowing persons with dementia to have a better quality of life. Anne Basting, PhD, will present "Exploring the Cultural 'Cure' for Memory Loss." Based on her book, *Forget Memory: Creating Better Lives for People with Dementia*, she will talk about using the frame of cultural studies to examine the relationship between our fears of memory loss and our expectations and understandings of how memory works. Francesca Rosenberg will present how the "Meet Me at MoMA" program uses great works of art to evoke emotional memory among persons with Alzheimer's disease.

THE MOMA ALZHEIMER'S PROJECT: MAKING ART ACCESSIBLE TO PEOPLE WITH DEMENTIA

F. Rosenberg, *The Museum of Modern Art, New York, New York*

The Museum of Modern Art in New York is widely known as the home to one of the most renowned collections of modern art in the world. Lesser known is the fact that MoMA is also a haven to thousands of people with dementia along with their caregivers. MoMA is one of the first museums in the country to offer programs designed to make its collection and special exhibitions accessible to this important audience. Art programs can provide an expressive outlet and opportunities for creative engagement for people with Alzheimer's disease and their caregivers. The act of looking at art within museum settings can provide impetus for meaningful and transformative experiences. Francesca Rosenberg will share findings from an evidence-based research study and discuss why visual art is the perfect tool for engagement and how museums can play a role in enhancing the lives of this vital part of American society.

ARTISTIC ENGAGEMENT IN DEMENTIA THROUGH THE LENS OF NEUROSCIENCE

M. Braun, 1. *Boston VA Healthcare System, Brockton, Massachusetts*, 2. *Psychiatry, Harvard Medical School, Brockton, Massachusetts*

Research abounds about the relationship between various art forms – dance, music, visual arts, activity reminiscence therapy, and theater – and improved quality of life in all stages of dementia. Involvement in art is not only important for improving quality of life and alleviating apathy for individuals with dementia, but it has also shown clinical benefit in the management of troubling symptoms that are difficult to address

with conventional treatments. Art in dementia will be explored from a neuroscientific perspective, with a discussion of the brain mechanisms involved in producing and experiencing various forms of art, as well as those that may be activated when individuals report feeling soothed or positively stimulated by art. Theories about how the neurobiological changes in dementia patients may make them particularly responsive to art will also be discussed.

EXPLORING THE CULTURAL 'CURE' FOR MEMORY LOSS

A. Basting, *University of Wisconsin Milwaukee, Milwaukee, Wisconsin*

Based on research for her book, *Forget Memory: Creating Better Lives for People With Dementia*, Basting uses the frame of cultural studies to examine the relationship between our fears of memory loss, our expectations and understandings of how memory works, and the lived experience of memory loss. As we wait for the pill/s to cure Alzheimer's disease, might there be a parallel cultural "cure" that could ease the pain of stigma, social isolation, and the generally poor quality of care people with dementia experience within our grasp today? Basting suggests that asserting the value of communal memory, and shifting away from the sense that memory is strictly individual property, can help ease the fear and stigma of memory loss that creates so much unnecessary pain in the lives of people experiencing it.

RELIGIOUS INVOLVEMENT AND SELF-RATED HEALTH STATUS: FINDINGS AMONG CHINESE RURAL ELDERLY

C. Sun¹, B. Wu², 1. *Ph.D. Program in Public Policy, UNC Charlotte, Charlotte, North Carolina*, 2. *UNC Greensboro, Greensboro, North Carolina*

Previous studies have shown that religion plays a beneficial role in individuals' health. However, little has been done in rural China. The purpose of this study was to examine the relationship between religious involvement and self-rated health among Chinese rural elders. This study used the data from a randomly selected sample of 663 elders aged 60 and above in rural Shanghai, China in 2004. The study found that a small percentage of rural elders (15%) reported having religiously affiliation. The ordinal logistic regression results showed that religious affiliation did not influence the self-reported health condition, however, religious practice such as praying, had a negative association. In addition, younger respondents who had higher income and practiced Tai Chi reported better health status, while having chronic conditions were negatively related. Our findings suggest that the association between religion and health needs to be interpreted within a particular social and historical context.

PRECLINICAL ALZHEIMER'S DISEASE: RELATIONSHIP WITH BRAIN/COGNITIVE RESERVE

J.C. Morris, C.M. Roe, M.A. Mintun, *Neurology, Washington University, St. Louis, Missouri*

The cognitive reserve hypothesis holds that persons with greater reserve tolerate the burden of the neuropathologic lesions of Alzheimer's disease (AD) without becoming demented. Educational attainment serves as a surrogate for reserve. Positron emission tomography with the Pittsburgh Compound-B (PIB) radiotracer for fibrillar amyloid-beta (A β) allows in vivo imaging of cerebral A β deposits, one of the hallmark lesions of AD. In 161 cognitively normal older adults and 37 AD individuals imaged with PIB, we determined whether PIB uptake interacted with level of education to predict cognitive function. As measured by the Clinical Dementia Rating-Sum Boxes, Short Blessed Test, and Mini Mental State Examination, better cognitive performance interacted with increased education in individuals with elevated PIB uptake. Conclusions: Cognitive reserve influences the association between AD pathology and cognitive dysfunction. Education did not influence cognitive performance in PIB-negative individuals, suggesting that education effects on test performance may be mediated by preclinical AD.

DECISION MAKING AND COGNITION

MEDICARE PART D: CHOICE SIZE AND DECISION-MAKING

S. Wood¹, C. Bhattacharya², B.A. Rakela¹, P. Liu², W.T. Eriksen¹, A. Schmidt¹,
1. Scripps College, Claremont, California, 2. Claremont Graduate University, Claremont, California

Medicare part D has received mixed reviews in terms of its overall design and ease of use. Statistics indicate that the average older adult faces over 50 plans to choose from and is unlikely to choose the best plan based on apparent cost (Gruber, 2007). The current project examines the impact that choice set size has on decision-making for Medicare part D material. Two hundred and twenty-three individuals participated in the study that included measures of numeracy, processing speed, and a simulated Medicare worksheet designed from the Medicare web site. Participants were randomly assigned to either a 3, 10, or 20 plan condition and asked to choose the best plan. Results indicated that participants in the 20 plan condition performed significantly worse than the 3 plan condition ($p < .01$). Older adults as a group performed worse across conditions ($p < .01$). Numeracy was a significant covariate, and when added to the model, eliminated the effect of age. In summary, our results indicated that increasing number of choices impaired the decision-making of our sample, and that older adults were especially impacted by the effect.

INFLUENCE OF LOCUS OF CONTROL, GENDER, AND DECISION DOMAIN ON OLDER ADULTS' PREFERENCES FOR COLLABORATIVE DECISION MAKING

C.C. Gayer, J.M. Jacobs-Lawson, C. Ortiz, Gerontology Center, University of Kentucky, Lexington, Kentucky

Previous research has demonstrated that older adults can benefit from collaborating with others when making decisions. The present study examined the effects of locus of control (LOC), gender, and decision domain on older adults' preferences for collaborative decision making. Participants (aged 55-90 years; $n=75$ men, $n=99$ women) completed a questionnaire containing three measures of LOC (internal, chance, powerful others), as well as preferences for involving others when seeking information needed to make a decision (information seeking) and actually making a decision (behavioral involvement) in three domains (financial, medical, and product purchasing). Analyses consisted of a series of 2 (LOC) \times 2 (sex) \times 3 (decision domain) mixed ANOVA's with repeated measures on the latter. Separate ANOVA's were conducted for each LOC measure. The dependent variables were preferences for information seeking and behavioral involvement. Analyses revealed that gender interacted with preferences for information seeking and behavioral involvement. For information seeking, gender differences emerged only for medical decisions. For behavioral involvement, men and women differed in terms of preferences for collaboration with others on medical and purchasing decisions, but not financial decisions. Powerful others and chance LOC interacted with information seeking such that both affected preferences for seeking information about purchasing a product. The study also revealed that spouses and children were participants' most preferred collaborators. This, along with the aforementioned findings has important implications for how older adults make medical and purchasing decisions, and on the extent to which individuals may benefit from collaborative efforts in each of these domains.

THE BENEFITS OF CONSCIOUS VERSUS UNCONSCIOUS THOUGHT ON EFFECTIVE DECISION MAKING IN ADULTHOOD

T.M. Hess, T.L. Queen, T. Patterson, Psychology, North Carolina State University, Raleigh, North Carolina

Some surprising research on decision-making has suggested that performance may be optimized if individuals are prevented from engaging

in active deliberation (e.g., Dijksterhuis, 2004). This enhancement through unconscious processing has interesting implications for decision-making in later life, where deliberation may suffer through inefficient or declining cognitive resources. The present study examined the relative benefits of active deliberation versus passive processing in facilitating performance as a general test of the model, while also testing the hypothesis that unconscious processing would disproportionately benefit decision-making in old age. Different-aged adults (20–85 years of age) were presented with two consumer decision-making tasks involving grocery stores and apartments under conditions in which they were instructed to engage in active deliberation or were prevented from thinking about the decision. Preliminary analyses on the data from 106 (of 168) participants provide little evidence for the benefits of unconscious thought over more active deliberation. Participants of all ages selected the optimal alternative at above-chance levels, and the probability of doing so was actually higher following active deliberation. Performance was also better in task conditions requiring active deliberation for successful performance (e.g., participants had to distinguish between attributes that were relevant and irrelevant to the decision at hand). Although not great, some age differences were evident in the impact of decision context (conscious vs. unconscious thought) and the degree to which task materials required active deliberation. These effects may be tied to age differences in cognitive resources. Implications for effective decision-making in later life will be discussed.

JUSTIFYING DECISIONS ABOUT SUNK COSTS: DO OLDER AND YOUNGER ADULTS REPORT DIFFERENT GOALS?

J. Strough, L. DiDonato, L. Schlosnagle, J. McFall, E. Keener, West Virginia University, Morgantown, West Virginia

Compared to younger adults, older adults' decisions about future investments are less influenced by prior investments that are "sunk" and can not be recovered—older adults are less likely to commit the sunk-cost fallacy (Strough, Mehta, McFall, & Schuller, 2008). We investigated whether older and younger adults' justifications for decisions about sunk costs reflected different decision-making goals. Drawing from prior research, we predicted younger adults' negativity bias and loss aversion would be associated with concerns about the amount of prior investment. We predicted older adults' positivity bias would be associated with considering affectively rewarding alternatives. Twenty-one community-dwelling older adults (16 women, M age = 75.43 yrs) and 20 younger adult college students (12 women, M age = 23.30 yrs) participated. Participants made decisions about hypothetical activities that had become boring and were asked what their goal would be if the hypothetical situation happened to them. Goals were reliably coded into 1 of 10 categories ($\kappa = .58 - .71$). In accord with predictions, younger adults were more likely to focus on the amount of prior investment ($p < .05$, $\eta^2 = .16, .33$). Younger adults also were more likely to mention social conventions ($p < .05$, $\eta^2 = .14$). In contrast to predictions, older adults were not more likely to consider positive alternatives to the boring activity, but were somewhat more likely to mention personal characteristics as a justification ($p = .07$, $\eta^2 = .08$). Implications of the findings for understanding mechanisms underlying age differences in decisions about sunk costs are discussed.

NONFLUENT APHASIA: THE RELATIONSHIP BETWEEN DEGREE OF LEFT- HEMISPHERE LESION, HOMOLOGOUS BRAIN ACTIVITY, AND PERFORMANCE

Z.Z. Zlatar, I.F. Levy, M. Benjamin, K. McGregor, M. Cohen, J. Trinastic, B. Crosson, Clinical & Health Psychology, University of Florida, Gainesville, Florida

Little is known about the predictive value of degree of lesion on the reorganization of language function and recovery in aphasia. This study investigated whether degree of lesion in left-perisylvian regions of interest (ROIs) was associated with the amount of right-hemisphere homologous functional activity during word generation, and performance on

the Boston Naming Test (BNT) and Western Aphasia Battery-Aphasia Quotient measures (WAB-AQ). Nineteen chronic, nonfluent aphasia patients (Mean age=67, SD=12) received structural and functional MRI prior to an intention-based language treatment aiming to re-lateralize language functions to the right hemisphere. During imaging, patients performed an event-related category member generation task. Two independent raters scored the degree of lesion in the left hemisphere on a scale of 0 to 5 and correlated the ratings with the volume of functional activity in the right-hemisphere homologues and the BNT and WAB scores prior to treatment. There was no relationship between degree of lesion in the left hemisphere and the amount of functional activity in the right-hemisphere homologous structures. However, patients with a higher degree of lesion showed poorer performance on measures of fluency and repetition. The authors concluded that reorganization of language functions to the right-hemisphere homologous structures shown in the literature may not be a universally applicable concept and that degree of lesion is marginally related to spontaneous speech and repetition abilities in this sample.

HOW BRAIN FITNESS TRAINING ENHANCES OLDER ADULTS' PSYCHO-SOCIAL WELL-BEING: A CONTROLLED COMPARISON

D.J. Hurley, M. Turner, *Human Development and Family Sciences, University of Arkansas, Fayetteville, Arkansas*

This study examined two goals: 1) identify differences in cognitive improvement among healthy older adults using the brain fitness program (BFP) compared to those using crossword puzzles and 2) differences between these groups' improvement in psycho-social functioning. Understanding brain plasticity has led to numerous computer software, video games, and other challenges to keep older adults' brains active. Research has found the BFP (Mahncke et al., 2006) to lead to significant improvement in cognition. Anecdotal stories have indicated that this cognitive improvement has also improved older adults' psycho-social dimensions. Little research has empirically examined these claims. This quasi-experimental design study involved older adults residing in a retirement community comparing the cognitive and psycho-social improvements among two groups. The experimental group (N=12) completed 40 hours in eight weeks with the BFP; the control group (N=10) used crossword puzzles for 40 hours in eight weeks. The researcher's interaction was identical in both groups. Paired t-tests indicated significant improvement in cognitive functioning and the psycho-social dimensions between T1 and T2 for the experimental group while no significant differences were found for the control group. Independent t-tests compared the mean difference scores between T1 and T2 for both groups on depressive symptoms, social interaction, and work and emotional productivity. The BFP group showed significantly more improvement in depression ($t=3.30$, $df=20$, $p=.002$) and work productivity ($t=1.74$, $df=20$, $p=.049$) than the control group. The study confirms that the choice of cognitive enhancement programs makes a difference and that cognitive improvement is related to psychosocial improvement.

TRAINING FOR TRANSFER: A META-ANALYSIS OF COGNITIVE AND PHYSICAL FITNESS TRAINING IN OLDER ADULTS

S. Hindin, E. Zelinski, *University of Southern California, Los Angeles, California*

Recent literature has questioned the possibility of transfer of skills trained to other cognitive abilities among older adults and whether cognitive or physical exercise is better. A quantitative meta-analysis was conducted to determine which training, constructs, outcomes, and transfer combinations have shown the largest transfer effect sizes. We hypothesized that effect sizes would vary based on the training, test, and transfer type. Studies that attempted to improve cognitive abilities with aerobic exercise, strategic training, or extended practice were selected if they tested the transfer of untrained abilities and had a no-contact compar-

son group. Only tests that could show transfer were included from the 31 studies in the analysis. From these, 319 effect sizes (Cohen's d) for between group differences were computed and coded several ways including transfer of sensory modality, application of skills to new activities, or over time i.e. e. if training effect was maintained for at least 2 months. The overall effect size was small and heterogeneous across studies (Mean=.05, $Q=217$). Aerobic training and extended practice were homogenous ($N=153$, $Q=63$ and $N=109$, $Q=49$), while strategy training was heterogeneous ($N=63$, $Q=103$). Expected variation was not found; all effect sizes were not far from zero. Past studies, no matter which type of training, do not show transfer for older adults. Exceptions include extended practice for reaction time trials $d=.17$ and maintenance over time $d=.1$ and strategy training of applied skills to new activities $d=.23$, all of which are for cognitive, not physical fitness training studies.

COGNITIVE REHABILITATION ADDRESSING WORKING MEMORY IN OLDER ADULTS

L. Hyer^{1,2}, K. Manantan², *1. Georgia Neurosurgical Institute, Macon, Georgia, 2. Mercer University, Macon, Georgia*

Objective: Deficits in working memory are associated with age-related declines. Many studies have utilized a cognitive rehabilitation program to enhance working memory performance in elderly populations. Previous researchers have examined a computer-based program, known as Cogmed, which consists of training sessions that successively increase in difficulty. Cogmed training also mandates the integration of caregivers into the cognitive rehabilitation program so as to increase its effectiveness. The present study utilized this program with older adults at a continuing care retirement community (CCRC). **Method:** Participants underwent a screening process to determine the degree of memory impairment. Qualified participants were then randomly assigned to one of two conditions. The experimental condition used the Cogmed software, and the control condition used a sham Cognitive Program. Both programs required an 80% completion of the required 25 sessions, which were distributed over a 5 week period. Each participant (currently 10/group) completed a neuropsychological test battery before and after the intervention and at a 20-week follow-up. Outcomes included cognitive, affective, functional and caregiver markers. **Results:** Groups differed pre-test to post-test in favor of the Cogmed group on several affective/functional/caregiver measures. Cogmed then enhanced working memory in older adults with mild memory impairment, as well as functioning. **Conclusion:** Cogmed appears to enhance working memory in older adults with mild memory impairment. We hope to validate this study with an extended double blind clinical trial on participant-caregiver dyads in a CCRC. We hypothesize that these results will show that Cogmed applied at later life can generalize beyond working memory.

SESSION 630 (POSTER)

EDUCATION & EMPLOYMENT

AN INVESTIGATION OF BEHAVIORAL AND SOCIAL GERONTOLOGY RESEARCH PROGRAMS

P.A. Lichtenberg, *Wayne State University, Detroit, Michigan*

Over a decade has passed since Achenbaum's Crossing Frontiers: Gerontology Emerges as a Science (Achenbaum, 1995) explored how gerontology programs were created and functioned. In order to gain insight into current structural aspects of social and behavioral gerontology programs leaders from 20 programs were interviewed by phone. The interview attempted to garner information from each program across a variety of topics including: research themes and funding priorities, educational and research training programs, interactions with other investigators and other programs on campus; issues regarding budget and work space; fund raising activities, and recommendations for anyone considering developing a new program in gerontology. programs were classified as either Centralized or a Network. A centralized program

was defined as having either faculty lines assigned to the unit or as having an annual budget provided by the University of at least \$250,000 per year. Centralized units were more likely to be identified as an autonomous program and to have fiscal control. The Network programs typically relied on drawing personnel, especially faculty, from across the entire campus and had considerable flexibility in how to carry out their mission. Many of the programs exist because an individual at the university, a foundation, or a state government had a deep personal commitment to older adults and the field of aging. These individuals helped to shape not only the structure of the programs but their overall mission. Four main tensions in the field were identified; gerontology and Ph.D. program structure, community engagement, and involvement in fund raising.

ONLINE GERONTOLOGY EDUCATION EXPERIENCE: FROM ENROLLMENT TO GRADUATION AND EMPLOYMENT

M. Corrigan, *School of Community Affairs, Wichita State University, Wichita, Kansas*

The 1990 Student Right to Know Act requires institutions of higher education to monitor and report graduation rates (student retention). To do this involves tracking student recruitment (both application and enrollment). Data from the National Center for Education Statistics indicates that for Title IV institutions, 4-year graduation rates were 56% in 2005. Other literature finds 70% to 76% 6-year graduation rates. No published studies have specifically examined gerontology program recruitment and retention, nor have published studies examined online education programs as a whole. This session will examine the 6-year recruitment, retention and employment rates for an online masters program in gerontology. The 6-year recruitment rates are important because students taking longer than this time to complete their degree need to repeat or certify prior course work. In the 6 years prior to the conversion to online classes, there were 28 applicants to the program, and 25 (89.2%) enrolled in the program. In the 6 years after the conversion, there were 72 applicants to the program, and 51 (70.8%) enrolled in the program. Prior to the conversion, 19 of the 25 students completed the program (76.0%). After the conversion (to date; not all have reached the 6-year limit), 25 of the 51 students have completed the program (49.0%). Both pre and post conversion to online education, over 85% of graduates found employment in the aging network. Implications of the data for online program student recruitment and retention will be presented at the session.

SERVICE-LEARNING AS A CREATIVE TEACHING METHOD FOR GERIATRIC EDUCATION AND THE VALUE OF INTERPROFESSIONAL EDUCATION

S. Kolomer¹, M. Quinn², K. Steele¹, *1. University of Georgia, Athens, Georgia, 2. Medical College of Georgia School of Nursing, Athens, Georgia*

Background: Interprofessional geriatric education for allied health professionals is a best practice for facilitating collaboration. An interdisciplinary team comprised of several community partners including nursing and social work faculty, a board certified chaplain and health promotion nurses worked in partnership to develop research/educational projects for allied health students that promote healthy aging. Method: Using service-learning as a method for interprofessional education, undergraduate nursing and social work students studying geriatrics designed and implemented four health fairs in local counties. The health fairs featured booths that addressed issues regarding physical, mental, emotional, and spiritual health. Students facilitated each booth in teams of two, a nursing and social work student at each. Results: Following the conclusion of the health fairs students completed a two-page evaluation of their interdisciplinary geriatric learning. Using a mixed method design, 87 students reported a high willingness to share and learn skills of other disciplines and expressed strong professional identities. There

was a statistically significant difference in mean teamwork scores ($p > .01$) of the nursing (mean=39.48, s.d. 5.4) and social work (42.18, s.d. 3.9) students. Students also reported learning the value of interdisciplinary communication and of the necessity of flexibility when working with other professionals. Discussion: Interprofessional practice is essential, as it is a holistic approach to aging clients' physical, mental, emotional, and spiritual needs. Utilizing service-learning as a method for interprofessional geriatric education among allied health students will have a lasting impact on reciprocal learning and best practices for facilitating collaboration among disciplines.

IMPLEMENTING A NEW PARADIGM IN INTRODUCTORY GERONTOLOGY TEXTBOOKS

J.A. Sugar¹, R.J. Riecke², H. Holstege³, M. Faber², *1. Sch of Community Health Sciences, University of Nevada, Reno, Nevada, 2. Grand Rapids Community College, Grand Rapids, Michigan, 3. Calvin College, Grand Rapids, Michigan*

Recruiting students into the field of gerontology could not be more important than it is today. Our introductory courses are one of our most valuable tools in achieving that goal. Thus, textbooks for these courses play a critical role. We are entering a time that requires a new paradigm for aging. The roles of older people, including the near old (Baby Boomers), the young old, the middle old, and the oldest old, in the family, in the workplace, and in the broader society continue to evolve. The population of older people is becoming more capable, more numerous, more diverse, and hopefully more integrated into society. The primary purpose of introductory classes should be to capture students' interest in gerontology. Interested students will want to learn more. If students take a boring introductory class, with a dry textbook of encyclopedic knowledge of aging, then we will lose those students to competing fields. Key components of a good textbook, then, include: (a) a framework based on the new paradigm, instead of the demographic imperative, which is not a compelling argument for most of our students; (b) a focus on positive aspects of aging (e.g., capabilities, evolving roles), so that our dialogue is not dominated by disease and decline; (c) provision of good information without overwhelming amounts of detail; and (d) a text that is interesting, especially for the majority of our students who are not already captivated by gerontology. Success in recruiting more students into gerontology depends on implementing the new paradigm.

COMMUNITY-BASED SERVICE-LEARNING FOR HEALTH PROFESSION STUDENTS – DO WE MAKE THE MOST OF IT?

E.M. Schmitt^{1,3}, D. Werdegart¹, G. Li², *1. Institute on Aging, San Francisco, California, 2. OnLok Lifeways, San Francisco, California, 3. UCSF Department of Physiological Nursing, San Francisco, California*

Most care for older adults takes place outside of institutions but health profession student training occurs predominately in hospitals (IOM, 2007). Community-Based Service-Learning (CBSL) and clinical experiences designed to apply theory into practice while engaging in civic activities should become an increasingly important training component in the education of the future geriatrics/gerontology workforce (Karasić, 2007; Scharlach, 2005). However, little is known about which components of CBSL best stimulate and maintain students' interest in geriatrics/gerontology and which infrastructure best enables Community-Based Organizations (CBOs) to deliver CBSL opportunities of excellence. An interdisciplinary community-academic 20-member Task Force organized by the Institute on Aging, San Francisco, to plan community-based education in geriatrics/gerontology identified six goals for improved CBSL including: 1) Implement and test community-academic interdisciplinary education partnership models analogous to those in successful community-academic translational research partnerships - utilizing instructions in CBO settings to stimulate effective knowledge transfer; 2) Establish specific CBSL learning objectives; 3) Establish standards for CBO preceptors' geriatrics/gerontological core teaching

competencies and preceptorship skills; 4) Provide resources to pay for protected student-preceptor interaction time; 5) Facilitate student contacts with healthy older adults as well as those with illness for instruction in preventive health and to dispel myth about aging; 6) Build the infrastructure for systematic CBSL research. After attending this presentation, participants will be able to discuss the potential of developing community-academic education partnerships to stimulate and maintain students' interest in working with older adults by effective use of CBSL experiences.

WHY LEARN IN OLD AGE? AN OVERVIEW OF THEORY AND RESEARCH ON OLDER LEARNERS

M. Wolf, *Gerontology, Saint Joseph College, West Hartford, Connecticut*

Any discussion of theory and research on older adult learners begins with an understanding of the role of education and construct of learning. For many older persons—whether it be for meaning-making, vocation, literacy, socialization or personal development—learning is a voluntary, often need-driven activity. For many, this is both a process of understanding and influencing the world and an important life course goal, a way of living in community and understanding the contradictions of a life time of experience. This presentation explores the theories and practices currently informing the development of programs and learning experiences for older persons. Included in the underpinnings of study are the theories of Paulo Freire who described the process of praxis as the naming, reflecting, acting and reevaluating on 'e world. Other related theorists cited are Cohen, Sadler and Krett, Erikson, Fisher, Kivnick, and McClusky. Currently, the practice of adult education for an aging society is directed by civic, academic, church-related and entrepreneurial enterprises. This presentation presents several successful models and explores the nature of changing needs in this fast-growing segment of gerontology. Issues of dissent and need-based learning in the field as well as cohort and work-related experiences of older adults are also addressed.

INTERDISCIPLINARY SENIOR MENTORS PROGRAM: LESSONS LEARNED FROM A PILOT PROJECT

A. Curtis¹, C. Ford¹, C. Hays¹, P. Sawyer¹, P. Bosworth¹, C.S. Ritchie^{1,2}, *1. Gerontology, Geriatrics & Palliative Care, University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

Optimal patient care depends on both physicians and other health care professionals. Because of the focus on collaboration among health care professionals, health systems are encouraging providers to participate in interdisciplinary team meetings. The focus of the meetings is to create individualized, comprehensive and collaborative plan for patient care integrating interdisciplinary perspectives. The UAB Geriatric Education Center offered an opportunity for students from dentistry, medicine, nursing, and social work to participate in an interdisciplinary team training pilot program during the 2009 Spring Semester. 23 students formed 7 groups and participated in the two-day program. Day 1 they visited Fairhaven Retirement Community to interview older adults and day 2 the groups met with geriatric trained preceptors to formulate a care plan. The learning objectives for the pilot program were to (1) practice communicating effectively and empathetically with older adults in an institutional environment, (2) describe the importance of interdisciplinary teams in the care of older adults, (3) appreciate the differing perspectives, values, and experiences of professionals in other disciplines, (4) learn how to communicate as a team member to develop a simple care plan addressing issues from medical, emotional, social, environmental, and economic perspectives, and (5) reflect on one's own attitudes towards older adults, including caring for the chronically ill. After attending this activity, participants will be able to discuss procedures and lessons learned regarding student recruitment, curriculum development, unique challenges with interdisciplinary training, as well as program implementation and evaluation.

opment, unique challenges with interdisciplinary training, as well as program implementation and evaluation.

THE HOME AS A VENUE FOR ACHIEVING CORE GERIATRICS COMPETENCIES

M. Van Zuilen^{1,2}, M.J. Mintzer^{1,2}, *1. Geriatrics, University of Miami Miller School of Medicine, Miami, Florida, 2. Geriatric Research, Education, and Clinical Center (GRECC), Miami, Florida*

Many medical schools have incorporated home visit programs with older adults in the preclinical years, programs that are resource intensive. While student and elder satisfaction with these programs is often reported, more formal outcomes are rarely assessed. As part of the 4-year longitudinal curriculum in geriatrics, pain management, and palliative care at the UMMSM, first-year students make three home visits to a well elderly volunteer in the community during which they practice communication and counseling skills. Specific learning objectives are formulated for each visit. Students undergo formal competency assessment on several of these objectives and must achieve a preset performance standard. Students not achieving this standard undergo remediation and reassessment. Core topics covered in the home visit program include the medical history, common chronic conditions, ADLs/IADLs, formal and informal support systems, nutrition and exercise screening, advance directives, warning signs of serious medical illness, emergency preparedness, and home safety assessment. Instructional activities helping students prepare for the home visits include a preceptor-led lecture and a small-group session, an online training module, and self-study materials. Two additional small-group sessions are conducted to debrief students and reinforce their learning. Over the past nine years, more than 1300 students have participated in the program. Results from our competency assessment allow us to document student learning. We believe that the home is an excellent venue for students to learn core geriatrics competencies and practice important communication and counseling skills with older adults.

CREATIVE APPROACHES TO PROVIDER EDUCATION FOR HEALTHY AGING

P. Swager¹, P. Charles¹, D. Chau², S. Donepudi², *1. Nevada Geriatric Education Center, University of Nevada School of Medicine, Reno, Nevada, 2. University of Nevada School of Medicine - Division of Geriatric Medicine, Reno, Nevada*

Nevada Geriatric Education Center (NGEC) sponsored a series of lectures delivered by fellows in the University of Nevada School of Medicine geriatrics fellowship program. A study was designed to assess provider knowledge retention following the lectures. Simultaneous to the lecture series, NGEC faculty worked with fellows to develop presentation skills. Six presentations were conducted in 2008. Five were included in the study. Presentations provide an overview, clinical guidance, literature updates, and discussion on selected geriatric topics. Providers estimated that as many as 2,310 patients would benefit from knowledge learned and applied during the series; and 57% to 100% of providers indicated plans to use information to educate patients/clients. In order to assess whether practitioners retain specific content from the lectures, a four to six question quiz is sent several weeks after each presentation. Post-test scores have improved from the first session and are generally higher than 90%, indicating that attendees retain most of the pertinent material presented. Poor delivery and post-test results following the first lecture spurred NGEC faculty to implement several strategies (e.g., presentation tips given to fellows, fellows include test questions and answers during the presentation, a "dress rehearsal" for fellows to refine presentations). These capacity building activities have contributed to improved presentations, and value has been added to the series. Evaluation data indicate that the educational efforts of the NGEC contribute to practitioners becoming more knowledgeable of providing quality care thereby contributing to healthy aging for their patients.

CREATING A HEALTHIER LEARNING ENVIRONMENT FOR LIFE-SPAN LEARNERS

L. Hollis-Sawyer, *Northeastern Illinois University, Chicago, Illinois*

Perceived “barriers” to learning and the perceived ability to learn new concepts can significantly impact older adults’ academic performance, their willingness to engage in life-long learning, and their general quality of life (e.g., Johnson, 2008). “Decrement stereotype threat belief,” or a personal belief that involvement in an educational experience confirms a negative stereotype (e.g., Steele & Ambady, 2006) was hypothesized to account for some adults’ evaluative anxieties and associated performance outcomes (study behavior, test scores). The purpose of the present study was to further investigate age- and diversity-related (e.g., “double jeopardy”) perceptions of testing and, specifically, math-related performance. The dependent variables consisted of studying behavior (estimated time, actual time), math test performance; and various evaluative and math anxiety reactions (e.g., test anxiety, social derogation, physical tenseness, cognitive obstruction, presence/impact of early “math-related” social role models). The total sample tested was $n = 120$. Racially and/or ethnically diverse “non-traditional” college (undergraduate) women ($n = 28$, ages 40 – 72; 49.9 (3.7)) and men ($n = 25$, ages 40 – 58; 43.6 (2.8)) were recruited from a large diverse mid-western university. A “control” group of younger women and men were also tested for study comparison purposes. Significant differences in reactions through interactions of age-level and gender (e.g., older women significantly higher in math-related anxiety), as well as age-level by race/ethnicity, will be presented in detail and have important implications toward the design of a “healthier” classroom environment for older learners. The impact of early gender socialization was a significant factor to also be discussed.

TRANSITIONING TRADITIONAL TEACHING: UTILIZING ONLINE MODULES TO INTEGRATE GERIATRICS ACROSS THE CURRICULUM

D.L. Brown, D. Simpson, E.H. Duthie, K. Denson, A. Helms, T.P. Webb, G. Larson, L. Meurer, *Educational Services, Medical College of Wisconsin, Milwaukee, Wisconsin*

Purpose: Currently, older adults have an estimated 11.7 contacts per year with physicians, compared to 4.8 contacts by adults under the age of 65. (Zulman, Estes, 2003). The 2008 IOM report documents the need to better prepare medical students to care for older adults. Geriatrics education must be interwoven through all disciplines and specialties. Better clarity of medical student geriatric competencies has been achieved with the 2007 AAMC/John A. Hartford Foundation Geriatric Consensus Conference. However, constrained curriculum, limited faculty time and/or geriatric content expertise along with competing educational priorities serve as barriers to integrating geriatrics within medical student education. . Methods: Recognizing the need for and barriers to geriatric curriculum, a geriatric education collaborative was developed to address the twenty six competencies (identified across eight general domains - Falls, Balance, Gait Disorders; Medication Management) developed at the 2007 AAMC/John A. Hartford Foundation Geriatric Competencies Consensus Conference. The collaborative identified difficult core concepts or gaps in required medical student courses/clerkships linked to the geriatric competency domains. Next, teaching methods were chosen to achieve competency performance within available instructional time including online modules. E-geriatrics modules were collaboratively developed and consist of case studies, text, video triggers, external resource links, a quiz and course evaluation. Results: A total of five modules have been developed (e.g. Bioethics, Psychiatry, Neurology, Biochemistry, Trauma – Resuscitation & Preoperative Medicine). 88% of students rated e-instruction “helpful/very helpful” in biochemistry and, 73% preferred the self paced and interactive on-line format to traditional neurology lecture. Conclusions: The Minimum Geriatric Competencies for Medical Students can be woven throughout medical school curriculum through a collabora-

tive faculty approach utilizing geriatrics to illuminate and reinforce difficult basic science and clinical concepts.

SOCIAL WORK STUDENTS WHO ARE INTERESTED IN WORKING WITH AGING: A PROFILE

T.C. Andersen, *Neurology, Gerontology & Social Work, University of Utah, Salt Lake City, Utah*

The National Institute on Aging has indicated that there will be an increased need for social workers working with our aging population. Data from the larger research project indicates that social work students had limited interest in working with aging. From the 1988 data set three of the four least desired populations to work with were aging, with Alzheimer’s disease rating the least desired population. Elder abuse ranked second and general geriatric service rated fourth least desired populations. The comparative study completed in 2007 indicated some improvement in the overall desire to work with aging but the category of geriatric/aging was still listed as the 4th least desired population. The data for this presentation is drawn from a survey of 282 second year MSW students from programs around the US. For this presentation an analysis was completed to determine if there is a profile of the students who reported having higher interest in working with aging. A Principal Component Analysis was run on those who indicated a desire to work with aging to determine if there were meaningful profiles. One component included positive loadings of four aging related variables “geriatric aging services” “elderly abuse” “Alzheimer’s disease” and “death and dying.” This component was labeled “Aging interest.” We used the “Aging interest” component in subsequent analyses rather than examining the four variables separately. The results of this analysis will be presented.

FEW AND FAR BETWEEN: GEROPSYCHIATRIC NURSING EDUCATION COURSE OFFERINGS IN THE US

S. Sifford^{1,2}, C. Beck¹, K.C. Buckwalter³, L.K. Evans³, 1. *University of Arkansas for Medical Sciences, Little Rock, Arkansas*, 2. *Arkansas State University, Jonesboro, Arkansas*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *University of Iowa, Iowa City, Iowa*

The National Institute of Mental Health predicts that by the year 2030, the numbers of older adults (age 65 and older) with mental illness will likely strain the nation’s health care system. As part of the Geropsychiatric Nursing Collaborative sponsored by the John A. Hartford Foundation and Atlantic Philanthropies, an exploration of current geropsychiatric nursing education in the US was performed. The overall purpose of the Collaborative is to identify methods of improving geropsychiatric nursing content in all levels of nursing education programs to better serve the mental health needs of older adults. A letter of inquiry was sent via the Internet to 242 US schools of nursing who claimed to offer geropsychiatric nursing content in their curricula. The letter stated the purpose of the investigation and requested any curricular information regarding the program’s geropsychiatric content. Data collection was conducted in 3 waves with 42 schools responding. Seven graduate courses and one undergraduate course dedicated to geropsychiatric nursing were identified. Extracted data from all schools that responded were analyzed for commonalities and specific strategies used in educating nurses about geropsychiatric issues. Specific data related to the integration of geropsychiatric nursing content and the amount of integration into the curricula, methods of content delivery to students, amount of clinical instruction, textbooks or other learning resources, and the geropsychiatric concepts included in the courses were compiled, systematically organized and reported.

QUALITATIVE ANALYSIS OF ATTRACTION TO AND LIVED EXPERIENCE IN UNIVERSITY-LINKED RETIREMENT COMMUNITIES: A LIFE-COURSE APPROACH

R.B. Meraz, *Leadership and Counseling, Eastern Michigan University, Ypsilanti, Michigan*

Higher education has a long history of responding to the needs of a diverse citizenry. While offering retirees and senior citizens opportunities for engagement on college campuses is not a novel concept, a new trend that of retirement living on campus is emerging. One of the more innovative ways higher education is engaging retirees is through the creative practice of university-linked retirement communities (ULRC). ULRCs are a relatively new in the world of retirement living and have been growing in popularity since the mid 1980s; ULRCs now exist on more than 50 campuses across the United States. The ULRC concept is one that meets both the needs of retirees and the university. This poster presentation will summarize the in-progress summary finding of dissertation research that involved visits to three unique ULRC's located in the Midwest, Northeast, and South. This research employed a qualitative, interpretive, ethnographic approach utilizing a series of individual life-history interviews, focus groups, observations, and artifacts as the main content for data analysis. The researcher will present insights on how the conceptual framework that drew upon psychosocial theories of aging including: activity, role, continuity and life course theory led to a deeper understanding of residents' attraction to and lived experiences retirement in a ULRC. The poster session is also intended to start a dialogue about ULRCs and the contributions they make to Third Age education and successful aging.

PAUL B. BEESON CAREER DEVELOPMENT AWARDS IN AGING RESEARCH: DOES GENDER IMPACT AWARD RECIPIENTS' CAREER GROWTH?

T. Ewers, *University of Wisconsin-Madison, Madison, Wisconsin*

In an effort to build leadership capacity in academic geriatrics, the Paul B. Beeson Career Development Awards in Aging Research Program is designed to facilitate the successful career development of physician-scientists conducting aging-related research. Similar career development programs have been reviewed in the literature, but few reviews consider the intersection of program participation and gender. This mixed-methods project explored the possible impact of gender on the experiences of the Beeson Award recipients, Beeson Scholars. It included content analysis of Beeson Scholars' survey responses to open-ended questions asking them to list factors they felt were helpful in advancing their careers or which slowed or derailed them from advancing at the rate they had hoped following their receipt of the Award. Their acquisition of NIH R01 funding as reported in the National Institutes of Health (NIH) Computer Retrieval of Information on Scientific Projects (CRISP) database subsequent to receipt of the Beeson Award was also analyzed. It was hypothesized the intense selectivity in finding top physician-scientists conducting aging-related research as well as anticipated research potential of Beeson Scholars would mean equal proportions of women and men received R01 funding. Beeson Scholars are generally successful in competing for NIH funding, but the likelihood of women obtaining funding is statistically significantly different than men. The survey sought to explain this variation; however, content analysis of responses did not provide statistically significant findings attributable to gender, although factors impacting career development of physician-scientists as reported by Beeson Scholars reflect existent themes identified in the literature.

JOB/WORKSITE FACTORS INFLUENCING OLDER HEALTHCARE WORKER TURNOVER

D. Spokus, A. Freivalds, E. Yoder, *Health Policy and Administration, The Pennsylvania State University, University Park, Pennsylvania*

This community-based pilot study will evaluate ergonomic workplace design in healthcare organizations using the Williamson Turn Stand

and assess the psychosocial aspects of individuals by examining the relationship between quality of work life and: job characteristics, social support and organizational characteristics. The study also will examine the relationship between turnover in health care organizations and: environmental worksite characteristics using the Williamson Turn Stand, job characteristics, social support, organizational characteristics and quality of work life. Findings from this study will contribute to our understanding of strategies to successfully recruit and retain older, experienced health care workers.

AN EXPLORATORY STUDY ON THE EMPLOYMENT BARRIERS OF KOREAN OLDER IMMIGRANTS IN LOS ANGELES

M. Rhee, I. Chi, *University of Southern California, Los Angeles, California*

With the rapid aging of the population in the United States and the nation's concern on the increasing costs of health care and Social Security, substantial amount of research has been done on the issue of how to recruit and retain older workers in the labor market. However, relatively very limited attention has been paid to the employment issues of ethnic minority older adults who often face dual risks of age and racial discriminations. For many sub-ethnic Asian Americans, not only exploratory studies are rare, but also they lose their uniqueness by often being lumped into Asians despite the fact that they are the most internally heterogeneous population groups. This study attempts to fill the research gap by exploring the employment experiences among Korean older immigrants in Los Angeles. According to the U.S. Census, there were about 70,000 Koreans in the U.S. in 1970s, but they are currently estimated at over one million with approximately 20% of them being over age 50. This study analyzes qualitative data of 36 Korean immigrants in Los Angeles who are 50 and above. The result of the study based on four focus groups, conducted separately for each gender of the employed and the unemployed, provides the comparison between gender and employment status in terms of employment barriers. The study also provides foundation knowledge both for practitioners and policy makers in developing culturally competent employment services by exploring the employment barriers Korean older immigrants face both at individual and social level.

THE INFLUENCE OF OCCUPATIONAL CONTEXTS ON RETIREMENT PLANS

H. Chung¹, M.E. Szinovacz¹, A. Davey², *1. Umass Boston, Boston, Massachusetts, 2. Temple University, Philadelphia, Pennsylvania*

The aging of the baby boom cohorts may lead to shortages in labor supply among selected industries and thus enhance opportunities for older workers. On the other hand, occupational and job contexts may discourage workers from remaining in their jobs or in the labor force. Extending on Ekerdt's previous research on retirement plans using Health and Retirement Study data, we address the influence of selected occupational contexts (industry, perceived age discrimination) on retirement plans. Initial Multinomial logistic regressions relying on the first wave of the HRS (our final analyses will use waves 1-7), indicate that individuals employed in the manufacturing and transportation industries are less likely to opt for reduced work hours rather than stopping work altogether, whereas individuals in public administration are particularly prone to strive for reduced work hours, and those in agriculture are more inclined to never retire. Perceived peer pressure to retire at age 65 enhances the inclination to plan for job changes, whereas perceptions of fewer promotion opportunities for older workers in their firm tend to encourage workers to make retirement plans: they are less likely to indicate no plans and somewhat more inclined to change jobs. Lack of opportunities for older workers to move to a less demanding job in their firm leads to decreased plans to reduce work hours rather than stopping work altogether. These data demonstrate that work contexts

can shape retirement plans. Employers may need to change work contexts if they want to encourage older workers to remain in their firms.

UNDEREMPLOYMENT AMONG OLDER WORKERS IN THE UNITED STATES

J. Mutchler, A. Butt, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

As unemployment rates reach levels not seen in more than three decades, it is critical to evaluate how older workers are faring. Labor force statistics summarizing the status of older workers typically highlight the labor force participation rate as a measure of labor force attachment, and the unemployment rate as a measure of labor force adequacy. In isolation, however, these indicators are insufficient. They describe neither the health of a labor market with respect to older participants, nor the extent to which older workers are finding suitable employment. In this paper we build on research that tracks underemployment as an expanded conceptualization of labor force participation and adequacy. Underemployment is a concept that includes unemployment, as conventionally defined, but also includes discouraged workers and individuals who are working part-time involuntarily. This expanded conceptualization of labor market insecurity sheds new light on later-life work experiences. Using data from the Current Population Surveys for 1998-2009, we summarize underemployment patterns among individuals aged 50 and over in the United States. We compare these trends and patterns in underemployment to those characterizing the working-age population as a whole, as a means of evaluating the extent to which older workers are differentially exposed to risks of underemployment. Using standardization techniques to take into account the shifting demographic composition of the older workforce, we evaluate trends over time in underemployment among older workers.

WORKERS, WORK SUPPORT, AND DAILY WELL-BEING

J.D. Wong, D. Almeida, *Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

Past studies have shown that low work support has been linked to increased risk of heart diseases and impaired mental health. Although it is important to consider the amount of work support received, it is as important to consider from whom work support is provided. This study examines the associations of type of work support (coworker, supervisor) and areas of daily well-being in a sample of 314 workers between ages 34 to 78 ($M=49.8$). Participants from the National Study of Daily Experiences (NSDE), which is a part of the National Survey of Midlife in the United States (MIDUS), completed telephone interviews about daily stressors, physical symptoms, psychological distress, and positive events over eight consecutive days. Controlling for household income and chronic health conditions, analyses revealed that type of work support differentially predicts areas of daily well-being. Older workers with high support from their coworkers were more likely to experience a positive event in comparison to their counterparts. In the area of supervisor support, males with low supervisor support were the most likely to experience a physical health symptom when compared to their counterparts. Findings suggest that the type of work support provided and individuals' socio-demographic characteristics are important in understanding daily well-being. Furthermore, these findings have implications for ways to improve the work environment.

SESSION 635 (SYMPOSIUM)

EFFECTS OF PERSONAL AND ENVIRONMENTAL FACTORS ON HEALTHY AND SUCCESSFUL AGING

Chair: C. Shawler, *University of Louisville, Louisville, Kentucky*

Discussant: D.A. Chyun, *New York University, New York, New York*

Successful aging involves adaptation to age related changes and creative understanding of the effects of personal and environmental factors such as culture, spirituality, race, age, gender, and social network. Under-

standing these factors can assist older adults to manage change and cope successfully so that their physical and mental functioning is enhanced. With increased awareness of the social, cultural, age, and gender issues, an environment can be created that is conducive for older adults to age successfully with improved levels of health. Nurse scientists have created knowledge that facilitates healthy and successful aging within multiple contexts and cultures. Spirituality of African American spousal caregivers was examined in the first study. Findings demonstrate an inverse relationship between spirituality and the length of time caregiving. In the second paper gender differences in self-rated health of elderly Korean immigrants was explored. Findings indicate that men had better self-rated health than women and women had higher prevalence of major health problems. The third paper examines the current health concerns of the oldest old – individuals who are aged 85 and older. The participants use creative approaches, despite limitations, to maintain social supports and community engagement. The final paper reports the results of a randomized control trial testing effectiveness of support group and exercises on cognitive and physical functioning of African American and Afro-Caribbean elders with mild to moderate dementia. Findings indicate how important differences in the groups affect health outcomes. These papers represent research conducted by participants of the Hartford Institute for Geriatric Summer Scholars Program.

SPIRITUALITY IN THE LIVES OF OLDER AFRICAN AMERICAN SPOUSAL CAREGIVERS

L. Parker, *Clayton State University, Morrow, Georgia*

This study is part of a larger study in which community dwelling older African American spousal caregivers completed in-home questionnaires on caregiver strain, spirituality and depression. The focus of this presentation is on data regarding spirituality. Thirty-eight participants completed the Spiritual Perspective Scale (Reed, 1968). One item from the scale explores the participants' views regarding spirituality. Descriptive statistics, correlations on study variables and scores from the SPS will be presented, along with themes from the transcribed text of participants regarding their perspectives about the meaning of spirituality in their lives. In this study participants rated their spirituality at 5.5 out of a possible 6 on a Likert scale indicating a greater spiritual perspective. There was an inverse relationship between spirituality and the length of time spent caregiving. Text transcription and emergent themes suggests that spirituality is extremely important in the lives of the spousal caregivers in this study.

GENDER DIFFERENCES IN HEALTH STATUS AMONG ELDERLY KOREAN IMMIGRANTS

M. Sin, *College of Nursing, Seattle University, Seattle, Washington*

Evidence increasingly shows that gender inequality is an important determinant of health status. The purpose of this cross-sectional study is to examine gender differences in self-rated health and health status of elderly Korean immigrants (EKI). A convenience sample of 88 EKIs (mean age: 75, $SD=6.48$, range 65-88) were recruited from senior centers and senior apartments in Washington state. Self-rated health was measured with a global Likert Scale of health (poor, fair, good, excellent) and health status with a structured questionnaire (lists of major health problems). In Chi-Square analysis, immigrant Korean men had better self-rated health than women ($X^2=10.8$, $p<.01$). Immigrant Korean women had a higher prevalence of major health problems (e.g., arthritis, headache, osteoporosis, falls, back pain, overweight) than immigrant Korean men ($p<.05$). More men were married living with spouse and had higher education than women. Careful examination of gender difference determining health status is an emerging priority to better manage health status among older adults.

CREATIVE APPROACHES TO HEALTHY AGING: ADVICE FROM THE OLDEST OLD

K.L. Mauk, C.K. Hendrix-Prater, A.J. Kennel, J. Francis, *College of Nursing, Valparaiso University, Valparaiso, Indiana*

The fastest growing part of the American population is adults aged 85 years and over. As life expectancy has increased, this cohort, previously considered the “frail elderly”, has changed with regard to their independence, sense of well-being, and health. A pilot study was conducted to explore the current health concerns of the oldest old group. A convenience sample of 12 volunteers in Northwest Indiana, ages 85 – 99, with an average age of 89.4, was interviewed. Qualitative data analysis revealed that this older cohort had developed specific positive coping mechanisms that enhanced their aging process, including: reliable social support, ways to remain engaged in the community despite limitations, and participation in certain common activities. The purpose of this presentation is to discuss the creative approaches to healthy aging provided by the participants in this study. Specific advice from study participants about staying healthy in old age will be discussed.

HEALTH, LIFESTYLE PRACTICES, HEALTH BELIEFS AND FAMILY SUPPORT OF BLACK ELDERS IN SOUTH FLORIDA

F. Keane, *Nursing, Florida International University, Miami, Florida*

The purpose of this randomized, controlled study is to test the effectiveness of a support group intervention, and exercise on cognitive and physical functioning; and to identify factors that affect these outcomes in a sample of African Americans and Afro-Caribbean elders with mild to moderate dementia. The sample will consist of 100 mildly or moderately impaired Afro-Caribbean and 100 mildly or moderately impaired African American elders. Before participating in the study the participants will be screened using the Short Portable Mental Status Questionnaire, A Functional Activities questionnaire, and the Clock Drawing Test. The independent variables are yoga exercise and support group participation. Dependent variables include cognitive and physical functioning. Behavioral outcomes will be improvement in mood and self esteem. Resulting data will allow examination of differences in these two ethnic subgroups and ethnic group factors that may interact to affect individuals’ cognitive and physical health in late life. Objective: After attending this activity the participants will be able to identify health differences for African American and Afro-Caribbean elders and factors that influence their health outcomes. Objective: After attending this activity the participants will be able to identify health differences for African American and Afro-Caribbean elders and factors that influence their health outcomes.

SESSION 640 (PAPER)

INTERGENERATIONAL EXCHANGES

COGNITIVE ACTIVITY AND COGNITION FUNCTION IN LONG-LIVED OLDER ADULTS AND THEIR ADULT OFFSPRING

C.A. Berg, K. Smith, *Psychology, University of Utah, Salt Lake City, Utah*

The relation between cognitive activity (Wilson et al., 2002) and multiple metrics of cognitive function (WAIS Digit Span, Memory, Boston Naming Test, Verbal Meaning) were examined in 105 long-lived adults (M age=93.4, SD=3.9) and their children (M age=64.1, SD=7.7). Significant group differences were found on (1) all measures of cognitive function, with the long-lived adults performing more poorly than their children, and (2) for the level of cognitive activity, with long-lived adults reporting less cognitive activity. For the long-lived adults, higher cognitive activity was associated with greater cognitive function across cognitive measures, with these associations reduced or not significant for their children. Although significant family associations for cognitive function were found, no significant association between parent and child

cognitive activity was found ($r=.08$). The results are interpreted in the context of potential methodological, cohort, and family factors associated with the measurement of cognitive activity in young-old and old-old adults.

MOTHER’S SUPPORT FOR EDUCATION: INTERGENERATIONAL SOCIALIZATION AFTER DAUGHTERS’ RETURN TO SCHOOL

M. Plikuhn¹, J. Suito¹, R. Powers², *1. Department of Sociology, Purdue University, West Lafayette, Indiana, 2. East Carolina University, Greenville, North Carolina*

This paper uses data from a 25-year study of 37 married mothers who returned to college in the early 1980s to study the ways in which adult children influence their parents’ attitudes. In recent years, scholarship on attitude formation has shifted from a focus on parents’ socialization of young children to exploring the ways in which family members serve as agents of socialization for one another across the life course. This paper investigates the ways in which married daughters who entered college while raising small children influenced their mothers’ attitudes regarding women’s pursuit of higher education while married and raising children. Preliminary analysis of data collected at the time of the entry into college, a year later, 10, and 25 years later suggests that regardless of mothers’ own educational attainment, changes in their support for their daughters return to school was shaped by the daughters’ educational and career successes.

A DYADIC ANALYSIS OF BEHAVIOR PROBLEMS AMONG ADOLESCENTS RAISED BY GRANDMOTHERS

M.L. Dolbin-MacNab, J. Savla, *Human Development, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Among grandparents raising grandchildren, grandchild behavior problems are frequently cited as a major source of stress and have been linked to compromised grandparent well-being. In response to these linkages and to evidence that children raised by grandparents often experience serious physical, emotional, and behavioral problems, researchers have begun to examine grandparent and family factors associated with grandchildren’s behavior problems. These studies indicate that parenting stress, poor grandparent mental health, and contextual stressors may predict grandchildren’s behavior problems. However, little is known about characteristics of the grandchild that predict their behavior problems. Further, studies of grandchild adjustment have relied on grandparent reported data and have not attended to the interdependence of grandparents and their grandchildren. To develop a more systemic understanding of grandchild behavior problems, this study is the first to collect reports from grandmother-grandchild pairs for the purpose of examining within and between dyad factors that are associated with adolescent (ages 11 to 18) grandchildren’s behavior problems. Using path analysis with these distinguishable dyads, we examine within-dyad predictors of grandchildren’s behavior problems including grandchild affect regulation and attachment to the grandmother, as well as grandmother mental health, coping, and parenting stress. We also examine between-dyad predictors such as family resources and family functioning. Variations based on grandchild gender are also considered. Results of this study highlight the value of using dyadic data for understanding the mediating role of grandchild characteristics and grandparent stress on grandchildren’s adjustment. Findings have implications for interventions for custodial grandparents and grandchildren alike.

THE ROLE OF RELIGIOUS SIMILARITY IN THE QUALITY OF PARENT-CHILD RELATIONS: DIFFERENCES WITHIN FAMILIES AND BETWEEN RACES

J. Sechrist¹, N. Vargas¹, J. Suito¹, K. Pillemer², *1. Purdue University, West Lafayette, Indiana, 2. Cornell University, Ithaca, New York*

Recent within-family studies have found perceptions of similarity to be one of the most powerful predictors of mothers’ closeness to adult

children. Further, these patterns are the same for both Black and White mothers' differentiation. However, this line of research has focused on perceptions of general similarity of outlook. We contend that the salience of some dimensions of similarity may differ by race. Specifically, we argue that because of the higher levels of religiosity and religious participation among Black than White women, religious similarity will play a larger role in closeness between Black than White mothers. This paper uses data on 591 White and 159 Black mother-child dyads nested within 290 families collected as part of the Within-Family Differences Study to examine this question. Preliminary analyses suggest that religious similarity predicts closeness as reported by both mothers and children; however, consistent with our expectations, both similarity of religious affiliation and religious participation played a larger role in the intergenerational relations of Black than White parents and children.

LINKED LIVES BEYOND ADJACENT GENERATIONS: FILIAL RESPONSIBILITY FOR AGING PARENTS FROM THE GRANDCHILD PERSPECTIVE

P. Oyama, M. Silverstein, V. Bengtson, *Gerontology, University of Southern California, Los Angeles, California*

Research suggests that intergenerational family relationships may shape individual conceptions of filial responsibility for the long-term care of the elderly, but few studies have examined this beyond adjacent parent-child dyads. This study examined young adults' attitudes toward filial responsibility for aging parents in relation to the quality of the grandparent-grandchild relationship. Data used were from young adult (16-24) participants pooled across three waves (1994, 1997, 2000) of the USC Longitudinal Study of Generations. The grandchild perspective was used to construct grandparent-parent-child triads ($N = 400$) consisting of responses about either a maternal grandparent and mother ($N = 225$) or paternal grandparent and father ($N = 175$). Filial responsibility was measured using a 6-item Likert scale indicating the amount of responsibility adult children should have for elderly parents in need. Quality of intergenerational relationships was measured using Bengtson's affectual solidarity scale. Multivariate (OLS) regression models revealed that independent of affection for parents, affection for grandparents had a significant positive association with young adults' filial responsibility attitudes. Gender differences in filial responsibility were not found. In addition to the parent-child relationship, the quality of the grandparent-grandchild relationship may also encourage future support to elderly parents, which suggests that the lives of family members are linked across relationships that extend beyond adjacent generations.

SESSION 645 (PAPER)

NURSING HOME CARE

MOBILIZING CARE RECIPIENTS VOICES AND THE MEANINGS OF CARE: AN ACTION RESEARCH PROJECT

R.A. Siders, D. Dannefer, *Sociology, Case Western Reserve University, Cleveland, Ohio*

Competence, autonomy and relatedness have been identified as three basic human needs (Deci & Ryan, 1985). These needs do not change or atrophy with age, but may become more difficult to realize in old age. Indeed, these three needs correspond to what Bill Thomas (1996) identified as the "three plagues" of nursing home life – boredom, helplessness, and loneliness. The culture change movement in LTC has as its self-proclaimed goal to ameliorate these plagues and to create a Life Worth Living (Thomas 1996) in the daily life experiences of residents living in LTC. One of the goals of culture change is to redefine the cultural and societal meaning of old age in a way that restores full social participation to elders, thus, nourishing the potentials for competence and providing opportunities for autonomy and relatedness to elders living in LTC is recognized as a never-ending task. Yet, although the efforts of the culture change movement have been great, the heavily regulated

and constantly demanding total-care milieu of LTC continues to fall short of the ambitious ideals of full participation for elders as active agents in quality care and quality of life. The primary goal of this research project is to utilize the methodology of Participatory Action Research as the primary vehicle to bring residents and the frontline staff who care for them into the process of culture change as active agents. This approach will involve operating Action Research Consortium (ARC) groups in a LTC facility in Northern Ohio. We believe that this approach can add value to the organization, to the culture change process and to the lives of residents living in nursing homes. Results of the action research process as well as outcomes will be presented.

THEMES OF CULTURE CHANGE: PRELIMINARY RESULTS OF AN ETHNOGRAPHIC CULTURE CHANGE EXAMINATION

A. Snow^{1,2}, M. Machac-Burleson¹, L. Vinson¹, M.L. Jacobs¹, J. Chandler¹, J. Copeland¹, P. Parmelee¹, C. Beck³, *1. University of Alabama, Tuscaloosa, Alabama, 2. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, 3. University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Supported by CMS and advocacy groups, increasing portions of the nursing home industry have turned to culture change, a system-wide organizational change strategy that prioritizes patient-centered care. Although there have been limited studies of its outcomes, there have been few studies of the culture change effort itself. This presentation describes preliminary results of an ongoing ethnographic study of culture change in a community nursing home. Data consists of qualitative interviews with leadership team members; data collection has been underway for 1.5 years and is guided by the grounded theory approach. The sample is multidisciplinary and currently includes recurring interviews with 23 individuals and ethnographic observations. Preliminary analyses have yielded three main themes. First, we describe the roles that optimism, labeling and fear play in the work experiences of facility leaders. Second, we describe the process by which the leadership team sets priorities regarding the strategic implementation of culture change initiatives, and degree to which these specific initiatives meet with challenges and/or success. Specific initiatives that are addressed in this study include decentralization of the MDS process, implementing Learning Circles, decentralization of the activities program, and leadership training. Third, we describe the role of race and proxies of race as facilitators and barriers to culture change; diverse perspectives serve as a facilitator, whereas communication difficulties serve as a barrier. Finally, we describe the role of the upper management in leading culture change, their motivators, their actions, and the factors that affect their decision to persevere in the face of enormous challenge. Religious commitment, the belief that change is necessary for marketing success, and a focused commitment to seeing the change through to success are some of these factors.

FACILITATING TRANSFORMATION: THE TOOLS AND PROCESSES USED IN LONG-TERM CARE CULTURE CHANGE

M. Chapin, *1. Art Institute of Atlanta, Atlanta, Georgia, 2. University of North Carolina at Charlotte, Charlotte, North Carolina*

Culture Change, the process of transforming a long-term care facility from operating under a medical model of care philosophy to operating under a holistic philosophy in a resident-centered care manner, focuses upon recreating long-term settings. This process of transformation involves an array of efforts aimed at changing the habits and assumptions of long-term care practice to support and maximize resident strengths (Cohen & Eisdorfer, 2001). Currently little has been developed on the role the physical environment plays in this transformation (Shields and Norton, 2006). Although making changes solely in the physical environment does not bring about culture change (McNamara, 1999), this research reveals that placemaking (the in-depth processes

of creating new or re-creating physical environments) may play a more important role in creating culture change than previously acknowledged. Using a systemic approach employing content analysis of an extensive literature review and in-depth case studies, this presentation presents insights into the complex, organic and lengthy process of culture change as it occurs within long-term care. This presentation offers a conceptual model for considering the physical setting as an integral part of a cultural milieu and highlights the fundamental hidden role design plays in culture change. In addition, this presentation will emphasize the need for congruence between physical, social, and organizational environments. Attendees will learn emerging conceptual frameworks that successfully guide culture change efforts and decision-making processes as well as the over 300 tools and actions that long-term care organizations used to facilitate transformation of their facilities into culture change communities.

MEDICAID LONG TERM CARE HOME AND COMMUNITY BASED SERVICES FOR THE ELDERLY: TRENDS IN PROGRAMS AND POLICIES, 1999-2006

C. Harrington, T. Ng, *UC San Francisco, San Francisco, California*

In response to consumer demand, the Supreme Court decision in the Olmstead case and the New Freedom Initiative, states have unevenly expanded combinations of three Medicaid home and community based services (HCBS): home health, state plan personal care services (PCS), and 1915(c) waivers. By 2006, the federal-state Medicaid program paid for 40 percent of the nation's estimated \$178 billion total long-term care (LTC) expenditures while institutional care (e.g., nursing homes) consumed 60 percent of those expenditures. As 41 states and DC project budget deficits in FY 2009 and beyond, the Deficit Reduction Act (2005) reflects growing concerns about the need to preserve and expand Medicaid HCBS and the need for information on program and policy trends. This paper draws from a unique national dataset to present the latest trends in participants, expenditures and policies for the three Medicaid HCBS programs serving the elderly. While data for 2006 show a steady increase in participants and expenditures, these growth rates have slowed since 2001. Inequities in access to services and limited funds have also resulted in unmet needs for HCBS among the elderly. Findings from the survey of policies used in the programs in 2008 show that states are increasing the number of waiting lists for elderly waiver services even as the number of available "slots" increases. Cost caps such as service and cost limits are also used in almost half the state plan personal care programs and almost a third of home health programs.

PRELIMINARY FINDINGS FROM MINNESOTA'S NURSING HOME PERFORMANCE-BASED INCENTIVE PAYMENT PROGRAM

K. Abrahamson¹, G. Arling², V. Cooke³, C. Mueller⁴, T. Inui⁵, *1. Department of Veterans Affairs, Indianapolis, Indiana, 2. Indiana University School of Medicine, Indianapolis, Indiana, 3. State of Minnesota Department of Health and Human Services, St. Paul, Minnesota, 4. University of Minnesota, Minneapolis, Minnesota, 5. Regenstrief Institute, Indianapolis, Indiana*

Minnesota's Nursing Home Performance-Based Incentive Payment Program (PIPP) supports provider-initiated projects aimed at improving the quality of nursing home care. Projects lasting 1-3 years are selected through a competitive process and funded for up to 5% of the daily per diem rate. Minnesota has funded 45 projects representing 160 facilities and \$23 million annually. Projects address areas such as falls, wounds, mobility, incontinence, pain, resident-centered care, and transitions from nursing home to community. In order to better understand the experiences of providers participating in the PIPP program, semi-structured interviews were conducted with project leaders. Leaders reported that project development was often data-driven, focused on current quality problems, and sensitive to cost and sustainability limitations. Leaders frequently reported extending quality improvement

beyond the targeted program area to improve resident quality of life overall. Organizational benefits included an improved public image, increased staff trust and cooperation, improved efficiency, and the ability to apply knowledge and skill obtained through PIPP projects to other challenges within the facility. There were also challenges. Staff members were at times hesitant to alter long-standing routines. Costs, especially those of staff training, often exceeded budget expectations. Sustainability of improvement was also a major concern. The relatively short duration of projects may not be sufficient to see improvement in quality indicators. Leaders expressed a need for learning more about generalizable models of success and noted the importance of disseminating their PIPP experiences. The experiences of PIPP leaders can be a model for others seeking to promote nursing home quality.

SESSION 650 (PAPER)

RESEARCH METHODS FOR ADVANCING AGING RESEARCH

USING ACTION RESEARCH IN A RESIDENTIAL CARE HOME FOR OLDER PEOPLE: LESSONS LEARNT - STRENGTHS AND PITFALLS

L. Low, *The Nethersole School of Nursing, The Chinese University of Hong Kong, Shatin, China*

The strength of using action research methodology rests in its potential to enable the researcher and participants to obtain systematic understanding of a setting in which a study is undertaken. As participants become co-researchers, a process of working together in partnership with the researcher becomes the ultimate goal. Together they explore, collectively self-reflect and adopt a more critical and creative stance to improve practice (Kemmis & McTaggart, 1988). Set in the context of Hong Kong, an action research study to explore the quality of life of older people in a subsidised residential care home was conducted. A triangulation of data collection methods was used: namely, participant observation, field notes, and semi-structured resident and staff interviews. Participants were encouraged to identify quality aspects and practices of the home that were important to them. Through a period of working in partnership with staff in groups, a programme for change initiatives was developed. Features of the physical setting and staff practices that require improvement were selected and addressed. Improved changes to the home were brought about by negotiating, planning workshops and conducting informal discussion groups with staff of all grades. Drawing upon the 12 months of data collected from 40 residents and 37 social care, nursing and care staff, this presentation will review on the strengths and pitfalls of undertaking an action research study in a large and hierarchical residential care home context. The impact of bringing about change to the care home and effects upon staff and residents will also be highlighted.

REACHING HARD-TO-REACH OLDER ADULTS IN BEHAVIORAL AND SOCIAL SCIENCE RESEARCH

M. Engstrom¹, D. Jenkins², N. Rowan³, *1. University of Chicago, Chicago, Illinois, 2. Texas Christian University, Fort Worth, Texas, 3. University of Louisville, Louisville, Kentucky*

Diverse bodies of research underscore the vulnerability and marginalization of many groups of older adults, including those who are affected by substance abuse, incarceration, mental health problems, and longstanding poverty, and those who are lesbian, gay, bisexual or transgendered. While many behavioral and social scientists are committed to involving these and other groups of vulnerable older adults in research, these groups of older adults are often hard to reach. The presenters draw upon their own research experiences and a review of relevant literature to provide practical strategies to reach and engage hard-to-reach populations of older adults in research. At the conclusion of this presentation, attendees will be able to identify specific strategies to: 1) reach and

engage marginalized and vulnerable groups of older adults in behavioral and social science research; 2) facilitate engagement with research sites; 3) coordinate study activities with research site staff; 4) directly reach vulnerable groups of older adults outside of an agency setting; and 5) facilitate the institutional review board process, particularly when the research focuses on older adults who may be considered vulnerable by institutional review boards. This presentation is especially well-suited to early stage scholars who are seeking practical steps to move their qualitative and quantitative research with vulnerable older adults forward.

EXPLORING RELATIONSHIPS AMONG AGING GROWTH PROCESSES USING THE STRUCTURAL EQUATION GROWTH MIXTURE MODEL

S. Tueller, G. Lubke, *Psychology, University of Notre Dame, Notre Dame, Indiana*

Longitudinal models such as the growth model allow researchers to test hypotheses about aging processes. Mixture models provide ways to account for unobserved heterogeneity which can lead to incorrect conclusions if left unaddressed. Unobserved heterogeneity can result from unobserved groups or latent classes. Growth mixture models (GMM) combine the growth model and mixture models. The GMM can be used to test hypotheses about unobserved aging trajectory groups. The GMM can be further extended to model the relationship among different growth processes with unobserved aging trajectory groups using the structural equation growth mixture model (SEGMM). Using data from the Notre Dame Longitudinal Study of Aging, the relationships among the aging processes stress, depression, life satisfaction, hardiness, and social support are explored using the SEGMM. In this didactic work, the steps for fitting a SEGMM are detailed. Initial steps should be done separately for each aging process (e.g., stress, life satisfaction, etc.). These steps include exploratory data analysis, the checking of items and/or scales, testing for measurement invariance across time, exploring appropriate shapes for aging trajectories (e.g., straight line or bounded curves), model identification, and estimating the number of unobserved aging trajectory groups. Once appropriate models are developed for each aging process, it is shown how hypotheses about relationships among aging processes are translated into testable models. Ways of addressing relationships between aging processes with different numbers of unobserved aging trajectories and/or different longitudinal data collection schedules are illustrated. Methods of model comparison and model selection are demonstrated.

INNOVATIVE TRANSLATIONAL RESEARCH IN GERONTOLOGY: CORNELL INSTITUTE FOR TRANSLATIONAL RESEARCH ON AGING

E. Wethington, R. Meador, K. Pillemer, *Human Development, Cornell University, Ithaca, New York*

In 2003, we began development of an innovative pilot studies model designed to foster partnerships between university researchers and agencies serving older people in New York City through the Cornell Institute for Translational Research on Aging (CITRA), an Edward R. Roybal Center. Professional development of researchers for projects that benefit frontline service agencies is critical for translating scientific research into evidence-based practice benefiting older adults. In this presentation, we will report on achievements, challenges, and lessons learned during the first six years of CITRA, and outline what we believe are the best practices for developing and supporting investigators in community-based research. Our pilot studies program required an infrastructure that supplemented individual pilot investigator efforts with centralized support resources to assure the proper implementation and dissemination of the research. Necessary components of the centralized resources included core staff, extensive time commitment from senior investigators to assist with IRB approvals and proposal writing, and an active community capacity-building program. Two formal seminars that attracted experienced investigators, junior faculty, and graduate students

were critical parts of the infrastructure. The program resulted in 50% higher investigator productivity, defined as proposal and peer-reviewed article success, compared to an earlier, conventional pilot program that did not have supporting educational and monitoring infrastructure. For the next five years, CITRA will expand to include two additional academic and medical institutions in New York City, aided by support from the Weill Cornell Translational Science Center. Implications for developing gerontological and geriatric researchers through CTSA's will be discussed.

HETEROGENEITY IN SELF-REPORTED LIFE SATISFACTION: RELATIONSHIPS WITH AGE AND PERSONALITY ARE NOT UNIFORM

H. Heidemeier, U.M. Staudinger, *Jacobs Center on Lifelong Learning and Institutional Development, Bremen, Germany*

This study aims to contribute to the resolution of the well-being paradox, that is, the fact that relationships between objective living circumstances, including age, and life satisfaction are typically weak. It challenges the assumption that relationships between life satisfaction and living circumstances are uniform and apply to all individuals in the same manner. Based on mechanisms of self-evaluation, we predict meaningful heterogeneity in a quality of life (life satisfaction) measure; that is, the need to distinguish subgroups within the overall sample. Within one of these two subgroups, the participants' age explained substantial parts of variance in life satisfaction scores. Different traits of personality predicted high scores of life satisfaction within each of the two groups. A match between personality traits (the Big Five) and the most relevant sources of life satisfaction predicted higher levels of overall life satisfaction. Self-deception and lifespan theory provide a useful interpretive framework for these results.

SESSION 655 (SYMPOSIUM)

SOCIAL INDICATORS OF DISEASE RISK AND DISEASE MANAGEMENT IN LATE LIFE

Chair: M. Franks, *Purdue University, West Lafayette, Indiana*

Discussant: L. Wray, *Pennsylvania State University, University Park, Pennsylvania*

The risk of chronic disease increases with age, and many older adults manage at least one chronic condition each and every day. Poor disease management can cumulatively, and sometimes irreversibly, affect the health outcomes of older adults. The five papers assembled for this symposium illuminate how individuals' station in life (e.g., gender, socioeconomic status, marital status, age) shapes their own and their social partners' attitudes, perceptions, beliefs and behaviors in the prevention and management of chronic illness in later life. Our first two papers use data from the Health and Retirement Study to explore social and behavioral factors that increase older adults' risk for disease and disability. One paper investigates socioeconomic and demographic differences in risk factors for cardiovascular disease. The second paper examines biobehavioral (e.g., diet, exercise) and psychosocial mediators (e.g., self-efficacy, family support) that explain gender differences in long-term physical disability patterns of women and men with type 2 diabetes. Our next two papers investigate the role of married partners' beliefs and interactions in the management of diabetes. One paper focuses on the effects of spouses' diet-related control amid partners' perceptions of the necessity of spouse involvement in one another's health (dyadic appraisals). The second paper examines spouses' perceptions of partners' illness as a predictor of their provision of diet-related support and control. Our final paper is a qualitative examination of age differences in attitudes and beliefs about managing diabetes among older adults and their physicians, and the influence such attitudes and beliefs may have on medical encounters.

GENDER DIFFERENCES IN PHYSICAL DISABILITY IN ADULTS LIVING WITH TYPE 2 DIABETES:

BIOBEHAVIORAL AND PSYCHOSOCIAL MEDIATORS

C. Chiu, L. Wray, *Penn State University, University Park, University Park, Pennsylvania*

Differences in physical disability between adults with and without diabetes were more evident in women than in men. The present study aims to test if that difference can be attributed to biomarkers, self-care behaviors, and psychosocial well-being. Data on 1,619 adults living with type 2 diabetes from the U.S. nationally representative Health and Retirement Study and diabetes-specific mail survey were used. Findings indicated that although women had better diet and blood glucose self-monitoring behaviors than did men, they had less favorable levels on BMI, HbA1c, blood pressure, early complications, exercise behaviors, perceived control, self-efficacy, coping, depressive symptoms, and family support than did men. The use of structural equation modeling revealed that biological and behavioral factors directly and completely mediate the gender differences in physical function; psychosocial factors, although not directly account for the gender-disability relationship, made indirect contribution in the link.

DYADIC APPRAISALS OF SPOUSE INVOLVEMENT AND DIABETES MANAGEMENT

A. Seidel¹, M. Franks¹, M. Stephens², K. Rook³, *1. Purdue University, West Lafayette, Indiana, 2. Kent State University, Kent, Ohio, 3. University of California, Irvine, Irvine, California*

Many individuals turn to their spouse as they manage a chronic illness. When spouses exert control to improve patients' illness management, their efforts sometimes elicit the opposite response resulting in poorer adherence. Given mixed findings for the effect of social control, we examined dyadic appraisals of spouse involvement as a moderator of the association between spouse control of patients' dietary behaviors and patients' outcomes (diet adherence, well-being) among couples where one partner has type 2 diabetes (N = 136). In couples with a shared appraisal affirming spouse involvement, dietary adherence was greater among patients reporting more diet-related spouse control. However, higher spouse control was associated with lower marital satisfaction, and dyadic appraisals did not moderate this association. Findings suggest that spouse control can facilitate patient adherence when partners share the appraisal that one spouse should be involved in protecting the health of the other, but may interfere with marital satisfaction.

SPOUSES' PERCEPTIONS OF DIABETES AND INVOLVEMENT IN PATIENTS' DISEASE MANAGEMENT

R.C. Hemphill¹, M. Stephens¹, M. Franks², K. Rook³, M. Iida¹, J.K. Salem⁴, *1. Department of Psychology, Kent State University, Kent, Ohio, 2. Purdue University, West Lafayette, Indiana, 3. University of California, Irvine, Irvine, California, 4. Summa Health System, Akron, Ohio*

Among individuals with chronic illness, spouses are often the primary source of support and control (influence) for self-management behaviors. Spouses' involvement in patients' disease management may be affected by their perceptions of illness. In this study of patients with type 2 diabetes mellitus (T2DM) and their non-diabetic spouses (N = 119 couples), we examined the effects of spouses' perceptions of T2DM as chronic (i.e., chronic vs. acute) and cyclical (i.e., cyclical vs. constant) on spouses' provision of support and control for patients' dietary adherence. Perceiving T2DM as more chronic was associated with spouses' providing less support and less control. Additionally, among spouses who viewed T2DM as constant, control decreased as a function of perceptions of chronicity. In contrast, among spouses who viewed T2DM as cyclical, there was no relationship between chronicity and control. Findings reveal the importance of spouses' perceptions of patients' illness for spouses' involvement in patients' disease management.

AGE DIFFERENCES IN ATTITUDES AND BELIEFS IN TYPE 2 DIABETES MANAGEMENT

E.A. Beverly^{1,2}, M.D. Ritholz^{1,2}, A. Leighton¹, K. Weinger^{1,2}, *1. Behavioral Research, Joslin Diabetes Center, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts*

An effective physician-patient encounter is of paramount importance in the treatment of type 2 diabetes (T2DM). The purpose of this ongoing study is to identify physicians' and patients' attitudes and beliefs in the management of T2DM. A purposive sample of 24 patients (83% White, 50% male, 59±8 years old, 11±4 years with T2DM, A1c=8.0±1.1%) and 13 physicians (92% White, 62% male, 51±8 years old, 23±9 years in practice) participated in semi-structured interviews. Transcribed interviews were coded by 4 researchers using content analysis. Findings revealed that older patients (≥60 years) described a more passive role in their management and expressed greater self-blame for unmet treatment goals. Older physicians (≥55 years) described T2DM as a progressive, chronic illness, acknowledging that despite patients' best efforts diabetes may worsen over time. These findings indicate that age differences in attitudes and beliefs may contribute to medical encounters that support or impede diabetes self-care.

THE SOCIOECONOMIC AND DEMOGRAPHIC DISPARITIES THAT ARE ASSOCIATED WITH CARDIOVASCULAR RISK FACTORS

K.R. Jenkins, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Cardiovascular disease (CD) is the leading cause of death in the U.S. To better understand important disparities in CD, we use publicly available data from the 2006 wave of the HRS to investigate the effects of socioeconomic and demographic characteristics on cardiovascular risk factors (CRF). With a sample of 8,392 older adults, we used multinomial logit models to predict the odds of having 0, 1-2, or 3+ CRF separately for men and women. CRF are defined using HDL cholesterol, Hemoglobin A1c, waist circumference, and blood pressure. For men, being African American and having lower educational attainment makes one more likely to have 1-2, or 3+ CRF. For women, being African American, having lower educational attainment and income makes one more likely to have 1-2, or 3+ CRF. The implications of these results are discussed in terms of the potential role that targeted interventions have for decreasing CRF and improving diseases.

SESSION 660 (POSTER)

SUCCESSFUL AGING

MANAGING POOR SLEEP IN LATER LIFE: INTERPRETING OLDER PEOPLES' ATTITUDES TO SLEEP MEDICATION AND SLEEP REMEDIES

S. Venn, S. Arber, *Department of Sociology, University of Surrey, Guildford, United Kingdom*

Background: Traditionally sedative hypnotics have been prescribed to older people who report difficulty sleeping, but increasingly alternative solutions are being sought for poor sleep, as it is recognized the benefits of hypnotics are outweighed by the potential risks, such as an increase in falls. Aims and Methods: This paper offers an interpretation of older peoples' attitudes to sleep medication and remedies through qualitative interviews (n=62) with older people living in the community. Results: All respondents had a PSQI (Pittsburgh Sleep Quality Index) score of > 5, an indicator of clinically poor sleep. However, most of the older people would not consider going to their doctor for help with their sleep. Those who did, and who were prescribed sleeping medication, rarely took it, or discontinued use after a short period of time. Older people reported two concerns about sleeping medication, (a) that the effects of the medication would continue into the day, (b) that they would become reliant on them. Alternative, more 'acceptable' medica-

tions included painkillers, antihistamines, or over the counter solutions, such as herbal remedies. Conclusions: Older people place great emphasis on being in control of their daily lives, so they may only seek professional help when they consider their poor sleep interferes with that. It is therefore important to identify the attitudes older people have towards solutions to sleep problems, and recognize older peoples' emphasis on active living, if these solutions are to be effective. The research is supported by the New Dynamics of Ageing initiative (RES-339-25-0009).

EFFECTS OF VOLUNTEERING ON THE SELF-RATED HEALTH OF OLDER ADULTS

Y. Jung, *UCLA, Los Angeles, California*

There is growing evidence supporting the positive effects of engagement in productive activities on the well-being of older adults. This paper aims to examine the association between older adults' self-rated health and volunteerism, with a focus given to the role of older adults' educational attainments. The present study is based on 368 adults aged 60 and older from the first (1995/1996) wave of the National Survey of Midlife Development of the United States (MIDUS), a nationally representative sample of adults aged 25-74. Ordered logistic regression analyses indicated that volunteers who have some college or more education show a positive association with self-rated health ($OR=2.05$, $95\% CI=1.15, 3.65$), while there is no significant association between volunteering and self-rated health for those who have less than high school education. These results support the hypothesis on differential effects of volunteering on perceived health depending on older adults' educational attainments.

ELDER PERCEPTIONS OF HIGHER EDUCATION AND SUCCESSFUL AGING

S.A. Trudeau, *1. Boston College, Chestnut Hill, Massachusetts, 2. Tufts University, Stow, Massachusetts*

There is a growing trend of colleges and universities to affiliate with retirement communities, often to enhance revenue sources. Little is known of the effect of this emerging phenomenon on the aging processes of elders living and learning on a college campus. This phenomenological study used focus group methodology to collect in depth interview data from a group of 31 elderly residents of a college-affiliated retirement community. Residents in this setting are required to complete 450 hours of continuing education per year. This continuing education requirement can be met through either age-segregated classes with other residents; or, intergenerational courses at the college with traditional aged students. The specific aims of this study included understanding the potential effects of the retirement community and campus settings on elders' ability to age successfully; and the impact of intergenerational engagement on the aging process. Findings from this study confirm that there are many opportunities which promote successful aging of elders in a higher education affiliated retirement community. Participants reported that successful aging is enhanced by the safety of the setting and access to: continuing education; dining facilities; socialization; intergenerational engagement; and general disposition of intellectualism in the setting. In addition, the educational requirement results in self-selection of residents with interest in intellectual matters and continued learning that is then accentuated within the community culture. Conclusions include recommendations that more institutions of higher education should consider similar models, with careful attention to issues of enhancing both funding sources and opportunities for diversity within the program.

SOCIAL INTEGRATION, SELF-RATED HEALTH, AND MORTALITY: A LONGITUDINAL STUDY OF ELDERLY JAPANESE

K. Tanaka¹, N.E. Johnson², *1. Center for Demography and Ecology, University of Wisconsin-Madison, Madison, Wisconsin, 2. Michigan State University, East Lansing, Michigan*

Do elderly Japanese people rate their health more highly and have a greater chance of surviving over the short term when they are more socially integrated rather than isolated? If so, then which social roles are crucial in conveying these advantages? These questions are answered in our analysis of Wave 1 and Wave 2 (1999 and 2001) of the Nihon University Japanese Longitudinal Study of Aging. Having more social roles, especially being a worker or a participant in an extrafamilial social group, was associated with better self-rated health among Japanese elders in 1999. Better self-rated health in 1999 boosted the odds of surviving over the next two years to participate in the 2001 wave (versus dying between the waves). We discuss how the present study updates, extends, and compares with similar works in Japan (Sugisawa et al. 1994) and upstate New York (Moen et al. 1989) and suggest directions for public policy and future research on promoting healthy aging in Japan.

BEYOND INDIVIDUALS: EFFECTS OF NEIGHBORHOODS ON OBESITY

R.A. Pruchno¹, M. Wilson-Genderson¹, F.P. Cartwright¹, M. Rose², *1. New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey, 2. The Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

Rates of obesity have increased exponentially over the past several decades such that 33% of adults over the age of 60 are now obese. While demographic, SES, and genetic factors influence obesity, the rate of growth of this epidemic renders implausible the likelihood that the trend can be explained by biology or genetics alone. We examine the extent to which neighborhood context affects BMI by linking interview data from 5,688 community-dwelling people aged 50 to 74 living in New Jersey with Census-tract data. Results indicate that there are significant gender differences in the influence of neighborhood characteristics. For women, in addition to education, income, and race (measured at the individual level), lower neighborhood SES, and less street connectivity (more streets, fewer nodes) predict BMI. For men, only education (measured at the individual level) predicts BMI. Findings suggest the important role played by neighborhood characteristics, especially for understanding obesity among women. Results are interpreted in terms of the need to develop environmental solutions to help stem the obesity epidemic.

ENGAGEMENT WITH LIFE: ACTIVITY PARTICIPATION AS A PREDICTOR OF SUCCESSFUL AGING AND QUALITY OF LIFE

R. Stevens-Ratchford, *Occupational Therapy and Occupational Science, Towson University, Towson, Maryland*

Introduction. This study examined the relation of long-standing occupation to successful aging and quality of life (QOL). Long-standing occupation was participation in a particular activity for a period of five years or more. QOL was a positive state of well being that was an inherent factor of successful aging. Successful aging was defined as continued good health and well being in concert with high function and active engagement with life (Row & Kahn, 1999). Engagement with life is involvement in leisure, social, and productive activities. QOL was defined as overall positive well being that included health status and life contentment. Engagement in long-standing occupation provides seniors with a vehicle for staying active and socially connected. Method. Correlational procedures were used to collect data on long-standing occupation, successful aging, and quality of life in a sample of 276 community-dwelling older adults. The Long-Standing Occupation Measure ($r=.81$) was used to measure activity participation. The Successful Aging

Profile ($r=.84$) was used to measure successful aging. The Quality of Life Scale ($r=.92$) was used to measure QOL. Regression analyses were used to determine predictors of successful aging and QOL ($p < 0.05$). Results. Findings indicated that long-standing occupation is a significant predictor of successful aging and quality of life. Productive occupation was a significant predictor of both QOL and successful aging. Conclusion. This sample of older adults had participated in a variety of leisure, social, and productive occupations across their lifetimes. These activities related to their overall successful aging and QOL.

HELPING BEHAVIORS AND HYPERTENSION: RECENT EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

J. Burr, J. Tavares, J. Mutchler, *UMass Boston, Boston, Massachusetts*

Hypertension is a risk factor for many serious diseases and is the leading risk factor world-wide for death. This condition is strongly associated with life style and health behaviors and may also be affected by individual's social interactions and connections. One form of social interactions examined in this study is as conceptualized as helping others, which is a common form of productive activity among older Americans. In this study, we evaluate whether informally helping other people in one's social network and volunteering one's time for formal organizations have a statistical relationship with high blood pressure among middle-aged and older persons. We analyze data from the 2006 Health and Retirement Study, including community-dwelling respondents only. Our bivariate results show a negative relationship between both types of helping behaviors and hypertension. In addition, after controlling demographic, social class, social support, and other health behavior risk factors, our binomial logistic regression results confirm a negative relationship between informal and formal helping behaviors and high blood pressure. That is, middle-aged and older persons in this nationally representative population-based sample who volunteer or help their neighbors, friends and non-co-resident relatives are less likely than persons who do not engage in this behavior to report high blood pressure. This study provides additional supporting evidence that helping others is beneficial for those who are helped as well as for the helper. Programs and policies that encourage these types of helping behavior may improve the overall health profile of the older population.

PERCEIVED AND ACTUAL CONNECTEDNESS BETWEEN ELDERLY PATIENTS AND THEIR PRIMARY CARE DOCTORS: TRUST WELL PLACED

B. Kahana¹, E. Kahana², M. Stone², J. Lin², *1. Cleveland State University, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

This paper explored perceptions of community dwelling elderly patients regarding connectedness with their doctors. These perceptions were considered in the context of physicians' and patients' evaluations of patient health and health habits. Interviews were conducted with 355 elderly patients (X age = 80) who participated in a panel study of successful aging. Most patients (86.8%) demonstrated a high level of trust in their primary care doctors. Patients also believed that their physicians are familiar with their values and preferences regarding health-care (87.5%), and with their health habits (82.6%). However, only 53.7% of the sample reported that their physician is well acquainted with their personal life. Data were also obtained from physicians of respondents, via telephone interviews (N= 187). The objective was to determine whether physician views of patient health and health habits corresponded with patients' self reports. Physicians evaluated most of their elderly patients as being in good health and free of cognitive impairment. There was a very high level of concordance between physician reports and patients' self evaluations. Physicians offered somewhat less positive health ratings relative to patients' self evaluations. The overall findings lend credence to patient perceptions that their physicians are familiar with their health needs, and suggest that elderly patients and their primary care physicians are well connected with one another.

