Participants will understand how organizations and coalitions have worked to defuse the public’s growing anxiety about suggested implications of the current economic and demographic trends’ effect on social insurance programs. They will appreciate the historical and ongoing work protecting and enhancing these programs, including field campaigns, amplifying the truth about the programs, and issuing regular, targeted publications tracking both proponents’ and oppositions’ activities. The new political environment requires a fresh paradigm of how to approach policy makers in a proactive, supportive, and principled manner. This presentation highlights how to efficiently and collaboratively be a relevant voice in policy discussions about social insurance programs in the political arena. Participants will understand strategy on developing political relationships to ensure credibility and a place at the table. Finally, new approaches to organizing and amplifying the grassroots’ voice in this discussion will be shared, including on line and digital video advocacy and organizing methods.

WHAT ENTITLED YOUTH? SOCIAL INSURANCE, MILLENNIAL ORGANIZING, AND A NEW METHOD OF POLITICAL ENGAGEMENT

C. Howarth, Policy, Roosevelt Institution, Washington, District of Columbia

Objective 1: After attending this session participants will be able to: Translate central social insurance principles and policies into messages suitable for both mainstream and youth-oriented markets. Objective 2: After attending this session participants will be able to: Create successful strategies for engaging and mobilizing young student and non-student populations around the issues raised by social insurance policy. Program Overview: As the 111th Congress gets underway, many have raised the specter of an “entitlement crisis” that requires immediate and drastic cuts to current spending on the federal government’s three largest domestic programs: Medicare, Medicaid, and Social Security. All groups along the ideological spectrum have launched campaigns targeted to young people, seeking to convince them of their arguments and mobilize their actions and their votes on the issue. Yet few campaigns, if any, have generated widespread youth engagement or any measure of rapid values-realignment. This presentation will focus on where policy framing meets

youth engagement, and a new era of political involvement that is unique to the Millennial generation. It will also explore social insurance's unique place among young people, both students and non-students, and suggest new organizing methods that directly capitalize upon young people's relationships to entitlement programs, emphasizing first-hand experience, Millennial messaging, and grassroots mobilization.

SESSION 1070 (SYMPOSIUM)

THE 2007 NATIONAL HOME AND HOSPICE CARE SURVEY (NHHCS): PROVIDERS, PATIENTS, AND HOME HEALTH AIDES

Chair: *L. Harris-Kojetin, National Center for Health Statistics, Hyattsville, Maryland*

Discussant: *P.H. Feldman, Center for Home Care Policy and Research Visiting Nurse Service of New York, New York, New York*

This symposium highlights new nationally representative data from the 2007 National Home and Hospice Care Survey (NHHCS) which can be used to examine health care topics concerning aging, chronically ill, and disabled populations. The 2007 NHHCS response rate was 71 percent and the public use data files are scheduled to be released in spring 2009. This session gives an overview of the 2007 NHHCS; provides data highlights on agencies, patients, and aides; and explains how to access the public use files to conduct analyses. The 2007 NHHCS is one in a series of national probability sample surveys of home health and hospice agencies conducted periodically since 1992. The 2007 NHHCS was redesigned and expanded to better meet the data needs of health care planners working to ensure that quality long-term care will be available for a growing senior population. New survey items include information on the training and certification of key personnel, electronic information systems, patient health and functional status, emergency department use and hospitalizations, medications, pain management, and end-of-life care. The 2007 NHHCS includes the first national survey of home health aides. With the population of older adults projected to double in the next 25 years, the desire of people to age in place, and a growing emphasis on home and community-based services, home health and hospice care are likely to play greater roles in the continuum of long-term care services. NHHCS provides valuable data to explore and track health care and policy issues affecting our growing aging population.

OVERVIEW OF THE REDESIGNED 2007 NATIONAL HOME AND HOSPICE CARE SURVEY (NHHCS)

L. Harris-Kojetin, National Center for Health Statistics, Hyattsville, Maryland

NHHCS uses a nationally representative probability sample of home health and hospice agencies to collect data on agencies, their patients, and staffs. The 2007 NHHCS was redesigned and expanded to better meet the data needs of researchers and health care planners working to ensure that quality long-term care will be available for the Nation's growing senior population. Conducted between August 2007 and February 2008, data were collected on 1,036 agencies, about 4,700 current home health patients, and about 4,700 hospice discharges through interviews with agency representatives. The 2007 NHHCS response rate was 71 percent. As a supplement to NHHCS, the first ever National Home Health Aide Survey collected data on home health aides working in home health or hospice agencies through 3,416 interviews completed between September 2007 and April 2008. This presentation explains key features of the redesign and describes some new content collected on agencies, patients, and aides.

COMPARISON OF HOME HEALTH AND HOSPICE AGENCIES BY ORGANIZATIONAL CHARACTERISTICS AND SERVICES PROVIDED

E. Park-Lee, F.H. Decker, National Center for Health Statistics, Hyattsville, Maryland

Demand for home health and hospice care has been growing over the years. Adding hospice benefits to Medicare in 1982 and the advent of a home health prospective payment system in 2000, together with increased awareness by patients and families of home health and hospice services as alternatives to institutional care, have led to an increase in the number of agencies providing these services. The 2007 National Home and Hospice Care Survey (NHHCS) collected nationally representative information on 1,036 home health and hospice agencies. Three types of agencies - home health only, hospice only, and mixed - were compared by organizational characteristics (e.g., ownership status, Medicare/Medicaid certification, freestanding vs. others, and region) and services they provide. Information on the similarities and/or differences in the configuration of these agencies contributes to enhancing patients' and policymakers' understanding of how the needs for home health and hospice care are being met.

AN OVERVIEW OF THE 2007 NATIONAL HOME HEALTH AIDE SURVEY

A. Bercovitz, A.J. Moss, M. Sengupta, E. Park-Lee, A. Jones, L. Harris-Kojetin, Long Term Care Statistics Branch, National Center for Health Statistics, Hyattsville, Maryland

This presentation will provide an overview of, and highlight selected national estimates for, the 2007 National Home Health Aide Survey (NHHAS), the first nationally representative survey of home health aides employed by agencies providing home health or hospice care. NHHAS includes variables on demographics; family structure and responsibilities; job benefits, including health insurance; use of public benefits; job history; job characteristics, including wages and hours worked and workload; measures of satisfaction with job and supervisor; training; travel time; and number, type, and cause of work-related injuries. NHHAS was designed to be comparable to the 2004 National Nursing Assistant Survey, with identical wording for many questions across the two surveys, permitting comparison of direct care workers across long-term care settings. The NHHAS file may also be linked with the National Home and Hospice Care Survey (NHHCS) agency file to control for agency characteristics.

NATIONAL HOME AND HOSPICE CARE SURVEY: PATIENT DATA

L.L. Dwyer, C. Caffrey, A. Jones, M. Sengupta, A. Moss, L. Harris-Kojetin, Division of Health Care Statistics, National Center for Health Statistics/CDC, Hyattsville, Maryland

The patient health (PH) and payment (PA) modules in the 2007 National Home and Hospice Care Survey contained many new content areas compared to previous survey years. The new content included questions about pain management, medications taken, advance directives, emergent care, and out-of-pocket expenses, to name some examples. Data were collected on approximately 4,700 current home health patients and 4,800 hospice discharges across more than 1,000 agencies. The patient modules had high response rates—95.4 percent for PH and 94.4 percent for PA. This presentation will highlight national estimates on selected new survey items for home health patients and hospice discharges and give information on how and where to access the online patient/discharge public-use data file and web documentation.

SESSION 1075 (SYMPOSIUM)

GENOME AND EPIGENOME INSTABILITY IN AGING

Chair: J. Vijg, *Genetics, Albert Einstein College of Medicine, Bronx, New York, New York*

Evidence is now accumulating that erosion of genome and epigenome informational integrity is a critical factor not only in cancer but also in non-cancer, age-related cell and tissue degeneration. Highly conserved pathways have evolved to detect the presence of genome damage, effectuate its repair or signal cellular responses, such as apoptosis and senescence. Understanding the cellular pathways involved in these processes during normal cellular development and aging and gaining a clear understanding of their consequences in terms of possible DNA sequence errors or chromatin alterations may eventually lead to novel interventions to delay cellular degeneration and death. Key questions that need to be addressed involve the type of (epi)genomic changes that occur during aging, their organ and tissue distribution, their effect on cell and tissue functioning and their relation to age-related disease. This symposium will focus on the use of novel, high-throughput approaches for studying changes in the genome and epigenome and their possible consequences during aging in humans and model organisms.

RELOCALIZATION OF CHROMATIN MODIFIERS AS A CAUSE OF AGE-RELATED CHANGES IN GENOME STABILITY AND GENE EXPRESSION

D.A. Sinclair, P. Oberdoerffer, *Pathology, Harvard Medical School, Boston, Massachusetts*

For decades, gene expression patterns have been known to change with age. Why certain genes are selectively altered and what consequences this has for the organism is unknown. Work by the Vijg lab indicates that changes in the expression of mammalian genes with age may be due to oxidative stress-induced DNA damage. In yeast and simple metazoans, the SIR2 gene family (aka the sirtuins) extend lifespan by mechanisms that ostensibly overlap with caloric restriction, although this is debated. We find that oxidative stress results in a loss of silencing at loci that are repressed by Sir2. Paralleling yeast Sir2, the murine orthologue SIRT1 participates in the silencing of repetitive (pericentromeric) and promoter DNA and that this silencing is reduced upon exposure to DNA damage. We have mapped promoters that SIRT1 binds to and observe a redistribution of SIRT1 upon exposure to oxidative stress that correlates with alterations in the expression of SIRT1-target genes in damaged cells and in the aging mouse brain. Following DNA damage, SIRT1 is recruited to sites of damaged DNA to facilitate repair and recruit key repair proteins including rad51 and Nbs1. Consistent with *in vitro* data, increasing SIRT1 expression in transgenic mice suppresses changes in SIRT1-regulated genes in the aging brain and promotes survival in a mouse model of genomic instability and cancer. The data support the idea that DNA damage-induced redistribution of chromatin modifiers (RCM) may underlie gene expression changes that characterize eukaryotic aging. This work was supported by NIA, The Glenn Foundation and the Ellison Medical Foundation.

DNA METHYLATION IN AGING AND CANCER

J. Issa, *University of Texas MD Anderson Cancer Center, Houston, Texas*

DNA methylation of CpG island associated promoters is a mechanism of gene inactivation during embryonic development that is physiologically involved in X-inactivation, imprinting and germ-cell restricted expression. In adult cells, this mediator of epigenetic silencing has been shown to be intimately involved in the development of neoplasia through acquired DNA methylation of tumor-suppressor (and other) genes. In the GI tract, we have shown that aberrant CpG island methylation can be acquired in normal-appearing tissues as a function of age and we have proposed that this molecular event predisposes cells to neoplastic transformation, implying that the earliest steps in sporadic carcinogen-

esis could be epigenetic. There is now significant support for this hypothesis from animal studies, and from the observation of epigenetic field defects surrounding many epithelial malignancies. Recent work will be discussed showing that, in humans, epigenetic variation in the GI tract is related to age more than any other factor such as diet or folate. Global methylation profiling reveals that age-acquired methylation is also common in mice proving that it reflects physiologic age rather than time-dependent events. The process is exquisitely tissue-specific and likely results from interplay between a genome architecture that predisposes to methylation, tissue specific factors that protect against methylation and extrinsic/exposure/stochastic factors that alter the balance, resulting in epigenetic variation in a genetically homogeneous population. It is likely that age-related promoter methylation alters cellular physiology and contributes to age-acquired diseases though this needs to be rigorously shown in experimental and human models. The availability of drug intervention to modify DNA methylation and histone modifications also raises the prospect of epigenetic based prevention for age-related diseases.

LIFE, DEATH, AND TRANSFORMATION: EPIGENETIC AND ARCHITECTURAL REGULATION

M.G. Rosenfeld², M.D. Cardamone², P. Cook², I. Garcia-Bassets², Q. Hu², K. Hutt², B. Ju², Y. Kwon¹, *1. Medicine, UCSD, La Jolla, California, 2. HHMI/UCSD, La Jolla, California*

While the role of liganded nuclear receptors in mediating coactivator/corepressor exchange is well established, nuclear motor-dependent regulation of chromosomal organization in the three-dimensional space of the nucleus to diverse signaling events is emerging as a major parallel strategy to achieve integrated transcriptional responses revealing a key role for the modulation of nuclear architecture in orchestrating regulated gene expression programs in the mammalian nucleus, using previously unsuspected classes of sensor molecules. Thus, a network of covalent modifications of coactivators/corepressors modulate general and gene-specific nuclear/chromatin architecture to regulate developmental, homeostatic, and disease gene expression programs. Chromosomal translocations and their corresponding gene fusions play important roles in many diseases of developmental and in initial steps in cancers, which is particularly well-established for leukemias, but now identified as a more general event in solid tumors. The molecular basis for these tumor translocation events is quite incompletely understood, although a prevailing model instituted by events in yeast, is that random translocations are selected by conferring growth advantage. A model for the molecular logic underlying tumor translocation events will be presented.

GENETIC VARIATION IN GENOME MAINTENANCE AND AGING

Y. Suh, *Albert Einstein College of Medicine, New York, New York*

Aging is a major risk factor for the most common human diseases and one of the most complex phenotypes that we know. The identification of genetic variation and their potential functional impact on aging-related phenotypes will be important in assessing genetic components of aging, including exceptionally healthy aging, ultimately contributing to our understanding of functional diversity in aging human populations. We hypothesize that genetic variation at loci involved in genome maintenance can be related to individual differences in the rate and severity of aging. We are conducting a systematic multidisciplinary study to discover "functional gene SNP haplotypes", i.e., allelic variation caused by multiple SNPs in the same gene, among over a hundred candidate genes acting in genome maintenance pathways. These candidate genes include all DNA repair genes in which heritable mutations have been found associated with accelerated aging in humans or mice as well as genes interacting with these key genes and other genes acting in the same pathway. To ascertain the functional relevance of observed positive associations, candidate gene-SNP haplotypes are screened for var-

ious parameters of cellular fitness in short-term cell culture studies. Functionally relevant gene variants will then be further studied for their in vivo effect during aging by modeling them in mouse. We will present an example of gene variants related to a major aging-related disease.

SESSION 1080 (SYMPOSIUM)

BRIDGING THE NEXUS OF AGING AND DISABILITY RESEARCH: CHALLENGES AND SOLUTIONS FOR IMPROVING HEALTH, EMPLOYMENT, AND INDEPENDENT LIVING

Chair: I.R. Molton, *Rehabilitation Medicine, University of Washington, Seattle, Washington*

Discussant: A. Jette, *Boston University, Boston, Massachusetts*

As a result of major advances in medical knowledge and rehabilitation practice over the past several decades, adults with long-term physical disabilities acquired early in the lifecycle are living well into older age. Similarly, increases in longevity in the general population mean a greater incidence of new-onset disabilities in older adults. This combined “wave” of individuals aging with and aging into physical disability represents a major challenge to researchers, health care practitioners, and policymakers. To meet this challenge, an interdisciplinary “bridging” perspective that spans the fields of disability and aging through the social model of disability will be of key importance. This symposium will highlight the importance of cross-collaboration between aging and disability research and practice networks, and will discuss the unique psychosocial, medical, and economic needs of middle-aged and older adults with physical disabilities. Dr.’s Campbell and Putnam will provide an overview of the important demographic, conceptual, and policy issues associated with the nexus of aging and disability, and will highlight the commonalities and differences experienced by those aging with a disability versus those aging into disability for the first time in mid- to later- life. Dr. Molton will provide an overview of the nature and course of prevalent secondary conditions, including pain, in middle-aged and older adults living with long-term disabilities, and will also discuss some statistical and methodological challenges in separating the effects of chronological age from disability duration. Finally, Dr. Johnson will present on factors associated with maintaining employment, transitioning to retirement, and maximizing independence and community participation in persons aging with spinal cord injury and other disabilities.

NATURE AND COURSE OF SECONDARY CONDITIONS IN MIDDLE-AGED AND OLDER ADULTS LIVING WITH PHYSICAL DISABILITY

I.R. Molton, *Rehabilitation Medicine, University of Washington, Seattle, Washington*

Physical disabilities such as spinal cord injury, multiple sclerosis, and limb amputation are often associated with equally disabling secondary conditions, including problems with chronic pain, nausea, difficulties with gait and balance, and psychological comorbidities. Increasing age is a known risk factor for physical disability, and with increases in longevity more older adults are living with both long-term and recently acquired physical disabilities. In this presentation, the author will review what is known regarding the expected nature, course and psychosocial impact of secondary conditions across the lifespan, with an emphasis on chronic pain and psychological functioning. The author will also highlight the importance of methodological consistency in advancing the field of aging and disability, and will explore some important statistical considerations present in effectively isolating the effects of “aging” variables (such as chronological age, time with disability, and time at disability onset) in cross-sectional analyses.

EMPLOYMENT AND DISABILITY

K. Johnson, *Department of Rehabilitation Medicine, University of Washington, Seattle, Washington*

People with spinal cord injuries (SCI), multiple sclerosis (MS) and other disabilities are employed at a much lower rate than the general population; however, most would prefer to work and employment status is associated with higher reported quality of life and better mental and physical health. Functional limitations alone cannot account for the low rate of employment. Rather, issues related to health care insurance, subsidy, and other socio-economic variables play a significant role. Of those who do enter employment, there is evidence that they may leave employment because of premature aging and loss of function associated with disability. Health care workers may assist with problem-solving barriers to employment, and assist people who are working make informed decisions about early retirement as their function decreases. Referrals for vocational rehabilitation and/or benefit planning may be critical. Supported by: The contents of this abstract were developed under a grant from the Department of Education, NIDRR grant number H133B031129. However, those contents do not necessarily represent the policy of the Department of Education, and you should not assume endorsement by the Federal Government.

BRIDGING THE AGING AND DISABILITY NEXUS: DEMOGRAPHIC, CONCEPTUAL AND POLICY PERSPECTIVES

M.L. Campbell¹, M. Putnam², 1. *U.S. Department of Education, National Institute on Disability and Rehabilitation Research, Washington, DC, District of Columbia*, 2. *Simmons College, Boston, Massachusetts*

Dramatic increases in longevity experienced by middle-aged and older adults with long-term and newly acquired disabilities highlight the need to better understand the demographic, conceptual and policy issues that characterize the nexus of aging and disability. To respond to this need, the authors draw on the social model of disability and the International Classification of Functioning, Health and Disability (the ICF) as a bridging framework and present national data documenting similarities and differences in key indicators of disability, health, functional status, employment, utilization of assistive technologies, and preferences for independent living for individuals aging with and aging into disability in mid- to later-life. The authors also describe the pros and cons of recent state and federal policy developments aimed at bridging the traditional gaps between aging and disability funding and service deliver streams. Conclusions offered identify next steps in advancing the nexus of aging and disability research agenda.

SESSION 1085 (SYMPOSIUM)

CREATIVE STRATEGIES FOR HEALTHY AGING IN MINORITY AND UNDERSERVED POPULATIONS

Chair: D. Yee-Melichar, *Gerontology Program, San Francisco State University, San Francisco, California*

Discussant: K.E. Whitfield, *Duke University, Durham, North Carolina*

This innovative symposium addresses the important conference theme of Creative Approaches to Healthy Aging. It features a distinguished panel of speakers who will discuss contemporary issues in minority and underserved populations. Sara E. Espinoza, M.D., Inkyung Jung, Ph.D., and Helen P. Hazuda, Ph.D. (University of Texas Health Science Center at San Antonio) will discuss targets for the promotion of healthy aging in Mexican American older adults from the San Antonio longitudinal study of aging. Participants will learn about a health promotion intervention described as the Healthy Active Lifestyle Program for low income Filipino elders from Melen McBride, Ph.D., RN, GSAF (Stanford Geriatric Education Center) and Susan Dilkes, MBA (Filipino American Service Group Incorporated). Yunju Nam, Ph.D. and Hyo Jin Jung, MSW (George Warren Brown School of Social Work,

Washington University in Saint Louis) will share information on the effects of noncitizen eligibility restriction on older immigrants' Medicaid participation and health insurance coverage after welfare reform, using data from the Current Population Study. Participants will learn about the measurement of cancer literacy in Filipino and Mexican American immigrant women from Barbara W.K. Yee (University of Hawai'i at Manoa) and Lydia P. Buki (University of Illinois). Darlene Yee-Melichar, EdD, chair of the GSA Task Force on Minority Issues in Gerontology and former chair of the DHHS-OWH Minority Women's Health Panel of Experts, will serve as moderator. Keith Whitfield, PhD, member of the National Board of Scientific Counselors, National Institute on Aging and former chair of the GSA Task Force on Minority Issues in Gerontology, will serve as discussant. Sponsored by the GSA Task Force on Minority Issues in Gerontology.