PREDICTORS OF PHYSICAL ACTIVITY IN THE OLDEST OLD: IMPLICATIONS FOR HEALTHY AGING PROGRAMS

D.W. Coon¹, M. Keaveny¹, M. Anderson¹, K. O'Connor², L. Evans², W. Nieri², *1. College of Nursing & Healthcare Innovation, Arizona State University, Phoenix, Arizona, 2. Sun Health Research Institute Center for Healthy Aging, Sun City, Arizona*

Though improved cognitive, physical, and psychosocial health, functional capacity, overall quality of life, and successful aging has been associated with regular physical activity among older adults, there has been much less attention focused on the oldest old (individuals age 85 and older). This study's aim is to explore potential predictors of different types of physical activity among the oldest old. Data from the Learning from our Elders: The Longevity Project (N= 166; 62.7% female; mean age =94.27; SD = 4.74) were analyzed using a logistic regression to determine predictors of different physical activity levels, including levels of flexibility and strength training. A variety of key psychosocial variables emerged as significant predictors in the models. More specifically, significant predictors for participation in weekly low intensity activity versus moderate or vigorous activity were age, self-confidence, social activity participation, and emotional coping ($ps < .05$). Organizational religiosity, informational social support, and satisfaction levels with amount of support were significant predictors ($ps < .05$) of participation in activities to improve flexibility with self-confidence exhibiting a trend ($p = .06$). Finally, factors remaining in the model to predict participation in activities to improve muscle strength were gender, perceived control, and Valuation of Life ($ps < .05$) with health ratings remaining a trend ($p = .091$). Physical activity as a critical component of successful aging and creative healthy aging programs will require researchers and providers to consider key psychosocial factors to effectively address the different activity needs of the oldest old.

SOCIOECONOMIC POSITION AND SUBJECTIVE WELL-BEING AMONG ELDERLY PEOPLE IN SWEDEN

I. K  reholt, M. Gl  nberg, *Aging Research Center, Stockholm, Sweden*

INTRODUCTION: Relationships between socioeconomic position (SEP) and health have been studied extensively, between SEP and subjective well-being less, especially among elderly. We study the relation between four measures of SEP and four measure of well-being. METHOD and MATERIALS: A nationally representative random sample of Swedes aged 77-99 years were interviewed in 1992 (n=537) (dropout rate=4.6%). MEASURES OF WELL-BEING: Sense of coherence is based on three questions, one from each domains comprehensibility, manageability and meaningfulness, life satisfaction on three questions regarding fulfilled life expectations, social circumstances on three questions about positive relations to important persons and housing autonomy, and quality of life on questions regarding family relations, leisure and evaluations of life. MEASURES OF SOCIOECONOMIC POSITION (SEP) are income, cash margin (ability to raise 1,300 \$ in a week), social class based on main lifetime occupation, and highest finished education. RESULTS: Significant correlations were found between SEP and well-being measured as sense of coherence, social circumstances, and quality of life, but not to life satisfaction. Not all separate correlations were significant. Many more significant correlations were found among men than among women. Among men significant effects were found for all four measures of SEP, among women only between cash margin and well-being. Among men income and cash margin were the most important measures of SEP, followed by social class and with education as the least important. CONCLUSION: SEP is important for subjective well-being among elderly, economically oriented measures of SEP more so. SEP are more important for men than for women.

OFF TARGET SPEECH IN AUTOBIOGRAPHICAL NARRATIVES: WANDERING WORDS OR ELABORATIVE ADDITIONS?

J.M. Baron¹, S. Bluck¹, N. Alea², 1. *Psychology, University of Florida, Gainesville, Florida*, 2. *University of West Indies, St. Augustine, Trinidad and Tobago*

Sharing autobiographical stories occurs across the lifespan. The characteristics of shared stories can affect the dynamics of social interactions. In particular, older adults' stories have been found to contain higher levels of off-target speech than younger adults' stories; they contain more speech that is irrelevant or indirectly relevant to the topic. Off-target speech is assumed to degrade the quality of older adults' communication. The aim of the study was to challenge this assumption by asking "What is the specific content of indirectly relevant information provided during story sharing?" Older and younger adults (N = 129) recalled either autobiographical memory stories or standard fictional stories about two everyday topics. Audio-tapes of their open-ended narratives were transcribed (blinded for participant identifiers and speech fillers) and content coded for irrelevant and indirectly relevant information using standard procedures. As expected, older adults produced more off-target information. To assess the content of this "off target" speech, all indirectly relevant speech was reliably coded for three categories that in fact provide useful story asides: (i) world knowledge related to the event, (ii) autobiographical facts about the story characters and (iii) references to related events in the characters' life story. Findings show that older adults produced more autobiographical facts and life story information than younger participants when sharing autobiographical memories, but not when sharing fictional stories. Thus, inclusion of story asides, previously considered off-target speech that degrades older adults' communication, appears to be used strategically by older adults to elaborate their autobiographical narratives.

STRATEGIES AND ACTIVITIES FOR SUCCESSFUL LATER AGING

C.K. Holahan, K.S. Velasquez, *Kinesiology & Health Education, University of Texas at Austin, Austin, Texas*

Although health has improved and disability has lessened for the elderly overall, the challenges of later aging remain significant. The present study investigated self-reported strategies and activities for successful aging in later aging. Participants were 242 members of the Terman Study of the Gifted who responded to an open-ended question across three years asking them to report strategies and activities they find most important in making the most of their aging years. They were average ages of 84 and 86 at the two time points. Up to 5 responses were coded for each participant, with an average of 2 responses at each time. Responses were content coded into 15 categories, which consisted primarily of motivational strategies and activities. The study explored changes in responses over time, gender differences, and variations in responses according to age, perceived health, and life satisfaction. Results showed that motivational strategies emphasized emotion regulation and adaptation, openness and agreeableness, and striving for independence and perseverance under adversity. Activities responses emphasized social relationships, family involvement, productive, intellectual, and leisure activity, and health maintenance. Changes over the three-year time period were consistent with contemporary theories of successful aging, with increased emphasis on emotion regulation and adaptation. Gender differences were evident with higher productive and intellectual activity in men and greater social involvement in women. Perceived health was more strongly related to strategies and activities than age. Life satisfaction was related to life engagement. Results are discussed in terms of their implications for successful later aging.

EFFECT OF INTERNAL ADAPTATION AND EXTERNAL RESOURCES TO PSYCHOLOGICAL WELL-BEING FOR THE DISABLED ELDERLY

H. Hsu, H. Tung, Y. Hsieh, *Asia University, Taichung, Taiwan*

Purpose: This study explored the effect of internal adaptation and external resources to psychological well-being for the disabled elderly. **Methods:** Data were collected by face-to-face interviews of physically disabled elderly, included the institutional and community-based long-term care service users in middle Taiwan. The survey was approved by IRB procedure. 563 persons interviewed and 505 of them completed the survey and met the disability criteria. Structural equation modeling was applied for analysis. Coping strategies and external resources were hypothesized to be related to adaptation difficulty to disability, and further carried their influence on the depressive symptoms and life satisfaction. Exogenous variables included demographics, physical and cognitive function, social support, and self management evaluation. **Results:** Acceptance-action coping strategy would reduce the difficulty of adaptation, but venting-avoidance and seeking-support coping strategies increased the difficulties. External resources reduced the effort of seeking-support coping, and also reduced the adaptation difficulty. People with more adaptation difficulties had more depressive symptoms and less life satisfaction, which means less chance to successful aging. **Discussion:** Engagement coping strategies and external resources are positive for the adaptation to disability, and therefore increase the opportunity of successful aging for the disabled elderly.

COPING WITH ADVERSITIES TO MAINTAIN AN EXERCISE PROGRAM AS A FUNCTION OF AGE

E. Entin¹, E. Entin², P.L. Entin³, 1. *Aptima, Inc., Woburn, Massachusetts*, 2. *Aptima, Inc, Woburn, Massachusetts*, 3. *Northern Arizona University, Flagstaff, Arizona*

To maintain a vigorous exercise program like running it is sometimes necessary to overcome disincentives such as physical adversities of varying severities. In accordance with the self-efficacy literature we hypothesized that individuals high in self-efficacy cope with such adversities more than those low in self-efficacy. We also maintain that commitment to an exercise program will over time, accrue psychological benefits similar to that of high self-efficacy due to mastery experiences. Thus, we predicted older runners, regardless of their level of self-efficacy, will cope with adversities on a level similar to younger, high self-efficacy runners. Results were derived from an internet survey of 565 runners ranging in age from 18 to 70. Congruent with the commitment position, younger runners high in self-efficacy reported a significantly greater adherence to running than those low in self-efficacy, whereas, all older runners reported adherence levels on par with the younger high self-efficacy runners. As predicted, high self-efficacy consistently aided younger runners to cope with physical adversities (e.g., aches, pains, illness) and poor running conditions (e.g., bad weather) significantly more than those low in self-efficacy. Self-efficacy did not appear to impact older runners as all older runners coped with adversities at a level equal to high self-efficacy younger runners. Our results imply that if individuals can be persuaded to maintain an exercise program long enough, in time they will develop necessary coping skills to overcome adversities that might weaken their commitment and thereby reap the benefits of continued vigorous exercise.

MEASURING EXISTENTIAL REGRET IN OLDER ADULTS: THE DEVELOPMENT AND VALIDATION OF THE MULTIDIMENSIONAL EXISTENTIAL REGRET INVENTORY (MERI)

S.E. White-Truckle, G.T. Reker, *Psychology, Trent University, Peterborough, Ontario, Canada*

The role of existential regrets in the lives of older adults is extremely important to recognize. Existential regret is a state of despair, guilt, and anxiety experienced over missed opportunities and failures to actu-

alize personal and interpersonal potentials in life. Given the absence of a reliable and valid measure of the construct, this study reports on the development and psychometric properties of a 50-item Multidimensional Existential Regret Inventory (MERI), with data collected from 106 community residing elderly. Item analysis resulted in the retention of 46 items and an exploratory principal components factor analysis uncovered 5 factors (60% of variance): Inner Struggle, Limits on Experience, Neglecting Others, Self-Deprecation, and Undoing the Past. Secondary qualitative analyses of responses to an open-ended question, "Do you have any regrets in life?" clearly confirmed the content validity of each MERI dimension. Regarding psychometric properties, the MERI and MERI subscales demonstrated good internal consistency. In support of construct validity, the MERI correlated positively with existential guilt, existential vacuum, depression, and a compromised health status, and negatively with personal meaning, death acceptance, self-forgiveness, personal responsibility, secondary control, and life satisfaction. The MERI showed some overlap with a measure of socially desirable responding. No significant differences on the MERI and the MERI subscales were found for gender, age, marital status, and living arrangements. Overall, the MERI shows promise as a useful tool for examining the impact of existential regret on the well-being and successful aging of older adults.

CONCEPTUALIZING AND OPERATIONALIZING HEALTH IN LONGITUDINAL RESEARCH ON AGING

C. Sparks¹, D.E. Bontempo¹, A. Piccinin¹, A. Spiro², S.M. Hofer¹, *1. Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. VA Medical Center, Boston, Massachusetts*

"Usual", "Healthy", "Optimal", and "Successful" aging are multi-dimensional concepts that can include physical and cognitive functioning, engagement, activity, and social relating in addition to health. However, no clear consensus exists on the operationalization of these concepts, or even on the basic terminology. Very little has been done to review operationalizations of these concepts in existing research, nor has the degree to which these constructs overlap benefited from systematic treatment. Our work takes operationalizations of healthy aging tabulated in Depp & Jeste's 2006 review (Definitions and predictors of successful aging: A comprehensive review of larger quantitative studies) and considers them in the context of existing longitudinal studies of aging associated with the Integrative Analysis of Longitudinal Studies of Aging (IALSA) research network. We examine the potential to replicate various operationalizations in each IALSA study. We also present graphic representations of a measurement model that treats these terms as nested, and facilitates consideration of how "healthy" aging concepts might apply at the individual and population levels.

EFFECTIVENESS OF NINTENDO BRAIN AGE IN PREVENTING COGNITIVE DECLINE IN MIDDLE-AGED AND OLDER ADULTS

D.K. Nadorff, J.H. Patrick, D. Tucker, *West Virginia University, Morgantown, West Virginia*

Effective cognitive interventions are those that delay decline or result in improvement, are convenient for participants to use, and adjust with increasing novelty and demand (Willis et al.). Several companies are now offering computerized tasks designed to provide the daily mental stimulation thought to slow cognitive decline, such as the Nintendo Brain Age programs. Preliminary work (Patrick et al.) suggests that these tasks offer an ecologically-valid approach to assessing cognitive performance. Although these programs may present fewer participant demands than lab-based intervention protocols, their effectiveness remains untested. The goal of the current study was to assess whether or not participants of the Nintendo Brain Age 1 and Brain Age 2 videogames would show cognitive improvement on a variety of psychometric tasks, such as Digits Backward, Trail-Making task, Raven's Matrices, and Digit-Symbol Coding tasks. Pilot study data were collected for five middle-aged adults

(M age = 54.0 yr, SD = 2.6), who completed baseline psychometric tests, played Brain Age 2 tasks daily for 14 days, and then completed post-test psychometrics. Results indicated a decrease in total Brain Age scores between pre- and post-test [$t(4) = 5.78, p < .01$], as well as a trend toward increased Digit Symbol Coding scores, working memory task scores, and decreased latencies for the TMT and Raven's Matrices tasks. Ongoing field work continues to address the effectiveness of handheld videogames as a cognitive intervention for middle-aged and older adults.

CORRELATES OF HEALTHY AGING AMONG OLDER ADULTS WITHOUT A HIGH SCHOOL DIPLOMA

S.J. McLaughlin¹, C.M. Connell², *1. Health & Disability Research Institute, Boston University School of Public Health, Boston, Massachusetts, 2. University of Michigan School of Public Health, Ann Arbor, Michigan*

Education is associated with health, with those with lower levels of education typically experiencing worse health outcomes than those with higher levels. Despite their elevated risk of poor health, some individuals with little formal education experience good health in older adulthood. To characterize those who maintain their health in the face of many presumed obstacles, we examined demographic and behavioral correlates of healthy aging among 2,782 older adults without a high school diploma (weighted characteristics: 57% female, 71% White, 47% married, median age = 76) who participated in the 2004 wave of the Health and Retirement Study. Healthy aging was defined as absence of major disease, disability, cognitive impairment, and depression. Correlates included age, years of education, gender, marital status, race, wealth, BMI, physical activity, and smoking and drinking status. Using logistic regression, healthy aging was regressed on each potential correlate individually and then simultaneously. Approximately 18% of participants experienced healthy aging. In adjusted models, the odds of healthy aging decreased with advancing age ($OR=0.95, p < .0001$) and were lower for those with less wealth ($OR=0.43, p < .0001$ for lowest vs. highest quartile). The odds increased with greater years of education ($OR=1.09, p < .0001$). Contrary to expectations, adjusted odds of healthy aging were higher among Blacks ($OR=1.51, p < .01$) and Hispanics ($OR=1.76, p < .05$) than Whites. Obesity, physical inactivity, and smoking were associated with reduced odds. An understanding of factors associated with healthy aging among those at high risk of negative health outcomes can inform efforts to reduce health disparities.

EFFECTS OF NEIGHBORHOOD SES ON FUNCTIONAL ABILITIES: TESTING THE ENVIRONMENTAL DOCILITY HYPOTHESIS

R.A. Pruchno¹, F.P. Cartwright¹, M. Rose², M. Wilson-Genderson¹, *1. New Jersey Institute for Successful Aging, University of Medicine & Dentistry School of Osteopathic Medicine, Stratford, New Jersey, 2. Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

The effects of neighborhood characteristics on health, above and beyond individual characteristics, have long been debated. Yet, this line of research largely has lacked theoretical grounding. Lawton's environmental docility hypothesis, which posits that environments should have their greatest effects on persons in moderate health, is tested. Data derive from 5,688 community-dwelling people aged 50 to 74 living in New Jersey recruited to participate in the ORANJ BOWL panel using random digit dial sampling procedures. The effects of neighborhood SES (normalized index of disadvantage) on the functional abilities of older persons with three levels of chronic conditions were examined. Group 1 included people who reported 0, 1, or 2 chronic medical conditions, Group 2 reported between 3 and 5 chronic conditions, and Group 3 reported 6 or more conditions. Predictors included individual education, household income, and neighborhood SES. Results of linear regression analyses were supportive of the environmental docility hypothesis. For both Group 1 ($Beta = .01$) and Group 3 ($Beta = -.04$), neighborhood SES did not have an independent effect on level of func-

tional abilities, while for Group 2, the effect of neighborhood SES was significant at the .001 level ($Beta = -0.11$). Implications of these results for theory and policy are discussed.

THE EFFECT OF DAILY SLEEP FACTORS ON VITALITY: DOES GLOBAL SLEEP QUALITY MATTER?

M.E. Braun, C. Bergeman, *University of Notre Dame, Notre Dame, Indiana*

Poor sleep is related to a decrease in psychological well-being, which can be represented by the subjective feeling of vitality, or the feeling of being alive and alert. In order to better understand this relationship in older adults, 296 subjects, aged 59 to 75, from the Notre Dame Study of Health and Well-Being completed the Pittsburgh Quality of Sleep Index to measure global quality of sleep and 56 consecutive days of daily quality of sleep items (i.e., waking rested, having trouble sleeping, and waking with pain). This study examined how daily quality of sleep affected daily vitality, and the function of global quality of sleep on this relationship. Although waking feeling rested increased daily vitality, and having trouble sleeping decreased vitality, these relationships were not moderated by global sleep quality. The relationship between daily vitality and daily pain, however, was moderated by global quality of sleep, such that when greater waking pain was reported, the daily level of vitality decreased. In addition, those who reported better global sleep quality also reported higher levels of vitality on a day when waking with less pain. Thus, those reporting the best global sleep quality, showed the steepest decline in daily vitality when waking with increased pain. The identification of these relationships is an important step in better understanding mechanisms that influence the relationship between sleep and well-being outcomes in older adults.

HEALTH AND SOCIAL SUPPORT AMONG CENTENARIANS

M.S. Heinz, L. Temple, P. Martin, L. Alekel, D. Russell, *Iowa State University, Ames, Iowa*

Previous studies have demonstrated that health and social support are important predictors of longevity. The purpose of this study was to examine the effect of social support on health among centenarians. The sample consisted of 138 Midwestern centenarians. About twenty-five percent of the centenarians were living independently, and seventy-five percent of centenarians were living in a care facility. For measurements of health, data on BMI, subjective health questions, and the Mini-Nutritional Assessment were used. To measure social support, the Social Provisions Scale was used with the focus on the subdimensions "guidance" and "reliability." Results indicate that, after controlling for BMI, participants with higher self-rated health were less likely to need assistance eating, $r = .30$, $p < .01$. Furthermore, when asked subjective health comparison questions, centenarians rated their health higher when comparing themselves with others, $r = .24$, $p < .05$. Centenarians who reported weight loss in the last three months also reported having nutritional problems, $r = -.24$, $p < .05$. Living independently was correlated with not needing assistance to eat, $r = .25$, $p < .05$. Centenarians who rated their health better also were more likely to live independently, $r = .26$, $p < .05$, reported no nutritional problems, $r = .22$, $p < .05$, reported there were more people in their lives they could rely on, $r = .23$, $p < .05$ and reported that they received more guidance from others, $r = .25$, $p < .05$. The main finding of the study shows centenarians with higher ratings of social support measures also had higher ratings on comparative subjective health questions, suggesting a positive association between health and social support.

SESSION 665 (SYMPOSIUM)

UNDERSTANDING THE MEANINGS OF STIGMA IN SENIOR LIVING COMMUNITIES

Chair: J.K. Eckert, *Center for Aging Studies, University of Maryland, Baltimore County, Baltimore, Maryland*

Discussant: P. Carder, *Portland State University, Portland, Oregon*

Stigma and the Cultural Context of Residential Settings for the Elderly is a large-scale, ethnographic study examining the experience and social construction of stigma in seven residential senior housing settings in the Eastern Mid-Atlantic region of the United States. Relocation to the variety of specialized, seniors-only housing settings often occurs in connection with stigmatizing circumstances and may simultaneously make stigma more pronounced as residents struggle to control or manage potentially stigmatizing conditions, especially those that might be perceived negatively by others and/or require relocation to a higher level of services. A large Active Adult Community (AAC) and a multi-residential senior housing site comprised of independent apartments, an assisted living community, and a nursing home will be the focus of the symposium. The AAC has approximately 1650 units consisting of single family homes, condominiums, and townhomes located on riverfront property with recreational, cultural, and social activities available through the community association. A community-supported health organization offers a range of services to members. The religiously-affiliated multi-residential site has over 450 units, including nearly 200 independent living apartments, 60 assisted living units, and a 162-bed skilled nursing and rehabilitation center. Residents within the independent living apartments have access to a range of community-based congregate care services, while assisted living and nursing home residents utilize on-campus resources, such as a nurse practitioner and board-certified internist/geriatrician. This symposium will present the analytic strategy employed, as well as research challenges and opportunities in identifying the varied dimensions of stigma in these very different settings.

"WE KNOW WHAT IT MEANS TO SERVE": VOLUNTEERISM AMONG OLDER ADULTS IN SENIOR RESIDENCES

L. Keimig¹, S. Zimmerman², A.D. Peebles¹, 1. *University of Maryland Baltimore County, Baltimore, Maryland*, 2. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Valued as a way to remain active and contribute to society, volunteerism is associated with many positive physical, cognitive, and psychosocial outcomes. This paper explores the volunteer experiences of older adults and their effect on self-identity and relationships. Drawing from in-depth interviews with residents, staff/administrators, and families in three settings, findings indicate that: 1) individuals are concerned about being perceived as unproductive if they do not volunteer; 2) economic considerations relate to volunteer involvement; 3) volunteers are widely admired, but the efforts of particular individuals are at times denigrated; and 4) complex dynamics influence how resources are allocated among volunteer groups, who receives recognition, and who rises to leadership. The politics of volunteerism affect individuals differently, sometimes leading to stress and causing some to relinquish their role while others flourish. Conclusions address what can be done to reduce stigma so that volunteerism leads to meaningful experiences in senior residences.

THE MANY FACES OF STIGMA: THE CASE OF FRED ASTAIRE

A. Frankowski, M.C. Nemec, A.D. Peebles, *UMBC, Baltimore, Maryland*

Stigma is often perceived as dichotomous: individuals actively stigmatize or are stigmatized by others. Our data indicate that the acts of stigmatizing residents in long-term care are more complex, demonstrating that both actions can and do function simultaneously. The focus of this paper is on one case study, Mr. Fred, an independent senior hous-

ing resident (a) who is stigmatized by several residents in his apartment house, (b) who is protected by staff from potential and actual acts of stigmatization by other residents, and (3) who himself discredits neighbors in some of his interaction within his building. This paper highlights the complex ways in which stigma operates in the field, frames this case study in light of the ethnographic data collected to date, further refines the theoretical construct of stigma, and offers implications for future research.

ANALYZING STIGMA: METHODOLOGICAL DEVELOPMENTS AND CHALLENGES

B. Harris-Wallace, J.K. Eckert, S. Goldman, M.C. Nemec, R. Hrybyk, *University of Maryland, Baltimore County, Baltimore, Maryland*

Stigma and the Cultural Context of Residential Settings for the Elderly is a large-scale qualitative study using in-depth ethnographic techniques (e.g., informal and formal interviewing; participant observation, reflected in detailed fieldnotes; document review; and team-centered debriefing sessions) in gathering information to better understand how stigma is defined within the socio-cultural environment of senior housing. The sites studied, which are very different in organizational structure and populations served, represent a variety of multi-level housing settings combining independent living, assisted living, and nursing homes. An interdisciplinary team of researchers developed interview guides for residents, family, and staff; regularly debriefed with the fieldwork team; discussed, and collaboratively-coded emergent concepts and themes from the interviews. This paper will present the analytic strategies employed and unique methodological challenges and opportunities presented by this ambitious large-scale study.

THE STIGMA OF INACTIVITY IN AN ACTIVE ADULT COMMUNITY: "AGE IS REALLY IRRELEVANT"

E. Roth¹, L. Morgan^{1,2}, L. Keimig¹, *1. Center for Aging Studies, UMBC, Baltimore, Maryland, 2. UMBC Sociology, Baltimore, Maryland*

This presentation explores the role physical/cognitive functioning plays in perceived "successful aging" within an active adult community. Our findings indicate how inactivity and social disengagement, not age, are the key stigmatizing factors. Drawing upon interviews with over 30 residents from a long-established active adult setting, we learn how old age is valorized when accompanied with relative good health and sound mind. Admired are those who have triumphed over illness or those who remain active at advanced ages. With well over 50 resident-initiated interest groups, there is a widespread expectation of resident involvement. However, as residents age, their ability to participate in many cases becomes limited. One's own potential disability, cognitive impairment or limitations, are at times feared and met with denial, often leading to a lack of planning for the future; it may also be one reason for the lack of support for the community-supported health services.

STIGMA, FEAR AND HIDING DECLINE IN A SENIOR HOUSING COMMUNITY

M.C. Nemec¹, A. Frankowski¹, D.J. Dobbs², *1. Center for Aging Studies, University of Maryland, Baltimore County (UMBC), Baltimore, Maryland, 2. School of Aging Studies, University of South Florida, Tampa, Florida*

Residents in senior housing, content with their current living environment, are fearful of transitioning to a nursing home. For this paper, we conducted a narrative analysis of ethnographic fieldnotes and interviews with residents, their families, and staff, compiled over a two-year period at one multi-residential senior community. We examine the relationship of stigma, fear, and hiding decline; discuss how it is manifested in everyday experience; and explore its relevance to residents transitioning to other levels of care. Our findings demonstrate that fear and stigma precipitate residents to elicit assistance from neighbors, family, friends, and staff to disguise their decline to prevent a move. Furthermore, the desire to age-in-place and the stigma associated with phys-

ical and/or cognitive decline motivate residents to hide health-related conditions or incidents (i.e., a fall or forgetting to take medication). Implications regarding practices to minimize resident fears about decline will be discussed.

SESSION 670 (PAPER)

USING TECHNOLOGY TOWARD HEALTHY AGING

VIRTUAL VOLUNTEERING, CIVIC ENGAGEMENT AND OLDER ADULTS: A SOCIAL CAPITAL PERSPECTIVE

D. Mukherjee, *Social Work, Southern Illinois University Carbondale, Carbondale, Illinois*

Virtual volunteering is one such phenomenon that refers to performing the act of volunteering from an offsite or remote location through the use of Internet communication technologies. The online nature of volunteering also paved the way for sections of population, whose physical mobility is restricted either by disability or old age, to participate in volunteering. Older adults have the time, knowledge and skills to contribute to many social causes across the world if not restricted by age related mobility issues. There are 75 million baby boomers going to retire in the next two decades and many of them are familiar with the Internet. The recent Pew Internet research (2006) also shows that Internet penetration is growing among older adults. This study offers a conceptualization and preliminary measurement strategy to enhance knowledge on the institutional capacity of virtual volunteer programs to engage older adults. Data were collected from 15 organizations that employ older adults for virtual volunteering (N=121) asking questions related to motivation and sustainability of virtual volunteering by older adults (age range 63-75). A mix method model has been used to collect indepth qualitative interviews with 7 program directors and an online focus group between 12 virtual volunteers to assess the extent of institutional capacity and volunteer motivation and civic engagement on this new kind of volunteering. The paper concludes with discussion on how this could enhance volunteering among baby-boomer retirees and the future possibilities that it could offer to enhance social capital among participating older adults.

PROMOTING OLDER ADULTS' E-HEALTH LITERACY: AN INNOVATIVE PUBLIC LIBRARY PROGRAM

B. Xie¹, J.M. Bugg², *1. College of Information Studies, University of Maryland, College Park, Maryland, 2. Washington University, St. Louis, Missouri*

Improving older adults' e-health literacy, or the ability to obtain, process, and use electronic health information, requires innovative interventions that effectively integrate the different resources and expertise of organizations at all levels. We first report the background, development, successes, and challenges of such an intervention, which represents a novel and fruitful collaboration among local public libraries and senior centers, a Library and Information Science academic program at a state university, and the National Library of Medicine and National Institute on Aging of the National Institutes of Health. Next, we report key findings of Phase One (September 2007-July 2008) and Phase Two (September 2008-May 2009) of this intervention. During Phase One, 131 older adults aged 54-89 (Mean=68.9, SD=8.0) participated in the 4-week long training and completed the questionnaires. Key findings include: a) participants had overwhelmingly positive perceptions of the training program; b) after learning about the NIH SeniorHealth and MedlinePlus websites from the training, many participants started using these online resources to find high quality health information and even to guide their health decision making; and c) computer anxiety significantly decreased ($p < .001$) while computer interest and efficacy significantly increased ($p = .001$ and $p < .001$, respectively) from pre- to post-training, suggesting statistically significant improvements in computer attitudes between pre- and post-training.

During Phase Two, objective measures were added to assess participants' improvements in e-health literacy skills and knowledge. Finally, we discuss the implications for organizations interested in developing innovative interventions to improve the e-health literacy of the older population.

END-USER PERSPECTIVES ON PRIVACY AND OTHER TRADE-OFFS IN ACCEPTANCE OF QUALITY OF LIFE TECHNOLOGY

S. Beach¹, R. Schulz¹, J. Downs², J. Matthews¹, K. Seelman¹, B. Barron¹, L. Person Mecca¹, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Carnegie Mellon University, Pittsburgh, Pennsylvania*

Technology aimed at enhancing function and enabling independent living among older and disabled adults is a growing field of research. Privacy concerns are a potential barrier to adoption of such technology. Other potential barriers include reduced efficiency of QoLT relative to a human attendant, training and maintenance requirements, and reduced opportunities for social interaction. This paper reports data on these issues from two surveys of potential end-users: 1) a national web survey of disabled and non-disabled older adults (65+) and baby boomers (45-64); and 2) a mail survey of gerontology, stroke, and wheelchair user research registry members. The national web survey showed that potential users were least accepting of sharing or recording information about toileting behavior; sharing information with the government and insurance companies; and recording the information using video (versus sensors). Respondents who reported current disability were significantly more accepting of sharing and recording of information than non-disabled adults. Preliminary results from the registry survey also showed reduced acceptance for video monitoring, as well as technology that: 1) takes twice as long to perform tasks as a human attendant; 2) requires 5-10 hours to learn how to use; and 3) requires about one hour of maintenance per day. Potential end users were least accepting of technology that reduced their opportunities for social interaction. These data provide initial evidence for implicit trade-offs involved in the adoption of quality of life technology, and have important implications for the design of QoLT applications.

A NEW TOOL TO MEASURE LIGHT EXPOSURE, ACTIVITY, AND CIRCADIAN DISRUPTION IN OLDER ADULTS

M. Figueiro, M.S. Rea, *Lighting Research Center, Rensselaer Polytechnic Institute, Troy, New York*

Aims: Sleep disturbances in older adults may be a result of lack of entrainment to the 24-hr day-night cycle due to low circadian light stimulus experienced by older adults. Light treatment, however, will not be embraced by clinicians until the relationship between sleep disturbances, circadian disruption and light exposures is established in the field. Several measurement problems exist for obtaining human circadian light-exposure data relevant to understanding how light therapy can improve sleep disturbances in older adults. Currently, activity and light data are collected using an uncalibrated wrist actigraph. **Methods:** Presented here is an overview of the recently developed Daysimeter, a personal device for recording activity and circadian light-exposure patterns. The Daysimeter is a head-worn device that places a photopic and a blue sensor near the plane of the person's cornea. Post-processing analyses using the model of human circadian phototransduction developed is used to estimate circadian stimulus (CS). **Data analyses:** Phasor analysis was used to quantify circadian entrainment and disruption using the circadian light-dark and rest-activity data from the Daysimeter. Correlations between rest-activity patterns obtained with the Daysimeter and the wrist actigraph were performed. **Results:** The correlation between activity data obtained with the wrist actigraph and the Daysimeter were high. **Conclusions:** The Daysimeter is a tool that can be used to increase efficacy of light treatment for sleep disorders in older adults. Data using the Daysimeter in older adults are needed to further the understanding

of how light and circadian entrainment can reduce sleep disturbances in older adults.

HEALTHY AGING: OLDER WOMEN'S CLOTHING NEEDS AND THEIR ATTITUDE TOWARD 3D BODY SCANNING TECHNOLOGY

Y. Lee, *Apparel, Educational Studies, & Hospitality Management, Iowa State University, Ames, Iowa*

Because the older segment of the population is increasing proportionately at a greater rate than other segments of the population, attention to their clothing needs and preferences makes sense from a market and human issues perspective. Older consumers complain about the difficulty of finding well-fitting, comfortable clothing in stores, especially in the areas of the shoulders, back, waist, bust, arms and abdomen. Good fit of clothing is vital to an individual's psychological and social well-being; yet finding well-fitting clothing can still be challenging for older women. Previously traditional tape measures were used to assess apparel fit, but now the 3D body scanner has the ability to obtain 3D data from the surface of the human body, providing valuable information to improve garment fit. Body scanning technology is beginning to have many significant uses in the apparel industry that will benefit consumers, such as developing custom-made designs, selecting the best-fitting brand and size of ready-to-wear clothing, and providing virtual try-on of garments sold over the Internet. This research explores older women's clothing needs and their attitude toward 3D body scanning by developing a film of the 3D body scanning process as a consumer information source used for collecting survey and focus group data. This research provides preliminary data that would support future study of emerging technology applications on older consumers' customized clothing shopping opportunities. In addition, potential application of 3D body scanning technology in health prevention, posture modification, and body image for older adult's healthy aging will be discussed.

SESSION 675 (PAPER)

VALUE ADDED?: THE IMPACT OF SOCIAL NETWORKS ON HEALTH

GENDER DIFFERENCES IN RELATIONSHIP QUALITY, SELF-RATED HEALTH, PHYSICAL HEALTH AND DEPRESSIVE SYMPTOMS

D.J. Van Dussen, *Sociology, Anthropology, and Gerontology, Youngstown State University, Youngstown, Ohio*

The current research examines gender differences in perceived emotional relationship quality (PERQ), self-rated health, physical health, and depression. A paper and pencil survey of 720 residents of 4 Continuing Care Retirement Communities was utilized to better understand the interplay of the study variables in the a growing housing choice among older adults. Structural Equation Modeling using random subsample cross validation was used to examine gender differences in this study. Results indicated six domains of PERQ and gender differences between the thoughtless and unwanted advice and informational emotional domains of PERQ and between self-rated health and the rejection domain of PERQ. Gender differences may be due to differing relationship expectations between men and women and their primary sources of support. These findings may help practitioners better understand the different expectations between men and women and their sources of social support. Women and men showed similar and significant associations between self-rated health, physical health, and depression.

A DAY IN THE LIFE: INVESTIGATING OLDER ADULTS' DAILY ACTIVITIES

P. Devereux¹, T. McMullen¹, A. Mburia-Mwalili¹, K.L. Heffner², 1. University of Nevada, Reno, Nevada, 2. University of Rochester, Rochester, New York

Although research on older adults' lives is increasing, much focus is on issues of pathology or loss. Less is known about the daily lives of healthy older adults. The primary objective of this qualitative research is to identify older adults' daily activities and social interaction. Adults age 65 and older (N=73; mean age =76; range 65-89) who resided in the community or a retirement living setting wrote about their planned activities for that day for 15 minutes. Using a grounded theory approach, 3 judges coded the essays for daily activities including interpersonal interactions and health promotion activities. Intraclass correlation for coders = .84; all t-tests for differences between coders NS. The most common activity mentioned were activities of daily living (ADLs) such as bathing, dressing, and eating. ADLs were discussed frequently by each participant (totaling 262 mentions for 73 participants). ADLs negatively correlated with walking ($r=-.26$) and doctor visits ($r=-.33$) and positively with depressive symptoms ($r=.33$). Only 6 participants (8%) mentioned working and 74% mentioned an interpersonal interaction. Overall, there were no significant differences in amount of activities reported between women and men but women reported more interactions with family and service providers, reading, praying, attending exercise groups, and napping. Men reported more yardwork activities. The results indicate that a focus on ADLs when describing one's daily activities may be associated with poorer health status.

INTENTION TO SCREEN AND ENCOURAGEMENT FROM SOCIAL NETWORK MEMBERS: A CROSS-GENERATIONAL PERSPECTIVE

S. Ashida¹, A.V. Wilkinson², L. Koehly¹, 1. NHGRI/NIH, Bethesda, Maryland, 2. The University of Texas M. D. Anderson Cancer Center, Houston, Texas

The interdependence model of social influence and interpersonal communication posits that social interactions partly impact individuals' health behaviors. Studies have documented that screening behaviors and intentions are enhanced through encouragement from healthcare professionals. This study evaluates associations between intentions to screen and the presence of social network members (family and friends) who encourage screening (blood cholesterol, blood pressure, blood sugar). The distinct roles of encouragers from different generations (older, same, and younger) were evaluated. Mexican origin adults (497 individuals from 162 families between 18 and 70 years of age) living in Houston, TX completed surveys regarding family health history, health related behaviors and cognitions, and their social networks. Results of hierarchical regression models show that having at least one same-generation network member who encourages participants to get blood cholesterol screening was associated with a higher intention to screen in the following year ($p \geq .001$), controlling for covariates (e.g., health beliefs, demographic characteristics). This association was stronger among participants in younger age groups (age < 55). For the blood pressure (BP) and blood sugar (BS) screenings, having same-generation (BP: $p=0.005$; BS: $p=0.045$) and older-generation (BP: $p=0.009$; BS: $p=0.008$) network members who encourage these screenings was associated with higher intentions to screen, whereas the presence of younger-generation encourager was not significantly associated. These findings suggest that intergenerational interventions utilizing social influence may be an effective strategy to increase screening behaviors for markers of metabolic syndrome among Mexican origin adults. Older-generation individuals may play an important role in motivating the screening behaviors of their network members.

"IT'S YOUR BADGE OF INCLUSION": AN EXAMINATION OF WOMEN'S SELF-ENHANCEMENT THROUGH INVOLVEMENT IN THE RED HAT SOCIETY

A. Barrett¹, M. Pai², 1. Florida State University, Tallahassee, Florida, 2. Kent State University, Kent, Ohio

One of our cultural mantras regarding aging is the importance of staying active and socially engaged. Although many studies report that people who are more socially integrated — for example, who participate in clubs and other organizations or spend time volunteering — enjoy better health and quality of life, we know little about the mechanisms through which such involvement enhances well-being in later life. Our study addresses this limitation using 56 semi-structured interviews with members of the Red Hat Society — an organization aiming to foster a supportive social network for middle-aged and older women and define aging more positively. Our analyses revealed five processes through which involvement in the group improved the women's self-conceptions and quality of life: (1) countering the invisibility of older women, which improved self-images, in part, by fostering a perception of women's agency in shaping others' views of them; (2) providing frames of reference for their own aging, which involved normalizing their experiences as well as making social comparisons that are either self-enhancing or inspirational; (3) sharing a belief in positive reflected appraisals of the group, which improves self-images of members; (4) promoting the maintenance of youthful identities that are self- and health-enhancing in our culture; and (5) expanding social networks at a stage of life when friendship ties are not only more important to well-being but also more difficult to create and maintain. We discuss the implications of our study for other organizations to which many older adults belong, many of which are — like the Red Hat Society — age and gender-segregated.

SOCIAL ENGAGEMENT AND HEALTH BEHAVIORS AMONG OLDER ADULTS IN THE HEALTH AND RETIREMENT STUDY

J.A. Ailshire, Sociology, University of Michigan, Ann Arbor, Michigan

Healthy behavioral habits are central to maintaining optimal health, and may be particularly important at older ages when health begins to decline for most adults. Prior studies have shown protective effects of social interactions and relationships on physical and mental health. However, we still have a limited understanding of how social interactions come to affect health among older adults. Using data from the 2006 Health and Retirement Study, I examined the role of social engagement on health behaviors among adults age 52 and older. Measures of social participation, social integration, and loneliness were used as indicators of social engagement. Linear regression models (logistic for outcome of smoking), estimated separately for women (N = 4146) and men (N=3035) and controlling for age, race/ethnicity, marital status, education, income, and employment status, were estimated for each of four health behaviors, body mass index (BMI), physical activity, sleep quality, and current smoking status. I found that women reporting higher social participation and integration were more physically active, had better sleep, and were less likely to smoke. In addition, loneliness was associated with higher BMI, less physical activity, and worse sleep among women. I also found that men with higher social participation and integration were more active and less likely to smoke, and men with higher participation also had better sleep. Among men, loneliness was associated with higher BMI, less physical activity, worse sleep, and higher odds of smoking. These results highlight the importance of social engagement for healthy behavioral habits in older adults.

SESSION 680 (SYMPOSIUM)

DEVELOPING A VISION-BASED IN-HOME MONITORING SYSTEM FOR OLDER ADULTS: OVERVIEW AND CHALLENGES

Chair: D. Parker Oliver, *Family and Community Medicine, University of Missouri, Columbia, Missouri*

This symposium will discuss the development of an in-home monitoring system for older adults using vision sensing. Methods to address privacy concerns regarding the use of cameras will also be highlighted. Three papers will be presented, including a hierarchical system for capturing and recognizing falls in the home environment, a calibrated, two-camera system in which a three-dimensional reconstruction is used to extract gait parameters, and a study investigating privacy concerns of older adults using this technology.

OLDER ADULTS' PRIVACY CONSIDERATIONS FOR VISION BASED RECOGNITION METHODS

G. Demiris¹, D. Parker Oliver², M. Skubic², M.J. Rantz², *1. University of Washington, Seattle, Washington, 2. University of Missouri, Columbia, Missouri*

This study aims to explore older adults' privacy considerations for vision-based monitoring systems. Alternative vision-based tools using silhouettes are investigated to address older adults' privacy concerns and willingness to allow such an application to be installed in their residence. Ten residents of an independent retirement community were recruited to participate in a series of normal activity scenarios. These sessions were video-recorded using different image processing and extraction approaches. Follow-up in-depth interviews with participants were conducted after a demonstration of the captured images. Findings indicate that image distortion can alleviate privacy concerns associated with the use of cameras. Participants expressed no privacy concerns with silhouette images and emphasized the importance of anonymity in the video sequences. They furthermore expressed the desire to control system operation by being able to turn a vision-based system off and on, and also determine who has access to the collected information.

VISION-BASED FALL RECOGNITION FOR ELDERS

M. Skubic¹, D. Anderson¹, J.M. Keller¹, M.J. Rantz², M. Aud², *1. Electrical and Computer Engineering Dept., University of Missouri, Columbia, Missouri, 2. Sinclair School of Nursing, University of Missouri, Columbia, Missouri*

Vision sensors represent a rich source of information that can be used to passively monitor activity and falls of elders and do not require the use of wearable sensing devices. In this talk, we describe a hierarchical system for capturing and recognizing elderly falls in the home environment using vision sensing. Privacy of the residents is preserved by not using the raw video, but instead, extracting binary silhouette maps, which represent the pixels a person occupies in an image. Silhouettes acquired from two cameras are used to build a three-dimensional object in voxel space. Linguistic summarizations are built from a sequence of three possible states: upright, on the ground, and in between. These linguistic summarizations are then used for the recognition of falls. One advantage of the hierarchical approach is that the lower level state signals provide a trace of what activity led up to the fall.

AUTOMATIC GAIT ANALYSIS USING VISION-BASED MONITORING

F. Wang, M. Skubic, E. Stone, J. Krampe, W. Dai, T. Banerjee, *University of Missouri, Columbia, Missouri*

In this paper, we will present a method of automatically computing gait parameters including walking speed, step time and step length from a calibrated three-dimensional reconstruction built from multiple cameras. These parameters are validated with an electronic GAITRite walk-

way and a three-dimensional Vicon motion capture system. Using the GAITRite and Vicon systems for validation, excellent agreement is found for walking speed, step time, and step length. The method is then applied and tested in TigerPlace with elderly residents who participated in a study designed to represent normal in-home activities. The technology provides a reliable and quantifiable method of monitoring the gait parameters in a daily normal environment.

SESSION 685 (POSTER)

DISPARITIES AND MINORITY AGING

CULTURAL AND SOCIAL INFLUENCES ON THE DECISION TO HAVE A TOTAL KNEE REPLACEMENT

T. Harrison, *The University of Texas at Austin, Austin, Texas*

Despite evidence suggesting that total joint replacement alleviates symptoms of osteoarthritis fewer women than men and fewer minorities than Non-Hispanic whites elect to have the procedure. The purpose of this in-depth case study was to analyze reasons for not undergoing total joint replacement despite pain, stiffness and limited movement. The participant was one of 24 Mexican American women currently participating in an on-going mixed-method culturally comparative ethnographic study exploring disablement outcomes. Multiple life history interviews, participant observations, surveys, and a life history calendar were used to understand how disablement influenced the life of this 75-year-old Mexican woman with mobility impairment. Life history themes explaining her decision to forego a total knee replacement included: Traditions of Family Healing; Memories of Medical Errors; Life after Past Surgeries; and Living with Bad Knees. This life history demonstrates how larger cultural and social factors influence the individual's medical decision to forego a potentially enabling procedure. This study was supported by a grant from NIH/NINR, R01NR010360.

IS THERE AN ETHNIC DISPARITY IN MORTALITY BETWEEN OLDER MEXICAN AMERICANS AND EUROPEAN AMERICANS?

S. Espinoza^{1,2}, I. Jung¹, H. Hazuda¹, *1. The University of Texas Health Science Center at San Antonio, San Antonio, Texas, 2. South Texas Veterans Health Care System, San Antonio, Texas*

Background: Frailty and diabetes are more prevalent in older Mexican Americans (MAs) than in European Americans (EAs) and are major contributors to mortality. This study examined whether this ethnic difference in risk factors for mortality predicts correspondingly lower survival in MAs. Methods: Subjects were 749 MAs and EAs in the San Antonio Longitudinal Study of Aging, aged 65-74 at baseline, followed an average of 9.9 years. Frailty and diabetes were classified using established criteria. Unadjusted ethnic differences in mortality at the end of follow-up were tested using chi-square. A Cox proportional hazards model estimated the ethnic (MA vs. EA) hazard ratio (HR) for mortality, adjusting for frailty, diabetes, cardiovascular comorbidity, and sociodemographic factors. Baseline ethnic differences in covariates included in the model were tested with chi-square or t-tests, as appropriate. Results: MAs compared with EAs had higher baseline prevalence of frailty (11.3% vs. 7%, $p < 0.05$) and diabetes (33.5% vs. 11.9%, $p < 0.001$). Before adjustment, more MAs than EAs were dead at follow-up (32.7% vs. 25.9%, $p < 0.04$). The adjusted ethnic HR for mortality, however, was non-significant (1.02, 95%CI:0.7-1.49). Nonetheless, both frailty (HR=1.8, 95%CI:1.2-2.71) and diabetes (HR=1.64, 95%CI:1.2-2.71) contributed significantly to increased mortality. Conclusion: In spite of the higher prevalence of known risk factors for mortality among MAs, there was no significant ethnic difference in survival over a 9.9 year follow-up period using a multivariate model. Understanding the underlying reasons for this unexpected finding may provide important insights toward development of creative strategies for promoting healthy aging in both MAs and EAs.

ADAPTING A FAITH-BASED, HEALTHY EATING PROGRAM FOR OLDER AFRICAN AMERICAN CANCER SURVIVORS

K.S. Clay, A. Dimatteo, *School of Social Work, University of Georgia, Athens, Georgia*

Body & Soul is an innovative faith-based dietary and lifestyle intervention for African Americans designed to build on the strengths of African American culture and the Black church as a way to promote increased fruit and vegetable consumption and overall healthy living. Body & Soul has demonstrated that a faith-based health promotion intervention that uses church-wide nutrition activities, self-help educational materials, and motivational interviewing can significantly increase fruit and vegetable intake and decrease fat consumption. Although African American cancer survivors could benefit from access to the Body & Soul intervention, no other study has tested the feasibility of applying this model to cancer survivors. In this presentation, the presenters describe the adaptation of Body & Soul for older African American cancer survivors. First, the development of the original intervention will be described. Next, information about early field research and the steps taken to adapt the intervention to the unique needs of older African American cancer survivors will be explained. Finally, it will be argued that Body & Soul is a highly beneficial and cost-effective approach to nutrition education in older African American cancer survivors. The complete pilot study outcomes will be presented separately.

MEDICARE PART D ENROLLMENT AWARENESS AMONG LOW INCOME AFRICAN-AMERICAN BENEFICIARIES

Y.G. Hipps, R. Socci, *Morehouse School of Medicine, Atlanta, Georgia*

Objective: In 2007, the U. S. Department of Health and Human Services estimated that about 4 million Medicare beneficiaries did not have creditable drug coverage. This study examined the Medicare Part D enrollment awareness and practices of low income African-American beneficiaries aged 65+. Settings: Volunteers were enrolled from community-based senior centers and residences in Fulton and DeKalb Counties, GA focusing on selected zip codes with varying proportions of low income African American Medicare beneficiaries aged 65+. Subjects: Of the 600 individuals outreached, 416 successfully completed the study. Outcome measures: Study participants completed four surveys: Medicare Part D Enrollment Awareness Survey; Short Form-36 (SF-36); and Socioeconomic Survey. A Medicare Part D Enrollment Practices Survey was administered randomly to a representative sample of the study population (n=100). Results: In both the 75+ and 65-74 age groups, despite gaps in enrollment knowledge and awareness, the participants were able to enroll in a Medicare plan with prescription drug coverage. For the 75+ age group, these gaps were associated with increasing age and a lower level of education ($p<0.05$); while for the 65-74 age group, the association was with lower yearly income. For both age groups, the PCS and MCS values from the SF-36 survey were significantly lower than those age groups in the general population. Significant socioeconomic differences were detected between volunteers from Fulton and DeKalb counties. Conclusions: There was a higher degree of health care disparities among the study population than among the general population as well as some comprehension and/or literacy challenges.

SELF-CARE PRODUCTION EXPERIENCES IN ELDER AFRICAN AMERICANS WITH HYPERTENSION AND COGNITIVE DIFFICULTY

K.W. Klymko^{1,2}, N.T. Artinian¹, O. Washington^{1,3}, J. Price⁴, C. Motyka⁵, *1. College of Nursing, Wayne State University, Detroit, Michigan, 2. Physician HealthCare Network, Port Huron, Michigan, 3. Institute of Gerontology, Wayne State University, Detroit, Michigan, 4. Family Health International, Kigali, Rwanda, 5. Oakland University, Rochester, Michigan*

Cognitive decline in elders is associated with difficulties carrying out self-care activities requisite to controlling blood pressure. More

knowledge is needed about elders' experiences in producing hypertension-related self-care. The investigators used Orem's Theory of Self-Care to explore the successful production of hypertension self-care in individuals demonstrating some cognitive dysfunction. A sample of 10 urban elder African Americans was recruited from a larger study. Individuals who had >1 SD from normative means on at least one of seven selected subtests of the Fuld Object Memory Evaluation (FOME) and the MacNeill Lichtenberg Decision Tree (MLDT) tests measuring memory, temporal orientation, or semantic fluency, yet successfully performed dietary or physical activity self-care and/or had controlled BP were eligible to participate. Data were obtained by semi-structured interviews and analyzed by identifying codes and themes. Elders were found to experience difficulties with producing self-care which were characterized by three themes: preparation, monitoring, and evaluation. Self-care production involving overcoming personal and environmental factors were found to be cognitively demanding. Despite 60% of the participants having difficulties with an aspect of cognitive function (i.e., semantic fluency), they were resourceful in using personal strategies such as social connectedness to overcome limitations to produce hypertension-related self-care actions. It was concluded that older adults with hypertension and cognitive difficulties experienced challenges in producing self-care related to blood pressure control. Consideration of initial assessments to include cognitive status, progress in self-care production, environmental supports, and personal strategies used to overcome limitations to self-care production may lead to better health outcomes.

SESSION 690 (PAPER)

END OF LIFE - HS PAPER SESSION

PAIN AND ITS TREATMENT IN OLDER HOSPICE/PALLIATIVE CARE NURSING HOME PATIENTS

J.T. Hanlon^{1,2}, S. Perera¹, M. Sevick^{1,2}, K.L. Rodriguez^{1,2}, E.J. Jaffe^{1,2}, *1. UPITT, Pittsburgh, Pennsylvania, 2. Pittsburgh VAHS, Pittsburgh, Pennsylvania*

The objective of this study was to determine the prevalence of pain, describe its treatment, and determine factors associated with any pain in older patients receiving hospice/palliative care in nursing homes. This cross sectional study included 303 subjects representing 33,413 patients from the 2004 National Nursing Home Survey (91% white, 72% female, 48% aged 85+years). Facility staff were asked if, in the past 7 days, the resident had reported or shown evidence of pain. Medication use data was derived from medication administration records. Information about demographics and health status were derived from Minimum Data Set records. Cancer was the primary diagnosis in only 11.4% of patients. Overall 36.6% had any pain in the previous week. Among those with any pain, 86.4% received some analgesic; specifically, 65.5% received opioids whereas 31.7% received acetaminophen. Those with any pain compared to those without pain had shorter lengths of stay (114 days vs. 156 days, $p<0.01$), and were more likely to have a pressure ulcer (26.3% vs. 15.7%, $p=0.02$), and be incontinent of bowel (40.7% vs. 24.9%, $p<0.01$) and bladder (31.4% vs. 20.5%, $p=0.03$). Pain symptoms were present in over one-third of older nursing home hospice/palliative care patients despite the use of opioids in two-thirds of those with any pain.

AN INTERDISCIPLINARY PROACTIVE PALLIATIVE CARE INTERVENTION: A CREATIVE APPROACH TO END OF LIFE CARE

M. Quinn¹, S. Kolomer², G. Fidel¹, M. LaRocca-Pitts³, B. Tyler⁴, C. Berding¹, S. Adams¹, J. Andrews³, 1. *School of Nursing, Medical College of Georgia, Athens, Georgia*, 2. *University of Georgia School of Social Work, Athens, Georgia*, 3. *Athens Regional Medical Center, Athens, Georgia*, 4. *Georgia Health Decisions, Atlanta, Georgia*

The Agency for Healthcare Research and Quality (2003) summarizes vast unmet needs in palliative care and advance care planning. Interdisciplinary teams offer effective and humane strategies to assist patients and their families at the end of life in the acute care environment. However, early intervention in the community in the form of interdisciplinary proactive palliative care (IPPC) may yield even greater benefits. The purpose of this study is to examine the feasibility of an IPPC intervention. The IPPC intervention consisted of the inclusion of advance care planning stations at interdisciplinary senior center health fairs, along with traditional stations such as blood pressure screening. The intervention was developed by an interdisciplinary team including gerontological nursing and social work faculty, a community advocate, a palliative care nurse and a board certified chaplain. The Critical Conditions Planning Guide was used as the advance care planning tool. Process evaluation was conducted by the interdisciplinary team. The results indicate that the IPPC intervention is feasible. Barriers included participants' unfamiliarity with the term advance directives and advance care planning, as well as the logistic placement of the advance directive station. The holistic approach was a strength of the intervention. Based on these findings, IPPC teams show promise in providing palliative care in the community. IPPC, comprised of advance care planning in the community, prior to the typical crisis that families and clinicians face in the hospital setting may be an effective method of providing end-of-life care.

THE EFFECTS OF EARLY PALLIATIVE CARE INTERVENTION ON REDUCTION OF HOSPITAL ADMISSIONS, INTENSITY OF INPATIENT CARE, AND INPATIENT MORTALITY

A. Brody^{1,2}, J. Newman^{2,3}, A. Lasher⁴, R. Serrahn⁴, 1. *UCSF School of Nursing, San Francisco, California*, 2. *Sutter Health Institute for Research and Education, San Francisco, California*, 3. *UCSF Institute for Health and Aging, San Francisco, California*, 4. *California Pacific Medical Center, San Francisco, California*

Patients with advanced illness often come to the emergency room (ER) when symptoms become too difficult to manage at home. Typically, these patients receive little advance care planning and are often placed on an aggressive treatment pathway in the ER. They therefore have high rates of inpatient utilization and mortality. This prospective study examined the effects of training ER clinicians to identify patients appropriate for consultation by the inpatient palliative care team (PCT) and in performing basic palliative care (PC) services. All patients admitted to two non-profit urban hospitals from the ER over a 1 year period were included in this study. Preliminary results found that of the 847 admissions, 35% of patients appropriate for PC received a referral. 50% of those who should have been referred were not because they were admitted on off hours when the PCT was unavailable. 6.7% of patients referred to the PCT in the ER had admissions avoided and were discharged home on hospice, and 40% were admitted directly to the acute PC unit. Of those patients admitted, those who were referred to the PCT in the ER had a shorter length of stay than those who should have been referred (11.1 days vs 3.7, $p < .0001$). This study shows that ER clinicians can appropriately identify and refer patients for PC, reducing admissions or the intensity of care, and improving quality of life for this complex patient population. However, PCT availability limited a large proportion of consults from occurring until later in the patient stay.

MEDICAL END-OF-LIFE DECISIONS BY MISSOURI PHYSICIANS

D.R. Mehr¹, P. Tatum¹, D. Vinson¹, W. Davis¹, J. Tulskey², P.G. Peters¹, 1. *Family and Community Medicine, University of Missouri, Columbia, Missouri*, 2. *Duke University, Durham, North Carolina*

Physicians, patients, and families frequently are faced with difficult end-of-life decisions. Following European methodology not previously used in the United States, we identified recent deaths from Missouri electronic death-certificate files and surveyed certifying physicians. We asked about end-of-life decisions that might have shortened life by: (1) withholding or withdrawing treatments (e.g., mechanical ventilation); (2) increasing medication to control pain or other symptoms; or (3) prescribing or administering medication with the intent of ending life (physician-assisted death). Studying 2203 deaths from the last quarter of 2005, we obtained 704 responses from physicians to anonymous mailed questionnaires. Adjusting for sampling and non-response, physicians reported that 56% of deaths involved end-of-life decisions, including 13% non-treatment decisions, 43% medication use to alleviate pain or suffering with possible life shortening, and 1% (8 deaths) physician assisted dying. In half of these 8 cases, physicians indicated that life was shortened less than 24 hours. Moreover, Missouri physicians were twice as likely to report possible life shortening by increased medications to alleviate pain or symptoms as Europeans. Opioids were by far the most commonly reported drug used. In only 10-13% of cases was life shortening estimated at more than 4 weeks. In 72% of competent patients and 68% of incompetent patients, decisions were discussed with the patient or family members, respectively. In conclusion, medical end-of-life decisions are common, and Missouri physicians may be excessively labeling treatment as either life-terminating or potentially life shortening, which might adversely limit appropriate palliative care at the end of life.

OUTCOME OF PALLIATIVE CARE SERVICES IN THE INTENSIVE CARE UNIT

J. Yoo^{1,2}, S. Nakagawa³, Y. Chang³, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *VA Ann Arbor Health System, Ann Arbor, Michigan*, 3. *Cleveland Clinic Foundation, Cleveland, Ohio*

Introduction: Palliative medicine is the discipline of medicine where clinical as well as social, cultural and holistic approach meet. However, the financial impact of palliative medicine is not clear. We studied the financial aspects of patient care in the ICU following the establishment of palliative care services and formal residents' rotation. Methods: A retrospective, longitudinal descriptive method was used. Inclusion criteria were age 65 years older, initial admission to the ICU, and co-morbidities numbering 5 or more by ICD-9. The main outcome was total expenditure and length of stay during their hospitalizations. A total of 1,125 patients were enrolled. Periods were divided into two groups: Pre-educational Era (PE: August 2004 to July 2005, $n=620$), and Educational Era (EE: July 2006 to May 2007, $n=505$). During EE, medical residents' integrated curriculum included monthly rotation of inpatient consultation services, multidisciplinary noon conferences of palliative medicine every two months, and interactive web-based communications between medical residents and palliative care team. Results: By implementing palliative care services in the ICU of Huron Hospital, total expenditure per patient were saved 20.0%, \$ 9,905.71 ($p = 0.011$), daily cost saving per patient was \$ 1,132.08. LOS per patient were saved 13.5%, 1.36 days ($p < 0.001$). Also, palliative care services reduced mortality rate slightly. Conclusion: By introducing palliative care services in a teaching hospital's intensive care unit, financial outcomes improved.

FALLS RISK I

CHRONIC MUSCULOSKELETAL PAIN AND THE INCIDENCE OF FALLS IN AN OLDER POPULATION: THE MOBILIZE BOSTON STUDY

S.G. Leveille^{1,2}, R. Jones^{3,2}, D.K. Kiely³, R. Shmerling^{1,2}, J. Hausdorff^{4,2}, J. Guralnik⁵, L. Lipsitz^{3,1,2}, J. Bean^{6,2}, *1. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Hebrew SeniorLife, Boston, Massachusetts, 4. Tel-Aviv Sourasky Medical Center, Tel-Aviv, Israel, 5. National Institute on Aging, Bethesda, Maryland, 6. Spaulding Rehabilitation Hospital, Boston, Massachusetts*

Chronic pain and falls are two highly prevalent and disabling geriatric conditions. Little is known about fall risk related to pain in older adults. The MOBILIZE Boston Study is a population-based longitudinal study of novel risk factors for falls in community-living adults aged >70y. Participants (n=749) recorded falls on monthly calendar postcards. Baseline home interviews and clinic exams collected extensive information on traditional fall risk factors, joint pain (hands/wrists, shoulders, back, hips, knees and feet), pain severity and pain interference with activities (Brief Pain Inventory). We used multivariable negative binomial models to determine incidence rate ratios (IRR) for falls during the 18-month follow-up; covariates included sociodemographics, fall risk factors, medications, mobility performance, and osteoarthritis by clinical criteria. Persons who had more locations of pain, more severe pain, or disabling pain had higher rates of falls [age-adjusted fall rates: 1.2 falls/person-year (p-yr) for >2 sites of joint pain, 0.9 falls/p-yr for single site pain, and 0.8 falls/p-yr for no joint pain]. Persons who had >2 pain sites (IRR=1.55, 95%CI 1.18-2.02), those in the highest tertiles of pain severity (IRR=1.57, 95%CI 1.15-2.15) and pain interference (IRR=1.62, 95%CI 1.21-2.18) had the highest risk for falls, compared to their peers with no pain or in the lowest tertiles of pain scales. In conclusion, chronic pain measured according to number of locations, severity or pain interference with daily activity, increased risk for falls in older persons. Greater attention to prevention and management of chronic pain could have important benefits for fall prevention.

BERG BALANCE SCALE AND INDOOR FALLS IN COMMUNITY-DWELLING OLDER ADULTS: THE MOBILIZE BOSTON STUDY

U.D. Nguyen^{1,2}, L. Quach¹, J.L. Kelsey³, D. Kiel^{1,2}, A.M. Galica¹, M. Gagnon¹, M. Hannan^{1,2}, *1. Institute for Aging Research Hebrew SeniorLife, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. University of Massachusetts School of Medicine, Worcester, Massachusetts*

The Berg Balance Scale (BBS) is associated with falls in nursing home patients, but its association with falls in community-dwelling older adults is less certain, especially with the clinical cut-point of 45. We examined whether BBS (higher number indicates better balance) predicts indoor falls in the MOBILIZE Boston Study, a population-based cohort of community-dwelling older adults (488 women, 276 men), and whether further subdividing BBS≤45 would better predict falls. We considered baseline BBS continuously (range 0-56), dichotomized at ≤45, and categorized as ≤40, 41-45, >45. We used negative binomial regression to estimate rate ratios (RR) and 95% confidence intervals (CI) for the association of BBS with indoor falls, adjusting for age, history of falls, education, depression, and number of medications. Mean baseline age was 78 years (± 5.4). Mean follow-up was 1.8 years (± 0.7). Average annual falls rates were 0.75 (± 1.0), 0.92 (± 1.8), and 0.35 (± 0.7) for BBS≤40 (n=69), 41-45 (n=57), and >45 (n=638), respectively. Each 5-unit decrease in BBS resulted in a RR of 1.2 (95%CI:1.1,1.3) for falls. Compared with BBS>45, those with BBS≤45 had a RR of 1.7 (95%CI:1.2,2.3), those with BBS of 41-45 had a RR of 1.6

(95%CI:1.1,2.5), and those with BBS≤40 had a RR of 1.7 (95%CI:1.1,2.6). In conclusion, BBS predicted indoor falls regardless of whether BBS was continuous or dichotomized at ≤ 45. Furthermore, those with BBS of 41-45 were as likely to fall as those with BBS≤40. BBS is useful to assess balance and falls risk in community-dwelling older adults.

NURSE'S ATTRIBUTION OF UNDERLYING CAUSES OF FALLS AMONG OLDER ADULT RESIDENTS IN A CCRC

D. Gray-Miceli¹, S.J. Ratcliffe², J. Johnson³, *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. University of Pennsylvania- Center for Biostatistics and Clinical Epidemiology, Philadelphia, Pennsylvania, 3. University of Pennsylvania- School of Medicine, Philadelphia, Pennsylvania*

Over 60 percent of the 1.63 million nursing home (NH) residents fall yearly. Discerning underlying causes of a fall and intervening can prevent additional falls. While falls among older adults occur from multifactorial reasons, current post fall assessment tools used by nurses (RNs) in NHs are limited in explicating root causes. In a prospective study [2004-2007] within a Continuing Care Retirement Community, trained nurses used a 30-item, valid and reliable post fall assessment tool during the intervention year to assess residents. RN assessment included identification of potential fall causes (sub-types) among each fall. SPSS version 7.0 and a Poisson regression analysis were utilized for analysis. Findings: 77 older adults, mean age 89.3 years, experienced 207 falls, 57.1 percent (n=44) were recurrent. Intervention year total falls were reduced by 29.4 percent (p<.001) compared to pre-intervention total falls (n=286). Number of falls/recurrent faller were reduced (p=0.025). Thirty-eight percent (n=79) of falls were injurious: 14 hit their head and 2.8 percent (n=6) died within 1 week post-fall. 193 falls were attributed by RNs to poor safety awareness (75%; n=145), chronicity (64%; n=124), misjudgment (49%; n=96), environment (35%; n=68); behavior (32%; n=62); acute causes (25%; n=48) and/or medication (15%; n=30). We describe resident experiences, physical findings and interventions within fall sub-types.

BODY SWAY AND OUTDOOR MOBILITY LIMITATION AS PREDICTORS FOR RECURRENT INJURIOUS FALLS IN OLDER PEOPLE

S. Sihvonen^{1,2}, P. Saari^{1,2}, E. Heikkinen^{1,2}, T. Rantanen^{1,2}, *1. Health Sciences, University of Jyväskylä, Jyväskylä, Finland, 2. The Finnish Centre for Interdisciplinary Gerontology, Jyväskylä, Finland*

BACKGROUND: Increased body sway predicts an increased risk for falls but the association with recurrent injurious falls remains unclear. The aim of this study was to examine the association of standing body sway with the incidence of physician-diagnosed injurious falls and assess whether self-reported outdoor mobility limitation plays a role in the association. **METHODS:** 415 persons aged 75 and 80 years at baseline underwent force platform balance measurements and reported whether they had limitations in outdoor mobility. Anterior-posterior sway velocity while standing with feet comfortably apart and eyes open was used to categorize participants into groups with low, moderate and high body sway. Information on injurious falls was gathered from hospital and health care centre records for 10 year after baseline. **RESULTS:** During the 10-year follow-up, 231 (56%) participants suffered at least one injurious fall and 100 (24%) subjects had two or more injurious falls. The percent of subjects with recurrent injurious falls was higher among those reporting outdoor mobility limitations compared to those without (30.5% vs. 20.8%). The groups based on body sway did not differ in relation to the incidence of recurrent injurious falls. The group including those with most body sway but no limitations in mobility had the lowest percent of recurrent injurious falls (15.6%). **CONCLUSIONS:** Self-reported limitations in outdoor mobility predicted recurrent injurious falls while standing body sway did not. This may suggest that mobility limitations are more closely related to real-life situations where

injurious falls happen whereas the measurement of sway may represent a physiological aspect of balance control.

RESULTS OF A 7-ITEM KNOWLEDGE/BELIEF QUESTIONNAIRE ON FALL CAUSES FOR HEALTHCARE PROVIDERS

D. Gray-Miceli, *New Jersey Department of Health and Senior Services, Trenton, New Jersey*

A 7-item Knowledge/Belief Questionnaire on Fall Causes for Healthcare Providers (HPs) was constructed to assay HPs knowledge/belief of fall causes in older patients. HPs working knowledge of fall causes can influence their management of older patient falls. Questionnaires were administered pre and post-3 month fall prevention educational intervention delivered to hospital HPs. Respondents answered 7 forced-choice "true/false" statements. Hospitals and HPs were de-identified. Data were recoded to "yes" or "no" responses by a trained assistant and Phi Coefficients were computed on un-paired data. Findings: Prior to workshop A, 115 HPs completed the questionnaire, and following the intervention, prior to Workshop B, 87 HPs completed questionnaires (n=202). Not one participant thought it is important to know why they fell. Percentage of respondents agreeing to the statement "most falls in older adults are accidental" fell 11% from 89% (Workshop A) to 77% (Workshop B; $p<0.02$). Agreement that falls occur by acute illness increased 14% from 89% (Workshop A) to 97% (Workshop B; $p<0.01$). Agreement that falls occur by chronic illness rose by 15% from 83% (Workshop A) to 97% (Workshop B; $p<0.01$). No evidence of a rate change was observed to the statement "falls occur from environmental hazards". Moderate correlations were observed between acute and chronic illnesses causing falls (0.54). Responses to "medications cause falls" were similar to acute illness (0.43) and environment causes" (0.53). HPs knowledge about illnesses as causes of falls increased as beliefs falls are accidental decreased.

SESSION 700 (POSTER)

HEALTH PROMOTION-INTERNATIONAL

RELATIONSHIPS BETWEEN RELIGIOSITY, HEALTH, AND HEALTH PROMOTION BEHAVIORS IN OLDER JAPANESE ADULTS

E. Imamura, C.J. Loveland-Cherry, J. Liang, A. Whall, J. Seng, *University of Michigan, Ann Arbor, Michigan*

The purpose of this study was to identify predictors of older Japanese adults' health promotion behaviors by examining relationships between their religiosity and health status; subjective feelings about health; social support/integration; and health promotion behaviors, including physical activity and alcohol and tobacco use through a secondary analysis of a data set from a study of Japanese elders (Liang et al., 1999). A sample of 1,897 community-dwelling Japanese men and women age 65+ were divided into three age groups: 65-74 (n = 1,054), 75-84 (n = 721), and 85+ (n = 122). Multiple linear regression and logistic regression analyses revealed that religiosity was positively related to chronic health problems, depressive symptoms, being employed, satisfaction with health status, social support, physical activity, number of children, and less memory impairment, being unmarried or widowed, and tobacco use. Results of the Sobel test also identified that religiosity partially mediated gender effects on chronic diseases, depressive symptoms, marital status, and tobacco use. Religiosity also partially mediated age effects on memory impairment, marital status, and the number of children. Mobility partially mediated religiosity effects on alcohol use and tobacco use, and marital status partially mediated religiosity effects on alcohol use and tobacco use. The path model fit the data well after removing insignificant paths and performing modification indices. The model explained 21.5% of the variance in physical activity, 17.8% in alcohol use, and 14.0% in tobacco use. Religiosity

was positively related to physical activity and negatively related to tobacco use, but not to alcohol use.

BARRIERS AND FACILITATORS IN HEALTH-RELATED LEARNING AMONG CHINESE THIRD AGERS

A. Leung¹, D. Leung¹, I. Chi², *1. Department of Nursing Studies, The University of Hong Kong, Hong Kong SAR, China, 2. University of Southern California, Los Angeles, California*

Introduction: Third agers are evidenced as a vulnerable group with lower awareness of self-care and more unhealthy behaviours than others in different ages. This study aims to explore third agers' barriers and facilitators in health-related learning by their educational level. **Methods:** This was a cross-sectional survey conducted from March to June 2005 in Hong Kong. Chi-square tests were employed to examine difference in barriers and facilitators in health-related learning by educational level (3 levels: tertiary, Grade 10-12, \leq Grade 9). Of the 1,625 questionnaires sent out, 800 (49.2%) were returned and 797 were valid for analysis. Results: Of the 797 subjects, 64% were females. Those with tertiary education perceived "no companion" (tertiary, Grade 10-12, \leq Grade 9) (15%, 9%, 8%, $p=.05$) and "too busy" (66%, 38%, 36%, $p<.01$) as the key barriers to health-related learning. On the contrary, those with lower educational level considered "poor memory" (25%, 34%, 31%, $p<.05$), "no financial support" (17%, 32%, 36%, $p<.01$) and "low educational level" (2%, 12%, 26%, $p<.01$) as the barriers. More educated subjects preferred "someone to teach me" in health education (56%, 59%, 42%, $p<.01$) while those with lower educational level considered "having financial support" as the facilitator (33%, 46%, 45%, $p<.01$). **Discussion and Conclusions:** Our results provided useful information on the barriers and facilitators to health-related learning activities among Chinese third agers. Attention should be paid to individuals' educational level and the identified barriers in learning as these might play some roles in affecting their readiness to learn health information.

A COMMUNITY-BASED INTERVENTION FOR PROMOTION OF PHYSICAL ACTIVITY AND GOOD DIETARY HABITS AMONG OLDER ADULTS IN JAPAN

Y. Yoshida¹, S. Kumagai², H. Iwasa¹, H. Yoshida¹, T. Suzuki¹, *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. University of Human Arts and Sciences, Saitama, Japan*

OBJECTIVES: The purpose of this study was to test the efficacy of a community-based intervention program to improve lifestyle among older adults. **METHODS:** A total of 1177 men and women, aged 65 years and over, participated in this study. An intervention program focusing on increasing the frequency of exercise and improving the variety of food consumption was conducted from 2002 to 2003. To assess the effect of the intervention on lifestyle during a 3-year period, follow-up surveys were conducted in 2003 (baseline) and 2006 (follow-up). The effects of the intervention on attitude to physical activity were assessed using multiple logistic regression analyses, and dietary variety scores were assessed using an analysis of covariance with repeated measures. **RESULTS:** After adjustment for confounding factors, the results showed that the intervention independently affected the initiation of physical activity ($P<0.05$), maintenance of physical activity ($P<0.001$) and improve of dietary variety scores ($P<0.001$). **CONCLUSION:** This community-based intervention was shown to promote a healthier lifestyle in older adults after 3 years. Physical activity and a good dietary habit are very important factors for maintenance of independence among the community-dwelling older adults. Therefore, community-based interventions are an efficient way of promoting a healthy lifestyle in older adults.

ASSOCIATION OF BIRTH OUTCOME WITH LONG-TERM SURVIVAL AND GENERAL HEALTH AT OLDER AGES IN CHINA

Y. Zeng^{1,3}, Z. Zhang², T. Xu², E. Ma², D. Gu⁴, F. Zhang⁵, J. Corless¹, *1. Duke University, Durham, North Carolina, 2. Peking Union Medical College Hospital, Beijing, China, 3. Peking University, Beijing, China, 4. Portland State University, Portland, Oregon, 5. Genes, Cognition and Psychosis Program, IRP, NIMH, NIH, Bethesda, Maryland*

Objectives: Almost all previous studies concerning impacts of fetal growth on health outcome in later life did not investigate association of birth outcome with long-term survival of the cohort members. Present study fills in this research gap by estimating the differences in cumulative survival probabilities from birth to older ages between those cohort members who have normal or low birth weight. We also estimate the association of birth weight with presence of the major chronic disease at older ages. **Methods:** The Fixed Attribute Dynamics (FAD) method and multivariate logistic regressions were employed to analyze data from birth records of 11,689 persons born in Beijing in 1921-54 and clinical examinations conducted during 2004-2006 from 2,085 tracked survivors aged 50-83. **Results:** The FAD analysis indicates that normal birth weight is positively and significantly associated with long-term survival from birth to older ages for both men and women, and the association for men is stronger than women. The risk of having at least one clinically diagnosed chronic disease at older ages among those with normal birth weight (≥ 2500 g) is 27.4 percent ($p < 0.1$) lower than those with low birth weight ($< 2,500$ g), controlling for age and gender. After controlling for 12 additional confounding risk factors, the difference is reduced to 13.7 percent ($p < 0.1$). **Conclusion:** Impairments in fetal growth have long-term effects on survival and general health at older ages. To understand the mechanisms of the effects (e.g. direct or indirect through affecting adult socioeconomic status), much more further research are needed.

SESSION 705 (SYMPOSIUM)

LONG LIFE FAMILY STUDY

Chair: *T.T. Perls, Medicine & Geriatrics, Boston University School of Medicine, Boston, Massachusetts*

Discussant: *A.F. Wilson, National Human Genome Research Institute, Bethesda, Maryland*

The NIA-funded Long Life Family Study (LLFS) has enrolled ~500 families (~4,800 subjects) demonstrating extraordinary clustering for exceptional survival. **Age Reporting:** In a subsample of probands, 23% were validated by birth certificate. Linkage of records to old US census records however revealed that the census age was either in agreement (83%) or within one year (98%) of the subject's reported age. **Uniqueness and Ranking of Families:** A means of ranking families according to clustering for extreme old age and availability of alive subjects for study was created. LLFS families were comparable to New England Centenarian Study (NECS) families and demonstrated much greater exceptional longevity than Framingham Heart Study (FHS) families. **Health and Function:** Compared to the FHS and NECS, diabetes, COPD and peripheral artery disease tended to be less common in LLFS. Continuous measures such as HDL and gait speed were higher. Age-specific comparisons showed patterns of differences consistent with a higher peak, later onset of decline or slower rate of change across age in LLFS participants. **Longevity Pathway Phenotypes:** Favorable traits amongst LLFS offspring were quantified and compared against FHS families. Familial healthy aging scores were significantly higher in LLFS offspring than FHS for protection from cancer, CHD, CVA, diabetes, good cognition and other measures. **Apolipoprotein E:** A preliminary study of 241 LLFS probands compared to ~1,000 age-matched referent cohort subjects without familial longevity revealed that the apoE epsilon-4 allele frequency was significantly lower amongst the LLFS probands.

AGE VALIDATION

I. Elo, L. Mykita, *University of Pennsylvania, Philadelphia, Pennsylvania*

Because of possible bias caused by age misreporting in studies of the oldest old in the United States the LLFS has taken steps to validate reported ages of US probands and their siblings. 23% of the probands were verified by a birth certificate. The most common document was a driver's license followed by a passport. Nevertheless, linkage to census records suggests that age reporting among the LLFS subjects is of high quality. Of the 219 probands without a birth certificate, 79% (174) were matched to an early life census record, among whom the census age was either in agreement (83%) or within one year (98%) of the subject's reported age. The high quality of age reporting is likely related to the subjects' relatively high level of education; over 50% had at least high school diploma or a GED and close to 15% had at least a bachelor's degree.

FAMILIAL CLUSTERING OF LONGEVITY PATHWAY PHENOTYPES IN THE LONG LIFE FAMILY STUDY (LLFS)

M.A. Province¹, E. Hadley⁴, M. Barmada¹, N. Schupf², P. Sebastiani⁵, R. Costa², K. Christensen³, E.W. Daw¹, *1. Genetics, Washington University in St Louis, St Louis, Missouri, 2. Columbia University, New York City, New York, 3. University of Southern Denmark, Odense, Denmark, 4. National Institute on Aging, Bethesda, Maryland, 5. Boston University School of Public Health, Boston, Massachusetts*

Objective: Do healthy aging profiles cluster in LLFS offspring? **Background:** Many studies find that children of extreme survivors, such as LLFS parental generation, have more favorable health profiles for their age/sex. **Methods:** We created trait-specific scores, quantifying each family's degree of clustering of favorable trait values, using expected age/sex percentiles from Framingham (FHS). We compare corresponding trait-score distributions between LLFS and age/sex matched FHS offspring (Kolomogorov-Smirnov). **Results:** Familial healthy aging scores were significantly higher in LLFS offspring than FHS for protection from cancer, CHD, CVA, diabetes, and good cognition, pulse-pressure, glucose, cholesterol, HDL and triglycerides ($p < 0.0001$). Multiple favorable traits clustered simultaneously in the same families more often in LLFS (CHD and Cancer protective scores correlated 0.31 in LLFS vs. -0.01 in FHS; 26% of LLFS families in the most protective quartile for 6+ traits simultaneously vs. 15% in FHS). **Conclusions:** LLFS offspring are enriched for familial healthy aging profiles.

HEALTH AND FUNCTION OF PARTICIPANTS IN THE LONG LIFE FAMILY STUDY: A COMPARISON WITH OTHER COHORTS

A.B. Newman¹, N.W. Glynn¹, P. Sebastiani², T.T. Perls³, R. Mayeux⁴, K. Christensen⁵, E. Simonsick⁶, E. Hadley⁶, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Boston University, Boston, Massachusetts, 3. Boston University Medical Center, Boston, Massachusetts, 4. Columbia University, New York, New York, 5. University of Southern Denmark, Odense, Denmark, 6. National Institute on Aging, Bethesda, Maryland*

We recruited families with a history of longevity for the Long Life Family Study (LLFS). To evaluate health and function in LLFS, we compared them to individuals from the Cardiovascular Health Study, the Framingham Heart Study, and the New England Centenarian Study (NECS). We found that diabetes, chronic pulmonary disease and peripheral artery disease tended to be less common in LLFS. Continuous measures showed more consistent differences. Pulse pressure and triglycerides were lower, high density lipids were higher, and a perceptual speed task and gait speed were better in LLFS. Health history was similar between LLFS and the NECS probands, another long-lived cohort. Age-specific comparisons showed patterns of differences that would be consistent with a higher peak, later onset of decline or slower rate of change across age in LLFS participants. These findings suggest several prior-

ity phenotypes for inclusion in future genetic analysis to identify loci contributing to exceptional survival.

A FAMILY LONGEVITY SELECTION SCORE (FLOSS): RANKING SIBSHIPS BY THEIR LONGEVITY AND AVAILABILITY FOR STUDY

P. Sebastiani¹, E. Hadley², M.A. Province⁴, K. Christensen³, W. Rossi², T.T. Perls⁵, A. Ash¹, 1. *Boston University School of Public Health, Boston, Massachusetts*, 2. *National Institute on Aging, Bethesda, Maryland*, 3. *University of Southern Denmark, Odense, Denmark*, 4. *Washington University, St. Louis, Missouri*, 5. *Boston Medical Center, Boston, Massachusetts*

We developed a metric to rank families for selection into a family study of longevity. Our measure, the "Family Longevity Selection Score" (FLOSS), is the sum of two components: (1) an estimated family longevity score built from birth-, gender-, and nation-specific cohort survival probabilities and (2) a bonus for older living sibs. We examined properties of FLOSS-based family rankings using data from three studies: the New England Centenarian Study, the Framingham Heart Study, and screenees for the Long Life Family Study. FLOSS-based selection yields families with exceptional longevity, satisfactory sibship sizes, high ages and numbers of living sibs. Parameters in the FLOSS formula can be tailored for studies of specific populations or age ranges or with different conditions. The first component of the FLOSS also provides a conceptually sound survival measure to characterize exceptional longevity in individuals or families in various types of studies and correlates well with later-observed longevity.

HEALTH AND FUNCTION OF PARTICIPANTS IN THE LONG LIFE FAMILY STUDY: A COMPARISON WITH OTHER COHORTS

A.B. Newman¹, N.W. Glynn¹, P. Sebastiani², T.T. Perls³, R. Mayeux⁵, K. Christensen⁶, E. Simonsick⁴, E. Hadley⁴, 1. *Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*, 2. *Boston University School of Public Health, Boston, Massachusetts*, 3. *Boston University Medical Center, Boston, Massachusetts*, 4. *National Institute on Aging, Bethesda, Maryland*, 5. *Columbia University, New York City, New York*, 6. *University of Southern Denmark, Odense, Denmark*

To evaluate health and function in families of the LLFS, we compared them to individuals from the Cardiovascular Health Study, the Framingham Heart Study, and the New England Centenarian Study (NECS). We found that diabetes, chronic pulmonary disease and peripheral artery disease tended to be less common in LLFS. Continuous measures showed more consistent differences. Pulse pressure and triglycerides were lower, high density lipids were higher, and a perceptual speed task and gait speed were better in LLFS. Health history was similar between LLFS and the NECS probands, another long-lived cohort. Age-specific comparisons showed patterns of differences that would be consistent with a higher peak, later onset of decline or slower rate of change across age in LLFS participants. These findings suggest several priority phenotypes for inclusion in future genetic analysis to identify loci contributing to exceptional survival.

APOLIPOPROTEIN E AND FAMILIAL EXCEPTIONAL LONGEVITY

N. Schupf, R. Mayeux, *Columbia University, New York City, New York*

To compare the likelihood of carrying an Apolipoprotein $\epsilon 4$ or $\epsilon 2$ allele in members of the Long Life Family Study (LLFS) with the likelihood of carrying these alleles in comparison cohorts. The $\epsilon 4$ allele of the gene for Apolipoprotein E (APOE) has been associated with increased mortality and the $\epsilon 2$ allele with decreased mortality, though inconsistently. Methods. We used logistic regression to compare APOE genotype and allele frequencies in Caucasian LLFS probands (n=241)

with similarly aged Caucasians without a family history of longevity (NIA-LOAD, n= 227, WHICAP, n=822). Results. Among LLFS family members, the proportion carrying an $\epsilon 4$ allele was 7.5%, compared with 17.3% among NIA-LOAD controls and 22.6% among WHICAP participants (OR= 0.4, 95% CI, 0.2-0.9). The proportion carrying an $\epsilon 2$ allele was 20.7% compared with 18% and 13.1% of the comparison cohorts (OR=1.2, 95 %CI, 0.7-1.9). Conclusion. These results suggest a role for APOE in familial exceptional longevity

SESSION 710 (SYMPOSIUM)

MINING HIDDEN TREASURES IN MULTIPLE DATA SOURCES

Chair: L. Phillips, *School of Nursing, UCLA, Los Angeles, California*
Discussant: E. Beattie, *Queensland University of Technology, Queensland, Queensland, Australia*

Nursing research with elders designed to build gerontological nursing science is complex because of the heterogeneity of the population, the unnatural settings in which some elders reside, the interdependence of elders and the others who reside with them, and pre-conceived ideas of researchers about the proper "lens" and proper measurement, data collection and analysis techniques. Designing research that accounts for these complexities and also yields valid and credible results is challenging. The objective of this symposium is to describe some of the challenges encountered and lessons learned in designing and implementing a variety of gerontological nursing research projects. The focus will be on raising issues about different ways to approach the design and implementation of projects including measurement and analysis. We will consider biobehavioral data sources as well as those involving narrative data. The first paper will focus on the challenges of collecting bio-specimens from frail elders in nursing home settings and ways these challenges affect the interpretation of results. The second paper will address on the analysis of longitudinal data features ways to analyze biologic and behavioral patterns rather than simply testing for difference in central tendencies. The third paper will focus on issues related to studying end-of-life and the ways context and the "researcher lens" can affect what questions are asked and the conclusions drawn. The final paper will raise some of the issues involved in finding and using archived data both for exploring phenomenon and testing hypotheses.

REFINING BIO-SPECIMEN LINKS TO HEALTH STATUS IN OLDER ADULTS

J. Mentis, *School of Nursing, UCLA, Los Angeles, California*

Analysis of biological specimens, such as saliva and urine, in research with older adults can provide empiric measures of health status. Matching the appropriate specimen to health parameter must consider patient characteristics, such as age, gender, medical diagnoses, and frailty. For example, while urine specific gravity may detect hydration problems in relatively healthy elders, it is not the best measure in frailer, incontinent elders, unless renal function is considered. Is salivary osmolality, a relatively new bio-measure more effective in ascertaining hydration problems in frail elders? The purpose of this presentation is to use data from two different studies; one on the detection of dehydration and another on reducing oral microbes as exemplars to illustrate methods issues in the determination of appropriate bio-measures, collection techniques and analysis issues, when using biological specimens in research with older adults.

CAPTURING THE TOTALITY OF END OF LIFE CONVERSATIONS

M. Cadogan, *UCLA School of Nursing, Los Angeles, California*

End of Life communication has focused predominantly on discussions regarding preferences for treatment and interventions such as cardiopulmonary resuscitation, artificial nutrition and hydration, hospitalization, and ventilator use. These discussions may target current or

future states with the aim of reaching a decision about treatment choices. Less well documented are the methodological issues involved in broader discussions of value based decisions within the context of overall goals of care. Using data from three studies of end of life conversations with nursing home residents, families, and providers, this presentation will examine the effects of timing, language, culture, spirituality, and disease burden on the quality of end of life conversations. Unique aspects of the nursing home environment that contribute to the challenge of data collection and data quality will be highlighted.

UNCOVERING PATTERNS IN BIOBEHAVIORAL LONGITUDINAL DATA

L. Woods, *UCLA, Los Angeles, California*

Behavioral symptoms of dementia (BSD) remain among the most challenging problems faced by elders, clinicians and caregivers with prevalence ranging between 66% to 98%. Understanding the biological basis for these behaviors is crucial for the development of relevant interventions. One limitation to this understanding is the analysis methods used to detect the association between BSD and biological variables. Given the heterogeneity in this vulnerable population, statistical methods that assume linearity over time, when the pattern may be quadratic or cubic, have limited application. Detecting BSD patterns in longitudinal data and mapping these patterns to biological variables that guide interventions continue to challenge researchers. Random effects analysis, allowing individuals different trajectories over time can uncover BSD patterns. This presentation will discuss the use of random effects analysis, with examples, to detect individual BSD patterns and to uncover the association between biological variables, such as cortisol, and BSD in longitudinal data.

DISCOVERING TREASURES IN ARCHIVED DATA

G. Guo, L. Phillips, *School of Nursing, UCLA, Los Angeles, California*

Enormous amounts of data are collected every day by government agencies, university faculty and students, private organizations, and many other agencies. Although each data collection has its specific purposes, the wealth of data available in the public realm provides gerontological nurse researchers a rich source for exploring ideas, and analyzing and testing hypotheses in their own research. This paper focuses on major methodological issues related to using archived data in the public domain. Pros and cons of conducting secondary data analysis will be discussed. Examples will be given to demonstrate challenges and strategies in using archived data.