WELFARE REFORM AND OLDER IMMIGRANTS' HEALTH INSURANCE COVERAGE

Y. Nam, H. Jung, *George Warren Brown School of Social Work, Washington University in Saint Louis, Saint Louis, Missouri*

Background: The welfare reform bill of 1996 severely constrained noncitizen's access to Medicaid by imposing restrictive eligibility rules. The bill prohibits states from providing federally-funded Medicaid benefits to post-enactment immigrants (noncitizens who immigrated after welfare reform) for their first five years in the country, while giving state governments flexibility in determining Medicaid eligibility of other noncitizens. This study investigates changes in Medicaid and health insurance coverage among older immigrants after welfare reform. **Methods:** This study conducts secondary data analyses using individual level data from the Current Population Survey and state-level Medicaid policy data. This study uses the CPS data from 1994 to 1996 (pre-welfare reform period) and from 2003 to 2008 (post-welfare reform period). This study employs differences-in-differences analysis that compares changes in Medicaid and health insurance coverage among older immigrants between those living in generous states (providing state-funded Medicaid to ineligible noncitizens) and those living in non-generous states. **Results:** Multivariate analyses show that older immigrants living in generous states are significantly more likely to participate in Medicaid and to have health insurance than those living in non-generous states. Naturalized citizens' Medicaid coverage is significantly higher than those living in generous states than those in non-generous states after welfare reform. Health insurance coverage is significantly higher among noncitizen living in generous states in comparison with those living in non-generous states. **Conclusions:** The results suggest that Medicaid eligibility rules play important roles in older immigrants' health insurance coverage. It is recommended to restore noncitizens' Medicaid eligibility to provide health insurance coverage to vulnerable noncitizens.

MEASUREMENT OF CANCER LITERACY IN FILIPINO AND MEXICAN AMERICAN IMMIGRANT WOMEN

B. Yee¹, L. Buki², 1. *University of Hawai'i at Manoa, Manoa, Hawaii*, 2. *University of Illinois, Chicago, Illinois*

Health literacy has emerged as an important construct and mediator of health outcomes. Four components (i.e., cultural and conceptual knowledge, listening and speaking (oral literacy), writing and reading (print literacy), and numeracy contribute to health outcomes (IOM, 2003). There is a lack of consensus regarding the most appropriate ways to measure these components of health literacy and their relative contributions to health outcomes. In the context of documented health disparities in breast and cervical cancer among immigrant populations (IOM, 2002), it is surprising that there is a relative absence of measurement tools to assess cancer literacy in low literate and limited English populations. This presentation will examine the processes we undertook to develop a measure of cultural and conceptual knowledge of breast and cervical cancer for Filipina and Mexican American immigrant women. The study consisted of three phases with Mexican and Filipino

women who were 39 to 88 years of age and had completed 0 to 12th grade educational levels. * Research project entitled "Culture and Cancer Literacy among Immigrant Women" was supported by the National Cancer Institute, R03CA115795 (Lydia Buki, PI)

HEALTH PROMOTION INTERVENTION FOR LOW INCOME FILIPINO ELDERS

M. McBride, *Stanford Geriatric Education Center, Stanford University, Stanford, California*

Low-income older Filipino immigrants in a West Coast metropolitan area continue to experience barriers to health care access and culturally relevant health information. A community-based, non-profit organization initiated the Active Lifestyle Program (HALP), a health promotion program in response to findings of a local health screening in which 43% (N=127) had elevated blood glucose that was undiagnosed. The agency developed a culturally oriented train-the-trainer model on nutrition and fitness exercise with Filipino martial arts (KALI) for 23 Senior Peer Educators recruited from nine community groups to educate peers on nutrition and exercise. Post-training results: 60% had decreased blood pressure; 52% had lower heart rate from baseline; 50% maintained normal body mass index (BMI); and 35% lost a total of 50 lbs. Outreach activities resulted in 133 educational sessions to 340 Filipino elders. Currently, older Filipinos with diabetes and the 50+ baby boomers are using this model.

TARGETS FOR THE PROMOTION OF HEALTHY AGING IN MEXICAN AMERICAN OLDER ADULTS: RESULTS FROM THE SAN ANTONIO LONGITUDINAL STUDY OF AGING

S. Espinoza, H. Hazuda, I. Jung, *University of Texas Health Science Center at San Antonio, San Antonio, Texas*

Background: In order to identify targets for clinical intervention to promote healthy aging in Mexican Americans (MAs) as they age, we examined the contribution of frailty, diabetes, and cardiovascular comorbidity to survival in older MAs. **Methods:** Subjects were 348 MA participants in the San Antonio Longitudinal Study of Aging aged 65-74 at baseline and followed for an average of 9.9 years. The contribution of frailty, diabetes, and cardiovascular comorbidity to mortality was calculated using a Cox proportional hazards model, adjusting for sociodemographic factors. **Results:** The hazard ratios (HR) for mortality were similar for frailty (HR=1.8, 95%CI:1.1-2.95) and diabetes (HR=1.51, 95%CI:1.01-2.26). The HR for cardiovascular comorbidity was not significant (HR=1.2, 95%CI:0.8-1.81). **Conclusions:** Caring for MAs as they age requires development of creative strategies for prevention and management of both frailty and diabetes as these conditions are significant contributors to decreased survival and undermine healthy aging.

SESSION 1090 (SYMPOSIUM)

DEMENTIA AND THE LIVED EXPERIENCE OF CAREGIVING AMONG LATINO FAMILIES: QUALITATIVE PERSPECTIVES ON SUFFERING AND RESILIENCE IN CHALLENGING SITUATIONS

Chair: L. Hinton, *Psychiatry, U.C. Davis, Sacramento, California*

Discussant: M. Iris, *Council for Jewish Elderly, Chicago, Illinois*

As the number of older Latinos with Alzheimer's disease and other degenerative dementias continues to grow, there is a great need to better understand how their families experience their roles as caregivers as the basis for more effective and cultural-tailored outreach and interventions. Through its focus on meanings and behaviors in context, qualitative research has the potential to broaden and deepen our understanding of these issues and to complement quantitative research. The presentations in this symposium are all based on qualitative methods and draw attention to the aspects of caregiving that Latino family members find particularly challenging as well as their management strategies. More specifically, these presentations highlight difficult behav-

ioral symptoms and their impact on the family (Jimenez), the importance of interpersonal violence and aggression (Hinton), meaning-making in the face of loss (Flores), and coping strategies for managing daily challenges (Mendez-Luck). Together, these papers highlight both the sources of suffering and sites of resilience in the lives of Latino caregivers. The implications of this research for both clinical practice and theory will be addressed.

SU HISTORIA ES MI HISTORIA (HER STORY IS MY STORY): NARRATIVES OF SPOUSES OF LATINA/OS WITH DEMENTIA

Y. Flores, L. Hinton, *Psychiatry, U.C. Davis, Sacramento, California*

This paper draws on qualitative interviews of Latina and Latino caregivers to offer an analysis of the role of migration and gender on the ethics of care of spousal caregivers of Latinos diagnosed with dementing illnesses. I examine how immigrant male and female caregivers give meaning to the experience of caring for spouses whose capacities are waning and whose illness at times they do not understand. These poignant narratives illuminate potential sites of intervention to lessen the stress of caregiving

LATINO FAMILIES RESPONSE TO NEUROPSYCHIATRIC DISTURBANCES IN ALZHEIMER'S DISEASE

D.E. Jimenez¹, L. Hinton², *1. Dartmouth Medical School, Lebanon, New Hampshire, 2. University of California, Davis Medical School, Sacramento, California*

Neuropsychiatric disturbances in dementia can complicate the caregiving process by increased disability, health care costs, and caregiver burden. Since Latinos tend to exhibit a greater number of behavioral problems than African-Americans and Caucasians, it is increasingly important to understand how families adapt and cope with behavioral problems, and how these coping strategies affect the care recipient. In-depth interviews were conducted with 45 Latino caregivers who were caring for a family member with dementia. Many of these caregivers stated that family and friends have distanced themselves from the care recipient as a result of behavioral problems. Also, neuropsychiatric disturbances tended to cause shame and embarrassment leading the caregiver to keep the care recipient isolated from family and friends. This isolation can have deleterious effects on the caregiver as well as the care recipient since the Latino culture is known for large social networks and has familismo as a core cultural value.

OVERCOMING A BAD DAY: A QUALITATIVE LOOK INTO THE ALZHEIMER'S CAREGIVING EXPERIENCE OF MEXICAN-AMERICAN WOMEN LIVING IN EAST LOS ANGELES

C.A. Mendez-Luck^{1,2}, S. Wallace^{1,2}, M. Miranda², *1. Community Health Sciences, UCLA School of Public Health, Los Angeles, California, 2. UCLA Resource Center on Minority Aging Research, Los Angeles, California*

Because the Latino population is relative young and the risk of acquiring Alzheimer's disease increases with age, greater numbers of Latino caregivers will eventually find themselves caring for an elderly loved one with the disease. Yet the current literature on Alzheimer's caregiving among Latinos is limited, requiring further research. We conducted one-time qualitative interviews with sixteen Mexican-American female caregivers about their experiences caring for an elderly relative, nine of whom had Alzheimer's disease. Eleven caregivers described caregiving as "tiring," "wearing," or "hard;" almost half were caring for relatives with Alzheimer's disease. Six of eleven women who described caregiving in these terms reported suffering from stress, insomnia, nervousness, migraines, and/or depression. We also found that Alzheimer's caregivers faced unique challenges, including changes in care recipients' personalities and behaviors over time. However, these

caregivers viewed support groups and home aide services as critical to their successful coping and longevity as caregivers.

UNDERSTANDING AGGRESSIVE BEHAVIORS IN SOCIOCULTURAL CONTEXT: AN ETHNOGRAPHIC STUDY OF LATINO'S FAMILY CAREGIVERS AND PERSONS WITH DEMENTIA

L. Hinton¹, J. Barker², *1. Psychiatry, U.C. Davis, Sacramento, California, 2. University of California, San Francisco, San Francisco, California*

This paper examines the phenomenology of aggressive behaviors as they emerged in social interactions between Latino elderly with dementia and their family caregivers. This paper is based on data collected during 15 months of intensive ethnographic field work with five Latina women caring a family member with dementia. Aggressive behaviors were identified as an important concern by caregivers and were often triggered by escalating conflicts over issues such as dressing, going outside the home, or personal hygiene. Caregivers understood aggressive behaviors in ways that differed with respect to the degree of responsibility or control attributed to the person with dementia. The behavioral and affective responses of families to aggression also varied considerably, ranging from emotional warmth to criticism and threats. We draw upon the expressed emotion framework as a way of thinking about the role of culture and the variability observed in family patterns of response to aggressive behaviors

SESSION 1095 (SYMPOSIUM)

DIFFERENTIAL CHANGE IN HEALTH IN LATER LIFE

Chair: *I. Schöllgen, German Centre of Gerontology, Berlin, Germany*

Discussant: *J. Smith, University of Michigan, Institute for Social Research, Ann Arbor, Michigan*

In aging research, health trajectories are often described as a phenomenon of progressive decline with increasing age, neglecting the differential trajectories of different people and different time frames of change. In this symposium the role of psychological and sociological variables associated with mean levels and long- or short-term change in health will be discussed. The first two speakers deal with long-term change, using nationally representative datasets of middle-aged and older adults. Schöllgen, Huxhold, and Tesch-Römer investigate variations in physical, functional, and subjective health within and between socioeconomic status groups as well as the role of psychosocial resources in accounting for some of these variations. Quiñones and Liang examine ethnic variations in disease trajectories, finding that blacks and Mexican Americans have higher levels of disease and greater rates of accumulation over time than whites. The final two papers deal with short-term variability and extend the symposium to include mental health. Wolff, Brose, Schmiedek, and Lindenberger show that daily couplings between negative affect and health complaints are stronger in older adults with high social support. Finally, Montpetit, Deboeck, and Bergeman look at variability in negative affect across multiple timescales and explore the differential impact of dispositional resilience, coping style, and physical health on different features of these time series. Smith will serve as discussant. Her expertise in research on healthy aging as well as long- and short-term change will provide insights towards understanding the complexity of health change in later life.

VARIATIONS IN HEALTH WITHIN AND BETWEEN SOCIAL STATUS GROUPS: THE ROLE OF PSYCHOSOCIAL RESOURCES

I. Schöllgen, O. Huxhold, C. Tesch-Roemer, *German Centre of Gerontology, Berlin, Germany*

Groups with higher socio-economic status (SES) show better health than low SES groups. Current research has paid less attention to variations in health within status groups, although such heterogeneity con-

stitutes evidence of modifiability. This work addresses age differences in these variations and links them to interindividual differences in psychosocial resources. First cross-sectional analyses used data from 2,454 persons 40 years and older from the nationally representative German Ageing Survey. Applying multiple group structural equation modeling, it was demonstrated that, in midlife, the lower the SES the higher the within-group variance in physical, functional, and subjective health. Psychological resources accounted for some of this variability and were more strongly associated with health in low SES groups. Here, we extend the cross-sectional findings to longitudinal analyses spanning up to three waves of measurement and up to 12 years of time, also looking at differences in health change between the status groups.

CHANGES IN DISEASE TRAJECTORIES IN MIDDLE AND OLD AGE IN THE U.S.: ETHNIC VARIATIONS

A.R. Quinones, J. Liang, *University of Michigan, School of Public Health, Ann Arbor, Michigan*

Few studies examine ethnic variations in the trajectory of disease with nationally-representative longitudinal data. This research examines intrapersonal changes in disease among Americans over the age of 50 for a period up to 12 years. It focuses on how changes in reported burden of serious diseases as well as the specific diseases of hypertension, diabetes and stroke vary across whites, blacks and Mexican Americans. Data came from 17,517 respondents of the Health and Retirement Study (1995-2006) with up to six repeated observations. Serious disease burden was measured by an additive index including cancer, diabetes, heart disease, hypertension, and stroke. Hierarchical linear models were employed to analyze ethnic variations in temporal changes of disease burden, hypertension, diabetes and stroke, respectively. Consistent with our hypothesis, blacks and Mexicans have higher baseline levels of disease and greater rates of accumulation over time relative to whites.

SOCIAL SUPPORT AS A MODERATOR OF THE DAILY AFFECT-HEALTH RELATIONSHIP

J.K. Wolff¹, A. Brose¹, F. Schmiedek^{1,2}, U. Lindenberger¹, *1. Max-Planck-Institute for Human Development, Berlin, Germany, 2. Humboldt University Berlin, Berlin, Germany*

The link between affect and health is well documented in previous literature. The current study investigates adult age differences in daily couplings of affect and health. In addition, social support is introduced as a potential moderator of the affect-health relationship. The data is collected in the currently conducted follow-up of the COGITO study, in which two age groups (101 younger adults, 20-31 years, 103 older adults, 65-80 years) completed 100 daily sessions. In the COGITO follow-up participants take part in four weeks of daily assessments two years after finishing the COGITO study. Multilevel analyses show a coupling of daily negative affect and daily health complaints. Preliminary results suggest that older adults with high social support scores show a stronger association of negative affect and health pointing out a negative effect of social support. Further analyses will investigate if this is also true for different kinds of social support.

OVERLAPPING SOURCES OF VARIABILITY IN NEGATIVE AFFECT: RELATIONSHIPS WITH COPING AND PHYSICAL HEALTH

M. Montpetit¹, P.R. Deboeck², C. Bergeman³, *1. Psychology, Miami University, Oxford, Ohio, 2. University of Kansas, Lawrence, Kansas, 3. University of Notre Dame, Notre Dame, Indiana*

The current study uses Derivative Variability Analysis to examine intraindividual variability in negative affect for 300 individuals from the Notre Dame Study of Health and Well-being. The differential impact of coping style and physical health on different features of these time series was investigated. Results suggest that worse self-reported health was positively associated with variability in observed scores and in rates

of change. Conversely, the use of proactive coping techniques was negatively related both to variability within the space of a week, and to variability in rates of change. Elders rating their physical health more poorly evinced greater emotional lability, and more variability in their rates of change. Perhaps physical health difficulties tax elders' reserve capacities, leaving them more vulnerable to the effects of everyday stressors. Similarly, proactive coping might help elders weather life's vicissitudes, allowing for less lability in negative emotions, and more consistent rates of change.

SESSION 1100 (POSTER)

HOUSING, NURSING HOMES, AND RESIDENTIAL CARE

ASSISTED LIVING AT SEA: OPINIONS FOR SENIOR CRUISERS

D. Parker Oliver, D.B. Oliver, *Family and Community Medicine, University of Missouri, Columbia, Missouri*

The purpose of this study was to explore the perceptions and feasibility of seniors residing on cruise ships as an alternative to assisted living facilities. The study used a mixed-methods approach with qualitative observations informing survey results on a 14-day Asian cruise and a 16 day South American cruise. A semi-structured questionnaire was developed by the authors, and extensive field notes and photographs were used to record observations. Lack of accessibility of cruise ship facilities was the most cited challenge for senior cruisers, followed by frustrations with waiting in lines and rules and regulations. Despite these challenges, nearly one-half expressed interest in living permanently on a cruise ship as they age. To meet the needs of an older and frailer residential population, cruise ships will need to assure that physical and social environments are appropriate. Recruitment and special training of employees will be essential.

ASSISTED LIVING ADMINISTRATORS' PERSPECTIVES ON TRANSITIONING THOSE WITH DEMENTIA TO MEMORY CARE

S.G. Kelsey¹, S.B. Laditka², J.N. Laditka², *1. Assistance + LLC, Hilton Head Island, SC, 2. University of North Carolina at Charlotte, Charlotte, North Carolina*

Individuals with Alzheimer's disease or related disorders can benefit from residing in an assisted living facility (ALF). Their families can also benefit. Of ALF residents, 23%-42% have moderate-to-severe dementia. As cognitive function declines, an ALF may no longer be able to accommodate the resident. Our study examines the process of transitioning residents from ALFs to special units for the care of those with severe cognitive impairment, often called memory care units (MCUs). We examine the process from the perspective of three different ALF organizational models: free-standing ALFs, ALFs with MCUs, and ALFs in continuing care retirement communities (CCRCs). We conducted in-depth interviews with 37 ALF administrators of these ALF types. Administrators in free-standing ALFs were notably more likely to discuss transfer policies at admission. CCRCs with MCUs were more likely to make multidisciplinary decisions. In ALFs with MCUs, typically the administrator and the director of nursing or resident care coordinator decided that a transition was required. In all ALFs, challenges included family resistance and denial of deficits, although there was notably less resistance in free-standing ALFs. CCRCs were much less likely than ALFs with MCUs to have trial MCU admissions. To reduce family resistance to MCU transfers, administrators in all ALFs need to maintain ongoing dialogue with family, discuss transfers at admission, conduct periodic resident reassessments, and provide regular opportunities for families to learn about dementia progression and memory care.

CAREWORKER'S NERVOUS FACTORS ON END-OF-LIFE CARE IN GROUP HOME

H. Shiotani, M. Teranishi, *Social Welfare, Hiroshima International University, Higashi-Hiroshima, Japan*

BACKGROUND: The number of dementia patients receiving end-of-life care in "Group Home (GH)" is increasing; GH is a kind of nursing home with 9 residents per unit for dementia patients in Japan. **OBJECTIVE:** To understand careworker's nervous factors on the end-of-life care in GH. **METHODS:** We sent out questionnaires to chief careworkers (200 persons) in GH, Hiroshima prefecture; the collection rate was 35.5% (n = 71). The results were analyzed by multivariate analysis - quantification method. **RESULTS:** Three important factors emerged. (a) Understaffing of careworkers: On average only one staff cares 9 residents in night shift so that they can not receive good care service especially for emergency. (b) Poor collaboration in medical services: GH has no full-time medical staffs. Residents receive medical care from regional medical services, i.e. visiting nurses and doctors. The collaboration between the careworkers and the medical staffs was poor and needs improvement. (c) Insufficient medical knowledge of careworkers: Careworkers have limited course hours on medicines in the training school and their medical knowledge is insufficient. **CONCLUSION:** This study suggests that increasing in the number of careworkers, promoting in collaborative relationships between careworkers and medical staffs, and enhanced training about hospice care in GH are required to improve the present careworker's nervous factors.