SESSION 715 (PAPER)

NUTRITION - HS PAPER SESSION

SWALLOWING DYSFUNCTION IS UNRECOGNIZED IN COMMUNITY-DWELLING OLDER ADULTS

S.G. Butler¹, A. Stuart², J. Williamson¹, S. Kritchevsky¹, D. Case¹, C. Rees¹,
1. Wake Forest Univ. School of Medicine, Winston-Salem, North Carolina, 2. East Carolina University, Greenville, North Carolina

Purpose: We recently reported the unexpected finding of silent aspiration (entry of liquids into the airways without a cough reflex) in approximately 30% of community-dwelling adults age > 65 years; whereas, aspiration is rare in young adults. Given the potential implications of this finding for both community-dwelling and dysphagic adults, it was important to determine if our previous findings in community-dwelling older adults were repeatable, and determine factors affecting the prevalence of aspiration. Methods: Community-dwelling older adults (n=14, mean age = 76 years), without a history of neurological disease/insult or swallowing complaints, participated. Penetration Aspiration Scale (PAS) scores were endoscopically assessed as a function of liquid type (water; skim, 2%, & whole milk), delivery method (cup & straw), and bolus volume (5, 10, 15, & 20 ml). Results: Thirty-three percent of the

participants aspirated, and 83% of the aspiration events did not elicit a cough reflex. A repeated measures ANOVA found PAS scores differed significantly by liquid type ($p < .001$) and delivery method ($p = .021$), but not by volume ($p = .089$). In general, PAS scores were higher for milk vs. water and for straw vs. cup drinking. Conclusion: The findings of this study support our previous findings that the proportion of aspiration in community-dwelling adults over 65 years of age was 30% (95% CI, 12%-54%). In addition, older adults who aspirate are more likely to aspirate on milk vs. water and with straw vs. cup drinking. Future investigations placing silent aspiration in a gerontological context are warranted.

DIETARY KETOSIS IMPROVES MEMORY FUNCTION IN MILD COGNITIVE IMPAIRMENT

R. Krikorian¹, S. Benoit¹, D. Clegg², M.D. Shidler¹, K. Dangelo¹, S. Couch¹,
1. Psychiatry, University of Cincinnati, Cincinnati, Ohio, 2. University of Texas Southwestern, Dallas, Texas

The prevalence of Alzheimer's disease (AD) and of obesity and type 2 diabetes are projected to increase dramatically in the near term. Peripheral hyperinsulinemia and accompanying central hypoinsulinemia contribute to neurodegeneration by accelerating beta-amyloid and proinflammatory cytokine expression and by inhibiting long-term potentiation. Recent preliminary data indicated that insulin-sensitizing treatment can improve memory acutely in subjects with AD and Mild Cognitive Impairment (MCI). We reasoned that dietary ketosis might be effective in enhancing memory function by correcting hyperinsulinemia and, possibly, because ketone metabolism itself might be beneficial. We randomly assigned 23 older adults with MCI to a high carbohydrate or very low carbohydrate (< 20g/day), ketogenic diet for six weeks. Body composition, metabolic parameters, and memory and mood measures were obtained before and after the intervention. There was no group difference in demographics, level of memory impairment, or metabolic parameters before the intervention. At the end of the intervention period, we observed significant reductions in weight ($p < .0001$), waist circumference ($p < .0001$), and glucose levels ($p = .03$) for the low carbohydrate group. Furthermore, verbal memory function was significantly improved for the low carbohydrate subjects ($p = .01$). Depressive symptoms were not affected by either diet ($p = .56$). These findings indicate that ketosis induced by very low carbohydrate consumption, even in the short-term, can improve cognitive function in older adults with greater risk for Alzheimer's disease. To our knowledge, this is the first controlled study of ketosis in this population. Further investigation of this intervention is warranted to evaluate its preventive potential and mechanisms of action

THE VALIDITY OF NUTRITION SCREENING INITIATIVE DETERMINE CHECKLIST RESPONSES IN OLDER GEORGIANS

S.J. Sinnett¹, J. Lee¹, R.A. Bengel¹, A. Brown³, A.P. Glass², M. Johnson¹,
1. University of Georgia, Department of Foods and Nutrition, Athens, Georgia, 2. University of Georgia, College of Public Health, Athens, Georgia, 3. Georgia Department of Human Resources, Division of Aging Services, Atlanta, Georgia

The Nutrition Screening Initiative DETERMINE Checklist (NSI) is a tool used nationally to assess nutrition risk in those seeking to participate in the Older Americans Act Nutrition Programs (OAANP). This study examined the ability of the NSI to evaluate nutrition risk status using the data from the Georgia Advanced Performance Outcomes Measures project. We specifically compared the agreements among six NSI and matched question pairs (eating < two meals daily, eating few fruits and vegetables or dairy, eating most meals alone, food security and using three or more medications daily). The study sample includes all new OAANP participants and waitlisted people who completed all NSI items and matching questions in the self-administered survey from July to mid-November, 2008 (n=924, mean age 75.0 ± 9.2 years, 68.8% women,

26.1% black). 94% of our sample provided at least one discordant response (mean 2.1 ± 1.1 responses); questions regarding food intake most frequently yielded discordant responses. All six NSI and matched question pairs showed statistically significant discordance (all $p < 0.01$). Those who were black and living alone were more or less likely to provide mismatched answers, respectively. In particular, food insecure individuals were less likely to provide mismatched answers for food intake questions. This study reinforces findings from previous studies on the limited ability of the NSI to reliably identify older adults at nutritional risk. Further investigation into the cause(s) of discordant responses and validity of these data sources is needed to ensure an accurate assessment of the nutritional status of older Georgians.

THE TRADITIONAL OKINAWA DIET: A UNIQUE NUTRITIONAL APPROACH TO REDUCING RISK FOR AGE ASSOCIATED DISEASE

D. Willcox^{1,2}, Y. Katsumata³, Y. Ohya³, S. Sasaki⁴, K. Zheng³, B. Willcox¹, H. Todoriki³, 1. *Pacific Health Research Institute, Honolulu, Hawaii*, 2. *Okinawa International University, Ginowan, Japan*, 3. *University of the Ryukyus, Nishihara, Japan*, 4. *University of Tokyo, Tokyo, Japan*

Background/Purpose: The people of Okinawa have among the world's longest life expectancies and lowest rates of age associated disease. This healthy aging phenomenon may be linked in part to the low caloric/high nutrient density traditional diet. **Methods:** Randomized cross-over design. Participants were 138 healthy Americans aged 40 to 69 years (average age 50.0 ± 7.2 years old, 51 men and 87 women). For two weeks, participants followed their typical Western style diet, then were randomly assigned to receive four weeks of traditional Okinawa diet. The intervention phase included the provision of specially prepared single-portion vacuum packed meals. **Outcome measures** were multiple and included: cardiovascular risk factors such as blood pressure, and other risk factors for age associated disease, as well as potential indicators of aging related pathology, such as levels of oxidative stress. **Results:** Preliminary results include significant reduction in body weight and decreases in 24 hour urinary excretion of sodium (significance of between group differences ranged from $p=0.032$ to 0.0002). Improvements in blood pressure were also impressive. Systolic and diastolic blood pressure decreased 2.6 mmHg (95% CI -4.3, -1.1), and 2.1 mmHg (95%CI -3.1 -1.0), respectively. Other health indicators are currently under analysis. **Conclusions:** The Okinawa diet, although unique in culinary approach, shares similar nutrient composition and food groups (vegetable rich, low in sodium, saturated, trans, and total fat) with NIH and other scientifically designed healthy dietary regimens. Therefore it may offer a unique, naturally occurring, Pacific(Eastern)nutritional approach to preventing and treating cardiovascular and other age associated diseases.

SESSION 720 (SYMPOSIUM)

BROADENING THE POOL OF SOCIAL WORK FACULTY ENGAGED IN AGING RESEARCH

Chair: C.M. Mehrotra, *The College of St. Scholastica, Duluth, Minnesota*

Discussant: S.M. Stahl, *National Institute on Aging, Bethesda, Maryland*

With support provided by NIH and Hartford Foundation, we have developed a training program to build and sustain a community of social work faculty committed to conducting aging research. Program design includes an initial summer institute, ongoing consultation, a mid-year meeting, and a follow-up institute. Evaluation data indicate that the program has been effective in expanding the pool of faculty members engaged in aging research. Of the 45 participants in the first three cohorts, 31 have been successful in securing research support from agencies such as the National Institute on Aging, National Institute on Drug Abuse, Veterans Administration, Center for Medicare & Medicaid Serv-

ices, and private foundations. The objective of the symposium is to share with the convention audience four examples of research conducted by program participants representing diverse institutions, backgrounds, and research interests. The presenters describe the funding mechanisms they used to secure grant support, outline the activities they have undertaken, present research methods and findings, and discuss implications of their research. The presenters and their topics include: Butler examines how individual, sociocultural and environmental factors affect retention of homecare workers; Davitt focuses on racial/ethnic disparities in home healthcare; Moore assesses the outcomes of a caregivers workshop on communicating with healthcare professionals; and Rosen focuses on providing depression care for older substance abusers at community agencies. They also share their experience with seeking external funding and outline what they learned during this process. Discussion focuses on how similar training programs may be designed to stimulate research in other disciplines.

BUILDING A RESEARCH AGENDA: RACIAL & ETHNIC DISPARITIES IN MEDICARE HOME HEALTH CARE

J.K. Davitt, *School of Social Policy & Practice, University of Pennsylvania, Philadelphia, Pennsylvania*

This research agenda evolved out of earlier work studying changes in access to Medicare home health care after the Balanced Budget Act of 1997 (BBA), which showed that there were racial disparities in use of this benefit post-BBA. Thus arose the focus of a long term research agenda to understand the contributing factors which affect the relationship between race/ethnicity and access to/outcomes of Medicare home health care. This presentation will focus on methods used (secondary analysis with qualitative interviews), strategies for supporting this agenda (foundation funding for preliminary work to NIA-R21 funding), and the resources necessary to successfully pursue a long term research agenda (e.g. initial reviewers, employing methodologists, recruiting consultants). In particular, the presentation will discuss the ability to obtain funding for secondary analysis of existing data, connecting preliminary work to future research phases (connecting the dots of results), and how to build an intervention study.

FINDINGS ON PROVIDING DEPRESSION CARE FOR OLDER ADULT SUBSTANCE ABUSERS AT A COMMUNITY AGENCY

D. Rosen, *Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania*

Depressive disorders among opiate abusers have detrimental effects on their well-being and ability to refrain from illegal drug use. This K-08 Award from the National Institute on Drug Abuse focuses on the adaptation, testing, and delivery of an intervention for older adults with co-occurring substance abuse and depression disorders and the development of a treatment model for older adults into the standard of care offered by substance abuse facilities. Pilot work with older methadone clients identified Problem Solving Therapy (PST) as the most appropriate intervention for this population. PST is an empirically tested treatment approach for older adults for the treatment of depression. The research site is a methadone clinic where a third of the clients are over the age of 50. Results from a randomized clinical trial comparing 40 participants receiving the PST intervention to 40 participants receiving treatment as usual will be presented.

IMPACT OF WORKER AGE ON TURNOVER AMONG HOME CARE WORKERS

S. Butler, *University of Maine/School of Social Work, Orono, Maine*

Maintaining an adequate supply of workers to provide the daily care needed by our nation's elders is a primary challenge in our long-term care system. With a trend toward community-based care, this shortage is particularly severe in home care. Encouraging older workers to enter or remain in this field is one potential solution to this workforce crisis. In order to investigate factors influencing retention and turnover among

personal care attendants in home care and the impact of worker age on these phenomena, funding was secured from the National Institute on Aging through an Academic Research Enhancement Award. This paper will describe the process of securing funding, the research design of this 18-month study, the involvement of social work and nursing students in project activities, and Time 1 survey findings. The influence of respondent age (n=261, mean age=46) on job experience and job tenure will be highlighted and implications discussed.

COMMUNICATING EFFECTIVELY WITH MEDICAL PROFESSIONALS: EVALUATION OF A FAMILY CAREGIVERS CURRICULUM

C.D. Moore, *Skidmore College, Saratoga Springs, New York*

Family caregivers often help patients use and understand health-related information, and provide support before, during, and after medical encounters (Glasser et al. 2001; Prohaska & Glasser, 1996; Silliman et al., 1996). The National Family Caregivers Association developed a standardized workshop curriculum to promote quality communication among medical professionals, family caregivers, and patients: Communicating Effectively with Health Care Professionals. Kurt Freeman (PI) and Crystal Dea Moore (co-PI) were funded by the Pilot Program for Caregiver Assistance (Veterans Health Affairs) in 2007 to evaluate the curriculum. Total funds awarded through 9/30/2009 were \$324,727. Family caregivers of 105 older veterans having a chronic illness were randomized into three conditions: face-to-face workshop, DVD adaptation, or usual care. A pre-test and three-month post-test telephone interview assessed family functioning, caregiver burden, and quality of communication with the veteran's healthcare team. Findings indicate that the curriculum is associated with self-reported increases in health-related communication skills for participants.

SESSION 725 (POSTER)

FINANCIAL SECURITY AND INSURANCE

IMPACT OF PENSION POLICY ON THE SUBJECTIVE WELL-BEING OF OLDER ADULTS: AN ANALYSIS OF LONGITUDINAL MULTI-LEVEL DATA

E. Calvo Bralic¹, C. Mair², 1. *Center for Retirement Research at Boston College, Chestnut Hill, Massachusetts*, 2. *North Carolina State University, Raleigh, North Carolina*

A basic assumption of most social policies is that they will improve well-being. Financial indicators are very informative about the economic well-being of older adults. However, we cannot say that older adults live well if they are in poor health or deem their lives undesirable. This study assesses the influence of old-age public pension policy on the well-being of older adults, with a focus on two outcomes that have been largely overlooked in previous cross-national research on pension policy: variation across countries with respect to subjective health and feelings for older adults. Drawing data from multiple sources, this study created a unique unbalanced panel dataset spanning from 1980 to 2007, and including 360,064 individual-observations across time (level-1), clustered within 256 country-observations across time (level-2), clustered within 101 high, middle, and low-income countries (level-3). Data is analyzed with a multilevel model that focuses on the effect of the level of public pension policy individualization and total public pension expenditures on both health and mental health. The set of predictors also include indicators of cultural values (e.g. traditional/secular and survival/self-expression) and economic prosperity, as they are likely to directly influence well-being of older adults and to moderate the effect of pension policy. Control variables include individuals' characteristics, demographics, living arrangements, and structural characteristics of welfare states.

DETERMINANTS OF WEALTH DECUMULATION IN LATER LIFE: A MULTIDISCIPLINARY PERSPECTIVE

D. Gray, *Gerontology, University of Massachusetts Boston, Arlington, Massachusetts*

Workers are more responsible for their financial security than ever before. The decision to decumulate involves converting assets accumulated in the working years to an income stream in later life. Asset draw down was reviewed from within a single country (United States) as social insurance and medical costs affect elders' consumption decisions. The factors influencing the decision to decumulate are complex and dynamic. Key determinants to consider when devising a wealth decumulation strategy are longevity, inflation, and investment risk. This study examined wealth decumulation by older adults from a multidisciplinary perspective. This multidisciplinary framework is based upon standard economic models of individual choice and expands the determinants of these choices to include social factors that have been neglected in economic analyses. The goal is to produce more powerful models of individual behavior that will provide insights into the ways decumulation decisions are made and change over time.

THE GERMAN LONG-TERM CARE INSURANCE SYSTEM: LESSONS FOR THE UNITED STATES

E. Robbins, *Miami University, Oxford, Ohio*

Like the U.S., Germany must consider financing mechanisms to meet the needs of a growing population of older adults who require long-term care. The long-term care (LTC) insurance system in Germany (Pflegeversicherung), established in 1994, legislates mandatory LTC insurance for all residents. Under this system, public LTC insurance is funded through payroll contributions from employees with employer contributions. Those who opt out of the public system, by meeting strict income criteria, are obligated to purchase private LTC insurance which guarantees at least as much coverage and benefits as the public system. Such a system ensures that a LTC insurance policy covers nearly the entire German population thus, relieving some of the burden on the means-tested social assistance programs. In addition to public records and an extensive literature review, structured interviews with German LTC insurance system experts provide the basis for this study. Although a universal long-term care schema may be far in the future for the U.S., the German system does provide guidelines for establishing alternative financing mechanisms for long-term care. Results of this study indicate that the German system has encountered many of the same issues faced by the U.S. regarding financing long-term care, including resistance to a universal system and degree of payroll contributions. Drawing on the experiences of the German LTC insurance system, the U.S. should move toward a stronger focus on financing community based long-term care as well as ensure that programs are in place to educate and support home caregivers

ASSESSING FINANCIAL SECURITY WITH SUBJECTIVE MARKERS: THE NEGATIVE EFFECT OF NEUROTICISM

Z.D. Gassoumis, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

This research examines the role of neuroticism on subjective assessments of financial security in adults who are retired or approaching retirement. Although subjective financial security (SFS) is being used increasingly in research, few studies use it as a dependent variable. To gain a better understanding of SFS and its precursors, we investigate its structure and how it relates to the personality construct of neuroticism. Financial security in retirement is usually assessed using objective measures: typically, income and wealth. However, this treatment of financial security fails to consider an individual's norms and expectations, which are driven by sociological and psychological phenomena. Thus, researchers are using more measures of SFS to augment the study of financial security in retirement. This study investigates SFS using 7,368 cases from the 2006 Health and Retirement Study (mean

age=65.9, range=52-104). Building on Hershey's retirement security model, structural equation modeling is used to detect a relationship between neuroticism and SFS. Since neuroticism stays fairly stable in aging individuals, the hypothesized directionality is from neuroticism to SFS. The model also includes age, education, income, and wealth to adjust for the effects of these variables on SFS. Several models are compared to identify the best model for ascertaining the effect of neuroticism on SFS. Results suggest that high neuroticism has a negative impact on SFS ($\beta=-0.228$, $t=-19.3$). The final model has good fit, with a RMSEA statistic of 0.0431. These findings can guide future research in the economics of aging, as well as provide insight for financial planning professionals.

THE TYRANNY OF COMPOUNDING EXPENSES: ARE MUTUAL FUND FEES BLEEDING RETIREMENT ACCOUNTS DRY?

S. Neufeld, *Wayne State University, Detroit, Michigan*

The current financial crisis has taken a heavy toll on individuals' retirement savings held in tax deferred accounts such as 401(k) or 403(b) plans. Even before the crisis, these savings were deemed insufficient. The Pension Protection Act (2006) aimed to increase the amount saved by allowing, for example, automatic enrolment, escalation, and investment allocation. However, the problem of low returns on the savings invested in retirement accounts has been largely ignored. A major, mostly unrecognized, obstacle to rebuilding balances in retirement accounts is the fraction of market gains that are skimmed off as mutual fund fees and other expenses. Even over relatively short investment periods, for example the last 20 years, the financial services industry captures the bulk of the market returns – but the investor takes all of the risk. Yet, woefully absent in the financial literature is a detailed analysis of investment returns on retirement savings that takes into account inflation, and actual market and mutual fund performance over many investment horizons. Our analysis shows that investors receive a declining proportion of the gain in equity markets with increasing time horizon. Moreover, investors fare even worse with bond and money market funds. Thus, while shortfalls in the amounts saved for retirement present a problem, a more pressing issue is the returns on savings already invested. We conclude that for retirement security to be ever achieved, major reforms in the governance of tax deferred plans are required. Our recommendations include restricting investments of retirement funds to low-cost (<20bp) index funds.

FACTORS ASSOCIATED WITH LONG-TERM CARE PLANNING AMONG OLDER ADULTS IN THE METROPOLITAN OMAHA, NEBRASKA AREA

P. Quinn, C.M. Kelly, *Gerontology, University of Nebraska at Omaha, Omaha, Nebraska*

Purpose: This study seeks to understand the factors associated with long-term care (LTC) planning by older Nebraskans, in an effort to assist individuals in preparing for their LTC needs (e.g., home and community-based services, assisted living facilities, skilled nursing facilities). The present study was designed to answer two research questions: (1) what distinguishes those who plan for LTC vs. those who do not; and (2) what distinguishes those who intend to pay for LTC themselves vs. those who will depend on public programs (e.g. Medicaid). Methods: Survey data were collected from a stratified random sample of adults age 60 and over ($n=651$) in the six-county greater Omaha metropolitan area. The survey contained a question regarding LTC planning, along with demographic and background items that could potentially explain variation among older adults in planning behavior. Ten explanatory variables were included in the model: age, gender, education, religious affiliation (Catholic vs. not), religious attendance, income, subjective rating of overall health, current functional ability, marital status, and awareness of LTC insurance. Data were analyzed using nested logistic regression models. Results: Findings indicated that those most likely to

have a plan for LTC were female, unmarried, with higher income, and aware of the availability of LTC insurance. Higher income was associated with paying for one's own LTC. Discussion: This research suggests that many older Nebraskans lack accurate information about LTC (available services, costs, payment options), particularly males and low-income elders. Education efforts targeting these populations are needed to address this gap in knowledge.

DISPARITIES IN THE OUT-OF-POCKET FINANCIAL BURDEN OF MEDICAL CARE AMONG RECENTLY-ARRIVED OLDER IMMIGRANTS

S. Choi, *Department of Social Work, State University of New York, Binghamton, Binghamton, New York*

Objective: Recently-arrived older immigrants are likely to be greatly affected by dramatically increasing out-of-pocket (OOP) expenditures for medical care due to their limited insurance options. This study examined disparities in the OOP financial burden of healthcare by immigrant status. Methods: The 2005 Medical Expenditure Panel Survey linked to the 2004 National Health Interview Survey was analyzed guided by the Andersen model. OLS models were tested for four DV's: total and OOP medical expenditures, and the percentage of total expenditure and income spent for OOP payments. Immigrant status (IV) had three categories ($N=3,454$; 65+): 1) late-life immigrants with less than 15 years of residence in US (recent immigrants; $n=77$); 2) longer-term immigrants ($n=392$); and 3) the U.S.-born ($n=2,985$). The SAS survey procedures were used to account for the complex sampling design. Results: The findings indicate no differences in the total and OOP medical expenditures, and the proportion of expenditures paid out-of-pocket across the three groups, after controlling for predisposing (e.g., age, gender, ethnicity), enabling (e.g., insurance status), and need factors (e.g., 12 medical conditions). However, recent immigrants spent a higher proportion of their income for OOP medical payments compared to the U.S.-born ($p=.020$) and longer-term immigrants ($p=.009$). In 2005, OOP medical payments accounted for 18% of recent immigrants' income (median), while it was only 4.6% and 3.9% among the U.S.-born and longer-term immigrants, respectively. Conclusion: Considering the higher OOP financial burden of healthcare among recent immigrants, appropriate policies should be considered (e.g., providing affordable health insurance options).

SESSION 730 (PAPER)

HOUSING

COMMUNITY-BASED LONG-TERM CARE: HOW RESIDENTIAL SETTING AND LIVING ARRANGEMENT INFLUENCE ELDERLY PUERTO RICANS' KNOWLEDGE AND USE OF SERVICE

N.W. Sheehan, M. Guzzardo, *Human Development & Family Studies, University of Connecticut, Storrs, Connecticut*

Despite growing concern, there is relatively little information about the barriers that limit Puerto Rican elders' access to community-based long-term care (LTC) services. The present study, using focus group methodology, explored Spanish-speaking Puerto Rican elders' service needs and experiences utilizing LTC services. Three focus groups ($N=28$) were convened, and each group represented a distinct type of residential setting: Latino senior housing, conventional senior housing, and community living. Analysis of focus group data revealed common and distinct themes. Limited family support was a major theme across all groups. Simultaneously, elders in Latino senior housing reported few unmet needs, satisfaction with services, and importance of the housing staff. However, participants in the other groups encountered a number of problems accessing formal services. Elders living in both conventional senior housing and community settings identified language barriers as preventing their use of formal services. Elders living in con-

ventional senior housing also reported that little or no help from neighbors or housing staff prevented their needs from being met. While these elders expressed a preference for formal services because families are unavailable, they reported high levels of unmet need. The majority of community-living elders expressed dissatisfaction with the quality of formal services and/or restrictive eligibility service requirements. While frustrated with the formal service system, these elders acknowledged the vital role of the local Latino senior center for meeting their psychosocial needs. Findings underscore the impact of multiple levels of environmental influences on minority elders' utilization of services.

THE CHALLENGES OF HOUSING CHRONICALLY HOMELESS OLDER ADULTS: THE ROLE OF PERMANENT SUPPORTIVE HOUSING

J.G. Gonyea¹, S.S. Bachman², *1. Social Work, Boston University, Boston, Massachusetts, 2. Boston University, Boston, Massachusetts*

The federal government has made it a top priority to end chronic homelessness within the next ten years. The government's definition of chronic homelessness includes homeless individuals with a disabling condition (substance disorder, serious mental illness, developmental disability, or chronic physical illness or disability) who have been homeless either: 1) continuously for one whole year; or 2) four or more times in the past three years. Although chronically homeless people represent only a small share—about 10% to 20%—of the total homeless population, these individuals constitute the most costly subpopulation of homeless people. It is increasingly recognized that for chronically homeless people the solution is permanent supportive housing, which requires the integration of affordable housing and supportive services. Yet, nationwide most of the emerging supportive housing programs have not focused specifically on older adults. An exception is Hearth, Inc, a non-profit organization in Boston MA, with the mission of ending elder homelessness. In this study, we engaged in a comparative analysis of three subpopulations of HEARTH 136 supportive housing residents: the chronically homeless, the homeless, and the marginally housed. Our analysis revealed both similarities and unique differences in these three populations in terms of physical and mental health status, functional ability, and social isolation. We propose policy recommendations for appropriate ways to finance both the affordable housing and supportive services that are needed to assist chronically homeless and disabled older adults to achieve housing stability and receive care for their chronic conditions.

DEVELOPMENTALLY DISABLED OLDER ADULTS IN GA: RURAL, METROPOLITAN, AND URBAN HOUSING AVAILABILITY

T. Cermak, A. Pearman, *Gerontology, Georgia State University, Atlanta, Georgia*

Older adults with developmental disabilities, such as autism or Down's syndrome, often experience similar age-related health changes as their typically developing peers. However, they also face challenges associated with aging with a life-long disability. Because of the increases in life expectancy for people with developmental disabilities, there is a growing need for long-term residential care. Urban, metropolitan, and rural areas may differ in the availability of viable long-term care housing options for disabled older adults. The current study examines a sample of 90 counties in the state of Georgia. Counties were chosen based on data obtained from the American Community Survey administered by the U.S. Census Bureau. Data are reported by county type for the following variables: average population, racial make-up, income, age, education, disability status of older adults, types of long-term care facilities available in each county, and number of available beds. I present these descriptive findings in a way that illustrates the dearth of long-term care options for disabled older adults, particularly in rural counties. Understanding the housing options for disabled older adults is an

important process that has implications for both policy and social service planning.

SUSTAINABLE HOUSING DEVELOPMENT FOR OLDER ADULTS: UNDERSTANDING ITS MEANING AND PRACTICE

A. DeLaTorre, *Institute on Aging, Portland State University, Portland, Oregon*

Empirical data focusing on the planning and development of affordable housing that is considered to be sustainable for older adults are limited. Although myriad studies have focused on housing for older adults, sustainable housing in general, and/or affordable housing for those of all ages and abilities, there is no research that looks at the convergence of these topics, especially the pre-occupancy stages of project planning and development. Additionally, because sustainable, affordable housing for older adults is rare—only six developments in Portland, Oregon over the past 10 years met the criteria—examining how and why this type of development came about and whether it has applicability beyond the Portland region will contribute to knowledge, and hopefully, facilitate future development. The research project—a doctoral dissertation—was a qualitative case study of housing for those aged 55 and older that is considered to be sustainable and affordable. Key informant interviews, focus groups, and policy analysis were the primary data collection techniques. This presentation focuses on the meaning of sustainable development for older adults according to the professionals who work within the planning, design, development, and construction fields. Additionally, it will focus on the importance of various professional roles involved in the development of housing for an aging society, from initial programming until the point of a building's occupancy. Finally, this presentation will address barriers and opportunities that exist for future developments, including municipal policies, economic conditions, and practices within the real estate development industry.

SESSION 735 (PAPER)

MAXIMIZING CIVIC ENGAGEMENT

THE ROLE OF LOCAL LEADERSHIP AND PARTNERSHIP COUNCILS IN COMMUNITY PLANNING FOR OLDER ADULTS

J. Hinterlong, A.M. Arellano, M. Womack, *College of Social Work, Florida State University, Tallahassee, Florida*

This session will report findings of an exploratory, mixed methods evaluation conducted to assess the structure, development, and functioning of seven voluntary community coalitions focused on the needs and abilities of older adults, called Leadership or Partnership Councils. The study draws upon the input of council leaders and members, documentary evidence, and the perspective of external consultants involved in the creation and implementation of these councils. Established by diverse communities throughout Florida, these Councils involve representatives of health systems, the aging network, the non-profit and business sectors, and older adult self-advocates. Initial member composition and the identification of local leaders are shown to be critical to member recruitment and resource acquisition. Lessons learned for council creation and effective management will be discussed. External technical assistance and a focused role for aging network members are highlighted as important strategies. Emergent sources of conflict and instability are also identified, along with approaches used in their mitigation. The session will highlight key initiatives in community planning, policy development, and project implementation emerging from these councils. Examples include new information sharing between health systems, influences on local and regional funding priorities, community-wide health promotion initiatives, and involvement of state agencies and external funders in council-led efforts. The session concludes

with consideration of how independent councils might further collaborate statewide.

DIVERGENT PATHS FOR AMERICA'S DEPENDENTS — 25 YEARS LATER

J.G. Haaga, *National Institute on Aging, Bethesda, Maryland*

In November 1984, Samuel Preston published, in both popular and scholarly outlets, a very influential address “Children and the Elderly: Divergent Paths for America's Dependents”. He marshalled evidence from a variety of sources showing that, contrary to some theories in economic demography, declining numbers of children had led to a worsening, not improvement, in their average well-being, while a steady increase in the number of elderly had been accompanied by improvement. Preston concluded with speculation about the political economy of generational well-being in a Western democracy. A quarter-century later, on the verge of a sharp increase in the size of the elderly population, following major changes in social policy under both Republican and Democratic administrations, it is time to revisit his conclusions. There is better evidence now on trends in well-being of both age groups (including efforts like Kids Count spurred by the Preston debate), on voting patterns for age-relevant transfer programs, and even cross-national evidence. These will be reviewed to assess whether Preston's 1984 fears of generational warfare or more sanguine views of “Win-Win” collaboration are now warranted.

DEVELOPING A THEORETICAL MODEL FOR VOLUNTEERING BY OLDER ADULTS

F. Tang, E. Choi, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Scholars have accumulated knowledge of the beneficial effects of volunteering on older people; however, previous research employed relatively weak theoretical frameworks to understand the mechanism through which older adults benefit from volunteering engagement. The aims of this paper are (1) to identify which individual and institutional factors are related to volunteer time commitment among older adults; (2) to understand the relationships among individual and institutional factors, volunteer commitment, perceived benefits, and subsequent health; and most importantly, (3) to build the theoretical model to elaborate the mechanism for the salutary effects of volunteerism in the older population. Data were collected through self-administrated questionnaire among 207 older adults from 10 volunteer programs at two points of time. We used Structural Equation Modeling (SEM) to test the hypothesized model. The findings revealed that the subsequent health benefits were not the direct results of volunteer engagement. The amount of benefits that older people perceived from their volunteer engagement was strongly associated with mental health of older volunteers. These psychosocial benefits, including socialization, self-worth, and personal growth, were likely to increase with the intensity of volunteer time commitment, that is, the time devoted to the designated volunteer program in a month. In addition, organizational support, such as on-going support and compensations tended to increase individual volunteer's time commitment. The tested model emphasizes the importance of both organizational support and time commitment to maximize the benefits of volunteer engagement for older adults.

CIVIC ENGAGEMENT OF ELDERS: INFLUENCE OF GENERATIVITY AND GEROTRASCENDENCE THROUGHOUT THE LIFE COURSE

L. Stephenson, *University of Kentucky, Lexington, Kentucky*

A record number of adults are entering older adulthood possessing the capability and desire to be civically engaged. With the current recession-riddled economy, local communities are hard pressed to provide resources and services to meet the needs of economically-challenged residents. The intersection of these two societal issues is the potential spark to ignite a civic renaissance through creative empowerment of older adults' experience and civic commitment to solve community prob-

lems. The purpose of this paper is to investigate the civic engagement process of older adults from a life course perspective to provide a framework for cultivating elders' civic capacity. The qualitative study was designed to identify factors influencing civic engagement through two in-depth interviews and a four-session community-based participatory research project of eight older adult participants. Based upon the findings of this study, this paper presents a model of civic engagement throughout the life course. The model integrates concepts of community connectedness with the influences of generativity and gerotranscendence on the civic engagement of older adults. The model depicts a dynamic interaction throughout the life course that inculcates personal beliefs, which, in turn, promote the desire and commitment to be civically active. Through these findings a pathway of engagement emerges that illustrates the importance of civic engagement nurtured early in life and continually cultivated through older adulthood. The paper seeks to expand the discussion of creative opportunities for community capacity building of older adults' civic engagement via developmental pathways throughout the lifecourse.

SESSION 740 (POSTER)

OLDER WORKERS AND EMPLOYMENT

WORK EXPECTATIONS, REALIZATIONS, AND DEPRESSION IN OLDER WORKERS

W. Gallo¹, T.A. Falba², J.L. Sindelar¹, *1. Epidemiology and Public Health, Yale University, New Haven, Connecticut, 2. Duke University, Durham, North Carolina*

In this study, we explore whether ex ante work expectations, conditional on work force status at age 62, affect depression symptoms at age 62. Our sample includes 4,387 participants of the Health and Retirement Study (HRS). It is composed of workers who were less than 62 years of age at the study baseline, and who had reached age 62 by the study endpoint, enabling comparison of realized work status with earlier expectations. We estimate the impact of expected work status on depressive symptoms using negative binomial regression. Sex-stratified regressions are estimated according to full-time work status at age 62. The outcome variable is a summary measure of depressive symptoms based on a short form of the Center for Epidemiologic Studies-Depression scale. The explanatory variable of interest is the subjective probability of working full-time at the age of 62, reported by participants at the 1992 HRS baseline. Confounding variables are controlled. Among participants who were not working full time at age 62, we find that men who provided a higher ex ante likelihood of full-time employment at 62 had significantly worse depressive symptoms than men who provided a lower ex ante likelihood. A similar effect was not found for women. Among participants who were working full time at age 62, we do not find a statistical relationship between ex ante expectations and age-62 depressive symptoms, for either men or women. The results suggest that an earlier-than-anticipated work exit is detrimental to mental health for men nearing normal retirement age.

THE STATES-AS-EMPLOYERS OF CHOICE SURVEY: ASSESSING STATE AGENCIES' LEVEL OF AWARENESS AND RESPONSE TO THE AGING WORKFORCE

M. Brown, *Center on Aging and Work, Boston College, Chestnut Hill, Massachusetts*

In state agencies, where 47% of the workforce is 45 or older, adopting strategies to encourage older workers to work past the traditional retirement age is a critical talent management strategy. While continued workforce participation is one aspect of healthy aging for many older adults, most older workers who want to remain in the workforce state that the typical 8-hour day/5-day workweek is not the employment structure they desire. The States-as-Employers of Choice Survey was conducted in order to assess state agencies' level of awareness and

response to the aging workforce, particularly in terms of offering flexible work options. Findings from the 222 state agencies from the 27 states that participated reveal that agencies that had made the connection between workplace flexibility and overall effectiveness were significantly more likely to report being motivated to offer flexible work options in order to recruit older workers, retain older workers, and increase the job engagement of older workers than agencies that had not made this connection. Additionally, agencies that had made this connection were significantly more likely to provide 'most' or 'all' employees access to a number of flexible work options (such as working an alternative schedule or working a compressed work week) than those agencies that had not yet done so. Offering a variety of flexible work options can be a 'win-win' for agencies concerned about recruiting and retaining workforce talent in light of changing workforce demographics as well as for older workers desiring a more flexible employment structure.

PUBLIC POLICY AND OLDER WORKER LABOR FORCE PARTICIPATION IN JAPAN: LESSONS TO THE UNITED KINGDOM?

M. Higo, *Sociology, Boston College, Chestnut Hill, Massachusetts*

The aging of the workforce projected for the decade ahead has pressured policymakers in most industrialized nations today to seek ways to delay the retirement of older workers. In this paper we discuss the role of public policy in promoting employment of older workers in two different national contexts: Japan and the United Kingdom. Japan today is one of the world's most aged nations and is characterized by substantially higher labor force participation rate among older workers than most other industrialized nations including the UK. This paper discusses three main public policy factors which help explain why workers in Japan remain in the labor force longer than those in the UK: (1) narrower pathways to early retirement; (2) greater employment protections for older employees; and (3) more thorough government active labor market programs designed to assist older job seekers. Quality of working lives of Japanese older workers is by no means better than that of the UK. Nonetheless, we conclude that, for the purpose of increasing the number of older workers in the labor force, it makes sense for policymakers of the UK to closely examine some of the mechanisms and effectiveness of active labor market programs for older job seekers in Japan.

HOW ARE OLDER GED STUDENTS DIFFERENT FROM THEIR YOUNGER COUNTERPARTS?

K. Chee, C. Mathis, *Sociology, Texas State University-San Marcos, San Marcos, Texas*

GED students typically come from disadvantaged backgrounds, which prevent them from graduating from high school on time. Older GED students, in particular, have life circumstances that kept them from pursuing and obtaining GED certificates over a longer period of time. Little is known about this group of individuals who have most likely been subject to cumulative disadvantages over the life course. This study attempts to understand the educational trajectories of older GED students and how they may differ from those of their younger counterparts. Survey data used for this analysis were collected from 88 student participants recruited from 16 GED classes in 10 Central Texas counties. Among the participants, 72 percent were women, and 76 percent were Hispanic. In addition, 17 students were older than 45 years of age (with the oldest being 71 years old), while the remaining 71 students were between 18 and 44 years old. The results of t-tests revealed many similarities and some significant differences between the two groups. Older students were less likely to report that they did well in science while in school, more likely to be motivated to attend GED classes in order to improve their reading skills, and less likely to be interested in preparing for college entrance. They were also more likely to consider their GED classes as their second families. Adult education professionals

may benefit from an improved understanding of the unique learning experiences shared by older learners who did not earn their high school diplomas when they were younger.

SESSION 745 (SYMPOSIUM)

PROMOTING PREVENTION FOR ADULTS 50 TO 64 - CLINICAL AND COMMUNITY PARTNERSHIPS

Chair: *L. Anderson, CDC, Atlanta, Georgia*

In the health reform dialogue, health care and health systems are at the center of most discussions. This session puts prevention at the heart of the debate. It builds on the Centers for Disease Control and Prevention (CDC), American Medical Association (AMA), and AARP's recently released report focusing on building clinical and community partnership addressing clinical preventive services for adults aged 50 to 64. This debate and dialogue session emphasizes the importance of using community as a platform for increasing access to and use of clinical preventive services, building bridges between clinical and community settings, and health reform. Opportunities for researchers, health care providers, and public health and aging practitioners will be highlighted. Panelists will address challenges and potential roles for stakeholders to collaborate in the delivery of clinical preventive services and address health reform that promotes community-wide improvements in prevention.

SESSION 750 (SYMPOSIUM)

PUBLICLY REPORTED NURSING HOME QUALITY MEASURES: GOALS, CHALLENGES AND THE TRANSITION TO THE MDS 3.0

Chair: *E.G. Walsh, Aging, Disability and LTC, RTI International, Waltham, Massachusetts*

Discussant: *V. Mor, Brown University, Providence, Rhode Island*

This symposium provides an overview of the publicly reported nursing home quality measures and the process of revising those measures for review by the National Quality Forum in light of the transition to the MDS 3.0. CMS currently posts information on the worldwide web reporting on 19 different aspects of nursing home quality for each nursing facility. These measures are derived from analysis of the Minimum Data Set (MDS) 2.0, so the transition to the MDS 3.0 requires identifying how and if each quality measure can be recreated using the MDS 3.0 and an opportunity to reconsider the importance and scientific merit of each existing measure. The first paper provides the context describing the government's goals and uses of these quality measures including how it fits with other nursing home quality-related activities like the survey and certification process, the 5-Star Rating system, and nursing facility pay for performance. The second paper provides details regarding the current measures and changes under consideration in the transition to the MDS 3.0 overall and describes several measures in detail. The third paper focuses on the clinical perspective and need for measures to be based on valid assessment items. The fourth paper provides a consumer perspective. Finally, we will present information about the National Quality Forum endorsement process for publicly reported quality measures and the NQF goal of developing harmonized measures that can be used across clinical settings.

NURSING HOME QUALITY MEASURES AS A STRATEGY FOR QUALITY ASSURANCE AND IMPROVEMENT

J. Wiener, R. Constantine, E.G. Walsh, *RTI International, Washington, District of Columbia*

An increasingly common strategy for quality assurance and improvement is to provide consumers, providers, regulators, and payers with information about the quality of care provided by individual providers. The premise is that publicly reported quality measures will make the

competitive market work better and motivate providers to improve performance. As part of this strategy, the Centers for Medicare & Medicaid Services (CMS) posts information on its Nursing Home Compare website on 19 nursing home quality measures which are based on the Minimum Data Set (MDS) 2.0. CMS has recently expanded use of these measures by including them in their nursing home pay-for-performance demonstration and by developing a 5-Star Nursing Home Quality Measure, a consumer-friendly composite measure of quality that uses survey and certification and MDS-derived quality measures. The transition from MDS 2.0 to 3.0 provides an opportunity to assess these measures and to refine them.

ASSESSING THE NURSING HOME QUALITY MEASURES FOR IMPORTANCE, SCIENTIFIC MERIT, USABILITY, AND FEASIBILITY

E.G. Walsh, R. Constantine, J. Wiener, A.M. Greene, M. Freiman, D. Brown, N. West, *Aging, Disability and LTC, RTI International, Waltham, Massachusetts*

Quality measures endorsed by the National Quality Forum (NQF) are subject to periodic review, evaluating their continued importance and analyses of their scientific merit, usability and feasibility. In preparation for seeking NQF endorsement of measures based on the MDS 3.0 in January 2010, we reviewed analyses of the MDS 2.0-based measures and of the MDS 3.0 field tests, convened a technical expert panel and consulted with other experts to identify which measures should be retained, revised, replaced or retired. We will report on our overall assessment for the 19 nursing home quality measures, and provide detailed discussion of several specific measures that reflect changes in the underlying assessment items in the MDS 3.0 (e.g., percent of residents with evidence of depression) or revisions to improve the salience and performance of the quality measure (e.g., decreased locomotion).

CONSTRUCTING MEANINGFUL QUALITY MEASURES

D. Saliba, 1. *UCLA/Jewish Homes Borun Center for Gerontological Research, Los Angeles, California*, 2. *Greater Los Angeles VA GRECC and Center of Excellence, Los Angeles, California*, 3. *RAND Corporation, Santa Monica, California*

For quality measures to be useful, they need to be based on valid and reliable data, and focus on important clinical issues within the control of the provider. The development of the MDS 3.0 provided an opportunity to improve the accuracy of many quality indicators and quality measures by improving the clinical assessments used to calculate these measures, including new approaches to assessing depression, impaired cognition, delirium and pain. We will discuss the results of validity testing of these clinical assessment instruments which showed MDS 3.0 items had either excellent or very good reliability even when comparing research nurse to facility-nurse assessment, how these assessments in turn serve as building blocks for meaningful quality measure development, and other clinical considerations in the selection and specification of appropriate nursing home quality measures.

SESSION 755 (SYMPOSIUM)

SERVICE PROVISION TO OLDER ADULTS LIVING WITH HIV/AIDS: BARRIERS AND OPPORTUNITIES

Chair: C.A. Emlet, *University of Washington, Tacoma, Tacoma, WA*
Discussant: L. Linley, *Centers for Disease Control and Prevention, Atlanta, Georgia*

Between 2004 and 2007, the estimated number of persons 50 years and older living with HIV/AIDS increased from 105,855 to 156,511 (CDC, 2009). Gerontological providers are increasingly likely to encounter this population. But are providers knowledgeable and capable of providing sensitive care? This symposium will examine issues related to knowledge and preparedness of gerontological providers to serve HIV infected older adults. The first paper reports on a national

random sample of gerontological social workers, gerontological nurses and geriatricians (N=486) capturing their knowledge and attitudes toward HIV in older people. Findings indicate that enhanced education of providers is necessary to ensure adequate clinical care. The second paper reports on a survey of all 13 Area Agencies on Aging in Washington State related to their experience in serving older HIV+ clients and perceived preparedness. Over half (61.5%) identified the need for increased staff training in HIV/AIDS among older adults. The third paper reports on a systematic review of gerontological journals between 1993 and 2008 related to the overall efficacy of HIV behavioral interventions designed to reduce HIV risk among older adults. Utilizing a comprehensive search of electronic bibliographic databases and hand searches, the study found only ten interventions met the criteria for best evidence using CDC criteria in that period of time. The fourth paper addresses the risk and protective factors related to traditional Latino gender roles, family values, religion, socioeconomic factors and health, providing recommendations for the development of culturally competent practices with older Latinas relative to HIV disease by gerontological providers.

KNOWLEDGE AND ATTITUDES OF GERONTOLOGICAL HEALTH PROVIDERS TOWARD HIV AND AIDS

A.K. Hughes, *Michigan State University, East Lansing, Michigan*

Incidence of HIV is increasing in adults over age 50. How well prepared are providers who specialize in gerontology/geriatrics? This study was undertaken to assess provider knowledge and attitudes toward HIV/AIDS. Sixty-five percent (N=486) of a national random sample of social workers who specialize in aging, gerontological nurses, and geriatricians responded to the survey instrument. Provider groups differed significantly on general knowledge of HIV, as measured by the HIV KQ-45 ($F(2, 483) = 18.63, p < .0005$), with physicians scoring highest of all provider groups. Attitudes were found to be positive, with low scores on avoidance and high scores on empathy. Significant differences were only found between nurses and social workers ($F(2, 952) = 6.84, p < .0005$), however this difference is unlikely to be practically significant. Knowledge of issues specific to older adults and HIV were less well known, indicating that education of providers is necessary to ensure adequate clinical care.

SERVING OLDER ADULTS WITH HIV DISEASE: RESPONSES FROM THE AGING NETWORK IN WASHINGTON STATE

C.A. Emlet, *University of Washington, Tacoma, Tacoma, WA*

As the numbers of older adults with HIV/AIDS grow, the aging network will increasingly be called upon to provide community based services. This paper reports on the results of a survey administered to the thirteen Area Agencies on Aging (AAA) in Washington State regarding their views of serving older, HIV positive adults and their preparedness to do so. The response rate from the AAAs was 100%. The majority of AAAs (84.6%) agreed or strongly agreed that serving this population was consistent with their mission. The proportion of HIV positive adults served was small, ranging from 0-5% ($M = 1.1, SD = 1.84$). The majority (86%) of agencies felt that written educational materials for staff and clients would be needed, while over half (61.5%) identified the need for increased staff training in HIV/AIDS among older adults. Plans are underway to create training opportunities regarding older adults and HIV/AIDS for AAA staff.

A SYSTEMATIC REVIEW OF THE EFFICACY OF HIV PREVENTION EDUCATION PROGRAMS FOR OLDER ADULTS IN THE UNITED STATES

N. Orel, *Gerontology, Bowling Green State University, Bowling Green, Ohio*

This systematic review examined the overall efficacy of HIV behavioral interventions designed to reduce HIV risk behaviors among older adults residing in the U.S. A cumulative database of HIV/AIDS behav-

ioral prevention literature focusing on older adults was developed using automated and manual search strategies. This included a comprehensive search of electronic bibliographic databases and hand searches of key Gerontological journals from 1993 to 2008. Additionally, contacts were made with researchers and/or aging service providers to obtain information on unpublished HIV/AIDS prevention programs for older adults. Standard systematic review methods were used to identify interventions demonstrating best evidence of efficacy in reducing HIV risk among older adults. Eligible studies were reviewed on the basis of the CDC's Prevention Research Synthesis Team efficacy criteria (i.e., study design, implementation/analysis, and strength of evidence). The results of this review indicated that ten interventions met the criteria for best evidence; however, important gaps still exist.

HIV/AIDS AND OLDER LATINAS: CULTURAL, GENDER AND GENERATIONAL CONSIDERATIONS

R.L. Beaulaurier, *School of Social Work, Florida International University, Miami, Florida*

Older Latina women are one of the fastest growing groups of new AIDS cases. Twenty percent of all women ever diagnosed with the disease are Latina and 5.5% of Latinas infected with the virus are older. Most older Latina women acquire HIV/AIDS through sexual contact. Yet, older Latina women are one of the least studied American demographic groups with regard to social, health, or sexual behavior. This could leave geriatricians unprepared for dealing with HIV/AIDS in this population. This [paper?] will address risk and protective factors related to traditional Latino gender roles, family values, religion, socioeconomic factors, health, and health care, with special attention to the /triple jeopardy /faced by this population by virtue of being female, seniors, and minorities. The author will make recommendations for the development of culturally competent practices with older Latinas and the development of a research agenda to better understand their risk-related and health-seeking behavior.

SESSION 760 (PAPER)

SOCIAL ISSUES IN PRIMARY CARE

EVALUATING VA HOME-BASED PRIMARY CARE: QUALITY DOMAINS, RESEARCH PRIORITIES, OUTCOMES, AND METHODOLOGICAL CHALLENGES

T. Olsan¹, P. Katz^{2,3}, J. Karuza², N. Swanson³, *1. University of Rochester School of Nursing, Rochester, New York, 2. University of Rochester School of Medicine, Rochester, New York, 3. Canandaigua VA Medical Center, Canandaigua, New York*

As the setting for delivering long-term care to chronically ill disabled older adults increasingly shifts from institutions to the home setting, effective models of home-based primary care will be needed for planning and evaluating home services. Although the Veterans Affairs Home-Based Primary Care (VA HBPC) program is an exemplary model that could be more widely adopted, the scarcity of program evaluative research limits its potential for dissemination. Our study addresses this gap by establishing a research agenda to build an evidence base demonstrating how well the 131 VA HBPC programs and satellites nationwide deliver and improve care for veterans and their informal caregivers. A descriptive two-stage consensus building study was conducted. In the first stage, focus groups with professionals (n=25) and interviews with veterans (n=6) and caregivers (n=4) elicited detailed information about how the VA HBPC works and the structures, processes, and patterns linked to quality. In the second stage, data displays and research priorities from the first stage were submitted to a four-round Delphi process with national experts in geriatrics and health services research (n=11). Experts enriched the data set by reacting to first stage findings and by adding other insights about how to define and measure VA HBPC quality. The resultant research agenda is described in this presentation, specifically,

the quality domains, research priorities, and outcomes relevant to the provision of primary geriatric care in the home. Recommendations for addressing the methodological challenges of multisite research with variations among individual programs will also be discussed.

SOCIAL WORK IN PRIMARY CARE: A PATIENT CENTERED INTERVENTION IMPROVING FUNCTIONING AND SATISFACTION WITH CARE

B. Keefe¹, S. Enguidanos², S.M. Geron¹, *1. Boston University School of Social Work, Boston, Massachusetts, 2. Davis School of Gerontology, University of Southern California, Los Angeles, California*

With growing awareness of the interrelatedness of medical and health issues with psychological, social, economical, behavioral, and environmental factors, research testing interventions using social workers in primary care are needed. Results of a randomized study using a Problem-Solving Therapy approach with older, frail primary care patients was found to improve satisfaction and physical functioning among intervention patients. From October 2004 to October 2006, 321 participants were enrolled in the study, 160 assigned to the intervention and 161 assigned to usual care. Among those in the intervention, 107 engaged in problem solving therapy, with a total of 568 problems identified, averaging 3.6 (SD=2) per patient. The vast majority (92%) of problems were identified by the patient, with 6% introduced by the social worker and 2% by the physician. Analysis of problems revealed that the most frequently patient identified problems included (1) eliciting information regarding diseases and self-management (16.2%), (2) engaging in exercise or weight loss activities (13%), (3) house and yard cleaning (9%), and (4) issues surrounding transportation (7.2%). Patients were significantly more likely to solve problems they identified as compared to problems identified by the primary care physician or social worker. Additionally, patients were more likely to solve problem that focused on This session will examine the relationship between problems solved and patient outcomes such as depression, functioning, problem-solving skills, and quality of life. Implications of a social work intervention utilizing a patient centered approach will be discussed.

TEACHING MSW STUDENTS TO CONDUCT CULTURALLY COMPETENT EVIDENCE-BASED TREATMENT FOR OLDER LATINOS IN PRIMARY CARE: INTEGRATION OF RESEARCH AND PRACTICE

L.M. Quijano^{1,2}, R. Marrujo², *1. Social Work, Colorado State University, Fort Collins, Colorado, 2. North Range Behavioral Health, Greeley, Colorado*

To bridge the gap between aging and mental health, social work students must be skilled in the provision of evidence-based treatments for common mental health disorders among older adults, culturally competent care, services within interdisciplinary settings. The purpose of this paper presentation is twofold: 1) To discuss a model for teaching MSW students to screen, assess and provide a culturally adapted cognitive-behavior treatment (CBT) intervention for older Latino primary care patients with generalized anxiety disorder (GAD) as part of a randomized controlled clinical trial; and 2) To present preliminary results and lessons learned in the implementation of the study. Estimates indicate that Latinos age 65 and above will become the largest ethnic minority group by 2028, comprising 16% of the older adult population. One major concern for this growing population is the lack of available evidence-based and culturally relevant mental health treatment, particularly for anxiety disorders. Generalized anxiety disorder (GAD), one of the most frequent anxiety disorders in later life, is a pervasive and chronic disorder that interferes with life function and significantly decreases quality of life. To approach treatment, this project uses CBT to treat elderly Latinos with GAD. The decision to use CBT as opposed to alternative psychotherapeutic methods was based on a large body of literature supporting the utility of CBT for anxiety disorders across diagnostic categories, patient subgroups, and treatment settings. Social workers

based in primary care provide an effective and efficient means of delivering services where older Latinos prefer to receive mental health care.

TESTING THE CAPACITY FOR CULTURAL CHANGE IN IRISH PRIMARY CARE

L.E. Carragher, F. Markey, D. Getty, R. Bond, *DKIT, Dundalk, Ireland*

Introduction The Irish Primary Care Strategy - A New Direction (2001) promotes the idea of a team-based approach to achieve better co-ordination and integration of services through the creation of multi-disciplinary primary care teams. This objective is still in its infancy, with entrenched cultural differences linked to professional boundaries continuing to present challenges. Given the dominance of the medical model in shaping approaches to care in Ireland, this doctoral study is concerned with the capacity for culture change in Irish primary care. It examines the values, attitudes, beliefs and artefacts of a multi-disciplinary home support team delivering care to community dwelling older people. In integrating theories of organisational culture, Schein's (1992) model of organisational culture is employed as a theoretical fulcrum. **Methodology** A phenomenological, comparative methodology is employed, involving in-depth interviews with team members as well as older people who are the recipients of home care. Focus groups with home care workers and observations of team working are also employed. **Results** Preliminary analysis suggests that intervention team culture has a high level of carer empowerment and client centredness with good levels of professional communications and no obvious power hierarchy. In contrast, carers working within the standard home support system feel undervalued and disempowered. **Discussion** As a large organisation, the Health Service Executive has embedded culture and subcultures particularly in ideas and beliefs surrounding authority, deference, status, discipline and blame. This research will make an important contribution to the literature on the 'de-medicalisation' of integrated care perspectives.

SESSION 765 (SYMPOSIUM)

TOWARD A SURVIVORSHIP MODEL: RESILIENCE AND FORGIVENESS AMONG HOLOCAUST SURVIVORS

Chair: *R.R. Greene, Social Work, University of Texas-Austin, Austin, Texas*

Discussant: *N.P. Kropf, Georgia State University, Atlanta, Georgia*

Most Holocaust survivors have now reached a time when they review their lives, attempt to resolve old conflicts, and find new meaning in life events. How have these survivors of earlier unprecedented separation and loss experienced the sometimes challenging transitions of the final stage of life? Have they relived trauma of the Holocaust or have they exhibited resilience—the capacity to bounce back despite the exposure to severe risks. The panel will discuss the results of a research study on Forgiveness, Resilience, and Survivorship funded by the Templeton Foundation among 133 Holocaust Survivors in nine U.S. locations. The snowball sample of older adults, who were considered cognitively aware, completed structured, recorded interviews. Interviews were analyzed to learn (a) how relatively forgiving study participants are, (b) how resilient they said they are (as it relates to being a Holocaust survivor), (c) how successfully they perceive they have accomplished Erikson's eight stages of life, (d) how these factors are interrelated, and (e) how survivors' Holocaust experiences affected subsequent life events and prepared them for old age. Theoretical frameworks were used to describe critical events in survivors' lives before, during, and after the Holocaust. Symposium members will present the components of a survivorship model involving the ability to survive and recover from severe adverse events or traumas. They will discuss actions and beliefs that enhanced the survival of individuals, families, and communities, allowing them to deal with feelings of distress, and then begin to heal. Implications for mental health practice are discussed with attendees.

MEANING-MAKING IN SURVIVORSHIP: APPLICATION TO HOLOCAUST SURVIVORS

M.P. Armour, *University of Texas-Austin, Austin, Texas*

Although meaning-making is fast emerging as a core construct in considering trauma and violent loss, research shows that trauma survivors have difficulty finding meaning when meaning-making processes are defined as sense-making or benefit finding. This study applies an emerging, noncognitive meaning-making process, meaning-making grounded in action, to the lifetime experiences of older Holocaust survivors. Findings indicate that survival was the core theme at 3 different time points. During the Holocaust, survival meant keeping hope alive and keeping self alive. After the Holocaust, survival meant reconstructing and regaining what was lost and cultivating proactive attitudes. Now, during the later years, survival means maintaining health, fulfilling obligations and moral imperatives, and building strength from protests and self-pride. Implications for other groups who have experienced mass trauma are discussed, as is the contribution of the findings to meaning-making theory. Funded by Templeton Foundation

CREATIVE EXPRESSIONS AND RESILIENCE AMONG HOLOCAUST SURVIVORS

C. Corley, *California State University, Los Angeles, California*

Positive psychologists and gerontologists are increasingly interested in the benefits of artistic experience and how it may contribute to resilience across the life course. This article presents vignettes of three visual artists who survived the Holocaust in Hungary and now live in the Los Angeles area. It discusses the intersection between their creativity and resilience, and how these creative expressions enhanced personal and community well-being. Implications for research on the use of images are discussed, along with possible innovations in social work practice and education. Funded by the Templeton Foundation.

RESILIENCE IN AGING: HOLOCAUST SURVIVORS SIXTY YEARS LATER

S.A. Graham, *University of Texas-Austin, Austin, Texas*

This study examined the lives of one hundred thirty-three Holocaust survivors in nine locations in the United States to gain insight into survivorship and resilience. Using a framework constructed by Lewis and Harrell (2002), resiliency in older adults can be evidenced in 1) Affiliation, 2) Safety and Support, and 3) Altruism. Analyses of selected questions and quotes focusing on aging and later life experiences, describes the Holocaust survivors as those with high levels of civic engagement, and community and familial support; strong commitment to maintaining physical activity and well-being; and on-going philanthropy and volunteerism. Findings support the literature that suggests that Holocaust survivors are aging resiliently. Research findings are expected to enhance the work of mental health practitioners and inform our understanding of factors and behaviors that contribute to resilience in aging. Funded by the John Templeton Foundation

MEMORY AND RESILIENCY

H. Cohen, *Texas Christian University, Fort Worth, Texas*

This paper examines the memories of 40 older Holocaust survivors who participated in a larger mixed method national study on survivorship sponsored by the Templeton Foundation. Data collected from open-ended questions about memory was analyzed. Autobiographical remembrances provide information involving loss, powerlessness, survival, and resiliency. Information is also gathered about the importance of survivors' families, how they transmitted values, educated the next generation, and contributed to the community. Their memories teach us how survivors can sum up their lives and come to satisfactory resolution of the tension between integrity and despair, despite negative experiences.

EXPLORING GENDER DIFFERENCES IN SURVIVORSHIP

C. Morano, *Hunter College, New York, New York*

This paper presents findings from the study Forgiveness, Resiliency, and Survivorship Among Holocaust Survivors, sponsored by a Templeton Foundation grant. A mixed methods approach was used to assess if the gender of the survivor accounted for differences in the perception of survivors successful completion of Erickson's Eight Stages of Development (8-items) or in their perception of how survivors adapted (16-items) following World War II (Danieli; 1995). Although the quantitative data suggest that gender did not account for significant differences in successful completion of Erickson's Eight Stages; or in the majority of items in the Danieli Typology, the qualitative analyses of 34 randomly selected transcripts (17 male and 17 female) suggest that coping mechanisms used to complete Erickson's Eight Stages and their adjustment following WWII, did vary by gender. Examples from transcripts of the interviews will be used to illustrate these differences.

EXPERIENCE AND CREATIVE EXPRESSION AMONG RESILIENT HOLOCAUST SURVIVORS

O. Macklin¹, C. Corley^{2,3,4}, 1. *California State University Los Angeles, School of Social Work, Los Angeles, California*, 2. *Professor, School of Social Work, California State University, Los Angeles, Los Angeles, California*, 3. *Doctoral Faculty, Fielding Graduate University, Los Angeles, California*, 4. *Associate Director, Applied Gerontology Institute, Lifelong Learning, CSULA, Los Angeles, California*

Growing interest in resilience across the life course pertaining to creative expression among the older adult population has prompted research. Although the two domains seem to be related, there has been insufficient evidence to date that artistry among older adults impacts the ability to survive life challenges. Transcript data from 133 U.S. Holocaust survivors revealed a number of older adult survivors engage in creative outlets. Follow-up interviews with selected survivors reveal that creative endeavors continue well into the later years and that sharing their artistry with others in life-enhancing ways is conducive to overall well-being. Visual art by three Holocaust survivors is presented along with an analysis of the experiences, shared creative expression, and the bearing that each has had on interpreting life's meaning. Findings are assisting social science practitioners in designing community-based programs identifying and inspiring artistic expression for resilience-enhancement in older adults.

SESSION 770 (POSTER)

BS POSTER SESSION II - FACE-TO-FACE TIME: 1:00 PM – 2:30 PM

THE METABOLIC SYNDROME AND THE ONSET AND PERSISTENCE OF DEPRESSIVE SYMPTOMS IN LATER LIFE

N. Vogelzangs¹, I. Boelhouwer¹, A. Beekman¹, Y. Milaneschi², L. Ferrucci³, B. Penninx¹, 1. *Psychiatry and the EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands*, 2. *Tuscany Health Regional Agency, Florence, Italy*, 3. *Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*

Introduction: Several studies report a cross-sectional association between metabolic syndrome and depressive symptoms. The longitudinal effect of metabolic syndrome on depression in later life is still unclear. **Methods:** Using data from 778 participants, aged ≥ 65 years, of the InChianti Study, we examined whether metabolic syndrome was associated with onset and persistence of depressive symptoms during 6 years of follow-up. Metabolic syndrome was assessed at baseline and defined as three or more of the following: abdominal obesity, high triglycerides, low HDL cholesterol, high blood pressure, and high fasting glucose. Depressive symptoms were assessed using the CES-D scale at baseline and after 3 and 6 years of follow-up. **Results:** At baseline

195 persons had metabolic syndrome, and 161 were depressed (CES-D ≥ 20). Among non-depressed persons, 26.1% developed depressive symptoms during follow-up; among depressed persons, 76.4% showed persistence/recurrence of depressive symptoms. Metabolic syndrome was associated with a more than 3-fold increased likelihood of persistence of depressive symptoms after adjustment for sociodemographics (OR=3.18, 95%CI=1.10-9.21), which decreased somewhat after adjustment for lifestyle and health factors (OR=2.58, 95%CI=0.86-7.77). Especially low HDL cholesterol levels predicted persistence of depressive symptoms (adjusted OR per SD increase=0.62, 95%CI=0.40-0.98). There was no association between metabolic syndrome and onset of depressive symptoms, but large waist circumference did increase the odds of onset of depressive symptoms during follow-up (adjusted OR per SD increase=1.30, 95%CI=1.06-1.59). **Discussion:** In late life, metabolic syndrome did not predict onset of depressive symptoms, but did predict persistence of symptoms among depressed persons. The latter may suggest that depression with cardiovascular abnormalities ('vascular depression') identifies a chronic subtype of depression.

DYNAMIC DETERMINANTS OF EXCEPTIONAL HEALTH AND LONGEVITY

A.I. Yashin, K.G. Arbeev, I. Akushevich, S.V. Ukraintseva, A. Kulminski, L. Arbeeva, I. Culminskaya, *Sociology, Duke University, Durham, North Carolina*

The fact that deviations of physiological indices from their normal values contribute to an increase in morbidity and mortality risks is well known. It is, however, unclear which dynamic characteristics of these indices can also play a significant role in such risks. In this paper we use longitudinal Framingham Heart Study data on body mass index, diastolic blood pressure, pulse pressure, pulse rate, level of blood glucose, hematocrit, and serum cholesterol to address this question. We found that different indices have different average age patterns, and may be characterized by different values of parameters describing their dynamic properties. We found that individual rates of change in physiological indices, as well as different measures of their individual variability manifested during the life course are important contributors to respective risks. We also found that for indices with non-monotonic average age trajectories the maximum values of respective indices, the ages when these values have been reached, as well as the values of the rates of decline in such indices after reaching a maximum value are important risk factors. The dependence between such risk factors is investigated. The values of dynamic characteristics corresponding to exceptional health and longevity are evaluated. The biological mechanisms which might contribute to exceptional health and longevity are discussed.

IL-6 MEDIATES AGE ASSOCIATED OVER-PRODUCTION OF IL-6 IN THE ADIPOSE TISSUE

M.E. Starr, B.M. Evers, H. Saito, *Biochemistry and Molecular Biology, University of Texas Medical Branch, Galveston, Texas*

Age-associated over-production of interleukin-6 (IL-6) during systemic inflammation is a well documented phenomenon and closely linked to increased mortality in the aged. We recently found that white adipose tissue is the major source of IL-6 production in a murine model of endotoxin (LPS)-induced systemic inflammation. In the present study, an in vitro organ culture system was applied to examine IL-6 expression in the white adipose tissues from young and aged mice. We found that LPS treatment induced levels of IL-6 production in the adipose tissues that were higher in aged than young mice. We also examined the effects of the two major early cytokines, TNF α and IL-1 β , and found that IL-6 production was induced by treatment with IL-1 β , but not TNF α . In addition, the LPS-mediated production of IL-6 was effectively lowered by treatment with neutralizing antibodies against IL-1 β in adipose tissues from aged mice only. Finally, we found that after intraperitoneal injection of mice with LPS, IL-1 β was strongly expressed in the lungs

and spleen with the level of expression being higher in the aged. IL-1 β was also expressed to a lesser extent in other organs including the adipose tissue. These findings suggest that, IL-6 over-production in the adipose tissue is mediated by IL-1 β produced in the adipose tissue itself and by circulating IL-1 β produced in other tissues. These processes are augmented in the aged and may partly explain their increased susceptibility to systemic inflammation.

NEUROCOGNITIVE IMPAIRMENT IN HIV INFECTED NAIVE PATIENTS : THE ROLE OF GENETIC POLYMORPHISMS, VIRAL CHANGES AND INTRATHECAL IMMUNE ACTIVATION

G. Annoni¹, M. Gregorio¹, A. Bandera², B. Tagliabue¹, E. Suardi², A. Gori², *1. Internal Medicine, Università Milano-Bicocca, Monza, Italy, 2. Division of Infectious Diseases, Department of Internal Medicine, San Gerardo Hospital, Monza, University of Milan-Bicocca, Monza, Italy*

Background. HIV penetrates central nervous system (CNS) early during primary infection, leading to HIV-associated neurocognitive disorders (HANDs), sustained by the HIV replication in CNS and immune activation. We correlated the change in CNS viral replication and intrathecal immune activation in naïve HIV patients with the genetic polymorphisms of immune activation markers and the neurocognitive performance obtained by an extensive evaluation pre and 6 months after combination antiretroviral therapy (cART). **Methods.** 18 patients (mean age = 42.4 years old) with CD4<200/ μ l starting cART were considered; at baseline and after 3 months were measured on plasma and cerebrospinal fluid (CSF) HIV-RNA, IL-6, IL-10, TNF- α , TGF- β 1, TGF- β 2, INF- γ , MCP-1 and MIP-1 α . Single nucleotide polymorphisms (SNPs) in genes of TNF- α , TGF- β 1, IL-10, IL-6 and INF- γ were assessed by SSP-PCR methodology. **Results.** At T0 HANDs was diagnosed in 6 patients. There were no significant differences in CSF HIV RNA levels between patients with normal and impaired tests at T0. Among cytokines we found higher levels of CSF IL6 in patients with HANDs. None of patients without HANDs develop cognitive impairment after 6 months. In patients with HANDs the frequency of IL-10-1082A allele, linked with a higher risk of Alzheimer disease, was higher (12.5%) than in those without HANDs. **Conclusions.** In this set of patients the neurocognitive impairment of HANDs doesn't seem to be associated with CSF HIV RNA levels, but with a proinflammatory pattern i.e. increased levels of IL-6 in CSF and the SNPs 1082A allele of IL-10.

NARROWING DOWN THE CONGENIC REGION THAT BEARING THE GENE IN B6C3H

Q. Meng, R. Yuan, *The Jackson Laboratory, Bar Harbor, Maine*

IGF-1 signaling pathway plays a key role in regulating biological processes of aging and longevity. Mutants with depressed IGF1 signaling show significantly extended longevity. However, genetic variations existing in normal population that might regulate IGF-1 and aging have yet been illuminated. Previous studies identified a quantitative trait loci (QTL) for IGF-1 is located on Chromosome 10: 78~110 Mb and generated a congenic strain B6.C3H-Igf1, which contains C3H alleles on Chromosome 10: 65.9~ 90.4Mb on the B6 background. This congenic strain has 17% higher ($p<0.05$) IGF-1 than B6, suggesting the polymorphisms in the congenic region are involved in regulating IGF-1 levels. Besides the physiologically elevated IGF-1, such polymorphism widely affects other aging related phenotypes including fat percentage, levels of glucose, insulin and leptin, and metabolic rate when compared to B6. These results implicate that genes in this congenic region may have important impact on biological processes of aging. However, there are more than 380 genes located within this 24.5Mb region (<http://www.ensembl.org/>), which might all account for the IGF-1 differences and phenotype variations. To identify the QTL gene(s), we backcross (B6.C3H-Igf1 x B6) F1 with B6, and genotype the offspring with single-nucleotide-polymorphism (SNP) markers and microsatellite (MIT) markers to select the desired recombination. So far, we have

significantly narrowed the congenic region to about 3.1Mb (87.0-90.1Mb), which contains 39 genes including Igf1. Studies of evaluating IGF-1 levels and aging related phenotypes of this congenic strain are on-going and will be ready to report at the meeting.

IMPAIRED ABILITY TO REMAIN UPRIGHT IS ASSOCIATED WITH REDUCED SKELETAL MUSCLE SRF IN OLD MICE

G. Azhar^{1,2}, C. Zuo^{2,1}, J.Y. Wei^{2,1}, *1. Central Arkansas Veterans Health Care Services, Geriatrics and Extended Care, Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Objective: Background: Aging changes in skeletal muscle include impaired mechanical performance and reduced muscle mass. A number of muscle genes in the skeletal muscle are controlled by SRF. It is possible that changes in skeletal muscle during aging might be associated with altered levels of SRF. **Method:** Functional status in young adult and aged mice was determined by the ability to grasp food pellets on the overhead cage grill in individually housed mice. Observations were made on the mice at fixed times in the morning and afternoon by 2 independent observers, blinded to the age of the mice. In another set of experiments a stop-watch was used to measure the duration of sustained upright posture (in seconds) on hind-limbs while nibbling on the overhead food pellets. The study period was 2 weeks, with 20 observations per mice. Western blot analysis was performed on the skeletal muscle of these mice. **Results:** The average number of attempts needed to successfully grasp food pellets (from the over-head cage grill) was 1.2 ± 0.1 for the normal young adult and 4.0 ± 1.1 for the old mice ($p<0.05$). The young adult mice remained upright for 13.6 ± 1 seconds vs 5.1 ± 2 seconds in old mice ($p<0.05$). On Western blotting, aged skeletal muscle had a 3 fold reduced SRF level vs. that in young skeletal muscle ($p<0.05$). **Conclusions:** Senescence is associated with an impaired ability to maintain upright posture and skeletal muscle weakness. These changes may be due to reduced SRF in skeletal muscle.

SYSTEMS BIOLOGY OF AGING—NETWORK MODEL 2009

J.D. Furber¹, P. Langley^{2,3}, *1. Legendary Pharmaceuticals, Gainesville, Florida, 2. School of Computing & Informatics, Arizona State University, Tempe, Arizona, 3. Institute for the Study of Learning and Expertise, Palo Alto, California*

The many observable signs of human senescence have been hypothesized by various researchers to result from several primary causes. Close inspection of the biochemical and physiological pathways associated with age-related changes and with the hypothesized causes reveals several parallel cascades of events that involve multiple interactions and feedback loops. We present a network diagram to aid in conceptualizing the many processes and interactions among them, including promising intervention points for therapy development. This diagram is maintained on the Web as a reference for researchers and students. Content is updated as new information comes to light. www.LegendaryPharma.com/chartbg.html In addition, we are adapting the network model's contents into an interactive website with links to references and background materials. A symposium to promote this development was held at Arizona State University, December 2008; abstracts are at <http://circas.asu.edu/symposia/aging/> This network model includes both intracellular and extracellular processes. It ranges in scale from the molecular to the whole-body level. Important pathways include: Extracellular proteins become damaged, altering environmental niches for cells. Lysosomes accumulate reactive, crosslinked lipofuscin. Mitochondrial DNA mutates. Lamin-A splice-variant, progerin, accumulates in nucleus. Nuclear envelope pore proteins become oxidized. Nuclear mutations, telomere shortening, chromosome breaks, chromatin alterations and epigenetic DNA adducts change gene expression. Oxidized aggregates in cytoplasm become crosslinked. Inhibited proteasomes reduce turnover of damaged molecules and of expired

ity. Our preliminary findings reveal that attention networks and their interactions are influenced by physical health, and impact on mobility. We will discuss these findings in the context of compensatory aging models.

SESSION 780 (SYMPOSIUM)

THE WILDER SIDE OF AGING: COMPARATIVE PHYSIOLOGY OF LONGEVITY AND LIFE HISTORIES

Chair: *D. Holmes, School of Biological Sciences, Washington State University, Pullman, Washington*

Discussant: *D. Holmes, School of Biological Sciences, Washington State University, Pullman, Washington*

The biology of aging integrates state-of-the art approaches to understanding both “ultimate” (evolutionary, comparative, and population-level) and “proximate” (molecular, cellular and physiological) mechanisms responsible for organismal senescence. This kind of integration is critical for assessing the generality and clinical relevance of specific mechanisms – like cellular resistance to oxidative damage – to aging and related disease processes in animals, including humans. This symposium will feature biologists who use “nontraditional” study animals and natural systems for examining the physiological correlates of aging and life span, ranging from long-lived birds and bats to snakes and field crickets.

WHAT DETERMINES MAXIMUM LIFESPAN? INSIGHTS FROM BIRDS, BEES AND OTHER SPECIES

A.J. Hulbert, *Biological Sciences, University of Wollongong, Wollongong, New South Wales, Australia*

Animals differ dramatically in their maximum lifespan yet we do not fully understand what determines these differences. A mouse can live up to ~4y, and humans ~120y, yet for our size we should only live ~25y. Birds live much longer than similar-sized mammals. Recently, it has been shown that membrane fatty acid composition varies systematically among mammals and birds in a manner correlated with maximum lifespan. Short-living species have membrane fatty acid composition in which peroxidation-susceptible fatty acids dominate while long-living species have membrane bilayers in which peroxidation-resistant fatty acids dominate. A similar difference is observed between (i) long-living queen bees compared to short-living worker bees, and (ii) the offspring of long-living humans compared to the offspring of shorter-living humans. It is proposed that membrane composition is an important determinant of aging and maximum lifespan.

RADIOTRACER, ENZYMOLOGICAL, AND MOLECULAR STUDIES OF LIPID TRADE-OFFS UNDERLYING THE DISPERSAL-REPRODUCTION TRADE-OFF IN A WING-DIMORPHIC INSECT

A.J. Zera, *University of Nebraska, Lincoln, Nebraska*

Dispersal polymorphism is common in insects, involves large-magnitude trade-offs between resources devoted to dispersal capability vs. reproductive effort, and is a useful model to investigate mechanisms underlying life-history trade-offs. In the cricket *Gryllus firmus* the genetic trade-off between triglyceride (flight fuel) accumulation and early age fecundity results from differential allocation of absorbed nutrients, but not differential acquisition of nutrients. Radiotracer studies have documented extensive morph-specific alterations of lipid metabolism such as fatty acid biosynthesis and oxidation, and relative biosynthesis of triglyceride vs. phospholipid. Consistent with expectations of Metabolic Control Analysis, flux differences are caused by correlated changes in specific activities of numerous enzymes of lipid metabolism, which, in turn, appear to be due to altered hormonal control of gene regulation. Advantages and disadvantages of using natural genetic variation vs. laboratory-generated mutations in studies of life history trade-

offs will be discussed. Research supported by NSF IBN-9808249 and IOS-0516973.

PHYSIOLOGICAL EVOLUTION IN NATURAL POPULATIONS OF SNAKES WITH DIVERGENT LIFESPANS, BUT NEGLIGIBLE SENESENCE

A. Bronikowski, K.A. Robert, *Iowa State University, Ames, Iowa*

Reptiles are an underutilized model for studying the biology of senescence; the existence of negligible senescence in many reptile species suggests that their study could provide intriguing insights into the biology of “not aging.” Long-term studies of natural populations of garter snakes combined with laboratory manipulative experiments will be discussed. Specifically, populations of garter snakes (*Thamnophis elegans*) in the Sierran Nevada range are differentiated along a slow/fast pace-of-life continuum. Individuals either: grow slow, reproduce late, and live many years; or they grow fast, reproduce early, and have short lifespan. I present results on the sources of mortality in the wild that have likely moulded their respective life-histories. And I provide detailed results of physiological experiments in the laboratory that reveal that the long-lived phenotype has evolved better resilience to oxidative and other stresses.

SESSION 785 (SYMPOSIUM)

APPROACHES FOR HEALTH PARITY AND ASSESSMENT FOR OLDER PEOPLE WITH INTELLECTUAL DISABILITIES

Chair: *E. Perkins, School of Aging Studies, University of South Florida, Tampa, Florida*

Discussant: *E. Ansello, Virginia Commonwealth University, Richmond, Virginia*

This is the official symposium for the Formal Interest Group on Developmental Disabilities. Increased longevity of adults with intellectual and developmental disabilities (IDD) has resulted in a greater need to determine lifespan access to health care and appropriate assessment of health status. There is concern regarding disparity in health access and status of persons with intellectual disabilities when compared with the general population. This symposium highlights research examining assessment of health and special health care issues of older adults with IDD. Specifically, Hsieh and Yamaki examine the health status and health risks of adults with IDD who reside at home. They also investigate the quality of preventive health care and dental services and report that disparity exists between IDD and non-IDD populations. Robinson, Davidson, Henderson and Janicki have used the Rochester Health Status Survey to estimate health trajectories and health service utilization for older adults with IDD. Though health status changes are similar to the non-IDD population, their data indicates that dental, psychiatric and behavioral health utilization raises important concerns. Finally, Lucchino describes the issues of long term medication usage and the increasingly common occurrence of Adverse Drugs Reactions (ADR's) in older adults with IDD. Each of these presentations highlight that health care issues in older adults with IDD require greater attention in assessing overall health access, promotion of preventative health care, and better health surveillance across the life span in this population.

HEALTH STATUS AND HEALTH CARE ACCESS AMONG ADULTS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES LIVING AT HOME

K. Hsieh, K. Yamaki, *Disability and Human Development, University of Illinois at Chicago, Chicago, Illinois*

Background: Access to quality health care for people with developmental disabilities (DD) has been a public health concern since the deinstitutionalization movement. In addition, they are likely to experience poorer health than the general population. This study sought to address

quality of health care by examining: (1) What is the health status and what are the health risks of adults with DD who reside at home? and (2) What is the quality of health care that this population receives regards to preventive health care and dental services? Methods: Data were collected on a sample of 238 adults with DD living at home with their family members who served as informants to fill out a questionnaire. Results: Health status, such as prevalence rates of high blood pressure, high cholesterol, obesity, and diabetes among adults aged 18-39 years, were comparable to those of their counterparts without disabilities. However, adults with DD aged 40 and older were more prevalent in obesity and physical inactivity; meanwhile they had lower rates of high blood pressure, high cholesterol, and cigarette smoking. Over 25% of the study subjects were taking psychotropic drugs. Although 86% of the study subjects had a physical examination within the past year, only 42% had received influenza vaccines. More than half of the study subjects had no dental insurance. Conclusions: People with DD have experienced health disparities. It is necessary to establish an effective quality assurance program that will promote healthy behaviors and provide preventive and dental services for people with developmental disabilities.

ASCERTAINING HEALTH-RELATED INFORMATION ON ADULTS WITH INTELLECTUAL AND DEVELOPMENTAL DISABILITIES: DATA COLLECTION AND RESULTS USING THE ROCHESTER HEALTH STATUS SURVEY

L.M. Robinson¹, P.W. Davidson¹, C.M. Henderson¹, M.P. Janicki², 1. *University of Rochester Medical Center, Rochester, New York, 2. University of Illinois at Chicago, Chicago, Illinois*

There is a lack of information about the health status and health care needs of people with intellectual or developmental disabilities (IDD) reaching older adulthood. Such information is needed to develop effective policies and practices that extend life, prevent morbidity, and increase the likelihood that persons with IDD can continue to lead independent and productive lives. We have developed the Rochester Health Status Survey (RHSS), a survey instrument to estimate health trajectories and health services utilization among older people with IDD. Cohorts have been surveyed in several sites in the US and in Israel and Taiwan. Our data indicate that health status changes with increasing age among people with IDD in a manner similar to what would be expected among people without IDD. However, there are disparities between trends for people with and without IDD. Organ system morbidity may vary with IDD diagnosis and as a function of provider practices. The trends identified in our research confirm some previous suspicions about health outcomes but also raise important questions regarding dental health and psychiatric and behavioral health. There is also a lack of information about the status of risk factors for acquiring diseases and disorders, in turn limiting the identification of strategies to prevent or reduce disease onset or severity. Defining and reducing disparities would be accelerated by more comprehensive data.

ADVERSE DRUG REACTIONS AND ADULTS WITH DOWN SYNDROME

R. Lucchino, *Utica College, Utica, New York*

There is no debating the fact that medications have been responsible for an increase in longevity and quality of life in the general population. The IDD population, especially Down's syndrome, is now reaching 60 to 80 year old age groups. As this population ages, so do the numbers of adverse drug reactions. The reason is three fold: a) age related biological changes, b) the number of medications person are consuming, and c) the aging- in of medications. The attention to ADR's has focused mainly on the general aging population, with very little focus on the IDD population. The concerns of medications and ADRs in the IDD population, especially the aging in of medications, will be the focus of this presentation. A new paradigm will be presented that equates changes in behavior and biology with ADRs that mimic age related changes that may be due to the aging-in of medications.

SESSION 790 (PAPER)

ARTHRITIS, PAIN AND PSYCHOSOCIAL FACTORS

FIT AND STRONG!: DISSEMINATION OF AN EVIDENCE-BASED INTERVENTION FOR OLDER ADULTS WITH OSTEOARTHRITIS

S. Hughes, R. Seymour, P. Desai, *Center for Research on Health and Aging, University of Illinois at Chicago, Chicago, Illinois*

The translation of evidence-based programs for older adults is a major public health priority. Fit and Strong! is an award winning evidence-based, multi-component exercise/behavior change program for older adults with osteoarthritis that is being diffused throughout the United States. Currently, two collaborative efforts are underway to translate and diffuse Fit and Strong!. The first effort is funded by the Centers for Disease Control and Prevention (CDC) and supports dissemination of the program in two states (1R18DP001140). Fit and Strong! is being diffused in two areas on aging in Illinois and two areas on aging in North Carolina with a minimum of 30 providers, involving the enrollment of 1,200 new participants. The Fit and Strong! team is also partnering with the National Arthritis Foundation (NAF) to translate and diffuse the program within four chapters: Northern and Southern New England, Northern California, Michigan, and Western Missouri/ Kansas. The goal of this partnership is to identify 24 new providers (6 per state) who can adopt the program, train and evaluate implementation of the program by 24 new instructors (6 per state) and enroll an additional 480 persons in the program. As a result of these efforts, we now offer the program in 7 states at 26 sites with 54 trained instructors and 292 participants. Pre-post outcomes and program evaluations are currently being collected. Factors that facilitate and impede program adoption, fidelity/adaptation, and sustainability will be discussed. Progress to date in translating/ diffusing the program will be described.

ROLE OF SOCIAL RELATIONS AND NEUROTICISM IN PSYCHOLOGICAL OUTCOMES FOR OLDER ADULTS WITH OSTEOARTHRITIS

A.M. Sherman, *Psychology, Oregon State University, Corvallis, Oregon*

Osteoarthritis (OA) is the most prevalent form of arthritis for older adults and can severely undermine psychological well-being. Psychological functioning (depressive symptoms, self-esteem, and life satisfaction) were investigated in the present study, using a sample of older adults (N = 160, mean age = 74 years) with self-reported OA. We investigated the relationship between social support, social strain, and neuroticism to the three outcomes. Hierarchical multiple regression analyses controlled for age, gender, income, and pain and severity of OA. Analyses indicated that neuroticism was significantly associated with all three outcomes, and further, that neuroticism fully mediated the association of social strain to all three outcomes, as well as the association of social support to self-esteem (using follow-up Sobel tests of mediation). Discussion will center on the contrasting mediation patterns for support and strain and the importance of evaluating both personality traits and existing social contexts for this population.

THE RECIPROCAL RELATIONSHIP BETWEEN PAIN AND DEPRESSION IN ARTHRITIC MEXICAN-AMERICAN OLDER ADULTS

M. Sutton, G.I. Caskie, *Lehigh University, Bethlehem, Pennsylvania*

Although previous research indicates a strong association between self-reported pain and depressive symptoms, the direction of this relationship has been greatly debated. In addition, few studies on the pain-depression link utilize ethnic minority older adults. The current study focuses on arthritis pain and depressive symptoms over seven years in a group of community-dwelling Mexican-American seniors from the Hispanic EPESE database. The direction and possible reciprocity of the relationship between pain and depression is examined utilizing a cross-

lagged panel design within a structural equation model. The total sample consisted of 1,166 participants reporting arthritis at baseline. Participants were, on average, 73 years old ($SD=6.6$), had 4.9 years of education (range=0-17), and included a total of 823 females and 343 males. The full model, in which all cross-lagged paths from pain-to-depression and depression-to-pain were estimated, showed good fit to the data ($\chi^2(8)=8.283$, $p=.406$, $TLI=.99$, $CFI=1.0$, $RMSEA=.006$). Including only the pain-to-depression paths or only the depression-to-pain paths significantly decreased the overall fit of the model when compared with the full model (both $ps<.01$), indicating that all cross-lagged paths should be included in the model. Although depression at waves 1 and 2 predicted pain at waves 2 and 3, respectively, all cross-lagged paths from pain to depression were significant (all $ps<.05$). Results show that, over this seven-year period, a reciprocal relationship existed between self-reported pain and depressive symptoms in this minority sample. These findings indicate that clinicians may need to take into account both pain and depressive symptomatology when working with older Mexican-American adults.

THE ROBUST ASSOCIATION BETWEEN CHILDHOOD PHYSICAL ABUSE AND OSTEOARTHRITIS IN ADULTHOOD: FINDINGS FROM A POPULATION BASED STUDY

E. Fuller-Thomson, M. Stefanyk, S. Brennenstuhl, *University of Toronto, Toronto, Ontario, Canada*

Research suggests a role of early life trauma in the development of arthritis. This study investigated the relationship between childhood physical abuse and osteoarthritis (OA) while controlling for age, gender, race, and socio-economic status (SES) in addition to the following types of risk factors for OA: 1) concurrent childhood stressors (ie. parental divorce, addictions and long term unemployment); 2) adult health behaviours (ie. obesity, smoking, alcohol consumption, activity level); and 3) depression. Data from the provinces Manitoba and Saskatchewan were selected from the 2005 Canadian Community Health Survey ($n=13,093$). Respondents with missing arthritis data or with arthritis types other than OA were excluded ($n=1,985$). Of the 11,108 remaining respondents, 854 reported childhood physical abuse by someone close to them and 1,452 reported that they had been diagnosed with OA by a health professional. The regional level response rate was 84%. When adjusting for controls and all three clusters of risk factors, a significant association between childhood physical abuse and OA was found of 1.56 (95% CI = 1.21, 2.00). The odds ratio for OA was only slightly higher at 1.99 (95% CI = 1.57, 2.52) when adjusting for sociodemographics (e.g. age, race, gender, education and household income). The association between childhood physical abuse and OA remained significant even after controlling for risk factors that may mediate the relationship. Further research is needed to investigate potential pathways through which arthritis develops as a consequence of childhood physical abuse.