A QUALITATIVE STUDY ON THE ATTRACTIVE POINTS OF WORKING AS A PROFESSIONAL CARE-WORKER IN JAPAN

A. Ohashi¹, K. Abe², *1. Chubu Gakuin University, Gifu, Japan, 2. National Center for Geriatrics and Gerontology, Aichi, Japan*

Objective: Recently, the number of people aiming to become professional care-workers has decreased substantially in Japan. Reasons for this include the fact that care-working in Japan are low-paying and stressful working structure which includes night shifts and interpersonal relationships. The aim of this study is to conduct exploratory analysis of the attractive points of working as a professional care-worker in Japan. **Method:** We conducted semi-structured interviews of 23 employees working in two nursing homes in the Tokai area. The questions were "What is the attractive point to you about this work before you started working?" and "How did you newly perceive the attractive point of this work after you started working?" **Results:** Most extracted attractive point of the work before they got their jobs is "worthwhile job." Second attractive points were "the qualification and employment structure" and "the job of human supporting." They newly perceived to be attractive point after they got their jobs, the most extracted point was "the pleasure of the work." The second was "being appreciated by older people." **Discussion:** Most of the points revealed in this study were identical to the general image of care-worker in Japan. It is clear that most employees who are actually working as care-worker have not been selecting their occupation based on special experiences or achievements. Furthermore, the greatest number of respondents said that the attractive point of the work was "being appreciated" which suggests that positive feedback to the care-worker is currently playing an important role for them.

PHYSICIAN PERSPECTIVES ON FALLS PREVENTION AND MONITORING IN ASSISTED LIVING COMMUNITIES

K. Nyrop, S. Zimmerman, P. Sloane, *UNC at Chapel Hill, Chapel Hill, North Carolina*

Falls contribute to increased mortality and morbidity as well as reduced functioning and independence among the frail and elderly in long-term care. **Aims:** This study identified physician perspectives on their role and the role of assisted living (AL) communities regarding: (1) assessing residents for falls risk, and (2) reviewing medications for potential side effects related to falls. **Methods:** Physicians identified by four AL communities as primary care providers (PCP) for their resi-

dents completed a questionnaire on falls prevention and monitoring in AL. Theory of Planned Behavior constructs were used to elicit physician attitudes, expectations and perceived constraints on conducting fall risk assessments (FRAs) and medication reviews (MRs). **Results:** 34 physicians completed the survey; 59% male, mean age 52 (SD 11.43). Respondents reported conducting FRAs for 46% and MRs for 71% of their AL patients. Respondents strongly agree AL patients should be assessed for falls risk (94%), and that knowing a patient's falls risk will result in specific actions by the PCP (71%) or AL community (50%). 53% strongly agree PCPs have the expertise to do FRAs; only 25% strongly agree AL communities have this expertise. 47% strongly agree appropriate alternatives could be identified and prescribed for medications with potential side effects related to falls. **Conclusion:** Despite strong support for FRA, a minority of physicians conduct them and believe AL staff are capable of doing them. There is need for PCPs to assume more ownership of this activity and/or to better equip AL staff to do so.

INFLUENCES ON NEW SENIOR HOUSING RESIDENT ADAPTATION AND WELL-BEING: RULES, MANAGEMENT, AND RESIDENT DEATH

H. Ewen, J. Chahal, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Physiological mechanisms provide our bodies with the ability to mobilize in the face of stressors. In the short term, such mechanisms are healthy, adaptive responses necessary for psychological and physical well-being. Prolonged situations of stress or situations for which we are ill prepared can lead to excessive reactivity and exacerbate or hasten onset of co-morbid health conditions. This longitudinal study of women relocating to senior housing examines the stresses associated with adapting to a new living environment and the psychological and physiological reactions through self-report measures as well as salivary cortisol sampling over a six month time period. Many residents were able to anticipate the stresses of the new environment, but many were unprepared for the death of other residents, the conflicting roles of the facility management, and unwritten social rules within the facility. Self-report measures of stress and well-being were highly correlated with cortisol reactivity. Death of other residents and the management's handling of resident death had a great impact on the stress reactions of new residents.

HEALTH CARE DELIVERY IN ASSISTED LIVING: THE EMERGING ROLE OF HEALTH CARE SUPERVISORS

B. Harris-Wallace¹, J. Schumacher¹, S. Zimmerman², P. Sloane², J.K. Eckert¹, R. Perez¹, P.J. Doyle¹, C. Mitchell², *1. University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of North Carolina - Chapel Hill, Chapel Hill, North Carolina*

Assisted living (AL) communities provide a supportive living environment for up to 1 million of our nation's older adults. With an average age of 85, these AL residents have a range of health conditions and needs for which AL settings must provide some level of care and monitoring. In this context, the role of a health care intermediary has emerged in AL. This person, whom we define as the Health Care Supervisor (HCS), is the AL staff member responsible for coordinating and supervising the healthcare provision and monitoring within the AL setting. This poster reports on structured interview data from an NIA-funded study that examines the HCS and his/her role in AL. In terms of education and credentials, preliminary analysis suggest just 50% of HCSs have nursing degrees (RN/LPN) while some serving in this role may have as little as a high school diploma. Additionally, many of HCSs report serving dual roles, including being a direct care worker (DCW) for residents as well as simultaneously being responsible for managing the overall health care delivery and monitoring issues across all of the AL residents. Conclusions drawn from the research are designed to inform a range of stakeholders including AL organizations, HCSs,

healthcare providers, and policy makers/regulators focusing on the current state, organization, and delivery of health care in AL settings.

CULTURE CHANGE MODELS AND RESIDENT-SPECIFIC OUTCOMES IN LONG-TERM CARE

N. Hill, P. Milone-Nuzzo, A.M. Kolanowski, *The Pennsylvania State University, University Park, Pennsylvania*

The traditional nursing home model has been challenged in recent years as an emphasis is placed on changing the culture of long-term care facilities. Culture change models claim to improve resident outcomes through the transformation of facilities from institutional environments into homes that recognize residents as individuals; however, a critical appraisal of the scientific evidence regarding benefits to residents has not been conducted. This integrated literature review explored research conducted on the effects of culture change model implementation, with a focus on resident-specific outcomes. An electronic search of CINAHL and PubMed was conducted, along with a subsequent search of relevant articles' reference lists and websites specific to the culture change models identified. Models selected for inclusion based on available research were the Eden Alternative, the Green House, Wellspring, and Resident-Centered Care. Findings related to resident-specific outcomes were compared and synthesized. Studies were classified according to level of evidence and an overall grade of the available evidence was determined. Evaluation of the literature indicates that results are conflicting and limited, although some evidence exists to support improvements in resident psychosocial outcomes after culture change model implementation. The overall grade of the evidence is quite low, a 'D', or the lowest rating by the latest SIGN recommendations. Future research that uses strong study designs, appropriate outcome measures, and longitudinal measurements is necessary to support the use of culture change models based on resident outcomes.

OLDER AND YOUNGER ADULTS PERCEPTIONS OF "SMART" FURNITURE

L. Smolentzov¹, J.O. Brooks¹, I. Walker¹, K. Green¹, W.C. Logan², K. Duckworth¹, L. Goller¹, *1. Clemson University, Clemson, South Carolina, 2. Greenville Hospital System, Greenville, South Carolina*

'Smart furniture' is furniture that employs user-centered design principles and computer-aided assistive technologies. 'Smart furniture' might help older adults adapt to self-care difficulties and encourage aging-in-place. This study assessed 36 older adults' and 36 university students' ideas about 'smart furniture' through structured interviews. Questions asked about their potential needs and preferences based on hypothetical scenarios in which they would have limited mobility or independence. Additionally, participants were shown pictures of prototypes for a 'smart' nightstand. Then they were asked for their opinions on the functions, usability, and design of the furniture. Results show that both groups would find 'smart' furniture useful in their own homes. These findings suggest both age groups are accepting of 'smart' furniture but express different preferences and needs. More study is necessary to further inform the future designs of 'smart' furniture.

THE RELATIONSHIP OF HEALTH, HOUSING, AND COMMUNITY FOR AGING ADULTS

L. Severson, C. Cook, M. Yearn, *Iowa State University, Ames, Iowa*

Housing accessibility and community livability are essential to healthy aging. Increases in the elderly population, coupled with the desire to age in place, requires additional research to understand what is needed to keep elders healthy, safe, and independent for as long as possible. The purpose of this study was to examine the relationship between health and home accessibility, as well as health and community livability to better understand the implications for those who age-in-place. Preliminary analyses were performed on a subsample of 1,134 individuals (55.4% male, 44.6% female) aged 65 and older from the 2005 Iowa Family Survey. Over 75% of respondents lived in rural areas. Partici-

pants were asked whether accessible features were present in their home, such as a bedroom and bathroom on the first floor, and handrails on the stairs. They were also asked to rate their community on items ranging from transportation to crime and safety. A small but significant relationship ($r = -.10$, $p < .01$) was found between health and home accessibility features. Those with poorer health had more accessible features in their homes, suggesting that as health worsens people include more accessibility features in their homes. Conversely, those with more livable features in their community had better health ($r = .12$, $p < .01$). The analyses highlight the importance of creating and/or maintaining a barrier-free environment and livable community for aging adults. Future analyses will examine the role of housing accessibility and community livability characteristics in predicting health and life satisfaction among aging adults.

CONTENTS OF NIGHTSTANDS AMONG OLDER RESIDENTS OF SKILLED NURSING FACILITIES

W.C. Logan^{1,2}, J.O. Brooks², A. DeArment², J. Honchar², K. Green², I. Walker², L. Smolentzov², *1. Greenville Hospital System, Greenville, South Carolina, 2. Clemson University, Clemson, South Carolina*

Furniture available to residents of Skilled Nursing Facilities (SNFs) is extraordinarily limited. One of the most frequently used pieces of furniture is the bedside table or nightstand. To begin to improve nightstand design, this study sought to evaluate the contents of nightstands for cognitively functional residents in SNFs. Locations, numbers and types of objects were recorded for 28 residents. Over 150 items were recorded and grouped into 25 categories. The most frequent categories were personal hygiene, clothing, food accessory, telephone, book / magazine, water pitcher, lotion, and tissue box. Most items were located on the top of the nightstand not in the drawers. We hypothesize that nightstand drawers may be functionally inaccessible for SNFs residents. The number of individuals having to reside in SNFs is rising. The nightstand is an important piece of furniture for these residents. Nightstand design needs to be re-thought based on user-centered principles.

CULTURE CHANGE IN THE NURSING HOME: THE RELATIONSHIP BETWEEN CULTURE CHANGE VALUES AND STAFF AFFECT

O.R. Burack¹, A. Weiner², S. Barsade², *1. Research, Jewish Home Lifecare, New York, New York, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

While the "culture change" process may vary across facilities, there are "culture change" values common to most initiatives. These include person centered care, participative staff decision-making, team functioning, and family and resident inclusion in care planning. The present study examines which of these "culture change" variables are related to positive (joy and caring) and negative (anger and sadness) staff affect. The importance of workplace affect has been well documented (Barsade and Gibson, 2007), as affect has been associated with a variety of work performance outcomes. Within the nursing home setting, staff affect may be especially critical as the clients served actually reside within the staff's affective environment. Moreover, emotional contagion studies indicate that emotions transfer from one individual to another, having important implications concerning the impact of staff affect on resident well-being. In the present study, 216 staff members completed self-administered surveys. Surveys included a culture change values questionnaire, asking staff to rate the presence of culture change values on their community (nursing unit), as well as the affective culture (Barsade and O'Neil, 2009) on the community, the frequency with which other staff members display different types of affect (joy, happiness, anger and sadness). Bivariate analyses showed that affect was related to the majority of culture change values examined. However, regression analyses indicated that after controlling for trait positive and negative affect, the culture change variables most consistently related to affective culture were "resident-focused care" and "team-functioning". Implications

for the nursing home environment and culture change implementation will be discussed.

ADHERENCE RATES OF A HOME MODIFICATION PROGRAM TO SUPPORT AGING IN PLACE

S. Stark, E. Somerville, J. Morris, *Washington University, St. Louis, Missouri*

Home modifications such as grab bars or ramps can improve the functional ability of older adults. Adherence rates for home modifications and adaptive equipment have been reported to be as low as 45%. Low adherence has been attributed to participant's denial of need, cost, and social stigma. We evaluated adherence in a population of older adults who received home modifications as part of a tailored, client-centered intervention program. Older adults prioritized the problems with activities of daily living and instrumental activities of daily living to be addressed and participated in designing the barrier removal plan. A group of 58 older adults who received home modifications from 1999-2007 were contacted in 2008. The survey ascertained the individual's current use and perceived usefulness of the home modifications. Adherence rates were high for both groups even up to 9 years after implementation (mean adherence rate: 84%). Analyses revealed no significant difference in adherence rates between those who paid out of pocket and those who received them for free. A client-centered approach that addresses functional problems identified by participants demonstrates a high adherence rate.

BARRIERS TO PAIN MANAGEMENT FOR PERSONS WITH SEVERE DEMENTIA IN THE NURSING HOME

A.R. White^{1,2}, A. Snow^{3,4,7}, M.E. Kunik^{6,7}, C. Beck⁸, T. Karner⁵, *1. Birmingham VA Medical Center, Birmingham, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. University of Alabama, Tuscaloosa, Alabama, 4. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, 5. University of Houston, Houston, Texas, 6. Michael E. DeBakey VA Medical Center, Houston, Texas, 7. Baylor College of Medicine, Houston, Texas, 8. University of Arkansas for Medical Sciences, Little Rock, Arkansas*

There is evidence that staff knowledge and attitudes toward pain influence attitudes toward pain management. We conducted interviews at four nursing homes to better understand barriers and facilitators of quality pain management for persons with dementia. Semi-structured guide questions for interviews focused on staff understanding of pain issues, ability to identify pain, approaches to managing pain, barriers and facilitators to pain management efforts, and staff's own prioritization of pain as a quality of care issue. Registered nurses and licensed vocational nurses were interviewed separately using one-on-one interviews, and certified nursing assistants participated in focus-group interviews. Each level of staff was interviewed separately so as to promote unrestricted conversation and prevent fear of reprisal or disciplinary action. Qualitative analysis based on a grounded theory approach was used to identify consistent themes in the staff interviews. The most prevalent barriers to pain management included: staff's difficulty assessing pain in dementia, ascribing disruptive behavior to dementia rather than pain, fear of manipulation by residents, lack of pain education, inadequate time and manpower, excessive documentation, and inadequate staff communication. These barriers resulted in staff frustration in caring for residents with pain, particularly among those with dementia and disruptive behavior. Overall, our findings suggest that changes in educational training, staff organization and workflow are a necessary foundation for any pain management intervention to succeed in changing caregiver attitudes and practice patterns.

EVALUATING THE PREDICTIVE VALIDITY AND RELIABILITY OF TWO MEASURES OF PERSON-CENTERED CAREGIVING

H. Lann-Wolcott, L.J. Medvene, *Psychology, Wichita State University, Wichita, Kansas*

The goal of this study was to test the predictive validity and reliability of the Person-Centered Behavioral Inventory (PCBI) and the Global Behavior Scale (GBS). The PCBI measures nurse aides' specific behaviors (positive regard), and the GBS measures nurse aides' overall person-centered style (respecting residents' personhood). Scores nurse aides received based on these measures were correlated with scores residents with moderate stage dementia received using the Resistiveness to Care Scale (kicking, etc.). Based on the Need-Driven Dementia-Compromised Theory of Behavior, which views residents' disruptive behaviors as needs that have not been met, it was expected that aides' person-centered behaviors would be negatively correlated with residents' resistive behaviors. Seventy videotaped caregiving interactions created as part of an NIH funded project (Williams, Herman, Gajewski, & Wilson, 2009) were coded. Caregiving interactions averaged 4.5 minutes in length and involved residents from two nursing homes: inter-coder reliability was .85. As expected, nurse aides' use of person centered global behaviors marginally predicted ratings of residents' resistive behaviors ($r = -.22, p < .08$). Concurrent validity for the Global Behavior Scale and Person-Centered Behavioral Inventory was strong ($r = .70$) as was the internal consistency for the Global Behavior Scale ($\alpha = .95$). The findings indicate that "global" versus specific behavioral aspects of aides' caregiving were most strongly related to residents behaviors. Emergent findings showed the biggest predictors of residents' resistive behaviors were nurse aides' age and experience ($r = -.37$ and $-.26$, respectively). These findings could have implications for future research regarding nurse aides' use of person-centered caregiving skills.

AN INDIVIDUAL CARE CONFIRMATION BOARD (ICCB) FOR ELDERLY PEOPLE IN THE NURSING HOME THE EVALUATION OF CAREGIVERS WHICH USED INDIVIDUAL CARE CONFIRMATION BOARD (ICCB) TO THE NURSING HOME

B. Saigo^{1,2}, R. Morizono¹, H. Kukihara¹, E. Yamaguchi², M. Min¹, E. Horikawa¹, *1. Saga University, Saga, Japan, 2. Saga Social Insurance Hospital intermedicate Nursing Home, Saga, Japan*

The aim of this study was to analyze the effect of care after using Individual Care Confirmation Board (ICCB) in the nursing home. Twenty one of caregivers answered to each self-report questionnaires concerning the effect of individual care for 44 elderly people using ICCB. The questionnaires were consisted of five items. (a) Take or not individual care? (b) Satisfied or not with individual care? (c) Accurate or not a method of indication for ICCB? (d) Changed or not for individual care? (e) Good or worse for individual care? And then, the answers for these each items were quantified to the each scores. There was positive correlation between mean age of caregivers and the scores of take individual care level ($r = 0.33, p < 0.05$). However there was negative correlation between mean age of caregivers and the scores of good for individual care level ($r = -0.30, p < 0.05$). The number of answers which a group of young aged caregivers (under 32 years old) evaluated for good were significantly much more than middle aged (over 32 years old) ($p < 0.01$). The number of answers which a group of middle-grade caregivers (working experience over 5 years) evaluated for take individual care were significantly much more than beginners' caregivers (under 5 years) ($p < 0.05$). The results of this investigation suggest that ICCB is useful to share the individual care with caregivers. we need to revise ICCB to improve the individual care system moreover.

DEFINING “FAMILY” IN SENIOR HOUSING AND LONG-TERM CARE SETTINGS: NEED FOR A PERSON-CENTRIC MODEL

A. Frankowski¹, R. Perez¹, S. Goldman¹, J. Schumacher¹, S. Zimmerman², I. UMB, Baltimore, Maryland, 2. University of North Carolina, Chapel Hill, North Carolina

Research on the role of family members in the lives of older adults indicates that they are key to quality of life; in long-term care (LTC) settings, they also are key to quality care. However, much research defines “family” narrowly, focusing on the legality of relationships through birth and marriage and ignoring people (a) who do not have family, (b) who have created family to include friends and staff, (c) whose family may not be legally recognized, or (d) whose family may not be culturally/ethnically represented. Lacking is a clear, inclusive definition of “family” that incorporates individuals without traditional families, such as elders in the gay, lesbian, bisexual and transgender (GLBT) communities. Two sources of data inform this work. First, we analyzed 514 fieldnotes and 829 ethnographic interviews collected at 21 senior housing (independent living) and LTC settings (assisted living and nursing home) for three NIA studies to determine emic definitions of family as voiced by residents themselves. Second, we examined academic articles and policy reports on residents in senior housing and LTC to ascertain how the family has been defined by researchers and analysts. Combining these data sources, we critically examined the implications of exclusivity in terms of defining family. Our findings suggest that the needs of non-traditional elders are not currently addressed across senior housing and LTC settings. The results indicate compromised quality of care and life for residents. We posit a person-centric model for defining family and explore its relevance to, and implications for, future research.

SESSION 1105 (POSTER)

INTERVENTIONS

DETERMINANTS OF PERSISTENT MEDICATION USE AMONG MEDICARE BENEFICIARIES WITH DIABETES

J. Lloyd^{1,2}, B. Stuart^{2,3}, J. Shoemaker^{2,3}, T. Shaffer^{1,2,3}, 1. Doctoral Program in Gerontology, UMB/UMBC, Baltimore, Maryland, 2. The Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland, 3. University of Maryland Baltimore, Department of Pharmaceutical Health Services Research, Baltimore, Maryland

Persistent use of medications such as older oral antidiabetic agents, ACE inhibitors, angiotensin II receptor blockers (ARBs), and statins among diabetic patients has been shown to result in lower Medicare costs and reduced risk of hospitalization. Factors associated with persistency of medication use are unknown. This study aims to predict persistency in medication use over a 3 year study period for users of older and newer oral antidiabetic agents, ACE-Is and ARBs, as well as statins. Hypothesized predictors include disease management behaviors (taking a diabetic self-management class, testing blood sugar, diet, exercise, aspirin use, checking feet sores), disease knowledge (good, some, and poor), medication management (use of older and new oral antidiabetic agents, ACE-Is and ARBs, statins, insulin, and other lipid lowering drugs), as well as other demographic covariates. Using data from the Medicare Current Beneficiary Survey (MCBS) from 1997 to 2005, six cohorts of Medicare beneficiaries with diabetes were each followed over 3 years (N=2,187). Preliminary multivariate regression results show that persistent medication management (with the exception of insulin and other lipid lowering drugs) was positively associated with persistent use of older and newer antidiabetic agents, ACE-Is and ARBs, as well as statins ($p<0.05$). Of the disease management behavior variables, testing blood sugar was associated with older antidiabetic agents and statins, while exercise was associated with these former drugs as well as with ACE-Is and ARBs ($p<0.05$). Increasing persistency of medica-

tion management for diabetes may have important policy implications for drug coverage and the Medicare program.

UNLOCKING THE ‘BLACK BOX’ OF CARE MANAGEMENT THROUGH A RETROSPECTIVE EXPLORATION OF BANDURA’S SOCIAL LEARNING CONSTRUCT OF SELF-EFFICACY: A CASE STUDY

K.D. Wright^{1,2}, S. Hazelett¹, K.R. Allen¹, J. David³, 1. Summa Health System Health Services Research Education and Institute, Akron, Ohio, 2. University of Utah College of Nursing Hartford Center of Geriatric Excellence, Salt Lake City, Utah, 3. Ohio State University, Columbus, Ohio

Stroke is the third ranking cause of death in the United States. Seventy-five percent of all strokes occur in people over the age of 65. Stroke survivors must learn self-management strategies to modify risk factors to avoid recurrent stroke and its disabling consequences. Interventions to promote self-efficacy can improve self-management skills. Self-efficacy consists of four principles: mastery experiences, vicarious experiences, verbal persuasion and physiological and affective states (Bandura, 1997) The purpose of this case study is to conduct a retrospective review from field notes and outcome measures of a participant in the Strategies to Enhance Post-Stroke Care and Recovery (STEPS CARE Summa Foundation and the National Institute of Neurological Disorders and Stroke, 5 R01 NS041333-02) Trial guided by the social learning construct of self-efficacy. A 68 year-old female status post-ischemic stroke with mild dysarthria was randomized into the intervention group of a post-stroke care management trial. The intervention involved an in home assessment and stroke education provided by an Advanced Practice Nurse Care Manager (APN-CM). The APN-CM uncovered that the patient was depressed, but reluctant to seek treatment. Phone follow-up and health coaching were provided over a 6 month period. Coaching consisted of positive affirmations, demonstration of skills, and monitoring of physiological states that could affect recovery. The patient's CES-D depression screen improved from 8 to 0. She quit smoking and developed an exercise routine of walking the track 45 minutes 5 days a week. The APN-CM utilized skills to promote patient self-efficacy that supported behavioral changes and improved stroke outcomes.

ADJUSTMENT TO PARKINSON’S DISEASE: THE ROLE OF COPING, CONTROL, AND GOAL ORIENTATION

C. Cantrell¹, M.H. Licht¹, B.G. Licht¹, L. Marsh², 1. Florida State University, Tallahassee, Florida, 2. Johns Hopkins Medical Institutions, Baltimore, Maryland

The present study investigates a possible causal model for the prediction of subjective well-being in Parkinson’s disease (PD). The primary hypothesis proposed that, controlling for disease severity, validation-seeking attitudes among individuals with PD would predict less use of secondary control coping strategies related to PD, lower psychosocial adjustment to PD, and lower subjective well-being. I also proposed that validation-seeking attitudes would indirectly contribute to lower adjustment to PD through the type of coping strategies used, as well as indirectly affect subjective well-being through both coping strategies and adjustment to PD. Consistent with the hypotheses, validation-seeking attitudes did predict lower positive subjective well-being, and better adjustment to PD predicted better overall subjective well-being, controlling for all other variables. However, hypotheses regarding relationships between the use of secondary control coping strategies and validation-seeking, adjustment to PD, and subjective well-being were not supported. These findings might have significant implications in planning interventions with individuals coping with physically limiting illness such as PD, both to decrease depressive symptoms and to improve positive subjective well-being.

THE DEVELOPMENT OF THE THAI VERSION OF THE DIABETES MANAGEMENT SELF-EFFICACY SCALE (T-DMSES) FOR OLDER ADULTS WITH TYPE 2 DIABETES

W. Iamsumang, S. Pomeroy, Y. Scherer, Y.B. Wu, *University at Buffalo, SUNY, Buffalo, New York*

The purpose of this study was to develop the T-DMSES for older adults with type 2 diabetes and evaluate its psychometric properties. This study had two phases. Phase 1 consisted of the back-translation method, using consensus meetings to translate and modify the 20-item English version DMSES to Thai. There was semantic equivalence of translation with .88 of Intraclass Correlation Coefficient (ICC). The Phase 2 sample ($n = 209$) of older adults with type 2 diabetes (mean age = 67.4, $SD = 5.5$) were from diabetic clinics in eight hospitals from four parts of Thailand. Acceptable content validity with the scale-level content validity index of .96 and the item-level content validity indexes of .80 or higher were found. Exploratory and confirmatory factor analysis supported the T-DMSES consisting of three subscales with 19 items. The convergent validity of the T-DMSES correlated well with the Thai version of the General Self-efficacy Scale ($r = .36, p < .01$). Criterion-related validity showed that the T-DMSES significantly correlated with the Thai version of the Ronsenbergs' Self-Esteem Scale ($r = .43, p < .01$). High internal consistency was found with Cronbach's alpha = .95 and test-retest reliability (ICC = .70) were acceptable. Conclusion: The T-DMSES is a brief and psychometrically sound measure. By using the T-DMSES, self-efficacy beliefs regarding diabetes self-care may be used to evaluate management of specific types of diabetic self-care behaviors in the Thai population.

DOES DIABETES-SPECIFIC HEALTH LITERACY MATTER FOR DIFFERENT DISEASE OUTCOME MEASURES?

T. Yamashita^{1,2}, C. Kart², *1. Dept of Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Miami University, Oxford, Ohio*

Diabetes mellitus (DM) is a major public health problem in the U.S. and puts individuals at risk for serious illness and even death. Whereas self-management is known as an effective strategy for control of DM, it is often challenging for patients because it requires extensive knowledge of complex treatment routines and recommended lifestyle changes. Recent studies with hospital patients suggest that poor health literacy (HL) or an inability to understand health-related information seems to be a barrier to DM self-management. However, little is known about the association between HL and DM self-management when controlling for demographic and health-related characteristics. Using data from the 2002-2003 Health and Retirement Study and diabetes module ($N = 1901$), this research asks whether health literacy matters for three different DM outcome measures: HbA1c test results, self-assessed DM self-care, and the average number of days five recommended self-management behaviors are practiced each week. The diabetes-specific HL index was created from 10 questions regarding understanding of DM and its management (Cronbach's alpha = 0.927). A hierarchical multiple regression analysis was conducted for each of the three outcomes with demographic and socio-economic characteristics entered first, DM and health-related factors entered second, and DM-specific HL entered on a final step. DM-specific HL was significantly associated with self-assessed DM self-care ($R^2 = 0.21$) and the average number of days the five recommended self-management behaviors were practiced ($R^2 = 0.08$). Explanations are evaluated for why diabetes-specific HL is associated with two outcomes of DM self-management but not with HbA1c test results.

USE OF COMPLEMENTARY AND ALTERNATIVE MEDICINE FOR FOUR CHRONIC CONDITIONS AMONG OLDER ADULTS

M.M. Tsulukidze, J.N. Laditka, S.B. Laditka, E.M. Tait, *UNCC, Charlotte, North Carolina*

Half of older adults in the United States use complementary and alternative medicine (CAM). Little is known about their reasons for CAM use for chronic health conditions, which we examined for ages 50+ for arthritis, diabetes, depression, and back/neck pain, common conditions that reduce quality of life. For example, there are limited options for effective medical treatment of diabetic neuropathy. Data were from the 2007 National Health Interview Survey and its CAM supplement ($n=10,104$). Descriptive, chi-square and logistic analyses accounted for the survey design and were weighted for national representativeness. Controls included age, race/ethnicity, education, marital status, health insurance, body mass index, health behaviors, and region. Those with arthritis, diabetes, or depression used CAM because medical treatments failed (59%, 17%, 13%, respectively), were too expensive (54%, 17%, 18%), or following health care provider recommendations (52%, 15%, 13%). Nearly 41% with back/neck conditions used CAM because medical treatments failed. Many did not discuss CAM use with providers: arthritis 49%, diabetes 15%, depression 4%, back/neck 13%. In adjusted results for arthritis, Latinos and African Americans were less likely to use CAM (Odds Ratios 0.53 and 0.71, both $p < .001$). Latinos and African Americans were also less likely to use CAM for the other conditions. CAM use tended to increase with educational attainment. Those with chronic conditions should be encouraged to discuss CAM use with health providers. This may prompt improved treatment, either by combining an effective CAM with conventional therapy, or by choosing an alternative conventional therapy to better address the individual's need.

RACIAL/ETHNIC DIFFERENCES IN HEALTH-RELATED SOCIAL CONTROL IN PATIENTS WITH TYPE 2 DIABETES

K. August, D. Sorkin, *University of California, Irvine, Irvine, California*

Health-related social control describes social network members' efforts to influence and regulate the health behavior of another individual. This type of influence may be particularly important in the context of chronic illnesses, which require daily adherence to prescribed health behaviors. No studies to date, however, have examined racial/ethnic differences in the receipt of and response to social control. Data were analyzed from an ethnically diverse sample of 492 older adults aged 65 and older who were recruited from 7 university-affiliated medical clinics and had a physician's diagnosis of type 2 diabetes. The sources, frequency, and effects of social control on dietary behaviors and emotional responses were examined. Results revealed that spouses were the most commonly reported sources of social control for non-Hispanic white patients, whereas children were the most commonly reported sources of social control for Hispanic and Vietnamese patients. Vietnamese patients reported receiving positive control strategies most frequently, whereas Hispanic patients reported receiving negative control strategies most frequently. Regression analyses revealed that both types of control strategies were significantly associated with better dietary behavior for Hispanic patients ($p < .05$), but not for white or Vietnamese patients. Hispanic and Vietnamese patients responded with appreciation to both types of control strategies (all $ps < .01$); white patients, on the other hand, responded with appreciation to positive control strategies, but with hostility to negative control strategies (both $ps < .001$). These findings underscore the importance of considering racial/ethnic differences in examining social network members' involvement in older adults' disease management.

THE ROLE OF SPIRITUALITY IN THE RELATIONSHIP BETWEEN CHRONIC ILLNESS AND PSYCHOLOGICAL WELL-BEING

S. Ballew^{1,2}, S.M. Hannum^{1,2}, J. Gaines², K. Marx^{2,1}, J.M. Parrish², 1. *Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland*, 2. *The Erickson Foundation, Catonsville, Maryland*

Spirituality plays an important role in the experience of chronic illness, affecting individuals at both psychological and physiological levels. Our research explores correlates of spiritual experiences over a three-year period in a sample (N = 118; mean age 82.01 years) in a continuing-care retirement community. Utilizing responses to the Daily Spiritual Experiences Scale, scores were analyzed for changes over time and their moderating effect in the relationship between chronic illness impact and markers of psychological well-being (as measured by the Geriatric Depression and Life Satisfaction scales). Repeated measures ANOVA indicated a significant decline ($p < 0.01$) in the amount of spirituality over time and t-tests showed a significant difference by gender ($p < 0.01$ in years 2 and 3), with women exhibiting higher levels of spirituality. Analyses found correlations between spirituality scores and life satisfaction in all years (year 1: $r = -.288$, $p < 0.01$; year 2: $r = -.209$, $p < 0.05$; year 3: $r = -.330$, $p < 0.001$) and there were only correlations between spirituality and depressive symptoms in years 1 ($r = .186$, $p < 0.05$) and 3 ($r = .254$, $p < 0.01$). Moderation effects of spirituality on the relationship between chronic illness impact and markers of psychological well-being were explored in all years, with an effect found only for depressive symptoms in year 3. Higher impact of chronic illnesses is associated with more depressive symptoms under conditions of low spirituality, which offers a clear connection to the management of chronic and comorbid conditions. Further research should evaluate the usefulness of a spirituality-inclusive care model in treating chronically ill older adults who exhibit depressive symptoms.

A WAKE-UP CALL OR JUST TOO LATE? HEALTH BEHAVIORS CHANGES AFTER CHRONIC ILLNESS

J. Newsom¹, N. Huguet², M.S. Kaplan², B. McFarland³, C. Crespo², 1. *Institute on Aging, Portland State University, Portland, Oregon*, 2. *School of Community Health, Portland State University, Portland, Oregon*, 3. *Oregon Health and Science University, Portland, Oregon*

Evidence is conclusive that lifestyle improvements following diagnosis with a chronic condition can reduce recurrence or complications, improve quality of life, and increase longevity. Although intervention studies suggest improvements are possible, population-based studies about how often patients typically make lifestyle changes are needed. We examined rates of smoking, alcohol consumption, and physical activity within 2 years before and after a newly reported diagnosis of heart disease (N = 2,736), cancer (N = 1,088), diabetes (N = 1,282), stroke (N = 536), and chronic lung disease (N = 919) among those 50+ in the Health and Retirement Study. Results showed significant, but modest, improvements that differed substantially across conditions. The most consistent improvement across conditions was in smoking rates (25.7% vs. 18.9% for heart disease; 23.7% vs. 17.1% for cancer; 20.7% vs. 17.3% for diabetes; 29.5% vs. 22.8% for stroke; 43.0% vs. 34.9% for lung disease). Patients were also generally less likely to consume any alcohol following diagnosis (49.5% vs. 42.8% for heart disease; 54.3% vs. 48.5% for cancer; 45.5% vs. 39.0% for diabetes; 41.2% vs. 28.3% for stroke; 47.2% vs. 40.1% for lung disease). Those with heart disease were most likely to increase vigorous activity 3+ times/week compared to those with other conditions (29.9% vs. 40.0% for heart disease; 38.9% vs. 39.4% for cancer; 35.3% vs. 33.6% for diabetes; 33.7% vs. 36.6% for stroke; 30.0% vs. 30.8% for lung disease). The findings suggest a need for further public health efforts to encourage more fundamental lifestyle improvements.

IMPROVING OUR UNDERSTANDING OF EFFECTIVE COMMUNITY-BASED ALZHEIMER'S INTERVENTIONS

M. Freiman, J. Wiener, D. Brown, E. Walsh, J. Maier, *RTI International, Washington, District of Columbia*

There is a growing body of evidence supporting the effectiveness of specific non-medical interventions for community-based persons with Alzheimer's disease and their caregivers. Several meta-analyses have synthesized the results of sub-sets of these individual studies. However, synthesizing this body of knowledge is complex because of several factors, such as: the range of outcomes analyzed, and the range of measures used for each outcome; varying characteristics of participants in studies, including dementia severity; and the medical treatment context for persons included in the studies, including the use of prescription medicines. We reviewed the intervention research for non-medical, non-drug interventions for community-based persons with Alzheimer's disease and their caregivers, focusing on articles whose analytical design had the potential to identify a statistically significant improvement in the condition of the caregiver or person with Alzheimer's disease as a result of the intervention. This presentation will describe the factors that affect our ability to fully synthesize the results of effective interventions, and will hopefully inform future interventions and their evaluations.

REDUCTION OF HEALTHCARE COSTS: IMPACT OF AN ENRICHED SENIOR OUTREACH PROGRAM

S. Pasupuleti¹, R.I. Allen¹, B. Bahret², J. Hoy¹, M. Prior¹, 1. *Social Work, The University of Toledo, Toledo, Ohio*, 2. *Mercy Healthcare System, Toledo, Ohio*

Increasing costs of healthcare is a key issue confronting all Americans today. Any effort to reduce the costs of healthcare is highly commendable. This problem is being addressed by the Senior Outreach Program (SOP) for at-risk senior citizens at the Mercy Home Care Program in Toledo. The team, which includes UT faculty and community healthcare professionals, are assessing the outcomes of this program. Seniors with mental illness and/or alcohol concerns have been observed to use costly services such as ambulances, ERs, and inpatient hospitalization more frequently. Specific factors associated with these high use patterns among this population remain unclear. An ongoing longitudinal study aims to collect data about the older adults entering this program. The first wave of data has been analyzed for those seniors. Preliminary data analysis suggests that SOP clients used significantly fewer inpatient hospital days after entering the program than in the year prior. In addition, between SOP admission and discharge, cigarette smoking declined and support from neighbors and community-based groups increased. The impact of the program is statistically significant at the 0.028 level ($t = 2.051$, $N = 18$, $df = 17$; one-tailed significance = 0.056).

PROJECT ASPIRE: A VIDEOPHONE-DELIVERED MEDICATION ADHERENCE INTERVENTION FOR HIV+ PERSONS LIVING IN RURAL AND URBAN AREAS

M.J. Skrajner¹, C. Camp¹, J.L. Haberman¹, T.G. Heckman², A. Kochman³, 1. *Research Division, Hearststone Alzheimer Care, Willoughby, Ohio*, 2. *Ohio University, Athens, Ohio*, 3. *Independent, New York, New York*

Project ASPIRE (Adherence Spaced-Retrieval Intervention with Remote Enhancement), an NIMH-funded study, is testing the feasibility, acceptability, and effectiveness of a videophone-delivered medication adherence intervention and of videophone-delivered pill counts. This presentation will focus on 11 older participants. We will begin by describing methods to conduct pill counts via videophone. We will then describe the intervention using a case study of "Stanley", a 50-year-old gay male living in rural Ohio. Stanley's baseline adherence rate was 74%. Intervention sessions were administered by a social worker twice per week for four weeks. An important treatment goal involved having Stanley place his pills, wallet, and keys near his front door every night before bed. After the intervention, Stanley's mean adherence rate

improved to 92.9%. There was a 6% improvement in adherence across all participants, albeit this improvement was not statistically significant. All participants remarked that the intervention helped “a lot”. Regarding the accuracy of videophone-based pill counts, concurrent in-person pill counts matched videophone-based pill counts. Regarding videophone acceptability, 10 of 11 participants indicated that they would “definitely be willing to use a videophone again in the future”. Preliminary findings suggest that videophones are a feasible, acceptable, and cost-effective modality by which to deliver interventions and track medication adherence in persons living with HIV/AIDS, particularly for persons living in rural areas. After attending this presentation, participants will be able to describe key elements of the intervention, understand pill count protocols, and discuss the feasibility and acceptability of using videophones in adherence work with HIV-infected persons.

GOT GAME? VALIDATING VIDEO GAME MEASURES OF COGNITIVE PROCESSING

J.H. Patrick, D.K. Nadorff, A. Plawsiuk, *Psychology, West Virginia University, Morgantown, West Virginia*

Engaging in cognitively stimulating activities has been shown to delay or prevent cognitive declines associated with aging (Zelinski et al.). Proprietary companies are now marketing cognitive training programs to community-dwelling adults, although the validity of these games has not been tested empirically. Thus, we examined whether video game tasks correlate with known psychometric scales of cognitive functioning and whether the associations differ by age. Adults ($n = 135$, age 18 to 58) completed a variety of psychometric tasks (i.e., Digits Backward, Trail Making Test, Raven's Matrices, Digit Symbol Coding, Ekstrom Vocabulary) and up to six Brain Age games on the handheld Nintendo DS. Measures hypothesized to index the same underlying construct exhibited correlations ranging from .20 to .60 across all participants, providing evidence of validity. Using Fisher's r to Z transformations to examine differences between the correlation coefficients by age group, no significant differences emerged. Moreover, results of a confirmatory factor analysis suggest three interpretable factors accounting for 68.7% of the variance. Together, these results suggest that the Brain Age tasks may be suitable for community-based cognitive intervention programs with adults. On-going field work (Nadorff et al.) is examining the effectiveness of these games as a cognitive intervention.