PAIN, DISABILITY AND DEPRESSION IN OSTEOARTHRITIS: RACE AND SEX MAKE A DIFFERENCE

P. Parmelee¹, T.L. Harralson², J. DeCoster¹, H. Schumacher³, *1. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama, 2. Albert Einstein Medical Center, Philadelphia, Pennsylvania, 3. University of Pennsylvania, Philadelphia, Pennsylvania*

Chronic pain and disability are linked with depression in complex ways. However, aside from some evidence on differential experience and presentation of symptoms, there has been surprisingly little research on racial differences in pain, and virtually none on the pain-disability-depression link in minorities. This project therefore examined these dynamics among African American (AA; $N=94$) and Caucasian (CA; $N=269$) older persons ($M=68$ years) with diagnosed osteoarthritis of the knee (OA). In-person interviews used standardized measures of depressive symptoms, OA-related pain and disability, general health, and other

variables. A series of regression analyses examined demographic characteristics, OA severity (duration, joint count, one/both knees), perceived and objective general health, pain and disability as predictors of depressive symptoms. After adjusting for other predictors, expected positive relationships among pain, depression and disability remained for the sample as a whole. However, depressive symptoms were greater among CAs than AAs. There was also a significant interaction of race with disability. Here, the usual positive association was observed for CAs, but AAs displayed a negative relationship of pain with functional disability. Subgroup analyses examining sources of possible collinearity further revealed marked race by sex interactions. Specifically, AA men displayed much stronger correlations of depression with pain and disability than did CA men. These interactions did not extend to the depression – overall health association, and no interactive effects were observed among women. Discussion addresses possible sources of differences along with their implications for research on and treatment of pain among ethnic minorities. (Supported by R01 MH-51800)

SESSION 795 (SYMPOSIUM)

AWARENESS OF AGE-RELATED CHANGE: EXAMINATION OF A PROMISING CONCEPT

Chair: M.K. Diehl, *Human Development & Family Studies, Colorado State University, Fort Collins, Colorado*

Discussant: U. Staudinger, *Jacobs University Bremen, Bremen, Germany*

The purpose of this symposium is to provide a systematic examination of the concept of Awareness of Age-Related Change (AARC) and a comparison with already established concepts such as age identity and subjective age status. Although the awareness of getting older is a major subjective component of human development and the aging self, a systematic conceptualization of this phenomenon has so far not occurred in the social gerontological literature. For the purposes of this symposium, we define AARC to include all those experiences that make a person aware that his or her behavior, level of performance, or ways of experiencing life have changed as a consequence of increased chronological age. Although this definition has some affinity to already established concepts, such as subjective age status or age identity, we argue that AARC goes beyond these concepts and can play an integrative role in theoretical and empirical work. Specifically, we propose that the concept of AARC can play a critical role in accounting for several well-documented phenomena in aging research, including between-person differences in proactive and age-related compensatory behavior. During this symposium, the utility of the AARC concept will be examined in contrast and comparison with existing and new research on the function of age identity and subjective age status. Specifically, the concept of AARC will be critically examined in terms of its additional explanatory value with regard to outcomes such as life satisfaction and level of functioning in specific behavioral domains, such as cognitive functioning.

THE CONCEPT OF AWARENESS OF AGE-RELATED CHANGE: POTENTIAL OF INTEGRATION AND STIMULATION OF NEW RESEARCH

H. Wahl¹, M.K. Diehl², *1. University of Heidelberg, Heidelberg, Germany, 2. Colorado State University, Fort Collins, Colorado*

The awareness of having grown older is a major subjective experience during the adult years. Given the ubiquity of this experience, it is surprising that social gerontology still lacks a systematic body of respective theoretical and empirical work. The concept of Awareness of Age-Related Change (AARC) is introduced with the intention to integrate what research on subjective age experiences and age identity already offers. The main objective of this presentation and the overall symposium is to stimulate new research. We define AARC to include all those experiences that make a person aware that his or her behavior, level of

performance, or ways of experiencing life have changed as a consequence of increased chronological age. The sample domains of health and physical functioning, cognitive functioning, and interpersonal relations are used to illustrate the relevance of AARC. We end with an integrative framework and a conceptual model for a future research agenda.

AGE IDENTITY AND SELF-ESTEEM IN THE UNITED STATES AND THE NETHERLANDS: THE ROLE OF IDENTITY PROCESSES AND THE EXPERIENCE OF AGING

G.J. Westerhof¹, S.K. Whitbourne², 1. *Psychology and Communication of Health and Risk, University Twente, Enschede, Netherlands*, 2. *University of Massachusetts, Amherst, Massachusetts*

Feeling younger than one's chronological age is generally seen as a strategy to enhance self-esteem in a youth-oriented culture. This study examined identity processes and the personal experience of aging as possible mediators of this relation in persons between 40 and 85 years in the United States (N=377) and the Netherlands (N=249). Americans reported a more youthful age identity and a stronger use of assimilative identity strategies than the Dutch. They experienced the aging process less as physical loss and more as continued growth, but equally in terms of social loss. Identity processes mediated the relationship between age identity and self-esteem in both countries, but the personal experience of aging did so in a stronger way in the USA. The self-enhancing function of youthful identities is thus more a matter of personal experiences of the aging process in the more youth-oriented American culture than in the Netherlands.

TWELVE-YEAR CORRELATED CHANGES IN SUBJECTIVE COGNITIVE COMPLAINTS AND MEMORY IN OLD AGE

D. Zimprich, M. Martin, *Gerontopsychology, University of Zurich, Zurich, Switzerland*

The question of whether and how subjective cognitive complaints are related to memory performance represents a central issue in applied cognitive aging research. However, many cross-sectional studies have failed to find a strong association between subjective and actual cognitive performance. In the present study, the association between 12-year changes in cognitive complaints and memory performance was assessed in a sample of older adults (N = 297, mean age at T1: 62 years) from the Interdisciplinary Study on Adult Development (ILSE). Results show that level of cognitive complaints and level of memory functioning correlated .18 at T1. By contrast the correlation between changes in complaints and changes in memory was .61, showing that the effect size regarding changes was about ten times as large. We conclude that there is a strong association between complaints and memory performance, but that the association is a dynamic one.

"STILL AN OPTIMIST ...": FUTURE TIME PERSPECTIVE, RESIDUAL LIFETIME, AND OPTIMISM IN OLD AGE

D. Ferring, I. Albert, T. Michels, *University of Luxembourg, Luxembourg, Luxembourg*

It is an essential characteristic of ageing that perceived residual lifetime and future time perspective diminish with increasing age; the temporal space for realizing one's projects get smaller the closer one gets to one's life expectancy. While future time perspective describes the temporal space and the projects to be realized within that space, optimism as a further construct also contains expectations about one's future in the form of generalized outcome expectancies. All three concepts – future time perspective, residual lifetime, and optimism – are involved in the process of regulating age awareness, and differing relations between these may be expected. Starting with a sample of 2.175 elderly adults between 50 and 90 years of age, the current study investigated the relations between the three concepts across four age groups as well as their relation with life satisfaction; all concepts were assessed using questionnaires. Findings showed (a) that the correlation between future time perspective and optimism diminishes in a cross-sectional

comparison across age groups, (b) life satisfaction was significantly predicted by age, optimism and future time perspective, and (c) optimism proved to moderate the relation between limited future time and life satisfaction.

SESSION 800 (SYMPOSIUM)

COGNITION AND FUNCTIONING IN LATE LIFE: A SYMPOSIUM IN MEMORY OF STIG BERG

Chair: S.H. Zarit, *Human Development & Family Studies, Penn State University, University Park, Pennsylvania*

Discussant: M. Gatz, *University of Southern California, Los Angeles, California*

The papers in this symposium celebrate the career of Stig Berg, the long-time director of the Institute of Gerontology at Jönköping University who died earlier this year. Dr. Berg was a pioneer in studying the junction of behavioral, social and biological processes in late life. In an initial paper, Gerald McClearn provides an overview of Dr. Berg's career and role as a catalyst in developing groundbreaking studies of older twins and other longitudinal studies of late life. The remaining papers present current findings from studies of which Dr. Berg had been a part. Nancy Pedersen and colleagues demonstrate the interplay of genetic and environmental influences on cognitive decline in later life, suggesting that the environment affects the timing of decline. A specific risk for cognitive decline is obesity. Anna Dahl and colleagues show that body mass index in middle age contributes to steeper decline in selected cognitive abilities over a period of 18 years. Another major influence on health and mortality is gender. Using a sample of unlike sex twins that controls for the effects of early experience, Carol Gold and colleagues demonstrate that gender influences number of health conditions, health behaviors, and functioning, as well as the sequence of events leading to functional decline and mortality. Bo Malmberg uses a resource model to investigate people's responses to environmental demands. Measures of actual and perceived resources provide distinct and complementary perspectives on resources and together provide a better understanding of functioning in old age.

THE CHANGING ROLES OF GENES AND ENVIRONMENTS IN COGNITIVE AGING AND DEMENTIA

N.L. Pedersen^{1,2}, M. Gatz^{2,1}, C.A. Reynolds³, D. Finkel⁴, 1. *Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden*, 2. *University of Southern California, Los Angeles, California*, 3. *University of California Riverside, Riverside, California*, 4. *Indiana University Southeast, New Albany, Indiana*

Paradoxically, genetic variance appears to decrease longitudinally for fluid and speeded cognitive domains, yet genetic variance for memory increases and Alzheimer's disease evinces substantial heritability late in life, much greater than that for longevity or remaining life span. We and Stig Berg have recently analyzed longitudinal cognitive test scores with change point models and dynamic change models. Results suggest that while genetic influences may be important for individual differences in initial levels, decline and accelerated cognitive decline, environmental influences are key for timing of entry into a period of decline. These findings underscore the dynamic nature of the interplay between genes and environments for the aging process.

ACTUAL AND PERCEIVED RESOURCES IN AGING

B. Malmberg, *Institute of Gerontology, School of Health Sciences, Jönköping, Sweden*

A resource theoretical model with categories of actual and perceived resources in relation to environmental demands could be useful in gerontology to understand feelings and behavior in old age. It is well known in social welfare studies and gerontology that it is necessary to consider both objectively measured resources and the individual's perception of these resources separate, although actual and perceived resources

are often intermingled. One reason for keeping actual and perceived resources apart is that the actual resources only account for one aspect of the perceived resources. Swedish data are used to illustrate the adequacy of using both concepts. Discrepancies are discussed in terms of measurement problems, earlier experiences, the surrounding environment and personal style of answering. Studies where the distinction between actual and perceived resources helps us better understand results are presented.

STIG BERG: ACADEMIC CATALYST PAR EXCELLENCE

G.E. McClearn, *Biobehavioral Health, Penn State University, University Park, Pennsylvania*

This paper will present a brief history of the collaborative enterprise in interdisciplinary gerontology of which Stig Berg was a leader. Begun from an exchange of technical information concerning measurement of cognitive functioning, the venture matured into an extensive network of collaborators pursuing research and training in the richly complex junction of behavioral, social and biological perspectives on aging. Research populations were established and characterized, collaborative courses were designed, student and faculty exchanges were arranged, and joint academic appointments were made. In all of these developments, Stig was an irreplaceable motivating and facilitating figure. Not only will the continuing generation of research results and training of students from this consortium be a testimonial to his career; the memory of his humanity will be an abiding inspiration.

MIDLIFE BODY MASS INDEX AND LONGITUDINAL TRAJECTORIES OF COGNITIVE CHANGE IN LATE LIFE: FINDINGS FROM THE SWEDISH ADOPTION/TWIN STUDY OF AGING

A. Dahl¹, L. Hassing², E. Fransson¹, C.A. Reynolds⁵, M. Gatz^{4,3}, N.L. Pedersen^{3,4}, 1. *Institute of Gerontology, School of Health Sciences, Jönköping, Sweden*, 2. *University of Gothenburg, Gothenburg, Sweden*, 3. *Karolinska Institute, Stockholm, Sweden*, 4. *University of Southern California, Los Angeles, California*, 5. *University of California Irvine, Irvine, California*

This study examines the relationship between body mass index (BMI) assessed 1963 or 1973 and general cognitive ability, verbal abilities, spatial abilities, memory, and perceptual speed measured five times over 18 years beginning in 1986 as part of the longitudinal Swedish Adoption/Twin Study of Aging. The 781 participants were aged 25-63 (mean age 41.6 years) when BMI was assessed. Latent growth curve models adjusted for twinning showed that persons with higher midlife BMI scores had lower mean level cognitive test performance across all domains. Midlife BMI also predicted steeper decline for general cognitive ability and spatial abilities, but not for verbal abilities, memory, and perceptual speed. We conclude that midlife overweight is associated with lower cognitive abilities in late life and especially with steeper decline in spatial abilities. Prevention of overweight and obesity in midlife might be important for cognitive functioning in late life.

THE GENDER STUDY: A LONGITUDINAL STUDY OF HEALTH AND BEHAVIOR OF OLDER UNLIKE-SEX TWINS IN SWEDEN

C.H. Gold^{1,2}, B. Malmberg^{2,1}, G.E. McClearn^{1,2}, N.L. Pedersen^{3,2}, A. Dahl², S. Nilsson², M. Rovine¹, 1. *Gerontology Center, The Pennsylvania State University, University Park, Pennsylvania*, 2. *College of Health Sciences of Jönköping University, Jönköping, Sweden*, 3. *The Karolinska Institute, Stockholm, Sweden*

The Gender Study is a comprehensive program of research on older unlike-sex twins, providing an ideal sample for examination of gender differences in the aging process. The nationally-based sample of 605 twinpairs responded to a survey that assessed health and behaviors. A subsample (N=249 pairs) were then investigated in their homes by nurses who assessed their health and functioning in greater detail (3 visits per

subject over 8 years). Blood samples were collected; most twins released their medical records to us. Analyses have found important gender differences in numbers and severity of conditions, behaviors, and functioning, e.g., men suffered more depressive symptoms than women as disability increased. Currently we are examining gender differences in the sequential patterns of disease history and functional ability. For example, among those with diabetes, women have higher rates of hypertension, with 74% diagnosed with hypertension first (compared with 50% of men with same co-morbid pattern).

SESSION 805 (POSTER)

COGNITION I

NOCTURNAL SUBJECTIVE SLEEP AND DAYTIME COGNITIVE FUNCTIONING IN OLDER ADULTS WITH INSOMNIA

J.M. Dzierzewski¹, C.S. McCrae¹, M. Marsiske¹, K. McCoy², J. McNamara¹, N. Dautovich¹, A.M. Stripling¹, A. Ross³, 1. *University of Florida, Gainesville, Florida*, 2. *University of Texas, San Antonio, Texas*, 3. *University of Akron, Akron, Ohio*

Disturbance of daytime functioning is a hallmark of insomnia. However, such disturbances have been difficult to illustrate empirically. This study sought to examine the relationship between nocturnal subjective (i.e., self-rated) sleep and daytime cognitive functioning in a sample of fifty older adults with insomnia (Mage = 69.10 years, SDage = 7.02 years). This study employed daily home-based assessment utilizing sleep diaries and paper/pencil self-administered cognitive measures (i.e., Letter Series and Symbol Digit; reasoning and processing speed, respectively). Measures were completed over fourteen consecutive days. Regression analysis revealed: (1) longer reported duration of insomnia (# months of perceived insomnia) was related to better reasoning performance, $\beta = 0.32$, $p < 0.05$, and (2) increased average amount of time spent laying in bed awake each night was associated with better processing speed performance, $\beta = 0.52$, $p < 0.05$. Models accounted for a large amount of the variance in cognitive functioning, reasoning $R^2 = 25\%$; processing speed $R^2 = 28\%$. Discussion of these surprising findings will consider potential explanations, including: (1) whether potential adaptation or habituation to insomnia symptoms may occur over time, (2) whether older adults with insomnia are getting their physiological sleep needs met, and (3) whether unmeasured influences, like caffeine, lead to spurious associations. Future investigations should collect multiple indicators of sleep and cognitive functioning and should recruit mixed samples of older adults with/without insomnia in order to better disentangle the relationship between nocturnal sleep and daytime cognitive functioning in older adults.

COGNITIVE REASONING ABILITY IN PERSONS WITH PARKINSON'S DISEASE

E.M. Gagnon, M. Lunsman, S. Norris, R. Manno, N. Rubin, D. Pierce, A.M. McLaughlin, J. Edwards, *School of Aging Studies, University of South Florida, Tampa, Florida*

In addition to mobility impairment, individuals with Parkinson's disease (PD) also experience cognitive difficulties (Raskin et al., 1990). Even though cognitive difficulties, rather than physical impairments, are better indicators of future disability and long-term care (Bronnick et al., 2006; Aarsland et al., 2005), cognitive reasoning has not been examined in relation to PD. The purpose of the present study is to compare cognitive reasoning for instrumental activities of daily living among persons with and without PD. The study included 29 community-dwelling older adults (55 to 84 years of age), 19 of whom had PD. The Everyday Cognition Battery (ECB; Allaire & Marsiske, 1999) was used to measure cognitive reasoning for everyday tasks such as medication use and financial management. Using MANOVA, results indicated that participants with and without PD did not differ in terms of education,

age, vision, mental status, or depressive symptoms, Wilks' $\Lambda=0.779$, $F(5, 23)=1.30$, $p=0.297$. However, when comparing ECB performance using a T-test, results showed significant differences between the two groups ($t(26)=2.65$, $p=0.013$). The PD group scored lower, suggesting greater difficulty with everyday reasoning tasks. This is significant in that reasoning difficulties could affect the ability to live independently and make medical treatment decisions (Griffith et al., 2005).

PREDICTORS OF NEUROPSYCHOLOGICAL PERFORMANCE AMONG HIV-POSITIVE AGING ADULTS

P.L. Fazeli, J.C. Marceaux, D. Vance, *Psychology-Graduate School, University of Alabama at Birmingham, Birmingham, Alabama*

In the US, with 25% of those with HIV being 50 and over, there is concern that cognitive deficits may become pronounced as people age with this disease. The objective of this study was to identify predictors of neuropsychological performance among adults with HIV. The sample included 98 HIV-positive adults with a mean age of 45.2 (24-67). Participants completed psychosocial measures (Lubben Social Network Scale, Profile of Mood States, drug use) as well as neuropsychological measures of speed of processing (Useful Field of View, Complex Reaction Time Test, Digit Symbol Substitution), executive function (CLOX, Trails B), psychomotor ability (Trails A, Finger Tapping Test, Digit Symbol Copy), and memory (Digit Span, Spatial Span). Regression analyses investigated predictors of neuropsychological performance. Step 1 examined the contribution of age and education quality (WRAT-3 Reading), and step 2 examined the contribution of health on performance. Results indicated older age, poorer educational quality, mood problems and higher drug use predicted poor performance on several neuropsychological measures. The individual regression models for each measure explained 8-34% of the variability. Overall this study posits that among adults with HIV, the best predictors of neuropsychological deficits were older age and poorer quality of education. Additional predictors of cognitive deficits included mood problems and drug use. Health factors such as years diagnosed with HIV, and the size of social network were not predictors in any models. Results suggest that those aging with HIV are subject to decreases in cognitive functioning. Implications for clinical and research settings are provided.

SMOKING INCREASES RISK FOR COGNITIVE DECLINE AMONG COMMUNITY-DWELLING OLDER MEXICAN AMERICANS

N. Collins¹, N. Sachs-Ericsson¹, K.J. Preacher², K.M. Sheffield³, K. Markides³, 1. *Psychology, Florida State University, Tallahassee, Florida*, 2. *University of Kansas, Lawrence, Kansas*, 3. *University of Texas Medical Branch, Galveston, Texas*

Few studies have investigated the relation between smoking and cognitive decline among older Mexican Americans, one of the fastest growing populations in the US. In the current study we explore the relationship between smoking status and cognitive changes over time in a large sample ($N=1557$) of community-dwelling adults age 65 and older of Mexican descent obtained from the Hispanic Established Populations for Epidemiologic Studies of the Elderly (H-EPESE). Latent growth curve analyses were used to examine the decreasing growth in the number of correct responses on a test of cognitive functioning with increasing age (7 years with 4 data collection points). In-home interviews were obtained from community-dwelling older Mexican Americans residing in the Southwest United States. Cognitive functioning was assessed at each of the 4 data collection points with the Mini-Mental Status Examination (MMSE). Participants' self-reports of health functioning and smoking status were obtained at baseline. With the inclusion of health variables and other control variables (e.g., demographics, socioeconomic status, and physical functioning), the effect of smoking status on cognitive functioning was significant such that the decrease in the number of correct responses over time on the MMSE was greater for smokers than for non-smokers. Therefore, in the current study we found that

smoking increases risk for cognitive decline among community-dwelling older Mexican Americans. There are numerous health benefits in quitting smoking, even for older adults who have been smoking for many years. Further efforts to ensure that smoking cessation and prevention programs are targeted toward Hispanics are necessary.

VASCULAR RISK FACTORS IN RELATION TO UFOV PERFORMANCE AND DRIVING EXPOSURE

R.L. Benz, M. Crowe, M.L. Ackerman, V.G. Wadley, *School of Nursing, University of Alabama at Birmingham, Birmingham, Alabama*

Vascular risk factors – hypertension, diabetes, and high cholesterol – were examined as predictors of useful field of view (UFOV) performance and driving exposure in a sample of 297 older drivers (age 75+) who participated in the State Farm Senior Driver Research Project in Alabama. UFOV is a measure of visual processing speed and attention previously established as a screening test for prediction of crash involvement in older adults. Driving exposure, an indicator of mobility, was measured using a composite of days and miles driven per week. Mean age of participants was 79.5 years ($SD=3.8$), 95% were Caucasian, and 44% were female. Vascular risk factors were self-reported; 54% of participants had hypertension, 15% had diabetes, and 46% had high cholesterol. Logistic regression was used to examine odds of poor performance on the UFOV based on a previously established cutoff. In analyses controlling for age, gender, education, and depressive symptoms, diabetes was associated with UFOV performance indicative of elevated crash risk (odds ratio [OR]=2.11, 95% confidence interval 1.07-4.14, $p=.030$). Hypertension (OR=0.76, 95% CI 0.46-1.27, $p=.297$) and high cholesterol (OR=0.73, 95% CI 0.44-1.20, $p=.214$) were not. Multiple regression models were used to examine driving exposure as an outcome, though none of the vascular risk factors were significantly associated with driving exposure. Findings support a link between diabetes and UFOV performance, suggesting that individuals with diabetes may be at risk for negative driving outcomes, such as elevated crash risk.

PERFORMANCE-BASED MEASURES OF COGNITIVE AND EVERYDAY FUNCTION IN RELATION TO LIFE-SPACE

A.C. Sartori, M. Crowe, O.J. Clay, K. Ball, V.G. Wadley, *Psychology, University of Alabama at Birmingham, Birmingham, Alabama*

Life-space, a measure of spatial extent of one's day-to-day life, reflects everyday function beyond traditional IADL measures. We utilized multiple regression analyses to examine associations between performance-based measures of cognitive and everyday function and life-space using baseline data from the ACTIVE study, which included 2,446 adults age 65+ who had complete data for variables of interest. Cognitive function was measured by composite scores from neuropsychological tests of memory, reasoning, and processing speed. Performance-based measures of everyday function included the Everyday Problems Test (EPT), Observed Tasks of Daily Living (OTDL), and Timed Instrumental Activities of Daily Living (TIADL). Life-space was measured on a 9-point scale from the Life Space Questionnaire. Mean age of participants was 74 years ($SD=5.9$), mean MMSE score was 27 ($SD=2.0$), and mean life-space score was 7.20 ($SD=1.24$). In models that controlled for age, gender, race, years of education, depressive symptoms (12-item CES-D), and physical functioning (SF-36 Physical Component Score), each composite domain of cognitive function predicted life-space in separate models (memory $B=.089$, $p<.001$; reasoning $B=.117$, $p<.001$; speed of processing $B=-.067$; $p=.001$). To investigate whether performance-based measures of everyday function added predictive utility, these measures were included in additional multiple regression models controlling for demographic factors and the cognitive composite scores. TIADL significantly predicted life-space ($B=-.097$, $p<.001$), as did EPT ($B=.086$, $p=.003$). Findings support an association between cognitive function and day-to-day function measured by life-space, with evidence that performance-based functional tasks may increase predic-

tive utility beyond that provided solely by the more traditional cognitive tests.

AN EXAMINATION OF FUNCTIONAL SOCIAL SUPPORT AND COGNITIVE FUNCTION IN OLDER ADULTS

R.C. Sims¹, K.E. Whitfield³, S.R. Waldstein², 1. *Center for Aging and Human Development, Duke University, Durham, North Carolina*, 2. *University of Maryland Baltimore County, Baltimore, Maryland*, 3. *Duke University, Durham, North Carolina*

Social support has long been identified as a “buffer” against the pathogenic effects of stress. Social support is found to be protective against poor outcomes for a number of other indices of well-being. The presence or absence of social support has been associated with increased cognitive performance and cognitive declines, respectively. In examining the association between social support and cognitive function, it may be important to understand the function that social networks serve rather than just the structure or persons involved in the social network. The purpose of the analysis was to determine whether the receipt of four types of functional social support (i.e. appraisal, belonging, self-esteem, and tangible) helps to explain variability in cognitive function. It was hypothesized that more functional support received would predict greater performance across a number of cognitive domains. Participants were 178 stroke- and dementia-free older adults [M(SD) age = 66.48 (6.83); M (SD) education = 16.26 (2.94)]. Participants completed the Interpersonal Support Evaluation List (ISEL) and neuropsychological tests that assessed learning, memory, and abstraction ability. Blood pressure, cholesterol, fasting glucose, and BMI were also assessed. Linear regression was used to analyze the relations between functional social support and cognitive performance after for controlling for age, gender, education, and health status variables. Results showed that more functional social support predicted greater performance across these cognitive domains after controlling for the covariates. Findings suggest that social support received may play a role in preserving or buffering late life losses in cognitive function.

DIABETES AND COGNITIVE DECLINE IN OLDER AFRICAN AMERICANS AND WHITES

M. Crowe¹, O.J. Clay¹, A.C. Sartori¹, V.G. Wadley², R. Andel³, P. Sawyer², R. Allman^{4,2}, 1. *Psychology, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *UAB Division of Gerontology, Geriatrics, & Palliative Care, Birmingham, Alabama*, 3. *University of South Florida, Tampa, Florida*, 4. *Birmingham VA Medical Center, Birmingham, Alabama*

There is recent evidence that diabetes may be associated with greater risk of cognitive decline and dementia in older adulthood. We sought to examine the relationship between diabetes and four-year change in cognitive function as well as investigate factors related to health disparities – race, vascular risk factors, and health care access and utilization – as potential moderators of this association. Participants were 624 community-dwelling older adults (age 65+) living in central Alabama. Diabetes was ascertained by self-report with physician, hospital discharge, or medication verification at baseline. Cognitive decline was measured by change in Mini-Mental State Examination (MMSE) score. Mean age of participants at baseline was 74 years (SD=5.9), 49% were African American, 53% were female, mean MMSE score was 26 (SD=3.9), and 25% had diabetes. In a multiple regression analysis controlling for age, gender, race, level of education, urban/rural residence and baseline MMSE, diabetes at baseline predicted future cognitive decline ($\beta=.69$, $p=.01$). This association remained statistically significant after additional adjustment for baseline physical activity, depressive symptoms, vascular risk factors, and diabetes-related comorbidity ($\beta=.58$, $p=.04$). Potential interactions between diabetes and race, vascular risk factors, and health care access and utilization were investigated. Only health utilization moderated the association between diabetes and cognitive decline, whereby participants who reported absence of visiting a physi-

cian within the past six months experienced significantly more cognitive decline than those with more frequent physician contact. Findings support a link between diabetes and cognitive decline and suggest that seeing a physician more regularly may help prevent decline.

USE OF COMPLEMENTARY AND ALTERNATIVE MEDICINE FOR COGNITIVE FUNCTION: RESULTS OF A NATIONAL SURVEY

J.N. Laditka, S.B. Laditka, E.M. Tait, M.M. Tsulukidze, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Half of U.S. adults ages 50+ use complementary and alternative medicine (CAM). Adults are concerned about cognitive health; little research has examined their CAM use responding to that concern. Data were from the 2007 National Health Interview Survey (NHIS). Analyses included chi-square and multivariate logistic analysis, accounting for the survey design and weighted for national representativeness. Controls included age, sex, race/ethnicity, education, marital status, health insurance, comorbidities, self-reported health, recent health changes, smoking, body mass index, and region. We examined CAM use both including and excluding vitamins; reported results, for ages 50+ (10,104 respondents), include vitamins. Of those without cognitive problems, 8.4% used CAM; of the 11% with cognitive problems, 12.1% did so ($p<.01$). Of the 16.2% of the population taking herbal supplements, 14.6% took them “to improve mental ability or memory”; of 55.4% taking vitamins, 13.2% did so for that purpose. In adjusted results, people reporting cognitive problems were notably more likely to use CAM “to treat” the problems than others were “to prevent” them (Odds Ratio 1.56, 95% Confidence Interval 1.21-2.00). Of those using CAM, 27% said they do not tell their health providers. Results suggest a substantial number of older Americans use CAM specifically to prevent or treat cognitive problems. People with cognitive problems are notably more likely to use CAM than those without them. Individuals with cognitive problems should be encouraged to discuss CAM use with health providers, as some CAMs, particularly herbal supplements, may interact with conventional therapies often prescribed for older people.

MODERATORS AND MEDIATORS OF COGNITIVE DEFICITS ASSOCIATED WITH AGING AND TYPE 2 DIABETES

G. McFall¹, B. Geall¹, A.L. Fischer², S. Dolcos^{1,3}, R.A. Dixon¹, 1. *Department of Psychology, University of Alberta, Edmonton, Alberta, Canada*, 2. *Department of Psychology, Simon Fraser University, Burnaby, British Columbia, Canada*, 3. *Department of Psychiatry, University of Alberta, Edmonton, Alberta, Canada*

Type 2 diabetes is increasing in prevalence in North American older adults and may be linked to a heightened risk of cognitive deficits and dementia. The Victoria Longitudinal Study (VLS) is positioned to contribute to the resolution of inconsistent diabetes-cognition findings. In two previous VLS studies, we observed robust diabetes-related deficits in cognitive speed and speed-intensive executive functioning, both cross-sectionally (Yeung, Fischer, & Dixon, 2009) and longitudinally (Fischer, de Frias, Yeung, & Dixon, in press). In the present study, we examined the roles of 13 commonly cited potential covariates of diabetes-cognition relationships. Specifically, we tested whether VLS indicators from the domains of subjective health, physical/biological fitness, lifestyle activities, and personal affect served as significant covariates, moderators, or mediators of group differences. Using data from VLS Sample 3 (Wave 1 2002-03; $n = 577$; age range = 53 to 85 years), we followed documented multi-step diagnoses and applied recommended exclusionary criteria (e.g., type 1 diabetes, dementia, comorbidities). Study sample consisted of diabetes ($n = 41$, M age = 68.6) and control ($n = 465$, M age = 67.5) groups. Three main results are reported. First, six significant covariates were identified (depression, negative affect, blood pressure, gait/balance, subjective health, BMI).

Second, using established regression methods, we found that depression and negative affect moderated the effect of diabetes on two cognitive speed measures. Third, mediator analyses showed systolic blood pressure, gait/balance, and subjective health mediated the relationship between diabetes and a consistent set of speed, executive functioning, and episodic memory measures.

THE ROLE OF POSITIVE WELL-BEING AS A BUFFER OF COGNITIVE DECLINE IN OLDER ADULTS

J. Fairchild^{1,2}, S.A. Beaudreau^{1,2,3}, 1. *VA Palo Alto Health Care System, Palo Alto, California*, 2. *Mental Illness Research, Education, and Clinical Centers (MIRECC), Palo Alto, California*, 3. *Stanford University, Palo Alto, California*

The literature suggests that aspects of positive well-being influence cognitive functioning. To date, however, there are no prospective investigations examining positive well-being as a predictor of future memory performance. Hence, one of the goals of this study was to determine if positive well-being protects against or reduces cognitive decline over time. A second goal of this study was to determine if depression mediates the relationship between positive well-being and cognitive decline. Using data from the Health and Retirement Study, the authors examined whether positive well-being was predictive of memory change over four years in a community dwelling sample of persons aged 50 or older. Change in memory was quantified as the total score on a measure of immediate and delayed recall of a word list. Positive well-being was measured using an experimental measure consisting of questions addressing positive feelings about life and health. Finally depression was assessed using an abbreviated version of the Center for Epidemiological Studies – Depression Scale (CES-D). Hierarchical multiple linear regressions revealed positive well-being to be a significant predictor of cognition at a four year follow-up. Further analyses revealed this relationship to be partially mediated by depression. This study provides evidence that people with higher positive well-being had less cognitive decline over time, lending more support to the role of positive well-being in cognitive functioning. Future research should focus on identifying the specific aspects of positive well-being that are most important in cognitive functioning.

SELF-EFFICACY, MEMORY, & IDENTITY PROCESSES IN OLDER ADULTS

K.M. Jones, S.K. Whitbourne, T. Rahhal, *University of Massachusetts, Amherst, Massachusetts*

Memory is a salient area of functioning in adulthood known to be influenced by beliefs about performance, including self-efficacy (Hess, Hinson, & Hodges, 2009) and stereotype threat (Hess, Hinson, & Statham, 2004). In the present study, the influence of feedback on self-efficacy and memory performance was examined by comparing the performance of 98 older adults ($M=70.05$, 60-90) randomly assigned to conditions of positive, neutral, or no feedback. Participants' self-efficacy was measured following presentation of feedback. Based on previous research showing relationships between identity and memory control beliefs (Jones, Whitbourne, Whitbourne, Skultety, in press), memory performance under the three feedback conditions was assessed in relation to the process of identity accommodation (IAC; changing identity in response to age-related changes). Path analyses tested self-efficacy as a mediator of the relationship between IAC and memory performance, and whether feedback moderated this process. The hypothesis of mediation was not supported; however there was evidence that the relationship between self-efficacy and memory differed by feedback. While preliminary analyses showed no support for the role of IAC a significant relationship between self-efficacy and memory was found in the positive feedback group ($b=.28$, $SE=.14$, $t=1.96$). Further, model comparison tests indicated that these paths were significantly different in the neutral-no vs. positive feedback conditions (chi-square change= 5.17 , $df=1$, $p=.03$). In addition to showing support for the relationship

between self-efficacy and memory in older adults, the current study demonstrated that, when compared to neutral or no feedback, positive feedback enhanced the effect of self-efficacy on performance.

ATTENTIONAL CONTROL AND COGNITIVE PERFORMANCE: AN INTRUSIVE THINKING INDUCTION EXPERIMENT

C.B. Rosnick¹, M. Lachman², 1. *Psychology, Southern Illinois University Edwardsville, Edwardsville, Illinois*, 2. *Brandeis University, Waltham, Massachusetts*

Previous research suggests that there is an inhibitory deficit/ decrease in attentional control across the lifespan and these deficits are negatively related to cognitive performance. Although there appears to be a negative effect of attentional control on cognitive functioning, previous research has not examined whether or not this negative effect is the same across age groups. For the current study, we randomized 160 younger and 100 older adults into two groups: 1) experimental group (EG) - those who received a negative life events (NLE) questionnaire prior to cognitive testing; and 2) control group (CG) - those who received a NLE questionnaire after cognitive testing. We utilized the Thought Occurrence Questionnaire, the Cognitive Interference Questionnaire and the Impact of Events Scale to assess intrusive thinking (IT- our measures of attentional control). The participants completed seven cognitive tasks that were z-scored and combined to create an overall cognitive performance measure. The results revealed that the older adults in the EG reported more IT compared to both the older adults in the CG and the younger adults in the EG. Furthermore, regression analyses revealed a significant 3-way interaction where the older adults in the EG who reported more IT demonstrated the poorest cognitive performance. The current findings suggest that the placement of questionnaires evaluating life stressors may have an impact on cognitive performance especially for older adult participants.

AGE DIFFERENCES IN THE CALIBRATION OF WORD RECALL PREDICTIONS

A. Trujillo, A. Pearman, *Georgia State University, Atlanta, Georgia*

Calibration is an approach where people predict how well they might perform on a task and then adjust later predictions based on actual task performance and other variables. Research on age differences in calibration has not been as abundant as research on age differences for other metacognitive processes. This study was designed to explore age differences in the calibration process for word list recall in younger and older adults. The participants were 59 older adults volunteers ($M\text{ Age} = 76.83$ years, $SD = 8.28$) from the Atlanta area and 51 younger adults ($M\text{ Age} = 21.19$ years, $SD = 3.22$) solicited for participation through the Georgia State University. Each participant was asked to give a prediction of their word recall performance before taking the immediate task. After a 20 minute delay, participants were again asked to predict their word recall performance. Their predictions consisted of giving a number from 0-30 with 30 being the total number of words in the list. Calibration was designated as the residualized difference between posttest and pretest prediction. We used separate regression analyses for young and older adults to examine differential predictors of calibration and included actual test performance and memory self-efficacy as potential predictors. For the younger adults, both actual and perceived performance on the initial tests predicted their calibration. However, for the older adults, actual and perceived performance on the delayed test predicted calibration. These results suggest that younger and older adults are using different information to make their predictions of performance.

THE ROLE OF AGE AND AFFECT IN RISK PERCEPTION: A PROSPECT THEORY APPROACH

T.L. Queen, T.M. Hess, *Psychology, North Carolina State University, Raleigh, North Carolina*

Prospect theory has become a widely used model of risk in the decision making literature (Tversky & Kahneman, 1987). Research based on this theory has shown that individuals overweight the likelihood of occurrence of small probabilities and underweight the occurrence of large probabilities. This research has focused primarily on younger adults' probability weighting. Age differences may exist in this weighting function due to increased attention to affective information in later life, which may lead to greater probability neglect (Peters et al, 2007; Finucane, 2008). That is, due to declines in deliberative resources, older adults may seek out emotional information which may affect how likely they perceive highly probable versus less probable events to occur. This tendency may result in differential risk perception in younger and older adults. The goal of this study was to examine age differences in a traditional prospect theory task. Participants aged 23-85 were presented with 4 gambles and indicated how much money they would have to receive to forgo the gamble. Gambles were either presented as percentages (i.e. 1% chance of winning \$100) or ratios (i.e. 99/100 chance of winning \$100). In the ratio condition, older adults underestimated the likelihood of highly probable events whereas younger adults overestimated less probable events. Both younger and older adults displayed typical prospect theory findings in the percentage condition. Participants' probability weightings were moderated by their numeracy level; thus, less numerate participants displayed emphasized over and underweightings of probabilities. These results suggest that older and younger adults perceive risk differently.

CORTISOL RESPONSE TO COGNITIVE CHALLENGE: AGE AND TIME OF DAY DIFFERENCES AND RELATIONSHIP TO WORKING MEMORY

G.E. Ennis, S. Neupert, *Psychology, NC State University, Raleigh, North Carolina*

Experimental studies have suggested that acute cortisol elevations affect working memory whenever elevations are substantial and working memory load is high (Oei, Everaerd, Elzinga, Van Well, & Bermond, 2006; Lupien, Gillin, & Hauger, 1999). Whether such effects are also dependent upon time of day of testing have not been fully investigated (Het, Ramlow & Wolf, 2005). Using data from the Boston subsample of the second phase of the Midlife Development in the United States national survey, the present study explored whether acute cortisol elevations occurring during an in-home cognitive testing battery would be associated with working memory impairment and whether such effects would be moderated by age and time of day of testing. Cortisol was measured as change from baseline to the time just prior to the working memory test. Controlling for education and baseline cortisol, moderated regression revealed an Age X Cortisol Change X Time of Day interaction associated with working memory performance. Decomposition of this interaction suggested that older adult cortisol responders tested in the afternoon had similar working memory scores as younger and middle-aged adult cortisol responders tested at this same time. Since cortisol response to cognitive testing has been associated with increased education in older adults (Neupert, Miller, & Lachman, 2006), a multilevel model examined whether cortisol reactivity was associated with age, education and time of day of testing. Results suggested that educated older adults had increased cortisol reactivity in the afternoon compared to older adults tested in the morning, regardless of educational status.

NUMBER AND SEVERITY OF PAST DEPRESSIVE EPISODES PREDICTS HIPPOCAMPAL VOLUME IN OLDER ADULTS

K. Sawyer¹, N. Sachs-Ericsson¹, E. Corsentino¹, N. Collins¹, D. Steffens², *1. Florida State University, Tallahassee, Florida, 2. Duke University Medical Center, Durham, North Carolina*

Past studies have demonstrated that depression is a risk factor for subsequent cognitive decline (CD), yet there is some controversy as to the cause(s) of this relationship. Dementia may cause depression; alternatively, depression may be an etiological factor in the development of dementia. In the former case, depressive symptoms may be an early prodrome of dementia, or may be an initial response to the individual's experience of changes in cognitive functioning. In the latter case, the depressive disorder may accelerate the clinical manifestation of dementing diseases. Specifically, depression may damage the hippocampus through a glucocorticoid cascade, which results in neuronal death in the hippocampus, and consequent hippocampal atrophy. The aim of this study was to examine the glucocorticoid cascade hypothesis. We studied a sample of depressed, community-dwelling older adults who presented for treatment at a university medical center. All participants received a structured interview assessing current symptoms and past depressive episodes, and underwent structural MRI at baseline, we examined the relationship of number and severity of past depressive episodes to current hippocampal volume, and compared our results to health controls. Results highlight the importance of diagnosing and treating depression in the prevention of cognitive decline. However, a limitation of this study is its cross-sectional design: conclusions regarding causality can not be confirmed. Further studies might prospectively examine the relationship of depressive symptoms and subsequent hippocampal volume and cognitive status. After attending this activity, participants will understand one important biological factor in cognitive decline among older adults.

SESSION 810 (SYMPOSIUM)

COORDINATED AND POOLED DATA ANALYSES OF LONGITUDINAL STUDIES OF AGING AND DEMENTIA-RELATED CHANGE IN COGNITION, AFFECT, AND PHYSICAL FUNCTIONING

Chair: *S.M. Hofer, Dept. of Psychology, University of Victoria, Victoria, British Columbia, Canada*

Replication of research findings across independent longitudinal studies is essential for a cumulative and innovative gerontological science. However, comparison of results from longitudinal studies is often limited by the available published information, different designs and measurements, idiosyncratic analyses, and practical limits on full reporting of results. These challenges are essential to take into account in a cumulative science and may best be resolved through a collaborative research process. Both coordinated and pooled data analysis approaches can provide a broad foundation for cumulating scientific knowledge by facilitating efficient analysis of multiple studies in ways that maximize comparability of results and permit evaluation of study differences. Brent Small and colleagues report on changes in cognitive functioning observed prior to the diagnosis of dementia in a pooled data analysis of five studies. Magnus Lindwall and colleagues consider the link between physical exercise and cognitive function in a coordinated analysis of three Swedish studies. Scott Hofer, Andrea Piccinin, and colleagues present a comparative analysis of patterns of between-person age differences and within-person age changes in cognitive functioning across multiple longitudinal studies. Tessa Van den Kommer, Hannie Comijs, and colleagues discuss results from a classification model for the diagnosis of dementia using self-report, functional, and blood markers across Dutch and Swedish studies. Martin Sliwinski and colleagues examine change and within-person coupling of daily measures of stress and negative affect using data from two daily diary studies based on measure-

ment burst designs. Discussion will focus on strengths and challenges for collaborative analysis of longitudinal studies.

INTEGRATIVE ANALYSIS OF LONGITUDINAL STUDIES OF AGING (IALSA): PATTERNS OF BETWEEN-PERSON AGE DIFFERENCES AND WITHIN-PERSON CHANGES IN COGNITIVE CAPABILITIES WITH AGE

S.M. Hofer¹, A. Piccinin¹, D.E. Bontempo¹, C. Sparks¹, L. Hoffman², *1. Dept. of Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. University of Nebraska, Lincoln, Nebraska*

Describing and understanding influences on patterns of change in cognitive capabilities has been a major endeavor in lifespan developmental research. Numerous studies have contributed in this regard, with important differences observed between cross-sectional and longitudinal analyses. In addition, measurement and design characteristics (e.g., language, culture, history, demographics) across longitudinal studies must be considered in cross-study comparison. We present results from the Integrative Analysis of Longitudinal Studies of Aging (IALSA) network focused on comparison of patterns of average change in various types of cognitive functions with age. The cross-study, cross-construct comparison of patterns of change in distinct cognitive domains provides evidence for the sensitivity and specificity of particular cognitive measures (i.e., memory, reasoning, speed) and a basis for directly comparing further explanatory models of change. The results demonstrate the importance of not assuming convergence of BP and WP effects in models of change.

CHANGES IN COGNITIVE PERFORMANCE IN PRECLINICAL ALZHEIMER'S DISEASE: A COLLABORATIVE ANALYSIS

B. Small¹, J.J. McArdle², K. Langa³, R. Lipton⁴, J. Morris⁵, G. Smith⁶, M. Storandt⁵, R.S. Wilson⁷, *1. University of South Florida, Tampa, Florida, 2. University of Southern California, Los Angeles, California, 3. University of Michigan, Ann Arbor, Michigan, 4. Albert Einstein College of Medicine, Bronx, New York, 5. Washington University-St Louis, St Louis, Missouri, 6. Mayo College of Medicine, Rochester, Minnesota, 7. Rush University Medical Center, Chicago, Illinois*

Preclinical Alzheimer's Disease (AD) refers to a period of time prior to diagnosis where cognitive deficits are present among persons who will go on to be diagnosed with AD. Understanding the nature of changes in cognitive performance during the preclinical period is paramount, because it may allow us to identify persons at greatest risk of being diagnosed with AD and apply prophylactic treatments to slow the course of the disease. In the current study, changes in cognitive performance were examined by pooling data from 6 longitudinal studies of aging and dementia, which included 4,578 persons who were nondemented and 994 individuals who would develop AD across the follow-up period. Results indicate that changes in cognitive performance in preclinical AD are characterized by relative stability of differences that are evident many years prior to diagnosis, followed by rapid declines just prior to diagnosis.

PHYSICAL EXERCISE AND COGNITIVE FUNCTION IN OLD AGE: INVESTIGATING THE SAME RESEARCH QUESTION IN THREE DIFFERENT SWEDISH POPULATION STUDIES SIMULTANEOUSLY

M. Lindwall¹, L. Hassing¹, V. Thorvaldsson¹, S. Berg², N. Pedersen^{4,3}, M. Rennemark⁵, B. Johansson¹, *1. Department of Psychology, University of Gothenburg, Gothenburg, Sweden, 2. Institute of Gerontology, Jonkoping, Sweden, 3. University of Southern California, California, 4. The Karolinska Institute, Stockholm, Sweden, 5. Blekinge Institute for Research and Development, Karlskrona, Sweden*

Although reviews and recent studies show support for the notion that physical exercise may be protective of future cognitive decline and risk

of dementia, the question of dose-response in this relation is still unclear. Different studies show different results and draw different conclusions depending on the particular characteristics and methods used. Therefore, the purpose of this study was to conduct a coordinated analysis of the relation between exercise and cognitive status, and dose-response in this relation, in three large prospective population studies simultaneously. Data were drawn from the following three population studies: (a) Origins of Variance in the Old-old: Octogenarian Twins (OCTO-Twin); (b) Gothenburg Longitudinal Study of Aging (H70); (c) The Swedish National Study on Aging and Care (SNAC). Despite the different measures for exercise and cognition used, a similar trend was observed in the results; a moderate rather than strenuous dose was related to maintained cognitive function.

CLASSIFICATION MODELS FOR EARLY IDENTIFICATION OF PERSONS AT RISK FOR DEMENTIA, A REPLICATION STUDY

H. Comijs¹, T.N. Van Den Kommer², D. Bontempo³, S.M. Hofer³, M. Dik², A. Piccinin³, D.J. Deeg², B. Johansson⁴, *1. Psychiatry, GGZinGeest/VUMC, Amsterdam, Netherlands, 2. VU University Medical Center, Amsterdam, Netherlands, 3. Oregon State University, Oregon, Oregon, 4. University of Gothenburg, Gothenburg, Sweden*

The objective was to replicate classification models for early identification of persons at risk for dementia that were previously established in the Longitudinal Aging Study Amsterdam (LASA). Therefore data were drawn from the OCTO-Twin study, including 521 nondemented subjects aged ≥ 80 . Data were analyzed using generalized estimating equations and Cox survival analyses. The 2-year incidence of dementia (DSM-III-R criteria) was 6.9%. In the first model with predictors already known were analyzed, memory complaints and a MMSE score ≤ 25 resulted in a predictive value of 28.8%. In the second model in which also biomarkers were analyzed, the 8-year incidence was 15.0%. Low cholesterol and a MMSE score ≤ 24 resulted in a predictive value of 45.8%. Both classification models were a good replication of the classification models found in LASA, and may therefore be useful for the early identification of persons at risk for dementia in primary care.

AGE CHANGES IN DAILY STRESS PROCESSES: COORDINATED ANALYSES OF TWO MEASUREMENT BURST STUDIES

M. Sliwinski¹, D. Almeida¹, R.S. Stawski¹, J. Smyth², *1. Pennsylvania State University, University Park, Pennsylvania, 2. Syracuse University, Syracuse, New York*

There is little longitudinal information on aging-related changes in emotional responses to negative events. We will present coordinated analyses from two measurement burst studies that examined intraindividual change and variability in the within-person coupling of daily stress and negative affect. We will describe two sets of analyses. The first set of analyses examined how average reactivity to daily stress increased longitudinally, and how this increase was evident across most the adult lifespan. The second set of analyses examined the extent to which emotional reactivity to daily stress exhibited long-term temporal stability, and how this stability varied across the lifespan. Taken together, the present results emphasize the benefit of coordinated analyses of data from intensive measurement designs for understanding age-related changes in daily stress processes.

SESSION 815 (SYMPOSIUM)

CREATIVE ANTICIPATION/ANSWERS ON SOCIAL DEVELOPMENTS; LATE LIFE SOCIAL INTEGRATION AND LONELINESS

Chair: J. Gierveld, NIDI, The Hague, Netherlands, VU University, Amsterdam, Netherlands

Social integration is of pivotal importance in establishing older adults' health and well-being. Older generations who grew up with traditional family values, are now confronted with individualization and modernization, affecting the composition and functioning of their kin networks and the values that direct support between older and younger generations. In this symposium researchers address the following questions: Is social integration decreasing? Are older adults becoming lonelier or are they creatively anticipating and answering these developments? This symposium brings together researchers from various countries (Netherlands, Spain and the U.S.) to report about new patterns of social integration. (1) Over the adult life span the oldest people are most lonely but trends in social integration of older adults in the Netherlands over a period of 24 years showed no significant increases in loneliness. (2) Now that older adults confronted with widowhood and divorce are facing long periods of living alone, more older adults opt for new types of partner relationships via so called Living Apart and Together. Results from (qualitative) research in the Netherlands and (3) in the U.S. showed preferences for guaranteeing both independence and intimacy in the new partner relationship. (4) Research comparing older Spanish and Dutch adults showed differentiation in type but not in intensity of support exchanged between parents and adult children. Together these results show creative accommodation of older adults to social circumstances such as individualization and modernization.

OLD AND LONELY: A PERSISTENT MISCONCEPTION?

T. Van Tilburg¹, J. Gierveld^{2,1}, 1. Dept. of Sociology, VU University Amsterdam, Amsterdam, Netherlands, 2. NIDI, The Hague, Netherlands

People's social network reflects both changes in roles and personal properties associated with growing old and with earlier life stages. Adaptation of the network to the personal situation assumes that people of different ages has about an equal likelihood of becoming lonely. Data from three Dutch surveys (N = 1000; 7711; 5219) including people aged 18 years to 96 years are analyzed. Older people are more often lonely; however, the majority of the very old is not lonely. Older people are more willing to report their feelings of loneliness, but are not higher in social loneliness. The results indicate an increasing acceptance of loneliness by the oldest fitting with the stigma of old people as being lonely. Intervention should be focused on people's close relationships, and should address the issue of stigmatization of old people as being all lonely.

NETWORK CHARACTERISTICS, SUPPORT EXCHANGE AND LONELINESS AMONG SPANISH AND DUTCH OLDER ADULTS

M.M. Sanchez¹, J. Gierveld², J. Buz¹, 1. Universidad de Salamanca, Salamanca, Spain, 2. Netherlands Interdisciplinary Demographic Institute, Den Haag, Netherlands

This article uses comparable data from two samples of community-dwelling Spanish (N = 646) and Dutch older adults (N = 656). The aim of the study is to examine the prevalence and social determinants of loneliness in the two countries. The results show that more participants are lonely in Spain than in the Netherlands. Living with a partner and social network size are related to less loneliness in the two samples. However, differences are found in the composition of the social network and type of support exchanged. Having friends in the network is a predictor of less loneliness in Spain but not in the Netherlands. Moreover,

instrumental support is related to less loneliness in Spain and emotional support in the Netherlands. The results are discussed in the context of cultural differences in norms and values about social relationships and the meaning of intimacy and closeness in different countries.

LIVING APART AND TOGETHER AFTER WIDOWHOOD OR DIVORCE: GUARANTEEING INTIMACY AND INDEPENDENCE

J. Gierveld, 1. NIDI, Den Haag, Netherlands, 2. VU University, Amsterdam, Netherlands

This paper uses data of the Netherlands Kinship Panel Study, wave 1 and 2, and additionally qualitative data of persons in lat relationships to examine characteristics of lat relationships of older adults after widowhood or divorce. After 1990 the incidence of older adults in lat relationships as compared to adults without partners increased significantly. Lat relationships are most frequently seen among the cohorts aged 50 to 64; 15 per cent of those without a partner in the household are involved in a lat relationship. People in lat relationships live in their own household and during part of the week share living quarters and in doing so combine their preferences for independence and for intimacy. Feelings of social embedment largely depend on the continuing relationships with own kin and secondary on new relationships with kin from the partner's side.

LIVING APART AND TOGETHER: A UNIQUE SITE FOR THE EXAMINATION OF GENDER ROLES, AGING, AND SOCIAL INTEGRATION IN LATER LIFE

D. Brothers-Mcphail, Sociology and Gerontology, Miami University, Oxford, Ohio

The dominant understanding of gender roles tends to be functionalist in nature, focusing on how they change across the life course within the context of the performance of occupational and family roles. For older adults, understanding gender and aging is mostly within the context of long-term marriages, showing how in the empty nest phase, wives become more agentic and husbands become more communal. Living apart and together (or lat) relationships, however, are unique in that the lack of shared family roles and a common household involves partners negotiating and performing gender roles in new ways. This paper extends the understanding of gender roles in later-life by examining them within an emerging non-conventional relationship arrangement. Drawing on the experiences of older men and women in lat relationships, this paper uses themes from poststructuralism to theorize the role gender plays in the formation and experience of intimacy and independence in lat relationships.

SESSION 820 (SYMPOSIUM)

DISASTER EXPERIENCES OF OLDER ADULTS WITHIN THE CULTURAL CONTEXT

Chair: D. Shenk, Anthropology, University of North Carolina Charlotte, Charlotte, North Carolina

Discussant: S.B. Laditka, University of North Carolina at Charlotte — Public Health Sciences, Charlotte, North Carolina

The recent occurrences of natural disasters throughout the world have prompted communities to develop or revisit emergency readiness plans to address the needs of their more vulnerable members, including older adults. For such plans to be effective, it is important to understand the effects of disasters on older adults and how they are affected by, cope with and prepare for such experiences. Utilizing a lifecourse perspective, papers presented in this symposium will consider the experiences of and strategies for coping with a natural disaster by older adult survivors in Peru and the United States. The session includes two papers studying the experiences of older adult survivors of the 2007 earthquake in Peru and two examining the experiences of survivors of hurricanes Katrina and Rita in 2005. Each presentation considers the disaster experience.

rience in the context of a lifetime of choices within the cultural context. The first two papers are based on a study of older adult survivors of the August 2007 earthquake in Peru. Shenk et al examine the experiences of survivors within the cultural context of gender roles and family relationships and Ramos et al analyze the coping strategies used by these same survivors. Roberto, Yoshinori, and Henderson consider individual, family, and community issues and concerns in the aftermath of hurricane Katrina for older adults who had evacuated from the New Orleans area. Silva and Cherry focus on the effects of hurricanes Katrina and Rita on health and well-being of very old adults.

UNDERSTANDING DISASTERS WITHIN THE CULTURAL CONTEXT: THE EXPERIENCE OF OLDER ADULT SURVIVORS OF THE 2007 EARTHQUAKE IN PERU

D. Shenk¹, K.D. Kalaw¹, J.D. Mahon⁴, B.M. Ramos³, I. Tufan², 1. *University of North Carolina Charlotte, Gerontology Program, Charlotte, North Carolina*, 2. *Akdeniz University, Antalya, Turkey*, 3. *University of North Carolina Charlotte, Dept of Social Work, Charlotte, North Carolina*, 4. *AMIGOS Volunteer Association, Arequipa, Peru*

This paper examines the experiences of older adult survivors of the August 2007 earthquake in Peru within the cultural context of gender roles and family relationships. Peruvian society is based on strong gender roles that position women's roles within the home and family, while men are positioned within public spaces and the larger community. Peru is an impoverished country where the cultural myth remains strong that elders are cared for and receiving support within their families. Although many live with their families, many face old age with few personal resources or government support and are taken advantage of by their families. Semi-structured videotaped interviews were conducted with 24 adults, 60 years of age and older, who survived the August 2007 earthquake in Pisco, Peru. Their experience and adjustment to the disaster will be examined within the cultural context.

COPING AMONG OLDER ADULTS SURVIVORS OF THE 2007 EARTHQUAKE IN SOUTHERN PERU

B.M. Ramos¹, I. Tufan², D. Shenk³, J.D. Mahon⁴, 1. *University of North Carolina at Charlotte, Department of Social Work, Charlotte, North Carolina*, 2. *University of Akdeniz, Antalya, Turkey*, 3. *University of North Carolina at Charlotte, Department of Anthropology, Charlotte, North Carolina*, 4. *AMIGOS Volunteer Association, Arequipa, Peru*

Coping responses to a major natural disaster may vary qualitatively within specific contextual milieus. For older adults, individual and environmental factors such as life experience and culture differentially influence a survivor's appraisal of stressors and sanction the emotions and behaviors considered appropriate for coping. Using in-depth interviews, we explored coping strategies among older adults (N=24) who survived the major 2007 earthquake in Southern Peru. Participants were men (N=13) and women (N=11) ages 65-90, primarily married, and of low education. Survivors drew from their life-long experience, religion, and the cultural values of familism and collectivism for coping. The theme of resilience in the midst of great sadness, fear of the aftershocks, and little or no material resources permeated throughout. Quantitative research that further explores this line of inquiry with large samples is warranted. Implications for practice, policy, and international disaster preparedness education will be discussed.

REBUILDING A LIFE NOW GONE: CHALLENGES FACED BY OLDER ADULTS IN THE AFTERMATH OF HURRICANE KATRINA

K.A. Roberto¹, Y. Kamo², T.L. Henderson³, 1. *Center for Gerontology, Virginia Tech, Blacksburg, Virginia*, 2. *Louisiana State University, Baton Rouge, Louisiana*, 3. *Oklahoma State University, Stillwater, Oklahoma*

Older adults displaced by Hurricane Katrina (HK) faced many challenges during the evacuation process and in the months that followed.

We explored the effects of HK on the daily lives of older adults who relocated from the New Orleans area to the Baton Rouge area using written journal entries, photographs, and follow-up telephone interviews. The majority of the 27 participants were female (89%), Black (70%), and on average, 72 years of age. Results are presented in terms of three major themes that emerged from our analyses of 759 journal entries and 440 photographs: emotional health (positive and negative emotions), faith (prayer, church attendance, religious gratitude), and interactions with family, friends, and neighbors (support and assistance). The findings reveal the complexity of responses to HK and strategies used by older adults as they began to rebuild their lives, and point to interventions that could assist individuals and communities in this process.

THE EFFECTS OF HURRICANES KATRINA AND RITA ON HEALTH AND WELL-BEING IN LATE LIFE

J.L. Silva¹, K.E. Cherry², 1. *Drury University, Springfield, Missouri*, 2. *Psychology, Louisiana State University, Baton Rouge, Louisiana*

The occurrence of Hurricanes Katrina and Rita (HK/R) in the Gulf Coast region in 2005 resulted in a unique opportunity to examine the impact of a natural disaster on self-reported health, coping and psychosocial well-being in very old adults in the Louisiana Healthy Aging Study (LHAS). We retested LHAS participants age 45 to over 90 years for whom pre-disaster experimental testing was completed within an eight-month period prior to the storms. To document the richness and diversity of the participants' personal storm experiences, we included a qualitative assessment in the LHAS hurricane study that covered previous hurricane and flood experiences; emotional and cognitive reactions to HK/R, coping before and after the storms, and perceived silver lining/positive outcomes. Discussion will include those individuals who engaged in helping behaviors in order to cope with the destruction of the storms. Together, these data speak to adaptive coping, resiliency and well-being in late life.

SESSION 825 (POSTER)

FAMILY II

THE ROLE OF FAMILY LIVING ARRANGEMENT ON VASCULAR AND COGNITIVE HEALTH

A.M. Couto, A.J. Revell, *Department of Psychology, University of Massachusetts Dartmouth, North Dartmouth, Massachusetts*

The influence of family living arrangement (residing alone or with family) and perceived quality of interpersonal relations (those relationships deemed supportive) in predicting vascular and cognitive health was investigated. Mild cognitively impaired individuals with vascular disease have performed significantly worse on tasks assessing processing speed and attention, syntax comprehension, and working memory (Nordlund et al., 2007). Further, longitudinal research (Haberman, Cooper, Katona, & Livingston, 2009) has suggested that care recipients' cognitive impairment and health may be improved if the individual is allowed to remain at home longer with family caregivers. In our investigation of community-dwelling middle-aged and older adults (Mage=68.36, range 53-90 years), global cognitive status (MMSE = 25.26, range = 19-30), self-reported vascular health, and family living arrangement were assessed. Of those tested, 27 indicated having a history of vascular health issues (n=4 reported none). With respect to family living arrangement, 16 lived alone, 13 with family, and 2 with non-relatives. Results indicated no significant differences in performance on the MMSE for those between the ages of 53 to 68 and 69 to 90 years of age ($t = -.54, p = .59$). There were also no significant differences between persons with and without vascular health issues ($t = .83, p = .42$), or between those residing alone or with others ($t = .43, p = .67$). Additional testing on a larger sample will be necessary, in addition to multi-group analytic models on the levels of vascular risk severity and cognitive health among the three family living arrangement groups.

'ONLY TIME WILL TELL': CONSTRUCTING NARRATIVES ABOUT MARRIAGE, DISABILITY, AND FAMILY FOLLOWING SPINAL CORD INJURY

A.A. Bender, *Department of Sociology, Georgia State University, Atlanta, Georgia*

Most research on life transitions focuses on the expected transitions people experience over the course of their life, such as birth of a child and retirement. Fewer studies examine non-normative transitions. This project focuses on one non-normative transition, spinal cord injury (SCI), and how couples construct narratives following injury. SCI primarily impacts people during their early adult years with an average age at the time of injury of 38. At this age, many people are in the first decade of marriage, engaged in full-time employment, and transitioning into parenthood. Sustaining an SCI at any point in time is life altering, but it places unique challenges on younger couples who might be less established in their lives. This presentation focuses on the experiences of 15 couples who have recently faced an SCI. This project included in-depth interviews with each partner at one, three, and six months post-injury. Data were analyzed using Grounded Theory Methods, which were guided by Perspectives of the Life Course. This presentation focuses on how people conceptualize the present and future following traumatic injury. This study expands on LaRossa and Sinha's (2006) typology of narratives, which presents four directional narratives new parents use when discussing the transition to parenthood. By contrast, results from this project suggest there is an additional, fuzzy, narrative in use by patients and partners, which does not imply direction; rather, it implies ambiguity about the future. Following this session, participants will understand the narratives people construct about marriage, disability, and family following SCI.

RELATIONSHIP REGULATION IN THE TRANSITION TO FAMILY CAREGIVING IN MIDLIFE

M.K. Rohr, F.R. Lang, *Institut of Psychogerontology University Erlangen-Nuremberg, Erlangen, Germany*

How do age-related changes in personality, attitudes, cognition, and contextual aspects contribute to potential transitions into caregiving roles? What chances and challenges do potential caregivers anticipate when an older parent or a spouse is going to need care in near future? Which influence does the perceived urgency of potential care have on the evaluation of this transition? The current project explores the dynamic nature of transitions into a caregiving role and investigates the involved adaptive mechanisms of relationship regulation in a dyadic perspective. Preliminary results of an online study (N = 181) found small effects of demographic and personality characteristics on caregiving decisions. Further analyses will therefore focus on the role of relationship characteristics in approaching the subjective deadline of caregiving to older family member. Results are discussed with respect to models of developmental regulation and the process of goal-disengagement and re-engagement in midlife and late adulthood.

THE ATTITUDES OF THE YOUNGER AND OLDER GENERATIONS PRIOR TO AND AFTER AN INTERGENERATIONAL PROGRAM

M. Stone, *Case Western Reserve University, Cleveland, Ohio*

This study assesses older and younger adults' attitudes toward those of other ages and the ability of an intergenerational program to change the attitudes of younger and older adults. The contact hypothesis suggests that positive interaction, while meeting six criteria, may lead to positive attitude changes. Three intergenerational classes and a comparison group that is age-segregated are used to examine attitudes before and after the course. After participation in an intergenerational program, older adults exhibit significantly more positive attitudes toward younger adults than do younger adults about older adults. However, there is not a significant difference between pre- and post-test mean scores for those in the age-integrated and age-segregated courses. Qualitative observa-

tions suggest that a significant amount of positive intergenerational interaction occurs in the intergenerational courses, and are used to assess the context of the classes and to explain the findings.

AN EXAMINATION OF CAREGIVER DEPRESSIVE SYMPTOMS AND AMBIVALENCE FOLLOWING THE DEATH OF AN ELDER CARE RECIPIENT

K. Dooley¹, G. Williamson², *1. Psychology, Murray State University, Murray, Kentucky, 2. University of Georgia, Athens, Georgia*

Many informal caregivers confront the death of an elderly care recipient. Caregivers are not unique in experiencing emotional and psychological strain following this event, but pre-death factors may complicate their responses. We conducted in-person interviews before and after a care recipient's death to assess caregiver adjustment. Both care-related and psychosocial variables were associated with individual differences in caregiver depressive symptoms (e.g., amount of care, care-related activity restriction, physical health, relationship history, depressive symptoms, and social support before the death predicted 39% of variance in post-death depression). Furthermore, evidence suggests that some caregivers experienced positive and negative emotional reactions simultaneously (i.e., both grief and relief), each associated with unique pre-transition factors and predictive of post-transition psychosocial adjustment. This research leads to further questions about the occurrence of emotional ambivalence following the death of a care recipient. Our research contributes uniquely to existing research on the prevalence and implications of ambivalence in caregiving and other family relationships. Strategies for conceptualizing and measuring ambivalence following death and other caregiving transitions are discussed.

HOW CAN WE FIGURE OUT WHETHER THE PAID CAREGIVERS ARE TRUSTED IN THE HOME-BASED CAREGIVING?

W. Cho, D.C. Lewis, *University of Georgia, Athens, Georgia*

To provide better in-home care for an ill or frail elder, family caregivers tend to seek paid caregivers to help or to substitute for their care provision. For family caregivers, finding trustworthy paid caregivers becomes a critical matter of concern for protecting the care receiver against potential risks to his or her safety, such as financial exploitation and intentional abuse by the paid caregivers. Although it has been argued that the relationship with the hired caregiver is a crucial determinant to the quality of in-home care, there are few studies about family caregivers' trustworthiness of the paid caregivers in the relationships. To explore how family caregivers figured out whether the paid caregivers for in-home care could be trusted, in-depth interview were conducted with nine family caregivers. This study found that family caregivers tried to reduce the vague risk of hiring someone and to find a new paid caregiver they could trust through obtaining trustworthy referral sources (e.g., friends, family members, and care agencies), getting trustworthy reputations of candidates from the trusted references, and assessing potential for the good caregiving relationships. After hiring a new caregiver, family caregivers still tried to discern whether the hired caregivers could be trusted through keeping an eye on them. Personal (e.g., competence and conscience), interpersonal (e.g., maintaining the good relationship with the care receiver), and contextual aspects (e.g., providing the qualified and secure physical environment) of the paid caregivers were crucial for family caregivers to enhance confidence in the trust of the hired home-care workers.

EXEMPLARY CARE AS A MEDIATOR OF THE EFFECTS OF DAILY CARE BOTHER AND CAREGIVER EMOTIONAL OUTCOMES

G.M. Harris^{1,2}, D.W. Durkin^{3,2}, R.S. Allen^{1,2}, L. Burgio^{4,5}, 1. *Department of Psychology, The University of Alabama, Tuscaloosa, Alabama*, 2. *The University of Alabama - Center for Mental Health and Aging, Tuscaloosa, Alabama*, 3. *The University of Alabama - School of Social Work, Tuscaloosa, Alabama*, 4. *University of Michigan - Institute of Gerontology, Ann Arbor, Michigan*, 5. *University of Michigan - School of Social Work, Ann Arbor, Michigan*

Providing care to someone with dementia is extremely burdensome. Despite the experience of a burdensome situation caregivers report experiencing positive aspects of caregiving (PAC). The transactional model of stress has been applied to the caregiving situation to help explain what leads to positive and negative outcomes experienced by dementia caregivers. Daily Care Bother (DCB) and Exemplary Caregiving (EC) are new constructs that warrant further study within this model. Using the transactional model of stress, we examined the relation between caregiver subjective appraisal (DCB, Burden, and Behavioral Bother), Exemplary Caregiving, and caregiver emotional outcomes (Depression and PAC). Specifically, EC was examined as a possible mediator of the effects of caregiver subjective appraisal on emotional outcomes. Regression analyses revealed that, after controlling for caregiver demographics and care recipient cognitive impairment, EC partially mediated the relation between DCB and the emotional outcome variables. Caregivers with higher EC scores reported lower depression and higher PAC. Sobel test statistics were calculated and these indicated that the strength of the mediations were significant. Findings for burden and behavioral bother were insignificant. Caregivers' perception of providing exemplary care to individuals with dementia lessened the impact of DCB on caregivers' symptoms of depression and increased the probability that caregivers would experience higher PAC. These data support the use of the transactional model of stress and cognitive interventions for caregivers targeting perceptions of quality of care.

AN INTERVENTION FOR LATINO FAMILY CAREGIVERS OF ALZHEIMER'S PATIENTS: UNIQUE NEEDS AND RESEARCH GAPS

C.E. Greer, *Social Work, New York University, New York, New York*

Latinos are the fastest-growing subpopulation in the United States. By 2050 they are projected to account for 25% of the population. The number of older Latinos is expected to increase from 2 million in 2000 to over 13 million in 2050. Additionally, it is estimated that the number of Latinos suffering from Alzheimer's disease (AD) will increase from 200,000 to over 1.3 million by 2050. As a result the number of Latino family caregivers will also increase. Research has shown that caring for someone with AD is particularly burdensome for families, and Latinos have a unique set of needs. Latinos are at greater risk because of factors like increased prevalence of vascular dementia and genetic predisposition in several Latino subgroups. AD affects Latinos an average of seven years earlier than it does non-Latinos, and Latinos with AD tend to suffer from greater behavioral and cognitive impairment. Interventions are needed to assist Latino caregivers with the special challenges they face. As part of a larger two-year community-based study evaluating a caregiver intervention, 13 Latino caregivers, and their families, received an average of nine hours of clinical contact. Themes of the sessions were developed using content analysis of clinical notes and were compared and contrasted with one another and with the literature. This poster compares the caregiving literature with themes uncovered. Similarities and differences are explored in order to provide a deeper understanding of the unique factors, such as ethnicity, language, and immigration, involved in Latino family caregiving of Alzheimer's relatives.

PROCESS OF AMBIVALENT NORMALIZATION: EXPERIENCE OF FAMILY CAREGIVERS OF ELDERLY WITH MILD COGNITIVE IMPAIRMENT IN TAIWAN

L. Kuo¹, Y.L. Shyu², 1. *School of Nursing, Hsin Sheng College of Medical Care and Management, Taoyuan, Taiwan, Taiwan*, 2. *Graduate Institute of Nursing, Chang Gung University, Taoyuan, Taiwan, Taiwan*

Aims. To conceptualise the caregiving process in Taiwan families caring for an elder with mild cognitive impairment. **Background.** Family caregivers play an essential role in the lives of elders with mild cognitive impairment by dealing with their cognitive status and daily function. Little is known, however, about the development of the caregiving trajectory, particularly in Asian countries. **Design.** Grounded theory methodology was used. Data were collected via in-depth interviews with 10 family caregivers of patients with mild cognitive impairment and living at home in northern Taiwan. Data were analysed by constant comparative analysis. **Results.** The process most used by family caregivers to adjust to conflicts and changes in relationships with elders with mild cognitive impairment was 'ambivalent normalisation'. This dynamic process included three components: subtle changes, optimistic appraisal, and ambivalent anticipation. Family caregivers who had developed this process were more likely to adopt multiple effective behavioural approaches to avoid conflict in their daily life and to begin outlining future caregiving tasks. **Conclusions.** The process of ambivalent normalisation can sensitise healthcare providers to family caregivers' needs and provide a basis for developing frameworks for future substantive theory and possible future research. **Relevance to clinical practice.** Interventions can be developed to facilitate family caregivers' awareness of the changes in their loved one in the initial stage of diagnosis and adopt multiple effective strategies to prevent conflicts in their lives. Healthcare providers can actively examine the cognitive function of older people in general outpatient departments, provide well-timed treatments, and minimise caregiver burden.

BIOMARKERS ASSOCIATED WITH STRESS AND METABOLIC SYNDROME IN OLDER CAREGIVERS AND NON-CAREGIVERS

L. Fredman¹, S.O. Stuver¹, T.C. Chen², A.D. Coviello², 1. *Epidemiology, Boston University School of Public Health, Boston, Massachusetts*, 2. *Boston University Medical School, Boston, Massachusetts*

Psychoneuroendocrine theories propose that stress-induced neuroendocrine dysregulation may lead to metabolic syndrome, thereby increasing the risk of health decline. Thus, the interplay among stress, neuroendocrine biomarkers and metabolic syndrome may reveal how caregiving affects health. We investigated the cross-sectional associations between three biomarkers (cortisol and epinephrine from 24-hour urine, and plasma dehydroepiandrosterone-sulfate; DHEA-S), stress, and metabolic syndrome in preliminary data from 15 elderly dementia caregivers (CGs) and 90 non-caregivers (NCGs) living in the Boston metropolitan area. The sample's mean age was 75.6 years. CGs were more likely to be married (87% vs. 28%) and male (67% vs. 33%), but had the same prevalence of ATP-III- defined metabolic syndrome as NCGs (33% vs. 32%). CGs reported more stress: mean Perceived Stress Scale scores = 18.5 (+ 6.3) vs. 15.6 (+ 8.1) and 47% vs. 23% scored in the top sample-based quartile ($p=0.05$). More CGs than NCGs fell in the top tertile for cortisol (53% vs. 27%, $p=0.03$) and epinephrine (43% vs. 31%, $p=0.16$) and the lowest tertile for DHEA-S (67% vs. 28%, $p<0.01$). We found non-significant associations between higher stress and both metabolic syndrome (odds ratio, OR, = 1.5, 95% CI = 0.6-3.7) and dysregulation of the 3 neuroendocrine biomarkers (ORs from 1.3 to 2.5). Further, dysregulation in cortisol and epinephrine, but not DHEAS, showed non-significant associations with metabolic syndrome (ORs = 1.9, 1.8, and 0.6, respectively). Though limited by small numbers and few caregivers, these results suggest that psychoneuroendocrine

models of stress-induced metabolic syndrome may explain the caregiving-health decline relationship.

EMAIL QUESTIONS ASKED BY MALE AND FEMALE CAREGIVERS OF STROKE SURVIVORS

V. Steiner¹, L.L. Pierce², 1. *University of Toledo, College of Medicine, Toledo, Ohio*, 2. *University of Toledo, College of Nursing, Toledo, Ohio*

Following rehabilitation after a stroke, many families must learn how to manage the survivor in the home, which raises questions for family members who often feel unprepared and overburdened. This secondary data analysis examined questions asked by caregivers who conversed via email as part of a web-based intervention. The subjects were caregivers of stroke survivors [n = 11 males; 25 females] from Ohio or Michigan who were enrolled in a one-year study on the experience of caring. The subjects were primarily white spouses and, on average, 54 years old. Narrative content analysis of 2,148 email messages posted to the discussion group or asked of the online nurse resulted in themes that were drawn to Friedemann's framework of systematic organization. Socializing with a group [Theme 1], coherence in Friedemann's terms, emerged from the data for all subjects as they reached out to one another. Asking questions about medical care [Theme 2], system maintenance, also emerged as a theme for all subjects. Female caregivers' themes of validating their caregiving efforts [Theme 3], coherence, and dealing with change [Theme 4], system maintenance, emanated. The male caregivers' only theme of giving advice [Theme 5], system maintenance, also evolved. Although male and female caregivers asked different questions, both groups were doing everything in their power to preserve their lives and family system. They also needed more information and wanted to share helpful information with others. Healthcare professionals can use these themes as topics for educational interventions with caregivers either in a face-to-face or web-based format.

RELIABILITY AND UTILITY OF A NEW MEASURE TO ASSESS READINESS TO CHANGE IN DEMENTIA CAREGIVERS

S. Yarry^{1,2}, K. Judge^{3,2}, T. McCallum¹, 1. *psychology, Case Western Reserve University, Cleveland, Ohio*, 2. *Benjamin Rose Institute, Cleveland, Ohio*, 3. *Cleveland State University, Cleveland, Ohio*

Numerous interventions have been developed to alleviate the negative effects of caregiving for individuals with dementia. Readiness to change is a construct that may be useful in examining caregivers' investment in interventions. Readiness to change was assessed using a newly designed questionnaire for dementia caregivers adapted from previous measures (McConaughy et al., 1983), the Stages of Change – Dementia and Memory Loss. Each of the five subscales showed excellent reliability (Cronbach's alpha ranged from .70 – .84.) in a sample of 58 caregivers who were seeking to be enrolled in a psychoeducational intervention (Judge, 2007). Participants were then classified into one of the five stages of change based on subscale scores. Results indicated that none of the caregivers were classified into the Precontemplation stage of change. Participants clustered in the latter stages of change, with the majority of participants indicating readiness to change caregiving behaviors: Contemplation (n = 7), Preparation (n = 15), Action (n = 20), and Maintenance (n = 16). Results suggest that readiness to change is a reliable and valid construct among dementia caregivers. These findings show that caregivers differ from substance abuse samples on readiness to change because no participants were classified into the Precontemplation stage, and the majority of participants indicated a willingness to change caregiving behaviors. It is recommended that interventions focus on presenting specific caregiving skills to capitalize on this readiness (Prochaska, DiClemente, & Norcross, 1992). Future research should examine readiness to change as it relates to psychosocial outcomes of interventions among dementia caregivers.

GRANDCHILDREN AND GRANDMOTHERS' CAREGIVING: SUPPORT, RESOURCEFULNESS, FAMILY LIFE, AND DEPRESSIVE SYMPTOMS

C. Musil, C. Warner, J. Zauszniewski, T.S. Standing, M. Singer, M. Wykle, *School of Nursing, Case Western Reserve University, Cleveland OH, Ohio*

Although there has been much attention to grandmothers as caregivers to grandchildren (grandmothers raising grandchildren, grandmothers in multigenerational homes and non-co-resident grandmothers), there has been less attention to the grandchildren in these different family structures. Using McCubbin's Model of Family Stress and Adaptation as a framework, this study examined depressive symptoms, support and perceptions of family life in 145 Ohio grandchildren (age 8-19) whose grandmothers were participating in a larger study of caregiving to grandchildren, well-being and health. After appropriate assent and consent were obtained, grandchildren completed a survey packet that measured resourcefulness (Children's Resourcefulness Scale, Zauszniewski), subjective and instrumental support (Duke Social Support Index), family functioning (McMaster Family Assessment Device), parental/guardian monitoring (Parental Monitoring Scale, Singer), importance of religion, and depressive symptoms (CES-D, Radloff). Analysis included descriptive statistics, reliability analysis, correlations and analysis of variance. Measures showed good reliability. Results of correlation analysis indicate that higher resourcefulness was associated with fewer depressive symptoms, more subjective support and better perceptions of family functioning. Grandchildren who reported more depressive symptoms also reported less subjective support, perceptions of worse family functioning and less parental/guardian monitoring. Participants who reported the most parental/guardian monitoring also reported more instrumental support and a greater importance of religion in their lives. Differences between grandchildren in the three different family structures were limited to support received and given to their grandmother. The inter-relationships among the variables of parental/guardian monitoring, family functioning, support, and depressive symptoms will be discussed within the context of family structure and overall family dynamics.

AN EXPLORATION OF CULTURAL TOURISM AND INTERGENERATIONAL RELATIONSHIPS AMONG THE MAASAI OF TANZANIA

J.M. Kalavar¹, C. Buzinde², K. Melubo³, G. Chick², 1. *Human Development & Family Studies, Penn State University, Upper Burrell, Pennsylvania*, 2. *Penn State University, State College, Pennsylvania*, 3. *Tumaini University, Iringa, Tanzania*

Besides social, economic, and environmental impacts, tourism has been shown to have important effects on intergenerational relationships and community well-being in developing countries. This project examines the impact of tourism on intergenerational relationships and community well-being among the Masaai in the Ngorongoro Conservation Area (NCA) of Tanzania, an indigenous community residing in a popular, nature-based tourism destination. The principal method employed in this study will be focus groups in which the researchers will explore how community members define well-being and intergenerational An exploration of Cultural Tourism and Intergenerational Relationships among the Masaai of Tanzania relationships as well as the relationship of tourism to these two factors. Data collection will occur within two villages located in NCA, namely Oloirobi and Irmsigio. Examining the intergenerational relationships among the Masaai community will require an understanding of the gender-based age grading system which is unique to their ethnic group. Unlike occidental societies which tend to define generations based on age, the Masaai draw on cultural ceremonies and natural events to differentiate between, for instance, adolescence, adulthood and late adulthood. A feasibility study was conducted in October 2008 to ensure the viability of the proposed project. This presentation will seek to describe the age-graded societal structure

amongst the Maasai, identify the factors that influence community well-being in this region, and ascertain how heritage tourism is perceived by different age groups in this region. Findings from this study carry the potential to influence our understanding of intergenerational relationships in other indigenous contexts.

EXPLORING AGE RELATED DIFFERENCES FOUND IN FEMALE AFRICAN AMERICANS VIEWS OF POSITIVE FATHERHOOD

J.D. Jackson¹, J.S. Burnett¹, T.N. Robinson¹, R.B. Tucker², *1. Psychology, Kutztown Univ, Reading, Pennsylvania, 2. Shippensburg Univ, Shippensburg, Pennsylvania*

This investigation explored age related differences in the concept of African American (Black) Fatherhood from the perspective of black females. It also sought to explore their perception of the “positive” pedagogy black males utilize in fathering. Participants were composed of two groups of African American females, with the first group ranging, in age, from 18 to 25 years, and the second group ranging, in age, from 55 to 90 years old. Subjects were given a battery of tests, including the Rosenberg Self-Esteem Scale, the Multidimensional Inventory of Black Identity, and the Positive Fatherhood Demographics Sheet, and were then asked to list as many “positive” things as they could about Black Fathers. An analysis of the data shows both quantitative and qualitative differences in the number and types of positive descriptors reported by females, depending on self-esteem scores, MIBI scores, and age.

RELATIONSHIP QUALITY IN LIVING APART AND TOGETHER RELATIONSHIPS (LAT)

J. Bulanda, D. Brothers-Mcphail, *Miami University, Oxford, OH*

Research on the quality and dynamics of later life intimate relationships has largely been limited to marital relationships. However, a growing number of older adults are experiencing alternative types of intimate partnerships in later life, such as “living apart and together” (or LAT) relationships. LAT relationships, generally defined as committed relationships in which the partners maintain separate residences, are a growing trend among older adults in the U.S. However, we have little information on factors associated with relationship quality in these types of unions. We use data from the third wave of the National Survey of Families and Households (NSFH) to examine a sample of adults aged 50 and over who indicate they are currently unmarried but in a steady relationship. We use OLS regression models to examine correlates of relationship satisfaction (including sociodemographic factors, attitudinal factors, and anticipated relationship outcomes) among those currently in LAT relationships as well as to explore gender differences in relationship quality.

THE POSITIVE AND NEGATIVE APPRAISALS OF CAREGIVING ARE DIFFERENT CONSTRUCTS

S. Vernon-Scott¹, M. Bedard^{1,2,3}, *1. Public Health Program, Lakehead University, Thunder Bay, Ontario, Canada, 2. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada, 3. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

The literature suggests that caregivers are able to appraise caregiving experiences as both very rewarding and very burdensome. Furthermore, there are data showing the absence of correlations between appraisals of gain and appraisals of strain or burden. These data, and others, suggest that gain and burden are separate constructs. Our study aimed at confirming these findings using two large datasets, the Resources for Enhancing Alzheimer's Caregiver Health (REACH) and the Canadian Study of Health and Aging (CSHA). We used three approaches: 1) we correlated indices of gain with indices of strain, 2) we calculated the proportion of participants who reported divergence (e.g., high gain and high strain), and 3) we examined the predictors of gain and strain. We found a weak correlation between gain and strain in the REACH data ($r(783) = -0.237, p < 0.01$), and none in the CSHA

data ($r(576) = -0.034, p = .452$). Using pre-determined cut-off values, we found that 18.4% of REACH participants had low positive and low negative appraisal and 25.1% had high positive and high negative appraisal. For the CSHA these proportions were respectively 33.6% and 7.2%. Finally, the models predicting gain and strain differed, for both datasets. These data confirm that gain and strain are separate constructs. A better understanding of each construct may support the development of interventions to maximize the positive aspects of caregiving and to minimize its negative influences.

DEVELOPING AN ACTION GUIDE TO ASSIST WITH MOVING CAREGIVING INTERVENTIONS INTO PRACTICE

M. Brown¹, L. McGuire¹, S. Toal³, L. Burzio², *1. Healthy Aging Program, CDC, Atlanta, Georgia, 2. University of Michigan, Ann Arbor, Michigan, 3. SB Toal, Atlanta, Georgia*

An estimated 21% of households in the United States are impacted by caregiving responsibilities. According to a national survey, more than half (53%) of all caregivers feel that their health has gotten worse due to caregiving responsibilities and that this has affected their ability to provide care for the care recipient. An emphasis within the caregiving and public health communities has been placed on establishing and sustaining strategies for moving effective evidence-based caregiving interventions into widespread practice and ultimately promoting the health and well-being of our nation's caregivers. The goal of this session is to describe the development of a tool, referred to as an “Action Guide,” designed to assist organizations in implementing caregiver programs. The first component of this session will focus on identifying and addressing strategies associated with implementing the REACH OUT intervention, formerly known as Alabama's REACH Demonstration Project. REACH OUT will be used to illustrate important questions and challenges inherent in translating evidence-based research into practice in the “real-world.” REACH OUT has been successfully implemented in Alabama as a state-wide program and in several other settings, while holding promise for additional widespread implementation. The second component will focus on identifying the steps necessary in planning and preparing an organization for delivering of a caregiving intervention, detailed in the Action Guide. Attendees will learn how this intervention's implementation can be facilitated with the methodical approach presented within the Action Guide for use within their organization.

FACTORS ASSOCIATED WITH USE OF COMMUNITY-BASED SERVICES BY LATINA AND CAUCASIAN DEMENTIA CAREGIVERS

J. Montoro-Rodriguez¹, D. Gallagher-Thompson², *1. California State University San Bernardino, San Bernardino, California, 2. Stanford University School of Medicine, Stanford, California*

Considerable concern exists regarding available caregiver support programs and services and to which extent they are used by diverse family caregivers of people with Alzheimer's disease (AD) and related dementia disorders. The majority of literature focusing on dementia caregivers has not adequately identified specific cultural factors that may contribute to an individual's caregiving experience. This study attempts an examination of cultural factors related to dementia care among female Latino and Caucasian caregivers. We examine the influence of factors such as the caregivers' self-efficacy beliefs, and use of supportive coping strategies on the health behavior of the caregivers, in particular the use of community-based services for older adults. Data were taken from interviews with 96 Caucasian, and 89 Latino caregivers enrolled in a program to evaluate a psycho-educational intervention program in the San Francisco Bay area. Logistic Regression was performed to assess the influence of self-efficacy and supportive coping strategies in predicting the use of community-based services, in particular, assistance with homemaker related to activities of daily living, use of transportation services, and participation in a senior day care and health programs. On the bases of the estimates for each type of service, it

appears that both, the caregiver's self-efficacy and supportive coping strategies contribute to a higher likelihood of service use, in the presence of relevant predisposing, enabling and need factors. Ethnicity is a relevant factor with Latinas having a greater likelihood to use transportation services and participating in a senior day care and health program than Caucasian caregivers.

EXTENDING THE ACTIVITY RESTRICTION MODEL OF DEPRESSED AFFECT TO INCLUDE QUALITY OF INFORMAL CARE

R. Smith, G. Williamson, *University of Georgia, Athens, Georgia*

The Activity Restriction Model of Depressed Affect (ARMDA) posits that stress predicts depression largely to the extent that stressors lead to increased restriction of normal activities. The purpose of the present study was to test the ARMDA in a sample of informal caregivers. Moreover, the model was extended to include how depression might be related to quality of informal care outcomes (i.e., caregiver respect and potentially harmful behavior [PHB]). Using data from 310 informal caregivers, the following hypotheses were tested: (a) activity restriction completely mediates the relation between the amount of care caregivers provide and depression, (b) caregiver depression leads to decreased respect and increased PHB, and (c) decreased respect predicts increased PHB. Path analysis using disturbance term regression tests examined the magnitude of hypothesized and omitted paths in the proposed model. The results provide support for the ARMDA and suggest that interventions aimed at improving caregiver depression (and thus the quality of care provided) should focus on ways to decrease activity restriction.

EQUITY OF INSTRUMENTAL AND EMOTIONAL SUPPORT EXCHANGES AND PARENT-ADULT CHILD CLOSENESS: THE EFFECTS OF PERCEPTIONS OR REALITY?

A.R. Howard¹, J. Suitor¹, K. Pillemer², *1. Sociology, Purdue University, West Lafayette, Indiana, 2. Cornell University, Ithaca, New York*

Exchanges between the generations have been a central focus of research on parent-adult child relations for several decades. This work has focused primarily on describing and explaining parents' and children's reports of support given and received, and the role that such exchanges play in intergenerational relationship quality. There has been much less attention to the role of perceptions of equity of exchanges in explaining the quality of parent-child relations; further, it is not known whether perceptions of equity reflect reports of exchanges between intergenerational role partners. In the present paper, we address whether: a) mothers' perceptions of equity in their relationship with each of their adult children are consistent with their actual reports of emotional and instrumental support exchanges; and b) whether relationship quality is better-predicted by perceptions of equity or by actual support exchanged. To examine these questions I will be using data from 774 mother-child dyads nested within 300 later life families collected as part of the Within-Family Differences Study.