TESTING SELF-EFFICACY AS A PATHWAY THAT SUPPORTS SELF CARE AMONG FAMILY CAREGIVERS IN A PSYCHOEDUCATIONAL INTERVENTION

M.Y. Savundranayagam¹, M. Brintnall-Peterson², *1. Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 2. University of Wisconsin-Extension, Madison, Wisconsin*

This study investigated the impact of a psychoeducational intervention on health risk and self-care behaviors of caregivers of individuals with Alzheimer's disease ($N=325$). Moreover, this study investigated the extent to which changes in self-efficacy explained changes in health risk and self-care behaviors. The study's findings revealed that family caregivers experienced reductions in health risk behaviors, and improvements in exercise, stress management, and relaxation activities as a result of participating in the psychoeducational intervention. Improvement in self-efficacy was linked with reductions in health risk behaviors, and increased involvement in stress management and relaxation activities. Implications are discussed in terms of the need to understand the mechanisms by which interventions influence family caregivers.

PERSONALITY ATTRIBUTES MODERATE THE EFFECTS OF STRESS INOCULATION TRAINING ON EVERYDAY SKILL

B. Hayslip, L.R. Knowles, *Psychology, University of North Texas, Denton, Texas*

Given the salience of individual differences in later life, the present study explored the issue of variability among older persons regarding

the benefits of cognitive behavior therapy. In order to explore moderator effects as they relate to a cognitive behavior therapy (i.e., stress inoculation training) intervention's impact on everyday competence, 77 community residing older adults (M age = 70.9) were randomly assigned to either a 5 session stress inoculation program targeting the modification of dysfunctional beliefs about declines in one's everyday skills ($n = 39$), or to a waiting list/no contact control group ($n = 38$), with measures of everyday competence (e.g. ETS, IADLs, Independent Living Scale scores) as dependent variables. After having first differentiated persons at the upper and lower quartiles of respective moderator variables' sample distributions at pretest, mixed models ANOVAS suggested that ($p < .05$) I levels of state anxiety, depression, both ability-specific and generalized self-efficacy, and self-rated concerns regarding the maintenance of one's everyday skills each moderated treatment benefits over time. These findings clearly suggest that moderator effects in both personality attributes and concerns about the demise of one's everyday living skills are substantial in understanding the impact of stress inoculation training on everyday skill among older persons. Thus, in this respect, some older persons benefit from stress inoculation training to greater or lesser degrees, consistent with variation across persons along multiple parameters.

THE INFLUENCE OF COGNITIVE TRAINING ON THE QUALITY OF RECALL FOR SHORT STORIES

S. Sisco¹, A.L. Gross², G. Rebok², M. Marsiske¹, *1. Clinical & Health Psychology, University of Florida, Gainesville, Florida, 2. Johns Hopkins University, Baltimore, Maryland*

Drawing on the Advanced Cognitive Training for Independent and Vital Elderly (ACTIVE) trial, the present study investigated whether a memory training intervention influenced specific features of memory for prose. This study examined whether a ten-session memory training program could improve memory for three aspects of paragraph recall: main ideas, details, and verbatim recall of specific phrases in the paragraphs. A subset of memory-trained participants also received four booster training sessions 1- and again 3-years post-initial training. Memory-trained participants ($N=478$) were compared to no-contact control participants ($N=476$), as well as two comparison groups who received either 10-session reasoning ($N=478$) or speed ($N=481$) training programs; five-year maintenance of training gains was investigated. Mixed effects models demonstrated the following pattern of effects. Data from 4 of the 6 study sites with available archival data was used. For total recall, a significant intervention group by occasion interaction ($p < .05$) was obtained, such that participants who received the initial ten sessions of memory training outperformed all other participants immediately, 1- and 3-years post-training. Initial memory training also improved main-idea recall, but this was true only at immediate posttest. For verbatim recall, booster trained participants outperformed all other participants ($p < .05$) at the third-annual followup. The ACTIVE memory training program encouraged participants to concentrate particularly on remembering main ideas, which may explain why this component of paragraph recall initially responded to training. Discussion focuses on possible explanations for the three-year durability of training effects, and the cumulative benefit of booster training for verbatim recall.

IMPACT OF COMMUNITY-BASED HEALTH INTERVENTIONS ON DEPRESSION OUTCOMES AMONG OLDER ADULTS WITH HEART DISEASE: A SYSTEMATIC REVIEW

Z. Gellis, C.D. Kang, *University of Pennsylvania, Philadelphia, Pennsylvania*

Purpose: This systematic review examined the effectiveness of community-based health interventions on depression outcomes among home-bound elderly (65 years and older) with heart disease. Design and Methods: A comprehensive literature search was completed to evaluate selected randomized controlled studies and their methodological quality using standard criteria developed by the Cochrane Collaborative

Review Initiative. Results: Seventeen studies met our inclusion criteria and were reviewed. Studies and interventions differ in scope and methodological rigor. Rigorous research has been limited to outpatient or home-based interventions. Sample sizes vary widely; all studies include depression outcomes; problems in masking of group assignment and treatment fidelity are noted. Out of six studies with positive treatment effects on depression outcomes, five studies were home-based heart disease interventions. Implications: Mixed evidence for community-based heart disease interventions on depression outcomes was found. There is a need for further rigorous research of community-based heart disease interventions of the effects on depression outcomes among older adults with heart disease.

LEAVING HOMELESSNESS QUILTING WORKSHOP: AN INNOVATIVE TOOL FOR OLDER AFRICAN AMERICAN WOMEN

O.G. Washington¹, D.P. Moxley², J.P. Crystal¹, L. Garriott¹, J. Gash¹, *1. Wayne State University, Detroit, Michigan, 2. University of Oklahoma, Norman, Oklahoma*

The quilting workshop is a creative innovation for helping older homeless African American women that addresses the consequences of their experiences as they endeavor to transition out of homelessness. While quilting has not been recognized as a therapeutic intervention, its use with older African American women who are coping with homelessness provides an additional strategy in a sociorehabilitative program. The focus of the quilting workshop was on expressive therapeutic outcomes rather than technical aspects of quilting. The quilt-making workshop intervention provided opportunities for participants to learn more about each other without resistance and anxiety normally associated with more formal group work settings. Eight older women participated in the 5-week intervention that met for approximately 2.5 hours once a week. Each woman interpreted her experiences with homelessness to create her patch. The collection of patches captured each of the unique pathways into and collective efforts associated with emergence from homelessness. The workshop encouraged collaborative interactions among the women, provided social support, and allowed a cathartic review of individual homeless experiences. The women developed alliances and garnered support as they became engaged in each other's worlds: developing trust, mutual respect, reciprocal affirmation, and team-building; sharing and talking informally; and comparing fruits of their work. The expressive and creative quilting workshop format helped participants develop a supportive network vital to facilitating the women's successful transitions out of homelessness, and restoration and recovery from its traumatic consequences.

THE IMPACT OF HEALTH ON TREATMENT RESPONSE IN COGNITIVE BEHAVIORAL THERAPY FOR DEPRESSIVE SYMPTOMS

A. Shah, A. Presnell, M.P. Morthland, F. Scogin, *University of Alabama, Tuscaloosa, Alabama*

Little information is available on the efficacy of cognitive behavioral therapy in those with various health conditions or comorbidities. This study examines the impact of health conditions on treatment response to home delivered cognitive behavioral therapy in older adults with depressive symptoms assessed with the Hopkins Symptom Checklist-20 (Derogatis, Lipman, Rickels, Uhlenhuth, & Covi, 1974). Data is from the Project to Enhance Aged Rural Living study (Scogin, Morthland, Kaufman, Burgio, & Kong, 2007). The Charlson Comorbidity Index (Charlson, Pompei, Ales, & MacKenzie, 1987) was used to determine a comorbidity score and identify health problems. Of the 75 treated participants, 77.3% improved; 20% worsened; and 2.7% had no change in depression scores. A paired samples t-test of baseline and posttreatment HSCL scores was significant, ($t(74)=-6$, $p<.001$), indicating that there was a reduction in depressive symptoms across time. A regression analysis was conducted to assess if greater comorbidity was related

to higher depression severity at posttreatment while controlling for pre-treatment scores but was not significant, suggesting that treatment response was not affected by the number of health conditions. The percent of treatment responders by health conditions (e.g. arthritis, diabetes, hypertension, cerebrovascular disease, myocardial infarction, and cancer) is presented.

RECEIVING WHILE GIVING: THE DIFFERENTIAL ROLE OF RECEIVING HELP ON CAREGIVER REWARDS FOR SPOUSE AND ADULT-CHILDREN

M.Y. Savundranayagam¹, V. Schmall^{2,3}, M. Brintnall-Peterson⁴, *1. Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 2. Aging Concerns, West Linn, Oregon, 3. Oregon State University, Corvallis, Oregon, 4. University of Wisconsin-Extension, Madison, Wisconsin*

There is a growing body of literature on the utility of caregiver rewards as buffers of the negative consequences of caring for a family member with Alzheimer's disease. Many caregiver psychoeducational interventions aim to empower caregivers to seek and obtain help from their social support network, with the expectation that help will enable caregivers to cope effectively. This study investigated the impact of changes in help and changes in satisfaction with help on positive aspects of caregiving for both adult-child ($N=156$) and spouse ($N=171$) caregivers who attended a psychoeducational intervention. Analyses using structural equation modeling revealed that increases in help predicted increases in caregiver rewards for adult-children. However, increases in satisfaction with help predicted increases in caregiver rewards for spouses. These group differences suggest that the quality of support is critical for spouses, whereas receiving extra help is useful for adult-child caregivers. These findings are discussed in terms of importance of understanding the differential needs of spouse and adult-child caregivers in practice.

IMPROVING COPING AND CARE MANAGEMENT STRATEGIES FOR INDIVIDUALS WITH DEMENTIA AND THEIR FAMILY CAREGIVERS: FINDINGS FROM PROJECT ANSWERS

K. Judge^{1,2}, S. Yarry³, W. Looman², S. Orsulic-Jeras², *1. Psychology, Cleveland State University, Cleveland, Ohio, 2. The Benjamin Rose Institute, Cleveland, Ohio, 3. Case Western Reserve University, Cleveland, Ohio*

Individuals with dementia and their families coping with mild to moderate dementia face unique challenges in managing and coping with the symptoms of dementia. These challenges can result in negative psychosocial outcomes for both caregivers (CGs) and individuals with dementia (IWDs). This poster will describe a 6-session intervention program designed to address the care needs of both IWDs and their family CGs. Grounded in a Strength-Based Approach, the intervention program, ANSWERS (Acquiring New Skills While Enhancing Remaining Strengths) provides caregiving dyads with a core set of evidence-based skills and techniques for managing and coping with dementia. Caregiving dyads were randomly assigned to either the control condition ($n = 58$) or the intervention condition ($n = 52$) and all participants were interviewed twice, once prior to random assignment and at T2, approximately 15 weeks later. Dyads in the intervention program received education and skills training in the following areas: effective communication; managing memory; staying active; and recognizing emotions and behaviors. Compared to the control condition, CGs in the intervention condition reported significantly: fewer symptoms of anxiety and depression; higher levels of caregiving mastery; less role captivity; less health strain; and less distress associated with IWD's ability to complete IADLs. Compared to the control condition, IWDs in the intervention condition reported significantly: fewer symptoms of anxiety; less relationship strain; less difficulty performing PADLs; and improved coping skills.

These results highlight the merits of using a Strength-Based Approach and demonstrate the efficacy of the ANSWERS intervention program.

SESSION 1110 (SYMPOSIUM)

MENTAL HEALTH AND ADJUSTMENT AMONG GRANDPARENT CAREGIVERS

Chair: B. Hayslip, *Psychology, University of North Texas, Denton, Texas*

Key to the well-being and adjustment of grandparent caregivers is both describing and understanding differences among them regarding their mental health as well as regarding their attitudes to mental health and mental health care. In light of the physical, psychological and interpersonal difficulties faced by many grandparent caregivers, seeking and receiving mental health care is critical to their well-being, relationships with others, their health, as well as to the health and well-being of their grandchildren. Holding positive attitudes toward mental and mental health care enhances the likelihood of seeking help, while negative such attitudes undermine help seeking. This symposium explores the mental health of grandparent caregivers, focusing on the identification of risk factors key to targeting those custodial grandparents who may be distressed, and consequently in need of professional help that may benefit them and their grandchildren. This symposium also explores variability in mental health attitudes among grandparent caregivers, also critical to seeking timely professional mental health care. The papers by Goodman, by Mitchell and colleagues, and by Yancura break new ground in incorporating grandchild characteristics as predictors of mental health difficulties among custodial grandparents, as well as in utilizing both longitudinal and qualitative data, while the paper by Hayslip and colleagues addresses the heretofore understudied issue of variability among grandparent caregivers in mental health attitudes. These papers allow us to begin to understand the antecedents of variations in mental health among grandparent caregivers, key to designing and providing mental health services to them which can be effectively utilized.

MENTAL HEALTH ATTITUDES AMONG CUSTODIAL GRANDPARENTS

B. Hayslip¹, S.R. Davis¹, G.C. Smith², C.C. Goodman³, 1. *Psychology, University of North Texas, Denton, Texas*, 2. *Kent State University, Kent, Ohio*, 3. *California State University-Long Beach, Long Beach, California*

Individual and within group differences in attitudes toward mental health services were explored among 240 grandparent caregivers (M age = 58.1; 82% women). Utilizing measures of openness to seeking help, biases about mental health issues, and breadth of conceptions of mental illness, hierarchical regression analyses indicated ($p < .05$) that income and experience with individual/group therapy predicted openness scores; experience with individual therapy and parental efficacy predicted biases scores; and experience with group therapy, number of grandchildren cared for, personal hardiness, and role satisfaction predicted breadth scores. MANOVAs revealed ($p < .01$) gender differences in all attitude scale scores, age differences in breadth scores, family caregiving type differences in bias and openness scores, and the grandchild's receiving professional help differences in all attitude scale scores. These findings suggest substantial variability among grandparent caregivers in mental health attitudes, wherein such attitudes are key to seeking help for themselves and their grandchildren.

GRANDMOTHERS RAISING GRANDCHILDREN: EVALUATION TEN YEARS LATER

C.C. Goodman, *California State University, Long Beach, Long Beach, California*

Grandparents raising grandchildren often provide care for extended periods, sometimes throughout their grandchild's childhood. This study is a follow-up of 50 grandmothers raising grandchildren in skipped gen-

eration families 10 years after (time 2) their original interview (time 1). Most grandmothers were retired, age 67 on average. Their young adult grandchildren, age 19 years on average, were primarily still living with them (62%). Gains in life satisfaction of the grandmothers (time 2, adjusted for time 1) were related to closer bonds with these grandchildren at time 1. Current (time 2) closeness with grandchildren was not significantly related to these gains in life satisfaction over the 10 year period, nor were changes in relationship closeness with the grandchild (time 2 adjusted for time 1). That is, good relationships with grandchildren during the school years contribute to an evaluation of a good life well into the future.

PATTERNS OF GRANDPARENTAL CAREGIVING WITH RELATION TO GRANDPARENT AND YOUTH FUNCTIONING IN A LOW-INCOME SAMPLE

C. Mitchell¹, A. Connell¹, T. Dishion², D. Shaw³, M. Wilson⁴, F. Gardner⁵, 1. *Case Western Reserve University, Cleveland, Ohio*, 2. *University of Oregon, Eugene, Oregon*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *University of Virginia, Charlottesville, Virginia*, 5. *Oxford University, Oxford, United Kingdom*

Many older adults are involved in providing care for grandchildren. In the current talk, we examine two important aspects of grandparental caregiving in relation to youth functioning in early childhood: grandparent involvement in caregiving and the link between grandparent psychopathology and child internalizing and externalizing disorders. Participants were part of a larger longitudinal study of 731 low-income families and data were collected when children were 2, 3, and 4 years old. Latent Growth Modeling (LGM) analyses indicated that initial levels of child externalizing problems at age 2 predicted greater use of grandparents as caregivers over time, while the involvement of grandparents as caregivers at age 2 predicted growth in youth internalizing symptoms over this same age range. Additionally, a Generalized Estimating Equations (GEE) approach was used to estimate the relations between grandparental symptoms and youth functioning. Grandparental depressive symptoms were related to observer ratings of their interactions with their grandchildren.

RISK FACTORS FOR DEPRESSION IN CUSTODIAL GRANDPARENTS IN HAWAII: THE STORY BEHIND THE NUMBERS

L. Yancura, *University of Hawaii, Honolulu, Hawaii*

Grandparents raising grandchildren (GRG) without support from the children's biological parents may be at greater risk for depression than their non-caregiving peers. This may be due to a high number of comorbidities for depression related to this off-time caregiving role. The present study uses qualitative and quantitative data from a sample of 274 ethnically-diverse custodial grandparents recruited through the State of Hawaii Department of Education to examine risk factors for depression. The ages of the grandparents ranged from 40-90 years ($X = 59.33$, $sd = 17.92$). Most (79.3%) were female. The most common reasons for raising grandchildren were because the children's parents were on drugs or in jail. Many GRG reported living in a rural area (62.5%), not having enough money to meet monthly expenses (48.5%), and/or receiving public assistance (28.3%). Responses to open-ended questions demonstrate that grandparents experience these difficulties but also experience positive aspects of caregiving.

MOBILITY

PREDICTING AGE RELATED CHANGES IN MOBILITY AND DRIVING HABITS

M. Mathews¹, D. Roenker², G. Cissell², K. Ball³, 1. *Clinical Psychology, UMass-Amherst, Amherst, Massachusetts*, 2. *Western Kentucky University, Bowling Green, Kentucky*, 3. *University of Alabama-Birmingham, Birmingham, Alabama*

M. Mathews, D. Roenker, G. Cissell, K. Ball Department of Psychology, University of Massachusetts-Amherst, Western Kentucky University, University of Alabama-Birmingham Older adults encounter many changes as they age, both cognitive and physical, which may impact mobility in terms of driving and exposure to traffic situations putting many at risk for lost independence. The present study sought to replicate a structural equation model proposed by Vance, Roenker, Cissell, Edwards, Wadley, and Ball (2006) in which it was found that cognitive function and health were predictive of both increased driving avoidance and decreased exposure to a variety of traffic situations. However, physical function appeared to make no contribution. The current study will attempt to replicate this model on a sample (N=299) of adults over age 55 who participated as part of the driver's licensing process at three Motor Vehicle Administration sites in Maryland. Upon recruitment, participants completed functional assessments of visual, motor, and cognitive abilities. Participants also consented to participate in yearly telephone interviews for the next four years (1999-2004) and were asked a variety of questions to determine their current health status, driving ability, and driving habits. In order to examine the time course of normal changes in mobility and determine what factors predict mobility and driving exposure, composite latent constructs of health status, physical function, and cognitive function were created as predictors of the latent constructs of driving exposure and avoidance in a structural equation model.

DISEASE, DISABILITY, AND DEVICES: WHAT DETERMINES OLDER ADULTS' ADOPTION OF MOBILITY ASSISTIVE DEVICES?

K.A. Pressler, L. Sands, K.F. Ferraro, *Center on Aging and the Life Course, Purdue University, West Lafayette, Indiana*

The purpose of this study is to predict the adoption of mobility devices, giving special attention to the contributions of disease, impairment, and prior mobility device use. Panel data from the 1994, 1999, and 2004 National Long Term Care Survey (NLTC) were used (N=1,047). A series of logistic regressions show that older adults were more likely to adopt a cane between 1999 and 2004 if they were female, overweight, obese, experienced higher levels of lower body impairment, or did not rely heavily on personal care to perform activities of daily living in 1999. Walker adoption was predicted by being older, obese, having arthritis, being a cane user in 1999, or experiencing an increase in lower body impairment between 1994 and 1999. Wheelchair adoption was more likely among older people, those with diabetes, or those who used a cane or walker. Prior use of a cane or walker increased the odds of wheelchair adoption by 104% and 150%, respectively. These findings indicate that lower body impairment and obesity raise the likelihood of using canes and walkers and that these devices are intermediary steps in the adoption of wheelchairs.