USE OF MUTUALITY SCALE WITH MEXICAN AMERICAN FAMILY CAREGIVERS OF OLDER ADULTS

H.S. Kao¹, M.L. Lynn², *1. The University of Texas, El Paso, Texas, 2. University of North Carolina, Chapel Hill, North Carolina*

This study builds on pilot work to probe the strength of cultural equivalences by field testing the Mutuality Scale for use with Mexican Americans (Usted y su ser querido). Although older Mexican Americans often depend on their family for care, we have no standard quantitative instrument against which to scale this motive for filial obligation. We used a non-experimental methodological design to test the psychometric properties of the Mutuality Scale employed with Mexican Americans. A purposive sample of 193 Mexican American adult family caregivers of older relatives was recruited in El Paso from October 2007 to January 2008 to complete a brief demographic survey and the bilingual Mutuality Scale. Using principal axis factoring (orthogonal rotation), a two-fac-

tor structure emerged, which accounted for 50% of the variance in total scores. We were targeting the Interaction between the Caregiving Dyad (7 items) and Reaction from the Care Recipient (4 items) (Cronbach's alpha was .88 and .81, respectively). Test-retest reliability across a 3-week interval was $r = .88$ and $.90$ (intraclass correlation). While use of the Mutuality Scale with Mexican American caregivers requires further study, it shows potential in measuring the motive set for elder care, which in turn may be useful in designing a culturally relevant intervention for family caregiving in this population.

FAMILIES LIVING WITH LUNG CANCER: INCONGRUENT PERCEPTIONS OF SYMPTOMS & FUNCTION

K.S. Lyons, J. Bennett, L. Nail, E. Fromme, S. Hickman, S. Hiatt, *Oregon Health & Science University, Portland, Oregon*

Lung cancer will contribute 15% of all new cancer cases and 29% of all cancer deaths in the United States. More people will die of lung cancer than colon, breast, and prostate combined. Approximately 58% of lung cancer patients (PTs) die within 1 year of diagnosis with a 5-year survival rate of 16%. Lung cancer PTs are more likely to have symptoms, such as pain, fatigue, and shortness of breath at the time of diagnosis than PTs with other common cancers. PTs and family members (FMs) struggle to manage symptoms, based on individual perceptions. Incongruent symptom perceptions can lead to poor symptom management, unnecessary PT suffering, and in some cases life-threatening complications. The primary goal of the study was to examine PT-FM incongruence in perceptions of PT physical function, pain, fatigue and shortness-of-breath and describe variables that predict incongruence. Using multilevel modeling, preliminary baseline Level 1 data on 57 family care dyads revealed that FMs, on average, rated PT fatigue and function significantly higher than PTs, whereas incongruence was not significantly different from zero, on average, for shortness-of-breath and pain interference. However, there was significant variability around the average for all four variables ($p < .001$). Level 2 models found PT depression, FM role overload, being a spouse, and the PT feeling listened to explained 15-36% of how high the dyad rated each symptom and between 5-31% of the incongruence between PT and FM. Findings will be discussed in regard to roles of PT depression, FM overload, and communication-based interventions.

EXPERIENCES OF BURDEN, DEPRESSION, AND UPLIFTS ACROSS THE CAREGIVING JOURNEY: DOES RELATIONSHIP MATTER?

M.Y. Savundranayagam, R. Montgomery, *Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

The caregiving journey begins within the historical context of an established familial relationship identity between the caregiver and family member with a chronic illness. The progression of the caregiving journey has been measured using intensity of care tasks or length of caregiving but those measures do not account for the variability in the caregiving experience. Care tasks do not necessarily become more intense over the length of the caregiving journey. Caregiver identity theory suggests as the journey progresses, individuals incorporate more of the caregiver role into their relationship identity. Using relationship identity to measure the phases of the caregiving journey, this study investigated whether experiences of burden, depression, and uplifts differed across the caregiving journey and between spouse ($N = 261$) and adult-child ($N = 232$) caregivers. Statistical tests using multivariate analyses of variance revealed interactions between relationship to care-recipient and caregiving phase for burden and depression, and a main effect of caregiver relationship for uplifts. As spouse caregivers incorporated more of the caregiver role into their relationship identity, they experienced a gradual increase in burden and depression. Adult-child caregivers, however, experienced the most burden and depression when the familial and caregiver roles equally comprised their relationship identity. While adult-children experienced similar levels of uplifts across the

caregiving journey, spouses experienced lower levels of uplifts. Findings are discussed in terms of the different needs spouses and adult-children have across the caregiving journey.

COPING MECHANISMS OF RESILIENT CAREGIVERS IN A NON-CLINICAL SAMPLE

E.B. Fauth¹, K. Piercy¹, M.C. Norton¹, C. Lyketsos², P. Rabins², J. Tschanz¹, 1. Utah State University, Logan, Utah, 2. Johns Hopkins University, Baltimore, Maryland

Research on dementia caregivers often includes caregivers sampled from clinical settings. The current analyses use data from a representative sample of caregivers residing in Cache County, northern Utah. Prior caregiving research has operationalized "resiliency" as having high well-being in the face of caregiving challenges. The current study observed 260 caregivers (80% female, 69% with at least some college education, and 90% married). These caregivers were categorized into four groups, based on higher or lower Beck Depression Inventory scores and higher or lower caregiving challenge, measured here as care recipients level of impairment in activities of daily living (ADL). The resilient caregiver group (low in depression but high in exposure to ADL impairment, $N = 69$) were compared to the non-resilient caregiver group (higher in depression, but lower in exposure to ADL impairment, $N = 68$). Resilient caregivers did not differ from non-resilient caregivers in terms of demographic variables, but did differ in their reported usage of certain coping mechanisms. T-tests indicated that, on average, the non-resilient caregivers used more avoidance strategies ($p < .05$), more wishful thinking strategies ($p < .05$), and less social support-seeking coping strategies ($p < .05$). There was also a trend where non-resilient caregivers were more likely to blame others. Whether these findings can be used to prevent or relieve emotional distress in carers will require prospective trials.

UNDERSTANDING THE RELATIONSHIP BETWEEN AGE AND THE POSITIVE AND NEGATIVE OUTCOMES OF DAUGHTERS CAREGIVING FOR WOMEN WITH BREAST AND OVARIAN CANCER

J.C. Steele, M. Barrineau, *Psychology, Radford University, Radford, Virginia*

The study investigated the relationship between age of an adult daughter caregiving for a biological mother with a potentially inherited female cancer (breast or ovarian cancer) and the positive and negative outcomes of the caregiving role (i.e., depression, perceived physical health, caregiver burden, and posttraumatic growth). The study investigated the mediating roles of social support and coping behavior. Women over age 18 who had been in the caregiving role within the past five years completed a set of questionnaires. Data is currently being collected. Of the 30 participants who have completed the survey ($M_{age} = 36$, $R_{age} = 18-56$), 72% provided support for a mother diagnosed with breast cancer and 28% for a mother with ovarian cancer. Preliminary results indicated 90% of the caregivers were concerned that their mother's cancer might be genetic. While it is known that the caregiving role is stressful (i.e., all of the participants displayed depressed affect), the caregiver role also encompasses positive benefits. For instance, 90% of participants were experiencing significant levels of posttraumatic growth, indicating that adult daughters were growing and changing as an outcome of their caregiving experience. Upon study completion, multiple regressions will be run to assess the relationship of caregiver age with positive and negative caregiver outcomes. It is expected that young adult daughters will experience the caregiving role more intensely than their older counterparts. Study applications related to the availability of age-appropriate caregiving resources for female adult caregivers of a mother with a potentially genetic female cancer will be discussed.

SESSION 830 (SYMPOSIUM)

GROWING OLD GRACEFULLY: WEATHERING THE PSYCHOLOGICAL VICISSITUDES OF AGING

Chair: N. Newton, *psychology, University of Michigan, Ann Arbor, Michigan*

Discussant: J. Smith, *psychology, University of Michigan, Ann Arbor, Michigan*

Lifespan research indicates myriad ways in which middle-aged and older adults adapt to the realities of aging (Baltes & Smith, 2004). The maintenance of well-being in the face of advancing age has been variously linked to the experience of regret (Dijkstra & Barelds, 2008; Jokisaari, 2004); facets of personality (Stewart, Ostrove, & Helson, 2001); self-regulation (Wrosch & Freund, 2001); and future orientation (Smith & Freund, 2002; Wrosch, Bauer, & Scheier, 2005). The goal of this symposium is to present new cross-sectional and longitudinal findings about adaptation and successful aging, with an emphasis on how regrets, age concerns, future perceptions, and resilience relate to well-being and longevity across the adult lifespan. Nicky Newton examines themes of regret and how they affect well-being in three cohorts of women (aged 20s, 40s, and 60s). Using longitudinal data spanning the entire period of middle age (40s to 60s), Shellae Versey evaluates the role of psychological empowerment, feelings about aging, and personality development as predictors of successful aging, as defined by Rowe and Kahn (1987). Maja Wiest explores the association between resilience and longevity in response to widowhood in old age. Dana Kotter-Gruehn examines how optimistic individuals envisage the future and how such future perceptions are related to changes in well-being and objective nearness to death in older adults aged 70 to 100+. Together, these papers will be discussed with respect to how middle-aged and older adults can experience aging as a period of development.

REGRET THROUGH THE AGES: MISSED OPPORTUNITIES, EXTERNAL RESTRICTIONS, AND WELL-BEING

N. Newton¹, C. Torges², A. Stewart³, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *North Dakota State University, Fargo, North Dakota*, 3. *University of Michigan, Ann Arbor, Michigan*

According to Butler (1974), life reviews allow older people to reflect on and address their regrets. Other researchers have found that reviews can take place at other times in adulthood (Stewart and Vandewater, 1999; Wrosch and Heckhausen, 2002). Acknowledging regrets can lead to lower overall well-being (Torges & Stewart, 2005); however, there are cohort differences in the responses elicited by questions about missed opportunities (Lecci, Okun, & Karoly, 1994). In the current study we found differences in three cohorts of women (aged 20s, 40s, and 60s) concerning regret themes: older cohorts more often mentioned external restrictions and missed career opportunities, whereas the youngest cohort more often mentioned that possibilities remain for the future. Moreover, restrictions and career issues related to lower well-being for the younger cohorts. These results suggest that developmental and social change may both be pertinent to women's experience of regret.

ADAPTATION TO WIDOWHOOD AS AN INDICATOR OF RESILIENCE AND ITS IMPACT ON MORTALITY

M. Wiest, B. Schüz, S. Wurm, C. Tesch-Roemer, *German Centre of Gerontology, Berlin, Germany*

The concept of resilience describes the sum of individual resources to cope with adverse events and adapt to critical life events. It is assumed that resilience affects long-term survival. Individual differences in resilience should thus be related to differential mortality. This study examines individual differences in resilience by examining differential adaptation to a common critical life event in later life, namely bereavement. In this study, a sample of 798 bereaved individuals from the German Socio-Economic Panel (GSOEP) is analyzed. With yearly assessments over 24 years, the GSOEP allows analyzing the impact of

bereavement on well-being and the adaption processes following the event. Preliminary analyses show substantial individual differences in trajectories of life satisfaction prior and after the loss of the spouse (variance component=1.626, SD=0.094, $p<.001$). Further analyses will identify latent trajectory classes of adaptation and examine their differential predictive power for mortality and longevity.

WHEN TIME IS RUNNING OUT: FUTURE ORIENTATION AND SUBJECTIVE NEARNESS TO DEATH IN VERY OLD AGE

D. Kotter-Gruehn, D. Gruehn, *Department of Psychology, North Carolina State University, Raleigh, North Carolina*

How optimistic older adults perceive their future is an important indicator of self-regulation and resilience. Using 12-year longitudinal data from the Berlin Aging Study (Baltes & Mayer, 1999) with 516 adults aged 70 to 104 years, we examined (a) how three indicators of future perception (future orientation, optimism, subjective nearness to death) change in very old age; (b) whether changes in future perception are related to changes in well-being; and (c) whether a subjectively limited future perception is related to objective nearness to death over time? With advancing age, participants reported fewer future plans, less optimism, and an increasing subjective nearness to death. These changes were related to changes in subjective well-being. Furthermore, positive future perceptions predicted longer survival times. Results suggest that older adults seem to have quite accurate perceptions of their remaining time and adjust their expectations accordingly.

PREDICTORS OF SUCCESSFUL AGING

H. Versey, A. Stewart, *University of Michigan, Ann Arbor, Michigan*

Successful aging contextualizes the positive lived experiences of older adults. Rowe and Kahn (1987) propose that successful aging is indicated by positive physical, mental and emotional health and well-being. Research currently aims to determine associations between aging well and disability. However, little is known about how elements of personality, emotional and social development in later life may be related to successful aging. Using longitudinal data, this study explores correlates and predictors of successful aging in two samples of college-educated women in their early sixties. This research examines the quality of life for women in late midlife, and evaluates the role of personality and developmental factors that reflect psychological maturity as predictors of successful aging. Predictors include psychological empowerment, feelings about aging, and personality development from an Eriksonian perspective. Together, these predictors provide insight into mind-body relationships that should be considered when evaluating associations between health and aging.

SESSION 835 (SYMPOSIUM)

INTERPERSONAL EFFECTS OF SUFFERING: CONCEPTS, MEASURES, AND OUTCOMES

Chair: R. Schulz, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Discussant: J. Heckhausen, *University of California, Irvine, California*

In close personal relationships the suffering of one individual has significant impact on the health and well-being of the other. Using family caregiving as a context, we show that patient suffering is a unique and powerful stressor that affects the physical and psychological well-being of the caregiver. The first two presentations provide a definition of suffering and new measures for assessing the experience of suffering and the perception of suffering in others (i.e., suffering from first and third person perspectives). Comparative data for whites, Hispanics, and African Americans are presented. The effects of patient suffering on caregivers are presented in two studies, one describing the impact of patient suffering on caregivers of patients undergoing depression treatment, and the other assessing the impact of patient suffering on caregivers of patients with dementia, using both perceived suffering and patient self-reported suffering as predictors. Finally, in a laboratory study

we show how watching and thinking about your partner suffering increases physiological reactivity in the form of increased blood pressure and heart rate. Current health and social policy focused on family caregiving emphasize the challenges of providing care to a loved one as a major source of distress among family members. Equal emphasis should be placed on minimizing or eliminating the suffering of the patient and developing intervention strategies that facilitate caregivers ability to cope with the suffering of their relative.

THE IMPACT OF PATIENT SUFFERING ON SYMPTOMS OF DISTRESS IN MINORITY FAMILY CAREGIVERS

S. Czaja¹, R. Schulz², D. Perdomo¹, 1. *University of Miami Miller School of Medicine, Miami, Florida*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Evidence has shown that caring for a relative/friend with an illness or disability causes distress in family caregivers and compromises their health and survival. These outcomes have been linked to the patient's physical disability, cognitive impairment, disruptive behaviors, and caregiving demands. Little attention has been given to how patient suffering influences caregiver distress. We examined the role of perceived patient suffering on caregiver outcomes among a sample of Black/African American (N=45) and Hispanic (N=55) family caregivers of patients with dementia participating in a caregiver intervention trial. We found that for both groups, feelings of compassion towards the patient increase with the caregivers' perception that the patient is experiencing negative physical symptoms and distress from these symptoms. Although the Black/African Americans report less burden; for both ethnic groups, patient symptoms of physical and psychological suffering are linked to caregiver depression and burden. These findings are discussed in terms of caregiver interventions.

CAREGIVING SPOUSES' CARDIOVASCULAR REACTIVITY TO PERCEIVED SUFFERING

J. Monin, R. Schulz, L.M. Martire, J. Jennings, J. Lingler, M.S. Greenberg, *University of Pittsburgh, Pittsburgh, Pennsylvania*

To examine the unique influence of perceptions of suffering on caregivers' risk for impaired psychological and physical health, a laboratory study of older adults with osteoarthritis and their spouses was conducted. Spouses' blood pressure (BP) and heart rate (HR) were monitored during two tasks designed to capture their partners' suffering. First, spouses watched their partner (and a stranger) carry heavy logs across an 8 ft space for 3 minutes, a task that elicited pain expression. Second, spouses gave a speech about their partner's suffering (and also about a typical meal with the partner). Results showed that spouses' BP and HR increased when watching and thinking about their partners' suffering, and exposure to a partners' suffering was more physiologically stressful than to a stranger's suffering. These findings suggest that heightened physiological stress caused by perceptions of a loved one's suffering may be one pathway to caregivers' increased risk for cardiovascular disease.

REDUCING PATIENT SUFFERING ALLEVIATES FAMILY CAREGIVER BURDEN

L.M. Martire, R. Schulz, C.F. Reynolds, *Psychiatry, University of Pittsburgh, Pittsburgh, Pennsylvania*

Depression is a hallmark of suffering and care recipient depression has been consistently linked to adverse health outcomes in caregivers. It follows that successful treatment of depression should decrease caregiver burden. In a study of older patients treated for major depression (N = 244) we show that short term improvement (Phase I) in patient depression is associated with a reduction in depression-specific burden ($\beta = -.24$, $p = .001$) and a trend toward improvement in general caregiver burden ($\beta = -.08$, $p = .08$). Caregivers of patients whose depression remitted during Phase II of the treatment study experienced further improvement in depression-specific burden, whereas caregivers of patients who did not remit showed no change in this outcome ($F = 4.59$,

$p = .04$). Findings inform our conceptual model of patient suffering and caregiver health.

CAREGIVER-PERCEIVED AND PATIENT-REPORTED SUFFERING AS PREDICTORS OF DEPRESSION SYMPTOMS IN DEMENTIA CAREGIVERS

S. Beach, R. Schulz, B. Zdaniuk, A. Dodds, *University of Pittsburgh, Pittsburgh, Pennsylvania*

This paper explores relationships between dementia patient suffering and caregiver depression using data from 84 caregiver-patient dyads (patient MMSE 15+). Patient suffering (physical, psychological, and spiritual/existential suffering) is assessed both by caregiver perceptions, and patient self-reports. Regression models controlling for caregiver demographics, patient IADL/ADL disability, patient memory/behavior problems, and caregiver health co-morbidities showed that caregiver perceptions of patient suffering were independent predictors of caregiver depression symptoms, assessed by the CESD. Patient self-reports of suffering did not predict caregiver depression, once the covariates were controlled. Significant effects were found for caregiver perceptions of patient psychological and spiritual/existential suffering, but not patient physical suffering. The role of caregiver beliefs about whether they can help reduce the patients suffering is also explored. Preliminary results suggest that among those who don't believe they can help reduce patient suffering, correlations between perceived psychological and spiritual/existential suffering and depression were reduced.

SESSION 840 (SYMPOSIUM)

NEW FRONTIERS IN RESILIENCE AND HEALTHY LONGEVITY: LONGITUDINAL STUDIES OF PROTECTIVE FACTORS

Chair: P. Fry, *Trinity Western University, Langley, B.C. V2Y 1Y1, British Columbia, Canada*

Discussant: P. Martin, *Iowa State University, Ames, 50011, Iowa*

Studies of resilience, well-being and healthy longevity have hitherto focused almost exclusively on youth rather than adults. Increased life expectancy without the compression of morbidity and stress has highlighted the need for greater attention to the capacity for resilient aging and healthy longevity during the later years of adulthood. The symposium will highlight the emerging scholarship of young and enthusiastic researchers on resilience, healthy longevity, and risks to mortality. Past formulations of resilience and longevity in the context of aging have treated the issues as primarily homeostatic, emphasizing the significance of select socio-demographic variables of age, disability, health status and income etc. as influential factors related to well-being, longevity and risks to mortality. In contrast, presenters in this symposium will draw attention to a number of other intriguing psychological influences, mechanisms and processes that contribute on a long-term basis to aging individuals' resilience, healthy longevity and to mortality risks. Together the findings from four longitudinal studies will reveal how, throughout adulthood, and especially in the later years, personality traits, marital happiness, occupational-personality congruence, and psychosocial resources of spirituality, family stability, social engagement, and commitment to life tasks, influence healthy aging and longevity both directly and indirectly. The role of control and challenge as trait factors will be discussed. Possible explanations for the predictive influences as revealed in longitudinal studies will be explored in depth.

OCCUPATION-PERSONALITY CONGRUENCE AND MORTALITY RISK IN AGING ADULTS

L.R. Martin^{1,2}, K.M. Clark², H.S. Friedman², M.L. Kern², 1. *Psychology, La Sierra University, Riverside, California*, 2. *University of California, Riverside, California*

Young adults are often encouraged to find careers that "match" their personalities, with important later-life outcomes hypothesized to depend on individual factors (e.g., personality), situational factors (e.g., occupation), and the congruence between them. Using an archival prospective cohort design, this study examined 551 men from the Terman Life Cycle Study to investigate the relationship of such congruence to mortality risk. Five of Holland's (1997) personality types and six occupational environmental types were examined as predictors of mortality risk over a 66-year period using Cox survival analyses. Men with Enterprising personalities or in Enterprising occupations had greater mortality risk than men in other groups; congruence on this dimension produced the highest risk. There was also a trend toward reduced risk for Social men in Social occupational environments. Overall, however, the congruence between personality and occupational environment was less important than the particular characteristics of the individual and the occupational environment.

PSYCHOSOCIAL RESOURCES AS PREDICTORS OF MORTALITY IN OLDER WIDOWS

P. Fry¹, D.L. Debats², 1. *Trinity Western University, Langley, British Columbia, Canada*, 2. *Groningen, Bedum, Netherlands*

The research focuses on the predictor role that psychosocial resource factors play in enhancing resilience and longevity of older widows. Mortality risk was examined for 385 widows and followed up in a 6.5 year longitudinal study. Strengths of the association between mortality and specific psychosocial resources were assessed for widows at baseline. Risk of death related to widowhood was estimated using Cox proportional hazard regression on predictor variables of psychosocial resources and resilience traits of control, challenge and commitment. Findings indicated that over time high scores of spiritual resources, family stability, social engagement, and commitment were protective factors reducing the risk of mortality significantly. In contrast, high scores on control and challenge had a negative effect on longevity. Findings demonstrate the utility of exploring modern psychosocial resource factors as a key for future study of resilience and longevity.

PERSONALITY: DIRECT AND INDIRECT INFLUENCES ON HEALTHY AGING AND LONGEVITY

M.L. Kern, H.S. Friedman, *Department of Psychology, University of California, Riverside, Riverside, California*

Personality differences contribute to later life health, well-being, and length of life both directly and indirectly, but a lifespan perspective is essential for understanding how individual differences unfold across the lifespan. Based on our work with the eight-decade Terman Life Cycle Study, we highlight intriguing predictors of older age health and longevity. Conscientiousness predicts better physical health, more productivity, and longer life; extraversion predicts better well-being and social competence; and neuroticism predicts worse subjective well-being and physical health, but not necessarily increased mortality risk. Importantly, individual differences interact with the social environment to moderate life course pathways and to influence later-life outcomes. Together, our findings suggest that employing more multi-faceted, nuanced, and representative models of real world processes is essential for understanding lifelong psychosocial influences on later life health and well-being.

MARITAL HAPPINESS AS A PREDICTOR OF HEALTHY AGING

L.L. Vie, M.L. Kern, C.A. Reynolds, H.S. Friedman, *Psychology, University of California, Riverside, Riverside, California*

Marriage is a key relationship for many Americans, and recent research suggests important links between marital quality and health. However, few studies have examined the relationship longitudinally. The current study considered measures of husband's and wife's marital happiness in early adulthood (mean age = 30 years) as predictors of two components of healthy aging, physical health and subjective well-being. These healthy aging components were derived from items completed 46 years later by participants from the Terman Life Cycle Study (190 males and 179 females). Regression analyses revealed that when husband's and wife's marital happiness are considered together, it is husband's marital happiness that significantly predicts their own health and their wife's healthy aging four decades later, controlling for baseline health, alcohol use, and personality, length of marriage at assessment, and whether the marriage remained intact. Possible explanations for the predictive influence of husband marital happiness are explored.

SESSION 845 (PAPER)

PHYSICAL ACTIVITY AND AGING

LONG-TERM RELATIONS OF INTENTION, PLANNING, AND PHYSICAL ACTIVITY IN A LIFESPAN SAMPLE

T. Reuter¹, J.P. Ziegelmann^{1,2}, S. Lippke¹, *1. Freie Universität Berlin, Berlin, Germany, 2. University of Zurich, Zurich, Switzerland*

Previous research suggests that planning may operate as one possible mediator linking behavioral intentions to health behaviors. This study examines long-term relations in intention, planning, and physical activity. A novel, process-oriented approach for testing mediation hypotheses combining mediation analysis and latent growth curve (LGC) modeling is presented. Data were collected in a sample of orthopedic rehabilitation patients aged 18 to 80 years ($n = 309$) from which repeated measures of intention, planning, and behavior were obtained on 5 measurement occasions across three years after discharge. The LGC mediation model (Chi square (87) = 335.39; RMSEA = .07) showed that the slope in intention affects the growth trajectory in planning, which affects the growth trajectory in physical activity. The present findings regarding long-term relations between intentions, planning, and behavior confirmed previous evidence on the mediating role of planning in the intention-behavior relation.

THE ROLE OF SOCIAL SUPPORT ON WALKING IN COMMUNITY DWELLING OLDER ADULTS

T. Prohaska¹, A. Eisenstein¹, W. Satariano², R. Hunter³, *1. Center for Research on Health and Aging, University of Illinois at Chicago, Chicago, Illinois, 2. University of California, Berkeley, Baltimore, Maryland, 3. University of North Carolina, chapel hill, North Carolina*

Introduction: This study examines the association of types of social support on the number of minutes walked per week and the community locations where older adults walk. **Methods:** Interviews were conducted with 884 adults aged 65 years and older in four US counties; Alameda CA; Cook IL., Allegheny, PA, and Durham/Wake, NC. Interview data included demographic characteristics, self-reported frequency and duration of walking and walking locations (neighborhood streets, parks, trails and indoor malls). Among measures of support were accompanied vs. unaccompanied walking, availability of walking companions, overall social support, and perceptions of neighborhood support. Multivariate analyses were conducted between social support, demographics, and dependent measures, number of minutes walk per week and walk in specific locations. Analyses were conducted separately for men and women. **Results:** While social support items were not associated with minutes

walked per week for men, several support measures were significant for women. Women who agree that people in their neighborhood know each other report walking significantly more minutes. Support measures are significantly associated with walking in parks and on neighborhood streets but not in indoor shopping malls or walking trails. Walking with pets, spouse and alone are positively associated with minutes of walking and walking in neighborhoods and parks. If others walk in the neighborhood, older adults are more likely to do the same. **Discussion:** Interventions to promote walking should consider the types of support that influence the amount of walking in the community and the specific locations where social support is likely to influence walking.

STAYING ONE STEP AHEAD OF DEATH: WALKING SPEED, MORTALITY AND SELF-RATED HEALTH

K. Machacova^{1,2}, S. Neufeld¹, M. Luborsky¹, *1. Institute of Gerontology, Wayne State University, Detroit, Michigan, 2. Faculty of Physical Education and Sports, Charles University, Prague, Czech Republic*

Objective physical function and also self-rated health (SRH) each are important predictors of key health outcomes in later life. Yet, their possible interactions in predicting mortality remain poorly understood. Substantial evidence shows that physical function as measured by performance-based tests, in particular walking speed, strongly predicts subsequent mortality even when adjusted for potential confounders such as age, gender, number of health conditions or health habits. This is also true of an individual's SRH. This study models the predictive value for mortality of usual walking speed, SRH, and their interactions. Data were collected from 239 community dwelling elders (mean age 71.5 ± 3.2 years) enrolled in the Healthy Aging Study, a stratified population sample of Medicare recipients in Philadelphia, including a seven year follow-up period with sixty-four deaths. Data analysis was conducted via logistic regression with mortality as the dependent variable. When modeled separately, both walking speed and SRH were, as expected, significantly associated with mortality after adjusting for several socio-demographic variables, number of health conditions, depression, and health habits. However, when both walking speed and SRH were included in a single regression model SRH was non-significant whereas usual walking speed continued to be independently and significantly associated with mortality ($p < 0.05$). No significant interactions between usual walking speed and SRH were observed. Findings demonstrate that usual walking speed is strongly associated with mortality even after adjusting for potential confounding factors, including SRH. Final discussion considers clinical and intervention implications for this quick and easy to administer test. [Support: NIH/NIA #R01AG15730]

REST-ACTIVITY FRAGMENTATION IN OLDER PEOPLE LIVING IN CARE HOMES

R. Luff, R. Meadows, I. Evers, E. Cope, S. Arber, *University of Surrey, Guildford, Surrey, United Kingdom*

This paper examines the rest-activity patterns of older people living in care homes. While 'normal' rest-activity patterns will show one major active period (day), and one major inactive period (indicating night-time sleeping), it was found that the wake-sleep pattern of care home residents is fragmented. It is argued that this fragmentation is not solely attributable to resident's age; the care home environment and management of resident's personal care needs also contribute. As part of the SomnIA: Sleep In Ageing research project, 10 care homes in South-East England, participated in the study. 125 residents wore actiwatchs (small movement sensors) and were supported by researchers to complete daily sleep and activity diaries over a 14 day period. Actigraphy was used to determine resident's Intradaily Variability (IV), which represents the fragmentation of periods of rest and activity. It was found that 81% of the residents showed a high IV of greater than 1, which indicates a fragmented rhythm, suggesting night-time disturbances and/or daytime napping. Differences in the IV were partially explained by variables relating to the individual resident, including age and level of

dependency. Using the diary data, it is argued that further IV differences can be understood by exploring aspects of residential care, such as hours spent in bed and common causes of waking at night. It is therefore argued, that some aspects of night-time care exacerbate sleep fragmentation which could increase daytime sleepiness. The research is supported by the New Dynamics of Ageing initiative (RES-339-25-0009).

SESSION 850 (SYMPOSIUM)

THE STROKE TELEMEDICINE ACCESS RECOVERY (STAR) PROJECT: A CREATIVE APPROACH TO COMMUNITY-BASED STROKE CARE

Chair: *P.C. Gregory, Physical Medicine and Rehabilitation, UNC-CH, Chapel Hill, North Carolina*

Discussant: *W.E. Haley, University of South Florida, Tampa, Florida*

Stroke disproportionately affects minorities and rural communities in the Southeastern United States. This symposium will examine the barriers to accessing care among stroke patients in a rural community and describe a unique program designed to increase access to care through 90 days of recovery. The Stroke Rehabilitation Process of Care study showed no access to psychiatry consultation and limited access to acute therapies. The Acute Stroke Process of Care study showed limited access to Neurology consult and dysphagia screening. The Family Caregiver Stroke Project showed limited use of 11 formal support services (i.e., physical therapist, home health aide) for older African Americans with stroke related disability. The American Indian Stroke Focus Group Study showed that patients rarely had options in choice of post-discharge rehabilitation setting and families often felt inadequate in caring for the stroke survivor. These studies utilized both quantitative and qualitative data analyses to highlight the gaps in care that include access to specialty care services, allied health services, and community resources. These findings guided development of a novel intervention to help bridge these gaps. The STAR project utilizes telemedicine video-conferencing to provide acute specialty care consultation to patients during their acute hospital stay with follow up at 30 and 90 days post stroke to maximize their rehabilitation access and secondary prevention. It also provides resources to the stroke caregiver and develops a stroke support group. Thus, it provides primary stroke center services to an underserved rural population that has high stroke prevalence and limited recovery resources.

STROKE REHABILITATION PROCESS OF CARE

P.C. Gregory¹, K.R. Faurot^{1,2}, D. Lam², *1. Physical Medicine and Rehabilitation, UNC-CH, Chapel Hill, North Carolina, 2. UNC-CH Gillings School of Global Public Health, Chapel Hill, North Carolina*

Early aggressive stroke rehabilitation maximizes functional recovery. Minority populations have greater stroke prevalence and severity with poorer functional outcomes. The purpose of this study was to evaluate the exposure to stroke rehabilitation resources acutely at a rural community hospital with a high prevalence of stroke and minority populations. We retrospectively reviewed the charts of 40 stroke patients to evaluate acute exposure to stroke services during the acute hospitalization. Results showed that no patients received a physical medicine and rehabilitation consult and rehabilitation assessment were completed in only 70% of cases. There was limited acute therapy exposure with only 67% receiving physical therapy, 45% receiving occupational therapy, and 58% receiving speech therapy. Only 25% of patients were discharged to an acute inpatient rehabilitation facility and 55% were discharged home. This limited exposure to stroke rehabilitation services could adversely affect outcomes. Future studies should assess novel interventions to increase access.

FORMAL SUPPORT USE AMONG AFRICAN AMERICANS WITH STROKE-RELATED DISABILITY

S.W. Williams¹, A.C. Felix², *1. Allied Health, UNC-CH, Chapel Hill, North Carolina, 2. UNC-CH, Chapel Hill, North Carolina*

Most (~80%) stroke survivors return home and depend on family caregivers for stroke-related recovery. While support from families is crucial, formal community-based programs are also crucial for optimal recovery. We used pilot data from The Family Caregiver Stroke Project to examine the extent of community-based formal support use for 36 older African Americans with stroke related disability. All caregivers reported use of at least one of 11 services. Fifty percent reported that the stroke survivor used services of a physical therapist; 36% speech therapist; and 28% reported use of an occupational therapist. However, fewer used a home health aide (11%); transportation (17%); or personal care services (11%). Given that formal supports can minimize the impact of stroke on survivors and caregivers, the relatively low use of formal services for this group suggests increased efforts are needed to maximize use of community-based formal support services for stroke survivors and their caregivers.

THE ACUTE STROKE PROCESS OF CARE STUDY

A.C. Felix, S. Williams, P.C. Gregory, K. Faurot, *UNC Chapel Hill, Chapel Hill, North Carolina*

Stroke morbidity and mortality are highest in the southeastern region of North Carolina (NC). The Acute Stroke Process of Care Study evaluated the rates of secondary stroke prevention at an ethnically diverse rural community hospital during the acute stay. Results of a retrospective chart review revealed a dysphagia screening rate of 35%, a venous thrombosis prophylaxis rate of 45% and no documented stroke risk factor education. These data revealed potential areas for intervention to improve stroke care. The Stroke Telemedicine Access Recovery (STAR) Project provides a comprehensive multi-disciplinary telemedicine intervention to improve stroke patient outcomes. Initial consultation for stroke patients occurs during the acute care hospitalization, with follow-up at 30 and 90 days. A Neurovascular Neurologist provides neurological consultation, a physiatrist provides rehabilitation consultation and a Stroke Caregiver expert provides information to caregivers and patients who may not otherwise receive these services.

THE AMERICAN INDIAN STROKE FOCUS GROUP STUDY

P.C. Gregory, K.R. Faurot, *Physical Medicine and Rehabilitation, UNC-CH, Chapel Hill, North Carolina*

Stroke disproportionately affects American Indians. We conducted 5 focus groups and interviews with 26 stroke survivors and 11 of their family caregivers who are members of federally-unrecognized tribes in rural areas. The goal was to assess the stroke rehabilitation recovery experience, including their evaluation of both their care and their coping strategies. Participants were referred through local health care providers, including home health. Analysis of transcripts revealed that patients reported limited options for services through the course of recovery both acutely and in the community. The stroke caregivers felt ill-equipped to care for the patients. The four recurrent themes that were repeatedly endorsed included: 1) Information deficits regarding treatment options; 2) Lack of long-term resources for patients and caregivers; 3) Coping with limitations through faith; 4) The therapeutic effect of sharing their experiences. The study results identified unmet needs in the community that we could use to target future interventions.

SESSION 855 (POSTER)

CANCER - POSTER SESSION

RECENT TRENDS IN PROSTATE CANCER INCIDENCE AND MORTALITY RATES: A CROSS-COUNTRY COMPARISON

K.E. Garcia, E. Crimmins, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Prostate cancer is the most common cancer in North American and European men. Screening procedures vary among countries and inconsistencies between mortality trends and the utilization of prostate specific antigen (PSA) screening have been reported. Dramatic increases in the reported prostate cancer incidence rates in the U.S., Canada, and Australia after increased PSA screening in the early 1990s have raised concerns as to the validity of PSA screening. Since then, however, prostate cancer mortality rates have decreased by 4.2% per year in the U.S. Our study examined prostate cancer incidence and mortality rates in the U.S., Canada, Australia, and seven European countries (including Denmark, France, Italy, The Netherlands, Spain, United Kingdom, and Sweden) using data from the GLOBOCAN 2002 database. We found that the U.S. has the highest incidence rate (124.8 per 100,000), but also one of the lowest mortality rates (15.8 per 100,000) when standardized to the world population. This suggests that alternate outcome measures (e.g., prostate cancer mortality) aside from prostate incidence rates should be considered in evaluating the usefulness of PSA screening.

CONVERSION FROM ACTIVE SURVEILLANCE TO ACTIVE TREATMENT FOR PROSTATE CANCER: A QUALITATIVE ANALYSIS

M. Wallace, *School of Nursing, Yale University, New Haven, Connecticut*

Active surveillance (AS) has been an option for prostate cancer management among older men for many years. However, only 10.2% of clinically appropriate prostate cancer patients undergo AS. The reasons for the low selection and adherence to AS are unknown. However, it is theorized that AS is associated with a high level of uncertainty which has been found in multiple studies to impact coping, well-being, perception of mental health, psychological adjustment, depression, and quality of life. In fact, AS has been shown to result in intolerable uncertainty that impacts quality of life to the extent that it is actually preferable to undergo treatment to simply "get rid of it" than to continue to live with the possibility of the cancer growing and killing. Men may also be influenced by family members and healthcare providers in making treatment decisions. The specific aim of this qualitative study is to examine the reasons why men convert from AS to active treatment. Improved understanding of why men choose to convert from AS to active treatment will help to develop interventions to support men in AS to remain with this management option. This study uses a qualitative approach to examine the reasons why men undergoing AS convert to active treatment. The results of the study will inform an internet intervention that will provide men who are clinically appropriate for AS with the education and psychosocial support to continue with this management option.

UNCERTAINTY SELF-MANAGEMENT INTERVENTION FOR OLDER MEN UNDERGOING ACTIVE SURVEILLANCE [AS] FOR PROSTATE CANCER

M. Wallace¹, D. Bailey², *1. School of Nursing, Yale University, New Haven, Connecticut, 2. Duke University School of Nursing, Durham, North Carolina*

Active surveillance has been supported as a reasonable management option in men with prostate cancer who are over the age of 65 with low grade and stage disease, associated with low and stable serum prostate specific antigen (PSA) levels. However, active surveillance has been associated with illness uncertainty which impacts many health outcomes.

Recently, evidence has been forthcoming that supports the role of self-management interventions at improving outcomes for men undergoing AS. The purpose of this pilot study was to develop and test a self-management intervention delivered via the internet, on self-efficacy, uncertainty and quality of life of older men undergoing AS for prostate cancer and compare the effects of the intervention with an historical control group. The first phase of the study focused on intervention development with a team of self-management experts who provided key resources for the internet intervention. The intervention was then tested among a pilot sample of active surveillance patients identified by participating urologists. The pilot study provides the groundwork for a larger clinical trial investigating the effectiveness of the uncertainty self-management intervention, delivered via the web, on uncertainty and quality of life in a representative patient sample.

SELF-RATED HEALTH, PHYSICAL FUNCTION AND FATIGUE IN OLDER CHEMOTHERAPY PATIENTS: GENDER DIFFERENCES

C. Robb¹, J.R. Mitchell¹, M. Extermann², *1. Epidemiology and Biostatistics, The University of Georgia, Athens, Georgia, 2. H. Lee Moffitt Cancer Center and Research Institute, Tampa, Florida*

Fatigue is the most common side effect of chemotherapy treatment in cancer patients. Self-rated health has been shown to be an excellent predictor of future health, and physical function is associated with older adults' ability to maintain independence. We were interested in the association of these variables to see whether self-rated health and decrements in physical function were associated with reported fatigue in older patients undergoing chemotherapy. Our sample consisted of 64 patients (26 male; 36 female) aged 65–88 years who were a subset of older adults participating in a study to examine quality of life in older patients undergoing chemotherapy at an NCI-designated comprehensive cancer center. We hypothesized that self-rated health and physical function would be positively associated with fatigue. Physical function was measured by self-report at baseline and performance measures at baseline, midpoint in chemotherapy, and upon completion of the treatment regimen. Fatigue was measured at baseline, midpoint and completion of treatment. In males, our results showed self-rated health (SRH) at baseline negatively correlated with levels of fatigue at baseline and midpoint, and lower-body performance at conclusion negatively correlated with fatigue. In females, SRH and lower-body performance at baseline were correlations with baseline fatigue; lower-body performance was associated with midpoint fatigue. Controlling for age and education, regression models confirmed the association between SRH and fatigue at baseline and midpoint fatigue in male and at baseline in females. Gender differences in longitudinal trends in fatigue during chemotherapy were also observed.

SESSION 860 (SYMPOSIUM)

IMPROVING THE QUALITY OF LIFE OF OLDER ADULTS: PREPARING GERIATRIC NURSE LEADERS

Chair: *C.J. Beverly, Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Discussant: *H.M. Young, University of California Davis, Sacramento, California*

The specialty field of Geriatric/Gerontologic nursing is experiencing a dearth of leaders. Leadership is critical to not only ensure not only expert quality care for the burgeoning numbers of older adults but also critical to promote progress and change within the US healthcare system. An assessment of nursing's leadership made it increasingly clear that gerontologic nurse academicians, clinicians, and administrators need enhanced leadership acumen in influencing and making health policy and in effecting change in systems of care. Early in the first phase of the Arkansas John A. Hartford Center of Geriatric Nursing Excellence (AR HCGNE), the leadership group decided to place a major focus

on developing leadership competencies of current and future faculty and students in the areas of research, macro-system change, policy, and education. To that end, the leadership of the AR HCGNE identified and implemented strategies to develop leadership in four areas: faculty as emerging leaders, research with particular emphasis on pre- and post-doctoral scholars and fellows, increasing gerontological nursing expertise in baccalaureate programs in the southern region and establishing an intensive eight week summer externship that is an eight week intensive in gerontological nursing. The goal of these programs capture the thoughts of Fagin (2000) in which she noted that the most needed geriatric nursing attribute is transformational leadership-leadership that shapes the changing social architecture, and then supports its progression. A synthesis of strategies, outcomes, and lessons learned through the development and implementation of each of these four areas will be presented.

GERIATRIC NURSING RESEARCH LEADERSHIP DEVELOPMENT

C. Beck, P. Tsai, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

The development of geriatric nurse leaders in research involves increasing their ability to publish and secure funding so that they can eventually mentor others in this process. To cultivate these skills, we develop formal mentoring plans for faculty researchers. Another important skill set for is providing constructive critique to others and receiving critique from others. The HCGNE sponsored Aging Research Interest Group at UAMS provides an opportunity for geriatric faculty and students to meet monthly and critique each other's manuscripts and research proposals within a collegial, non-threatening environment. The interdisciplinary participation in the Group also adds the unique and enriching perspectives of other disciplines to the critique. Participation in the group has increased participants understanding of both giving and receiving constructive critique. Lastly, we invite baccalaureate students as part of a Geriatric Summer Externship to observe the faculty's research activities, including the Aging Research Interest Group.

THE COALITION APPROACH TO EXPANDING GERIATRIC CURRICULAR CAPACITY IN SOUTHERN SCHOOLS OF NURSING

E. Souder¹, C. Cole^{1,2}, C.J. Beverly¹, S. Lubin¹, *1. U of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Administration, Little Rock, Arkansas*

The South has a disproportionate number of aging individuals; however, only 5% of nursing faculty have advanced geriatric education, and it is unknown to what degree geriatric nursing content is taught. The Southern Region Coalition, formed in 2004, is an outreach effort of the Hartford Center for Geriatric Nursing Excellence to integrate core geriatric competencies in nursing curricula. To assess the current status of geriatric curricula in undergraduate programs, we conducted a survey of all BSN nursing programs in the 15 states making up the Southern Region Education Board. Of survey data collected to date, 58% of schools require a dedicated undergraduate geriatric nursing course, 50% require a clinical component, and 60% offer the course in the junior year. 58% of respondents reported that content mapping of geriatric content has been completed. The goal is to have all programs map geriatric content to ensure that competencies are being taught.

EMERGING LEADERS IN GERIATRIC NURSING

R.E. McAtee, C. Cole, *University of Arkansas for Medical Science, Little Rock, Arkansas*

Leaders who can establish and communicate a compelling vision are essential to the profession of geriatric nursing. The "Emerging Leader" program of The Arkansas Hartford Center of Geriatric Nursing Excellence has provided three junior members of the geriatric faculty the opportunity to grow as leaders and develop requisite personality traits.

The three emerging leaders are partnered with three senior members of the leadership team and participate in all aspects of leadership activities. Although research demonstrates that the most relevant aspects of personality for effective leadership are surgency, conscientiousness, agreeableness, adjustment and intelligence. The emerging leaders have learned that some personality traits are considered especially relevant to successful leadership. Those most salient are high energy levels, stress tolerance, self-confidence, internal control orientation, emotional maturity and integrity. The opportunity to observe successful members of the leadership team has provided an invaluable opportunity for growth for these emerging leaders.

INNOVATIVE RECRUITING: GROWING A GERIATRIC SUMMER EXTERN PROGRAM

C. Cole^{1,2}, C. Beverly¹, E. Souder¹, C. Beck¹, *1. College of Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veteran's Administration, Little Rock, Arkansas*

The mission of the University of Arkansas for Medical Sciences College of Nursing Hartford Center of Geriatric Nursing Excellence (HCGNE) is to prepare highly educated nurses in three areas: leadership, research, and education to care for older adults. To achieve this goal we implemented an innovative geriatric summer extern program (GSEP) in which students between the junior and senior year are selected to participate. GSEP provides externs the opportunity to work with geriatric nurse leaders in each of the three areas. The 8-week summer externship offers a stipend of \$4,000 plus tuition for one two-hour course: Summer Extern Program and Role Seminar. After five years, GSEP is growing and the majority of externs are pursuing an advanced degree in nursing and identified gerontologic nursing as their specialty. GSEP is a viable, effective, and exciting way to recruit our best and brightest into a career as gerontologic nurse leaders.

SESSION 865 (SYMPOSIUM)

MUSCLE POWER AND MOBILITY: MEASURES, MECHANISMS AND INTERVENTIONS

Chair: *E.S. Strotmeyer, Epidemiology, University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*
Discussant: *J.F. Bean, Harvard University, Boston, Massachusetts*

Aging muscle is characterized by the loss of muscle fibers, predominantly type 2 fast twitch fibers, and an increase in clustering of type 1 fibers. Given the known atrophy and denervation thought to underlie muscle aging, it is remarkable how little is known at the clinical and population levels about the relationship between age-related lower extremity muscle power (LEMP) decline and physical disability. LEMP may influence physical function differently than strength, since LEMP is dependent on factors intrinsic to both the nervous and musculoskeletal systems. LEMP is an independent predictor of disability in older adults and may be a better predictor of certain physical function measures compared to strength. Whereas muscle strength represents maximal limb force production, muscle power represents the combination of muscle force and velocity. This symposium will describe the biology of LEMP loss with aging (Dr. Fielding) and review data from clinical and epidemiologic studies to improve LEMP in older adults (Dr. Marsh). Importantly, the impact of LEMP training in older adults to functional outcomes will be illustrated (Drs. Marsh, Delmonico). Finally different LEMP measurement methods will be evaluated as a contributor to multiple functional outcomes and disability, with a focus on epidemiologic studies (Dr. Caserotti). The discussion led by Dr. Bean will critically review current LEMP research, focusing on unresolved scientific issues and defining future directions for the role of LEMP in preventing physical function decline and disability in older adults.

BIOLOGICAL BASIS OF MUSCLE POWER LOSS WITH ADVANCING AGE

R.A. Fielding, *Nutrition, Exercise Physiology, and Sarcopenia Laboratory, Tufts University, Boston, Massachusetts*

Although lower extremity muscle strength is a reliable measure of impairment and an index of functional capacity in the elderly, peak power or the maximum capacity to perform muscular work per unit of time may play a more important role in functional independence and disability prevention than muscle strength alone. Recent work from our laboratory suggests that peak lower extremity power, compared to lower extremity strength, is a better predictor of performance-based function and is an independent predictor of self-reported disability in frail elderly women. Several recent reports have attempted to delineate the underlying biological bases for the deficits in muscle power output that are manifested with advancing age. In this presentation, I will attempt illustrate the varying degrees to which muscle loss (sarcopenia), intrinsic muscle contractile properties (specific force; unloaded shortening velocity), and neuromuscular control (central activation, antagonist muscle activation) contribute to the age-associated decline in muscle power output.

DO INTERVENTIONS DESIGNED TO INCREASE LOWER EXTREMITY MUSCLE POWER LEAD TO IMPROVEMENTS IN PHYSICAL FUNCTION IN OLDER ADULTS?: EVIDENCE FROM RCTS

A.P. Marsh, *Health and Exercise Science, Wake Forest University, Winston Salem, North Carolina*

Both muscle strength and power decline with age, but power declines earlier and at a faster rate than strength. Cross-sectional and longitudinal studies show that lower extremity muscle power is associated with physical function and is predictive of functional limitations and disability in older adults. However, there are few RCTs that have been designed to improve muscle power in older adults that have also assessed physical function. For example, in 45 older adults (74.8±5.7y) we have found 12 weeks of lower extremity power training to produce similar increases in strength (~20%), but 2-fold greater improvements in power compared to strength training. Although we observed improvements in physical function favoring the power training group, these changes were modest. This presentation will provide an overview of these RCTs with an emphasis on the importance of the modes of activity used to increase power and the link between muscle power and physical function.

EFFECT OF RESISTANCE TRAINING WITH WEIGHT LOSS ON LOWER EXTREMITY MUSCLE POWER IN OVERWEIGHT OLDER ADULTS

M. Delmonico^{1,2}, K. Clark², P.J. Chomentowski², A.B. Newman², B. Goodpaster², 1. *Kinesiology, University of Rhode Island, Kingston, Rhode Island*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

We investigated the effect of traditional resistance training (RT) plus weight loss (WL) on muscle function in 10 overweight to obese (BMI=32.4, SD=2.5 kg/m²) older adults (age=65, SD=5 yrs). Subjects underwent a hypocaloric diet and engaged in RT three times per week for 16 weeks for the leg extensors and flexors using exercise machines. Lower extremity muscle power (LEMP) and strength were assessed using a pneumatic leg extension machine, and LEMP was measured at 40%-70% of measured strength. Subjects lost -11.4 ± 2.7% of their body weight (p=0.003) and had an increase in LEMP (5.3 ± 2.3%, p=0.045) and strength (17.4 ± 4.3%, p=0.003). A randomized, follow-up WL study that used higher-velocity RT in a comparable group of obese older adults (n=27) showed similar changes in LEMP and strength. These data suggest that strength and LEMP can be improved with RT during diet-induced WL, but LEMP improvements may be attenuated.

ASSESSMENT OF MUSCLE POWER IN OLDER ADULTS AND ASSOCIATION WITH FUNCTIONAL PERFORMANCES

P. Caserotti¹, P. Aagaard², T. Harris¹, 1. *Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, Bethesda, Maryland*, 2. *Institute of Sport Sciences and Clinical Biomechanics, University of Southern Denmark, Odense, Denmark*

The association of lower extremity muscle power (LEMP) and functional performance may depend on the fraction of force (% of individual maximal strength) and the time required to accomplish a specific motor task. Decline in maximal strength with increasing age increases the fraction of force for the same motor task and may modify this association. We assessed LEMP during multi-joint weight-bearing (jumping, chair-rise) versus non-weight-bearing (Nottingham power Rig - NPR) tests in 60-65 and 79-85 year-old women. LEMP showed the highest age-deficit for NPR (38%) followed by jumping (25%) and chair-rise (7%, ns). The highest correlation was found for LEMP jumping and chair-rise in the oldest group (r=0.7). Correlation with other functional performances (walking, balance, chair-rise, Physical Performance Test battery) varied according to the age-group and LEMP method implemented. This presentation will highlight the importance of LEMP measurements methods in determining the relationship with physical function in older adults.

SESSION 870 (POSTER)

PHYSICAL FUNCTION

SELF-ASSESSED PHYSICAL FUNCTION LEVELS OF OLDER PERSONS WITH/WITHOUT FIBROMYALGIA

D.N. Rutledge, C. Jones, B. Cherry, L. Zettel-Watson, L. Lopez, R. Cayetano, *California State University, Fullerton, Fullerton, California*

This study aimed to determine whether persons 50+ with fibromyalgia (PWF) report decreased physical functioning compared to healthy peers. In 70 community dwelling PWF (93% female, M age = 60 years), 76 persons without FM (PWO; 67% female, M age = 68 years), PWF had lower self reported physical function (Physical Ability Impact scale) than did PWO when age, gender, and depression were controlled (p < .0001). Greater activity limitations were reported in PWF (e.g., 51% vs. 95% PWO could climb 1 flight stairs; 49% vs. 99% could walk 1/2 mile). Proportions of those with specific activity limitations were not different by age (50-64 years vs. 65+) for PWF or PWO, indicating that decrements were FM-related, not age-related. Findings validate differences in self reported physical function in older PWF as compared to healthy elders. Deconditioning has major impacts on life quality. Programs are needed to assist PWF to prevent/reverse deconditioning.

ASSOCIATIONS BETWEEN SERUM BIOMARKER CHANGE AND FUNCTIONAL CHANGE IN VERY OLD ADULTS

J. Sanders¹, R. Boudreau¹, A. Cappola², A. Arnold³, P. Chaves⁴, J. Robbins⁵, M. Cushman⁶, A.B. Newman¹, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *University of Washington, Seattle, Washington*, 4. *Johns Hopkins University, Baltimore, Maryland*, 5. *University of California Davis, Davis, California*, 6. *University of Vermont, Burlington, Vermont*

Though cross-sectional associations between biomarkers and functional ability in the elderly have been described previously it is unknown how biomarkers and function change simultaneously and which changes are most strongly correlated. We describe correlates of biomarker and functional change in the Cardiovascular Health Study All Stars study [N=991, mean (SD) age 85.2 (3.6) years in 2005-06]. Serum biomarkers [dehydroepiandrosterone sulfate (DHEAS), androstenedione, interleukin-6 (IL-6), insulin-like growth factor-1, cholesterol, glucose] and function (gait speed, grip strength, 3MSE and DSST scores) were meas-

ured at 1996-97 and 2005-06. We used linear models adjusted for 1996-97 covariates (age, race, smoking, BMI, marital status, comorbidities). In men: a 20mg/dl cholesterol or 5mg/dl glucose drop was associated with -0.60kg ($p<0.01$) or -0.10kg ($p=0.01$) grip strength change; a 1pg/ml IL-6 increase with -0.43 point ($p=0.05$) and -0.40 point ($p=0.05$) 3MSE and DSST change. In women: a 0.25ug/ml DHEAS drop was associated with change in grip strength (-0.51kg, $p<0.001$), gait speed (-0.03m/s, $p<0.01$), 3MSE score (-1.14 points, $p<0.001$), and DSST score (-1.24 points, $p<0.01$); a 1pg/ml IL-6 increase with grip strength (-0.28kg, $p<0.001$) and gait speed (-0.01m/s, $p=0.02$) change. Change in DHEAS or IL-6 was most associated with functional change in very old adults, but associations varied by gender. Prospective data with >2 measurements of these factors would provide greater mechanistic insight across the lifespan.

THE ASSOCIATIONS BETWEEN BASELINE SERUM VITAMIN E CONCENTRATIONS AND RECOVERY OF PHYSICAL FUNCTION DURING THE YEAR AFTER HIP FRACTURE

C. D'Adamo¹, M. Shardell¹, R.R. Miller¹, G. Hicks³, D. Orwig¹, M. Hochberg¹, L. Ferrucci², J. Magaziner¹, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *National Institute on Aging, Baltimore, Maryland*, 3. *University of Delaware, Newark, Delaware*

Background: Poor nutritional status after hip fracture is common and may contribute to the steep decline and protracted recovery of physical function post-fracture. Low serum concentrations of vitamin E have been associated with incident decline in physical function among older adults, but the role of vitamin E in physical recovery has never been explored in older hip fracture patients. We examined whether serum vitamin E concentrations shortly after hip fracture were associated with physical function at specific points and throughout the year after fracture. Methods: Baseline concentrations of the two major forms of vitamin E – alpha and gamma tocopherol – were assessed among female hip fracture patients in the Baltimore Hip Studies cohort 4 (BHS 4). Four physical function measures; Lower Extremity Gain Score (LEGS), Six Minute Walk Test (6MWT), SF-36 Physical Functioning Domain (SF36-PF), and Yale Physical Activity Score (YPAS); were assessed at 2, 6, and 12 months post-fracture. Generalized estimating equations modeled the relationship between serum tocopherol concentrations and physical function at each post-fracture time point. Results: Ninety-six women were studied. Higher levels of alpha tocopherol and combined alpha and gamma tocopherol were associated with longer 6MWT distances ($p<0.01$) and higher YPAS scores ($p<0.07$) during the year post hip fracture after adjusting for covariates. Conclusions: Serum concentrations of both alpha and gamma tocopherol were associated with better physical function after hip fracture. These micronutrient markers of a healthy diet may represent a potentially modifiable factor related to recovery of physical function after hip fracture.

A NOVEL APPROACH TO ESTIMATE OVERALL FUNCTIONAL FITNESS IN OLDER ADULTS: A PILOT STUDY

K. Machacova^{1,2}, D.E. Adamo^{1,3}, V. Bunc², 1. *Institute of Gerontology, Wayne State University, Detroit, Michigan*, 2. *Faculty of Physical Education and Sports, Charles University, Prague, Czech Republic*, 3. *Department of Health Care Sciences, Wayne State University, Detroit, Michigan*

Functional fitness is a major determinant of quality of life and an important predictor of many health outcomes in later life. Functional fitness is a latent construct consisting of specific components essential for independent functioning; including muscle strength, stamina, flexibility and agility. Accurately estimating overall fitness is essential for clinical and research purposes because multiple evaluations are not always satisfactory or even desirable. However, the structure of functional fitness and the contribution of its individual components have

been under-investigated. The Senior Fitness Test (Rikli & Jones, 2001), which consists of six performance-based tasks validated to measure functional fitness components, was administered to 78 adults (82.0 ± 8.8 years). Single level structure model of Overall Functional Fitness was tested using structural equation modeling performed in LISREL. The standardized maximum likelihood solution of the initial model showed satisfactory goodness-of-fit indices (RMSEA = 0.00; NFI = 0.95; GFI = 0.97; RMR = 0.038 and $\chi^2 = 7.64$, $df = 9$). Findings demonstrate that the structure of functional fitness is one-dimensional and contributions of its individual components are hierarchical in nature. Therefore, an accurate estimation of Overall Functional Fitness considers the weighted sum, rather than a simple sum, of all identified components. Using an estimation of Overall Functional Fitness, derived from performance measures on the six tasks in the Senior Fitness Test, contributes to implementing and evaluating effective activity/exercise programs targeting the select needs of older individuals that become increasingly variable with the onset of diseases or disabilities that often accompany the aging process.

SUCCESSFUL AGING AND MENTAL AND PHYSICAL FUNCTIONING IN OLDER CANADIAN MEN: MANITOBA FOLLOW-UP STUDY

R.B. Tate, D.J. Bayomi, *Community Health Sciences, University of Manitoba, Winnipeg, Manitoba, Canada*

Since 1948, the Manitoba Follow-up Study has investigated the natural history of cardiovascular disease in a cohort of 3,983 originally healthy, young men. After 60 years, 849 men are alive (mean age 87 years). Since 1996, seven "Successful Aging" (SA) questionnaires have been administered, each asking about activity, living arrangements, mental and physical functioning (SF-36), and the man's definition of SA. Our objective is to determine whether specific theme(s) in a man's definition of SA is related to his mental and physical functioning. Generalized linear model methodology was used to examine repeated standardized mental (MCS) and physical component scores (PCS). At up to 7 time points each, 1,753 community dwelling men contributed a total 6,782 survey responses. Each survey response included an MCS and PCS score and indicator variables for each of 28 SA themes. Over the 12 year observation period, mean MCS remained constant at 54 ± 8 , while mean PCS declined from 46 ± 10 to 41 ± 10 . In multivariate models, controlled for age and year of survey, longitudinally the SA themes of physical activity, having interests, adaptation, and retirement were each independently associated ($p<0.05$) with an increase in MCS and PCS. In addition, the SA themes of attitude, happiness, mental activity, acceptance, independence and longevity were associated ($p<0.05$) with better MCS, but not PCS. Age was significantly related to decline in MCS and PCS (both $p<0.001$). Our prospective evidence demonstrates that mention of specific themes in an older man's definition of successful aging is related to higher mental and physical functioning.

MEASUREMENT INVARIANCE OF FUNCTIONAL OUTCOMES IN OLDER ADULTS WITH SELF-REPORTED VISUAL IMPAIRMENT

B.A. Steinman¹, S. Berger², 1. *Gerontology, University of Southern California, Los Angeles, California*, 2. *Boston University, Boston, Massachusetts*

Studies in cognitive aging have suggested a strong association between vision and cognition, such that both share a negative trajectory with old age. Thus, performance on cognitive tasks has been predicted by vision measures with seemingly little relation to tasks at hand. A second body of research associates vision loss and functional decline. Generally, older adults with visual impairments have relatively more difficulty performing functional tasks than those with unimpaired vision; more specifically, older adults with visual impairments have greater difficulty with instrumental activities of daily living (IADLs), which are thought to be cognitively more complex than activities of daily living

(ADLs). The purpose of this study was to determine whether items that compose traditional multidimensional facets of functioning (i.e., ADLs & IADLS) in older adults are equivalent between older persons with visual impairments compared to those with good vision. Older persons with visual impairments are hypothesized to respond differently to highly cognitive-oriented items (e.g. managing money) compared to persons without visual impairments, due to concurrent losses they may experience in cognition. Functional variables from the 2006 wave of the Health and Retirement study were analyzed using SPSS. Participants were selected if they were 70 or older. Logistic regression was conducted controlling for demographics, health measures, and four measures of cognition on each measure of ADL and IADL functioning. Results suggest non-invariance of cognitively-oriented functional items between the vision groups. Findings suggest a need for improved/unique structural measures of functioning in older persons with visual impairments.

THE ACTIHEART™ TO MEASURE HEART RATE AND MOTION RESPONSE TO ACTIVITIES IN OLDER SURGICAL PATIENTS

C.M. Casey¹, J.A. Bennett¹, H.M. Young², K. Winters-Stone¹, G. Knafl³, *1. Oregon Health & Science University, Portland, Oregon, 2. University of California-Davis, Davis, California, 3. University of North Carolina, Chapel Hill, North Carolina*

Older adults often experience loss of function during hospitalization, thus clinical care activities (activities), like transferring, are part of routine hospital care to prevent functional decline. A paucity of research exists to measure this type of activity objectively. This instrument feasibility study evaluated the utility of the Actiheart™ to measure heart rate and motion responses to five activities, turning, dangling, transferring, sitting, and walking. Fifty-four adults aged 65 and older ($M=72$), scheduled for surgery, participated in a simulation of the five activities. The study's major findings indicate that the Actiheart™: 1) successfully measured motion and heart rate during various activities; 2) works well to measure activities that may not show much change in motion alone (like sitting) or heart rate alone (like turning); and 3) can reasonably measure heart rate and motion even in the presence of covariates such as gender and BMI. One-way repeated measures analyses of variance also showed that the Actiheart™ discriminated significant differences in average heart rate and total motion across the five activities (Wilk's $\lambda = 0.21$ [$F_{4, 49} = 45.37, p < 0.001$] and Wilk's $\lambda = 0.23$ [$F_{4, 50} = 41.17, p < 0.001$], respectively). This study was the first to explore the utility and feasibility of the Actiheart™ in a cohort of older adults in a hospital-like environment. It should next be used in an inpatient setting to examine activity patterns of older adults during hospitalization.

I-SEE INTERVENTION ASSOCIATED WITH INCREASED PHYSICAL PERFORMANCE FOR DUALY IMPAIRED LONG-TERM CARE ELDER

P.Z. Cacchione¹, L. Willoughby², E. Binder³, *1. Saint Louis University, School of Nursing, St. Louis, Missouri, 2. Saint Louis University, Research Methodology, St. Louis, Missouri, 3. Washington University, School of Medicine, St. Louis, Missouri*

Individualized –Sensory Enhancement for the Elderly (I-SEE) is a nursing intervention for visually and/or hearing impaired long-term care elders. This study investigated the impact of the I-SEE intervention on physical performance (Nursing Home-Physical Performance Test, NH-PPT), cognitive performance (MMSE), depression (GDS) and social engagement (BASE). The I-SEE intervention includes nursing assessments, actions, and referrals. Resident's ($n=117$) from five long-term care settings were randomly selected and enrolled if they were visually impaired (20/50 vision or worse, $n=41$) or hearing impaired (PTA \geq 40DBs, $n=37$), or both ($n=39$). Participants took part in the I-SEE intervention (I-SEE, $n=67$) or attention control (AC, $n=57$) conditions over a period of 16 weeks. Due to non-normality, Friedman's test was

used to evaluate within group changes and paired comparisons were made using the Wilcoxon signed ranks test. Results of the Friedman test indicated differences in the NH-PPT across time within the dually-impaired I-SEE group ($P=.03$). Follow-up comparisons revealed that within the dually-impaired group, NH-PPT scores were higher at week 16 ($M=15.7, Md=17$) when compared to baseline ($M=14.4, Md=15$; $P=.01$). There were no changes in the NH-PPT scores observed within the remaining groups. Nor were there improvements in MMSE, GDS, or BASE scores in any sensory-impaired I-SEE group. The I-SEE nursing intervention shows promise for improving physical performance in dually impaired long-term care elders.

SESSION 875 (SYMPOSIUM)

SUSTAINABILITY, IMPUTATIONS AND MISSING DATA: 12-MONTHS AFTER A PHYSICAL ACTIVITY COUNSELING TRIAL

Chair: M.C. Morey, *Geriatrics, VA and Duke Medical Centers, Durham, North Carolina*

Discussant: C.F. Pieper, *Geriatrics, VA and Duke Medical Centers, Durham, North Carolina*

Successful completion of a randomized trial marks the beginning of interpreting, understanding and disseminating its full impact. For behavioral trials promoting physical activity, there is hope that study participants remain physically active. Investigators examine the data for insight that informs subsequent work. The Veterans LIFE study (Learning to Improve Fitness and Function in Elders) was a 12-month primary care-based, counseling trial in which 400 older veterans (ages 70-92) were randomized to either multi-component physical activity counseling (PAC) or usual care (UC). The primary endpoint was change in usual and maximal gait speed. Although no between group differences were noted at 12 months for usual gait speed, rapid gait speed improved significantly more for the PAC group [1.56(0.41) m/sec to 1.68(0.44) m/sec] compared to UC [1.57(0.40) m/sec to 1.59(0.42) m/sec, $p=0.04$]. A year after completion of the trial each study participant was invited to undergo reassessment of study outcomes. The first paper will provide an overview of the trajectory and sustainability of the outcomes and behaviors targeted by the intervention. The second paper will examine transitions over time in personal health goals. The third paper will discuss challenges associated with the analysis of the 400-meter walk test as an outcome measure over 5 time points in which study participants either "completed", "did not complete" or "refused to attempt" the test at various time points. The fourth paper will discuss the implications and strategies of dealing with missing data in the primary endpoint.

TRAJECTORIES OF PHYSICAL PERFORMANCE AND ACTIVITY AFTER 12-MONTH CESSATION OF TELEPHONE COUNSELING

M.C. Morey^{1,3}, M. Peterson^{1,3}, C.F. Pieper^{2,3}, R. Sloane^{2,3}, G.M. Crowley¹, E.S. McConnell¹, H. Bosworth¹, *1. Geriatrics, VA and Duke Medical Centers, Durham, North Carolina, 2. Duke Medical Center, Durham, North Carolina, 3. Older Americans Independence Center, Durham, North Carolina*

The Veterans LIFE study was a 12-month counseling trial in which 400 older veterans (ages 70-92) were randomized to either multi-component physical activity counseling (PAC) or usual care (UC). The primary endpoint was change in usual and rapid gait speed. Although no between group differences were noted at 12 months for usual gait speed, rapid gait speed improved significantly more for the PAC group [1.56(0.41) m/sec to 1.68(0.44) m/sec] compared to UC [1.57(0.40) m/sec to 1.59(0.42) m/sec, $p=0.04$]. Following one-year with no participant contact: (a) the trajectories and between group differences observed for usual gait speed were sustained; and (b) although the magnitude of change over time decreased between the two arms for rapid gait, overall between-group differences were sustained [1.64(0.43) m/sec

at 24 months compared to UC 1.58(0.42) m/sec, $p=0.035$ for omnibus test of group and group x time].

PERSONAL HEALTH GOALS IN OLDER ADULTS: PROSPECTIVE TRENDS AND LONG-TERM PREDICTORS

K. Hall¹, G.M. Crowley¹, R. Sloane², M. Peterson¹, M.C. Morey¹, *1. Durham VA Medical Center; Durham, North Carolina, 2. Duke University, Durham, North Carolina*

Goal setting is a recognized tool for improving performance. To date, little research has examined individual progress on self-selected goals. Participants in the Veterans Life Study physical activity trial were asked to identify their most important health goal and rank on a scale of 0 (worst) to 10 (best) where they perceived themselves at the present time. Participants were instructed to rank themselves on this same goal again at 6-, 12-, and 24-months. A series of latent growth curve analyses were performed to assess patterns of change in goal status and the effects of individual factors on both initial status and change over time. Although both the treatment and control groups demonstrated improvement on their goals, the rate of change was significantly greater in the treatment group. Subsequent analyses examining predictors of change in goal status from 12 months to one year post-intervention will be discussed.

THE 400 METER WALK AS AN OUTCOME MEASURE IN LONGITUDINAL TRIALS

R. Sloane¹, M.C. Morey^{2,1}, C.F. Pieper¹, M. Peterson^{2,1}, *1. Duke University, Durham, North Carolina, 2. Veterans Affairs Medical Center, Durham, North Carolina*

The 400 Meter Walk is a commonly used method to assess mobility in physical performance trials of older persons, expressed as the number of seconds to walk the entire distance or dichotomized as the ability to walk the entire distance. It has been shown to be a reliable measure with good predictive qualities but when used as a continuous outcome measure care must be taken to adequately process incomplete or missing data and extreme values. The continuous metric was used in the Veterans LIFE study as an outcome measure over the five assessments. At baseline 15.5% of the participants could not complete the 400 meters, and in subsequent assessments the proportion of non-completers increased (17.1%, 19.1%, 22.0% and 20.5%). We discuss methods for imputing reasonable estimates of velocity for the non-completers using partial data from the 400 Meter Walk, or from other walking measures where the participants refused outright.

ISSUES WITH MISSING DATA IN EXERCISE INTERVENTIONS FOR ELDERLY WITH LONG-TERM FOLLOW-UP

M. Peterson^{1,2}, C.F. Pieper², R. Sloane², M.C. Morey^{1,2}, *1. Research, VA Medical Center; Durham, North Carolina, 2. Duke Medical Center, Durham, North Carolina*

Missing data is ubiquitous in research involving older adults. Exercise interventions are particularly susceptible to missing data due to attrition. In addition, substantial data lost to follow-up can make post-intervention maintenance difficult to interpret. This talk will discuss strategies and their implications of dealing with missing data in exercise interventions. Of the 400 baseline subjects in the Veterans LIFE study, usual and rapid gait speed data from 355 and 238 subjects were available at 12 and 24 months, respectively. We will estimate change in gait speed over time, with a focus on change from 12 to 24 months. Repeated measures analysis of variance (ANOVA) with and without imputation, and hierarchical linear models (HLM) will be employed and estimates of change compared. Discussion of the statistical models' estimates, variances, and appropriately modeling the form of trajectory of gait speed will be highlighted.

SESSION 880 (SYMPOSIUM)

UNDERSTANDING THE INFLUENCE OF THE CULTURE OF CARE ON END-OF-LIFE CAREGIVING

Chair: J. Penrod, *Penn State School of Nursing, University Park, Pennsylvania*

Discussant: J. Hupcey, *Penn State School of Nursing, University Park, Pennsylvania*

Family caregivers are integral components of the patient system receiving care for end-stage chronic illness. While characteristics of caregivers/caregiving have been well-documented, little is known about the caregiving trajectory from active treatment through the end of life. These partners-in-care provide needed care and assistance over years of illness, interfacing with health care providers only during brief office visits across the trajectory of illness. This symposium presents findings of an ethnographic inquiry that examined how the culture of care influenced the supportive care of informal family caregivers across three distinct death trajectories: heart failure, lung cancer, and amyotrophic lateral sclerosis. Paper 1 introduces basic conceptual models for understanding caregiving across unique death trajectories and four key elements identified as indicative of the culture of care in the clinic settings. Each of the following papers addresses the four elements of the culture of care as manifest in the specific clinics: Paper 2: Heart Failure; Paper 3: Lung cancer; Paper 4: ALS. The three clinics examined in this study demonstrate markedly different approaches to managing the care of patient systems and, ultimately, to the progressive end of life care provided. Understanding the influence of the culture of care on caregivers will permit more thoughtful development of strategies to support family caregivers as both co-providers and co-recipients of end-of-life care in a variety of care settings.

DEATH TRAJECTORIES AND THE CULTURE OF CARE

J. Penrod, J.E. Hupcey, B. Baney, P.Z. Shipley, P.C. Spigelmyer, J. Thurheimer, *Penn State School of Nursing, University Park, Pennsylvania*

A trajectory model of caregiving derived through grounded theory frames the phases and critical junctures of caregiving, demonstrating that the illness trajectory has a profound effect on the course and duration of phases of caregiving. A subsequent ethnographic study of the culture of care in clinics serving three distinct death trajectories revealed four key elements that significantly influenced the caregiving experience. The first element, Role of the Health Care Provider, addresses the degree to which the delivery system functions as a multidisciplinary team versus individuals. Second, Conceptualization of the Patient System addresses how the clinicians incorporate informal caregivers into the clinic visit. Third, the Focus of the Visit, deals with whether the visit includes holistic concerns of the illness/caregiving experience or tends to be highly constrained on the patho-physiological course of the illness. Finally, the Flow of Care, refers to the flow of care both in clinic and between visits.

THE CULTURE OF CARE IN A LUNG CANCER CLINIC

J. Thurheimer, J. Penrod, B. Baney, *Penn State School of Nursing, University Park, Pennsylvania*

In lung cancer, diagnosis/staging is followed by aggressive curative treatment. Early visits are focused on treatment outcomes and related side effects. For many, this curative focus shifts abruptly toward comfort care when available treatments are unsuccessful. This mixed trajectory (curative/comfort care) is evident in the culture of care. The Role of Health Care Providers in this clinic is differentiated. Physicians bear the responsibility for breaking bad news or good news. Nurses serve as de-briefers, helping patient systems to interpret rather complex medical communications, discussing treatment management, and initiating end of life discussions. The Conceptualization of the Patient System by medical clinicians focuses on the cancer; however, nurses integrate family caregivers more fully while debriefing the medical communication, as

co-providers of care. The Focus of the Visit pivots on response to treatment. While the Flow of Care is focused on the clinic visit, frequent between-visit communications are handled by the nurse.

THE CULTURE OF CARE IN AN ALS CLINIC

P.Z. Shipley, J. Penrod, *Penn State School of Nursing, University Park, Pennsylvania*

Amyotrophic Lateral Sclerosis [ALS] is a progressive degenerative neuromuscular disease affecting one's ability to move, swallow and, ultimately, breathe. Family caregivers provide increasingly supportive care often extending over years of declining capacity. The duration of this debilitating trajectory varies; however, the outcome is clear: ALS is a terminal diagnosis. A unique culture of care surrounds this expected death trajectory. This clinic functions as a highly coordinated interdisciplinary team, integrating varied Roles of the Health Care Providers. The Conceptualization of the Patient System is marked different: family caregivers (and paid caregivers) are embraced as both co-providers and co-recipients of care. The Focus of the Visit is holistic rather than medically-driven. Family caregivers are seamlessly incorporated into all aspects of the visit. The Flow of Care is not restricted to the clinic visit, as team members are available via email or phone, home visits, and specialized support group meetings.

THE CULTURE OF CARE IN A HEART FAILURE CLINIC

P.C. Spigelmyer, J. Penrod, *Penn State School of Nursing, University Park, Pennsylvania*

Heart failure is a progressively deteriorating condition with high morbidity and mortality. The trajectory of illness is marked by a high degree of uncertainty and the course of treatment is focused on maintaining medical stability using medications, dietary restrictions, and implantable devices. This unexpected death trajectory is reflected in the culture of care. The Role of Health Care Providers in this clinic is constrained to symptomatic complaints and markers of the progressive disease. Relational issues or functional incapacity are not commonly addressed. The Conceptualization of the Patient System focuses on the person with heart failure. Accompanying family caregivers are rarely integrated into the visit unless they initiate interaction. The Focus of the Visit is clearly on medical stabilization and related diagnostic tests that confirm stability. The Flow of Care is highly focused on the clinic visit, between-visit communications are most often symptom-oriented using call-in systems.

SESSION 885 (SYMPOSIUM)

UTILIZING THE SUMMER: AN OVERVIEW OF SUMMER TRAINING PROGRAMS AND INSTITUTES ON AGING RESEARCH

Chair: *K.E. Garcia, Davis School of Gerontology, University of Southern California, Los Angeles, California*

Summer training programs and institutes on aging research are excellent opportunities for emerging scholars to gain a greater understanding of methodological approaches, sharpen their analytic skills, and advance their research agenda. Trainees improve their research skills through extensive collaboration with distinguished researchers and learn about new and ongoing areas of research through lecture series and workshops led by experts from diverse academic disciplines. Summer programs provide research development and grant application consultation, and launch trainees into a career trajectory in research on aging. This symposium will provide an overview of national and international summer training programs and institutes for predoctoral, postdoctoral, and emerging scholars, with a focus on programs supported by the National Institute of Aging. A panel discussion on the attributes of a competitive application will be followed by a question-and-answer period with representatives from multiple training programs.

A BRIEF OVERVIEW OF SUMMER OPPORTUNITIES FOR STUDENTS INTERESTED IN AGING

S. Vasunilashorn, Davis School of Gerontology, University of Southern California, Los Angeles, California

There are a number of opportunities for students interested in obtaining additional research and training outside of their institution; however, given the limited time of available summers, selecting which programs are best fit for each individual can be a difficult task. This presentation will highlight one student's experiences from various aging-related summer opportunities. The programs and workshops to be discussed include the: National Institutes of Health Summer Internship Program in Biomedical Research, Cells to Society (C2S) Summer Biomarker Institute hosted by Northwestern University, International Program in Aging Research hosted by Penn State University, RAND Summer Institute, as well as summer courses offered at various universities and institutions. Research skills and training obtained from these and other programs will enhance the student's knowledge base and better prepare individuals for successful careers as professionals in the field of gerontology and geriatrics.

SPECIFIC SUMMER TRAINING PROGRAMS TO CONSIDER

A. Hagedorn, Davis School of Gerontology, University of Southern California, Los Angeles, California

A variety of specific summer training courses and funding opportunities will be described. Deadlines are early, with applications accepted as early in November (up to 7 months in advance), and due by March 1st or April 1st, so it is important to start planning your summer early. After attending this session, participants will be aware of the major summer training programs available in aging. For pre-doctoral students there are a variety of short training courses for specific research methods hosted by universities and think tanks including Univ. of Michigan, Univ. of California San Francisco, Univ. of California San Diego, Univ. of Hawaii, Univ. of Southern California, RAND, and others. A variety of funding options are available through the National Academy of Social Insurance, NIA training grants, and local foundations. The session will describe the topics, costs, and offer resources for more information.

THE RAND SUMMER INSTITUTE

D. Malouf, Labor and Population, RAND, Santa Monica, California

The RAND Summer Institute consists of two annual conferences that address critical issues facing our aging population, sponsored by the National Institute on Aging and the NIH Office of Behavioral and Social Sciences Research. The two conferences, the Mini-Medical School for Social Scientists and the Demography, Economics, and Epidemiology of Aging, feature distinguished speakers from across scientific disciplines. This symposium will provide an overview of the RAND Summer Institute and will highlight training opportunities available to persons working in the field of aging who hold a Ph.D. or have completed two years of a Ph.D. program.

SESSION 890 (SYMPOSIUM)

VITAMIN D AND PRECURSORS TO DISABILITY: POTENTIAL PATHWAYS FOR DECLINE AND RECOVERY IN OLDER ADULTS

Chair: *G. Hicks, Physical Therapy, University of Delaware, Newark, Delaware*

Discussant: *D.K. Houston, Wake Forest University School of Medicine, Winston-Salem, North Carolina*

Disability prevention is a key goal of geriatricians and aging researchers. Recent epidemiologic literature suggests that vitamin D status is linked to multiple poor outcomes on the pathway to disability in older adults. The goal of this symposium is to highlight recent work exploring the longitudinal relationships between vitamin D and impor-

tant intermediary health outcomes along the pathway towards disability in community-dwelling older adults. Using data from the Health, Aging and Body Composition study, a prospective cohort study of older adults who were healthy upon enrollment, the first paper will determine the associations between vitamin D status, race and inflammation. Using data from the InChianti study, a prospective cohort study of older Italians, the second paper will examine associations of vitamin D status with muscle composition and strength over a six-year period of time. The third paper will use data from the Women's Health and Aging Study II, a prospective cohort study of highly functioning women, to evaluate vitamin D as a predictor of incident frailty. Using InChianti data, the fourth paper will examine the associations of vitamin D status with frailty transitions. Lastly, the final paper will use data from the Baltimore Hip Studies fourth cohort to assess the relationship between vitamin D and recovery of walking ability in the year following a hip fracture. The overall findings of these papers suggest that vitamin D is an important biomarker that should be considered when evaluating both declines and improvement in health status of older adults.

LONGITUDINAL ASSOCIATIONS OF VITAMIN D WITH MUSCLE COMPOSITION AND STRENGTH: THE INCHIANTI STUDY

G. Hicks¹, M. Shardell², R.R. Miller², D. Alley², A. Cherubini³, S. Bandinelli⁴, L. Ferrucci⁵, 1. *Physical Therapy, University of Delaware, Newark, Delaware*, 2. *University of Maryland School of Medicine, Baltimore, Maryland*, 3. *Institute of Gerontology and Geriatrics, University of Perugia Medical School, Perugia, Italy*, 4. *Laboratory of Clinical Epidemiology, INRCA Geriatric Dept., Florence, Italy*, 5. *Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*

Aging-associated reductions in vitamin D [25(OH)D] have been implicated as a potential reason for the deleterious changes in muscle composition and strength among the elderly. We examined the association of baseline 25(OH)D with lower leg muscle mass, strength and quality over a six-year period of time. Analyses included 830 participants aged ≥ 65 years from the InChianti study. Muscle mass of the lower leg was measured using quantitative computed tomography. Ankle dorsiflexion strength was measured using dynamometry. Generalized estimating equations adjusting for covariates were used. In unadjusted models, low baseline levels of serum 25(OH)D ($<25\text{nmol/L}$) were associated with reduced muscle mass, strength and quality over time ($p<.001$). In fully adjusted models, low baseline levels of 25(OH)D were still associated with reduced muscle strength over a six-year time-period ($p=.008$). Further clarification of the role of 25(OH)D in muscle strength decline will provide greater insight into the development of strategies for disability prevention.

VITAMIN D STATUS AND RISK OF INCIDENT FRAILTY: THE WOMEN'S HEALTH AND AGING STUDY (WHAS) II

P.H. Chaves¹, Q. Xue¹, S. Yasar¹, J.D. Walston¹, L.P. Fried², 1. *Johns Hopkins University, Division of Geriatrics, Baltimore, Maryland*, 2. *Columbia University, New York City, New York*

Whether low vitamin-D levels contribute to frailty development, a major geriatric syndrome, is not known. Building on previous cross-sectional studies, we examined the relationship between vitamin D status and incident frailty in community-dwelling older women. Data are from WHAS II (1994-2008). Frailty was defined according to a validated phenotype. Vitamin-D status based on serum 25-OH-vitaminD (radioreceptor assay): deficiency ($<15\text{ng/mL}$), insufficiency ($15\text{--}30\text{ng/mL}$), and normal ($>30\text{ng/mL}$). Follow-up: up to 11 years. Sample size: 373. Cumulative frailty incidence per baseline vitamin-D status: deficiency: 37% ($n=31$); insufficiency: 20% ($n=47$); and normal: 17% ($n=10$). Adjusted relative risk for incident frailty was 2.4 ($p<.05$) and 1.4 ($p=.398$) times higher in those with deficiency and insufficiency, respectively, as compared to those with normal vitamin-D. Vitamin-D deficiency was associated with a substantial increase in frailty devel-

opment risk. These data are in support of trials to assess the efficacy of vitamin-D deficiency correction in preventing frailty in older adults.

ASSOCIATION OF 25(OH)D LEVELS WITH DECLINE AND RECOVERY FROM THE PREFRAIL STATE: THE INCHIANTI STUDY

M. Shardell¹, G. Hicks², R.R. Miller¹, D. Alley¹, A. Cherubini³, S. Bandinelli⁴, L. Ferrucci⁵, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *University of Delaware, Newark, Delaware*, 3. *Institute of Gerontology and Geriatrics, University of Perugia, Perugia, Italy*, 4. *Tuscany Regional Health Agency, Florence, Italy*, 5. *Longitudinal Studies Section, Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*

Relationships of low vitamin D [25(OH)D] with frailty have been reported. No work has examined whether vitamin D status is associated with positive or negative transitions from a prefrail state. Analyses included 310 prefrail participants aged ≥ 65 years from the InChianti study. Frailty was defined as presence of ≥ 3 of the 5 following criteria: slowness, weakness, sedentariness, exhaustion, and weight loss. Robustness and prefrailty were defined, respectively, as presence of zero and 1-2 criteria. Logistic regression adjusting for covariates was used. Serum 25(OH)D was associated with transitions from prefrailty ($p=0.02$). Those with 25(OH)D $>50\text{nmol/L}$ were more likely to become robust ($\text{OR}=2.14$, $95\%\text{CI}=0.85, 5.42$) and less likely to become frail ($\text{OR}=0.27$, $95\%\text{CI}=0.08, 0.94$) than remain prefrail compared to those with 25(OH)D $<25\text{nmol/L}$. Lower 25(OH)D was associated with incident frailty, and higher 25(OH)D was associated with recovery from prefrailty. Additional research examining vitamin D and physical recovery is warranted.

LONGITUDINAL ASSOCIATIONS OF SERUM VITAMIN D LEVELS WITH RECOVERY OF WALKING ABILITY FOLLOWING HIP FRACTURE: THE BALTIMORE HIP STUDIES

R.R. Miller¹, G. Hicks², M. Shardell¹, D. Orwig¹, J. Yu-Yahiro³, M. Hochberg⁴, E.A. Streeten⁴, J. Magaziner¹, 1. *Department of Epidemiology and Preventive Medicine, University of Maryland School of Medicine, Baltimore, Maryland*, 2. *University of Delaware, Newark, Delaware*, 3. *Union Memorial Hospital, Baltimore, Maryland*, 4. *University of Maryland School of Medicine, Baltimore, Maryland*

Serum levels of vitamin D [25(OH)D] are associated with neuromuscular function in older adults, and 25(OH)D levels at the time of hip fracture are associated with recovery of lower extremity function. Whether 25(OH)D levels relate to recovery of walking ability in the year post fracture is not known. Analyses included 100 women with incident hip fractures from the fourth Baltimore Hip Studies cohort. We examined the association of 25(OH)D levels with 6-minute walking distance (6MWD) at 2, 6 and 12 months post fracture using generalized estimating equations. Adjusting for covariates, each additional nmol/L of 25(OH)D, was associated with longer 6MWD by 0.7m ($95\%\text{CI } 0.1\text{m}, 1.3\text{m}$), 0.7 ($95\%\text{CI } 0.1\text{m}, 1.4\text{m}$) and 0.7m ($95\%\text{CI } 0.1\text{m}, 1.3\text{m}$) at 2, 6 and 12 months, respectively. Serum 25(OH)D levels were positively associated with walking ability following hip fracture. Vitamin D supplementation may represent an opportunity for intervention.

25-HYDROXYVITAMIN-D, INFLAMMATION, AND RACE IN HEALTH ABC

K. Shea¹, D.K. Houston¹, J. Tooze¹, D.B. Hausman², M. Johnson², D.C. Bauer³, T. Harris⁴, S. Kritchevsky¹, 1. *Wake Forest University School of Medicine, Winston-Salem, North Carolina*, 2. *University of Georgia, Athens, Georgia*, 3. *University of California San Francisco, San Francisco, California*, 4. *National Institute of Aging, Bethesda, Maryland*

We examined the association between serum 25-hydroxyvitamin-D [25(OH)D] and inflammation in 947 black and 1510 white [mean \pm SD

25(OH)D= 52±26nmol/L and 72±27nmol/L, respectively] community-dwelling participants of Health ABC (mean age 75yrs, 50% female). After controlling for age, sex, BMI, and season, serum 25(OH)D was correlated with the inflammatory markers C-reactive protein (CRP) ($r = -0.06$, $p = 0.006$), interleukin-6 (IL-6) ($r = -0.09$, $p < 0.001$), TNF-alpha (TNFα) ($r = 0.04$, $p = 0.048$), and plasminogen activator inhibitor-1 (PAI-1) ($r = -0.04$, $p = 0.038$). Blacks had higher CRP and IL-6 and lower TNFα and PAI-1, compared to whites (all $p < 0.01$), adjusted for age, sex, BMI, co-morbid disease, and medication use. Further adjustment for 25(OH)D attenuated the racial difference in IL-6 only ($p = 0.11$). Race and 25(OH)D are independently associated with PAI-1 (both $p < 0.001$). The racial difference in IL-6 is confounded by 25(OH)D. The inverse associations between 25(OH)D and IL-6 and PAI-1 may partially explain the observed associations between 25-hydroxyvitamin-D and age-related diseases

SESSION 895 (SYMPOSIUM)

SRPP PRESIDENTIAL SYMPOSIUM: COMMUNITY APPROACHES TO HEALTHY AGING

Chair: A.E. Scharlach, *Social Welfare, University of California, Berkeley, California*

Discussant: M. Ory, *Texas A&M, College Station, Texas*

A growing body of evidence attests to the importance of physical and social environments for promoting healthy aging. Indeed, the environmental docility hypothesis posited by Lawton and Nahemow suggests that contextual features are apt to assume increased importance with age, potentially affecting levels of competence in person-environment interactions, with resultant implications for actual and perceived well-being. Recent years have seen an upsurge of scholarly interest in environmental gerontology, as well as policy efforts to rebalance public expenditures and incentives so as to enable older persons to “age in place” in their own homes, and popular interest in “good places to grow old.” Emerging from these efforts is a focus on the role of community in shaping the challenges and opportunities that individuals encounter as they age. This Symposium examines the community context of healthy aging, and implications for intervention. Andrew Scharlach’s presentation describes a conceptual model of developmentally-constructive community characteristics and an empirically-derived framework for mapping “aging friendly” community change efforts. Edward J. Olson’s presentation examines current challenges in the interface between older adults and their built environment, and provides a vision for physical and technological innovations for healthy aging. William Satariano’s presentation examines environmental factors that affect mobility and health behaviors. Kathryn Lawler’s presentation describes Atlanta’s Lifelong Communities Initiative, an innovative 10-county effort focused on “building a healthy community and a place individuals can live throughout their lifetime.”