BMI TRAJECTORIES IN U.S. MIDDLE-AGED AND OLDER ADULTS LIVING WITH DIABETES AND LINK WITH FUTURE DISABILITY TRAJECTORIES

C. Chiu, L. Wray, *Penn State University, University Park, Pennsylvania*

Inconsistent findings regarding weight change patterns in adults with diabetes are reported in diabetes research. Few studies have explored how patterns of change in body weight relate to patterns of change in

disability across time. The present study aims to: (1) discern the distinct weight and disability trajectories experienced by middle-aged and older adults living with diabetes; and (2) reveal how weight trajectories are associated with disability trajectories later in life. Data on 1,064 adults aged 51-61 who self-reported having diabetes in 1992 U.S. Health and Retirement Study (HRS) were analyzed by dual-trajectory models based on a group-based trajectory modeling approach. We identified four distinct trajectories of body weight change in adults with diabetes from midlife to older age (stable normal weight, 29.0%; stable overweight, 46.5%; loss and regain obese, 17.6%; and weight cumulating morbid obese, 6.9%) and three disability trajectories (little or low increase, 34.6%; moderate increase, 45.4%; and chronic high, 20.1%). Individuals in stable normal weight group had highest propensity in little/low increase disability, and individuals in the weight cumulating morbid obese group had highest probability in chronic high disability. However, 19% of adults in stable normal weight group go into chronic high disability, suggesting the complexity of diabetes control in those with relatively normal weight. CONCLUSIONS: Various relationships among these two sets of trajectories were found. Importantly, the recommendations for weight control in adults with diabetes in order to prevent future disability were strongly supported in the present study.

LEISURE PARTICIPATION EXPERIENCES OF OLDER ADULTS LIVING WITH LOW VISION: THE CHALLENGES OF "GETTING OUT"

S. Berger, 1. *Boston University, Boston, Massachusetts*, 2. *University of Massachusetts, Boston, Massachusetts*

Vision loss significantly impacts participation, defined broadly as engagement in life activities. Participation in life activities has been shown to facilitate health and well-being. Researchers have demonstrated the importance of social participation and engagement in meaningful activities to quality of life for persons with physical disabilities. Yet most of the research on participation about older adults with vision loss focuses only on activities of daily living (ADL) and/or instrumental activities of daily living (IADL). Fewer researchers have explored participation beyond ADL and IADL for persons with low vision. Yet leisure participation has been shown to be related to quality of life, successful aging, and depression for older adults. Therefore, the purpose of this research was to learn about the lived experience of older adults with acquired vision loss, specifically related to participation in leisure activities. Through in-depth, repeated interviews of 26 older adults with vision loss and observations of their participation in leisure activities, this phenomenological study provides an understanding of the experience of vision loss related to leisure participation. Several key themes evolved from this study. One of the main influences on leisure participation is the daily struggle of "getting out." Several themes related to this topic emerged including transportation, social support, vulnerability, less fun, and the lack of community accessibility. Occupational therapy practitioners need to promote policies that eliminate barriers and support leisure participation for older adults with low vision, including improved lighting in community buildings, alternative transportation options, and increased font size for public documents.

WALKING CHARACTERISTICS ON THE 5 DAYS BEFORE AND AFTER A FALL: NO HARM, NO FOUL, NO CHANGE?

T. Buracchio^{1,2}, N.C. Mattek¹, T. Hayes¹, J. Kaye^{1,2}, 1. *Oregon Health & Science University, Portland, Oregon*, 2. *Portland VAMC, Portland, Oregon*

It is difficult to motivate older people to change behavior following a single fall. We hypothesized that for non-injurious falls there would be little change in walking speed or amount of walking for the 5 days prior to or immediately following the fall. Subjects were 21 independently living older persons (mean age: 84 years; 81% female) who experienced a non-injurious fall. Using unobtrusive in-home gait assessments, walking speed and number of walks were determined by sequential firing of motion sensors. Fall onset was determined by weekly

on-line questionnaires asking if falls occurred in the prior week. Statistical analysis compared mean walking speed and number of walks 5 days before and after each fall using paired t-tests. During the study period (mean = 553 ± 79 days), subjects reported 35 non-injurious falls. No significant difference between mean walking speed prior to the fall and mean walking speed post-fall among subjects was identified. Average number of walks per day ($n = 14 \pm 11$) among subjects was also not significantly different preceding or following the fall. We found no significant difference in walking speed or activity, as measured by daily number of walks, in the period preceding or following a fall. This suggests that older persons do not significantly change their walking habits after a fall in the absence of an injury which may contribute to a “no harm, no foul” attitude toward falls.

THE ASSOCIATION BETWEEN SELF-RATED HEALTH AND CHANGES IN GAIT SPEED OVER TIME AMONG OLDER PERSONS

L.C. Barry¹, D.J. Martinez³, T.M. Gill^{1,2}, S.V. Kasl², 1. *Internal Medicine, Yale University School of Medicine, New Haven, Connecticut*, 2. *Yale University School of Public Health, New Haven, Connecticut*, 3. *Robert Wood Johnson Foundation, Princeton, New Jersey*

Background: Whereas poor self-rated health (SRH) has been found to be associated with subsequent functional disability, whether worse ratings of self-rated health are independently associated with objectively measured lower extremity dysfunction is largely unknown. We evaluated the association between SRH and change in gait speed, an objective indicator of lower extremity performance, among older persons. Methods: Participants (N=754) were evaluated at 18-month intervals for 72 months. SRH was categorized as Excellent/Very Good, Good, and Fair/Poor. Participants walked 10 feet forward and 10 feet back at a rapid pace, with gait speed defined as normal (≤ 10 seconds) and slow (> 10 seconds). Generalized multinomial logit models, adjusted for demographic, biomedical, and psychosocial factors, and activities of daily living, evaluated the association between SRH and the likelihood of six possible transitions (from normal or slow gait speed to normal gait speed, slow gait speed, or death) over time. Results: Compared with those reporting Excellent/Very Good SRH, participants reporting Fair/Poor SRH were more likely to transition from normal to slow gait speed (OR=2.08; 95% CI:1.35-3.21) or to death (OR=2.19; 95% CI:1.01-4.74) than to maintain normal gait speed. SRH was not associated with a transition from slow to normal gait speed or to death over 72 months. Conclusion: Our results suggest that self-rated health is associated with the development of, but not with recovery from, lower extremity dysfunction, among older persons. This relationship may be indicative of an intermediate step that precedes disability in basic activities of daily living and mortality.

OLDER ADULTS' PHYSICAL ACTIVITY AND YEARS OF LIVING IN THE COMMUNITY AT-LARGE

Z. Wang, *Texas A&M University, College Station, Texas*

Background: Physical activity among older adults can bring significant health benefits, and thereby reduce societal demands for institutional long-term care. This research examines the relationship between older adults' years of living in the community at-large (general communities where most people live) and their physical activities in nearby outdoor environments, including yard activities (yard work, gardening, and walking on residential sites) and neighborhood walking. Methods: This cross-sectional study surveyed 168 older adults in eleven assisted-living facilities in TX about their age, facility stay, and physical activities at the site and neighborhood levels before moving to assisted-living facilities. The survey instrument was developed by incorporating previously validated or tested questions. ANOVA tests were used to estimate older adults' years of living in the community as a function of their physical activities. Results: The duration of older adults' yard activities per occurrence was found to be significantly associated with their years

of living in the community ($p \leq 0.05$). The number of years in older adults who engaged in yard activities at least 1 hour/ 10 minutes to 1 hour/ less than 10 minutes per occurrence was 85.35/ 82.52/ 81.1 on average. The frequency of yard activities and the frequency/duration of neighborhood walking were found to be un-significant in predicting the years. Conclusion: Physical activity is associated with older adults' years of living in the community at-large. More empirical studies are needed to further understand the interactive roles of physical activity in promoting older adults' years of living in the community.

PILOT STUDY OF USE OF A Pedometer TO MONITOR PHYSICAL ACTIVITY IN OLDER ADULTS

Y. Lee¹, C. Kim², 1. *San Diego State University, San Diego, California*, 2. *Seoul National University, Seoul, Korea, South*

BACKGROUND: Walking is an important physical activity (PA) providing health benefits to older adults. However, methods of monitoring walking, particularly characteristics of steps, have not been well studied. PURPOSE: To conduct preliminary tests of the reliability and validity of pedometer use by older adults living independently. METHODS: Step counts along a 10 m line were determined by observation and pedometer for thirty-one older adults living independently in senior apartments and retirement communities. Each individual then completed a 7-day step count using a pedometer, a PA diary, and a self-reported PA questionnaire. FINDINGS: There was no significant difference in steps measured by observational count and pedometer. Average walking speed was 1.28 m/s, and average step length was 56 cm. Cronbach's alpha coefficients for 7-day pedometer records ranged from 0.77 to 0.90. Number of steps recorded by pedometers was significantly correlated with self-reported walking distance and amount of leisure time PA, but not with household activity. Pedometer step counts were somewhat, but not significantly, higher in individuals who reported normal blood pressure, normal BMI, and no prescription drugs, than in other individuals.

OLDER AND YOUNGER ADULTS' PERCEPTIONS ABOUT NON-MOTORIZED TRANSPORTATION AND A SOCIAL MARKETING CAMPAIGN TO PROMOTE CYCLING AND WALKING: A QUALITATIVE STUDY

A. Fitzgerald^{1,2}, B. Kinser¹, S. Schubert¹, J. LeMaster¹, 1. *Curtis W. & Ann H. Long Department of Family and Community Medicine, University of Missouri, Columbia, Missouri*, 2. *University of Missouri School of Medicine, Columbia, Missouri*

Promoting physical activity in adults remains an important challenge in preventing obesity and its related diseases; cycling and walking in one's own neighborhood can play a significant role in the total amount of physical activity in which a person participates. Neighborhood-based social marketing programs may be helpful at increasing physical activity in one's own neighborhood, but may be limited by residents' perceived physical, social, and psychological barriers. To investigate this, we conducted a qualitative study of 48 residents of a neighborhood in central Columbia, Missouri where a social marketing campaign, “Neighbors on the Go” (NOG), had been recently completed. We used a purposive sampling frame to conduct semi-structured interviews of adults over 50 years-old who opted into the program ($n=12$) and opted out of the program ($n=12$) as well as among similar adults less than 50 ($n=12$ who opted in, $n=12$ who opted out). Interviews were taped and transcribed, and text was coded to identify qualitative themes. Older and younger adults shared many similar concerns on cycling and walking in their own neighborhood. However, older adults were more concerned about personal safety and physical challenges while younger adults struggled with time management and were more willing to cycle or walk despite perceived barriers. Regardless of age, those who participated in NOG were more likely to have been physically active prior to the start of the program. Older adults participated for health benefits and educational activities while younger adults participated for social activities.

PILOTING A COMPREHENSIVE NURSING REHABILITATION PROGRAM FOR NURSING HOME ELDERLS: LESSONS LEARNED

V.T. Grando¹, K.C. Buckwalter², M. Maas², M.J. Rantz³, V.S. Conn³, M. Brown³, 1. College of Nursing & Health Innovation, Arizona State University, Phoenix, Arizona, 2. University of Iowa College of Nursing, Iowa City, Iowa, 3. University of Missouri-Columbia, Columbia, Missouri

Hospitalization with its accompanying bed-rest and immobility puts frail elders at serious risk for decline in activities of daily living (ADL) and physical functioning that often precipitates nursing home placement. This is a significant health care concern because 44% of nursing home admissions come directly from hospitals. To address the complexity of promoting post-hospitalized frail elders' physical functioning, a 4- to 8- week Comprehensive Nursing Rehabilitation Program (CNRP) was developed to promote the physical functioning of moderately frail post-hospitalized nursing home residents. It incorporated three interventions: Performance Interventions (fostering daily mobility), Capacity Interventions (improving strength and balance), and Facilitating Interventions (providing education, support, and stress management). The pilot study aimed at the following: (a) to examine the feasibility of implementing the CNRP in a nursing home setting, (b) to obtain feedback necessary to refine and strengthen the CNRP, (c) to determine the effectiveness of recruitment procedures, and (d) to examine the preliminary efficacy. We used a longitudinal design with an experimental group and a nonequivalent comparison group. A convenience sample of 24 subjects was recruited. Their physical functioning was assessed at baseline, 4 weeks, and 8 weeks. The Wilcoxon Matched-Pairs Test was used to test for differences. We found that: (a) the intervention group believed that the CNRP improved their physical functioning, (b) the CNRP was easily implemented in nursing homes, (c) a significant improvement in ADLs between the pre- and post-test scores ($p < 0.05$) in the CNRP group, and (d) many potential subjects declined to participate in a voluntary CNRP.

SQUARE-STEPPING EXERCISE AS AN AUTONOMOUSLY ORGANIZED EXERCISE FORM FOR OLDER ADULTS

R. Shigematsu¹, R. Nakanishi¹, M. Saito², T. Okura², M. Nakagaichi³, T. Sakai⁴, Y. Nakamura⁵, K. Tanaka², 1. Faculty of Education, Mie University, Tsu, Mie, Japan, 2. University of Tsukuba, Tsukuba, Japan, 3. Nagasaki University, Nagasaki, Japan, 4. Doshisha University, Kyoto, Japan, 5. Ryutsu Keizai University, Ryugasaki, Japan

Square-stepping exercise (SSE) has been recently developed as a novel exercise form for older adults. Participants simply walk along a thin mat partitioned into 40 squares (25 cm each) arranged in 4 rows; they are also required to memorize the step patterns demonstrated by a leader prior to each stepping. The exercise improves fall risk factors, as confirmed through our two studies lasting 3 months. Since the end of the first study, the participants have voluntarily continued SSE for 4 years, once a week, without any supervision. Those in the second study have also continued for 3 years. In the current study, we intend to determine the reasons that they have continued the exercise. Participants in this study were those who attended the previous studies and have continued SSE for 3 or 4 years ($n = 31$, currently aged 69-77 years). They were individually interviewed by one of the authors for 30 minutes. Qualitative analyses showed that "enjoyment of communication," "fall prevention," and "health improvement" were major common reasons. Features such as the provision of brain teasers for remembering step patterns, the motivation for people to challenge difficult patterns, and the need for no special equipment were the reasons specified to SSE. No adverse events, such as falls or episodes of fear, were experienced during the exercises. Of the participants, 2 voluntarily set up another SSE class in a community hall for their friends and have organized it for 3 years. Thus, SSE could be used as a continuable, voluntarily organized, and supervision-free exercise form.

ASSOCIATIONS BETWEEN PERCEIVED BARRIERS AND PHYSICAL ACTIVITY IN OLDER RURAL WOMEN

M. Umstätt¹, L. Turner¹, S. Baller¹, J. Hallam², 1. Health Science, The University of Alabama, Tuscaloosa, Alabama, 2. The University of Mississippi, Oxford, Mississippi

Background: The role of physical activity (PA) in preventing chronic disease, including type 2 diabetes, obesity, and cardiovascular disease, is well established. However, in 2007 39.3% of U.S. adults 65+ did not meet PA recommendations. Rural areas in the U.S. have disproportionately greater rates of chronic disease, obesity, and physical inactivity. While substantial research supports the influence of individual and environmental factors on PA in urban and suburban areas, limited research has examined these factors as facilitators and/or barriers for PA in rural settings. **Purpose:** The purpose of this study was to examine the relationships between perceived PA barriers (environmental, safety, and individual level: planning and psychosocial) and PA in a rural sample of older women. **Methods:** Valid and reliable self-report surveys were completed by older adult women ($n=90$, mean age=68.8 years) residing in one of two rural counties in the southeastern U.S. Analyses were computed using SPSS 16.0. **Results:** Participants were predominantly African American (61%); 62% were overweight, obese, or morbidly obese ($BMI \geq 25$). Preliminary bivariate analyses revealed significant, inverse relationships between PA and both individual level barriers (planning and psychosocial) and age ($p < .01$). Perceived safety and environmental barriers and self-efficacy were not significant. Regression analysis also revealed individual level barriers ($p=.047$) and age ($p=.013$) as significant in the model ($R^2=.17$, $p=.007$). **Conclusion:** Although safety and environmental factors have been hypothesized as significant barriers in rural PA engagement, this study suggests the importance of individual level barriers for PA behavior in older adults.

QUALITY OF LIFE AND FUNCTION IN OLDER ADULTS WITH ACUTE LEUKEMIA: A PHYSICAL ACTIVITY PILOT INTERVENTION

S.L. Mihalko^{1,2}, S.C. Danhauer², J. Tooez², L.N. Cook¹, K. Daley³, T. Vishnevsky³, H. Klepin², 1. Health and Exercise Science, Wake Forest University, Winston-Salem, North Carolina, 2. Wake Forest University School of Medicine, Winston-Salem, North Carolina, 3. University of North Carolina, Charlotte, North Carolina

Acute myelogenous leukemia (AML) is largely a disease that affects older adults who have lower survival rates and worse functional outcomes than younger patients. Further, treatment for AML with a lengthy hospitalization has been linked to poor quality of life and substantial deconditioning. Previous research in other disease groups suggests that physical activity is beneficial for physical function, treatment-related symptoms, and quality of life in older adults. Research studies on behavioral interventions in older adults with AML are timely and needed. This prospective pilot study tested the effectiveness of a four week physical activity intervention in adults ≥ 50 years of age hospitalized for AML chemotherapy on physical function and quality of life. Twenty-four participants (M age = 65.1 years) were scheduled to participate in 3 sessions per week that consisted of walking, strength and flexibility exercises. All assessments were obtained at baseline, upon completion of intervention, and upon readmission for consolidation chemotherapy. General linear mixed models were used to examine changes in outcomes over time. Negative affect and depression decreased significantly ($p < .05$), while health-related quality of life (FACT-Leukemia) significantly increased ($p < .01$). Specific to physical function, both the physical and the functional well-being subscales of the FACT significantly increased ($p < .05$). No decline was observed for the Short Physical Performance Battery (SPPB) or grip strength at follow-up. Physical activity shows promise for older acute leukemia patients undergoing inpatient treatment to enhance emotional functioning, decrease self-reported functional impairment, and maintain performance-based function in this understudied patient population.

FEASIBILITY OF A PHYSICAL ACTIVITY INTERVENTION FOR OLDER ADULT INPATIENTS WITH ACUTE LEUKEMIA

H. Klepin¹, S.C. Danhauer¹, J. Tooze¹, K. Stott², M.T. Jesse^{1,3}, S.L. Mihalko²,
1. Wake Forest University School of Medicine, Winston-Salem, North Carolina, 2. Wake Forest University, Winston-Salem, North Carolina, 3. University of North Carolina at Charlotte, Charlotte, North Carolina

Acute myelogenous leukemia (AML) largely affects older adults, for whom optimal therapy is unclear. Curative treatment is associated with lengthy hospitalizations and substantial morbidity. Few interventions have been designed to improve quality of life and functional status during treatment. We tested the feasibility of a physical activity intervention to improve physical and psychological health for older adults (≥ 50 years of age) with AML undergoing induction chemotherapy. The four-week (12 session) individualized inpatient exercise intervention included stretching, walking, and strength exercises. Self-report questionnaires (quality of life, physical function) and physical performance tests were administered at baseline, upon completion of intervention (week 5), and post-initial hospitalization (weeks 9-13). Feasibility measures included recruitment, retention, number of exercise sessions completed, and barriers to participation. Among 58 eligible inpatients, 24 enrolled (41.4%). The mean age was 65.1 (SD 7.8), 62.5% were female, and 27.3% had unfavorable tumor biology. 88% of enrolled participants completed baseline measures; 81% attended ≥ 1 exercise sessions, and 52% completed post-intervention assessment. The mean number of exercise sessions attended was 2.7 (range 0-8, SD 2.4). Primary reasons for missed sessions were "feeling poorly" (75.7%) or discharged (11.8%). Among baseline characteristics including quality of life, functional and clinical parameters, only higher Short Physical Performance Battery score was associated with greater number of exercise sessions attended ($p=0.03$). In this cohort of hospitalized older cancer patients receiving chemotherapy, recruitment to an exercise intervention was feasible. However, future interventions will require increased flexibility to maximize participation.

CORRELATES OF PHYSICAL ACTIVITY PARTICIPATION IN COMMUNITY-DWELLING OLDER ADULTS

C. Haley, R. Andel, *Aging Studies, University of South Florida, Tampa, Florida*

We examined socio-demographic and health factors in relation to engagement in three types of physical activity, as well as the role of gender in activity. We used 686 community-dwelling participants from Wave IV (2002) of the Americans' Changing Lives Study who were 60-95 years of age and 70% female. Binary logistic regression was used to examine level of activity (low/high) in gardening/yard work, walking and active sports/exercise as a function of age, gender, race, marital status and educational level, functional health, activity limitations due to health, BMI and depressive symptoms. Male gender, being married, and better functional health were associated with significantly greater odds of performing gardening/yard work ($p<.05$). Male gender, better functional health, and lower BMI were associated with greater odds of walking ($p<.05$). Increasing age, male gender, higher education, and better functional health were associated with greater odds of engaging in sports/exercise ($p<.05$). Variables accounted for 18% of the variance in gardening/yard work, 14% in walking, and 12% in sports/exercise. Subsequent analyses yielded an interaction of functional health by gender in sports/exercise participation ($p=.06$), suggesting that participation in sports and exercise may be more influenced by functional health in men than in women. Gender and functional health appear to be particularly important for overall physical activity participation, which may be useful when designing interventions. However, given that other variables correlated with only some types of activity, attention to different subgroups may be needed in order to maximize the effectiveness of efforts to increase participation in specific activities.

BODY WEIGHT AND NUTRITIONAL CHANGES AMONG ELDERLY PARTICIPANTS OF A COMMUNITY LONG-TERM CARE PROGRAM

R. Liu, C.N. Porter, D. Davis, *Rui Liu, University of South Carolina, Columbia, South Carolina*

Nutrition is a critical component of healthy aging. Poor nutrition leading to both unintentional weight loss and obesity may increase the risk of frailty and other disabilities in older adults. Improper nutrition has also shown to elevate the risk of institutionalization. We evaluated similarities and differences in nutrition and BMI status among individuals participating in a Community Long-Term Care (CLTC) program in 1996 ($n=2,639$) and 2002 ($n=3,037$). Data from both cohorts were obtained and examined for a period of approximately 6 years or until their exit from the program. In both cohorts, about 73% of participants were women, 51% white, 52% with eighth grade education or less, 22% married, with age at enrollment slightly higher in the 1996 cohort (mean 73, SD ± 15.9). Among those 65 years of age or older, the percent of CLTC clients that were overweight or obese at enrollment increased from 43% in 1996 to 51% in 2002, with the latter cohort having 1.37 (95% CI 1.21, 1.56) times higher odds of being overweight or obese. Near enrollment, those in the 2002 cohort were more likely to have gained 10 pounds within the past 6 months without intent than those in the 1996 cohort ($p<.022$). Interestingly, participants in the 2002 cohort were more likely to not eat enough fruits, vegetables, and milk products per day (all $p<.001$). In addition, they were more likely to suffer a wasting disorder ($p=.003$). Results suggest the need to design and implement tailored nutritional interventions to promote healthful behavior changes.

RISK FACTORS FOR COMMUNITY DEATH AND NURSING HOME ADMISSION IN A COMMUNITY LONG-TERM CARE PROGRAM

C.N. Porter, R. Liu, D. Davis, *University of South Carolina, Columbia, South Carolina*

Long-term care services are vital components of the healthcare system. As more individuals require these services, the healthcare system will potentially be strained. This study presents analyses of two cohorts of participants in a Community Long-Term Care (CLTC) program. The two cohorts consisted of new program enrollees in 1996 and 2002. Each cohort's data was examined for a follow-up period of up to approximately 6 years or until exit from the program. The two cohorts were similar in terms of their demographics. Survival curves indicated longer times to community death and nursing home admission for the 2002 cohort. Regression models were adjusted for cohort year, age group (<65 vs. $65+$), race, gender, marital status, and level of educational attainment. Those who were <65 years of age, married, and with less than a high school education were at greater risk for community death. The risk of community death was also 35% ($p<0.0001$) higher for those who were underweight compared with those of normal weight. Other indicators for risk of community death included factors related to nutritional health, such as use of dietary supplements, weight loss, and wasting. Risk of nursing home admission was higher for whites and those with Alzheimer's disease. Interestingly, obesity exhibited a protective effect; obese persons were at lower risk of nursing home admission than normal weight individuals (HR=0.81, $p=0.01$). Results indicate that the influence of BMI and nutrition on community death and nursing home admission requires closer examination as individuals seek long-term care services.

TESTING A THEORETICAL MODEL OF ACTIVITY, DISABILITY, AND QUALITY OF LIFE IN LONG-TERM CARE RESIDENTS

K. Hall^{1,2}, E. McAuley², 1. *Durham VA Medical Center, Durham, North Carolina*, 2. *University of Illinois at Urbana-Champaign, Champaign, Illinois*

Assisted (ALF) and independent (ILF) living facilities represent the fastest growing types of residential care for older adults. Little is known about those factors associated with the prevention and attenuation of age-related declines and the consequent impact on quality of life (QOL) among facility residents. 106 older women and men residing in 9 ALFs and 4 ILFs completed measures of physical activity, self-efficacy, functional limitations and disability, and QOL. Participants also wore an accelerometer for 7 days and completed the Short Physical Performance Battery. Demographic and general health information was also collected. A series of path models within a covariance modeling framework were used to test sequential hypothesized models. Results indicated that individuals who were more physically active were more efficacious ($\beta=.22$) and demonstrated better functional capacity ($\beta=.24$), and consequently, reported fewer functional limitations ($\beta=.40$, $\beta=.21$, respectively). Although self-efficacy, functional performance, and functional limitations were hypothesized to influence disability, only self-efficacy was significantly associated with disability ($\beta=.39$). Finally, disability was significantly associated with QOL ($\beta=.32$). Alternative tested models are presented and discussed. Results from this study suggest that self-efficacy plays a pivotal role in formulating perceptions of disability, and as such, should be considered in models of function and disability. To our knowledge, this is the first study to examine a theoretical model of the relationships underlying disability in the context of physical activity. Future research examining the nature of these associations and the implications for QOL among older adults is needed.

MOBILITY AND COGNITIVE FUNCTIONING: CAN SOCIOECONOMIC POSITION MODERATE THIS ASSOCIATION?

R. Andel¹, M. Crowe², I. K  reholt^{3,4}, M.G. Parker^{3,4}, 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *University of Alabama at Birmingham, Birmingham, Alabama*, 3. *The Karolinska Institute, Stockholm, Sweden*, 4. *Stockholm University, Stockholm, Sweden*

Physical function has been associated with cognitive function in older adulthood. We used 877 participants from SWEOLD, a nationally representative study of individuals 77+ years of age living in Sweden, to examine the association between mobility limitations and cognition. We also tested occupational status as a modifier. An abridged, 11-point version of the Mini-Mental State Examination was administered in-person in 1992 or 2002. Mobility, measured with three items indicating difficulties with walking, running, and going up-and-down stairs, was assessed concurrently with cognition and in 1968. Ordered logistic regression adjusted for age, sex, education, time from baseline to follow-up, occupational status, and health indicators at follow-up (self-rated health, vascular health, and depressive symptoms) indicated that mobility difficulties at baseline ($\beta=-0.19$, $p<.001$) and at follow-up ($\beta=-0.24$, $p<.001$) were independently associated with lower level of cognition at follow-up. The association between mobility at follow-up and cognition was modified by occupational status ($p<.05$) such that the association was significant among former manual workers ($n=518$, $\beta=-0.34$, $p<.001$) but not non-manual workers ($n=359$, $\beta=-0.11$, $p=.275$). Indicators of childhood environment (parents' education, father's socioeconomic position, conflicts with family, and financial difficulties) did not mediate these results. Results were replicated with cognitive impairment as the outcome, determined as scoring one standard deviation below the mean (n impaired=129). Factors associated with non-manual occupation may moderate the association between mobility limitations and cognition in advanced old age.

SESSION 1120 (SYMPOSIUM)

SOCIOECONOMIC HEALTH DISPARITIES: NEW MEASURES, NEW INSIGHTS?

Chair: D. Alley, *University of Maryland, Baltimore, Maryland*
Discussant: J. Kelley-Moore, *Case Western Reserve University, Cleveland, Ohio*

Socioeconomic health disparities are well-established: older adults with lower income and education and lower status occupations have poorer health and a higher risk of mortality. However, traditional measures of socioeconomic status (SES), typically relying on a single measure of income, education, and/or occupation, may be inadequate, especially in poor and older populations. These measures are limited both practically, due to problems such as income underreporting and limited information on educational quality, and theoretically, as they do not incorporate lifecourse processes of change in SES. Furthermore, they have limited usefulness in developing interventions to reduce old age health disparities. The purpose of this symposium is to highlight research examining health disparities using novel measures of SES and to determine whether such measures enhance our understanding of the processes leading to health disparities. First, Alley and colleagues examine associations between material resources (housing, food, and health care) and health and functional declines. Second, Thorpe and colleagues use indicators of poverty status, reading level, income inadequacy, assets, and home ownership to examine race and socioeconomic differences in functional decline. Next, Ferraro and colleagues compare health status among older women with different occupational prestige trajectories. Finally, Crimmins presents data using individual, household and community indicators of disadvantage among older people in developing countries. These studies, utilizing longitudinal data, diverse populations, and novel measures to examine health disparities, will provide important information about the utility of more refined measures of SES and the processes through which SES affects health.

MATERIAL RESOURCES AND POPULATION HEALTH: DISADVANTAGES IN HEALTH CARE, HOUSING, AND FOOD AMONG ADULTS OVER 50

D. Alley¹, B.J. Soldo², J. Pagan³, J. McCabe², M. deBlois⁴, S.H. Field⁵, D. Asch², C. Cannuscio², 1. *University of Maryland, Baltimore, Maryland*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*, 3. *University of Texas Pan-American, Edinburg, Texas*, 4. *Harvard University, Cambridge, Massachusetts*, 5. *University of North Carolina, Chapel Hill, North Carolina*

Material resources (goods and services that improve one's standard of living) have been proposed as critical determinants of population health, and unequal distribution of these resources may contribute to health disparities. We examined associations between housing, food, and health care disadvantage and major declines in self-rated health and walking ability in the Health and Retirement Study, a prospective panel representative of U.S. adults over age 50 ($N=15,441$). Disadvantages in health care ($OR=1.39$, 95%CI:1.23-1.59), food ($OR=1.69$, 95%CI:1.29-2.22), and housing ($OR=1.20$, 95%CI:1.07-1.35) were independently associated with declines in self-rated health, while only health care ($OR=1.43$, 95%CI:1.29-1.58) and food ($OR=1.64$, 95%CI:1.31-2.05) disadvantage predicted incident walking limitations. Participants experiencing multiple forms of material disadvantage were particularly susceptible to worsening health and functional decline. Controlling for material disadvantage attenuated relationships between Black race, poverty, education, and health declines. Material disadvantages appear to uniquely contribute to socioeconomic health disparities, beyond the contributions of education and income.

HEALTH CONSEQUENCES OF WOMEN'S OCCUPATIONAL MOBILITY OVER THREE DECADES: IS MOBILITY ALWAYS HARMFUL, EVEN IF UPWARD?

K.F. Ferraro, L.A. Rinaldo, T.P. Shippee, *Center on Aging and the Life Course, Purdue University, West Lafayette, Indiana*

Objectives: This research examines the relationship between occupational mobility and women's self-rated health over 36 years. Given inconsistencies in prior research, we assess whether any form of occupational mobility—upward or downward—is deleterious to health. **Methods:** Using the National Longitudinal Survey of Mature Women, we examine the effect of mobility on health using two measurement approaches: (a) changes in occupational prestige and (b) perceived work trajectories. **Results:** We find no evidence that upward occupational mobility is harmful to health, but consistent evidence that downward occupational mobility compromises health—and the effect is stronger among Black than White women. Also, effects are stronger when measured with perceived work trajectories than with change in occupational prestige. **Discussion:** Although upward occupational mobility is challenging, we did not find any harmful effects. The findings also draw importance to women's interpretation of their work trajectories as critical to long-term health and well-being.

RACE, SOCIOECONOMIC RESOURCES, AND LATE LIFE FUNCTION AND DECLINE: FINDINGS FROM THE HEALTH ABC STUDY

R.J. Thorpe, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

We examined associations between race, socioeconomic status (SES) and function in 2,538 non-disabled black (39%) and white, men (47%) and women aged 70-79 participating in Health ABC. SES measures included education, poverty status, reading level, income inadequacy, assets, and home ownership. At baseline, blacks were more likely to report diminished walking ability (men: OR=1.40, 95% CI: 1.04-1.88; women: OR= 1.56, 95% CI: 1.18-2.06) and had slower walking speed (men: 1.15 vs. 1.27m/s, women: 1.05 vs. 1.17m/s; $p<.001$ for all), independent of age, site, and SES indicators. After 5 years, accounting for age, site, baseline function and SES factors, race was unrelated to functional decline. Although SES differences did not completely account for race-related disparities in functional capacity in functionally intact men and women, SES factors, particularly education and income, appeared to modify race-related differences in functional decline over five years.

HEALTH DISPARITIES IN CHINA, INDONESIA, BOLIVIA, AND MEXICO

E. Crimmins, S. Vasunilashorn, F. Wheaton, S. Davarian, *University of Southern California, Los Angeles, California*

In countries where education is low, few people work in the market economy, there is limited access to medicine or everyone has access to the same medical care, we would expect socioeconomic health differentials at the older ages to be smaller and even reversed in some cases. To test this hypothesis we examine health differentials using multiple indicators of socio-economic well-being that characterize the individual, the household and the community. Indicators include the structure of the home and its amenities like plumbing facilities and water availability. Community indicators include means of subsistence, jobs in the non-agricultural sector and medical facilities. These data come from new surveys of national populations in Mexico and Indonesia (the Mexico and Indonesia Family Life Surveys); a new representative survey of two provinces in China (the China Health and Retirement Survey); and an anthropological study of the health and well-being of a traditional population in Bolivia.

SESSION 1125 (POSTER)

TECHNOLOGY FOR A BETTER LIFE

DEALING WITH VISION LOSS - COVERING THE PERSPECTIVES OF PARTICIPANTS AND TRAINERS IN LOW VISION INTERVENTION

I. Himmelsbach, *Goethe University, Frankfurt, Germany*

Age-related Macular Degeneration (ARMD) is the main cause for severe visual impairment in western countries. As a consequence intervention and rehabilitation programs gain in importance. Intervention research is predominantly present in quantitative follow-up designs concentrating on the change of outcomes in *participants*. This study used a qualitative approach for investigating different programs for elderly visually impaired as well from the perspective of trainers ($n=5$) as from the perspective of participating elders ($n=15$). The study is based on semi-focused interviews which were analyzed following the methodological paradigm of Grounded Theory. The analyses of those who are considered professional experts and of individuals who suffer from ARMD were conducted as case-based within and between group comparisons. The contribution will report those categories which show *how* construction of meaning is relevant for (un)successful training processes. These meanings in the domains of Facing Vision Loss and Biography, Setting, Educational Forms and Phases may explain the importance of considering both perspectives in intervention research. Within group comparisons of participants reveal coping with vision loss as a continuous dynamic between competence and deficit that challenges adaptational and learning processes of persons with a progressive eye condition. Whereas the within group comparison of experts allow for a better understanding of how underlying assumptions or views may drive certain professional agendas. The potential benefit of such insights is that they can be used to increase mutual understanding and exchange between the various experts in the field, an aspect that is still weak to nonexistent in most settings.

TRANSITIONAL REHABILITATION USING SELF-MANAGEMENT TECHNIQUES (TRUST) IN A SKILLED NURSING FACILITY

M.A. Dolansky¹, M. Zullo¹, R. Boxer², J. Schaefer², S.M. Moore¹, *1. Nursing, Case Western Reserve University, Cleveland, Ohio, 2. Case Western Reserve University, Cleveland, Ohio*

Patients over the age of 65 with multiple morbidities are surviving cardiac events and roughly 30% require transitional skilled nursing facility (SNF) services. Cardiac rehabilitation (CR) is available to assist with recovery and the benefits are well known. Unfortunately, older adults that use a SNF attend outpatient CR at lower rates than others. The purpose of this pilot study is to test the feasibility, safety, and efficacy of a novel SNF-based CR program, "Transitional Rehabilitation Using Self-management Techniques (TRUST)". TRUST CR is a family-focused intervention that includes progressive low intensity walking and education on self-management skills to facilitate recovery and promote future participation in a CR program. In this pilot study, a quasi-experimental two-group design was used. Participant mean age was 74.5, 85.3% were female and 100% lived with a family member. Recruitment and intervention success was limited by reports of extreme fatigue and difficulty meeting with family. At baseline, the usual care had higher levels of depression than the intervention group. At discharge the intervention group had higher levels of outcome expectancy (t -test 2.1, $p<.05$) than the usual care group. At 6 weeks, the groups differed in CR attendance but not in exercise maintenance (number of steps) and self-efficacy. The majority of participants were satisfied with the intervention. The innovative intervention has the potential to empower the patient-family dyad to bridge the transition of care from hospital to SNF to home to CR by the enhancement of self-management skills.

"I NEVER HAD TO STUDY": AN ANTHROPOLOGICAL STUDY OF OLDER ADULTS' TECHNOLOGY LEARNING PROCESSES

M. Harrod, *Wayne State University, Detroit, Michigan*

Within the past decade, a new field of research known as "gerotechnology" has emerged to study the use of technology among older adults. The emergence of this multi-disciplinary specialty implies that older adults have special needs when learning and using technology. While the goal of gerotechnology is "...to understand the underlying characteristics of the aging human in their social context (the biopsychosocial model) in order to best develop technological innovations," (Burdick and Kwon, pp. xvii-xviii), this important topic remains understudied. As Selwyn, Gorard, Furlong and Madden state, "the information [technology] society is also an ageing society," (2003, p. 562). This ethnographic study specifically examined the creation of "successful" computer users within an older-adult oriented computer learning center. Practice theory (Bourdieu, 1977) framed this study in order to understand how an age-specific educational habitus comes to be created, maintained and supported through a specific teaching approach. Study aims included documenting the various learning processes within the learning center and how these processes had to be negotiated and accommodated from both the student and instructor perspectives. Data collection in this year-long study involved participant-observation (N=60) and formal and informal interviews (N= 24). Findings suggest that the success of the learning process is not solely dependent on learning the technical, instructional material, but also on being able to negotiate and benefit from the social interactions that occur within the computer center including demonstrating how to use the skills learned to represent acquisition of various forms of culturally prioritized capital.

RESULTS FROM A STUDY OF INTRA-ORGANIZATIONAL DIFFERENCES IN WEB USE

V. Laila, *University of Massachusetts Boston, Boston, Massachusetts*

The rapid evolution and proliferation of Internet may have positive implications for extending service reach by voluntary health organizations. The focus of the poster presentation is to share findings from a study to investigate the use and adoption of web-based applications at a national voluntary health organization in the United States. Specifically, intra-organizational characteristics which influence use of Internet as a mode of service delivery to family caregivers of persons with Alzheimer's Disease and related dementia (ADRD) will be identified and examined using Rogers' Diffusion of Innovation theoretical paradigm. Findings from a cross-sectional online survey (n=56) will be presented as well as results from semi-structured phone interviews with key informants and systematic evaluation of chapter websites. Discussed will be implications and suggestions for service agencies to incorporate Internet-based services for the target population.

SOCIAL NETWORKING SITES, NOT JUST FOR KIDS ANYMORE: HOW TO RECRUIT OLDER ADULTS ONLINE

A. Creamer, A.M. Stripling, M. Heesacker, *Psychology, University of Florida, Gainesville, Florida*

The purpose of this presentation is to advance gerontologists' understanding of social networking sites as fertile ground for online recruitment focused on adults and older adults. The internet has become increasingly accessible to the public, creating a large and convenient participant pool for gerontological researchers to utilize. Research conducted on online sampling has primarily provided information on the pros and cons of internet recruitment. However, little practical guidance has been provided to direct researchers in how to maneuver this new terrain, and less still that are specifically focused on targeting specific samples, such as older adults. According to the Pew Internet and American Life Project, the number of adults using online social networking sites has quadrupled in the past few years. This finding has major implications for online recruitment of adults and older adults, both of whom are erroneously

thought to have a minimal presence online and on peer-to-peer networking sites. This advancement in understanding will be accomplished by providing information about a protocol currently in use to identify participants and elicit participation in studies investigating attitudes on aging. The protocol describes how and where to locate participants based on identifying target sample demographics and the use of web etiquette to facilitate responses from members of target groups. The presentation will provide relevant information to gerontologists about adult and older adult use of electronic social networking and will provide specific instruction about engaging in online recruitment targeted toward older adults.

EXAMINING THE USE OF ONLINE HEALTH AND SOCIAL RESOURCES IN ADULTHOOD

B.L. Browne¹, S. Kohn¹, M.E. Pratarelli², *1. Psychology, Valdosta State University, Valdosta, Georgia, 2. Colorado State University - Pueblo, Pueblo, Colorado*

Much research has focused on the aspects of Internet use among the young, but relatively few studies have examined how the Internet is used by older adults. The purpose of the current study, therefore, was to address how older adults are using the Internet and other forms of contemporary information-technology (e.g., cell-phones); and how their usage and preference patterns differ relative to younger adults. The data were collected with Pratarelli and Browne's (2002) Internet Use Scale, which contained 44 items comprised of 25 Likert-scaled questions along with 19 categorical and quantitative questions. The participants were all community dwelling older adult volunteers (N=119) recruited from senior centers, religious centers, and educational facilities in the Northeastern, West Central and Southeastern USA. The sample's mean age was 70.58 (SD=7.12 Age-range=59-84 years), and consisted of 115 females and 4 males. The primary data analysis consisted of an exploratory principle components analysis (PCA) to examine the factor structure from our 25 Internet/computer usage questions. Three unique factors emerged from this analysis (KMO=.78) with Eigenvalues greater than 2. Based on these results, we found that older adults tend to use their computers and the Internet primarily for health and informational purposes while the younger age group primarily uses it for social reasons (e.g., Facebook, My Space, and games). These findings are consistent with some previous studies (e.g., Pew, 2006); but more importantly suggest that any research on the impact of the Internet and information-technology on human behavior must take into account both developmental issues and differences.