FRAMEWORKS FOR CREATING ‘AGING-FRIENDLY’ COMMUNITIES

A.E. Scharlach, *Social Welfare, University of California, Berkeley, California*

This paper reports the results of a comprehensive review of available evidence regarding local and regional initiatives purportedly designed to help communities become more “aging-friendly.” Utilizing keyword searches of available online databases, supplemented with follow-up contacts, 272 local initiatives were found that identified themselves as “aging-friendly,” “elder-friendly,” “age-friendly,” “communities for all ages,” “livable communities,” etc. Content analysis of available data yielded five domains: 1. target systems (e.g., housing, transportation, health care, productivity) 2. focal areas (e.g., physical infrastructure, social infrastructure, technological infrastructure) 3. inclusiveness (e.g., age-segregated vs. age-integrated) 4. community-change processes (e.g., community planning, locality development, social action) 5. intended goals (e.g., individual well-being, organizational capacity

development, culture change) The types of innovations within each domain, and the balance among them, serve to differentiate the various “aging-friendly” initiatives. This framework provides a conceptual foundation for evaluating outcomes attributable to specific goals, mechanisms, and processes.

CREATING LIFELONG COMMUNITIES: LESSONS FROM THE ATLANTA REGION

K. Lawler, *Atlanta Regional Commission, Atlanta, Georgia*

The rapidly growing older adult population is already reshaping most communities whether they are prepared or not. The Atlanta Regional Commission as the Area Agency on Aging and the Metropolitan Planning Organization for the 10 county area quickly found that it was at the center of this major demographic shift and had to develop a comprehensive response that could match the scale of the change. ARC’s Lifelong Communities Initiative is a multi-year project to create local, cross disciplinary partnerships in each of the region’s counties to work toward three goals: promoting housing and transportation options, encouraging healthy lifestyles and expanding information and access. While the emphasis is on the needs of the older adult population, the goal is to design and implement solutions that benefit people of all ages. The session will discuss the process employed including the recent Lifelong Communities charrette and the successes and ongoing challenges of this work.

INSIGHTS REGARDING HEALTHY COMMUNITY AGING

E. Olson, *E. J. Olson & Associates, Milwaukee, Wisconsin*

This presentation will highlight the exciting dynamics of the 21st century that are fostering more independence and self determination for older adults. Dramatic technological innovations include modifications to the built-environment, new care-giving models, and a focus on person-centered technologies. As a by-product of these changes, the “boomer generation” will dramatically modify the continuum of care which will be consumer focused and defined in terms of needed services. Because of the transformative era in which we live, the session will discuss evidenced-based research of the Robert Wood Johnson (RWJ) Pebbles Initiative, results of RWJ’s research on the Eden Alternative and Green House models which emphasize households within neighborhoods, highlight the Massachusetts Institute of Technology Living House, Cambridge, MA which profiled a “Smart Environment”, and discuss environment-based technology within the framework of post-occupancy evaluations of designs for older adults.

AGING, HEALTH BEHAVIOR, AND THE ENVIRONMENT

W. Satariano, *University of California - Public Health, Berkeley, California*

Environmental factors, e.g., home and neighborhood design, have been found to be associated with health behaviors, such as diet, nutrition, and physical activity, in older populations. Different strategies, such as Geographic Information Systems, environmental audits, and personal interviews have been used to examine these associations. We will review some of the key findings in this area and examine the methods used to conduct this research. Special attention will be given to the specific contributions made by each type of research method. New directions for research and the implications of that research for practice and policy will also be addressed.

SESSION 900 (SYMPOSIUM)

CONTEXTUAL FACTORS INFLUENCING GERIATRICS EDUCATION AND EVALUATION IN RURAL AND URBAN LOCALES

Chair: J. Manchester, *Case Western Reserve University, Cleveland, Ohio*
Discussant: J. Rose, *Case Western Reserve University, Cleveland, Ohio*

This symposium will give participants an understanding of geriatrics education programming and evaluation issues in rural and urban social contexts. As faculty from these locales will present related challenges in health professions programming, attendees will be better equipped to identify contextual factors in their own operations and account for them in evaluation planning. Rural and urban-based educational programs vary in their ability to demonstrate results. This condition stems from relational and organizational systems factors inherent to these settings. The quality of partnerships may be enhanced in urban environments due to proximity; however, community partners (hospitals, care facilities) may compete for consumers and funding outside of mutual programming. The quantity of partners, important in expanding access to trainees and patients, may be limited in rural areas due to geography. However, quality partnerships facilitate reliable programming over time in these settings; this may override the actual number of partners as a capacity factor and speak to the developmental phase of a geriatrics education effort. These programmatic and evaluation challenges will be discussed using systematic and systemic (contextual) elements. Relational and organizational components (access to faculty and measurable groups) are proposed to influence systematic factors (trainee skills lead to field practice in educational or clinical settings). Systematic components will be illustrated with systemic (relational and organizational) accompaniments. Implications for analyzing data to include contextual factors and collecting data with and for partners to enhance programming and evaluation will be discussed.

USING RURAL AND URBAN CONSTELLATIONS TO FACILITATE DISCOVERY IN GERIATRICS EDUCATION

J. Manchester, *Case Western Reserve University, Cleveland, Ohio*

The presentation will examine contextual factors that influence programming and evaluation activity within geriatrics education, specific to rural and urban distinctions. Understanding partnering and organizational elements that influence delivery and outcomes will allow participants to enhance evaluation plans in these settings. When such factors are known, issues of measurement (data collection and analysis) or adequate stakeholder recruitment can be proactively addressed. Participants will gain knowledge on applying a systemic logic model that illustrates contextual factors pertinent to health professions programming in rural and urban contexts.

EVALUATION PLANNING AND IMPLEMENTATION IN A STATEWIDE GERIATRIC EDUCATION CENTER CONSORTIUM: RELEVANT FACTORS IN A RURAL-URBAN MODEL

J.L. Howe, *Mt. Sinai School of Medicine, New York, New York*

The Director of The New York Consortium of Geriatric Education Centers (CNYGEC), based at Mount Sinai School of Medicine, New York City, will present a logic model pertinent to education programming in a geographically diverse State ranging from Central New York rural areas to the densely populated metropolitan New York City area. The scope of logic model planning, program implementation and measurement is influenced by contextual factors such as statewide consortium partnerships, private and public funding streams, and travel and seasonal considerations. Other considerations impacting evaluation planning and implementation include lack of validated outcome measures for training programs and partner compliance with data collection plans. Finally, contextual challenges in identifying and working with partner clinical sites for patient outcome data in both urban and rural settings

will be discussed. Participants will be able to identify opportunities, challenges, and solutions in program evaluation based on the experiences of the CNYGEC.

GERIATRIC EDUCATION IN FRONTIER ALASKA: CAPACITY BUILDING AND HYBRID MODELS OF DEVELOPMENT

R.M. Rosich, *Psychology/AKGEC, University of Alaska Anchorage, Anchorage, Alaska*

Delivering programming through statewide outreach in Alaska is dependent upon advantageous relational and organizational factors. The Director of the Alaska Geriatric Education Center at the University of Alaska will discuss contextual facets as they influence GEC programming with rural/bush outreach. The scope of faculty development logic model planning, program implementation and measurement are influenced by contextual factors germane to a rural/bush context. For example, the level of participation among consortium partner sites and, in turn, the comprehensiveness of evaluation plans, is influenced by these contextual variables. Participants will learn to identify contextual facets and apply them in their own planning. The value in identifying developmental phases of GECs for capacity building, using such data, will be discussed.

IMPACT OF CONTEXTUAL FACTORS ON GERIATRIC EDUCATION FOR HEALTHCARE PROFESSIONALS IN AN URBAN MULTI-SITE SETTING

E. O'Toole, K. Ondus, *Case-MetroHealth, Cleveland, Ohio*

Implementing education and training in multiple competing healthcare systems in close proximity and in association with one academic institution is fraught with challenges including varying approaches to educational programs and their evaluation. The relational and organizational factors that impact the standardization of curricula and practitioner/patient-level evaluation in this context will be reviewed and approaches to addressing these issues will be discussed. Participants will be able to identify how contextual factors in an urban environment both facilitate and inhibit aspects of program development and evaluation planning. Participants are invited to share their strategies and experience.

SESSION 905 (PAPER)

INCREASING SATISFACTION AND QUALITY OF LIFE IN RESIDENTIAL CARE

INSTITUTIONAL AND COMMUNITY SUPPORTIVE HOUSING: RESIDENT EXPERIENCES OF QUALITY AND SOCIAL ISOLATION

J. Robison¹, I. Reed¹, N. Shugrue¹, N. Thompson¹, P. Smith², C. Gruman^{3,1}, 1. *University of Connecticut Health Center, Farmington, Connecticut*, 2. *Connecticut Center for Healthy Aging, New Britain, Connecticut*, 3. *The Lewin Group, Falls Church, Virginia*

An extensive literature on nursing home residents has accumulated, together with a smaller body of work examining various community-based long term care settings. However, little research to date has compared the experiences of residents of various supportive housing types using identical measures. This study compares residents of three types of supportive housing types on their assessments of quality of care, quality of life, emotional well-being and social isolation. Specifically, we look at differences between community and institutional settings as well as differences across the two community settings. Data come from 150 interviews with residents of 57 nursing homes, assisted living communities, and residential care homes, part of the statewide 2007 Connecticut Long Term Care Needs Assessment. Residents of assisted living, residential care homes, and nursing homes differ on multiple dimensions. Controlling for demographic differences, residents of these three types

of supportive housing do not differ significantly on their assessments of quality of care, emotional well-being, or social isolation. Assisted living and residential care home residents have significantly more privacy than those in nursing homes ($p < .05$), but give similar assessments of dignity and autonomy. While community-based housing as a general concept may be preferable to institutional settings, individual experiences across these settings vary, with important policy implications.

“HOME IS HOME, BE IT EVER SO HUMBLE”: NEW SENIOR HOUSING RESIDENTS’ PERCEPTIONS OF FACILITY LIFE

H. Ewen, J. Chahal, P.P. Brown, *Sociology and Gerontology, Miami University, Oxford, Ohio*

The loss of familiar social and neighborhood ties can be disconcerting for older adults who move into senior housing. With time, new social and environmental connections are established within the facility and surrounding community. This paper presents findings on a panel study of 30 women who relocated to senior housing facilities from their own homes in the greater community in 2005-2007. Movers reported on characteristics of multiple facets of their new home: privacy, sense of belonging, social outlets, and environmental control. Qualitative and quantitative analyses were used to analyze the data. Results of this mixed-method study show that six months after relocation, most movers report a sense of connectedness to others and overall satisfaction with their new living arrangements. Unwritten social rules and established social cliques exist, but most movers were able to establish their own friendships and sense of belonging. A mixture of management stipulations and unwritten resident rules provided the foundation for visitation policies and boundaries essential for establishing privacy. A sense of control over the physical environment promoted feelings of competence and feeling at “home”.

LIFE IN AN ELDER COHOUSING COMMUNITY TWO YEARS AFTER MOVE-IN

A.P. Glass, M. Schroeder, *University of Georgia Institute of Gerontology, Athens, Georgia*

ElderSpirit Community (ESC), among the first elder-only cohousing communities in the U.S., blends a unique combination of features, including mutual support, resident management, affordable housing, and both rental and owned units, all within a context of later life spirituality. Older adults proactively chose to move into ESC beginning in 2006. As part of a mixed methods longitudinal analysis, we report on the status of ESC in 2008. Through qualitative interviews with the 33 “charter residents,” who were white, 79% female, and averaged 72.1 in age (range = 65-86), we developed a model of how they defined “sense of community.” Five themes emerged: Belonging, Companionship, Mutual Support, Meaningful Relationships, and Unity/Higher Purpose. Residents strongly agreed on feeling a sense of belonging at ESC. Mutual support is another value of ESC, and it was found that, with one exception due to health problems, all residents reported both giving and receiving help, with a mean of 7.6 types of neighboring behaviors provided and 5.3 types received. Listening and providing information were among the most common, with hands-on care the least. Six respondents reported improvement in physical health from the year before and four worsened; nine reported improvement in mental health with only one reporting worse mental health. Some challenges of living “in community” are discussed, such as decision making by consensus. Based on 28 variables, mean resident satisfaction overall was 118 out of a possible 140 (range = 84-139), and was particularly high in aspects such as convenience, security, dignity, and mutual support.

SATISFACTION WITH CARE AMONG CANADIAN ASSISTED-LIVING TENANTS

H. Cooke, S. Baiton-Wilkinson, *Fraser Health Authority, Vancouver, British Columbia, Canada*

Satisfaction surveys provide a means of integrating and utilizing the perspectives of those involved in the continuum of elder care and can therefore serve as potent tools for improving service delivery. To date, few large-scale satisfaction surveys (none in Canada) have been used to assess tenant satisfaction with assisted living. In 2008, assisted-living tenants in one the largest health authorities in British Columbia, Canada participated in an inaugural Tenant Satisfaction Survey. Adapted from the Ohio Department of Aging Resident Satisfaction survey, the survey consisted of 42 questions in 10 domains (Activities, Choice, Care/Services, Staff Relations, Staff Responsiveness, Communications, Meals/Dining, Laundry, Building Environment and Resident Environment). A series of demographic questions were also included. Surveys were mailed to 1,150 tenants at 27 assisted-living sites; 798 surveys were received (69.4% response rate). Tenants who were older, had less education, had better perceived health and who lived in a smaller residence reported higher levels of satisfaction. Mean satisfaction scores were highest for the Choice and Resident Environment domains and lowest for the Activities and Meals/Dining domains. Smaller residences (<25 units) had significantly lower mean scores on the Activities domain than those of medium or large sized residences. Survey results suggest that a mail-out survey is a practical and affordable option for soliciting tenant feedback in assisted living.

FAMILY COMMENTS ON NURSING HOMES: A LONGITUDINAL ANALYSIS OF FOUR WAVES OF FAMILY SATISFACTION DATA

S. Mwangi¹, H. Baker^{2,1}, *1. Miami University, Oxford, Ohio, 2. Muskingum College, New Concord, Ohio*

In 2000, 2002, 2006, and 2008, nursing homes within the state of Ohio received family satisfaction surveys from the Ohio Department of Aging. Facilities then sent the surveys to their current residents’ responsible parties (e.g. spouses, children, friends). The responsible parties returned the surveys to the Scripps Gerontology Center for analysis. An examination of each returned family satisfaction survey was checked for additional comments written by the respondents on the survey. The comments are logged and qualitatively coded based on themes identified by the researchers. For example, 2008 data, 5,341 comments from 1,682 surveys were logged and coded based on themes used by the researchers. The researchers qualitatively analyzed how these themes and number of family comments have changed over time. For example in previous surveys, clarification of a response to an item was the most frequent comment. However in 2008, family complaints about care was the most frequent type of comment. By examining the trends in family satisfaction surveys for Ohio nursing homes, insight is gained into the views and expectations of long-term care consumers. How such views and expectations have changed over time also may help inform professionals and researchers of the industry’s past, present, and future from the consumer’s standpoint.

SESSION 910 (SYMPOSIUM)

RELIGION AND SPIRITUALITY: FROM DEFINITION AND VARIABLE TO PRACTICE APPLICATION

Chair: *J.W. Ellor, School of Social Work, Baylor University, Waco, Texas*
Discussant: *F. Netting, Virginia Commonwealth University, Richmond, Virginia*

The last 15 years have exploded with research to define and then discover the role of religion and spirituality as a variable in gerontological research, however the work to integration these definitions and the data from the variables into direct practice has lagged behind. The traditional infusion of religious and spiritual values, symbols and behaviors

employed principles of faith and practice. This allowed practitioners to bring subjective and often personal beliefs into the workplace. In today's evidence based practice environment little effort seems to be expended to use research based definitions and variables to relate to the practice outcomes in the field. This symposium will present three different studies that reflect religious and spiritual variables in direct practice in palliative care, group practice and spiritual assessment. Discussion in each presentation will reflect the definitions used the aspects of practice impacted and the outcomes of religion and spirituality in the various contexts. The discussant will then draw the dialogues together in an effort to further the impact of the research in the area of religion and spirituality on direct practice.

ASSESSING SPIRITUAL DISTRESS IN ELDERLY PATIENTS UNDERGOING REHABILITATION

S. Monod¹, E. Rochat¹, B. Spencer², C.J. Bula¹, 1. *Service of Geriatrics, University of Lausanne Medical Center, Lausanne, Switzerland*, 2. *University Institute of Social and Preventive Medicine, Lausanne, Switzerland*

Spiritual distress has been associated with worse health outcomes. Assessing patient's spirituality seems especially relevant in older patients undergoing post-acute rehabilitation. However, few instruments are designed to assess spiritual distress. The objectives of this research were 1) to conceptualize the spiritual dimension and to develop an instrument to assess spiritual distress in hospitalized older patients; 2) to determine spiritual distress prevalence and to investigate its relationship with rehab outcomes. A qualitative approach was used to develop the Spiritual Distress Assessment Tool (SDAT). The SDAT is a semi-structured interview that assesses unmet spiritual needs, and quantifies spiritual distress. In a pilot study among rehab patients (N=69, 82.5±8.3 years), 61% reported spiritual distress. Compared to the others, these patients had more functional impairment and tended to have longer stay. Further studies are needed to determine whether spiritual intervention would be effective to address spiritual distress and improve health outcomes.

A PSYCHO-SPIRITUAL INTERVENTION FOR LATE-LIFE SUFFERING

J.M. Thibault, *Family and Geriatric Medicine, University of Louisville, Prospect, Kentucky*

Late life often brings suffering that can neither be resolved nor mitigated with the most advanced medical interventions. Many religions have spiritual disciplines that could be used in medical settings; meditation is one that has produced evidence of its positive effects on health. The practice described in this paper, the "Dedicated Suffering Group" is the use of an ancient Catholic devotional practice historically referred to as 'offering it up', as a psycho-spiritual intervention for unresolved physical and emotional suffering. When used in long term care settings, where pain and suffering are rampant, the results have included decreased self-absorption, increased socialization, and a renewed sense of meaning and purpose among the participants.

IMPROVING THE QUALITY OF SPIRITUAL CARE IN PALLIATIVE CARE: CONSENSUS PROJECT REVIEW

H. Nelson-Becker¹, B.J. Kramer², 1. *Department of Social Welfare, University of Kansas, Lawrence, Kansas*, 2. *University of Wisconsin-Madison, Madison, Wisconsin*

The National Consensus Project guidelines for standards in palliative care were released in 2004. Spiritual, religious and existential aspects of care were identified as one of the eight domains essential for quality palliative care. A recent Consensus Document and Conference on "Improving the Quality of Spiritual Care as a Dimension of Palliative Care," sought to "establish a common language for spiritual care, identify resources that have practical applications, and develop recommendations that will advance the practice of spiritual care." Initial disciplinary orienting definitions led to creation of a new definition of

spirituality. This presentation will describe the development of the Consensus Document, highlight a spiritual model of care, and discuss the seven essential elements of spiritual care addressed by the Conference. Implications for practical implementation will be emphasized, with attention to spiritual assessment tools and practice principles. The website for the document will be provided.

USE OF SPIRITUAL LIFE MAPS IN A HOSPICE SETTING

S.Y. Bushfield, *School of Social Work, New Mexico State University, Las Cruces, New Mexico*

Spiritual care is an essential component of holistic hospice care at the end of life. However, hospices vary considerably in the process of spiritual assessment as a precursor to spiritual care. The Spiritual Life Map (Hodge, 2006) is one tool which has been developed to address diverse spiritual perspectives. Introduction and adoption of such a tool may require training and ongoing support to facilitate its use in a hospice setting. This qualitative study evaluated the introduction, demonstration, and use of Spiritual Life Maps in a hospice setting. Focus groups with hospice chaplains and social workers were conducted to assess hospice professionals' definitions of spiritual care and their responses both before and after hands-on training in the use of Spiritual Life Maps as a tool in end of life care. Results suggest the need for ongoing training and support in addressing spiritual needs at the end of life. Implications for research, training and practice are discussed.

SESSION 915 (POSTER)

THE LONG TERM CARE WORKFORCE - SRPP POSTER SESSION

NURSING HOME CHARACTERISTICS AND THE AVAILABILITY OF BENEFITS FOR NURSING ASSISTANTS

A. Temple², D.J. Dobbs¹, R. Andel¹, 1. *University of South Florida, Tampa, Florida*, 2. *James Madison University, Harrisonburg, Virginia*

In the nursing home (NH) setting, limited availability of employment-based benefits is a significant factor affecting the recruitment and retention of nursing assistants (NAs). This study explored the presence of benefits available to NAs and investigated NH organizational characteristics associated with benefits offered to these staff. Cross-sectional data on 944 nationally representative NHs were derived from the 2004 National Nursing Home Survey. Benefits were measured as a continuous variable weighted by cost to employers. Ordinary least squares regression was used to examine associations between NH organizational characteristics and NA benefits. The results indicate that for-profit ownership and Medicaid occupancy were negatively associated with NA benefits ($p < .05$). Chain membership, bed size, occupancy rate, union presence, and education of the nursing home administrator were positively associated with benefits of NA staff ($p < .05$). The findings suggest that organizational characteristics may explain some of the variation in the availability of NA benefits across the NH industry and may be informative for policy and practice to improve NA staff recruitment and retention. In particular, facilities with for-profit ownership and high proportions of Medicaid residents should consider cost-effective ways to enhance the benefit package offered to NAs.

QUALITY OF CARE: IMPACT OF NURSING HOME CHARACTERISTICS ON NURSE STAFFING LEVELS

H. Lee, C. Harrington, M.A. Blegen, *UCSF School of Nursing, San Francisco, California*

Inadequate staffing levels in nursing homes have long been a policy concern in the United States. The main purpose of this study was to better understand the relationship between nursing home characteristics and quality of care. This paper presented the first aim of the study, which identified important predictors that affected nursing staffing lev-

els considering organizational characteristics, resources, resident, and market characteristics. This study used secondary data from Online Survey Certification and Reporting (OSCAR) data, Minimum Data Set (MDS) 2.0, quarterly staffing data from the state inspections, and Area Resource File (ARF). The population of 195 nursing homes out of 199 Colorado freestanding homes in 2000 was analyzed. Two-stage least squares regression and ordinary least squares regression models were used for data analysis. For-profit and chain-affiliated nursing homes provided less total staffing hours per resident day (hprd). Larger nursing homes also provided less RN and total staffing hprd, as well as lower RN skill mix. Higher Medicaid reimbursement rates were associated with higher RN hours, RN skill mix, and total hours when other factors were controlled. The number of RNs in the Health Services Area was negatively associated with RN hours and RN skill mix in nursing homes when endogeneity and other factors were controlled. Given the findings, this study concluded that (1) quality of care in nursing homes was highly dependent upon resources from the external environment, (2) Medicaid reimbursement rates and proportion of Medicare residents were critical resources for nurse staffing levels in nursing homes.

THE PERCEPTIONS OF THE JAPANESE NURSING CARE WORKERS ABOUT ACCEPTING FOREIGN CARE WORKERS

N. Tsukada¹, T. Tataru², 1. *Nihon University Graduate School of Business, Tokyo, Japan*, 2. *Shukutoku University, Chiba, Japan*

Japan accepted 104 nursing care workers from Indonesia in August 2008, and is expected to accept 300 more from the Philippines at the end of April 2009. The purposes of this nationwide mail survey, funded by the Mitsubishi Foundation were to explore how they would perceive accepting foreign care workers in their institutions, to find out what kinds of concerns they would have, and to determine what sorts of preparations that may be needed to accept them. The nationally representative survey data, in which the respondents were nursing care workers (N=577, the response rate: 26.5%) across the country, collected in March through April 2008, were analyzed for this presentation. Preliminary analyses revealed that 79.5% of the nursing care workers responded that they "would not object to working with foreign care workers, if there were no other choices." For those nursing care workers who responded in this way, the "personality of foreign care workers" (90%), was cited as the most important quality in forming their opinions, followed by the "attitudes toward work" (79%). Moreover, almost all Japanese nursing care workers (99.7%) expressed their concerns about working with foreign care workers, and their biggest concern was that they "would not be skilled enough to communicate smoothly with older people, their family members and colleagues" (96%), followed by "the misunderstanding and troubles that are likely to be caused because of different values, living and eating habits and religions" (81%) and "a lack of the writing and reading abilities in the Japanese language" (76%).

THE RELATIONSHIP BETWEEN CHARACTERISTICS AND TURNOVER RATE OF NURSING FACILITIES IN JAPAN

R. Hata, K. Masuda, M. Shirasawa, *Graduate School of Social Welfare, Osaka City University, Osaka, Japan*

In Japan, as population aging has been rising, nursing facilities are required to provide high quality care. However, the high turnover rate of staff in nursing facilities makes it difficult for them to provide this high quality care. This study aims to clarify the relationship between the characteristics of nursing facilities and the turnover rate of staff in nursing facilities, and to determine what kind of working environment is needed to improve the retention rate of the staff of nursing facilities. The research design was a cross-sectional survey using mailed questionnaires. Participants in this study were managers of 527 nursing facilities in Osaka prefecture. The response rate was 29.6 % (N=156). The turnover rate is as following: very high, 4.1%; high, 47.6%; low, 40.4%; very low, 4.8%. As a result of factor analysis, the situations of the facil-

ities the managers addressed were composed of the following 5 categories: (1) Relationships within and outside of their workplace, (2) System of staff's training, (3) Working conditions, (4) Supporting system of the staff at their workplace, and (5) Respect for the staff as individuals. The turnover rate was significantly related to relationships within and outside of their workplace, $t(136) = -2.87, p < .01$, and working conditions of the staff, $t(141) = -3.21, p < .01$. Consequently, maintaining good personal relationships within and outside of their workplace, receiving a good evaluation from facilities users and the region, and improving salary and benefit programs will be effective in improving the retention of the staff.

RELATIONSHIP BETWEEN CHARACTERISTICS OF HOME HELPERS' AGENCIES AND THE TURNOVER RATE OF HOME HELPERS

M. Shirasawa, R. Hata, K. Masuda, *Osaka City University, Osaka, Japan*

Although population aging is increasing in Japan, the situation is that home helpers' turnover rate is high and agencies are having difficulty retaining them. The purpose of this research is to clarify what kind of workplace environment is needed for the home helpers to remain employed for a long term. The research design was a cross-sectional survey using mailed questionnaires. Participants in this study were 1191 managers of home helper agencies in Osaka city. The response rate was 35.9 % (N=428). According to the results, the turnover rate of the agencies is as follows: very high, 4.0%; high, 26.6%; low, 38.6%; very low, 28.5%. Using factor analysis, the work situations that the managers addressed were categorized into the following four factors: (1) Improving staff training, (2) Benefit programs, (3) Working conditions, and (4) Relationships outside of the agency. The turnover rate was significantly related to only "working conditions" $t(408) = 1.560, p < .001$. Consequently, it was found that establishing a good relationship with supervisors and co-workers, establishing benefit programs such as paid holidays, and having a fair evaluation of an employee's performance will lead to improving the continuous retention of a home helper's workforce. In order to improve the working conditions at these agencies, the agencies are requested to reconsider the position of the supervisors who guide and support the home helpers, and to make administrative operations clear. If these are improved, the retention rate of the home helper's workforce will be high.

AN INVESTIGATION OF STATE DIFFERENCES IN THE HOME CARE WORKFORCE

J. Deichert, K. Kosloski, L. Holley, *Gerontology, University of Nebraska at Omaha, Omaha, Nebraska*

Home care workers typically comprise two distinct populations that provide very different types of services. Home health aides (typically credentialed) help with ADLs, personal care, and perform clinical procedures such as changing bandages or taking blood pressures and, in some states, administering oral medications. Companion and home care aides (typically un-credentialed) generally provide companionship and custodial care, and may perform housekeeping chores, meal preparation, and the like. The present study examines the proportional distribution of these two types of workers by state, and seeks to explain the large discrepancies between states in the distribution of these workers. Specifically, New York, North Carolina, and Ohio, with greater than 70% home health aides (n=210,111), were compared to California, Washington, Vermont and Oregon, with fewer than 30% home health aides (n=209,794). This study uses the 2005-07 American Community Survey Public Use Microdata Sample which is large enough to provide reliable estimates at the state level. The findings show that states with a large proportion of un-credentialed workers had workers who were more likely to be employed by government or self-employed, and less likely to work at for-profit businesses such as home health care agencies. Workers in these states also were more likely to be non-African-American, speak some language other than English, be part-time work-

ers, and earn less than credentialed workers. Demand characteristics (e.g., percent of states' population 65 plus or with disability) did not explain the differences among states.

CRIMINAL HISTORY SCREENING FOR LONG-TERM CARE WORKERS: FINDINGS FROM THE CMS PILOT PROGRAM EVALUATION

T. Radcliff^{1,3}, A. White², D.T. Hurd², D. West¹, *1. Medicine, University of Colorado Denver, Aurora, Colorado, 2. Abt Associates, Cambridge, Massachusetts, 3. VA Eastern Colorado Healthcare System, Denver, Colorado*

This presentation will discuss findings from the evaluation of the Background Check Pilot Program, a Congressionally-mandated demonstration that examined issues related to background check screening requirements for long-term care employees with direct patient access. Seven States participated in the pilot program: Alaska, Idaho, Illinois, Michigan, Nevada, New Mexico, and Wisconsin. A major goal of the pilot was to improve on the type of screening done on direct patient access workers by requiring fingerprint-based State and national criminal records checks. While the legislation that established the pilot program specified certain required elements of background checks, States had considerable flexibility with respect to many policies and procedures. States varied with respect to the types of providers and employees for whom background checks were required, the types of disqualifying crimes, the types of information that was disseminated to employers, and appeal policies. Understanding these differences and how they contributed to the effectiveness and efficiency of State programs was a critical component of the evaluation. The evaluation focused on a set of evaluation topics specified by the legislation that created the pilot, including identifying the most efficient and effective procedures for conducting background checks, determining the extent to which background checks result in unintended consequences, such as a reduction in the size of the available workforce, assessing the costs of conducting background checks, considering issues related to whether employers or employees should be required to pay for background check costs, and recommending appropriate procedures and payment mechanisms for implementing a national background check program.

NEGOTIATING THE CARING CONTRACT: EXPERIENCES OF AGENCY-DIRECTED AND INDEPENDENT HOME CARE AIDES

J.M. Conahan, *University of Massachusetts Boston, Boston, Massachusetts*

Home care aides, who provide a majority of the nonmedical personal care and homemaking services to older adults, are among the least trained and lowest paid direct care workers. Although they make up one of the most rapidly growing occupational groups, their retention on the job is volatile. Because these paid caregivers work in the largely isolated, unstructured, unregulated environment of the elder's home, there may be ambiguity about the breadth of their responsibility, the boundaries between their domestic and occupational roles, the closeness of their relationships and the worth of their caring work. Little is known about how caregiving aides, particularly independently hired aides whose employers may also be their clients, negotiate their rights and responsibilities on the job. The purpose of this study was to explore the perceptions of home care aides of their negotiation experiences with their clients. The experiences of aides in agency-directed and consumer-directed care structures were compared. This qualitative study involved face-to-face interviews with 15 to 20 home care aides in each of three groups: agency-directed aides, subsidized consumer-directed aides and independent consumer-directed aides. Several themes emerged. Negotiation occurred at objective and emotional levels. Agency rules could pre-empt negotiation. Loss could affect the subsequent negotiation of closeness. Most negotiation was unwritten, much was unspoken. Movement to agency home care and to independent consumer-directed home

care suggested a caregiving trajectory. At a minimum public education about the roles and responsibilities of aides and their clients/employers is needed to improve support for their work life.

EXAMINING THE IMPACT OF CREATIVE AND TRADITIONAL ACTIVITIES ON ENGAGEMENT AND AFFECT BETWEEN OLDER PARTICIPANTS AND LONG-TERM CARE STAFF

J. Rowe, M.Y. Savundranayagam, J. Lang, R. Montgomery, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

The integration of creative activities into daily programming at adult day centers is becoming more prevalent. Creative activities are assumed to foster greater engagement and positive affect among older adults with dementia. However, empirical evidence to support the impact of creative activities on outcomes is limited. The goal of this study was to empirically assess the impact of creative activities on adult day center participants' (n=32) level of engagement with and expressed positive affect toward staff. An eight-week observational study recorded elders' interactions with others (n=241) in a sculpture activity, in traditional activities with a creative component and in traditional activities without a creative component. Results revealed staff-participant engagement was significantly higher for those involved in the sculpture activity than those involved in creative or non-creative activities. Participants also expressed significantly more pleasurable affect during interactions with staff in the sculpture activity compared to the other traditional activities. Findings are discussed within the context using creative programming to strengthening the relationships between staff and older adults in long-term care settings.

SESSION 920 (PAPER)

TRAINING AND SUPPORTING NURSING HOME STAFF

NURSING ASSISTANT TRAINING AND CERTIFICATION PROGRAMS WITHIN NURSING HOMES 1997-2007

D. Tyler, H. Jung, Z. Feng, V. Mor, *Center for Gerontology, Brown University, Providence, Rhode Island*

Purpose: The federal government mandates all certified nursing assistants (CNA) receive at least 75 hours of training and be certified before working. Information about whether or not nursing homes (NH) were providing this training and certification in-house began to be collected in 1997. This study describes the changing prevalence of these programs over the past decade, describes differences between NHs that offered training programs continually, those that offered programs intermittently, and those that never offered them, and characterizes interstate differences in the prevalence of such programs. Methods: We used the annual OSCAR survey to generate descriptive statistics to compare the three groups of NHs over the period 1997 to 2007. We also examined the prevalence of these programs across states and conducted interviews and internet searches to identify policy and other contextual factors in order to explain observed interstate differences. Results: Prevalence of NH-based CNA training and certification programs dropped throughout the study period, while CNA staffing increased among all three groups over the study period. This suggests that most CNAs may now be receiving their pre-employment training in other venues, such as community colleges and proprietary training facilities. Further, policy and contextual data gathered about states suggest that, in many cases, NHs are not voluntarily dropping their programs, but are losing the ability to provide them due to poor annual surveys. This appears to vary by state due to differences in surveying and imposition of civil monetary penalties.

THE EFFECT OF A WORK-BASED LEARNING PROGRAM ON ASSISTED LIVING DIRECT CARE WORKERS AND RESIDENTS

D. White¹, D. Cadiz¹, C. Lopez¹, C. Green¹, S. Jackson², 1. *Institute on Aging, Portland State University, Portland, Oregon*, 2. *Portland Community College, Portland, Oregon*

Training and career development opportunities for direct care workers (DCW) in assisted living (AL) facilities are limited. Educational and provider partners in Oregon developed an occupational profile of this workforce, identifying basic competencies required for the job. A work-based curriculum consisting of 27 different modules was developed addressing these competencies. Through the Jobs to Careers project (funded by Robert Wood Johnson and Hitachi Foundations), the curriculum is being implemented in five AL facilities. Several individuals from each AL, including experienced DCWs, attended train-the-trainer workshops and are now teaching the modules in their facilities. DCWs who complete all modules, which require return competency demonstration, can receive college credit through Portland Community College (PCC). This paper reports on the evaluation of the project using mixed methods. Focus groups with DCWs and managers/administrators suggested overall satisfaction with the training. A survey of all DCWs confirmed that the modules have made a difference in all 17 areas identified in the focus groups, with greatest gains in confidence in ability to provide good care, knowledge of how to provide good care, and confidence in coworkers to provide good care. DCWs in these facilities have positive job satisfaction scores, low intentions to quit, and most plan to continue working in long term care; virtually all value career development. Observations of DCW and resident interactions and interviews with residents about their care reveal areas of consensus as well as opportunities for continued staff development. Implications of the training program for widespread adoption are discussed.

EMPOWERMENT AMONG NURSE AIDES: EFFECTS ON BURNOUT

C. Cready¹, S. Shashidhara², D. Yeatts¹, Y. Shen¹, 1. *Sociology, University of North Texas, Denton, Texas*, 2. *University of North Texas, Denton, Texas*

Purpose: Recent studies of empowerment among nurse aides (NAs) in nursing homes have found many positive effects for staff and residents. Are there any negative effects? The current study examines the effects of NAs' perceptions of their levels of empowerment, specifically, their levels of autonomy or ability to make decisions about their work, on burnout. **Design and Methods:** Data were drawn from self-administered questionnaires of 335 NAs from eleven nursing homes located in North Texas. Exploratory and confirmatory factor analyses were used in the construction of measures. Regression was used to estimate the effects of NAs' perceptions of their ability to make decisions about their work on burnout, controlling for other factors expected to influence burnout. These factors include personal characteristics (e.g., difficulty paying bills), perceptions of other work-environment characteristics (i.e., staffing levels, availability of supplies, recognition for good work, and peer support), and facility. **Results:** Factor analyses revealed two dimensions of autonomy—direct decision making and participating with management in decision making. Using measures of these two dimensions, the regression results indicated that direct decision making among NAs affects burnout. However, its effect differs by the degree to which NAs feel they also work with management in decision making. When also working with management in decision making, direct decision making among NAs is associated with lower burnout. When not also working with management in decision making, direct decision making among NAs is associated with higher burnout. **Implications:** Effective empowerment of NAs in nursing homes requires management support.

WORKPLACE INJURIES AMONG FRONT LINE WORKERS IN NURSING HOMES

H. Degenholtz, P. Ghuman, J. Rosen, *University of Pittsburgh, Pittsburgh, Pennsylvania*

The nursing home is a dangerous workplace. Care staff are expected to undertake difficult, strenuous, and repetitious physical work with little training or preparation. Although the overall rate of injuries occurring in nursing homes is reported at the industry level, there is less data available about the individual risk factors and consequences associated with injuries. We examined the detailed injury reports for a 30 month period at two nursing homes (one urban, one suburban, both about 135 beds). Injury reports were linked to job satisfaction surveys to determine predictors and consequences of injury. Most injuries (60%) occurred during direct care, 27% in non-direct care, while 13% could not be classified. The most common part of the body to be injured was the back (28%) followed by the hands (14%) and knees (7%). Direct care injuries resulted in an average of 4.4 days of restricted duty and 12.6 days away from work. Over the time period studied, there were a total of 194 injuries resulting in a productivity loss of approximately 40 hours per 1000 care hours delivered. We conclude that reducing workplace injuries can have a dramatic impact on productivity.

SESSION 925 (SYMPOSIUM)

GSA POLICY SERIES: AGING AND THE NIH STIMULUS

Chair: G. O'Neill, *The Gerontological Society of America, Washington, District of Columbia*

After years of relatively flat funding, the National Institutes of Health (NIH) is poised for rapid growth through fiscal year 2010 as a result of the boost in new funds received under the American Recovery and Reinvestment Act. This symposium will explore several key issues related to this historic stimulus, including how recovery-act funds will likely impact the field of biomedical science, the challenges of the recovery-act funding goals and timetable, and the prospects for biomedical research beyond the NIH stimulus period.

SESSION 930 (SYMPOSIUM)

PROTEIN ALTERATIONS IN AGING AND AGING DISEASE

Chair: A. Gafni, *Biophysics, University of Michigan, Ann Arbor, Michigan*

Discussant: A. Cuervo, *Albert Einstein College of Medicine, New York, New York*

The accumulation of conformationally-altered, dysfunctional, proteins in tissues of aging organisms has been recognized for many years. Recent work has revealed that, in addition to a loss of native activity, certain age-altered proteins gain a toxic activity. This phenomenon is at the origin of a large number of severe human diseases including Type-2 diabetes, Alzheimer's, Parkinson's and Huntington's diseases, to name a few. Why the proteins involved in late life diseases become conformationally altered, what is the origin of their acquired toxicity and what are its underlying mechanisms are all important, hitherto unanswered, questions. This symposium will feature four presentations addressing the effects of protein misfolding in aging and in late life disease, delivered by researchers who have recently made important contributions to this field, each working on a different system. Together, these presentations will serve to portray an updated picture of research in the area of protein misfolding diseases and their age related occurrence.

QUALITY CONTROL THROUGH SELECTIVE AUTOPHAGY: IMPLICATIONS IN DISEASE AND AGING

A. Cuervo, *Albert Einstein College of Medicine, Bronx, New York*

Most cells in old organism accumulate altered proteins. Although often at a very slow pace, this progressive accumulation often com-

promises important cellular functions and eventually becomes detrimental. Cells count on two surveillance systems to handle protein alterations: chaperones and proteolytic systems. Malfunctioning of these systems contribute in large extend to the abnormal accumulation of those altered proteins in numerous diseases and in aging. Our studies have focused primarily in one of the cellular systems for protein removal, autophagy, or the degradation of intracellular components in lysosomes. I will describe the recent findings on the molecular mechanisms of autophagy, its physiological functions and its role in diseases related to problems in protein homeostasis. I will use different examples of aggregopathies to illustrate the contribution of alterations in macroautophagy and CMA to age-related disorders and comment on the efforts of my group to restore normal autophagic activity in old rodents.

ALPHA-SYNUCLEIN: UNTANGLING THE ROLE OF A SHAPE-SHIFTING PROTEIN IN PARKINSON'S DISEASE

E. Rhoades, A. Trexler, E. Middleton, E. Sevcsik, *Yale University, New Haven, Connecticut*

Alpha-Synuclein is the primary component of the Lewy body aggregates found in the brain tissue of persons with Parkinson's Disease. Alpha-synuclein is intrinsically unstructured in solution, though it undergoes a conformational change to predominantly alpha-helical structure upon association with lipid membranes. We use a variety of ultrasensitive fluorescence methods to investigate the effect of membrane composition on the structures and dynamics of membrane-bound alpha-synuclein with the goal of understanding role of conformational plasticity in alpha-synuclein function and misfunction.

SESSION 935 (PAPER)

ASSESSMENT OF PHYSICAL AND MENTAL HEALTH

THE MEASURE OF DAILY LIFE: PROBLEMS WITH DISABILITY CRITERIA AND HOME CARE POLICY FOR OLDER ADULTS

A.W. Costley, *York College-CUNY, Jamaica, New York*

U.S. Population aging is invariably projected through dire predictions of growing dependency among frail adults. Rates of disability and need are routinely assessed through standardized and quantitative surveys on "difficulty" and the need for "assistance" with Activities of Daily Living (ADLs) and Instrumental Activities of Daily Living (IADLs). Much less is known, however, about the social context of the assessment process and sociocultural factors shaping daily life for older adults when home care and family members are unavailable. Mixed methods (semi-structured surveys, descriptive statistics, participant observation, open-ended interviews, and thematic analysis), were used to explore the lives of 64 diverse, community-dwelling adults in New York City: 42 women, 22 men, ages 69 to 91 (mean = 79, SD = 5.6). Data revealed considerable complexity in how older adults assess their own needs, resist labels of dependency, and make important distinctions between needing help and having difficulty. Many maintained basic ADLs, but acknowledged increasing inter-dependence with IADLs and tasks not covered by home care policies (e.g. shopping for groceries, walking outside, and managing finances). Proximity to family was also not a strong predictor for daily support where family members were deemed inappropriate caregivers for many basic care tasks. Mixed methods and the resulting data can challenge existing means for assessing dependency and daily needs as well as existing criteria for coverage. Problems with measures of disability and dependency should also challenge existing local and national policies on home care.

INDIVIDUALIZED ASSESSMENT OF QUALITY OF LIFE IN OLD AGE - EMPOWERMENT IN MEASUREMENT

M. Holzhausen, P. Martus, *Charité - Universitaetsmedizin Berlin, Berlin, Germany*

Most assessments of quality of life in old age systematically disadvantage chronically or multiply diseased persons because of their focus on functioning. The domains by which to rate quality of life are fix in virtually all questionnaires. There is need to develop new, age-adequate measures that take into account individuals' priorities and subjective views on quality of life in the highly heterogeneous population of over 65 years. A new questionnaire (FLQM) was validated in a sample of 300 elderly women and men from a representative sample of community dwelling citizens. It provides information about level, but also individual sources of quality of life by asking respondents to generate themselves the domains that most markedly affect their quality of life. Participants were administered the FLQM as well as measures of affectivity, satisfaction with life, health-related quality of life, and subjective and functional health. Convergent and discriminant validity were assessed using Pearson's correlation coefficients. Differential validity was tested for different levels of physical disability and illness. Also, content analysis of the domains mentioned was conducted. Correlation coefficients with convergent and divergent measures point to a good validity. Variability of scores was high; there were floor- or ceiling-effects. Content analysis revealed differential patterns of life domains depending on patterns of morbidity and functionality. The FLQM is a promising new tool for the assessment of level and content of quality of life in old age. It can be utilized for mere monitoring or for in-depth research on individual determinants of subjective quality of life.

SELF-REPORTED HEALTH AND MORBIDITY ONSET IN THE MID-LIFE POPULATION

K. Latham, C.W. Peek, *Sociology and Criminology & Law, University of Florida, Gainesville, Florida*

Self-reported health (SRH) is recognized as a strong and consistent predictor of mortality and functional health decline. Many researchers assume that the predictive ability of SRH extends to morbidity; however, there are few studies examining SRH as a predictor of morbidity onset. Those studies that have examined whether SRH predicts subsequent morbidity have produced equivocal results. This study examines the predictive ability of SRH on morbidity onset among the mid-life population. Utilizing all eight waves (1992-2006) of the Health and Retirement Study (HRS), Cox proportional hazards models were used to estimate the effect of SRH on initial incidence of a general measure of chronic illness as well as initial onset of: coronary heart disease (CHD), diabetes, stroke, lung disease, arthritis, and cancer. A growth curve model was also estimated to examine the impact of SRH (measured at baseline) on the pace of accumulation of chronic comorbidity for those reporting no chronic illnesses at baseline. Age was included in all models as a time-varying covariate. The results revealed that SRH was a significant predictor of initial onset of chronic illness generally and of all conditions except cancer. The effect was particularly pronounced for lung disease and arthritis. Further, those respondents who began the study with higher levels of SRH had exhibited a slower accumulation of comorbidity than those with lower SRH at baseline. This research aids in establishing SRH as a predictor of morbidity onset. The significance of this study is the inclusion of cause-specific morbidity onset and greater time resolution.

PAIN ASSESSMENT TOOLS FOR COGNITIVELY IMPAIRED INDIVIDUALS: FURTHER PSYCHOMETRIC EVALUATION

E. Cisek¹, S. Rosendahl-Masella¹, M.H. Phillips², P. Sansone¹, S.J. Caccappolo¹, *1. Bon Secours Center for Research in Geriatric Care, Riverdale, New York, 2. Ravazzin Center on Aging, West Harrison, New York*

Research indicates that much of the pain experienced by cognitively impaired older adults is under-recognized and under-treated, despite the availability of several tools available to assess such pain. Several recent reviews conclude that these tools must undergo further psychometric testing. As part of an ongoing project funded by the New York State Department of Health, we examined the reliability and validity of three tools designed to assess pain in persons with cognitive impairment: PAINAD, CNPI, and DOLOPLUS-2. Nurses and certified nursing assistants (CNAs) from a non-profit urban nursing home completed the selected tools on two occasions at 24 or 48 hour intervals on a total of 55 residents with advanced dementia. A separate group of nurses and CNAs from the facility's short term unit completed the same tools for 46 cognitively intact patients. For the cognitively impaired sample, we calculated intra-rater reliability, comparing observation 1 and observation 2 for both nurses and CNAs; inter-rater reliability, comparing nurse observations to CNA observations; and internal consistency for each measure. For the cognitively intact group, we compared nurse and CNA assessments to patient self-report, as indicated on the Iowa Pain Thermometer (IPT), as a measure of validity for each tool. Findings show differences in reliability estimates both between instruments and between nurses and CNA's. Correlations between the IPT and the observation measures were all statistically significant. The presentation will discuss the relative benefits of each test to identify pain among the cognitively impaired within a nursing home environment.

AN IRT-BASED ASSESSMENT OF PACSLAC

S. van Nispen^{1,2}, M.J. Candel¹, S. Zwakhalen², J. Hamers², L.M. Curfs³, M.P. Berger¹, *1. Methodology and Statistics, Maastricht University, Maastricht, Netherlands, 2. Department of Health Care and Nursing Science, Maastricht University, Maastricht, Netherlands, 3. Department of Clinical Genetics, Academic Hospital Maastricht, Maastricht, Netherlands*

Introduction: Previous research showed that the PACSLAC observational checklist is very useful to measure pain in nursing home residents with dementia. PACSLAC was translated into Dutch and the number of items was reduced by applying classical test theory to pain ratings of a researcher (PACSLAC-D). The primary aim of this study was to use ratings of nursing personnel to test the psychometric properties of the items in PACSLAC and to detect biased items by testing for differential item functioning (DIF). Methods and materials: Nursing personnel observed 128 nursing home residents during rest, the influenza vaccination and a patient-specific moment of potential pain. Item response theory was used to achieve the primary aim of this study. Confirmatory factor analysis was applied to determine the factor structure of the valid and reliable items. Results: Of the items that nursing personnel frequently registered as present, 2 items showed DIF. Eighteen items were valid and reliable, of which 14 items were also selected for PACSLAC-D. This finding confirms that these items are valid and reliable indicators of pain in older people with dementia. Confirmatory factor analysis showed that the data could not be ascribed to pain as a general factor, but rather to 3 components of pain: 'Negative reactions to pain', 'facial/vocal/ emotional expressions of pain' and 'resistance to pain'. Conclusion: A refined version of PACSLAC was created that nursing personnel with different educational backgrounds might use to assess pain in older people with varying degrees of dementia.

SESSION 940 (PAPER)

CAREGIVER STRAIN: PHYSICAL AND MENTAL HEALTH PERSPECTIVES

A SNAPSHOT OF THE HEALTH OF CAREGIVERS IN HAWAII, KANSAS, AND WASHINGTON, BEHAVIORAL RISK FACTOR SURVEILLANCE SYSTEMS 2007

L. McGuire¹, E. Bouldin², E. Andresen², L. Anderson¹, *1. CDC, Atlanta, Georgia, 2. University of Florida, Gainesville, Florida*

Caregiving status and its association with modifiable healthy lifestyle behaviors, use of preventive services, having a healthy weight, and presence of chronic health conditions were examined among adults ≥ 65 years-old. Participants (N=6,138) were obtained from the 2007 Behavioral Risk Factor Surveillance System (BRFSS), a list-assisted random-digit-dialed telephone survey of the noninstitutionalized U.S. adults. Participants in the states of Hawaii, Kansas, and Washington completed questions about caregiving on their state BRFSS survey. Information about self-reported modifiable healthy lifestyle behaviors (not smoking, consuming ≤ 1 alcoholic beverage per day, consuming at least five fruits or vegetables daily, participating in moderate-to-vigorous physical activity during the average week), use of preventive services (receiving an annual influenza immunization and ever receiving a pneumococcal immunization), having a healthy weight (body mass index 18.5–24.9 kg/m²), and chronic health conditions (asthma, arthritis, diabetes, and heart diseases) was obtained. Caregivers were significantly more likely to meet physical activity recommendations than non-caregivers (54.1% versus 42.0%, $p < 0.001$). The two groups did not differ significantly on the modifiable health behaviors of fruit and vegetable consumption, smoking status, or alcohol consumption, or a healthy weight, or in the presence of chronic health conditions. No differences were found between caregivers and non-caregivers on receipt of influenza and pneumococcal vaccination. Older adults who are caregivers have a similar pattern of engaging in health behaviors, body weight, chronic health conditions, and use of preventive services compared to those who are not caregivers despite reporting worse health status.

CONSTRUCTING A PROGNOSTIC TOOL TO IDENTIFY CAREGIVERS AT RISK FOR PSYCHOSOCIAL DISTRESS AFTER NURSING HOME ADMISSION

J. Gaugler¹, M.S. Mittelman², K. Hepburn³, R. Newcomer⁴, *1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. New York University Langone Medical Center, New York, New York, 3. Emory University, Atlanta, Georgia, 4. University of California, San Francisco, California*

The objective of this study was to develop and validate a prognostic index to identify dementia caregivers at greatest risk of having clinically persistent burden and depression following institutionalization study. Data were utilized from the Medicare Alzheimer's Disease Demonstration Evaluation (MADDE). The multi-regional sample of MADDE included 1,116 care recipient and caregiver dyads with data from before and up to 12 months after institutionalization. Statistically and clinically significant reductions in burden occurred for most caregivers following NHA in MADDE, but subsets of dementia caregivers experienced persistent psychosocial distress during the placement transition. The screening tool that emerges from these empirical results could be administered to caregivers at the time their family member enters nursing home care, and would allow a health care team to direct support to individuals at greatest risk during this critical time of transition.

WHO ARE THE STRAINED CAREGIVERS?

C. Etkin, C. Farran, J.J. McCann, *Rush University Medical Center, Chicago, Illinois*

Background: Research findings suggest that caregivers of persons with Alzheimer's disease who experience strain have greater negative

effects on physical and mental health. Few known caregiver interventions have targeted strained caregivers and addressed their health promotion needs. Purpose: The goal of this presentation is to discuss preliminary findings from a lifestyle physical activity intervention for strained family caregivers. Challenges and strategies for recruiting, screening and retaining strained caregivers in intervention studies will be addressed. Design and Methods: This randomized clinical trial tests a multi-component lifestyle physical activity intervention in comparison to a usual-care skill-building intervention. Strain is assessed as level of strain with providing IADL/ADL care. Results: 83 caregivers have been enrolled to date. Strain is prevalent in our study; 16% (n=13) experience low strain, 63% (n=52) experience moderate strain, while 22% (n=18) experience high strain. These caregivers report multiple chronic conditions (61%, n=44), health risk factors (29-41%, n=24-32), and personally challenging situations beyond the caregiving role (30%, n=25). Additionally, 40% to 60% (n=33-50) of caregivers report such symptoms as feeling depressed, restless, or lonely. Chronic physical health conditions include arthritis (63%, n=52), heart disease (16%, n=13), and diabetes (13%, n=11). Health risk factors include 41% (n=32) with hypertension, 29% (n=24) who had a systolic blood pressure >140 at baseline; and 32% (n=27) who have gained/lost weight in the past year. Conclusions: Strained caregivers have a variety of co-morbid conditions that require creative efforts for recruitment, intervention, and retention in clinical trials.

SUGAR MAMAS: THE INFLUENCE OF CAREGIVING RESPONSIBILITIES ON THE DIABETIC HEALTH OF AFRICAN-AMERICAN PRIMARY CAREGIVING GRANDMOTHERS

D. Carthron, *Nursing, Winston-Salem State University, Winston-Salem, North Carolina*

Background: 1 in 4 African-American women over 55 are diabetic. Approximately 480,000 women over 50 are primary caregivers of their grandchildren. It is estimated that at least 25% of African-American primary caregiving grandmothers are diabetic. Objectives: To compare the diabetic health of diabetic African-American primary caregiving grandmothers to diabetic African-American women who are not primary caregivers. Methods: 34 African-American primary caregiving grandmothers and 34 diabetic non caregiving women 55-75 years of age were recruited in Arkansas. Measures of diabetic health included BMI, blood pressure, HgbA1c, total cholesterol, urine protein and urine creatinine. Results: The data was analyzed using an Independent t-test with Bonferroni correction and Mann-Whitney test. Statistically significant differences in Systolic pressure ($t = -3.42, p=0.001$) and diastolic pressure ($t = -3.790, p=0.000$) and urine protein ($W=294.00, p=0.000$) were significantly higher in the caregiving group. No statistically significant differences were noted in BMI, HgbA1c, total cholesterol and urine creatinine. Discussion: Differences in systolic and diastolic pressures along with the difference in the urine protein suggest that diabetic African-American primary caregiving grandmothers may have some difficulty maintaining their diabetic health compared to diabetic non caregiving African-American women. Additional research is needed to develop tailored intervention to assist this population in regaining and maintaining their diabetic health since African-American primary caregiving grandmothers' health needs are often unrecognized or overlooked.

SESSION 945 (PAPER)

CHARACTERISTICS OF OLDER DRIVES

PHYSICIAN INTERACTIONS WITH AGING PATIENTS CONCERNING DRIVING FITNESS AND PHYSICIAN UNDERSTANDING OF REPORTING OBLIGATIONS AND REQUIREMENTS

J.C. Witte¹, J.O. Brooks³, W.C. Logan², R.F. Beeco³, *1. Sociology, Clemson University, Clemson, South Carolina, 2. Greenville Hospital System, Greenville, South Carolina, 3. Clemson University, Psychology, Clemson, South Carolina*

The proportion of older drivers is rising. Timely and accurate assessment of driving fitness is becoming increasingly important. Primary Care physicians have the most office visits with older patients. Thus, they have frequent opportunities for driving fitness assessment. While the AMA has published guidelines for driving fitness assessment, these may not be broadly known. Additionally, each State governs physician reporting of driving fitness and processes of anonymity differently. To gain understanding about driving fitness assessment and reporting knowledge and practice, survey data were collected from the Primary Care Physicians at a large hospital. While the majority of respondents felt that physicians have a responsibility to report concerns about older adult driving fitness, they did not feel that physicians are the most qualified professionals to make these decisions. The majority of respondents indicated that they would benefit from more education and are unaware of statutory reporting requirements for physicians.

CONSISTENCY OF OLDER ADULTS' DRIVING BEHAVIOR OVER TWO WEEKS

A. Trang, R.A. Blanchard, A. Myers, A. Crizzle, *Health Studies & Gerontology, University of Waterloo, Waterloo, Ontario, Canada*

Few studies have used in-vehicle technologies to capture the naturalistic driving behavior of older adults, all of which have been limited to a maximum one-week monitoring period. The aim of the current study was to examine the consistency of driving over an extended (two-week) period. Thirty-two drivers, 53% female aged 65 to 91 years had two recording devices installed in their vehicle to monitor driving for 14 consecutive days. Each person completed the Driving Comfort Scales: DCS-D (Daytime) and DCS-N (Nighttime). Exposure data was consistent from week to week for distance (total, for each day of the week and at night), duration and number of stops. On average, participants made one more trip ($p = .01$) and drove an extra day ($p = .02$) during the first week compared to the second. Over the two weeks, each participant logged at least one event of night driving; however 11 people did not drive at night in either week 1 or week 2. Also, there were some inconsistencies regarding the strength of associations between perceptions and exposure. For instance, relationships with duration were significant with DCS-D and DCS-N scores in week 1, but did not reach significance in week 2. Distance (km), meanwhile, was significantly related to DCS-N for both weeks, but only reached significance for DCS-D in week 1. Data for one week may not be enough to capture less frequent events (e.g., night driving) and reveal significant relationships that may exist, especially if samples are small.

PSYCHOLOGICAL RESOURCES VARIABLES ARE ASSOCIATED WITH DRIVING CESSATION

G. Kafka¹, M. Bedard^{1,2,3}, *1. Public Health Program, Lakehead University, Thunder Bay, Ontario, Canada, 2. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada, 3. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

The decision to stop driving is a difficult, complex one, influenced by a number of variables difficult to capture. In this study we sought to better understand the variables associated with driving cessation in a convenience sample of 223 participants ranging in age from 55 to 91

years. The following variables were expected, based on the literature, to be associated with driving cessation: age, gender, functional ability, and health variables. To enhance our model we added personality traits and psychological resource variables. Using a hierarchical approach, we entered the demographic, function, and health variables first, followed by the psychological variables to determine the additional component of the variance they explain. At the time of the survey, 30 (13.5%) participants had stopped driving in the past three years. The demographic, function, and health variables explained 29% of the variance in driving status (Nagelkerke's R^2 ; $p < .001$) with age being the most important one (older drivers had higher odds of not driving). The addition of the psychological variables explained an additional 10% of the variance in driving status (final model: Nagelkerke's $R^2 = .39$; $p < .001$). Specifically, lower scores on a measure of life purpose and possessing a more external locus of control were associated with driving cessation. The inclusion of psychological variables enhances our understanding of driving cessation and should be included in future studies. Further work using a longitudinal approach is required to better understand if the psychological variables data are predictors or outcomes of driving cessation.

OLDER AUSTRALIAN DRIVERS: PREDICTORS, COGNITIVE AND VISUAL IMPAIRMENT, AND INTERNATIONAL COMPARISONS

L.A. Ross¹, K. Anstey¹, K.M. Kiely¹, T. Windsor¹, J. Byles², M. Luszcz³, P. Mitchell⁴, 1. Centre for Mental Health Research, Australian National University, Canberra, Australian Capital Territory, Australia, 2. The University of Newcastle, Newcastle, New South Wales, Australia, 3. Flinders University, Adelaide, Victoria, Australia, 4. University of Sydney, Sydney, New South Wales, Australia

OBJECTIVES: This study aimed to investigate: (1) associations between demographic, health and functional factors and reported driving status, (2) the proportion of current drivers with probable cognitive and visual impairments and (3) the rates of driving/licensure across three countries. **PARTICIPANTS:** Adults aged 65 to 103 ($n=5,206$) from the DYNOPTA project. **MEASUREMENTS:** Measurements included: driving status, demographic characteristics, Mini Mental State Examination (MMSE), visual acuity and occupation. **RESULTS:** Men and participants with higher-level occupations had increased odds of reported driving. Older age, more medical conditions, and poorer vision increased the odds of not driving. Compared to married adults, persons who were divorced, widowed or never married were at a greater risk of not driving. Descriptive analyses revealed a large proportion of men with probable visual or cognitive impairments who reported driving. Subsequent comparative analyses with the DYNOPTA sample to other published US and Canadian data revealed lower proportions of current drivers among DYNOPTA women and those at older ages; however there were consistently lower proportions of drivers within Australia and Canada relative to the US. **CONCLUSION:** The rate of men with probable dementia or visual impairment who report driving is of particular concern. Research and policy needs to focus on evidence-based assessment of older drivers and development of appropriate interventions/programs to maintain the mobility and independence of older adults.

GENDER DIFFERENCES IN DRIVING EVALUATIONS

A.E. Dickerson¹, T. Reistetter¹, M. Monahan², 1. Occupational Therapy, East Carolina University, Greenville, North Carolina, 2. Fletcher Allen Health Care, Burlington, Vermont

Concerns have surfaced about the gender differences in driving for older adults. The research question in this study, evaluated gender differences in a subject pool of 55 adults, with and without disabilities, who were given comprehensive driving evaluations, including a behind-the-wheel (BTW). The data was collected at centers in two states. In addition to the typical driving evaluations, a standardized instrumental activities of daily living (IADL) assessment was performed with the

subjects and compared between those who passed, failed, and were restricted on the BTW as well as for gender effects. There was no sampling bias between the two centers. Results indicated that the IADL assessment was able to differentiate between individuals who passed the BTW and those who failed, and between those with restrictions and those who failed ($F=6.54$, $p<.01$) This presentation will discuss the fact that there was a significant difference between men and women who passed the BTW ($X^2=5.18$, $p<.04$) with women failing the BTW less frequently than men. This gender effect also corresponds with the results of the IADL assessment. Using the Assessment of Motor and Process Skills (AMPS), which generates a skill score for motor skills and process (cognitive) skills, the women had higher mean scores than men for both motor and process. There was a significant difference between men and women for motor ($t=-2.03$, $p<.048$) and it approached significance for process ($t=-1.96$, $p<.058$). The clinical significance of this study will be discussed along with implications for practice.

SESSION 950 (PAPER)

COGNITIVE ISSUES IN DEMENTIA

DOES EMOTIONAL CONTENT ENHANCE OLDER ADULTS' AND ALZHEIMER'S DISEASE PATIENTS' MEMORY BINDING?

K. Nashiro, M. Mather, University of Southern California, Los Angeles, California

Previous studies have shown that associative memory for within-item features is enhanced for emotionally arousing items, whereas arousal-enhanced binding is not seen for associations between distinct items (for a review see Mather, 2007). For example, if you witness a car accident, you may accurately remember the type of car or its color (intrinsic features), whereas you may not correctly remember the pedestrian who called 911 (background information associated with the accident). The former type of associative memory is referred to as within-item memory binding, and the latter is called between-item memory binding. These positive and negative effects of arousal in memory binding have largely been tested on younger adults but not on older adults and patients with Alzheimer's disease (AD). The present study compared younger, older, and AD groups in the effects of arousal on item memory and within-item and between-item memory binding using arousing and non-arousing pictures as target items and abstract shapes as background objects. The results revealed that arousal improved all groups' item memory and older adults' within-item memory binding. Arousal had no effect on younger and AD groups' within-item memory binding and all groups' between-item memory binding. Non arousal-enhanced within-item memory binding in younger adults was due to a ceiling effect. Overall, our results suggest that the effects of arousal on item memory remain similar in normal aging and, to a smaller extent, in early stage AD, whereas the effects of arousal on within-item memory binding remains intact in normal aging but not in AD.

THE VALUE OF CNAS IN RECOGNIZING PAIN IN COGNITIVELY IMPAIRED NURSING HOME RESIDENTS

S. Rosendahl-Masella¹, E. Cisek¹, M.H. Phillips², P. Sansone¹, S.J. Caccappolo¹, 1. Bon Secours Center for Research in Geriatric Care, Riverdale, New York, 2. Ravazzin Center on Aging, West Harrison, New York

Research indicates that at least one in four nursing home residents suffer from moderate pain daily. A large proportion of these residents have pain that is undetected and/or under-treated. Cognitively impaired residents receive less pain management, despite having the same conditions that are known to cause pain in cognitively intact residents, primarily due to their inability to verbalize their pain. As part of a study funded by the New York State Department of Health addressing pain among the cognitively impaired, four focus groups were conducted with

nursing home nurses (2) and certified nursing assistants (CNAs, 2) to explore whether they had similar ways of identifying pain, the process by which that pain is addressed, and their feelings about using a structured pain instrument in their work. Findings indicate that both groups identify behavioral signs of pain that are consistent with American Geriatrics Society Guidelines, and highlight the importance of a change from the resident's usual behavior. Both groups take action to address pain but also reported that difficulties sometimes exist when they need to report pain to their superiors. They would welcome a brief assessment and tracking tool, used by CNAs on the "front line," to cue staff to signs of pain, to provide back up to verbal reports, and to track pain over time. Future research will evaluate the effectiveness of implementing such a tool.

AGGRESSIVE BEHAVIORS BETWEEN RESIDENTS WITH MEMORY LOSS: AN IN-DEPTH EXAMINATION

E. Caspi, *Gerontology, UMass Boston, Boston, Massachusetts*

Aggressive behaviors between residents (ABBR) with Alzheimer's disease or a related dementia who live in long-term care residences is a concerning but understudied phenomenon. Verbal and physical ABBR may cause psychological and physical harm to the residents involved in such incidents. This paper presents results from a recent 10-month qualitative study that was conducted in two Special Care Units of an Assisted Living Residence dedicated to elders with memory loss. Direct observation was used as the primary data collection strategy (complemented by semi-structured interviews with care staff members). Both the prevalence of occurrence of ABBR and the circumstances in which they took place were examined. The paper reports on the prevalence of ABBR and provides an in-depth look into the circumstances in which these occur. Most of the incidents that were documented were situational and developed gradually, which indicates a significant opportunity for prevention of these behaviors. Identification of patterns of these situational circumstances can serve as the basis for development of informed and effective intervention strategies in long-term care residences. The findings suggest strategies for prevention and alleviation of ABBR. Missed opportunities for prevention will also be reported. After attending the talk participants will have an in-depth understanding of the nature of ABBR and will be able to identify the ways in which they develop and can be prevented. Implementation of effective measures to prevent ABBR may assist in improving the quality of life of the residents who are directly or indirectly involved in these distressing behaviors.

LAY APPRAISAL OF COGNITIVE IMPAIRMENT SYMPTOMS IN MID-LIFE AND OLDER ADULTS

D.D. VonDras, *University of Wisconsin-Green Bay, Green Bay, Wisconsin*

This research explores mid-life and older adults' appraisal of cognitive impairment symptoms and need to seek medical care. Previous research has indicated base-rate information to influence illness perceptions and behavior (e.g., Jemmott et al., 1988). For example in the area of cognitive impairment, older adults who worry about memory problems were found to be more likely to perceive greater risk for developing Alzheimer's disease (AD) and more serious consequences of the illness (Werner, 2002). A survey methodology was used to examine how age and family occurrences of dementia and stroke may moderate appraisals of cognitive impairment and decision to seek medical care. The sample was comprised of 210 adults ranging in age from 40 to 91. Respondents read vignettes embedded with symptoms of cognitive impairment and stroke, and made illness appraisals, ratings of need to seek medical care, and indicated family occurrence of illness. Results indicated an Age by Family Occurrence of Dementia interactions on ratings of the significance of cognitive impairment symptoms, $F(1, 196) = 4.26, p < .05$, and the need to seek medical care, $F(1, 196) = 5.91, p < .05$; these interactions suggest advancing age and family occurrence

of dementia to lower ratings of significance of symptoms and the need to seek medical care. Similar effects were not found in appraisal of stroke symptoms. In general, these data suggest advancing age and exposure to family members with dementia may alter appraisal of cognitive impairment symptoms and resultantly the decision to seek early diagnosis and professional help.

INCREASE IN TOTAL SLEEP TIME ASSOCIATED WITH DOSAGE OF STRENGTH TRAINING IN COGNITIVELY IMPAIRED ELDERS

G. Kalra, K. Richards, M.H. Kleban, *Abramson Center for Jewish Life, Polisher Research Institute, North Wales, Pennsylvania*

The study examined whether improvement in total sleep time (TST) was associated with dosage of strength training, social activity, and walking. As a part of a randomized controlled trial, 31 cognitively impaired elders (mean age 81.9 y; 18 men) received 7 weeks of strength training (ST), individualized social activity (SA), and walking. The elders received high intensity ST to the hip and arm extensors 3 days a week, and 2 days a week they walked with a research assistant for up to 60 minutes. The elders also received individualized social activities 1 hour daily 5 days a week. Mean TST (measured at baseline and 7 weeks using 2 nights of polysomnography) increased from 4.9 h (SD = 1.6) to 5.9 h (SD = .89). Number of days of ST (mean = 20.03 days; SD = 8.44), SA (mean = 37.5 days; SD = 7.71), and walking (mean = 9.5 days; SD = 6.7), were correlated with increase in TST. Only number of days of ST showed significant correlation with TST ($r = .41; p = .02$). We conclude that the number of days of ST is an important influence on response to a combined ST, SA, and walking intervention. Support: R01-NR-007771

SESSION 955 (PAPER)

DEMENTIA: PRESCRIPTIONS AND PERSPECTIVES

THE IMPACT OF HOSPICE AND DEMENTIA SPECIAL CARE UNITS ON END-OF-LIFE CARE FOR INDIVIDUALS WITH DEMENTIA

C.E. McCarty, *School of Aging Studies, University of South Florida, Tampa, Florida*

In the nursing home setting approximately 50-75% of residents have a diagnosis of dementia. Many of these individuals die in nursing homes. End-of-Life (EOL) care for individuals with dementia is provided in three settings, hospice care, Dementia Special Care (as expressed in Dementia Special Care Units) and traditional care. Hospice provides EOL care for individuals with dementia regardless of nursing home setting. Both hospice and Dementia Special Care Units (DSCU) are models of care with improved outcomes. They share a holistic approach and limited enrollment for persons with dementia. Traditional EOL for individuals with dementia in nursing homes is difficult. In one study, most residents admitted with advanced dementia died within six months of admission with only 11% being referred to hospice. Non-palliative care has little success in alleviating symptoms, with an increase in decline, and hastened death. Research on hospice care shows care benefits such as decreased hospitalization, pain and dyspnea when compared to traditional care. DSCU research has found improved outcomes such as increased personalization, and decreased social withdrawal and cognitive decline when compared to traditional dementia care. Using Structure-Process-Outcome theory, this pilot study analyzed the structure and process factors of hospice and DSCU versus traditional care to determine their association with the outcome factor of better EOL care scores. Preliminary results include a positive correlation between Comfort at Death scores and enrollment in Dementia Special Care. The process factor of family participation in inter-disciplinary team care plans is negatively correlated with the number of days in hospice.

OPERATIONAL ZING PERSON-CENTERED CARE FOR PERSONS WITH DEMENTIA DURING HANDS-ON CARE: AN INDUCTIVE EXPLORATION

K.L. Swafford, L. Miller, *Oregon Health & Science University, Portland, Oregon*

SIGNIFICANCE: Person-centered care (PCC) is a philosophy of care emphasizing the individual needs, priorities, and preferences of patients over those of health care team members or institutions. This approach to care is being widely promoted in the United States as a means to ameliorate known quality of care concerns in nursing homes. However, there is a lack of understanding about how PCC is operationalized during hands-on nursing home care, and is even less understood in the care of persons with dementia. The purpose of this study was to develop conceptual definitions of person-centered interactions that occur during assistance with morning care between professional caregivers and persons with dementia residing in nursing homes. **METHODS:** Observational methods using qualitative description and content analysis were used to examine existing video-recorded episodes of morning care. Content of selected episodes was described, coded, and then classified in an inductive exploration. Content experts and practicing professional caregivers reviewed, discussed and contributed to the conclusions. **DATA SOURCE:** 144 video-taped episodes of morning care being provided to persons with dementia in 3 urban nursing homes in Portland, Oregon. Of these, 7 cases were purposefully selected for analysis. **FINDINGS:** Critical attributes that emerged during analysis include a) monitoring for cues, b) asking for feedback, c) deferring to the resident, and d) adjusting care. Conceptual definitions were developed that correspond to the critical attributes. Findings suggest that modifications to current theory are due consideration in order to more accurately portray the concrete activities comprising person-centered care during hands-on care delivery.

THE ALZHEIMER'S DISEASE MOVEMENT AND THE DEBATE BETWEEN CURE VS CARE: THE REPERCUSSIONS OF RELIANCE ON THE BIOMEDICAL MODEL AS A SOCIAL MOVEMENT RESOURCE

B.A. Hollister, P. Fox, C. Chaufan, *Social and Behavioral Sciences, University of California, San Francisco, San Francisco, California*

The historical development of the Alzheimer's disease (AD) movement can be, in part, traced back to caregivers' attempts to draw attention to the lack of appropriate services available to help them address the needs of people with AD, and the transformation of the medical concept of AD. The organization of caregiver and medical researcher interests evolved into the Alzheimer's Association. Authors highlight the importance of: 1) political constraints on entitlement spending; and 2) the medical re-conceptualization of AD (as primarily affecting elders), that institutionally shifted the movement toward advocacy for biomedical research funding (i.e., cure) and "away" from expanding LTC funding to assist the feminized informal care system. Adoption of the medical frame, resources accepted, early leadership, and political opportunity structures allowed for the permeation of AD movement organizations' boundaries leading to advocacy for a cure as their primary goal rather than advocacy for LTC services and support. Policy and movement priorities emerged in the context of social and political opportunity structures that historically had been instrumental in building the NIH research enterprise. The political and economic feasibility of the curative approach, legitimacy of the medical frame, commodification of aging, fear of aging and cognitive decline, and relative inability of those with AD to advocate for themselves, contributed these outcomes. A question that arises is whether the "curative" emphasis will successfully address the social and health problem of AD; or whether sustaining the essential informal LTC networks for the growing population of people with AD will necessitate other policy approaches.

SOCIAL ACTIVITY AND EXERCISE INCREASE TOTAL SLEEP TIME: A RANDOMIZED CONTROLLED TRIAL

K. Richards^{1,2}, C. Lambert³, C. Beck³, W.J. Evans³, D. Bliwise⁴, P.K. Roberson³, M.H. Kleban¹, D.H. Sullivan³, *1. Abramson Center for Jewish Life, Polisher Research Institute, North Wales, Pennsylvania, 2. University of Pennsylvania, School of Nursing, Philadelphia, Pennsylvania, 3. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 4. Emory University School of Medicine, Atlanta, Georgia*

Nocturnal sleep in older adults with cognitive impairment (CI) is light and fragmented with frequent awakenings. The aim of this randomized controlled trial was to determine the effect of individualized social activities and exercise on total sleep time. 193 residents (mean age, 81.87 years; 116 women; mean Mini-Mental Status Examination score, 20.35) of nursing homes and assisted living centers were assigned to 7 weeks of: 1) individualized social activity, SA (n = 50); 2) physical resistance training and walking, PT-W (n = 55); 3) combined SA/PT-W (n = 41); or 4) usual care (n = 47). The SA group received social activities 1 hour daily 5 days a week. The PT-W group received high intensity strength training to the hip and arm extensors 3 days a week, and 2 days a week they walked with a research assistant for up to 60 minutes. The combined SA/PT-W group received both SA and PT-W. The control group participated in the usual activities provided in the homes. Total sleep time was measured at baseline and 7 weeks using 2 nights of polysomnography. A one-way analysis of covariance, with the covariate the mean of the 2 nights of baseline total sleep time, showed that total sleep time in the SA/PT-W group significantly increased in comparison to the control group (adjusted means 364.2 minutes versus 328.9 minutes, $p = .001$). We conclude that individualized social activity combined with strength training and walking resulted in improved nighttime sleep in cognitively impaired older adults. Support: R01-NR-007771

IN SICKNESS AND IN HEALTH: SPOUSE'S EXPERIENCES OF EARLY STAGE MEMORY LOSS

R.L. Beard, *Department of Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts*

To better understand the social impact of Alzheimer's disease, this research examined the similarities and differences of spouses' experiences when one person is living with memory loss. In-depth qualitative interviews were conducted with nine dyads (N=18) and resulted in 311 pages of transcript narrative data. Grounded theory methods were used to collect, code, and analyze data into overarching themes. Common themes included a belief that they were "in this together" and a shared desire to focus on "what is left." Significant differences according to gender and mental status were also reported, however, with women caregivers being more likely to downplay their stressors and focus on maintaining the autonomy of their male spouses and those diagnosed seeing their condition more as a normal accompaniment to aging and dismissing the negative implications of framing the experience as a loss of self. There were also important gender distinctions in the coping strategies used by caregivers, with men employing less tangible mechanisms, such as faith and optimism, and women utilizing concrete aides like keeping lists. Understanding the importance of gender roles and social norms regarding living with Alzheimer's disease can be used to inform medical encounters and help diagnosed individuals and their families receive quality care that is person-centered. Ultimately, these findings challenge views about Alzheimer's that claim the experience is all bad by demonstrating the strength of spousal bonds in helping both entities manage their daily lives.

SESSION 960 (SYMPOSIUM)

HEALTHY AGING THROUGH ACTIVE LIVING

Chair: *K.E. Whitfield, Psychology and Neuroscience, Duke University, Durham, North Carolina*

As our knowledge about aging increases, the traditional ways of thinking about quality and quantity are being challenged. There is interesting work arising from biological studies like those of telomere length and interventions like caloric restriction that address quantity of years lived. There is more interest than ever in not just adding years to life but adding life to years. It is clear that behavioral and social factors significantly contribute to this equation. In this presidential symposium for the Behavioral and Social Sciences section, we will examine mental, physical, and social aspects of engaging in programs that promote an active lifestyle. Specifically we will discuss how physical activity, volunteerism and training the mind contribute to healthy aging. Presentations will address: the impact of lifestyle on quality of life, challenges to implementing programs, models for delivery and implementation of active lifestyle programs, and results of these programs.

PHYSICAL ACTIVITY AND HEALTHY AGING

D. Buchner, *Kinesiology & Community Health, University of Illinois, Champaign, Illinois*

Regular physical activity provides extensive health benefits throughout the lifespan. In particular, physical activity is a key determinant of health-related quality of life in older adults. However, older adults are the least active age group. Objective assessments of physical activity in NHANES indicate that less than 5% of older adults meet public health recommendations. This presentation will summarize the evidence for health benefits of physical activity especially relevant to older adults, including reduced risk of falls, cognitive impairment, depression, and functional limitations. Next, the presentation will discuss public health recommendations for older adults from the 2008 Physical Activity Guidelines for Americans (e.g., how to monitor the intensity of physical activity in older adults so as to reduce injury risk). Finally, the presentation will discuss evidence-based approaches to increasing physical activity in older adults, with a focus on the translational research of the Active for Life initiative.

STAYING MENTALLY FIT: COGNITIVE TRAINING

S.L. Willis, *Department of Psychiatry & Behavioral Sciences, University of Washington, Seattle WA, Washington*

Recent research indicates that cognitive engagement in midlife and old age is associated with maintenance of everyday functioning and possibly in delaying the onset of cognitive risk in old age. A major literature supporting this position comes from the cognitive training literature. An overview of the evolution of research on cognitive training, outlining major findings and limitations will be presented. A major focus will be on key findings from the Advanced Cognitive Training in Vital Elderly (ACTIVE) project, the largest randomized clinical trial of behavioral cognitive intervention with nondemented elderly, funded by NIH. Findings of ACTIVE are particularly relevant to the symposium theme, since study outcomes focused on maintenance of everyday functioning as well as improvement of cognitive abilities. The ACTIVE conceptual framework linking basic cognition and everyday functioning will be presented. Future directions in cognitive training interventions will be the final topic of the presentation.

VOLUNTEERISM AND HEALTHY AGING

L.P. Fried, *Mailman School of Public Health, Columbia University, New York, New York*

Certain types of volunteer roles offer potential pathways to health promotion, via generativity, structured activities, and/or physical, cognitive and social activity. In addition, volunteer roles that reimburse for

expenses or provide income support are of import in health outcomes for some older adults. Further, volunteer roles designed for societal benefit are of import in changing perceptions of older adults in an aging society, perhaps strengthening the cost-benefit perceptions of programs such as Medicare. This talk presents an overview of the import of such roles, and talks about lessons from one model of senior volunteerism designed to positively benefit all of these risk factors: Experience Corps. In this program, a critical mass of older adults serve in public elementary schools in roles designed for high impact for all children in a grade. The evidence-based design of Experience Corps also sought to improve key factors for healthy aging. Early evidence for impact for the individual and implications for society are discussed.

SENIOR ODYSSEY: THE EFFECTS OF INTELLECTUAL AND SOCIAL ENGAGEMENT ON COGNITIVE VITALITY

E. Stine-Morrow, S. Noh, X. Gao, *Educational Psychology and Beckman Institute, University of Illinois, Champaign, Illinois*

Individuals who engage in complex work and leisure activities are often found to show relatively high levels of cognitive performance. While such data are consistent with the notion that an active lifestyle serves to enhance cognition (the “use it or lose it” hypothesis), an alternative explanation is that more cognitively vital individuals seek out more challenging activities. The Senior Odyssey is a program of intellectual and social engagement revolving around ill-defined problem solving, with elements of team-based collaboration, competition, and play. Participants are randomly assigned to participate in the Odyssey or to a waitlist control, and groups are compared on components of fluid ability in a pretest-posttest design over approximately five months. We report data suggesting experimental support for positive effects of engagement on cognition.

SESSION 965 (PAPER)

LIFE IN NURSING HOMES

DISCONTENTMENT WITH THE CONTINUITY OF FORMER RELATIONSHIPS: ASSISTED LIVING RESIDENTS SPEAK OUT

C.J. Tompkins¹, E.S. Ihara¹, A. Cusick¹, N. Park², *1. George Mason University, Fairfax, Virginia, 2. University of Alabama, Tuscaloosa, Alabama*

Older adults who need assistance with personal care are increasingly choosing assisted living facilities over more institutionalized settings because of the belief that assisted living facilities offer more choice and control, dignity, and a home-like atmosphere than nursing homes (Kane, 2001). The transition from independent living to an assisted living environment often involves a change in relationships, roles, and responsibilities. In an effort to understand the continuity of familial and social support for assisted living residents, this study used grounded theory to identify the main themes that emerged from the qualitative interviews conducted with 29 residents of four different assisted living facilities in Alabama. This study is a subset of the sequential mixed method project. Participants in the qualitative interviews were 65 and older, were not diagnosed with dementia, and were capable of understanding and answering questions. The interviews took place between February and July, 2007. The core theme that emerged from the interviews was discontentment with the continuity of their former relationships with family and friends. The residents expressed a desire of “wanting more” and a sense of “losing control.” They wanted to feel more connected to their family and friends but seemed hesitant to ask for more, fearing being perceived as being dependent or burdensome. They appreciated what they had but yearned for the past. The results of this study can inform social workers and other professionals in their understanding of ways to improve residents’ interactions with family and social support networks.

BEHIND CLOSED DOORS: SEXUALITY IN THE NURSING HOME

G. Doll, *Kansas State University Center on Aging, Manhattan, Kansas*

Nursing homes are currently attempting to provide “person-centered” care. This care is focused on attending to residents’ medical, social, psychological and spiritual needs. Through seven years of researching and writing about culture change in Kansas nursing homes, the Center on Aging at Kansas State University has explored various aspects of resident life including dining, end-of-life needs, activities, community connections, and diversity. In the course of this work staff recognized sexuality in the nursing home as the least understood of resident needs. Little is known about this topic and administrators seldom proactively determine staff direction when sexual activity occurs in the home. In most cases sexuality is only considered when a complaint has been lodged with a state regulatory agency. Sexual expression, both appropriate and inappropriate, has been a subject to be avoided and kept “behind closed doors.” Center on Aging staff surveyed social workers and social service designee from the pool of 325 non-profit and for-profit nursing homes in Kansas to determine the frequency of resident sexual expression and what policies, if any, are used to direct staff behavior following these incidents. These results are shared with the audience. In addition, participants will be given access to training materials for improving staff attitudes and behavior related to sexuality in nursing homes.

RESIDENT CHARACTERISTICS ASSOCIATION WITH TRANSFER FROM THE NURSING HOME TO ACUTE CARE

A. Ashcraft, *SON, Texas Tech University Health Sciences Center, Lubbock, Texas*

Nursing home residents and their families are frequently confronted with the decision to transfer to the hospital for advanced treatment modalities. Besides not being the best place to receive primary care, transfer to the hospital may be contrary to resident preference. Interventions that show promise in reducing hospitalizations include the presence of a mid-level practitioner in the nursing home, home health in the nursing home, and alignment of reimbursement so providers do not have financial incentive to hospitalize. With prevention of transfer being the goal, the specific aim of this study was to identify resident characteristics associated with transfer from a skilled nursing home to the acute care setting. Data was collecting using retrospective chart review of skilled nursing home residents transferred to the hospital the previous year. The most frequent diagnoses on transfer were hypertension, CAD, and CHF. The most frequent signs and symptoms requiring transfer were dyspnea, decreased oxygen saturation, chest pain, and elevated blood pressure. The most common procedures implemented prior to transfer were vital sign assessment, oxygen by nasal cannula or face mask, and x-rays. In the hospital, x-rays, laboratory blood analysis, and IV fluid infusion were performed most frequently. Upon return to the nursing home, common diagnoses that were added to a resident’s diagnosis listing that were not present upon initial transfer included pneumonia, UTI, dehydration, and CHF. These results will guide the next study to evaluate an intervention aimed at preventing transfer and managing resident care at the safest and lowest level of care.

A SYNTHESIZED REVIEW OF ACTIVITY AS THERAPY IN LONG TERM CARE

M. Machac-Burleson^{1,2}, M.J. Norton^{1,2}, R.S. Allen^{1,2}, A. Snow^{1,2,3}, *1. Psychology, The University of Alabama, Tuscaloosa, Alabama, 2. The Center for Mental Health and Aging, Tuscaloosa, Alabama, 3. Tuscaloosa Veterans Affairs Medical Center, Tuscaloosa, Alabama*

Engagement in pleasant and/or meaningful activity is a fundamental component of quality of life. The role of activity engagement as therapy in long term care settings was formalized 22 years ago with the passage of the Nursing Home Reform Act, as part of the Omnibus Budget Reconciliation Act of 1987 (OBRA ’87) which, for the first time, broad-

ened the concept of adequate care to include psychosocial and quality of life issues and required activities personnel be employed in certified long term care facilities. The review was limited to activities whose primary purpose was to promote an active state, an operationalization that didn’t require an activity to be defined as “leisure”, and that could include rehabilitative activities but excluded activities if the primary purpose was rehabilitation. Disciplines which have contributed to the development of activity interventions include recreation therapy, occupational therapy, music therapy, certified activity professionals, psychology, social work, and sociology. Successful activities depend on the match between the individual and the activity, the pleasantness and/or meaningfulness of the activity for the individual, and the presentation of information regarding the activity. We synthesized the literature regarding behavioral activation therapy, animal-assisted therapy, recreation therapy, music therapy and music activities, art therapy, and life review. Overall, the findings should be considered preliminary and interpreted cautiously due to the lack of randomized, controlled trials needed for strong causal inferences. Future directions that include the use of technology (e.g., Wii®, touch screen reminiscence intervention) and policy changes such as furthering pervasive culture changes are discussed.

SESSION 970 (POSTER)

MINORITY AGING

RECRUITING AFRICAN AMERICAN OLDER PARENT-ADULT CHILD DYADS WITH HYPERTENSION (CHAAF)

J. Warren-Findlow¹, R. Seymour², D. Shenk³, C.A. Matthews¹, *1. Public Health Sciences, The University of North Carolina at Charlotte, Charlotte, North Carolina, 2. The University at Illinois at Chicago, Chicago, Illinois, 3. The University of North Carolina at Charlotte, Charlotte, North Carolina*

Many African Americans experience the onset of hypertension at an early age; thus multiple generations within a family may be struggling to manage their high blood pressure. This presentation reports our ongoing efforts to recruit 90 African American, older adult – adult child pairs diagnosed with high blood pressure for a face-to-face interview to examine the congruence of hypertension self-care practices within generations of a family. Adult children had to be at least 21 years old, with parents of any age, and both parties must have hypertension for at least 6 months. We recruit across the age span, and are able to target either the adult child or the parent as the initial participant of the pair. A multi-pronged strategy is utilized: recruiting through Black churches, clinician referrals, blood pressure screenings at health fairs, presentations at senior centers, write ups in the local media, and partnerships with health-related organizations. Results: To date, we have achieved 29% of our goal with one year remaining. Participants range in age from 26-85; mean age of children is 44.73 and mean age of parents is 67.77; 32% live in the same household. Contacts are initiated evenly between parents and children. Most participants were recruited from specific events (53%), and 12% from local media. Over 7000 flyers were distributed at Black churches, but few parishioners initiated contact. However, church health ministry workers significantly raised our visibility in the larger community. Participant referrals to other eligible family members generate increasing numbers of participants.

DISABILITY AND DEPRESSION AT MIDLIFE: MAKING SENSE OF COMPARISONS ACROSS THREE ETHNO RACIAL GROUPS

B.E. Gibson¹, K. Boerner^{1,2}, *1. Research Institute on Aging, Jewish Home Lifecare, New York, New York, 2. Mount Sinai School of Medicine, New York, New York*

Previous research has demonstrated that depressive symptoms and depressive disorder are more common among middle-aged and older adults with disabilities than those without disabilities in those age groups.

In addition, previous research has shown differences across ethnoracial groups in prevalence of depression in disabled, non-disabled, and caregiving populations. This study used data from a broader study of coping with vision loss at midlife to examine similarities and differences in depressive symptoms across three ethnoracial groups: White (non-Hispanic), Black (non-Hispanic), and Hispanic (of any race). Telephone interviews were conducted with 191 middle-aged (45-64 years) adults with vision impairment who self identified as White (105), Black (63), or Hispanic (23). At the bivariate level, there were no statistically significant mean differences in total CES-D scores across the three groups. However, Blacks had significantly higher mean scores (more positive affect) on the well-being subscale of the CES-D than Hispanics, and there were no differences between Blacks and Whites or Hispanics and Whites. At the multivariate level, we regressed CES-D well-being scores on a number of demographic, health, and social variables. In the final model, better self-rated health, fewer difficulties with activities of daily living, and more social support from family were positively related to well-being scores. In addition, Whites had significantly lower well-being scores than Blacks after accounting for all other variables in the model. These findings demonstrate the complexities in understanding depressive symptoms across diverse ethnoracial groups. Implications for assessment and practice will be discussed.

HEALTH NEEDS OF VIETNAMESE AMERICAN ELDERS

N.L. Chu¹, T. Tripp-Reimer², 1. *College of Nursing, University of Oklahoma HSC, Oklahoma City, Oklahoma*, 2. *University of Iowa, Iowa City, Iowa*

Purpose: The purpose of this descriptive ethnography was to identify the barriers and facilitators to health care access and utilization for Vietnamese American elders residing in Oklahoma. **Methodology:** The sample (N=57) was a purposive sampling of 27 Vietnamese elders ages 60 years and over, 11 middle aged adults and 19 community leaders and providers. Data collection methodology included ethnographic interview, field notes and participant observation. The face-to-face interview was conducted in the respondent's home or a place of choice by the respondent and lasts for about an hour. A semi-structured interview guide was used. Each interview was conducted in the language preferred by the respondent (English, Chinese or Vietnamese). Informed consent was obtained before the interview. The interview was audio taped and transcribed verbatim. Data was analyzed using NVivo 8 software for categories, themes and domains. Comparison was made of the responses from the elders, their younger adults, and the community leader/provider group. **Findings:** The data revealed Vietnamese elders residing in smaller urban enclaves in the US have particular difficulty accessing Western health care and understanding health information compared to younger Vietnamese or Anglo populations, and more than Vietnamese elders who reside in larger urban enclaves. Reasons for this include their lower English proficiency and access to bi-lingual services, greater transportation barriers, fewer bilingual providers, and fewer social networks especially when adult children have long work days. The data revealed elders' reliance on adult children for access to health care, their low rates of health literacy and lack of health concern about mental health issues. The interviews also elicited data on elders' preferences in receiving health information. **Implications:** This data will be important in future programs to provide innovative health literacy interventions in this community and other diverse vulnerable populations.

AFRICAN AMERICAN TRIATHLETES: AN EXERCISE REGIMEN FOR THE AGING WOMAN

C. Brown¹, S. Collins², 1. *Bethune-Cookman University, Daytona Beach, Florida*, 2. *Summer Collins, MPH, Dallas, Texas*

While the life expectancy rate for African Americans has increased in recent years, it is still on average 5.1 years shorter than other American ethnic sub-populations. The leading causes of death, by certain chronic diseases, can be positively impacted by increased regular phys-

ical activity and exercise. Significant numbers of non-African American women participate jointly in physical fitness activities and challenges. The fact that African American women participants are lacking in these groups contributes to the 70% of US minority women who do not participate in regular physical activity. A minority triathlon group, in Denver, Colorado, is composed of approximately 30 women ranging in age from 20-70 years old. Subjects participate in regular exercise regimens and work within a supportive, nurturing environment to achieve the tangible objective of completing a triathlon. We anticipate participants will increase physical activity levels, be more likely to continue physical activity upon completion of the triathlon, and experience an overall improvement in well-being and self esteem. Data will be collected from participating triathletes during training and 12 weeks following the triathlon, using an administered survey. The Rosenberg Self Esteem scale will be used to assess any change in self esteem at the end of the training. We anticipate this model of group participatory exercise, while currently rare among minority women, can be widely implemented to improve their physical health and social networks, ultimately leading to improved gains in overall health status and life expectancy.

FACTORS PREDICTING ALCOHOL USE AMONG OLDER KOREAN IMMIGRANTS

W. Kim, *University at Buffalo, Buffalo, New York*

Undetected alcohol problems can lead to serious physical and mental health problems, resulting in diminished quality of life for older individuals. The purpose of this study is to investigate factors that influence drinking behavior among older Korean immigrants in Toronto. A total of 149 participants (mean age = 74.07, SD = 8.24), age 60 or older, completed face-to-face interviews conducted in Korean. Logistic regression models were used to assess how demographic characteristics (gender, age, years of immigration, religion), health condition, depression, and social support were associated with drinking behavior after controlling for first age of drinking. The results showed that married older immigrants were 1.6 times more likely to drink than were divorced or widowed participants ($p < .05$). The separate analyses of men and women showed that there were no significant predictors of drinking for men, whereas married women were almost 4 times more likely to drink than were women who were single, and Protestant women were 3.3 times more likely to drink than were non-Protestant women ($p < .05$). Heavy drinking, defined by two or more drinks for women and three or more drinks for men, was significantly associated with the level of depression ($p < .05$). Gender differences were also observed in the model. For older Korean men, higher depression scores were associated with heavy drinking, whereas for women, younger age was associated with heavy drinking. Overall, gender was an important moderating factor of drinking behavior. Findings and implications are discussed in a cultural context.

RACE, EDUCATION, AND HEALTH IN LATE LIFE

L.L. Barnes¹, R.S. Wilson¹, L.E. Hebert¹, P.A. Scherr², D.A. Evans¹, C.F. Mendes de Leon¹, 1. *Rush University Medical Center, Chicago, Illinois*, 2. *Centers for Disease Control and Prevention, Atlanta, Georgia*

The combined effects of low SES and minority background on health in old age remain poorly understood. We examined racial differences in the cross-sectional association of education with two health indicators – cognitive and physical function performance in older adults. Participants included over 9500 Blacks and Whites, 65 years and older, from the Chicago Health and Aging Project (64% Black, 60% women, mean age = 73 (SD=6.9), mean education = 12 (SD=3.5)), a geographically-defined population-based study of Alzheimer's disease. Education was measured as years of schooling completed. Cognitive function was assessed with four performance-based tests and physical function was assessed using three physical performance tests; composite measures were created and used in analyses. In multiple regression models that controlled for age, age-squared, sex, and race, and their interactions,

Whites and those with higher education performed significantly better on both composite measures. There was also a significant interaction between education and race for both measures (education x race estimate = 0.050, SE=.005, $p < .001$ for cognitive function; 0.095, SE=.024, $p < .001$ for physical function) such that racial differences were substantially greater for those with less than 12 years of education than those with more than 12 years. The results suggest that racial differences may be smaller at higher levels of education, possibly as a result of greater gains with education beyond high school for Blacks compared to Whites. Further, the results suggest that early life factors related to quality of education may need to be considered in studies of SES and health.

RESOURCES USEFUL IN LEARNING ABOUT AGING AND DIVERSITY

L. Wagner¹, C. Mehrotra², 1. *Department of Psychology, University of San Francisco, San Francisco, California*, 2. *College of St. Scholastica, Duluth, Minnesota*

Elders from different ethnic and cultural groups are growing at a much faster rate than those from European American backgrounds. Increased attention is therefore being given to conduct research to enhance our understanding of how the elements of diversity affect the aging experience. However, new research is often not readily accessible to those who work with or are planning to work with diverse elders. This, in turn, creates a gap between the generation of new knowledge and its utilization in addressing the needs of this segment of population. The goal of this poster, therefore, is to share examples of resources that focus especially on aging in diverse populations. Examples include: Specialized journals and monographs that focus on key aspects of aging and diversity (e.g., The journal *Ethnicity and Disease* published by the International Society on Hypertension in Blacks); Internet sites that provide current information (e.g., <http://spiral.tufts.edu> provides selected patient information resources in Asian languages); audiovisual resources that present abstract concepts and principles in a user-friendly manner (e.g., Li Biyiin, a film about a Navajo man who finds out he has diabetes); exercises that engage the participants in active learning (e.g., activities that involve gathering information from the internet and then evaluating the quality of that information); and federally-supported centers that create and disseminate new knowledge focusing on different ethnic groups (e.g., Resource Centers for Minority Aging Research). Making the convention audience aware of these resources will help further the goal of increased utilization of new research on a continuing basis.

ARE THERE RACIAL/ETHNIC DISPARITIES BASED ON ELDERLY HOSPITAL ADMISSION SOURCE?

E. Onsomu, E.M. Tait, M.M. Tsulukidze, A. Arif, *College of Health and Human Services, The University of North Carolina at Charlotte, Charlotte, North Carolina*

Research Objective: Minimizing disparities in health and access to healthcare has been a public health focus. However, disparities continue to exist among minority populations. The researchers examined differences based on racial/ethnic disparities in hospital admission source [physician referral, transfer, and emergency room (ER)] for Medicare beneficiaries. **Population Studied:** Data were from the 2005 Florida Inpatient Discharge Database (n=894,630) consisting of hospital inpatient data, ambulatory surgical data, emergency department data and surgical infection prevention measures. **Study Design:** The cross-sectional study used bivariate, univariate, and multivariate multinomial analyses. The model for hospital admission source was fit using the variables: payer, age, sex, and co-morbidity. Elixhauser methodology was used to group co-morbidities. The model was tested using the Hosmer and Lemeshow Goodness of Fit test. **Principal Findings:** African Americans (AA) were more likely to be admitted to the hospital through transfer (6.7%) vs. physician referral (5.0%) compared to their White coun-

terparts (75.7% and 85.8%) respectively. AA have 1.5 OR (95% CI 1.4-1.6) to be admitted to the hospital via transfer as compared to Whites. Furthermore, AA have 2.0 OR (95% CI 1.9-2.0) to be admitted to the hospital via the ER as compared to Whites. Compared to Whites, Hispanics also have a higher admittance to the hospital via transfers (1.7 OR 95% CI 1.7-1.8), and almost twice the admittance to the hospital via the ER (1.8 OR, CI 1.8-1.9). **Implications for Policy:** Eliminating disparities in referral practices will ensure improved provision of health-care services, increased quality of life, and healthy aging for all.

CULTURALLY RELEVANT NATIVE ELDER MISTREATMENT RESEARCH – A COLLABORATIVE PROCESS

L. Jervis, *Anthropology and Center for Applied Social Research, University of Oklahoma, Norman, Oklahoma*

Elder mistreatment is woefully understudied in the general population, with the field as a whole thought to be several decades behind child maltreatment and domestic violence. With respect to American Indians, the many scientific, practical, and ethical challenges involved in this area of inquiry are compounded by distrust resulting from a historic legacy of research that provided little benefit to Native communities. As a result, very few empirical studies of Native elder mistreatment have been conducted. However, for some time now, American Indians have called for partnership in studies, and Community-Based Participatory Research (CBPR) offers the promise of research that is more mutually beneficial. Here we describe an ongoing effort to collectively develop and pilot a culturally relevant survey on Native elder mistreatment that can be used in future detection efforts with urban and rural tribal communities. The goal of the project is to use what we learn from developing and implementing the pilot study to inform a series of recommendations for identifying the cultural phenomenology and extent of elder mistreatment among American Indians. A core component of the study is a collaboration between two groups: 1) a culturally and geographically diverse panel of community experts with backgrounds in Native elder advocacy and abuse intervention, and 2) an interdisciplinary team of researchers with expertise in American Indian communities. Here we describe our collaborative process, the early findings of the survey, and our initial recommendations for future directions for Native elder mistreatment research.

CAREGIVING AMONG MEXICAN AMERICAN OLDER ADULTS: RESULTS FROM THE H-EPESE STUDY

E.A. Hahn, D.A. Chiriboga, *Aging Studies, University of South Florida, Tampa, Florida*

Elizabeth A. Hahn, David A. Chiriboga, Ph.D. University of South Florida Introduction: In comparison with African Americans or non-Hispanic Whites, Mexican American (MA) caregivers to older adults may experience more distress and burden. Within group differences, such as level of acculturation or family solidarity, may be an important factor to better understand caregiver outcomes in this minority group. The purpose of the present study is to evaluate the correlates and possible consequences of becoming a caregiver among MA older adults. **Methods:** The present study included 187 MA adults from the first wave of the Hispanic Established Populations for Epidemiological Studies of the Elderly (H-EPESE) who had become caregivers within the past year, out of the total sample of 3,050 MA adults over age 65 who comprise the H-EPESE study (a national probability sample study). The Center for Epidemiological Studies Depression (CES-D) Scale, a common measure of well-being, was used to assess depressive symptoms. **Results:** Those who had recently become caregivers reported significantly more depressive symptoms compared to the non-caregivers ($p < .05$). Controlling for gender, education and marital status, regression analyses revealed that greater acculturation was related to fewer depressive symptoms. **Conclusions:** The onset of caregiving among Mexican Americans may be a stressful experience, and specific within group dif-

ferences (such as acculturation) may help understand poor outcomes. A better understanding of cultural aspects of caregiving for Mexican Americans is necessary for this increasing population.

UTILIZATION OF MAMMOGRAPHY AMONG OLDER HISPANIC WOMEN

M.V. Martinez, C. Unson, *Public Health, Southern Connecticut State University, New Haven, Connecticut*

Objective: The purpose of the study is to investigate factors that are associated with adherence to yearly mammograms over 5 years among Hispanic women aged 50 and older. **Methods:** A convenience sample of 105 Hispanic women was recruited from Hispanic churches in a New England metropolitan area. Trained interviewers administered the questionnaires, usually in Spanish. Questions pertained to constructs of the Health Belief Model. The reliability coefficients (Cronbach Alphas) for perceived susceptibility, perceived severity, perceived benefits, perceived costs and self-efficacy are .89, .78, .79, .57, .85, respectively. **Results:** The average age was 60.0 (SD=8.7); average years of education was 11.4 (SD=3.7). The majority were from Puerto Rico (83.8%). Ninety-five percent have had a mammogram. They had an average of 3.5 mammograms in the last 5 years. The data show a lack of perception of susceptibility to breast cancer ($M=2.8$; $SD=1.0$), a lack of perceived severity consequences of breast cancer ($M=3.7$, $SD=.86$); and few perceived barriers to mammograms ($M=2.2$, $SD=.74$). The data show modest ratings of the beneficial effects of mammograms ($M=3.7$, $SD=.84$), and self-efficacy in obtaining mammograms ($M=4.1$, $SD=.81$). Low scores on perceived barriers scale ($p<.01$) was significantly associated with high adherence to 5-year annual mammograms as the dependent variable when controlling for other HBM constructs. Items significantly correlated with low 5-year adherence were lack of money, not knowing where one can obtain a mammogram, and lack of time. **Conclusion:** Barriers appear to have the strongest relationship to adherence to yearly mammograms among older Hispanic women.

EXPANDING THE ASSESSMENT OF COPING AMONG DIVERSE GROUPS OF CAREGIVERS

M.D. Cohen^{1,2}, P. Dilworth-Anderson^{1,2}, 1. *Health Policy & Management, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *UNC Institute on Aging, Chapel Hill, North Carolina*

Coping with the demands of giving care to an older dependent family member can be very rewarding but also stressful for caregivers. They may experience feelings such as anger, stress, and frustration. These feelings can lead to high levels of burden and physical and emotional health problems. Using data from a qualitative study of African American, American Indian, and White dementia caregivers, we developed a 10-item scale to assess how caregivers use the following five coping strategies to manage the range of emotions they experience while giving care: humor, faith, disengaging from the care recipient, preempting conflict with the care recipient, and support-seeking. Using our newly developed coping scale, "Caregiver Coping for Me," telephone interviews were conducted with 200 African American and White caregivers across North Carolina. Caregivers were mainly adult children (64%), White (59%), married (59%), employed (54%), and living with their care recipient (63%). The average age was 57 years and most had at least some college education (59%). Care recipients were an average of 82 years and nearly half (48%) were diagnosed with memory loss. Findings showed that African Americans and Whites differ in coping. African Americans were more likely than Whites to use humor to deal with stressful feelings and more likely to rely on faith. Whites were more likely to disengage from their care recipient by physically and emotionally removing themselves from stressful caregiving situations. However, both African Americans and Whites reported preempting conflict with the care recipient and seeking support from people and organizations.

PROJECT PEARL: FOLLOW-UP DATA FROM A COGNITIVE BEHAVIORAL INTERVENTION TO IMPROVE THE QUALITY OF LIFE OF FRAIL RURAL ELDERS

M.P. Morthland¹, F. Scogin¹, A.V. Kaufman¹, L.D. Burgio², W.F. Chaplin³, G. Kong³, 1. *The University of Alabama, Tuscaloosa, Alabama*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *St. John's University, Queens, New York*

Project PEARL (Project to Enhance Aged Rural Living) is a study funded by the National Institute on Aging to test the effectiveness of providing in-home, cognitive behavioral therapy to improve emotional well being and quality of life among older rural adults. One-hundred, thirty-four participants, predominately African-American primarily rural, low resource, and physically-frail, were randomly assigned to either immediate or delayed CBT. The current poster reports on follow-up data for this project. For the purpose of these analyses, data for the two groups were collapsed and matched on the time of assessment (pretreatment, posttreatment, and six-month follow-up). Mixed regression analyses were used to test the effect of treatment on the follow-up outcomes of quality of life (Quality of Life Questionnaire; QOLI) and emotional well-being (Symptoms Checklist-90; SCL-90). Results for the QOLI indicated a change from pretreatment to follow-up ($t = 6.27$, $p < .01$) and no statistically significant change from posttreatment to follow-up ($t = .33$, $p = .75$) indicating maintenance of gain. Results for the SCL-90 indicated a change from pretreatment to follow-up ($t = -3.78$, $p < .01$) and no statistically significant change from posttreatment to follow-up ($t = -.23$, $p = .82$) indicating maintenance of gain. These data suggest that treatment effects can be achieved and maintained with a disadvantaged sample of older adults and suggest that evidence-based treatments delivered through non-traditional means can have effects beyond posttreatment.

DISABLED OLDER ASIANS AND LIVING ARRANGEMENTS: DOES ETHNICITY MATTER?

S. Lee, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

The purpose of this study is to examine if older Asians from various ethnic backgrounds response to disability differently in terms of living arrangements. Despite the fact that numbers of older Asians are increasing more rapidly than any other ethnic groups, little is known about disability within this group; nor is there adequate information linking disability and living arrangements within the group. This study compares six Asian ethnic groups (Japanese, Chinese, Korean, Asian Indians, Filipinos, and Vietnamese); the majority of older Asians are from one of these six countries. The data from the 2000 Census 5% Public Use Microdata Sample (PUMS) were analyzed to identify the characteristics of older Asians' living arrangements. In the analysis, individuals living alone and couples living with no other adults in the household are classified as living alone. Interaction terms for disability and ethnicity are included in the analysis to explain living arrangements. Because the process of choosing living arrangements is different for singles and for couples, samples are analyzed separately according to marital status. Results show that, among singles, disability has a significant stronger effect for Korean, Chinese, Vietnamese and Filipinos than for Japanese seniors. For couples, disability has a significant stronger effect for Korean and Chinese than for Japanese senior couples. The results confirm that the effect of being disabled is significantly different across Asian ethnic groups.

OBJECTIVE AND SUBJECTIVE HEALTH AS PREDICTORS OF DAILY PHYSICAL FUNCTIONING OF HISPANIC OLDER ADULTS

G.I. Caskie¹, J. Margrett², J.D. Bremer¹, *1. Education and Human Services, Lehigh University, Bethlehem, Pennsylvania, 2. Iowa State University, Ames, Iowa*

Poor health can lead to decreased day-to-day functioning among older adults. Given Hispanic elders' increased health risks, understanding the relationship of both objective and subjective health measures with daily physical functioning is especially important for this ethnic group. Participants included 3,050 Hispanic adults aged 65 and older, who participated in the baseline assessment of the Hispanic EPESE (Markides, 1999). A structural equation model examining objective health (indicated by number of doctor visits, number of prescription medications, and number of comorbid health conditions) and subjective health (indicated by self-rated health, confidence in ability to be independent, and health control) as predictors of physical functioning (indicated by standing balance performance, ADLs, and IADLs) showed good fit to the data (e.g., CFI=.95, RMSEA=.05); age and education were also included as covariates. Subjective health was positively related to physical functioning ($\beta=.86$, $p<.001$). Although objective health was significantly related to subjective health ($p<.001$), it did not significantly predict physical functioning. In addition, greater age was significantly related to poorer everyday physical functioning ($p<.001$) as well as poorer subjective and objective health; education was positively related to subjective health ($p<.001$), but not to objective health or physical functioning. Approximately 53% of the variance in daily physical functioning was explained by the model. These results illustrate the predictive utility of subjective health perceptions above and beyond more objective indicators of health status. More research is needed to better understand the health perceptions of Hispanic elders and how these map onto their health-related experiences (e.g., service utilization, diagnoses).

INTERGENERATIONAL TRANSFER OF CULTURE PROMOTES OLDER MINORITY ADULTS' HEALTHY AGING

L. Holmes, *University of Nebraska at Omaha, Omaha, Nebraska*

Social isolation of older adults is well established as a threat to healthy aging, which for minorities is exacerbated by limited English language ability and other barriers to access. This study describes, and reports results of service learning projects targeting social isolation of older minority adults conducted over seven consecutive semesters with four nonprofit organizations, each serving a different minority group (African, Chinese, Latino and Native Americans). Each semester, project formats were (re)designed, tested and evaluated to improve effectiveness. Although a different format was effective for each group, engaging older minority adults in activities focused on intergenerational transfer of culture was effective in all groups. This result is consistent with Gelfand's (2006) suggestion that ethnic identity may buffer negative effects of aging, and with significant support in the literature for the positive effects on older adults of engaging in socially useful activity. Totals participating each semester ranged from 43 to 60 older adults, and 39 to 64 children. Impact on elders has been evaluated using: older adult participant ratings on Likert-type scales that included spaces for open-ended responses; qualitative observation and data analysis by students with support and guidance from the professor; evaluation interviews with each partner organization leader; and results of a focus group with all the partner organizations. Results of evaluation indicate older adults view the activities as very positive (e.g., they consistently indicate they want "more activities like this one"). After the activity, they readily volunteer to discuss and evaluate the activity, and plan future activities.

KNOWLEDGE ABOUT ALZHEIMER'S DISEASE, SHAME, AND AWARENESS OF SERVICES IN KOREAN AMERICAN ELDERS

Y. Jang, D.A. Chiriboga, G. Kim, *University of South Florida, Tampa, Florida*

Early detection of symptoms of Alzheimer's Disease (AD) and successful interventions can be facilitated by knowledge about AD and utilization of relevant services. However, a lack of knowledge, stigma, and an underutilization of services related to AD are often encountered among racial/ethnic minority populations. The present study focuses on an understudied and underserved population: Korean American elders. It was designed to explore predictors of knowledge about AD, stigma, and awareness of AD-related services. Using data with 675 Korean American elders (Mean age = 70.2, SD = 6.87), hierarchical linear or logistic regression models were estimated. Individuals with greater levels of education and acculturation were more knowledgeable about AD. Individuals who reported that having a family member with AD would bring shame were more likely to have lower levels of education and acculturation and to be less knowledgeable of AD. Awareness of AD-related services was more likely among individuals who were married, had greater levels of education and acculturation, and had a family member with AD. Overall, our findings underscore the pivotal role of education and acculturation in predicting knowledge about AD, stigma, and awareness of services. The observed link between knowledge of AD and stigma highlights the importance of knowledge dissemination to racial/ethnic minority communities.

FAMILY CAREGIVING RESEARCH: LEARNING FROM A HARD TO FIND POPULATION

M. Tang, *Social Work Program, The Richard Stockton College of New Jersey, Pomona, New Jersey*

Purpose: This poster highlights some recruitment challenges in conducting family caregiving research. Research implications for ethnic minorities are presented. **Methods:** Data were collected through face-to-face survey interviews with 113 Chinese American caregivers who provided care to their elderly dependent relatives in the San Francisco Bay Area. This study used a snowball sample method. An array of recruitment strategies were used to recruit Chinese American caregivers for this study. The methods included referrals through newspaper outlet, memory disorder centers, adult daycare centers, caregiver support groups, senior centers, senior housing apartments, community organizations, and local churches; and referrals by other caregivers. A \$20 gift certificate was offered to each participant who completed the questionnaire. **Results:** Caregivers were referred through the investigator's network contacts (22.1%), churches (5.3%), social service agencies (15%), caregiver support group (6.2%) and other caregivers (51.3%). **Implications:** A \$20 gift certificate was an effective incentive to recruitment of Chinese family caregivers into this study. Recruitment flyers had been distributed to senior centers, churches, and day care centers. However, only personal contacts with gatekeepers and potential caregivers could effectively facilitate study participation. Successful recruitment required a relationship of trust between members of the Chinese community and the investigator. In working with the Chinese community, the research staff, especially the interviewers, must be fluent in Chinese. Beyond language facility, a familiarity with and understanding of Chinese traditions and behavior is seen as essential to reduce alienation and overcome obstacles to recruitment in the community settings.

USE OF THE GERIATRIC DEPRESSION SCALE IN AFRICAN AMERICAN AND CAUCASIAN MEDICARE BENEFICIARIES

O.J. Clay¹, M. Crowe¹, M. Crowther², P. Sawyer³, R. Allman^{4,3}, 1. Department of Psychology, University of Alabama at Birmingham, Birmingham, Alabama, 2. Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 3. UAB Division of Gerontology, Geriatrics, and Palliative Care, Birmingham, Alabama, 4. Birmingham VA Medical Center, Birmingham, Alabama

The 15-item version of the Geriatric Depression Scale (GDS-15) has been widely used to assess depressive symptoms in older adults. This investigation examined the psychometric properties of the scale in a sample of 1,000 community-dwelling African American and Caucasian Medicare beneficiaries. The sample was 50% Caucasian, 50% female, and 51% rural with a mean age of 75.3 years (SD=6.7). An exploratory factor analysis that utilized principle components extraction was performed to examine the factor structure of the GDS items, and a promax rotation was utilized because the extracted factors were believed to be correlated. The scree plot suggested a two-factor model (Depression and Life Satisfaction) best fit the data. Separate models for African American and Caucasians also provided evidence to support a two-factor model in each subgroup although some differences were observed in the factor loadings between groups. Construct validity for the factors was explored by correlating them with social support, anxiety, and physical and mental health composites of the SF-12. The factors had moderate correlations with anxiety and mental health with the absolute value of Pearson's r ranging from 0.37 to 0.53, p 's<.0001. The factors were also significantly related to social support and physical health, p 's<.0001. Results provide evidence that the GDS-15 is appropriate to use in samples of African American and Caucasian community dwelling older adults. Investigators must consider potential racial differences in the factor structure of instruments before deciding to use brief versions of these scales in samples that are comprised of more than one racial group.

LATE LIFE MINORITY RECRUITMENT IN A RANDOMIZED CLINICAL TRIAL FOR ANXIETY

J.S. Calleo¹, C.A. Kraus-Schuman², N. Wilson¹, M. Khan¹, J. Cully^{2,1}, M. Kunik^{2,1}, M. Stanley^{1,2}, 1. Psychiatry, Baylor College of Medicine, Houston, Texas, 2. Michael E. DeBakey VAMC, Houston, Texas

Effective treatment for older adult minorities is needed to reduce disparity in health services. Recruiting older adult minorities in research has been a challenge. Recruitment for underrepresented subjects is examined for a randomized clinical trial of cognitive behavior therapy in primary care for late life Generalized Anxiety Disorder (GAD). Recruitment primarily occurs through letters sent by the providers of two primary care clinics to potential participants introducing the project, and research staff follow-up by phone. Participants are eligible if they are 60 years or older and have a principal or co-principal GAD with no active psychosis, substance abuse, bipolar or suicidal intent. To date, 76 participants have signed consent and 66 have completed the diagnostic assessment. The reasons for signing consent but not continuing to diagnostic assessment included a negative screen for anxiety ($n = 1$) and loss of contact or withdrawal ($n = 9$; 78% African Americans). Of the 66 participants who completed diagnostic assessment, 19 (29%) are minority participants (13 African American; 4 Hispanic, 1 Asian; 1- Multi-Race). However, only 26% (5 of 19) of minorities compared to 60% of Caucasians (28 of 57) met inclusion criteria. Reasons for exclusion for minority ethnic groups are no psychiatric diagnosis ($n = 3$), GAD not primary ($n = 3$); and no GAD ($n = 8$). It appears that we are obtaining consent from a representative sample, but inclusion rates are meaningfully different between minority and non-minority subgroups. Examining where underrepresented populations leave the study will inform strategies to improve minority recruitment.

THE RELATIONSHIP BETWEEN COGNITION AND INFLAMMATION IN BLACK AND WHITE OLDER ADULTS

A. Aiken-Morgan¹, S. Leurgans¹, A.E. Aiello², M. Morris¹, J. Kelly¹, D. Fleischman¹, D. Bennett¹, L. Barnes¹, 1. Rush University Medical Center, Chicago, Illinois, 2. University of Michigan, Ann Arbor, Michigan

Studies suggest that higher levels of inflammation are associated with poorer cognitive performance. Despite consistent findings that older Blacks have higher inflammation and poorer cognitive performance compared with older Whites, few studies have examined racial differences in the inflammation-cognition association. The objective of this study was to examine racial differences in the cross-sectional association of inflammation levels (as measured by blood serum levels of CRP, IL-6, and TNF- α) and cognition in a sample of 728 community-dwelling Black and White elders participating in the Rush Minority Aging Research Study or Rush Memory and Aging Project (mean age = 77.2 (SD=7.0); mean education = 14.8 (SD=3.2); mean MMSE = 27.8 (SD=2.4); 43% Black). Participants were administered 19 cognitive tests from which composite measures of 5 cognitive domains were derived. In multiple linear regression analyses, controlling for age, education, sex, and BMI, both IL-6 and TNF- α were associated with lower performance on global cognition and all 5 cognitive domains (all p 's < .01); CRP was associated only with lower perceptual speed and visuospatial ability (both p 's < .01). After controlling for race, only TNF- α continued to be associated with lower global cognition and perceptual speed. No interaction terms for race and the markers were significant. Overall, these findings suggest that higher levels of serum inflammation markers are associated with poorer cognitive performance but provide little support for racial differences in the association of inflammation and cognition. Future research should consider the effects of inflammation on longitudinal changes in cognition in diverse samples.

COMPLEMENTARY AND ALTERNATIVE MEDICINE: USE AND PROVIDER COMMUNICATION BY DIVERSE GROUPS

S.B. Laditka, J.N. Laditka, M.M. Tsulukidze, E.M. Tait, Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina

About half of older adults in the United States use complementary and alternative medicine (CAM). Relatively little is known about how CAM use, or reporting CAM use to medical providers, differs among older adults by race/ethnicity. Data were from the 2007 National Health Interview Survey and its CAM supplement. Analyses, stratified by sex, included chi-square and multivariate logistic regression, accounting for the survey design and weighted for national representativeness. Racial/ethnic groups were non-Hispanic African Americans, Hispanics, Asian Americans, and non-Hispanic whites (whites). Controls included age, education, marital status, health insurance, comorbidities, body mass index, and region. We examined CAM defined both including and excluding vitamins; reported results, for ages 50+ (10,104 respondents), include vitamins. In multivariate analyses, compared with whites, CAM use was significantly less common among African Americans (odds ratio, OR 0.77), Hispanics (OR, 0.73), and Asian Americans (OR 0.90) (all p <.001). Among all CAM users, 60.9% reported telling a provider; 53.9% of African Americans, 49.8% of Hispanics, 59.1% of Asian Americans, 62.5% of whites (p <.0001). In adjusted results for women, African Americans, Hispanics, and Asian Americans were less likely to tell a provider than were whites (ORs 0.66, 0.54, 0.61, respectively, all p <.001); results were similar for men. Results for CAM defined without vitamins were similar. Findings suggest there may be opportunities to promote CAM use with established health benefits among older minorities. Because CAMs, e.g., herbal supplements, can interact with conventional therapies, providers should inquire about CAM use, particularly among older patients in minority groups.

TRAJECTORY OF LIFE SATISFACTION AMONG OLDER MEXICAN-AMERICANS

N.H. Fultz, J.M. Bennett, J. Liang, *School of Public Health, University of Michigan, Ann Arbor, Michigan*

Life satisfaction is a key component of subjective well-being, an important concept in social gerontology since the 1950's. A cognitive evaluation of one's life as satisfying or congruent with one's goals, life satisfaction is thought to be relatively stable over time. Nonetheless, current knowledge is largely based on cross-sectional studies, which confound intrapersonal changes with interpersonal differences. A more complete understanding requires an examination of the level and shape of the trajectory of life satisfaction over an extended period of time. Further, although SWB has been examined extensively among white Americans, studies involving ethnic minorities are relatively rare. This is especially true for Mexican-American older adults. Data for this research came from the Hispanic Established Populations for Epidemiologic Studies of the Elderly (HEPESE), which were collected in 1993, 1995, 1998, 2000, and 2004, yielding 10,317 observations from 3,050 respondents. To chart the trajectory of life satisfaction, Hierarchical Linear Modeling (HLM 6.06) was undertaken, with life satisfaction measured by using a single-item rating of one's life. Older Mexican-Americans showed a very slight, but statistically significant, decrease in life satisfaction over time. Covariates included demographic characteristics, SES, acculturation, social support, health status, and financial strain. The trajectory of life satisfaction was significantly associated with a number of variables including age, gender, social support, and physical health.

CULTURAL MODELS OF "BENIGN SENESCENT FORGETFULNESS" VS. ALZHEIMER'S IN THREE U.S. ETHNIC GROUPS

B. Schrauf¹, M. Iris², *1. Applied Linguistics, Pennsylvania State University, University Park, Pennsylvania, 2. CJE Senior Life, Chicago, Illinois*

"Benign senescent forgetfulness" is meant to describe the normal pattern of memory lapses associated with aging in contrast with the pathological processes of Alzheimer's disease. In one sense the common, quotidian, unmarked experience of forgetting this-or-that has now become a worrisome borderland between "safe" aging (never mind "successful") vs. unthinkable degenerative decline. However, some bioethicists have argued that this is a particularly cultural phenomenon seen especially in the "hypercognized" culture of the US where self-control, independence, and autonomy are threatened by cognitive impairment. Thus, in the US, Alzheimer's has come to frame aging rather than vice-versa. This poster addresses whether individuals from alternate cultural backgrounds—older Russians, older Mexicans, and older African-Americans—show the same re-framing of normal aging under the influence of Alzheimer's. To wit, we assessed whether samples from each group had a single, coherent model of AD vs. normal memory loss. Results from the consensus analysis showed that in fact all three groups expressed coherent, largely scientific models of Alzheimer's (ratios of 1st to 2nd eigenvalue: African Americans 6.15, Russians 4.64, Mexicans 6.87). However, concerning models of normal memory loss, only African Americans showed a single, coherent model (3.62) whereas Russians (2.97) and Mexicans (2.08) did not. We believe this reflects cultural differences whereby African Americans share the hypercognized themes of US culture, whereas the older Russians and Mexicans do not. In essence, the 'benign-ness' of memory loss seems to depend on cultural background.

SESSION 975 (SYMPOSIUM)

SOCIO-CULTURAL AGING

Chair: H. Fung, *Chinese University of Hong Kong, Hong Kong SAR, China*

Discussant: D. Isaacowitz, *Brandeis University, Waltham, Massachusetts*

This symposium aims at shedding light on how socio-cultural forces may shape aging processes. The first two papers describe how older adults may react to the same social interactions differently depending on their relationships with the particular social partners. Cheng and colleagues examined the association between negative social interactions and psychological well-being among three different relationships: relationships with a member of the vertically extended family, a member of the horizontally extended family member, and a nonkin. You and Fung then focus on anger responses and report a study that compared how younger and older adults from Hong Kong and Mainland China reacted to imagery anger-eliciting scenarios when the perpetrator was a family member, a close friend or an acquaintance. The next two papers are about how cultural contexts shape social relationships. In contrast to the well-established finding in the American literature that negative social exchanges are negative, Fung and colleagues found among Chinese, across adulthood, that negative social exchanges increased emotional closeness over a 2-year period. Yeung and colleagues also found that interdependent self-construal helped Chinese, particularly older Chinese, to benefit more from peripheral social partners. Finally, Sims and colleagues present a model that shows how cultural views of aging among European-Americans and Chinese-Americans explain their ideal affect across adulthood. Taken together, these papers illustrate the multiple ways through which socio-cultural contexts may define and guide socioemotional development across adulthood.

NEGATIVE INTERACTIONS AND PSYCHOLOGICAL WELL-BEING: DO SOURCES OF NEGATIVE EXCHANGES MATTER?

S. Cheng¹, K. Li², *1. City University of Hong Kong, Hong Kong SAR, China, 2. University of Hong Kong, Hong Kong SAR, China*

Close relationships are important to positive aging. However, negative interactions are more frequent among immediate family members than among distant family and friends. A question arises: Are negative interactions with immediate family less distressing because one becomes habituated to them over time, or more distressing because they represent annoyances or hostilities that would not easily go away. In this study of 1,005 older adults in Hong Kong, we tested if the effect of negative interactions on psychological well-being differs, depending on whether the person is a member of the vertically extended family (spouse, children and grandchildren), a member of the horizontally extended family member, or a nonkin. Results showed that negative interactions accounted for lower well-being in all relationship types, but the effect was slightly stronger in the vertically extended family. The results are discussed in terms of the emphasis on familism and norm for harmony in Chinese societies.

ANGER RESPONSES UNDER RELATIONAL CONTEXTS: A COMPARISON OF YOUNGER AND OLDER ADULTS FROM HONG KONG AND MAINLAND CHINA

J. You, H. Fung, *Chinese University of Hong Kong, Hong Kong, China*

This study examined individuals' anger responses under relational contexts among younger and older adults from Hong Kong and Mainland China. Our sample included 108 Hong Kong Chinese (40 younger, 68 older) and 101 Mainland Chinese (35 older, 66 younger) to assess their anger experience, motives and behavioral responses toward family members, close friends or casual friends using 9 imaginary anger-eliciting scenarios. Considering the results of anger experience, Hong Kong older adults displayed the lowest level of stream motives in close

friendships whereas Mainland Chinese older adults displayed the highest level of stream motives in kinships. Moreover, we found that only the younger Mainland Chinese adults expressed the lowest level of malevolent motives in kinships than in friendships. For the motives across kinships, causal friendships and close friendships, only the younger adults from the Mainland China showed significantly higher level of constructive motive. Also, results from behavioral responses found that younger Hong Kong Chinese showed significantly higher level of direct aggression in kinships than in casual friendships. However, younger Mainland Chinese had significant higher level of non-aggression across all three relationship contexts. Finally, all the participants displayed highest level of indirect aggression and cognitive reappraisal in casual friendships than in kinships. Our investigation explores and contributes to the understanding of emotion under different relational contexts from two different Chinese samples.

NEGATIVE SOCIAL EXCHANGE INCREASES EMOTIONAL CLOSENESS

H. Fung¹, D. Yeung², K. Li³, F. Lang⁴, 1. *Chinese University of Hong Kong, Hong Kong, China*, 2. *City University of Hong Kong, Hong Kong SAR, China*, 3. *University of Hong Kong, Hong Kong SAR, China*, 4. *Friedrich-Alexander University of Erlangen-Nuremberg, Erlangen, Germany*

Negative exchange in social relationships has traditionally been studied as having negative consequences. This study explored whether it might have positive effects for relationship closeness. Sample included 351 adults, aged between 18 and 91 years, residing in Hong Kong, China. Closeness of social partners to the participants was measured by the Social Convoy Questionnaire, and the levels of negative exchange, instrumental support and emotional support of each social partner were assessed. Multi-level analyses revealed that moderate levels of negative exchange were positively associated with increases in closeness over a 2-yr period, even after statistically controlling for instrumental support and emotional support. This positive relationship was observed to a greater extent among kin than among non-kin.

HOW COULD PERIPHERAL PARTNER BENEFIT OLDER ADULTS IN A LONG RUN

D. Yeung¹, X. Zhang², H. Fung², 1. *City University of Hong Kong, Hong Kong SAR, China*, 2. *Chinese University of Hong Kong, Hong Kong SAR, China*

This study examined the relationship between social network composition (SNC), interdependence self-construal and loneliness over two years. A sample of 365 Hong Kong Chinese adults aged between 18 and 92 years participated in two phases of assessment. Hierarchical regression analyses revealed that age moderated the relationship between interdependence self-construal and the number of emotionally close social partners. In particular, the positive association between interdependence and the number of emotionally close social partner was only significant for older adults but not for younger adults. Moreover, the number of peripheral partners partially mediated the relationship between interdependence and loneliness. Higher levels of interdependence were associated with lower levels of loneliness, and this association was partially mediated by having more peripheral partners in social networks. However, this mediation effect was only found among older adults but not among younger adults. These findings qualify prior research on the benefits of SNC to older adults.

YOU'RE AS YOUNG AS YOU WANT TO FEEL: CULTURAL VARIATION IN IDEAL AFFECT ACROSS THE LIFESPAN

J.L. Tsai¹, E.A. Thomas¹, T. Sims¹, C. Park¹, J. Hong¹, H. Fung², 1. *Psychology, Stanford University, Stanford, California*, 2. *Chinese University of Hong Kong, Shatin, NT, PRC, China*

Compared to American culture, Chinese culture is less youth-oriented and more accepting of old age. Do these different cultural views

of aging influence how people want to feel across the life span? Our findings suggest that they do: consistent with the American emphasis on youthfulness, European American older adults (60-79 years) wanted to feel excitement states as much as did European American younger adults (20-39 years), whereas Chinese American older adults wanted to feel excitement states less than did their younger counterparts. Moreover, whereas Chinese American older adults' ideal affect was consistent with what they wanted in their daily lives, European American older adults' ideal affect was not, suggesting that Chinese Americans are more accepting of age-related changes in ideal affect than are European Americans. We discuss the implications of these findings for understanding wellbeing in later life.

SESSION 980 (SYMPOSIUM)

THE DYNAMIC NATURE OF STRESS AND WELL-BEING: SHORT-TERM VARIABILITY FROM A LIFESPAN PERSPECTIVE

Chair: A. Brose, *Center for Lifespan Psychology, Max Planck Institute for Human Development, Berlin, Germany*

Discussant: S. Neupert, *North Carolina State University, Raleigh, North Carolina*

Well-being and stress constantly vary over short periods of time, such as days, and undergo developmental change over years and decades. This symposium focuses on short-term variability in stress as indicated by variation in affective reactivity, stressor-type and -appraisal, as well as cortisol and cardiovascular activity. It highlights the importance of studying short-term functioning for understanding long-term developmental change. Participants of the symposium will learn (a) about different kinds of variability such as meaningful variation in relation to changing situations and variability as person characteristic (b) how age group differences in variability relate to theories and findings on developmental change in the domains of stress and well-being. In addition, diverse methodological approaches toward studying within-person variability will be explained. Stawski et al. investigate variation in affective reactivity as a function of stressor appraisal and stressor type across the adult life span. Brose et al. show that individuals' affective reactivity varies across time and they analyze transient influences on reactivity such as current health condition. Deboeck and Bergeman illustrate associations between short-term fluctuations in stress, long-term change, and distal well-being outcomes. Piazza et al. demonstrate age- and gender specific differences in within-person variability of cortisol response to awakening. Results by Wrzus et al. suggest age-related differences in physiological reactivity to and recovery from stress. In sum, this symposium provides an overview on recent conceptual and methodological approaches to the experience of stress across the lifespan, including psychological and physiological outcome variables.

LINKING DAILY STRESSORS TO NEGATIVE AFFECT: THE IMPORTANCE OF SUBJECTIVE APPRAISALS AND EVENT TYPE

R.S. Stawski¹, K.E. Cichy², D. Almeida¹, 1. *Pennsylvania State University, University Park, Pennsylvania*, 2. *Kent State University, Kent, Ohio*

An assumption of psychological theories of stress is that subjective appraisals of stressful events are important for understanding the effects of these events on health and well-being. However, it is unclear whether the influence of subjective appraisals is invariant across different types of stressful events. Respondents included 1,265 adults (Mean Age = 57, SD = 12, Range = 33-84, 56% Female) from the second wave of the National Study of Daily Experiences. We examined whether subjective ratings of event severity were associated with negative affect (NA) during that particular event. Participants reported on their daily stressful experiences and NA during these experiences during telephone interviews on eight consecutive evenings. Results revealed that the subjective appraised severity of the events was positively related to the level

of NA experienced during that event ($p < .01$). Furthermore, the degree to which subjective severity influenced NA depended on the type of event ($p < .01$).

AFFECTIVE REACTIVITY TO DAILY HASSLES VARIES WITHIN INDIVIDUALS: TRANSIENT INFLUENCES IN YOUNGER AND OLDER ADULTS

A. Brose¹, F. Schmiedek^{2,1}, U. Lindenberger¹, *1. Center for Lifespan Psychology, Max Planck Institute for Human Development, Berlin, Germany, 2. Humboldt-Universität Berlin, Berlin, Germany*

Being exposed to daily hassles impairs affective well-being. The strength of this association is moderated by, for example, personality characteristics or current levels of perceived stress. The latter points to the importance of transient influences on how individuals react to hassles. The present study investigates three types of time-varying influences on affective reactivity: whether an epoch surrounding a stressor is characterized by (a) heightened exposure to events and, (b) perceived stress, and (c) bad health. We tested 101 younger (20-30) and 103 older (65-80) adults in 100 daily sessions. By means of 3-level multilevel modeling, variation in within-person affective reactivity across time was identified when the 100-days phase was divided into smaller epochs. First evidence supports the assumption that epoch-specific exposure to events, perceived stress, and health condition predict within-person variation in affective reactivity. Age-group differences in these influences will be discussed from the perspective of lifespan theory.

RELATING INTRAINDIVIDUAL CHANGE AND VARIABILITY: PREDICTING 3-YEAR CHANGES FROM DAILY VARIABILITY IN OLDER ADULTS

P.R. Deboeck¹, C. Bergeman², *1. University of Kansas, Lawrence, Kansas, 2. University of Notre Dame, Notre Dame, Indiana*

There are interindividual differences in the aging process, with some individuals appearing to be more resilient to the changes that occur with advancing age. This resiliency is often postulated to affect how individuals change in both short-term (days) and in the long-term (years). If this is the case, then there should be relationships evident between short-term intraindividual variability and long-term intraindividual change. This study examines the data of a large sample of older adults from the Notre Dame Longitudinal Study on Aging. Using Derivative Variability Analysis, we examine daily and weekly variance in observed scores and the rates at which stress is changing, and whether this variability is predictive of well being outcomes over the course of three years. Relationships between short-term variability and long-term outcomes may help inform the changes that can be made on a daily or weekly time scale to promote healthier aging.

INTRA-INDIVIDUAL VARIABILITY IN THE CORTISOL AWAKENING RESPONSE: AN EXAMINATION OF AGE AND GENDER

J.R. Piazza, R.S. Stawski, D. Almeida, *Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

The cortisol awakening response (CAR) exhibits a high degree of intra-individual stability, leaving some researchers to conclude that any remaining variability may simply be reflective of error variance. Intra-individual variability in the CAR, however, may also reflect systematic changes in the HPA axis. To explore this possibility, the current study examined age and gender differences in intra-individual variability in the CAR using a national sample of adults between the ages of 35 and 85. Results revealed a significant age by gender interaction, indicating that although no systematic age-related differences emerged for women, intra-individual variability in the CAR response increased with age among men ($p < .01$). Whereas younger men showed the lowest levels of intra-individual variability, older men showed the highest levels of intra-

individual variability—levels comparable to women of any age. Findings will be discussed in terms of theoretical and practical significance.

GETTING OLDER, GETTING WISER - AND LESS STRESSED? AGE DIFFERENCES IN AFFECTIVE EXPERIENCE AND PHYSIOLOGICAL RESPONDING TO STRESS

C. Wrzus¹, M. Riediger¹, V. Müller¹, G.G. Wagner^{1,2}, U. Lindenberger¹, *1. Max Planck Institute of Human Development, Berlin, Germany, 2. Socio-Economic Panel Study, Berlin, Germany*

Recent life-span theories suggest that the ability to regulate one's affect improves during the second half of life. Empirical evidence supporting this claim, however, is sparse. In addition, even though it is generally acknowledged that affective reactions involve experiential, behavioral, and physiological components, available investigations have mainly focused on subjective self-evaluations. To overcome this limitation, we investigated age-related differences in within-person trajectories of affective experiences and cardiovascular responding to a stressful experience. 92 participants aged 14 to 84 years were exposed to a cognitive-social stressor in between two resting phases. Cardiovascular activity and breathing were constantly monitored, and momentary affective experiences were repeatedly assessed. Results demonstrate age-related differences in physiological reactivity to, and recovery from, the stressor as well as in the association between subjective affective and physiological reactivity. Implications of these findings for the understanding of lifespan differences in affective self-regulation are discussed.

SESSION 985 (SYMPOSIUM)

THE NEW DYNAMICS OF AGEING PROGRAMME

Chair: A. Walker, *University of Sheffield, Sheffield, United Kingdom*
Discussant: A. Matthews, *Canadian Institute on Aging, Vancouver, British Columbia, Canada*

The key objective of this symposium is to report findings from the New Dynamics of Ageing (NDA) Research Programme. The NDA is the largest programme of ageing research ever mounted in the UK (and Europe) and comprises 34 individual projects which together span all of the major disciplines, from Arts and Humanities to Biological Sciences. The NDA Programme is investigating the multidisciplinary factors that account for the changing dynamics of ageing and, critically, searching for ways to ensure that new scientific research benefits the ageing population. In this symposium some of the early results from the Programme will be showcased. The individual contributions have been chosen to provide an interesting cross-section of projects. A short introduction will be provided, by the chair, about the NDA Programme in order to put the individual papers in context (no abstract submitted for this short introduction). There are four individual papers covering older people's views on the maintenance of dignity and the preservation of self especially in interaction with health professionals; vulnerability to financial abuse among cognitively impaired older people navigate familiar and unfamiliar urban spaces. As well as NDA Programme participation the thread that connects each of these project presentations is the combination of high quality science with a policy or practice orientation aimed at rapid and effective knowledge transfer.

MAINTAINING DIGNITY IN CIRCUMSTANCES OF DEPENDENCY: OLDER PEOPLE'S VIEWS

L. Lloyd, K. White, *University of Bristol, Bristol, United Kingdom*

This paper presents preliminary findings from research with 40 people aged 75 and over, who depend on others for care and support in everyday life. We aim to obtain participants' perspectives on dignity and on their thoughts about the future. Information is gathered through interviews conducted periodically over a period of 2-3 years. Emerging findings reveal a range of experiences, including both humiliating and respectful practices by health professionals. There are clear differences in participants' perceptions of dignity as well as in their ability to stand

up to undignified treatment. Initial analysis suggests that a life-course perspective is essential for understanding these differences. The research offers a dynamic perspective that takes account of the relationship between past, present and future in terms of the development of individual identities, challenges to dignity, interpersonal relationships and perspectives on the future.

ROUTINISING THE DAY AND NIGHT BEYOND RETIREMENT: CONSEQUENCES FOR POOR SLEEP IN LATER LIFE

S. Venn, S. Arber, *Department of Sociology, University of Surrey, Guildford, United Kingdom*

This presentation is based on one element of a large multi-disciplinary research project, SomnIA (Sleep in Ageing) which is researching sleep among older people. Qualitative in-depth interviews with 62 older people living in their own homes demonstrated that most people felt sleep quality and quantity had declined with age. Retirement ostensibly brought freedom from the routines and structures which may have previously curtailed opportunities for sleep. However, time spent in bed, and napping during the day, were believed to be both an indicator of aging, and linked to a sense of guilt at 'wasting time'. Therefore many people did not take advantage of this freedom from routines, and they continued to set their alarms early in the morning, and avoided sleeping during the day. This presentation examines the juxtaposition between sleep needs in later life, post-retirement routines in later life, and older people's perceptions of their ageing identity.

DETECTING AND PREVENTING FINANCIAL ABUSE OF OLDER ADULTS: AN EXAMINATION OF DECISION MAKING BY MANAGERS AND PROFESSIONALS IN HEALTH, SOCIAL CARE AND BANKING

M.L. Gilhooly, *School of Health Sciences and Social Care, Brunel University, Uxbridge, England, United Kingdom*

With increasing numbers of cognitively impaired older people cared for in the community, there are growing challenges associated with money handling. Financial abuse of vulnerable older people is of growing concern. It is equally important to protect professionals and carers from unfair allegations of financial abuse. The aim of this project is to examine decision-making in relation to the detection of financial elder abuse. Health, social care and banking professionals are the focus of this study. There are three phases to this study: Phase I - In-depth interviews, using critical incident methods, with health, social care and banking professionals. Phase II - Experiments aimed at testing hypotheses about decision-making using case scenarios: Phase III - Examination of policy documents and guidelines. This research is funded by the UK New Dynamics of Ageing Programme. The aim of this presentation is to present findings from Phase I of the study.

NAVIGATION IN FAMILIAR AND UNFAMILIAR TOWN CENTRES

J.E. Phillips, *Swansea University, Swansea, United Kingdom*

As town landscapes change through regeneration or decline, the use of space changes and previously familiar places may become unfamiliar. Unfamiliarity can lead to insecurity, disorientation, fear over personal safety, social exclusion and loss of independence. The present study investigates visits to familiar and unfamiliar town centres by two groups of participants aged 60+ years. Participants who evidenced difficulty in following directions stayed in populated areas and relied on street signage. The participants who had no difficulty used landmarks in the built environment and asked local people for directions. In a social network analysis, participants who follow directions were more "adventurous" travelling to more unfamiliar towns using different modes of transport and travel arrangements. The research informs spatial planners about how to improve navigation of built environments that contain services and facilities that are important to independence.

TACKLING AGEING CONTINENCE THROUGH THEORY, TOOLS AND TECHNOLOGY (TACT3)

E. van den Heuvel, *Brunel University, Uxbridge, United Kingdom*

The overall aim of the TACT3 project is to reduce the impact of continence difficulties for older people by investigating three different research areas. 1) Investigating continence care Is specialist continence care is significantly better than standard continence care? Exploring the views of patients, family and healthcare professionals, the advantages of specialist continence care and barriers to seeking treatment will be investigated. 2) Investigating the problems older people have finding and using toilets when they are away from home. Exploring challenges facing toilet providers.. Designing public toilets that would better suit the needs of older adults. 3) Developing two products that have been requested by continence pad users. 1) urine odour detector that will warn that the pad needs changing before any odour is detected by the human nose. 2) smart underwear that will detect a pad leak immediately, giving warning before the leak spreads to outer clothes.

SESSION 990 (SYMPOSIUM)

THE PERSISTENCE AND REDUCTION OF FEAR OF FALLING IN COMMUNITY-DWELLING OLDER PERSONS

Chair: G. Kempen, *School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

Discussant: B. Resnick, *University of Maryland School of Nursing, Baltimore, Maryland*

Fear of falling is considered a substantial health concern, particularly when this results in avoidance of activity. Prevalence rates for fear of falling in community-dwelling elderly range from 20 to 60% and for avoidance of activity due to fear of falling from 15 to 55%. Fear of falling is suggested to be a potential health problem of equal importance to a fall. Self-induced activity restriction due to fear of falling may lead to decreased physical, psychological, and social functioning. These adverse consequences require knowledge about the pathways of fear of falling and preventive strategies to reduce fear of falling. During this symposium findings from four studies performed among different populations of elderly in three different countries will address the persistence and the reduction of fear of falling in old age. First, the persistence and variability of fear of falling in a community population (N=170) participating in an exercise behavior study was analyzed monthly over a period of 9 months in the US. Second, a study was conducted to determine the effect of a 10-week, low intensity, exercise training program on fear of falling and gait in 50 community-dwelling volunteers in Switzerland. Third, the cost-effectiveness of a cognitive-behavioral group program to reduce fear of falling and avoidance of activity in 540 community-dwelling older people in the Netherlands is presented. And fourth, differential effects of this cognitive-behavioral group approach to reduce fear of falling was studied: who is to benefit the most? Our discussant will complete this symposium by addressing issues in a more general context.

PERSISTENCE AND INTENSITY OF FEAR OF FALLING IN OLDER ADULTS

H. Lach, J. Kraenzle Schneider, *School of Nursing, Saint Louis University, St. Louis, Missouri*

Persistence of fear of falling (FOF) is a concern to researchers. We measured FOF monthly for 9 months in 170 older adults participating in a larger RCT to increase exercise behavior (mean age 72.4±5.4, 77.6% female, 87.1% White). Using a 1-10 point scale, participants reported how fearful they were that they might fall. FOF scores were averaged across months for participants, then correlated with functional measures, exercise behavior, and SF-36 subscales. Using 9-month outcome measures, FOF was positively related to timed up-and-go test ($r=.25$, $p=.002$) and negatively related to 6-minute walking distance ($r=-.34$, $p=.000$), self-reported physical functioning ($r=-.30$, $p=.000$), role ful-

fillment-physical ($r=-.25$, $p=.001$) and emotional ($r=-.21$, $p=.007$), energy ($r=-.22$, $p=.005$), social functioning ($r=-.27$, $p=.001$), and general health ($r=-.22$, $p=.006$). Increased frequency and intensity of fear is associated with more negative outcomes, even when participant responses are variable. Support by Grant NR04771.

EVOLUTION OF GAIT PERFORMANCE AND FEAR OF FALLING AFTER A 10-WEEK PROGRAM OF EXERCISE TRAINING IN COMMUNITY DWELLING OLDER PEOPLE

C.J. Bula¹, E. Martin¹, K. Aminian², B. Najafi², C. Piot-Ziegler³, S. Rochat¹,
1. Geriatrics, University of Lausanne Medical Center, Lausanne, Switzerland, 2. EPFL, Lausanne, Switzerland, 3. Psychology Unit, University of Lausanne, Lausanne, Switzerland

A pilot study was conducted to determine the effect of a 10-week, low intensity, exercise training program on fear of falling and gait in fifty (mean age 78.1 years, 79% women) community-dwelling volunteers. Fear of falling (measured by falls self-efficacy) and gait performance were assessed at baseline and one week after program completion. At follow-up, participants modestly improved their falls self-efficacy and gait speed. To investigate whether this effect differed according to participants' fear of falling, secondary analyses stratified by subject's baseline falls efficacy were performed. Subjects with lower than average falls efficacy improved significantly their falls efficacy and gait performance, while no significant change occurred in the others. Small but significant improvements occurred after this pilot training program, particularly in subjects with low baseline falls efficacy. These results suggest that measures of falls efficacy might be useful for better targeting individuals most likely to benefit from similar training programs.

COST-EFFECTIVENESS OF A GROUP PROGRAM REDUCING FEAR OF FALLING: RANDOMIZED CONTROLLED TRIAL

G. Kempen, G. Zijlstra, M. Hendriks, M. Goossens, J. Van Eijk, J.C. van Haastregt, School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands

This cost-effectiveness study was embedded in a two-group randomized controlled trial. We compared the costs and effects of an 8-week cognitive behavioral group intervention conducted by trained nurses ($N=280$) with those of usual care ($N=260$). Clinical outcomes were fear of falling and associated avoidance of activity. Direct healthcare costs included costs related to consultations of general practitioners, physiotherapists and specialists, hospital days, hours of domestic help and professional home care, home adaptations, aids, and assistive devices until 14 months after the intervention. The costs for the program were on average [€276 per person in the intervention group. The total direct healthcare costs per person (including intervention costs) were somewhat higher in the intervention group (€4,925) compared to the control group (€4,828). This difference was not statistically significant ($p=.899$). Only the costs for physiotherapy were significantly lower in the intervention group, compared to the control group (€295 versus €509, $p=.007$).

AN APPROACH TO REDUCE FEAR OF FALLING IN COMMUNITY-LIVING OLDER PEOPLE: WHO IS TO BENEFIT THE MOST?

G. Zijlstra^{1,2}, J.C. van Haastregt^{1,2}, G. Kempen^{1,2}, 1. Dept. of Health Care and Nursing Science, Maastricht University, Maastricht, Netherlands, 2. School for Public Health and Primary Care, Maastricht, Netherlands

Results of an RCT showed the effectiveness of a cognitive behavioral intervention on concerns about falling in community-living older people. This study explored who is most likely to benefit from this group intervention. The sample comprised 540 community-living older people. Potential effect modifiers, like age, gender, educational level, per-

ceived health, falls history, fear of falling at baseline, and intervention compliance, were studied regarding concerns about falling at short- and long-term follow-up. Mixed-effects regression analyses showed significant subgroup effects at short-term follow-up for males ($p=.05$), participants with poorer perceived health ($p=.02$), participants with >2 falls in the 6 months prior to baseline ($p=.04$), and for participants with higher levels of fear of falling at baseline ($p<.01$). Additionally, compliers were more likely to benefit from the intervention (short-term: $p=.01$; long-term: $p=.03$). These outcomes underscore the importance of intervention compliance and indicate that the program's effectiveness can be improved in certain subgroups.

SESSION 995 (SYMPOSIUM)

TRAUMA, AGING, AND THE LIFE COURSE

Chair: E.H. Davison, National Center for PTSD, VA Boston Healthcare System, Boston, Massachusetts, Department of Psychiatry, Boston University School of Medicine, Boston, Massachusetts

Discussant: A. Spiro, Massachusetts Veterans Epidemiology Research and Information Center, VA Boston Healthcare System, Boston, Massachusetts

The potential lifelong impact of traumatic events on aging persons is often overlooked in both research and clinical practice, yet it may have important implications for current health and behavior. A growing body of research demonstrates that older trauma survivors may be both more vulnerable and more resilient when faced with the vicissitudes of aging. With the aim of bringing together clinicians, researchers, and policymakers interested in the unique ways in which trauma experienced across the life course interacts with the aging process, an informal interest group called "Trauma, Aging, and the Life Course" recently convened at the Gerontological Society of America; the papers today represent the work of several interest group members. In the first paper, Aldwin, Spiro, and Kang examine the relationships among combat exposure, post-traumatic stress symptoms, and mortality in aging World War II and Korea era military veterans. Next, Glicksman considers the methodological challenges of studying trauma in the elderly, using research with Holocaust and Soviet WWII survivors to illuminate these challenges. Aydin then discusses the buffering effects of formal health care resources against depression in post-Civil War Lebanese elders. Finally, the Kahanas examine elders' coping in the face of a life-threatening cancer diagnosis, and propose a new theoretical model to illustrate how coping strategies may be more flexible and more targeted than previously assumed. Taken together, these papers exemplify the richness and breadth of the current research in life-course trauma and aging, and suggest directions for future inquiry and application.

COMBAT EXPERIENCE AND MORTALITY AMONG WWII AND KOREA ERA VETERANS

C.M. Aldwin¹, A. Spiro², S. Kang¹, 1. Human Dev. & Fam. Sci., Oregon State University, Corvallis, Oregon, 2. Boston University School of Public Health, Boston, Massachusetts

The relationships among PTSD, combat exposure and mortality in late life are complex. While PTSD is consistently associated with mortality in later life (Keehn et al., 1974; Boscarino, 2006a), the effect of combat exposure on mortality varies by measure and war (Boscarino, 2006b; Bramsen et al., 2007). We investigated the relationship between combat exposure, PTSD, and mortality in 961 WWII and Korea era veterans whose combat experience was assessed in 1990 (Mage = 65.44, SD = 6.42). Controlling for age, smoking status, and pre-existing disease (coronary heart disease, cancer, and diabetes), we found that having moderate combat exposure (HR = .716, 95% CI = .530-.967) and low PTSD symptoms (HR = .677, 95% CI = .513-.893) was protective against premature mortality. Veterans with moderate combat exposure

who avoid illness in mid-life experience better longevity in later life than those with little or heavy combat exposure.

STUDYING TRAUMA IN THE ELDERLY: METHODOLOGICAL CHALLENGES

A. Glicksman, *Planning, Phila Corporation for Aging, Philadelphia, Pennsylvania*

The study of older trauma survivors presents many challenges to be considered when undertaking a study in this area including: 1) identifying a person as a survivor; 2) avoiding retraumatization; 3) idealization of the survivor; 4) reinterpretation of past events by the survivor; 5) using the trauma experience as predictor of current status; 6) placing the trauma into an ideological framework; 7) issues of counter-transference 8) identifying the appropriate theoretical framework; and 9) what about aging perpetrators? Using examples from work with older persons who survived the Second World War either in the former Soviet Union or under Nazi occupation each issue will be described along with ways of dealing with these challenges. Special attention will be paid to how these issues could affect the interpretation of data collected in studies of older trauma survivors.

A TARGETED ADAPTATION (TAD) MODEL FOR ACHIEVING WELL-BEING IN THE FACE OF CANCER TRAUMA

E. Kahana¹, B. Kahana², *1. Sociology, Case Western Reserve, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

Life threatening illness and specifically, cancer, presents unique challenges to identity and social functioning during different phases of the lifecourse. Cancer symptoms and treatments pose highly stressful and often traumatic experiences to patients (Hewitt, Greenfield & Stovall, 2006). Effective coping efforts have been found to ameliorate adverse life effects of illness related trauma. However, the literature focused on the stress paradigm considers coping dispositions to be traitlike and does not target them to diverse adaptive tasks posed by illness related stressors. We propose a more differentiated model of Targeted Adaptation (TAD), that specifies each psychological and social domain where adaptation is needed. These include cognitive regulation, emotion regulation, social support regulation, proactive illness management, and social role management. Regulation denotes the purposive nature of these proactive adaptations and emphasizes mastery within situational constraints that older patients facing illness related trauma may achieve. We will discuss implications of the TAD model for non illness related traumatic experiences. We provide a portrayal of task-specific coping efforts in order to enhance the explanatory power of research seeking to understand the role of coping in diminishing the impact of trauma on quality of patients' lives.

THE ROLE OF FORMAL HEALTH CARE SERVICE RESOURCES AS A BUFFER AGAINST DEPRESSIVE SYMPTOMS IN POST-WAR LEBANON

M. Aydin, *UCLA Center for Health Policy Research, Los Angeles, California*

Little is known as to whether access to formal health care resources provides the same benefits to mental well-being as do informal social resources among older adults residing in post-trauma environments. This study examines the association between recent stress and depressive symptoms, and the role formal resources play in moderating this relationship. Data were obtained from the Elder Health Survey (AUB, 2003), utilizing N=490 (60+) Lebanese residing within three under-privileged Beirut communities. Multivariate analyses indicate that having access to medical care decreases depressive symptoms with each additional life stressor experienced. Interestingly, increased access to medical care exacerbates the psychological effects of specific negative events such as death and health decline, while limited access to medical care worsens the effects between violence-related events and depressive symptoms. Formal health care resources may or may not reduce the

impact of a negative event on depressive symptoms depending on the event's saliency.

SESSION 1000 (POSTER)

BODY COMPOSITION AND OUTCOMES

HOW DOES BODY WEIGHT CHANGE OVER TIME? MULTILEVEL MODELING OF BODY-MASS INDEX TRAJECTORY IN MIDDLE AND OLD AGE

A. Botosaneanu, J. Liang, *Health Management and Policy, University of Michigan, Ann Arbor, Michigan*

Background: Current knowledge concerning body-weight changes in middle and old age is largely based on cross-sectional studies. Longitudinal data available generally reflect short follow-up time without exploring the heterogeneity in the trajectory of body-mass index (BMI). Objective: To chart BMI trajectories over a period of 15 years in middle and late adulthood and to examine interpersonal variations in BMI trajectory in relation to socio-demographic characteristics and health conditions. Methods: Data came from 8 waves (1992-2006) of the Health and Retirement Study with a national sample of 13,545 Americans age 51 to 61 years old at baseline. Hierarchical linear modeling (HLM) with time-varying covariates was employed to examine interpersonal variations in intrapersonal differences in BMI. Results/Discussion: BMI increased over time in an approximately linear fashion. Initial BMI level was associated with education ($b=-0.11$, $p=.000$), race ($b=1.47$, $p=.000$), and age at baseline ($b=-0.02$, $p<.05$), but not with gender or Hispanic ethnicity. The rate-of-change in BMI was correlated with race ($b=-0.02$, $p<.05$), Hispanic ethnicity ($b=-0.03$, $p<.05$), and age at baseline ($b=-0.003$, $p=.000$). Significant differences in BMI intercept and slope were found between those who died and those alive at the end of the study (intercept: $b=0.38$, $p<.01$; slope: $b=0.06$, $p=.000$). Within-person variations in BMI were correlated with change in marital status ($b=0.2$, $p<.01$), heart disease ($b=0.32$, $p<.05$), smoking ($b=-0.009$, $p<.05$) and alcohol use ($b=-0.08$, $p<.01$). Research on the heterogeneity in the changes of body weight may facilitate the identification of groups and individuals targeted for health risk modification interventions in older ages.

THE IMPACT OF MID-LIFE OBESITY ON ACHIEVEMENT OF EXCEPTIONAL LONGEVITY

P.V. Targonski, C.R. Caldwell, A. Handlogten, L. Peterson, E. Tangalos, *Primary Care Internal Medicine, Mayo Clinic, Rochester, Minnesota*

Obesity is well-recognized as a risk factor for many acute and chronic threats to individual and public health in the 21st century. The impact of obesity on exceptional survival (ES) is not well-known, despite an increasingly aged population and increasing prevalence of obesity in the US. Utilizing the Mayo Clinic longitudinal records linkage system, we evaluated the association of body mass index (BMI) with achievement of ES (defined as reaching age 90 or older) in a historical birth cohort of Olmsted County, Minnesota residents born prior to 1911. 531 ES cases were matched by gender, birthyear, and a proxy of health-care access/utilization with controls who died at or near life expectancy (LE), defined as expected age at death for the study cohort (approximately 65 years). BMI was collected at, and 10 and 30 years prior to, the age at death of the control/case LE. Higher BMI was associated with increased odds of achieving ES at LE (OR=1.06, 95% CI = 1.00 – 1.12, $p=0.047$), which likely reflects acute weight loss among controls sampled in the peri-mortal period. However, higher BMIs at 10 and 30 years prior to achievement of LE (or death of control subjects) was associated with lower odds of reaching ES (OR= 0.96, 95% CI=0.91-1.00, $p=0.08$ and OR=0.91, 95% CI=0.86-0.97, $p=0.001$ for each unit increase in BMI >25). These data suggest that obesity is a strong inhibitor of ES and attention to weight control even at young adult and middle age is necessary if ES is to be achieved.

DECONDITIONING IN THE AGING ADULT: TRANSLATING THE SCIENCE FOR APPLICATION

L. Ehiemua-Pope, B.J. Holtzclaw, *University of Oklahoma HSC, College of Nursing, Donald W. Reynolds Center of Geriatric Nursing Excellence, Oklahoma City, Oklahoma*

Loss of the older adult's physical functioning impacts quality of life and the ability to live independently. Deconditioning is a significant factor contributing to loss of physical functioning cited in the literature, yet definitions and concerns differ across disciplines. Purpose: A systematic review of the literature was undertaken to determine factors related to the cause, progression, and abatement of deconditioning in older adults. A secondary purpose was to assess the present and potential state of interdisciplinary research of the phenomenon of deconditioning. Methods: Literature databases searched were Medline (Ovid), Cinahl (EBSCO), PubMed, and Cochrane (OVID), and included relevant research findings from physiology, cardiopulmonology, neuroscience, kinesiology, occupational therapy, gerontology, aerospace science, psychology, nutrition, biochemistry, clinical medicine, and nursing. Comparisons of disciplinary assumptions, perspectives, and cross-disciplinary interpretations of physical deconditioning were made. Related concepts, such as frailty, sarcopenia, and disuse myopathy, were examined for relevance to an interdisciplinary care approach. Descriptive and intervention studies were included. Research evidence was evaluated for design and sampling adequacy, clear description, ease and validity of measurement, conceptual congruence for use with other measurements. Findings: Lack of agreement between discipline-specific definitions of deconditioning were found, although nearly all accepted studies offered clear rationale and possibilities for translation into assessment and care of the older adult. Possibilities for interdisciplinary research in this area are apparent.

SESSION 1005 (PAPER)

DEMENTIA - HS PAPER SESSION

MEASURING CORTISOL AND DETERMINING HYPOTHALAMIC-PITUITARY-ADRENAL (HPA) AXIS REGULATION AND DYSREGULATION IN PEOPLE WITH DEMENTIA

C. Kovach¹, D. Woods³, H. Raff², *1. University of Wisconsin, Milwaukee, Wisconsin, 2. Medical College of Wisconsin, Milwaukee, Wisconsin, 3. University of California, Los Angeles, California*

Assessing cortisol levels of people with dementia has the potential to contribute to a better understanding of stress and underlying mechanisms associated with negative outcomes. The purpose of this study was to test the feasibility of saliva collection to measure endogenous cortisol in nursing home residents with advanced dementia and describe alterations in hypothalamic-pituitary-adrenal (HPA) axis function. Eighty three people with an average age of 87.54 (SD=6.74) and average Mini Mental Status Exam Score of 7.3 (SD = 6.3) participated. Ninety-three percent (N = 616) of the samples were able to be collected and were of sufficient quantity for assay. Analysis of data using our algorithm revealed that 14% (n = 11) showed the normal adult pattern, half (54% n = 42) demonstrated an increase in the evening cortisol levels, while the remaining profiles were flat (32%, n = 25), suggesting HPA dysregulation. These data suggest the feasibility of salivary cortisol collection and analyses to obtain cortisol rhythm in a population of nursing home residents with dementia who are difficult to study. The dysregulated and flattened cortisol profiles may be an indication of sleep disruption increased agitated behavior, or impending acute illness. As such, assaying salivary cortisol and the resulting cortisol profiles may provide insight into identifying and intervening early with those individuals most at risk for developing these clinical conditions. As such, assaying salivary cortisol and the resulting cortisol profiles may provide

insight into identifying and intervening early with those individuals most at risk for developing these clinical conditions.

EMPIRICAL DERIVATION AND VALIDATION OF A WANDERING TYPOLOGY

D. Algae¹, C. Antonakos¹, E. Beattie², C. Beel-Bates³, L. Yao¹, *1. Swcheool of Nursing, University of Michigan, Ann Arbor, Michigan, 2. Queensland University of Technology, Brisbane, Alabama, 3. Grand Valley State University, Grand Rapids, Michigan*

Problem: Although several wandering typologies have been published, only one has been empirically derived, based on the geographic pattern of individual wandering episodes. Our goal was to develop and validate a wandering typology based on differences in frequency, duration, and temporal distribution of wandering at the person level. Methods: Using a cross-sectional, correlational descriptive design in 22 NH and 6 ALF, we studied 142 residents with dementia who spoke English, met DSM-IV criteria for dementia, scored <24 on the mini-mental status exam (MMSE), were ambulatory (with or without assistive device), and maintained a stable regime of psychotropic medications. Data on wandering were collected by direct observations, plotted serially by rate and duration to yield 21 parameters; and reduced through factor analysis to four components: high rate, high duration, low/moderate rate and duration, and time of day. Other measures included the Minimum Data Set 2.0 mobility items, Cumulative Illness Rating Scale – Geriatric, and aural body temperature readings to determine parameters of circadian rhythm. Results: Cluster analysis revealed three distinct groups of wanderers: classic, moderate, and subclinical. MMSE, mobility, and heart and upper and lower GI problems differentiated among groups of wanderers and in comparison to non-wanderers, with classic wanderers having the highest rate and duration, the best mobility, the greatest cognitive impairment, and the poorest health. Neither time of acrophase nor amplitude of circadian rhythm differentiated groups. Conclusion: Results have implications for improving identification of wanderers and treatment of possible contributing factors.

MORNING CORTISOL AND BEHAVIORAL SYMPTOMS OF NURSING HOME RESIDENTS WITH DEMENTIA

L. Woods, H. Kim, M. Yefimova, *UCLA, School of Nursing, Los Angeles, California*

Behavioral symptoms of dementia (BSD) are a significant challenge for elders and their caregivers, with a prevalence ranging between 66% and 98%. While several studies have examined BSD type and frequency, few studies have examined the contribution of a hypothalamic-pituitary-adrenal axis dysregulation to BSD. The purpose of this study was to examine the relationship between morning cortisol and BSD in nursing home (NH) residents with dementia. Method. A within subject longitudinal design was used. Saliva was collected four times daily for 5 days to obtain a diurnal rhythm from thirty NH residents, aged 80 – 102. Behavior was observed every 20 minutes for 12 hours/day for five days. Mixed model analysis was used to test the association between morning cortisol and BSD. Participants were divided into two groups, low and high morning cortisol. The mean and standard deviation for total behavior and median morning cortisol (µg/dl) was used as a cut point for group division. Results indicated a significant inverse association between mean overall BSD and morning cortisol (F = 12.71, p=.000) in addition to a significant inverse association between low and high morning cortisol and behavior variability which also increased with time (F = 15.36, p=.000). Low or high morning cortisol had a significant effect on the association between two prevalent co-occurring behaviors, vocalization and restlessness (F = 19.59, p = 0.000). Conclusion. While preliminary, these results suggest a relationship between morning cortisol and BSD. Low morning cortisol, indicating HPA axis dysregulation, increases vulnerability to increased BSD.

CHARACTERISTICS OF WHEELCHAIR LOCOMOTION IN MALE VETERANS WITH DEMENTIA: IS IT WHEELCHAIR WANDERING?

D.H. Moore¹, E. Beattie^{2,3}, D. Gavin-Dreschnack¹, C. Vanderweerd³, 1. *VISN 8 VA Patient Safety Center, Tampa, Florida*, 2. *Queensland University of Technology, Brisbane, Queensland, Australia*, 3. *University of South Florida, Tampa, Florida*

Wandering is a common and potentially dangerous behavior that may expose persons with dementia to elopement, getting lost and death and has generally been considered bipedal. However recent empirical data suggests that wandering locomotion occurs by other modes such as assisted by wheelchair. The purposes of this focus group study were to: 1) describe locomotion assisted by wheelchair in persons with dementia and 2) compare characteristics of dementia-related assisted by wheelchair locomotion to empirically validated characteristics of bipedal wandering for conceptual clarity. Data from four focus groups undertaken with three types of direct care staff (RNs, CNAs, LPNs) in two Veteran's Administration nursing homes in Florida yielded descriptions of a wheelchair-assisted phenomenon consistently described as 'wandering' by participants. Data suggests that wheelchair assisted locomotor behavior parallels empirically-defined bipedal wandering in perceived causality, temporal distribution, resident profile and behavioral outcomes. However it diverges from bipedal wandering because it requires different physical dynamics and involves the presence of rapid and efficient travel to a planned destination. Further, a high incidence of patient and staff injury was reported in conjunction with staff attempts to curtail potentially dangerous aspects of wheelchair locomotion. Results suggest that, while wheelchair locomotion in male veterans with dementia shares some characteristics of bipedal wandering, there are other features of the behavior that are arguably unique to it. Further investigation is required to explicate the behavioral correlates of wheelchair locomotion which may extend knowledge of wandering and have important theoretical and management implications.

SESSION 1010 (PAPER)

EPIDEMIOLOGY

THE USE OF PSA TEST AMONG MEN AGED 75 YEARS AND OLDER IN THE UNITED STATES: FINDINGS FROM THE 2006 BEHAVIORAL RISK FACTOR SURVEILLANCE SYSTEM DATA

J. Li, G. Zhao, L. Pollack, J. Lee, D. Joseph, *CDC, Atlanta, Georgia*

Background: Prostate cancer is the most frequently diagnosed non-skin cancer. In 2002, U.S. Preventive Services Task Force (USPSTF) concluded that there was insufficient evidence to advocate for or against routine prostate cancer screening using prostate specific antigen (PSA) testing. Last August, USPSTF updated this guideline and recommended against screening for prostate cancer in men aged ≥ 75 years because potential harms outweighed potential benefits. Objective: To describe the prevalence of PSA testing for American men aged ≥ 75 years and identify potential factors that correlate with the use of PSA test. Methods: We used 2006 BRFSS data to estimate the prevalence of PSA testing within the past year. We conducted bivariate and multiple logistic regression analyses using SAS/SUDAAN software. Results: Overall 60% of men aged ≥ 75 years reported having a PSA test within the past year. Men who had health insurance, were satisfied with life, or always had emotional support were more likely to report having had a PSA test ($p < .05$). However, men who were ≥ 81 years, never married, or had less than high school education were less likely to report having had a PSA test ($p < .05$). Conclusions: In 2006, a large proportion of men in the U.S. aged ≥ 75 years reported having PSA testing. Certain social, demographic and psychosocial factors were associated with receipt of PSA testing. This study not only provides baseline data to evaluate future acceptance/implementation of the new USPSTF screening guideline,

but helps to inform the development of educational materials and interventions for this population.

PROBIOTICS TO COMBAT IMMUNOSENESCENCE: A SYSTEMATIC REVIEW OF THE LITERATURE

A. Bearden, 1. *Medicine, Section of Infectious Diseases, University of Wisconsin, Madison, Madison, Wisconsin*, 2. *Center for Women's Health Research, University of Wisconsin-Madison and Meriter Hospital, Madison, Wisconsin*

Background: Age-related impairment of the immune system, known as immunosenescence, leaves the elderly population at increased risk for infection. Methods: A systematic review of the literature, using multiple computerized databases using the search terms "probiotics AND elderly." Inclusion criteria: elderly population, clinical trial, either a serum immunologic outcome or an infection related outcome. Results: 8 studies met criteria including 4 randomized, controlled-trials, 3 pre-/post-intervention trials, and 1 randomized, uncontrolled trial. The probiotic organisms studied were *Lactobacillus rhamnosus* HN001, *L. johnsonii* La1, *L. casei* DN-114 001, *Bifidobacterium longus* 2C and 46, and *B. lactis* HN019. *B. lactis* and *L. rhamnosus* both demonstrated significant increases in natural killer (NK) cell (3 studies), neutrophil (4 studies) and monocyte (3 studies) functioning. No significant results were found regarding modulation of specific cytokine levels after treatment with probiotics (2 studies; *B. longus*, *B. lactis*, and *L. johnsonii* evaluated). 1 study demonstrated significant increases in total, CD4+, and CD25+ T-cells counts (*B. lactis*), and 2 studies showed increased number of NK cells (*B. lactis*, *L. rhamnosus*). 2 randomized trials showed decreased duration but not incidence of infections compared to control or placebo (*L. johnsonii*, *L. casei*). No adverse events were reported in any study. Conclusions: The heterogeneity of the studies precluded the use of meta-analysis. Overall, the results of this review suggest that certain probiotic organisms have immunostimulatory effects and can be safely used in the elderly. Additional randomized, placebo-controlled trials are needed to study strain-specific effects including relevant clinical outcomes.

SLEEP DIFFICULTY AND MORTALITY IN A COHORT OF OLDER ADULTS WITH 27 YEARS OF FOLLOW-UP

S.E. Tom¹, K.V. Patel¹, R. Wallace², J. Guralnik¹, 1. *Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, Bethesda, Maryland*, 2. *University of Iowa, Iowa City, Iowa*

Complaints regarding sleep are common among older individuals. While several papers have shown a relationship between short and long duration of sleep and metabolic outcomes and related mortality, few analyses have examined the relationships between other qualities of sleep and subsequent outcomes. The objectives of this paper are to examine the relationships between mortality and difficulty with the following aspects of sleep: going to sleep, waking at night, waking too early, napping, and waking not feeling rested. This paper utilized the Iowa cohort of the Established Populations for the Epidemiologic Study of the Elderly, a group of adults aged 65 and older at baseline who were followed-up for 27 years ($n = 2787$). Results suggest that those who frequently napped or woke not rested at baseline had earlier mortality within 10 years of follow-up (age and sex adjusted HRs: 1.18 and 1.26, respectively). However, inclusion of limitations of activities attenuates these relationships (fully adjusted HRs: 1.04 and 1.07). For mortality after 10 years of follow-up, napping did not predict mortality. Waking not rested sometimes or frequently were associated with increased mortality (age and sex adjusted HRs: 1.21 and 1.45), but the associations were attenuated in the fully-adjusted model. Other sleep characteristics were not associated with mortality. Napping and waking not rested may be related to the severity of underlying disease processes that both directly relate to mortality and indirectly through increased fatigue and strain with daily activities. Further analysis is needed to clarify the timing difference for these two risk factors.

CHRONIC CONDITIONS FROM THE LINKED DATA: INCIDENCES, PREVALENCE, AND AGE AT DIAGNOSIS (NHEFS, MEDICARE CLAIMS)

Y. Gorina, R. Francis, E. Kramarow, R.F. Gillum, *National Center for Health Statistics, Hyattsville, Maryland*

As a result of the demographic transition and improved detection, secondary prevention, and treatment of chronic conditions such as heart disease, cancer, and diabetes, the number of older persons living with chronic conditions has increased significantly. About 83 percent of Medicare beneficiaries have at least one chronic condition. The National Center for Health Statistics linked data from the National Health and Nutrition Examination Survey, 1971-1975 (NHANES I), the NHANES I Epidemiologic Follow-up Study (NHEFS), and claim data from CMS allowed us to determine incidences, prevalence, and age at diagnosis for major chronic conditions for more than 4,800 study participants. To determine the time of diagnosis, we used the NHANES I and NHEFS questionnaires, NHEFS medical facility stay records, and our adaptation of the Chronic Condition Warehouse algorithm, developed by the CMS. This algorithm allows extracting claim records related to 21 chronic conditions. Our preliminary findings show that during the study period 1971-2000 among participants who were born in 1935 or earlier, 25 percent developed diabetes, 53 percent developed ischemic heart disease, 18 percent developed dementia, 31 percent developed chronic obstructive pulmonary disease or emphysema, and 60 percent developed arthritis. Using data from the NHANES I interview, we determined effects of smoking, BMI status, and other risk factors over 30 years, from baseline to the time of the onset of chronic conditions. The limitations and benefits of using linked data from the interviews, medical records, and administrative claims will be discussed.

ADMINISTRATIVE DATA ALLOW PROGNOSTIC STRATIFICATION OF OLDER PATIENTS IN THE EMERGENCY DEPARTMENT

M. Di Bari¹, D. Balzi², A.T. Roberts¹, A. Barchielli², A. Ungar¹, S. Fumagalli¹, N. Marchionni¹, *1. University of Florence, Florence, Italy, 2. Epidemiology Unit, Local Health Unit 10, Florence, Italy*

Aim. To evaluate whether administrative data allow initial prognostic stratification of older patients accessing Emergency Departments (ED). **Methods.** From discharge records of 10,913 patients aged 75+ years, admitted to ED of hospitals in Florence, Italy in 2005, information on demographics, previous drug treatment, hospital admissions and discharge diagnoses was retrieved, to develop a 1-year mortality prognostic index. Further, we compared survival of patients admitted to a Geriatrics or an Internal Medicine ward, after stratification by the prognostic index. **Results:** Patients who scored 4-6, 7-10 and 11+, compared to those who scored <4, had hazard ratios (95% confidence interval) for 1-year mortality of 1.5 (1.3-1.7), 2.2 (1.9-2.6), and 3.0 (2.6-3.4). Patients in the worse prognostic stratum experienced a 33% lower mortality when admitted to a Geriatrics ward. **Conclusion.** Simple administrative data predict long-term survival in older patients hospitalized via ED. Patients with a worse prognosis benefit from admission to Geriatrics wards.

SESSION 1015 (PAPER)

FALL PREVENTION

DOES CONSCIENTIOUSNESS PROTECT AGAINST RECURRING FALLS IN OLDER MEN?

K. Faulkner¹, S. Studenski¹, M. Scheier², J. Morse¹, M. Coday³, E. Simonsick⁴, K. Yaffe^{5,6}, J.A. Cauley¹, *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Carnegie Mellon University, Pittsburgh, Pennsylvania, 3. University of Tennessee Health Science Center, Memphis, Tennessee, 4. National Institute on Aging Clinical Research Branch, Baltimore, Maryland, 5. University of California San Francisco, San Francisco, California, 6. San Francisco VA Medical Center, San Francisco, California*

Background: Older men may fall as often as older women who generally have more functional limitations because they engage in more riskier activities, such as climbing on ladders and taking out the garbage under icy conditions. Since the trait of conscientiousness is associated with more accident control behaviors and less risk-taking in traffic, high conscientiousness may protect older men from falling. **Methods:** We examined the association between conscientiousness and incident recurrent fall risk in 419 men enrolled in the Cognitive Vitality Substudy of the Health, Aging and Body Composition Study (mean age=75.4 years). Conscientiousness was assessed using the NEO-FFI and men were subsequently followed prospectively over 2 years. Recurrent fallers (fell 2+ times in 2 years) were identified by self-reported number of falls every year for two years. Odds Ratios (OR) were estimated from multivariate logistic regression models adjusted for age, race, study site, education, and executive function. **Results:** The mean (SD) conscientiousness score was 33.6 (5.5) and 16.5% (N=69) of men fell at least twice over the 2 year study. In the multivariate model, a 2SD increase (defined as ± 1 SD of mean) in Conscientiousness score was associated with a 44% lower odds of recurrent falls (OR=0.56, 95% CI:0.33-0.95). **Conclusion:** Conscientiousness in men is associated with low risk for recurrent falls, perhaps because more conscientious men take more care while performing riskier displacing activities or just engage in those activities less often. Findings have important implications for identifying men at high risk for recurrent falls and fall prevention.

THE EFFECTIVENESS OF THERAPEUTIC YOGA ON THE RISK OF FALLING IN OLDER ADULTS: A PILOT STUDY

K.K. Zettergren, *Physical Therapy, Quinnipiac University, Hamden, Connecticut*

Purpose: An estimated 3.7 million adults over the age of 65 experience one fall each year. Therapeutic exercise reduces the risk of falling. The purpose of this study was to assess the effects of a therapeutic yoga program on the risk of falling. **Subjects:** There were 8 female research subjects (mean age = 84) and eight control subjects (6 female, 2 male, mean age = 81.3). **Methods:** Subjects signed an informed consent and were screened using the MMSE. Pre-test evaluation consisted of: Timed up and Go, Berg balance scale, gait speed (preferred and fast), four square step test and floor to stand transfer. Research subjects participated in an 8 week yoga program (90 minutes, twice weekly). Control subjects received no intervention. **Results:** All subjects attended at least 10 of the 16 classes (62% attendance). Post-test paired t-tests revealed the following: Yoga participants: BERG balance scale ($t = 4.51$, $p = .0003$) and fast gait speed ($t = 2.69$, $p = .031$). In addition, timed floor to stand approached significance ($t = 1.20$, $p = .086$). No other significant changes were noted. **Conclusions:** Improvements in the Berg balance scale and fast gait speed indicate that research subjects have a decreased risk of falling. In a well designed yoga program subjects perform activities standing, sitting and lying on the floor. Therefore, subjects perform many activities that improve mobility and reduce the risk of falling.

IMPROVING SAFETY CULTURE ONE FALL AT THE TIME

A.A. Zecevic, M. Halligan, *University of Western Ontario, London, Ontario, Canada*

This study combines the concept of safety culture and a method for investigating adverse events in health care called Systemic Falls Investigative Method (SFIM). Guided by High Reliability Organization Theory, safety culture is defined as shared perceptions and beliefs about safety, and is embraced by high reliability organizations such as aviation. SFIM is an innovative and comprehensive method of identifying organizational and personal causes and contributors to falls in health care. It reveals latent safety deficiencies that can guide immediate targeted interventions. Previous studies determined that hospitals and long term care facilities (LTC) were not ready for the integration of investigative findings and implementation of strategies that will facilitate removal of causes of falls. The purpose of this study was to investigate the potential of SFIM implementation to contribute to the improvements of safety culture in organizations providing care to older adults. We conducted a comprehensive literature review to identify best practices for risk management in health care, focusing on elements of safety culture and the creation of safety teams. Staff and administrators from selected units in two hospitals and one LTC, were surveyed using the Patient Safety Culture in Healthcare Organizations Survey, prior to implementation of the SFIM. Two SFIM investigators from each site were trained and monitored while conducting falls investigations. Pre- and post-intervention interviews and focus groups identified facilitators and barriers to safety culture change associated with patient falls. Results show promising potential of SFIM to contribute to improvements of safety culture throughout the organization.

FALLS AND ASSISTIVE DEVICE USE: NOVEL FALL PREVENTION STRATEGIES

C. Luz, T. Bush, J. Rubinstein, R. Mukherjee, J. Elberling, E. Faucett, M. Geimer, *Michigan State University, East Lansing, Michigan*

Significance: Falls are well documented as a major reason for morbidity, loss of independence and need for long term care among older adults. Ample literature exists on fall prevalence, contributing factors, and preventative measures but little on the benefits of canes/walkers, or use at time of falls. Increased understanding of patterns of device use and reasons for non-use have important implications for clinical education and care, as well as design considerations for new assistive devices. Hypothesis: When people fall in their own homes, they do not have their device with them or it is not easily accessible. Methods: The study involves two parts: development of a technology assisted cane/walker and a survey of people age 60 plus with a history of falling who use a cane or walker. A survey is currently being distributed to 1000 eligible subjects, focusing on fall risk and history, patterns of assistive device use, and reasons for non-use. An abbreviated version of the survey was recently piloted with a sample of older adults. Results: Preliminary survey revealed that 94% of respondents had fallen within the last year, 75% had prescribed assistive devices, only half of these used their devices all of the time. Of specific interest was that the assistive devices were not consistently used in their own residence, where the falls took place. Reasons for non-use were identified as well as device features that respondents felt would increase use. These findings support the need for device development and educational interventions to reduce falls.

SESSION 1020 (POSTER)

FALLS - HS POSTER SESSION

EFFECTS OF GUIDED RELAXATION AND EXERCISE IMAGERY ON OLDER ADULTS WITH A FEAR OF FALLING

B. Kim¹, R.A. Newton¹, M.L. Sachs¹, J.L. Glutting², J. Ducette¹, *1. Physical Therapy, Temple University, Philadelphia, Pennsylvania, 2. University of Delaware, Newark, Delaware*

Fear of falling (FOF), a major health care concern, contributes to a decreased quality of life. Our study examined a 6-week intervention using Guided Relaxation and Exercise Imagery (GREI) to reduce FOF in community dwelling older adults. 184 primarily African American and Asian adults (mean age = 73.2 yrs) were assessed using functional performance (TUG, SLS) and FOF measures (1QFOF, short FES-I, ABC). Subjects were then divided into 4 groups based on their FOF response: 2 placebo control groups (FOF-PC; NoFOF-PC) and 2 intervention groups (FOF-I; NoFOF-I). The intervention groups received an audio CD containing a GREI program. The control group received an audio CD containing two relaxation tracks and music. Duration of each program was 10 minutes, 2 times per week for 6 weeks. Compared to the FOF-PC group, the FOF-I group significantly reduced FOF (78% vs. 20%). Significant increases in exercise imagery rates, efficacy in falls related activities, and perceived exercise levels, and decreased TUG times occurred in FOF-I and FOF-PC. Reduced FOF-PC may be due in part to the relaxation component associated with these groups. This is the first study documenting the effectiveness of 6-weeks of GREI to reduce FOF and increase falls-related efficacy, exercise imagery, and perceived exercise levels. An advantage of GREI is that it can be used anywhere, anytime, and no physical skills are required. Further exploration of GREI on psychological variables related to fear of falling and falls may substantiate its effectiveness as a fear of falling intervention.

ASSOCIATION BETWEEN PULMONARY FUNCTION AND RISK OF RECURRENT FALLS WAS MEDIATED BY MUSCLE STRENGTH

Y. Sheu¹, T. Harris², A. Koster², D. Mackey³, C.R. Womack⁴, A.B. Newman¹, J.A. Cauley¹, *1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. National Institute on Aging, Bethesda, Maryland, 3. California Pacific Medical Center Research Institute, San Francisco, California, 4. University of Tennessee, Memphis, Tennessee*

Decreased muscle strength has been found in patients with impaired pulmonary function. It is unclear whether the effect of pulmonary function on muscle strength leads to higher risk of falls, especially before impaired pulmonary function is clinically diagnosed. A total of 1,925 participants (average age: 73.5 years old; 52% female; 39% black) from the Health, Aging, and Body Composition study with a valid pulmonary function test (PFT) at baseline, and free of chronic obstructive pulmonary disease and airflow obstruction were included. PFT was measured using spirometry, and muscle strength at upper and lower extremities was measured using a hand-held dynamometer and a Kin-Com dynamometer. Generalized estimating equation was used to evaluate the effect of PFT on risk of recurrent (≥ 2) falls. After 8 years of follow-up, recurrent falls occurred in 583 participants. Lower forced expiratory volume in 1 second (FEV1) and forced vital capacity (FVC) were significantly associated with higher risk of recurrent falls after adjusting for age, race, gender, site, BMI, smoking history, physical activity, Parkinson's disease, emphysema, chronic bronchitis, asthma, and use of pulmonary medication (both $p < 0.04$). Every standard deviation decrease in FEV1 (SD=0.61) and FVC (SD=0.79) was associated with a 17% (95%CI: 1-36%) and 20% (95%CI: 2-41%) higher risk of recurrent falls, respectively. However, this significant inverse association disappeared when muscle strength was adjusted (FEV1: OR=1.06(0.90-1.26); FVC: OR=1.08(0.90-1.30)). Our findings suggest that weak pulmonary function may increase the risk of recurrent falls through decreased muscle

strength, and its effect may occur before clinical diagnosis of obstructive pulmonary function.

FALL RISK IN THE OLDER ADULT WITH DIABETES: A REVIEW

M. Litchman, *University of Utah, Salt Lake City, Utah*

PURPOSE The purposes of this literature synthesis is to integrate research investigating falls associated with diabetes medications, glycemic control, or hypoglycemia in older adults who fall. A common rationale for less stringent glycemic control in older adults is fall risk, but the evidence-base is unclear. **BACKGROUND** Management of diabetes mellitus (DM) in the geriatric patient has unique challenges, complicated by clinical and functional heterogeneity. Older adults with diabetes have histories ranging from recent diagnosis to long-standing disease, influencing the effects of microvascular and macrovascular complications. Diabetes is progressive and will often coexist with other chronic conditions. There is no published research substantiating the practice of changing glycemic targets for individuals related to the dependent variable of fall status. Currently there are few data examining diabetes medication use, glycemic control, or hypoglycemia in older adults who fall. **METHODS** The review included search of the electronic databases PubMed, CINAHL, Google Scholar, and Ageline with no date limits. Keywords integrated in the search were aged, DM, diabetes management, falls, medication, insulin, glycemic control, glucose, A1C, hypoglycemia, and frailty. Included articles were research studies in peer-reviewed journals published in the English language. Excluded were dissertations, unpublished studies, reviews, position papers, or abstracts. **RESULTS** There is conflicting data among researchers correlating falls risk to diabetes medications or glycemic control. There is no evidence supporting hypoglycemia being a risk factor for falling, however the data is sparse. **IMPLICATIONS** There is a narrow body of literature available, and virtually no reports of well-controlled, well-sampled studies that provide an evidence base for clinician decision-making. Additionally, conflicting data among researchers add to the confusion in treating geriatric patients with diabetes. The topic warrants further research investigation.

THE MEDIATING ROLE OF HEALTH DIMENSIONS ON VISION IN PREDICTING FALLS IN OLDER PEOPLE

B.A. Steinman, J. Pynoos, M. Silverstein, *Gerontology, University of Southern California, Los Angeles, California*

This study examined contributions of health dimensions that could mediate vision in affecting limb functioning, and predicting falls in older adults. Based on Nagi's model of disability, this study considered four main stages progressing from (1) risk factors, through (2) pathology/impairments, resulting in (3) functional loss, and eventually, (4) disability. Poorer health outcomes are assumed to result when declining visual functioning leads to greater disability—for example, older people with poor vision may be more likely to limit activity-levels or eat poorer diets due to difficulties performing ADLs/IADLs, compared to peers with normal vision. In turn, disability could lead to new risk factors, which play out as new pathology/impairments and result in increased/new functional losses. Such iterative cycling could explain relationships between seemingly unassociated systems, like vision and the musculoskeletal system. Data from 2004 and 2006 waves of the Health and Retirement Study were analyzed, using participants who were 70 years or older in 2004. Path analyses were conducted using AMOS to link variables representing each stage of the disability process. Results support a mediated relationship between vision and falls. Poor vision was statistically associated with greater disability; which was associated with the risk factor, body mass index; BMI was associated with an aggregate measure of pathology/impairment, which predicted limb functioning. Finally, limb functioning was statistically associated with falls. Implications for exercise programs designed for older people with visual impairments are discussed. Notably, the study highlights

unique circumstances of this group, in maintaining adequate limb functioning through physical activity.

FEAR OF FALLING AMONG OLDER WALKER USERS: A CROSS-SECTIONAL STUDY

H. Liu¹, V.T. Grando², K. Jordan¹, R. Zabel³, J. Nolen¹, S. Hart¹, 1. *Physical Therapy, University of Central Arkansas, Conway, Arkansas*, 2. *Arizona State University, Phoenix, Arizona*, 3. *San Angelo State University, San Angelo, Texas*

Background. Fear of falling is considered a risk factor for falls. Walkers are commonly used by older adults for enhancing mobility. **Aim.** To investigate the level of fear of falling in terms of the Falls Efficacy Scale, how that level is associated with fall frequency, and how walkers were used among older walker users. **Method.** Forty-two qualified older adults completed the Falls Efficacy Scale and a questionnaire concerning walker use and history of falls in the last 12 months. Their walkers were assessed for appropriate use and maintenance. **Results.** Fifteen subjects (36%) fell at least once after beginning to use a walker in last 12 months, but the number of falls did not correlate to the duration of walker use. A moderate positive correlation existed between Falls Efficacy Scale scores and number of falls. Assessments of walkers showed that the most common misuse was lack of medical consultation in obtaining a walker, followed by incorrect walker height, poor posture during ambulation. Frequency of the posture problem is significantly different between the fallers and the non-fallers. **Conclusions.** Walker users who fall tend to have a higher fear of falling and to have poor posture during ambulation. This poor posture may result from individual or combined effect of lack of medical consultation and incorrect walker height. Clinicians including nurses and therapists should possess knowledge to instruct older adults on appropriate walker use and thereby reduce risk of falling.

MULTIDIMENSIONAL RISK ASSESSMENT TOOLS FOR FALLS: A SYSTEMIC REVIEW

C. Wu, J. Specht, *College of Nursing, The University of Iowa, Iowa city, Iowa*

A quick, valid and effective fall risk screening tool is essential for preventing falls. There are many existing assessment tools for identifying fall risks, not all of them have adequate psychometric properties or feasibility for use in various settings. Clinicians must be informed in order to choose an appropriate assessment tool. The purpose of this paper is to analyze existing multidimensional fall risk assessment tools to enable more informed choices for nursing staff. **Method:** CINAHL and Pub Med databases were searched using “falls” and “assessment tools” as the key words. The search yielded fourteen articles developing and fifteen re-testing multidimensional risk assessment tools. Studies focused on developing or re-testing a falls screening tool were selected. Only the studies reporting psychometric properties were included. Major review and analysis focused on the validity, feasibility and effectiveness of the current existing tools. **Results:** History of falls, impaired mobility and mental dysfunction were the most common intrinsic risk factors. No tool included environmental risk factors. Twelve tools were developed within hospitals and two within community settings. Only the Fall Risk Assessment Tool and St. Thomas's Risk Assessment Tool in Falling Elderly Inpatients (STRATIFY) had acceptable psychometric properties. The feasibility and effectiveness of those screening tools were under- tested. Limitations from research designs impairs the generalizability of those tools. **Conclusion:** While additional research is needed to test current tools in various settings, Fall Risk Assessment Tool and STRATIFY are recommended for assessing falls in hospital settings. Tropm's tool is tentatively recommended for community-dwelling settings.

NURSE CHAMPION MODEL TO REDUCE FALLS AND RELATED INJURIES IN NH RESIDENTS IN A LARGE TEACHING NURSING HOME

M. Silverman^{1,2,3}, R. Leitter², I. Benjamin², W.F. Arce Montoya⁴, B.A. Roos^{1,2,3}, M. Esquenazi², T. Ferreira², *1. Geriatrics, University of Miami Miller School of Medicine, Miami, Florida, 2. Miami Jewish Home and Hospital, Miami, Florida, 3. Stein Gerontological Institute, Miami, Florida, 4. Jackson Memorial Hospital, Miami, Florida*

Beginning with a small state-sponsored grant, the MJHH, a 500-bed teaching nursing home in south Florida, developed a dynamic, comprehensive falls prevention strategy employing a nurse champion for support, guidance, and critique of falls risk assessments, incident reporting, and care planning. In 2007 fall incidents reports were analyzed, and in 2008 a new facility-wide strategy was implemented. **METHODS:** The model comprises a restorative nurse in charge of program implementation and monitoring; advanced technology such as bed and chair sensor alarms; extensive use of low beds (30% of residents); universal preadmission falls risk analysis; PT evaluation of all residents and restorative nurse assessments after each fall with suggested care plan modifications; weekly progress review by the fall IDT; ongoing fall prevention and management training for all nursing levels; rigorous medication review; daily meeting on the previous day's falls; additional trained CNAs dedicated to fall prevention in busy areas with high falls rate (e.g., dining rooms). **RESULTS:** Using chi-square analysis, we compared data for 12 months before (2007) and 12 months after (2008) the model was implemented. In 2007 there were 826 falls per 160,600 bed days. After intervention falls for this same population declined to 621 [$p < .001$, CI (3.57, 4.18)]. The number of emergency visits and hospitalization for fractures decreased; fracture incidence

SESSION 1025 (SYMPOSIUM)

GERONTOLOGIC BIOSTATISTICS AND THE NEW GERONTOLOGIC RESEARCH ALGORITHMS & STATISTICAL PROGRAMS WEBSITE

Chair: *H. Allore, Internal Medicine, Yale University, New Haven, Connecticut*

Discussant: *R. Jones, Harvard University, Boston, Massachusetts*

Multifactorial etiologies of geriatric health syndromes and multiple morbidities of older patients present challenges for designing and analyzing research studies. This symposium highlights a set of statistical issues that, while not unique to gerontologic research, constitutes a distinctive ensemble worthy of deliberate and systematic attention, e.g. addressing issues of missing data, multiple and correlated outcomes and predictors, analysis of complex longitudinal data sets, disease of later life with genetic components, and multi-component intervention designs. We provide practical advice on ways to control the overall error rate in multiple outcomes studies, consider various methods for missing data including impacts of ignoring 'missingness' and imputation strategies for repeated measures and survival analysis. Furthermore, genetic resources for exploring conditions that have later life onset with potential genetic contributions are demonstrated. The symposium includes a discussion of a new website Gerontologic Research Algorithms & Statistical Programs (GRASP) that is a resource for those involved in analysis of gerontologic research. GRASP provides sample programs, data structures, articles and links to resources, such as the Geriatric Research Instrument Library (GRIL). GRIL is an online repository of data collection instruments in geriatrics research. For each instrument GRIL includes a description, references, and links to online resources, and many entries provide downloadable PDF documents. GRASP was created by the joint efforts of Yale, Duke and Wake Forest Universities Older Americans Independence Centers with funding from the NIA. This symposium will present a rich set of gerontologic resources and highlight this exciting and expanding methodological field.

CENSORING AND DEATH AS FACTORS IN THE ANALYSIS OF GERONTOLOGIC DATA

C.F. Pieper, M. Kuchibhatla, L.R. Landerman, *Duke University Medical Center, Durham, North Carolina*

Missing values, due to dropout, death, and inability, are ubiquitous in studies of the elderly, both in long term epidemiologic studies and shorter termed clinical trials. Missing values rarely meet the assumption of Missing at Random. Typically, bias results from failure to consider missingness, while increased standard errors for estimates typically results from imputation. Using examples from several large panel studies of the elderly, we will present the impact of ignoring 'missingness' on the results and various strategies for dealing with missing values in repeated measures and survival analysis: (1) the impact of incorporating death and censoring in a repeated measures format in the EPESE (Established Populations for the Epidemiologic Study of the Elderly), and, (2) in survival analysis, the impact of informative censoring on disease-free survival in the Cache County Memory Study (CCMS). Finally, the methods housed in GRASP useful in dealing with missing value issues will be shown.

GRASP- A TRAINING MANUAL FOR STATISTICAL ANALYSIS OF GENETIC DATA

E. Hauser, C. Haynes, S. Nelson, E. Rusnak, *Center for Human Genetics, Duke University, Durham, North Carolina*

The identification of genetic contributions to disease is an important focus of aging research. While incorporating the same challenges faced by general statistical methods in the analysis of aging data, genetic analysis itself brings its own challenges. Over the past 20 years, the Duke Center for Human Genetics (CHG) has developed a comprehensive set of statistical analysis procedures for the analysis of genetic data. These include old and new methods as they are developed along with novel statistical genetics methods developed by researchers at the CHG. We have catalogued these methods along with tools, procedures and tutorials on a common website to introduce these methods to researchers new to genetic analysis as well as to provide standard operating procedures for ongoing studies. These materials, previously not generally available, are now incorporated into the GRASP website. We will introduce general genetic methods and demonstrate features of the genetics training manual.

SOME CONSIDERATION ON MULTIPLE OUTCOMES IN AGING RESEARCH CLINICAL TRIAL DESIGN

X. Leng, *Department of Biostatistical Sciences, Wake Forest University School of Medicine, Winston Salem, North Carolina*

When multiple outcomes are obtained from aging research clinical trials, a predefined error rate such as Family Error Rate (FER) in the strong sense is desired to control false positive rate. Bonferroni method controls FER in the strong sense and is easy to apply. However it has been blamed being too conservative when outcomes are correlated. We studied how this "conservativeness" has impact on power and sample size consideration for multivariate normal outcomes in a two-arm clinical trial design. These results can easily be extended to more than two treatment group design and analysis of covariance.

AN EVALUATION OF THE DESIGN AND LAYOUT OF THE GRASP WEBSITE

G. Demiris, *University of Washington, Seattle, Washington*

The database-driven GRASP website is based on conventional open-source technologies. The user-interface is driven by twin aims – library and community. Through the extensive use of client-side programming, and Asynchronous JavaScript and XML (AJAX) functions to selectively refresh content, the need for frequent full-screen refreshes are eliminated, and the interface has the feel of a local PC application. The StatLib website hosted by Carnegie Mellon University is a comprehensive resource of statistical materials; Pennsylvania State University and

UCLA have relevant methodology cores with website access. GRASP differs from these resources because it has a more narrowly-defined targeted audience, namely professional biostatisticians and epidemiologists working in gerontologic research. Content can be organized in a way that makes navigation simpler and more intuitive than more general websites. This presentation will evaluate the extent to which GRASP has the potential of becoming a nexus for an online community of workers in this field.

SESSION 1030 (POSTER)

HEALTH RISK BEHAVIORS

ANTHEM OR SWAN SONG? AGING BABY BOOMERS AND ILLICIT DRUG USE

D.B. Bradley¹, D.F. Duncan², T. Nicholson¹, J. White¹, J. Bonaguro¹, 1. *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*, 2. *Duncan & Associates, Bowling Green, Kentucky*

While the anthem “sex, drugs and rock and roll” might have resonated with members of the baby boom cohort as teenagers, it is generally believed that substance abuse is not a problem among aging baby boomers. Recognition that alcoholism occurred in the elderly often enough to be a public health problem came only in the last quarter of the 20th Century. This new awareness accompanied a general view that older adults might abuse alcohol or prescribed drugs but not illegal drugs. To test this view, we examined admissions of persons 55 years of age and older ($n = 918,955$) in the Treatment Episode Data Set (TEDS). The TEDS is an administrative data system providing descriptive information about the national flow of admissions to providers of substance abuse treatment. TEDS is one of the three components of SAMHSA’s Drug and Alcohol Services Information System. The proportion of individuals admitted for alcohol abuse declined from 81.7% (1992) to 51.6% (2006). The proportion of individuals admitted for other drug use increased from 7.6% to 23.2% over the same period. Similarly, the proportion of persons admitted for alcohol plus other drug use increased from 7.9% to 23.1%. Given the historically high levels of drug use among this generation there should be an impact on admissions of older persons to substance abuse treatment programs. We conclude by suggesting changes in policy that take into account the possible abuse of illicit drugs as the “baby boomers” reach retirement age.

SESSION 1035 (SYMPOSIUM)

HEALTH-RELATED QUALITY OF LIFE ISSUES CONFRONTING AGING OLDER ADULTS

Chair: S.Y. Hawkins, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Discussant: C. Shawler, *University of Louisville, Louisville, Kentucky*

Health-related quality of life (HRQOL) assessment has become a universally accepted part of health care research. HRQOL is a multidimensional concept that is defined as the “optimum levels of mental, physical, role, and social functioning including relationships and perceptions of health, life satisfaction, and well-being”. Cognitive function, productivity and intimacy, and symptoms of critical importance to life quality such as pain, sleep disturbances, and depression are often included in definitions of HRQOL. Measures of HRQOL can be classified into two types, those designed to assess HRQOL among a specific patient population such as older adults, or those designed for specific diseases or health-related conditions such as urinary incontinence. Conducting nursing research on HRQOL can provide knowledge and methods that will potentially improve the lives of older adults. The purpose of this symposium is to explore HRQOL research conducted with older adult populations with selected physical, psychological, and/or sociological challenges. Two presenters in this symposium will discuss the experiences of older adults who have relocated from their private

homes to various types of assisted living facilities and the multiple HRQOL challenges encountered with this transition. The other two papers will explore the effectiveness of using a theoretically-based nursing intervention designed to improve selected HRQOL indices for ill older adults. All of these papers represent research directly with older adults with implications for nursing practice that have been conducted by participants of the Hartford Institute for Geriatric Nursing Summer Scholars Program.

TELEMEDICINE INTERVENTION FOR HEART FAILURE PATIENTS WITH URINARY INCONTINENCE

S.Y. Hawkins¹, M.H. Palmer¹, J. Busby-Whitehead², 1. *University of North Carolina at Chapel Hill School of Nursing, Chapel Hill, North Carolina*, 2. *University of North Carolina at Chapel Hill School of Medicine, Chapel Hill, North Carolina*

Background: Urinary incontinence (UI) is prevalent in 45% of heart failure (HF) patients. Many UI patients have limited knowledge about its management. Home telemonitoring of chronic diseases seems to be a promising patient management approach. Methods: This study is a two group, pre-test/post-test, randomized control design based on a validated stages of behavioral change model. The sample consists of 30 incontinent HF inpatients. Following discharge, subjects are participating in 4 weekly telephone educational sessions with a nurse practitioner using UI or healthy lifestyle educational materials. Standardized questionnaires and 24-hour urinary pad tests are being used. Results: Descriptive statistics have been computed and differences in pre and post measures will be analyzed. Conclusions: Chronic diseases require innovative management. Should this intervention be effective in reducing wetness and increasing quality of life, another study will be undertaken to determine if incontinent HF patients can be successfully managed with a theory-based telemedicine intervention.

A RANDOMIZED CONTROL TRIAL OF A NURSING COMMUNICATION INTERVENTION TRANSITIONING INTO THE HOSPITAL

B.J. Roberge¹, E. Mahoney^{4,1}, S. Chuang³, K. Minaker², 1. *Massachusetts General Hospital, Yvonne Munn Center for Nursing Research, Boston, Massachusetts*, 2. *Massachusetts General Hospital, Department of Medicine, Boston, Massachusetts*, 3. *Massachusetts General Hospital Department of Oral and Maxillofacial Surgery, Boston, Massachusetts*, 4. *Boston College, William F. Connell School of Nursing, Boston, Massachusetts*

Nurses are expected to care for older adults during fast-paced hospitalizations with minimal information about baseline function, yet this information is essential to planning care. The study purpose was to determine whether a model of preventive nursing communication during transitioning into the hospital improved problem identification and interventions (judgment) and patient recovery of baseline function (nutrition, cognition, continence, mobility). A prospective randomized design was used (N 101 experimental 147 control). Nurses were informed about patients’ pre-hospital baseline. Data collection over 7 days was from interviews/chart review. The communication intervention improved identification of geriatric syndromes ($t=2.28$, $p=.02$) and cognition (OR 2.54 CI 1.24-5.21 $p<.01$). While identification of some problems improved and nursing judgment was evident, proactive judgment was not. Recovery was adversely impacted by LOS ($p = .008$) but not our intervention. Findings have implications for practice by raising questions about the challenges of proactive care for acutely ill patients.

MIXED METHODS STUDY OF OLDER ADULTS' EXPERIENCES IN A TRADITIONAL AND SMALL HOUSE NURSING HOME

S. Molony, 1. Yale University, New Haven, Connecticut, 2. University of Pennsylvania, Philadelphia, Pennsylvania

A mixed-methods pilot study was conducted with residents (N=25, mean age = 84.04) of a skilled nursing facility who were given the option of relocating to a new "small house" model residence. Measures of health, physical function, at-homeness and other variables were gathered for movers (N=16) and non-movers (N = 9), at baseline, 3 months and 6 months after the move (or equivalent for non-movers). A longitudinal mixed model analysis revealed significantly different time effects between groups on ADLs ($p=0.0519$) and at-homeness ($p = 0.0079$). Movers (small house dwellers) demonstrated greater functional independence over time as measured by the Minimum Data Set. Movers had significantly lower levels of at-homeness at baseline (pre-move) and at-homeness increased over time after the move. Movers had greater depressive symptoms than non-movers at baseline and their depression decreased over 6 months (not statistically significant). Qualitative data validate findings and provide potential explanatory mechanisms.

METHODOLOGICAL CHALLENGES IN RESEARCHING INTIMACY IN ASSISTED LIVING FACILITIES

L. Macera, University of California, San Francisco, San Francisco, California

Assisted Living (ALF) is growing rapidly as a housing option for seniors who need assistance with activities of daily living. Many ALF residents have lived in private homes, sometimes for decades, and may now be sharing a room with a stranger. They are faced with making new friends and adapting to a new activity level. This qualitative pilot study sought to begin to understand the lived experience of elders living in ALF with regards to meeting their needs for intimacy. The researcher spent months gaining access to the first two facilities and was able to complete only three interviews. A third facility was added and after the fourth interview further appointments were canceled. This presentation will discuss difficulties with access to appropriate participants and challenges with informed consent. The researcher will present suggestions for future study of sexuality and intimacy in older adults living in ALFs.

SESSION 1040 (PAPER)

MINORITY OLDER ADULTS

PHYSICAL PERFORMANCE AMONG AFRICAN-AMERICAN OLDER ADULTS: THE FOUR SQUARE STEP TEST

D.W. Klima¹, T. Adkins¹, J. Fernandez¹, G. DeLeon¹, R.A. Newton², 1. Physical Therapy, UMES, Princess Anne, MD, Maryland, 2. Temple University, Philadelphia, Pennsylvania

Purpose/Hypothesis: Studies examining physical performance with emerging test instruments in African-American elders remain limited. The Four Square Step Test (FSST) is a unique functional mobility battery designed to examine balance performance in conjunction with multidirectional stepping in a four square cane matrix. The purpose of this pilot study was to examine and confirm the hypothesized relationship between performance on the FSST and other mobility and sociodemographic measures among 39 African-American older adults. **Participants:** Subjects included 39 community-dwelling African-American elders over 60 ($x = 73.8$; $SD = 7.6$; range: 60-90 years) living in home residences or senior housing facilities. **Materials/Methods:** Subjects completed a basic demographic profile, the FSST, the Berg Balance Scale (BBS), and Timed Up and Go (TUG) Test. Additional assessments included the 15-item Geriatric Depression Scale (GDS) and Falls Efficacy Scale-International (FES-I) tool. Data were analyzed using Pearson and Spearman rho correlations. Significance was set at the .05 level.

Results: Demographic profiles revealed that ten subjects (26%) had fallen over the past year. Fifteen (38%) subjects disclosed a fear of falling. Subjects demonstrated a mean test value of 19.6 ± 12.9 sec. on the FSST. FSST performance was significantly correlated with both BBS ($\rho = -.55$; $p < 0.01$) and TUG ($r = .75$; $p < 0.01$) scores, and GDS ($r = .56$; $p < 0.01$) ratings. A significant association was found between FSST performance and falls efficacy on the FES-I instrument ($\rho = .45$; $p < 0.01$). Multiple regression analysis demonstrated that FES-I and GDS scores predicted 31% of the variance in FSST performance. **Conclusions:** Data findings suggest that the Four Square Step Test demonstrates appropriate concurrent validity with other physical performance and affective tests among African-American elders. **Clinical Relevance:** Preliminary findings suggest the FSST offers a unique and psychometrically stable mode of functional mobility assessment which may be administered in a variety of diverse clinical geriatric settings.

FACTORS ASSOCIATED WITH POOR LOWER EXTREMITY FUNCTION IN PUERTO RICAN ADULTS

C. Castaneda-Sceppa^{1,2}, S. Noel², M. Van Rompay², L. Falcon¹, K. Tucker², 1. Northeastern University, Boston, Massachusetts, 2. Tufts University, Boston, Massachusetts

Hispanics are the fastest growing ethnic group in the United States. Puerto Ricans are the second largest Hispanic subgroup in the country and the largest in the northeast, and they bear a disproportionate burden of disability. Poor physical function, specifically lower extremity function, is the hallmark of frailty and predicts adverse health outcomes in older adults including disability, nursing home admission, and mortality. Frailty is also associated with isolation and psychosocial distress. Although the prevalence of self-reported disability has been documented in Puerto Rican older adults, there is limited information about the association between lower extremity function and potential risk factors that may contribute to frailty and the disability disparity in this population. Therefore, we examined associations between frailty (measured as walking speed < 0.4 m/sec) and insulin resistance (Homeostasis Model Assessment), inflammation (C-Reactive Protein), and perceived stress (Perceived Stress Scale), independent of socio-demographic (age, sex, education and income) and lifestyle (smoking, alcohol and physical activity) factors in a sample of Puerto Rican adults aged 45-75 y living in the greater Boston, area. More than 52% of women and 39% of men were frail, measured by walking speed < 0.4 m/sec. By multivariate logistic regression analysis, frailty was associated with insulin resistance ($OR = 1.77$, 95% $CI = 1.22, 2.57$, $P < 0.002$) and higher perceived stress ($OR = 1.04$, $CI = 1.02, 1.05$, $P < 0.0001$), for each unit on a scale from 0.08 to 0.99 m/sec, but not inflammation, after adjustment for covariates. Targeted interventions are needed to reduce frailty in this rapidly growing high-risk population.

MEANINGFUL CHANGE IN PHYSICAL PERFORMANCE MEASURES OF OLDER AFRICAN AMERICANS

K.K. Mangione¹, R.L. Craik¹, H. Blevins¹, A. McCormick¹, E. Sullivan-Marx², 1. Physical Therapy, Arcadia University, Glenside, Pennsylvania, 2. University of Pennsylvania, Philadelphia, Pennsylvania

The purpose of this research study is to determine the reliability and standard error of the measurement (SEM) – a distribution-based method for estimating small but meaningful individual-level change for the short physical performance battery (SPPB), gait speed, 6 minute walk distance, and timed up and go (TUG) speed in a sample of frail, older AA. **Methods:** Forty three older AA were tested a minimum of two times over a week period. SEM was calculated as $Sx \cdot (1-r)$, where r is the reliability coefficient. **Results:** 42 older adults, 92% female (79 + 9 yrs) completed 2 tests, and a subset of 15 completed three trials. Average BMI was 30, MMSE score was 25, and participants had multiple chronic conditions, the most common were: hypertension 71%, osteoarthritis 60%, diabetes and renal disease 40%. The mean SPPB

was 7.6 points (time 1-T1), 8.6 (time 2-T2); mean gait speed was 0.78 m/s (T1), 0.82 m/s (T2); mean 6 min-walk was 270 m (T1), 270 m (T2); and the mean TUG time was 12.9 sec (T1), 11.8 sec (T2). The SEM for SPPB was 1.15 sppb points, SEM for gait speed was .11 m/s; for 6-min-walk distance was 25 meters; and for TUG time was 1.6 sec. These data are consistent with published SEMs by Perera et al and suggest that the small and substantial meaningful changes reported for other samples would apply to older, frail African Americans.

WILLINGNESS OF ORGAN DONATIONS IN AFRICAN AMERICANS

J. Yoo^{1,2}, Y. Chang³, S. Nakagawa³, Y. Cho⁴, 1. University of Michigan, Ann Arbor, Michigan, 2. Veteran Affairs Health System, Ann Arbor, Michigan, 3. Cleveland Clinic Foundation, Cleveland, Ohio, 4. University of Minnesota, Minneapolis, Minnesota

Introduction: Compared with whites, it had been reported that African Americans were less willing to donate their organs. The pervasive mistrust of health system was explained as one of this phenomenon. The present study was aimed at identifying reasons of less enthusiastic about organ donation in the African Americans. **Methods:** Cross-sectional data were gathered from 145 African Americans, ages were between 18 and 80, who were admitted in a hospital in the Midwest of the US with no history of dementia and schizophrenia. Participants did not have history of HIV, HBV, HCV and End-Stage Renal Disease (ESRD). Data collection was performed by face-to-face interviews. They were questioned about their willingness to donate organs if they were in case of brain death, and, if not, were asked to choose one out of three reasons behind their decisions: lack of information of organ donation, preference of being buried intact and mistrust of health system. Religious beliefs were defined as belonging to faith traditions regardless of their denominations. Logistic regression analysis was used to investigate the associations between willingness of organ donations and their attributable factors. The SPSS version 16 (SPSS Inc., Chicago, IL) was used. **Results:** 26.2% were willing to donate their organs. Participants had following characteristics: an average age \pm standard deviation(SD) (52.0 \pm 12.7), lives alone (12.4%), an average of number of co-morbidities (total 8 items) \pm SD (2.0 \pm 1.2), an average of utilizations of healthcare as outpatient or/and inpatient over the past 12 months \pm SD (3.41 \pm 2.46), lack of insurance (40.6%), presence of advance directive (living will or/and designation of durable power of attorney; 15.9%), and religious beliefs (79.4%). African Americans with old age ($p=0.008$, OR=1.07, CI 1.02-1.14), high number of healthcare utilizations ($p=0.027$, OR=1.33, CI 1.03-1.73) and religious beliefs ($p=0.047$, OR=3.40, CI 1.01-11.36) were more unfavorable to donate their organs. Preference of being buried intact (57.0%) was the most common reason that affected their decisions and was followed by lack of information about organ donation (29.9%) and mistrust of health system (13.1%). **Conclusions:** African Americans who were old and utilized healthcare services frequently were reluctant to donating their organs in case of their brain death. Recognition of their preference of being buried intact might help to understand why African Americans with religious beliefs were less enthusiastic about organ donation.

OSTEOPOROSIS SCREENING OF AFRICAN AMERICAN OLDER ADULTS

J. Yoo^{1,2}, Y. Chang³, S. Nakagawa³, Y. Cho⁴, 1. University of Michigan, Ann Arbor, Michigan, 2. Veteran Affairs Health System, Ann Arbor, Michigan, 3. Cleveland Clinic Foundation, Cleveland, Ohio, 4. University of Minnesota, Minneapolis, Minnesota

Introduction: Women age over 65 can receive osteoporosis screening by the DEXA scan without copayment. African American postmenopausal women have a lower prevalence of the osteoporosis (4%) compared to whites (8%). However, African American postmenopausal women have a higher mortality after osteoporotic fractures. Lack of recognition of the risk factors and deficiency in the proper management

of osteoporosis in African American women might have contributed to this phenomenon. The purpose of present study was to measure the screening rate of the DEXA scan and to identify facilitators and barriers of the DEXA scan in African American elderly women. **Design:** A total of 402 women, age 65 and older were enrolled in a non-profit community health center. Retrospective electronic chart was reviewed for 28 months. Modified Charlson's co-morbidity index, medications that can affect their bone adversely (thyroid supplements, phenytoin, or systemic steroid administration for 3 months or more), and evidence of osteoporosis by the DEXA scan, x-ray and dictation and insurance status. Physicians' specialties were categorized as primary care and specialties regarding bone health (rheumatology, endocrinology, geriatric and orthopedic surgery). We asked physicians to rank the following medical categories according to their priority in screening their conditions (colon cancer, breast cancer, hyperlipidemia, pap smear, domestic violence, alcohol or substance abuse, and osteoporosis). **Results:** The osteoporosis screening rate was 15.9%. The prevalence of osteoporosis was 29.6%. Participants had following characteristics: an average of age \pm standard deviation (SD) was 74.8 \pm 7.04, an average of Charlson co-morbidity index was 5.08 \pm 1.49, offending medications were 22.3%, evidence of osteoporosis was 29.6% and premium insurance rate was 50.0%. Logistic regression analysis revealed the associations between the DEXA screening and its facilitators/barriers. Old age ($p=0.01$, OR=0.91, CI 0.86-0.96) was a barrier but evidence of osteoporosis ($p=0.001$, OR=6.33, CI 3.25-12.34), premium insurance ($p=0.02$, OR=2.09, CI 1.07-5.23), an average ranking of osteoporosis in physicians' screening priorities ($p=0.001$, OR=2.87, CI 1.57-5.23) were facilitators of the DEXA screening. **Conclusion:** The absolute rate of the DEXA scan (15.9%) was still low and prevalence of osteoporosis (29.6%) was higher than that of previous studies. Along with patients' demographic and socioeconomic status, physicians' preference of osteoporosis among health maintenance items contributed to the DEXA scan rate.

SESSION 1045 (POSTER)

HEALTH AND HEALTH PROMOTION

SOCIAL DETERMINANTS OF HEALTH-RELATED QUALITY OF LIFE TRAJECTORIES IN A COHORT OF OLDER CANADIANS

N.A. Ross^{1,2}, H. Orpana², J. Bernier², M.S. Kaplan³, D. Feeny⁴, B. McFarland⁵, 1. Geography, McGill University, Montreal, Quebec, Canada, 2. Statistics Canada, Ottawa, Ontario, Canada, 3. Portland State, Portland, Oregon, 4. Center for Health Research, Kaiser Permanente Northwest, Portland, Oregon, 5. Oregon Health and Science University, Portland, Oregon

Background: Longitudinal studies of how socioeconomic circumstances influence health status continue to be scarce in the research literature. These are important methodologically in that they establish socioeconomic conditions prior to health outcomes, thereby limiting the concern about an artefactual relationship between socioeconomic position and health status. This paper examines the social determinants of differences in health-related quality of life trajectories in a large cohort of Canadians. **Methods:** Trajectory analysis of six waves of the Canadian National Population Health Survey (initial sample > 17,000). The outcome of interest is the Health Utilities Index Mark III, a measure of health-related quality of life. **Results:** The trajectories for health-related quality of life as measured by the HUI III show differences by income and education at age 40. Those with low incomes and low educational attainment have poorer health-related quality of life at age 40 than their more affluent and better educated counterparts. After that time, trajectories appear to track in parallel, suggesting no obvious acceleration in decline in health related quality of life linked to socioeconomic characteristics. **Interpretation:** Health-related quality of life at midlife is determined, in part, by socioeconomic position, although the decline in

health-related quality of life after age 40 does not appear to be appreciably accelerated by social factors. The influences of early life seem to fix the trajectory of health-related quality of life in mid- and later life. Canada's population health record has historically been very favourable but inequality in household earnings has increased dramatically in the past 10 years and poverty rates have increased across all age groups. These broader socioeconomic changes may affect the health-related quality of life of older Canadians.

BRAIN FITNESS ACTIVITIES AND HEALTH AMONG FEMALE SENIOR CENTER PARTICIPANTS IN MONTREAL, CANADA

S.Y. Bushfield¹, T. Fitzpatrick², 1. *School of Social Work, New Mexico State University, Las Cruces, New Mexico*, 2. *Jewish General Hospital, Montreal, Quebec, Canada*

With the increasing number of aging individuals living well into their nineties and the advent of the baby boom generation turning 65 years old, the number of individuals who will become afflicted with Alzheimer's Disease or other cognitive diseases will definitely increase. Little research has addressed the influence of brain fitness activities and their relationship to mental and physical health specifically among older women living in the community. Data were collected from nine French and English Senior Centers in Montreal, Quebec. A self-administered survey, translated in both English and French, was used among a sample of older women (N = 257). Multivariate Analysis (MANOVA) with post-hoc Bonferroni-t-tests revealed that activities such as aerobics, strength exercises, career decisions, working for pay, participating in a computer lab, learning new languages, group work and listening to speakers were significantly related to the physical health indicators of self-reported health and chronic conditions. Activities such as laughing together, career decisions, working together on a project, and strength exercises were significantly related to mental health indicators such as overall feelings (spirit), happiness and an interesting life. The results have implications for clinical practice and future research.

FACTORS ASSOCIATED WITH ADVANCE CARE PLANNING AMONG OLDER WOMEN IN SOUTHWEST FLORIDA

K. Black¹, S. Reynolds², 1. *Social Work, University of South Florida Sarasota - Manatee, Sarasota, Florida*, 2. *University of South Florida, Tampa, Florida*

As the nation's population continues to age, many older women will face care needs that can be anticipated in advance. However, little is known about the advance care plans of older women and the characteristics of those who plan. This study utilized a stratified random sampling design to survey older women (n = 124) in the state of Florida regarding their attitudes towards future care and planning behavior in social- environmental, health, and financial domains. Regression analyses were conducted to determine factors most predictive of attitudes towards future care and planning behavior by domain. Results suggest that advanced age predicts greater planning behavior, while living alone is associated with less advance care planning behavior. Other factors associated with less planning by domains of care needs include: income status, chronic health conditions, educational attainment, and religious status. Non-accepting attitudes toward planning were associated with a decreased likelihood to have advance care planning documents.

THE ROLE OF SPIRITUALITY IN HEALTHY AGING FOR GERIATRIC SOCIAL WORKERS AND THEIR PATIENTS

T.K. Amador, *Health Services Administration Dept., Regis University, Denver, Colorado*

Introduction: Geriatric health care professionals work within a complex health care industry, often described by staff and patients alike as fast-paced and stressful. Geriatric social workers are focusing on spiritual interventions such as prayer, meditation, and reflection to enhance their own well-being and the well-being of patients (Amador, 2007).

Literature Review: The use of spiritual interventions is controversial within social work practice due to questions surrounding the education and training of social workers (Hoyt, 2008). Research indicates, however, that social workers are widely utilizing spiritually based interventions with their patients (Sheridan, 2009). Methodology: Qualitative methods were utilized in this study of 40 geriatric social workers. Data were obtained through semi-structured interviews. Interviews were taped, transcribed, and analyzed using thematic analysis. Findings: Geriatric social workers reported nurturing their spirituality to promote a healthful body, mind, and soul. Regardless of specific religious or spiritual beliefs, most participants said they spend a considerable amount of time praying for their patients, colleagues, and career including whether they were in the right position and whether they were performing well. They also used spirituality in work with patients as part of a holistic approach to health. Conclusions: Geriatric social workers in this study were focused on spirituality for themselves and their patients. Participants felt that making a conscience choice to attend to their spiritual needs and those of their patients would improve long-term health and well-being. Spirituality as an intervention for healthy aging should be explored further and include other geriatric health care professionals. References Amador, Tristen K. (2007). Geriatric social workers: An exploration of job satisfaction, strengths, and motivation for continued care for older adults. Ph.D. dissertation, University of Houston, United States — Texas. (Publication No. AAT 3260228). Hoyt, C.A. (2008). What if the spirit does not move me? A personal reconnaissance and reconciliation. *Social Work*, 53(3), 223-231. Sheridan, M. (2009). LEGISLATING ADVANCE HEALTH CARE PLANNING: AN INNOVATIVE APPROACH

M. Henry², M. Luptak¹, 1. *College of Social Work, University of Utah, Salt Lake City, Utah*, 2. *Utah Commission on Aging, University of Utah Center on Aging, Salt Lake City, Utah*

Advance health care planning has the potential to decrease the cost of health care by eliminating unwanted intervention at the end of life, decrease the burden on courts that adjudicate guardianship cases that occur because the individual has not named a health care agent, and increase the chance that an individual's health care preferences will be followed when health care decision making capacity is lost (as it is for a majority of people prior to death). However, evidence shows that first generation living wills are of limited value in achieving these potential benefits. Based on the evidence, the Utah State Legislature recently repealed the 25-year-old Personal Choice and Living Will Act and replaced it with the Advance Health Care Directive Act, a model piece of legislation. The state used an innovative policy making process to develop an advance health care planning system that can inform policy making in other states. This poster outlines the steps the Utah Commission on Aging used to develop an advance health care planning system and to pass necessary legislation. It identifies key components of the collaborative process, from convening an expert multidisciplinary panel of health care and legal professionals, to reaching agreement on a guiding principle (autonomy) and objective (honor health care wishes), to drafting and passing the law. Finally, it specifies critical elements of the advance health care planning system implemented in Utah.

SELF-CARE PRACTICES OF GERIATRIC SOCIAL WORKERS

T.K. Amador, *Health Services Administration Dept., Regis University, Denver, Colorado*

Introduction: Geriatric health care professionals are at-risk of "burnout" due to their often demanding and emotional work with patients and families. The self-care practices of geriatric social workers were studied to better understand how burnout can be avoided and physical,

mental, and emotional well-being can be sustained (Amador, 2007). Literature Review: Burnout can be defined as “a syndrome of emotional exhaustion and cynicism that occurs frequently among individuals who do ‘people work’ of some kind” (Maslach & Jackson, 1981, p. 99). This concept has been studied for many years yet remains a concern for health care professionals. Methodology: Forty geriatric social workers who had worked for at least one year with older adults and their families were interviewed in this qualitative study. Each participant’s interview was taped and transcribed in order for data to be analyzed and organized into themes (Amador, 2007). Findings: Self-care practices for participants included “processing” their experiences related to work and “disconnecting” from work. Additional forms of self-care included establishing and maintaining good relationships with loved ones such as family and friends. Finally, spirituality and exercise are also forms of self-care that geriatric social workers employed to improve well-being (Amador, 2007). Conclusions: Geriatric social workers explained self-care as necessary to sustain well-being and provided several creative practices such as processing and disconnecting. These practices and others must be utilized and expanded upon for optimal health and well-being of geriatric social workers and other geriatric health care professionals. References: Amador, Tristen K. (2007). Geriatric social workers: An exploration of job satisfaction, strengths, and motivation for continued care for older adults. Ph.D. dissertation, University of Houston, United States — Texas. (Publication No. AAT 3260228). Maslach, C., & Jackson, S.E. (1981). The measurement of experienced burnout. *Journal of Occupational Behaviour*, 2(2), 99-113.

USING HEALTH IT TO MEASURE CHANGES IN FUNCTIONAL ABILITY IN OLDER ADULTS WITH VISION IMPAIRMENT

C. Stuen, V. Cimarolli, V. Torres-Suarez, *Policy and Evaluation, Lighthouse International, New York, New York*

The purpose of this study was to assess changes in older adults’ functional ability in a vision rehabilitation setting using an electronic health record called Electronic Vision Rehabilitation Record (EVRR®) implemented at three agencies – representing urban, suburban, and rural rehabilitation settings. Vision rehabilitation services - individualized therapeutic interventions and counseling designed to restore functioning, safety and self-sufficiency to people with vision loss - include such interventions as techniques of orientation and mobility (safe travel), independent living tasks (cooking and child care safety), and psycho-social interventions. EVRR®’s methodology is consistent with the functional model of rehabilitation which involves the patient’s and the provider’s assessment of the patient’s functional difficulties and relating them to needed interventions. Following service delivery, patients are re-assessed to document changes in functioning. Study participants were 326 older adult clients who received orientation and mobility, 808 patients who received independent living services, and 51 patients who received psycho-social services. Results from paired t-tests demonstrate that all self-assessment and provider intervention functional ability scores significantly improved following the receipt of service. Hence, the use of the EVRR® system and its tools, specifically interventions that are based on standardized assessments, facilitate the restoration of functioning in patients with impaired vision and consequently help to reduce the disabling effects of vision loss.

METHODOLOGICAL RECOMMENDATIONS FOR CONDUCTING FORMATIVE EVALUATION OF COMMUNITY-BASED INTERVENTIONS: REVISION OF THE ARTHRITIS FOUNDATION WALK WITH EASE PROGRAM

M. Altpeter^{1,2}, B. Schoster², A. Meier², L. Callahan², 1. *UNC Institute on Aging, Chapel Hill, North Carolina*, 2. *UNC Thurston Arthritis Research Center, Chapel Hill, North Carolina*

This poster describes the formative evaluation phase of a community-based intervention study to revise, update and test the Arthritis Foundation Walk With Ease (WWE) program, funded by the Centers for Disease Control and Prevention Arthritis Program. Originally created about ten years ago, WWE was designed to help participants: understand arthritis and its relationship with exercise and pain; use motivational strategies to set and monitor realistic goals for improving fitness; and learn appropriate stretching and strengthening exercises to protect joints and minimize pain. The current study involved standardizing and testing WWE in two delivery formats: instructor-led group and self-directed. Our formative evaluation was conducted as a two-phase process that included the triangulation of data collection targets (leaders, coordinators, participants in the original WWE program, and leaders and participants of the pilot of the revised program) as well as methods (written surveys, focus groups, and structured telephone interviews) in order to provide breadth and depth to our findings. Overall, these extensive data led to revisions in the intervention itself and to related materials, which were well-rated in subsequent testing. We describe our study population, methods, challenges, and findings in conducting a formative evaluation and share key tools we used. We also offer practical methodological recommendations to community service providers for conducting this kind of effort.

INFLUENCES OF SOCIAL ENVIRONMENTAL FACTORS ON THE PHYSICAL FUNCTIONING OF THE OLDEST OLD IN URBAN CHINA

F. Sun¹, C. Lu³, M. Tang⁴, J. Kosberg², 1. *Arizona State University, Phoenix, Arizona*, 2. *University of Alabama, Tuscaloosa, Alabama*, 3. *Michigan State University, East Lansing, Michigan*, 4. *Richard Stockton College of New Jersey, Pomona, New Jersey*

Purpose: This study focuses on how municipal-level social environmental factors interact with individual-level factors to influence physical functioning [Activity of Daily Living (ADL)] among the oldest old in urban China. Methods: Data are drawn from the fourth wave of the Chinese Longitudinal Healthy Longevity Survey and the 2005 Chinese Statistical Yearbook. The sample consisted of 3,830 older adults from 131 cities across China. Participants were on average age 86.3 (SD=1.21) years old, and 56.4% were female. Analyses were conducted using hierarchical linear modeling strategy. Individual-level factors include demographics, cognitive status, and engagement in activities. Municipal-level factors include Gross Domestic Product (GDP) per capita, three pollution indexes (industrial waste water, dust, and sulfur dioxide), and three indicators of health service availability (doctors, beds, and hospitals). Results: Findings disclosed that poorer health, less engagement in activities, and lower levels of cognitive status statistically predict more ADL limitations ($p<.01$). Two municipal-level predictors (GDP per capita and concentration of dust) significantly interact with individual factors to influence physical functioning. Compared to those living in more developed areas, participants living in less developed areas have a greater increase in their ADL limitations when their engagement in activities decreases. Compared to participants living in areas with lower dust concentration, those living in areas with higher levels of dust concentration have a sharper increase in ADL limitations as their cognitive function decrease. Implications: Interventions at individual levels should plan more social activities among older adults, and macro-level policy initiatives should facilitate local economic development without generating pollution.

OUTCOMES AND LESSONS FROM THE LIVING WELL PROJECT: IMPLEMENTING EVIDENCE-BASED WELLNESS PROGRAMS IN THE COMMUNITY

D. Wagner¹, D.M. Cox¹, J. Gennusa², E. Takagi¹, *1. Gerontology, Towson University, Towson, Maryland, 2. Maryland Department of Aging, Baltimore, Maryland*

In 2007, the "Living Well" Project was implemented in six regions of the State of Maryland. The project used Stanford University's Chronic Disease Self Management Program to empower people with chronic illness to take control of their own health. Towson University's Center for Productive Aging evaluated the implementation of this program through a process evaluation and data collected through baseline and post-test surveys administered to project participants. More than 800 participants completed the baseline surveys and to date we have post-test surveys from more than 700 of these participants. About 18% of the participants who began the program dropped out before completion; most because of health problems. The median age of participants was 76 years, and 80% were women. Participants were mostly White (68%) with 24% African American and the remaining were Asian, Hispanics and mixed ethnicities; 7% spoke a language other than English. Participants reported a range of chronic illnesses including diabetes (27%), hypertension (58%), lung disease (18%), arthritis (51%) and heart disease (19%). Preliminary analysis of the post-test data collected suggests that some modest improvements in health behaviors were reported. More often there were positive shifts in the extent to which participants reported that health interfered with social activities and the ability to do errands. This poster outlines the changes over time, the trends associated with program participation and the interpretation of the data in the context of the process evaluation findings and the implications for practice.

ASSOCIATION OF HEALTH STATUS AND REPORT OF DISCRIMINATION: DOES RESPONDENT AGE MATTER?

P.T. Ryder, J. Mulvaney, *Pharmacy Practice, Butler University, Indianapolis, Indiana*

Background: Reports of racial/ethnic discrimination have been associated with many health outcomes. Older people may have lived through times of institutional racism, yet they report discrimination less often. Lifetime discrimination is a source of chronic stress, which has been demonstrated to mimic and exacerbate aging. Discrimination may also lead to delayed healthcare or poor treatment adherence. These all contribute to health disparities, but little attention has been paid to how the association of discrimination and health varies by age. Methods: We use data from the 2004 Behavioral Risk Factor Surveillance Survey Reaction to Race Module from 7 states and the District of Columbia, to examine associations of report and reaction to discrimination in 4,555 non-Hispanic blacks, 22,673 non-Hispanic whites, and 1,382 Hispanics. Results: We create separate logistic regression models for each group to assess the association of age and reaction to discrimination while controlling for gender and education. Age (comparing ages 17-29 with ages 70+) and discrimination (comparing those reporting 2+ instances of unfair treatment versus those reporting none) are significantly associated with fair/poor self-reported health for whites and blacks (whites, OR age = 7.2, 95%CI=5.4-9.7, OR discrimination = 3.9, 95%CI=2.8-5.4; blacks OR age=7.0 95%CI=4.6-10.8, OR discrimination = 3.2, 95%CI=1.5-3.0). For Hispanics, age is significantly associated with fair/poor health (OR=4.3, 95%CI=2.0-9.5), but report of discrimination is not (OR=1.9, 95%CI=0.9-4.2). Conclusions: The relationship between report of discrimination and health status does vary by age. Whether differences are due to age, period, or cohort effects needs further investigation.

HEALTH LITERACY IN A GERIATRICS AMBULATORY PRACTICE: AN ASSESSMENT OF OLDER ADULTS AND THEIR CAREGIVERS

D. Greenberg, M. Dave, P. Wald Cagan, A. Ehrlich, *Montefiore Medical Center, Bronx, New York*

Background: Health literacy is the ability to understand and act on health information. Numeracy, the ability to use numbers in daily life, is a critical component of health literacy. Objectives: The purpose of this study was to measure health literacy levels of older adults and their caregivers in a multicultural, urban geriatrics practice using a test of reading comprehension: The Rapid Estimate of Adult Literacy in Medicine (REALM) and a test of health numeracy: The Newest Vital Sign (NVS). Methods: The REALM and NVS were administered to English and Spanish speaking patients at the time of their medical appointments. If patients were unable to participate due to a diagnosis of dementia or visual impairment, their caregivers were asked to complete the tools. 201 patients and 41 caregivers gave informed consent and participated in the study. Results: Patients: 86 % of patients scored at high school reading level on the REALM. 28% had limited literacy possible, 52% limited literacy likely on the NVS. Caregivers: 85% scored at high school reading level on the REALM. 25% had limited literacy possible, 31% had limited literacy likely on the NVS. Informal caregivers had higher levels of literacy than formal caregivers. Conclusion: The majority of patients and caregivers read at high school level in this study. However, over half of the patients scored as likely to have limited literacy on the NVS while 31% of caregivers were found likely to have limited literacy on the NVS. Further research is needed in using the NVS in the geriatric population.

UTILIZING GIS IN PUBLIC HEALTH RESEARCH TO EXPOSE PERSISTENT POOR HEALTH IN GEORGIA'S OLDER ADULT POPULATION

M.A. Okundaye¹, A.R. Fertig¹, D.C. Bachtel², A. Dahal³, *1. University of Georgia, Department of Health Policy and Management, Athens, Georgia, 2. University of Georgia, Department of Housing and Consumer Economics, Athens, Georgia, 3. University of Georgia, Department of Economics, Athens, Georgia*

Background: Older adults are vastly becoming a larger segment of our population. It is important to understand the impact that poverty has on population level health to a group already susceptible to age related mortality. Understanding how poverty interacts with health outcomes may also help to guide policy, and ultimately influence distribution of resources and support. In this study, easy to understand maps were created of indices of poor health for older (65+) Georgians by utilizing Geographic Information Systems (GIS) technology. Methods and Results: A 2003 University of Georgia study examined persistent poverty in Georgia and found 91 counties to be categorized as such. For this study, county level health outcomes of mortality rates due to Cancer, Diabetes, and falls/accidents for the nation's 3,140 counties were retrieved. By identifying those counties in the bottom 50th percentile of the nation for two time periods, 1992-1997 and 2000 to 2005, health indices were then created. Georgia's 159 counties were then extrapolated, further stratified into persistent poor health indices, and then mapped in various ways to examine relationships between persistent poor health and persistent poverty. Lastly, geographic characteristics such as urban, rural, and southern rural Blackbelt, were utilized to further examine demographic and economic trends in the state and how they compared to this study's findings of the interactions between poor health and poverty on older adults.

IMPACTS ON HEALTH OUTCOMES FOR OLDER ADULTS LIVING WITH CHRONIC ACS DISEASES

S. O'Connor^{1,2}, V. Lamb², R. Wortham², D. Greene², 1. *Department of Epidemiology & Preventive Medicine, University of Maryland, Baltimore, Maryland*, 2. *Department of Sociology, North Carolina Central University, Durham, North Carolina*

Background: While obesity-related diseases are often preventable, their treatment and management require continuous monitoring and evaluation. These diseases are known as ambulatory-care sensitive (ACS), as they require a high level of outpatient care and can lead to poor health outcomes if not actively managed. This study examines impacts on health outcomes for older individuals living with chronic ambulatory-care sensitive diseases. **Methods:** This study analyzed cross-sectional data from the 2004 National Long Term Care Survey. The sample included 3,933 community-dwelling individuals 65 years or older. Respondents were included if they reported having one or more ACS conditions, including obesity, diabetes, arteriosclerosis, chronic pain, heart attack, heart problems, hypertension, and circulation trouble. Independent variables included demographic factors, ADL measures, socioeconomic variables, health care coverage variables, and measures of continuity of care. Models were constructed to isolate the effects of socioeconomic and health insurance coverage variables on overnight hospitalizations. Analyses were conducted using SAS version 9.1.3. **Results:** Results showed no significant differences between White and Blacks, although a significantly reduced risk was noted for respondents reporting race as other. Individuals with a history of diabetes, heart attack, or heart problems had a higher likelihood of hospitalization. No differences were noted among socioeconomic factors even after controlling for demographic factors and chronic disease indicators. Respondents having Medicare or private insurance coverage had a higher risk of being hospitalized. Respondents who had utilized emergency care services in the past month were more than twice as likely to experience hospitalization.

RESOURCES AND SUBJECTIVE HEALTH AMONG OLDER ADULTS

K. Daugherty¹, P. Martin¹, L. Poon², M. Johnson², 1. *Iowa State University, Ames, Iowa*, 2. *University of Georgia, Athens, Georgia*

With increasing age, older adults are more susceptible to disease; however, reports of self-rated health often do not change as people age. The objective of this study was to assess possible influences of different types of resources (e.g., social and economic resources, as well as mental and functional health) on concurrent and longitudinal subjective health ratings. Data for this study was taken from the first Georgia Centenarian Study. Participants (N = 176) were comprised of three age groups: sexagenarians, octogenarians, and centenarians. Structural Equation Modeling (SEM) was employed to test the direct influence of each resource variable on the latent variables of subjective health at time 1 and time 2. Age was also added included in the model. Results suggest that economic resources ($\beta = 0.18$, $p < .05$) and activities of daily living (ADL, $\beta = 0.44$, $p < .05$) significantly contributed to self-rated health at time 1. Age, mental health, and social resources were not significant. No resources at time 1 significantly predicted changes in self-rated health, however a modest relationship was obtained for ADLs and self-rated health at time 2 ($\beta = 0.26$, $p = .052$). In conclusion, subjective health is influenced by the unique contribution of activities of daily living (ADLs) and economic resources, not age. Change in subjective health is not influenced by economic resources; however, ADLs show a slight influence. Implications of these results suggest that economic and physical resources (ADLs) should be of concern for older adults and monitored for declines in subjective health.

GLOBAL AGING AND HEALTH: EXPANDING A SERVICE-LEARNING PARTNERSHIP FROM PORTLAND, OR TO NICARAGUA

M. Lopez Noron¹, K. Wilson^{1,2}, M.B. Neal², A. DeLaTorre², 1. *The Jessie F. Richardson Foundation, Clackamas, Oregon*, 2. *Institute on Aging, Portland State University, Portland, Oregon*

Beginning in 2004, Portland State University's (PSU) Institute on Aging (IOA) and the charitable non-profit organization the Jessie F. Richardson Foundation (JFR) began the joint design and teaching of an interdisciplinary service learning course on global aging and health with a focus on Nicaragua. That year culminated with two weeks of service with elders in Nicaragua for nine students and two faculty members from PSU. The program, Global Aging and Health: Enhancing Communities in Nicaragua, is now in its sixth year and has included 86 students, 7 faculty, and 11 staff members with an on-going relationship in a small Nicaraguan community, Boaco. This poster presentation will detail the how the local community partner (JFR), the university partner (IOA), the students participating in the program, and the international community stakeholders are working together to create sustainable solutions to support a growing elder population. For example, in 2008, Dr. Milton Lopez – a Nicaraguan geriatric physician and public health expert – was hired by JFR to facilitate community engagement throughout the year as part of an investment in indigenous capacity building through on-going training and community outreach. This investment has enabled student and faculty service work to become more efficient and effective as community needs and student skills have become more closely aligned. Each author will contribute a unique perspective that will elucidate the innovative partnership that is aiming to become a model for international service learning work with older adults in less developed countries.

HEALTH LITERACY AMONG OLDER ADULTS LIVING IN RURAL COMMUNITIES: IMPLICATIONS FOR HEALTH PROMOTION INTERVENTIONS

E.T. Jurkowski, *School of Social Work, Southern Illinois University Carbondale, Carbondale, Illinois*

Health disparities, according to Healthy People 2010 and the Centers for Disease Control and Prevention are greater in rural communities among older adults, when compared to urban communities. This study examined health literacy levels among older adults (n=300) who lived in rural and frontier communities in a Midwest from the aspects of behavioral and oral health. A survey tool, using the Knowledge, Attitude and Behavioral (KAB) approach was utilized to identify specific strengths and areas for development within the realm of one's health literacy. Subjects (n=300) were chosen through a random selection of Senior Nutrition Sites (N=4) within a thirty one county area within a Midwest state. Findings suggest that respondents were more likely to understand the importance of overall health, followed by behavioral health when compared to one's oral health. Findings also revealed that older adults do not consider the importance of health issues which are not covered by Medicare or Medicaid (ie: Preventative oral health procedures). Subjects also revealed that a limited emphasis was placed on health areas if Medicare or Medicaid health coverage was non-existent. Implications suggest that health promotion campaigns need to consider one's overall health literacy rather than merely the programs which can be reimbursed under the current health mechanisms. Policy and program interventions can include the expansion of current coverage to prevention and health promotion efforts among older adults.

HEALTH PROMOTION

COST-EFFECTIVE HEALTH PROMOTION FOR OLDER WORKERS: FINAL FINDINGS

S. Hughes^{1,2}, R. Seymour¹, R. Campbell^{1,2}, J. Shaw³, R. Sokas², C. Fabiyi¹, 1. *UTC Institute for Health Research and Policy, Chicago, Illinois*, 2. *UTC School of Public Health, Chicago, Illinois*, 3. *UTC Department of Pharmacy Administration, Chicago, Illinois*

Health behaviors adopted by older workers during employment could reduce Medicare expenditures after retirement. We used a randomized trial to test two health promotion interventions with older workers. The first intervention combines web-based risk assessments with an action plan that is negotiated with a "Coach" who provides personalized follow-up reinforcement. The second intervention is a web-based health risk assessment and risk profile with disease-specific follow-up reinforcement modules. Outcomes examined included participant health behaviors, absenteeism, presenteeism and use and cost of health services at baseline, 6 and 12 months. Participants (N = 423) had a mean age of 51, ranging from 40-68. Approximately 80% were female, 62% minority, 81% reported at least one chronic condition, and 75% were overweight or obese. Analyses indicate that COACH participants experienced significant improvements on: stress and health-related stress at 6 months; participation in moderate physical activity at 6 and 12 months; and, on percent of energy from fat at 6 and 12 months and intake of fruits and vegetables at 12 months. COACH participants also used the program more extensively than RealAge participants (97% vs. 57%, respectively). Findings from this study provide insight into the development and implementation of cost-effective health promotion programs for our burgeoning number of older workers. We will also describe a follow-up study that has been funded to evaluate the translatability of the two interventions. The follow up study is examining preferences for packaging and marketing the programs, and barriers and facilitators to adoption, implementation, and maintenance.

HOW MUCH ARE PEOPLE DRINKING, ANYWAY: FINDINGS FROM NESARC

L.M. Ginzer, V.E. Richardson, *The Ohio State University, Columbus, Ohio*

The DSM diagnostic criteria for alcohol use disorders are based on behaviors, physiological responses to alcohol consumption, and consequences, not quantities of alcohol consumed. This analysis examines quantities of alcohol consumed and the frequency of binge drinking as a function of age and diagnosis, including the "at-risk" diagnostic level defined for people over the age of 60. Data are from the first wave of the National Epidemiological Survey on Alcohol and Related Conditions (NESARC) comprised of over 43000 US dwelling non-institutionalized people. Findings show that drinking at the dependence and abuse levels increase with age even though the overall levels of drinking decrease. Binge drinking levels decrease slightly after age 60 for those with alcohol abuse diagnoses. Interestingly, those without alcohol abuse diagnoses drink only slightly less than those with alcohol abuse diagnoses at all age groups although older adults binge drink considerably less than younger persons. Still, the presence of binge drinking at all diagnostic levels and ages is of concern. A significant percentage of those with dependence or abuse significantly reduce their drinking over a 12-month interval. These findings are important for practitioners assessing older adults' drinking behaviors and when communicating with older adults about healthy behaviors.

HEALTH PROMOTION WITH AFRICAN AMERICAN ELDERS: DETERMINING STRATEGIES AND INTERVENTIONS FOR AN URBAN ENVIRONMENT

C. Waites, S. Robinson-Lynk, F. Martin, *Social Work, Wayne State University, Detroit, Michigan*

This study explores strategies and interventions for health promotion with African American elders residing in an urban environment. With the growing number of aging African Americans, it is vital that health professionals and researchers identify culturally compatible health promotion strategies and interventions. Generally, we understand a great deal about the relationship between individual behavior and healthy aging. However, much less is known about the impact of the environment in the context of the aging process – especially among African Americans elders. Using a social ecological framework, this study examines the environment and the geographic accessibility of greenways, walking trails, health supporting services, senior centers, aggregate meal programs, casinos, transportation resources and other aging services available within the metropolitan Detroit, Michigan area. The study also examines the values, attitudes and traditions regarding healthy aging and health promotion of the elders who live in these communities. Geographic information system analysis (GIS), focus groups and surveys were conducted. Findings show that urban African American elders express interest in health and healthy lifestyles. Most important was their desire to maintain their independence and to engage in fulfilling social activity. They indicated that access to safe places to walk and having access to a senior center with a variety of activities and educational programs was sometimes challenging. They wanted more programs in their communities which will assist them in staying active and allow them to age in place.

IMPACT OF SUBJECTIVE AND OBJECTIVE NEIGHBORHOOD MEASURES ON DEPRESSION AMONG OLDER MEXICAN AMERICANS

K. Gerst, M. Peek, *University of Texas Medical Branch, Galveston, Texas*

Extant literature has suggested that neighborhoods are an important predictor of physical health. However, few studies have examined such a neighborhood effect on mental health outcomes, and none have examined subjective measures of neighborhood in addition to objective measures. This study examines the associations between subjective and objective neighborhood measures on depressive symptoms among Mexican American elders. Two-level hierarchical analyses were done using the fifth wave (2004-2005) of the Hispanic Established Populations for Epidemiologic Studies of the Elderly (Hispanic-EPESE). The sample consisted of 1,376 Mexican Americans aged 75 and over living in 307 neighborhoods across five southwestern states. The outcome was measured using the Center for Epidemiological Studies Depression Scale. The subjective neighborhood context was measured using the Social Cohesion and Trust Scale (SC&T). Objective neighborhood variables were matched to individual cases using 2000 US Census tract data. Results showed that high depressive symptoms varied across neighborhoods, even when controlling for individual and contextual variables. Among contextual level variables, the percent Mexican Americans in the neighborhood was significantly related to high depressive symptoms ($\beta = -0.02$), as was the percent of persons aged 75 and over living in the neighborhood ($\beta = -0.12$). Even after controlling for these additional variables, higher scores on SC&T were a significant predictor of high depressive symptoms ($\beta = 0.07$). We find that the effects of subjective and objective measures of neighborhood are independently associated with depressive symptoms. Future studies should therefore not only include community-level factors when examining mental health, but also respondents' subjective view of the neighborhood.

INTERVENTION IN PEDESTRIAN ENVIRONMENTS: OLDER PEOPLE'S APPRAISAL OF ENVIRONMENTAL MEASURES TAKEN, DIFFICULTY OF WALKING AND FREQUENCY OF ACTIVITY

S. Iwarsson¹, A. Stahl², 1. *Health Sciences, Lund University, Lund, Sweden*, 2. *Lund Institute of Technology, Lund University, Lund, Sweden*

OBJECTIVES: To investigate older inhabitants' appraisal of environmental measures taken in their residential area, overall and related to age, sex, perceived health, use of mobility devices and mode of transport, and to follow changes in perceived difficulty in walking, and changes in outdoor activity as related to age, change in perceived health, and use of mobility devices and mode of transport. **DESIGN:** Evaluation of an intervention project, based on data collected with a pre-/after postal questionnaire. **SETTING:** Residential area in a medium-sized Swedish town. **PARTICIPANTS:** 195 community-living people aged 65+ responded to postal questionnaires at baseline and at a 5-year follow-up. **MEASUREMENTS:** Appraisal of environmental measures taken in the pedestrian environment in the residential area, perceived health, use of mobility devices, mode of transport, change in perceived difficulty in walking, change in frequency of outdoor activity. **RESULTS:** Older people's appraisal of environmental measures taken in their residential area is overall positive, with women reporting higher appraisal, in particular as regards longer green time at signalised crossings. Overall appraisal was higher for those reporting better perceived health, in particular concerning separation between bicyclists and pedestrians. Also use of mobility devices influenced the appraisal of specific environmental measures. There was no significant change in difficulty in walking and actually the outdoor activity decreased over time, overall as well as in sub-groups. **CONCLUSION:** The main contribution of the current study is on the one hand the identification of which environmental measures older people appreciate, on the other the identification of the topical participant variables influencing their appraisal, indicating that there are sub-groups that benefit more of this kind of intervention in pedestrian environments.

SESSION 1055 (SYMPOSIUM)

NURSING HOME CULTURE CHANGE: PUTTING PROMISE INTO PRACTICE

Chair: *M. Bern-Klug, Social Work, University of Iowa, Iowa City, Iowa*
Discussant: *D. Downes, Jewish Home Lifecare, New York City, New York*

A sense of home (rather than of "hospital") is valued by people who live in residential long-term care settings. The term "home" conveys physical and emotional comfort as well as a sense of promise. Promise that basic human rights like privacy and basic human values like dignity will be honored. This symposium addresses the extent to which the promise of culture change has resulted in improved practices, by reporting the results of a critical review of green house homes based on existing literature; describing a study designed to measure culture change in one state; reporting the characteristics of nursing home social service directors who are involved in culture change; and by describing the link between social worker role identity and resident outcomes, and how building on this connection may help to facilitate culture change.

A CRITICAL EVALUATION OF GREEN HOUSE® HOMES IN THE CONTEXT OF EXISTING LITERATURE

S. Zimmerman, L.W. Cohen, Cecil G. *Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

The Green House® model is a style of small home skilled nursing care. These homes house 10-12 residents (called elders), have private rooms, a central hearth/living area, a communal dining area, open kitchen, universal workers, and non-hierarchical staffing. They have stimulated great interest and despite little outcomes research, there are 50 homes in operation and 130 in development. This presentation will provide

results of a detailed literature review that examined explicit and implicit components (structure, process, outcome) of the Green House model which was conducted after an expert panel achieved majority consensus regarding the extent to which each component was seminal to the model. For example, all experts agreed the organization of staffing was seminal. The related literature indicated that minimum recommended staffing thresholds (which are not met in 97% of all nursing homes) are met for both direct care and licensed staff in Green House homes.

THE LOUISIANA CULTURE CHANGE STUDY: EVALUATING NURSING HOME SOCIAL WORKERS AND CULTURE CHANGE

P.D. Allen, *School of Social Work, Louisiana State University, Baton Rouge, Louisiana*

The nursing home culture change movement seeks to improve nursing home resident health by building environments that lead to enhanced staff-resident relationships—relationships created and maintained through resident-centered choices. Social workers are logical agents to aid in this multidimensional movement that aims to improve all aspects of life within the nursing facility, such as standards as care quality, satisfaction, and staff retention and commitment. The purpose of this paper is to assess Louisiana's nursing homes in term of implementation of culture change and to highlight the role of social workers. The study compares the implementation rates of culture change with the level of training and education of social workers/social service designees. Facilities with higher implementation rates in three of the six of the culture change categories were significantly related to social work education level: Staffing, Homelike Environment, and Activities.

THE LINK BETWEEN SOCIAL WORK ROLE IDENTITY AND POSITIVE OUTCOMES IN PSYCHOSOCIAL CARE: IMPLICATIONS FOR THE SOCIAL CULTURE OF SKILLED NURSING FACILITIES

R.P. Bonifas, *Social Work, Arizona State University, Phoenix, Arizona*

Cultural change efforts in skilled nursing facilities have demonstrated a connection between the well-being of employees and the well-being of facility residents. However, facility social service providers have received limited attention in cultural change research. This presentation reviews recent findings that link stronger role identity among social service directors (SSDs) with positive outcomes in resident psychosocial care as identified by facility state survey inspectors. Differences by role identity level indicate that SSDs with stronger role identity are more likely to notify residents of upcoming changes, feel more influential in their facilities, and receive more support from co-workers. In addition, they ascribe a higher priority to accessing mental health services and financial resources for facility residents, more frequently provide linkage to community resources, and are more involved with resident advocacy efforts. The implications of these findings for cultural change and creating supportive working environments for facility SSDs will be discussed.

CHARACTERISTICS OF NURSING HOME SOCIAL WORKERS WHO REPORT INVOLVEMENT WITH CULTURE CHANGE

M. Bern-Klug¹, N. Takahashi², L. Levy-Storms², 1. *Social Work, University of Iowa, Iowa City, Iowa*, 2. *UCLA, Los Angeles, California*

Nursing home (NH) social workers are responsible for working toward resident psychosocial (emotional) well-being, which overlaps with a premise of the culture change movement: that the emotional experience of living in a long-term care setting is vitally important. This study looks at the extent to which NH and social service (SS) departments are involved with culture change. Findings (national sample of 1,071 NH SS directors) revealed variation: 43% reported their NH was involved in culture change, 26% "no" and 31% "I don't know." Among those whose NH was part of the culture change movement, 20% reported

that SS was the lead department for culture change, and 69% reported department involvement but not lead. The remaining 12% reported “other” and many wrote in “all departments are equally involved.” Logistic regression results indicated that region, number of beds, and profit status are related to culture change.

SUCCESSSES AND CHALLENGES IN IMPLEMENTING SMALL-HOUSE NURSING HOMES

R.A. Kane, L. Cutler, *Health Policy & Management, School of Public Health, University of Minnesota, Minneapolis, Minnesota*

Using examples from 3 large, multi-site, multi-level firms, we identify challenges in sustaining and expanding small-house nursing homes within an organization. At the level of the individual house we discuss role definitions for professionals, integration cooking and other roles into the front-line universal workers’ job descriptions, recruitment and training at all levels, and leadership. Small-house models require rethinking of every role in a nursing home—e.g. director of nurses, administrator, staff developer, activities director, dietary personnel social worker, or MDS coordinator. The models also require rethinking functions such as admissions, and quality assurance, managing post-acute care and adapting staffing patterns to different resident mixes in the various houses. Institution creep must be constantly avoided. At the system level, it is challenging to develop a small-house program while maintaining other foci of excellence—e.g. in assisted living or senior housing.

SESSION 1060 (SYMPOSIUM)

OLDER WORKERS IN HEALTH AND SOCIAL SERVICE SETTINGS

Chair: S. Butler, *University of Maine/School of Social Work, Orono, Maine*
Discussant: A. Barusch, *University of Utah and University of Otago, Salt Lake City, Utah*

According to the Bureau of Labor Statistics (BLS, 2008) employment of workers 65 and older increased 101% over the past three decades, as compared to a 59% increase for total employment (i.e., workers 16 and older). Moreover, BLS data indicate that while the total workforce is projected to increase by 8.5% in the next decade, the rate of increase for people 55-64 is expected to be 36.5% and for those over 65, more than 80%. Industries with labor shortages, such as health care and social services, face a shrinking pool of younger workers, requiring more focused attention on hiring and retaining older workers. Although age discrimination is ubiquitous, considerable evidence demonstrates that older workers have characteristics that make them ideally suited to caring professions: experience, maturity, loyalty, good judgment, dependability, and reliability. This symposium explores the experiences of older workers in four health and social service settings: child welfare, nursing education and practice, and home care. Cohen-Callow and co-authors report on a large study of child welfare workers comparing organizational experiences, turnover and work withdrawal behaviors of younger and older workers. Falk presents results from her grounded theory study focused on deans’ perceptions of extending the academic employment of aging nurse faculty. From a statewide survey, McIntosh and co-authors compare responses of older and younger nurses on general health, emotional health, and intention to leave their jobs. Butler and co-authors explore results from survey research on the job experiences of home care workers and highlights differences by worker age.

JOB EXPERIENCES OF OLDER HOME CARE WORKERS

S. Butler¹, M. Brennan², W. Turner¹, A. Ashley¹, 1. *University of Maine/School of Social Work, Orono, Maine*, 2. *AIDS Community Research Initiative of America, New York City, New York*

Maintaining an adequate supply of frontline workers in our long-term care system is challenging. As the baby boom generation ages and the supply of younger workers decreases, encouraging older workers to enter or remain in the field of direct care could be a win-win situation:

it provides meaningful work to older adults and workers to an industry facing labor shortages. This paper reports on a study of Personal Support Specialists in homecare (n=261) throughout Maine. Participants ranged in age from 18 to 82, with a mean age of 46. Increased age was related to lower physical function ($p < .05$) but greater social function ($p < .05$) and greater vitality ($p < .05$). Job burnout scores did not differ significantly by age, although older workers appeared to feel emotional exhaustion less intensely than younger workers ($p < .01$). Implications related to recruitment and retention of older workers will be outlined.

RETAINING THE WISDOM OF AGING NURSE FACULTY THROUGH RE-ADJUSTMENT

N.L. Falk, *George Mason University, Falls Church, Virginia*

By 2016, over one million new and replacement nurses will be needed to care for an aging U.S. population. Nurse faculty members are vital to educating nurses; yet, on average, they are over 50 years of age and face key retirement decisions. In 2006-2007, about 30,000 qualified applications were denied admission to nursing programs due largely to the faculty shortage. Continued employment of aging nurse faculty offers potential benefits to stakeholders. In this grounded theory study, interviews were conducted with deans from 9 diverse baccalaureate nursing programs in 8 states to gain understanding about perceptions related to extending the academic working life of aging nurse faculty. Findings reveal: aging nurse faculty are highly valued, programs and faculty face environmental challenges, when aging faculty fail to keep current—a mismatch, or “stakeholder incongruence” may occur, and re-adjustment can lessen the incongruence. Session attendees will be equipped to identify practical re-adjustment opportunities.

RNS PERCEPTIONS OF EMPLOYER HEALTH AND SAFETY INITIATIVES AND RETENTION

B. McIntosh, B. Rambur, M. Palumbo, *University of Vermont, Burlington, Vermont*

Retention of nurses in the workforce will continue to be important given growing shortages and increasing demand (US Department of Health and Human Services, 2002). Employer health and safety interventions are particularly important in the context of nurses’ perceived general and emotional health and their reported intention to leave their jobs (ANA, 2007). This study utilized a mail survey sent with standard relicensure materials to all RNs in a small rural state in March, 2007 (53% response rate, $n = 3,955$). Not unexpectedly, both physical and emotional health were predictors of intention to leave in both age cohorts (under 55 and 55+). Employer’s attention to safety practices was a strong predictor of intention to leave among nurses under 55 years of age and a slightly weaker predictor among those 55+. Perceptions of employers’ attention to health was a predictor of younger nurses intention to leave but not nurses 55 and older.

APPLICATION OF THE LIFE COURSE MODEL: DIFFERENCES BETWEEN YOUNGER AND OLDER WORKERS IN THE PUBLIC SECTOR

A. Cohen-Callow, K. Hopkins, H. Kim, *University of Maryland School of Social Work, Baltimore, Maryland*

Little evidenced based information exists on how best to respond to calls made for the public sector to retain older workers in service areas with high turnover. Using the life course model as a framework for this research, data was analyzed from a cross-sectional study of a random selection of employed child welfare workers in one East coast state ($n = 516$). Study participants ranged in age from 23 – 67 years of age. Generational differences were found with Baby boomers reporting lower levels of work withdrawal (i.e., absenteeism, unfavorable behaviors) ($p < .0005$), fewer search behaviors ($p = .06$), lower levels of stress ($p = .04$), and lower levels of work-life interference ($p = .02$) than Genera-

tion X workers. Discussion will address retention strategies and research that takes into account potential differences among cohorts of workers.

SESSION 1065 (SYMPOSIUM)

ORGANIZING AGAINST THE ATTACK ON ENTITLEMENTS: CURRENT POLICY AND ADVOCACY STRATEGIES IN SUPPORT OF SOCIAL INSURANCE

Chair: *L. Rogne, Minnesota State University, Mankato, Minnesota*

Discussant: *E. Kingson, Syracuse University, Syracuse, New York*

As the American people, a new Presidential Administration, and a new U.S. Congress struggle with an economic crisis, familiar forces favoring privatization of Social Security and the dismantling of our fundamental social insurance programs have capitalized on anxiety about our economic futures with a renewed attack on entitlements. Policy and advocacy groups supporting social insurance have mobilized to inform the public and advise policy makers about the realities of Social Security and Medicare and to assure that the programs that have provided for basic health and economic security in this country will be preserved and enhanced. Faced with a renewed wave of conversation in the political arena and in the media about the notion of a Social Security and Medicare funding “crisis,” policy experts and advocates are using social networking strategies, including the Internet, to respond quickly to proposals for drastic changes in social insurance programs. This symposium brings together leading scholars and advocates to discuss how they are working together to respond quickly and effectively to media misinformation and policy proposals that threaten social insurance programs. Presenters talk about how to translate key policy issues related to Social Security and Medicare into talking points for use with the public and policy makers and discuss how they are organizing resistance to proposals that would undermine basic social insurance principles.

SOCIAL INSURANCE AND THE CLAUDE PEPPER LEGACY

L. Polivka, Florida Policy Exchange Center on Aging, Tampa, Florida

This presentation is based on the perspective that Senator Claude Pepper’s vision of social insurance strategies for ensuring retirement security is as relevant today as it was over the course of his long career in public service. In fact the presentation will argue that Social Security, Medicare, and an improved Medicaid long-term care program will be more essential sources of retirement security for the baby boomers than they have been for their parents. The increasing importance of these programs is a function of deterioration in the private pension system, stagnant wages, declining savings, rising health care costs over the last 30+ years, and the projected need for over \$240,000 in savings to cover health care costs by 2030. The presentation will conclude with a discussion of “What Claude Would Do” if he were alive today, based on his social philosophy and legislative record.

HEALTH CARE REFORM AND THE DEFENSE OF SOCIAL INSURANCE

S. Gorin, Social Work, Plymouth State University, Canterbury, New Hampshire

Advocates of health care reform can play a critical role in defending social insurance programs. In recent years, individuals from a range of perspectives have argued that the United States faces an “entitlement crisis,” which can only be addressed by cutting spending on Social Security and Medicare. Yet, Social Security has built up a surplus that will remain for at least another thirty years. Medicare costs have accelerated, but this is a reflection and consequence of health care inflation generally. The solution to the “entitlement crisis” is not cutting Social Security and Medicare but reforming our health care system, a point not always understood by health care reform advocates. If advocates of health care reform and defenders of social insurance join together they can strengthen each movement. This paper describes efforts to bring these groups together.

THE ASSAULT ON SOCIAL SECURITY AND THE BIRTH OF A COUNTERMOVEMENT

C.L. Estes¹, J. Svihula³, B. Hollister¹, B. Grossman¹, L. Rogne², 1. UCSF, San Francisco, California, 2. Minnesota State University-Mankato, Mankato, Minnesota, 3. University of North Carolina, Chapel Hill, Chapel Hill, North Carolina

While antagonists have existed since Social Security’s inception in 1935, opposition to the program reached a climax in President Bush’s second term privatization campaign. Alongside federal budget deficits and the US economic meltdown, efforts persist to dismantle social insurance and the social contract via calls for “Entitlement Reform” and claims of the unsustainability of Social Security and Medicare. In this political cauldron, the authors contend that a fragmented set of actors and organizations (working separately and together) have emerged to produce a fledgling countermovement of resistance. Social Movement theories (e.g., resource mobilization and political opportunity) are utilized in examining the development, composition, activities, and promise of this countermovement. Data sources include congressional and administrative documents, think tank Web Sites, The Congressional Quarterly and other online databases and groups, Obama White House convenings, and statements of public opinion leaders and advocates (2000-2009).

SILENCING CHICKEN LITTLE: CALMING THE HYSTERIA AROUND SOCIAL INSURANCE PROGRAMS THROUGH EDUCATION AND GRASSROOTS ADVOCACY