ETHICAL ISSUES AND OPPORTUNITIES IN THE USE OF WEARABLE SENSORS

A.L. Curl¹, R.S. Bowers², *1. School of Social Work, University of Missouri, Columbia, Missouri, 2. Science Applications International Corporation, Washington, District of Columbia*

Advances in technology have recently made it possible to create wearable sensors. These devices allow health monitoring, location tracking, and other information about people who wear them, but they also involve ethical issues and policy decisions which should be considered before their adoption. This poster describes the state of wearable sensor research for elder care. It includes a brief survey of different technologies that are under development for aiding in the care and monitoring of older adults. It also discusses why these technologies may be helpful, opportunities for using these technologies, opportunities for future technology use, and issues that may arise with the use of these technologies. Specific issues addressed include privacy, loss of control, and decreased human contact. There is also the potential that health providers may seek to reduce the number of caregivers by replacing basic health monitoring with these devices. One near term opportunity presented by these devices include the ability to monitor health measures in detail remotely, allowing caregivers and relatives to view pulse, oxygen saturation, blood pressure, and other statistics that today require people under care to be

tethered to a station. Other opportunities that will develop in the near term include detecting diseases before symptoms develop, evaluating mobility through motion tracking, and detecting signs of abuse and neglect. This poster expands on these topics and provides insight into what may need to be balanced.

CHARACTER USER INTERFACE ACCEPTATION AND PLEASANTNESS IN PERSONS WITH MILD COGNITIVE IMPAIRMENT, INFORMAL AND FORMAL CAREGIVERS

N. Galdona¹, J. Yanguas¹, I. Etxeberria¹, J. Millán-Calenti², C. Huijnen³, S. Dittenberger⁴, A. Rigaud⁵, A. Hochgatterer⁶, 1. *Fundación Instituto Gerontológico Matia - INGEMA, Research & Development Department, San Sebastian, Spain*, 2. *Universidad de la Coruña, Gerontology Research Group, La Coruña, Spain*, 3. *Smart-Homes, Limburg, Netherlands*, 4. *Center for Usability Research and Engineering - CURE, Vienna, Austria*, 5. *Hôpital Broca- Assistance Publique Hôpitaux de Paris, Paris, France*, 6. *Austrian Research Centers GmbH, Vienna, Austria*

The Companionable project (Integrated Cognitive Assistive & Domestic Companion Robotic Systems for Ability & Security aims to help the elderly people) aims to help the elderly people to live as long as possible at home. One of the ICT challenges is to develop a more natural interface in order to improve the interaction between the elderly people and the system, especially elderly people with Mild Cognitive Impairment (MCI). Method: 17 elderly persons with MCI, their 13 non-professional caregivers and 31 professional caregivers participated. The aim of the study was to explore the acceptability of the character user interface in the three groups. Four different animated avatars (a woman, a man, a cartoon and a pet) were displayed and participants were asked to complete a semi-structured interview to address acceptance and pleasantness of the avatars using 10-point Likert scales for opinion, pleasantness and perceived usability, as well as open questions about qualitative aspects. The results showed that persons with MCI ($M=6.5$; $sd=2.4$) and the professionals ($M=6.2$; $sd=2$) preferred the feminine avatar meanwhile the caregivers ($M=6.4$; $sd=3$) preferred the pet avatar. Generally the most preferred avatar ($M=6.2$; $sd=2.4$) was the feminine one as the most pleasant, because she is evaluated as sympathetic, human, and friendly in most of the qualitative questions. "The study presented is being supported by the European Commission under the strategic objective "ICT and Aging" of the Seventh Framework Programme (FP7/2007-2013) under the agreement n° 216487".

EVALUATION OF TELEHEALTH IN A RURAL AND REMOTE MEMORY CLINIC

D.G. Morgan^{1,2}, M. Crossley^{1,3}, A. Kirk^{1,4}, N. Stewart^{1,8}, C. D'Arcy^{1,5}, J. Basran^{1,6}, V. Dal Bello-Haas^{1,7}, L.E. Holfeld^{1,2}, 1. *Canadian Center for Health & Safety in Agriculture, University of Saskatchewan, Saskatoon, Saskatchewan, Canada*, 2. *Canadian Centre for Health & Safety in Agriculture, Saskatoon, Saskatchewan, Canada*, 3. *Department of Psychology, Saskatoon, Saskatchewan, Canada*, 4. *Division of Neurology, Saskatoon, Saskatchewan, Canada*, 5. *Applied Research/Psychiatry, Saskatoon, Saskatchewan, Canada*, 6. *Division of Geriatric Medicine, Saskatoon, Saskatchewan, Canada*, 7. *School of Physical Therapy, Saskatoon, Saskatchewan, Canada*, 8. *College of Nursing, Saskatoon, Saskatchewan, Canada*

OBJECTIVE: This study evaluated telehealth videoconferencing in a memory clinic serving rural and remote regions in Saskatchewan, Canada. **METHODS:** Pre-clinic assessment is conducted via telehealth, with the patient and family in their home community and the clinic team in the tertiary care centre where patients are subsequently seen for a full-day interprofessional assessment. Patients are randomly assigned to telehealth or in-person follow-up at 6 weeks, and then alternating at 12-week and 6-month follow-up. Rural telehealth coordinators and patients/family dyads complete questionnaires following each contact. **RESULTS:** Of the first 169 patients, 40% were male and mean age was

73 years. Alzheimer Disease was the most common diagnosis (35%). The mean distance saved by telehealth vs. in-person appointments was 426 kms/round trip. Rural telehealth coordinators rated most patients as comfortable (55.5%) or very comfortable (29.9%). There was no significant difference in mean satisfaction with telehealth vs. in-person appointments, $p = 0.158$. However, convenience was significantly better for telehealth, $p < 0.0001$. Telehealth Satisfaction Scale scores at pre-clinic and 6-months did not differ ($p = 0.152$). Patients who discontinued follow-up by 6 months had lower telehealth satisfaction scores compared to those who continued ($OR = 0.88$, 95% $CI = 0.78, 0.98$). Risk of discontinuing was 8.7 times higher when patients needed to travel ≥ 100 km to telehealth. Patients 80+ years were 5 times more likely to discontinue compared to those ≤ 70 years ($OR = 5.12$, 95% $CI = 1.15, 22.73$). **CONCLUSION:** Telehealth is a feasible and acceptable strategy for delivering services to rural seniors.

CREATIVE USE OF SENSOR/ALERT TECHNOLOGY MAY ENABLE ELDERS LIVING ALONE TO DELAY TRANSITION TO HIGHER LEVELS OF CARE: A TESTED HYPOTHESIS

R. Roush¹, C. Meriano^{2,1}, 1. *Baylor College of Medicine, Houston, Texas*, 2. *Quinnipiac University, Hamden, Connecticut*

Early research on PERS use and health outcomes (Roush and Teasdale, 1996) led to studies of how "smart home" technologies assist elders to live independently longer than otherwise might be the case (Glascock and Kutzik, 2008; Agnew, 2008). Electronic activities of daily-living reporting systems (e-ADLRS) gather data unobtrusively and report on the well-being of elders living alone. The efficacy of such a program is being studied by one of the co-authors (Meriano). Elders ($N=70$) residing in Masonicare, an ALF in Wallingford, CT, were randomly assigned to groups with and without e-Neighbor sensors in their apartments. The hypothesis tested is, due to earlier detection of problems, residents with sensors and reporting systems will experience fewer ADL decrements and possibly delayed transition to NH care over the two-year period of the study. All participants had a functional evaluation during summer 2008 using the Performance Assessment of Self-care Skills (PASS), the Mini Mental Status Exam (MMSE), and the Timed Up and Go (TUG). These assessments established a baseline of all participants. The three measures will be repeated on all 70 participants again during summer 2009 to evaluate any change in function between the two groups. Results of data analyses on the main outcomes of efficacy will be presented.

COMMUNICATION PATTERNS OF AGING FAMILIES: THE ROLE OF TECHNOLOGY IN ASSISTED LIVING FACILITIES

C.L. Vair¹, S.H. Qualls¹, M.A. Doffing¹, R. Bliesner², M.D. Williams¹, 1. *University of Colorado, Colorado Springs, Colorado*, 2. *Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

The placement of an older adult in an assisted living (AL) facility alters the role that family members undertake in the day-to-day lives of their aging loved one, including family interactions and communication patterns. Families show reciprocal support with older adults, and maintain connections within and across generations, yet older adults living in long-term care are at high risk of depression and loneliness which likely results from disconnection from previous social networks. This study assesses the impact of one device designed to facilitate communication between residents of ALs and their families. The Family Connections Service (FCS) allows AL residents to send text or photos from a one-touch digital mailbox with the assistance of residential staff. This poster reports on the patterns of interactions between older adults from three diverse community assisted living facilities and family members interfacing with their preferred technology. Data on frequency of communication, range of persons communicating with the elder, and family and staff perceptions of usability as well as measures of impact on elder and family well-being will be used. The present study describes

the initial data on the recruitment of older adults and family members and utilization launch and patterns. Findings are interpreted as demonstrating the acceptability of the technology, and the value to the families as well as the AL staff that accrues from more frequent communication with a larger range of the residents' networks.

SESSION 1130 (SYMPOSIUM)

THE ARKANSAS AGING INITIATIVE: SUCCESSFUL IMPLEMENTATION OF EVIDENCE-BASED EDUCATIONAL PROGRAMS IN RURAL COMMUNITIES

Chair: R.E. McAtee, *The University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Discussant: N. Whitelaw, *National Council On Aging, Washington DC, District of Columbia*

This session will demonstrate that evidence-based educational programs are effective in rural communities. The Arkansas Aging Initiative (AAI) is a rural network of eight Centers on Aging whose mission is to improve the quality of lives for older adults through two primary components, education and clinical care. The AAI is implementing at least two evidence-based educational programs per year on a statewide multi-site basis. These programs are developed by healthcare and educational professionals and cover topics that the target audiences identify as being important. Over the past two years, four such programs have been developed; arthritis, exercise, strokes, and fall prevention. Each program utilizes an evidence-based program and is developed with the specific audiences in mind. One is developed for the lay community of older adults and their families, one for paraprofessionals and one for healthcare professionals. Each program developed for the older adult community has several components including a PowerPoint® presentation, an ad campaign complete with flyers, TV ads, billboard ads, articles for release in local publications and approved evaluations. The professional education is done in partnership with the Arkansas Geriatric Education Center (AGEC). Participation in these statewide events has been outstanding and the results are being evaluated for satisfaction and impact. Three of the individual symposiums will review different evidence-based programs, their delivery methods and outcomes. The fourth one will review the professional programs done with the AGEC and evaluation results.

EVIDENCED-BASED HEALTH INFORMATION: HOW DOES THE COMMUNITY KNOW WHAT TO BELIEVE

C.J. Beverly, R. McAtee, *Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

A rapidly growing wealth of health care information is available to the public and an active part of consumer decision making about preventive or therapeutic interventions. The basis for informed consumer decision making is the communication of evidence-based scientific data. However, many consumers lack the ability to critically critique and understand scientific results. Guided by this concern, the Arkansas Aging Initiative developed a strategic plan to develop two evidence-based education programs targeting the community on an annual basis. A process was established to synthesize the research results for a defined health topic that was led by a team of Arkansas Aging Initiative education directors. Results of the synthesis guided the development of two evidence-based education programs annually. This presentation will examine the process and lessons learned in the development of these programs targeting older adults in Arkansas.

HEALTHY CHANGES: RESULTS FROM AN EVIDENCE-BASED DIABETIC SELF-MANAGEMENT PROGRAM

T. Horton, *AAI: South Central Center on Aging, University of Arkansas for Medical Sciences, Pine Bluff, Arkansas*

The Arkansas Aging Initiative offered the evidence-based Healthy Changes program to older adults in rural Arkansas. This program is

designed to assist older adults in the day-to-day self-management of diabetes by focusing on the role nutrition and physical activity play. Emphasis is placed in setting achievable goals, problem solving and better preparation to work with healthcare providers. This was the first attempt by the AAI regional sites to offer a multi-session program in a rural setting and participation was voluntary. Although several more older adults participated in the program, only 29 participants completed the pre-test and only 13 completed the post-test. Barriers to implementation and lessons learned will be discussed along with the findings based on comparison of the data obtained through pre and post tests.

HIPPS: AN EVIDENCED BASED FALL PREVENTION PROGRAM FOR RURAL COMMUNITY DWELLING OLDER ADULTS

K.A. Packard, *University of Arkansas for Medical Sciences, Hot Springs, Arkansas*

The Arkansas Aging Initiative (AAI) partnered with Area Agencies on Aging to offer an evidenced based Fall Prevention program in rural Arkansas. This "Home Injury Prevention Program for Seniors" (HIPPS) was developed to teach older adults to identify risk factors and implement treatment plans to prevent falls and injuries. Participants were provided with a home safety checklist book and participated in an interactive forum on how to safely change their home environment to reduce the risk of falls. Participants in the program evaluation were volunteer community dwelling older adults. To measure the outcomes, the Falls Free Questionnaire was completed by consenting participants prior to the HIPPS educational program, followed up by a phone call asking the same questions six months after the HIPPS educational program. Comparison data will be presented.

EVIDENCE-BASED EDUCATIONAL PROGRAMS FOR RURAL HEALTHCARE PROVIDERS: STRATEGIES FOR SUCCESS

R. Chernoff, 1. *GRECC, Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*, 2. *AGEC, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Providing education to health providers who live in rural communities is a challenge due to the distances they are often required to travel to access programs. Professional education is achieved through several methodologies including live interactive video teleconferences which are digitally recorded, edited and produced as DVDs with supporting handout material, post-tests, participant profiles, and evaluation forms, all of which can be accessed on-line. Continuing education symposia are offered in Little Rock several times annually but selected programs are developed to address the specific topics chosen by the rural Centers on Aging education directors and offered at 4 rural sites per year. Self-study programs offer another option for rural-based practitioners. All professional education programs are evaluated at the completion of the program and then 90 days after the event to assess the clinical impact of the continuing education program. Attendance at programs offered at rural sites has been excellent.

THE IMPACT OF THE EVIDENCE-BASED ARTHRITIS FOUNDATION SELF HELP PROGRAM IN RURAL SETTINGS

R. Alcon, B. Parker, T. Williams, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

The Arkansas Aging Initiative (AAI) partnered with the Arthritis Foundation, Arkansas Chapter to offer their evidenced-based self-management program "The Arthritis Foundation Self-Help Program" in some very rural areas of Arkansas. This is a six week program designed to help participants: 1) Become active members of their health-care teams; 2) Work better with their health-care providers; and 3) Handle the day-to-day challenges of the disease. This evidenced-based program included pre and post questionnaires which were administered to all par-

ticipants on the first and last day of class. It covered such areas as pain management, general health, ADLs, quality of life and physical activity. The results are based on the comparison of 41 participants' pre and post questionnaires from 6 rural sites. Results report significant differences in several areas after participation in the self-help program. This program, typically offered in more urban areas, can still be effective when offered to older adults in very rural settings.

SESSION 1135 (SYMPOSIUM)

THE ROLE OF GENETIC AND LIFESTYLE FACTORS FOR COGNITIVE CHANGE IN ADULTHOOD AND OLD AGE

Chair: *B.J. Stiehler, Human Development-Family Studies, Penn State University, University Park, Pennsylvania*

Discussant: *R.S. Wilson, Rush University Medical Center, Chicago, Illinois*

Lifespan research has long been interested in the heterogeneity of cognitive aging and the multitude of factors that may account for such interindividual differences in cognitive performance and change. One long-standing promising approach is to target genetic factors: APOE, COMT, or BDNF as risk factors for cognitive decline. Another approach has targeted lifestyle and psychosocial variables such as activities and well-being as possibly moderating cognitive change. Our objective in this symposium is to bring together a collection of empirical work from these research traditions to showcase contemporary approaches to study the role of genetic and lifestyle factors for cognitive change across adulthood and old age. Anstey and colleagues report differential predictive effects of health behaviors, medical conditions and APOE for cognitive change in middle-aged and old-aged participants of the PATH Through Life Study. Li and colleagues report evidence for the hypothesis that the magnitude of genetic effects (BDNF Val66Met polymorphism) on episodic memory is greater when brain resources are reduced, such as old age. Small and colleagues report that the COMT genotype relates to lower cognitive performance and that such genotype-related cognitive deficits were exacerbated among cancer survivors treated with chemotherapy. Stiehler and colleagues demonstrate that level and change differences between APOE e4 carriers and APOE e4 non-carriers on measures of fluid and crystallized abilities cannot only be detected in old age, but already commence in middle age. The discussion by Wilson integrates the four papers, highlights their theoretical and methodological contributions, and considers research opportunities that promises further understanding.

MEDICAL CONDITIONS, SMOKING AND APOE AS PREDICTORS OF SUBTLE COGNITIVE CHANGE IN MID-LIFE AND EARLY-OLD AGE: THE PATH THROUGH LIFE STUDY

K. Anstey, N. Cherbuin, R. Burns, *Australian National University, Canberra, Australian Capital Territory, Australia*

Health behaviors, medical conditions and APOE were evaluated as predictors of cognitive decline in narrow age cohorts in their 40s ($n = 2485$) and 60s ($n = 2160$) with 4-year follow-up. Population level analyses showed improvement in memory but no change in processing speed in the 40s, while the 60s declined in both domains. Subgroup analyses showed that females in their 40s reporting a history of cancer, stroke, smoking or head injury declined in processing speed. Males in their 40s reporting history of stroke declined in speed and memory. In the 60s, participants reporting history of cancer or diabetes declined in both speed and memory. Head injury predicted memory decline in males and female smokers declined in processing speed. APOE had minimal associations with decline. We conclude that smoking and specific medical conditions (or their treatments) increase the risk of cognitive decline in mid-life, with women showing greater vulnerability.

THE INFLUENCES OF THE BDNF VAL66MET POLYMORPHISM ON EPISODIC MEMORY IS MODULATED BY AGING

S. Li¹, C. Chicherio², L. Nyberg⁴, I. Nagel¹, T. Sander⁵, H.R. Heekeren³, U. Lindenberger¹, L. Bäckman⁶, *1. Center for Lifespan Psychology, Max Planck Institute for Human Development, Berlin, Germany, 2. University of Geneva, Geneva, Switzerland, 3. Free University of Berlin, Berlin, Germany, 4. Umea University, Umea, Sweden, 5. Cologne Center for Genomics, Cologne, Germany, 6. Karolinska Institute, Stockholm, Sweden*

The brain-derived neurotrophic factor (BDNF) is known to affect learning and memory. In a sample of 948 younger and older adults, we investigated the influence of a human BDNF gene Val66Met polymorphism on episodic memory as assessed by the serial recall task. BDNF polymorphism affected backward recall in older adults only, with any Met carriers (i.e., individuals with reduced BDNF signaling) recalling less accurately than Val homozygotes. This finding is in line with the hypothesis (Lindenberger et al., 2008) that the magnitude of genetic effects on cognition may be greater when brain resources are reduced, as is the case in old age.

CATHECHOL-O-METHYLTRANSFERASE GENOTYPE MODULATES CANCER-RELATED COGNITIVE DEFICITS

B. Small^{1,4}, K. Sharp Rawson¹, T. Hughes², L. Iser¹, H. Jim⁴, M. Andrykowski³, P. Jacobsen⁴, *1. University of South Florida, Tampa, Florida, 2. University of Pittsburgh Medical Center, Pittsburgh, Pennsylvania, 3. University of Kentucky School of Medicine, Lexington, Kentucky, 4. Moffitt Cancer Center, Tampa, Florida*

Evidence indicates that cancer survivors may be at risk for cognitive deficits associated with their cancer treatment. In the current study, we examined cognitive deficits among breast cancer survivors who were treated with radiation and chemotherapy ($n = 82$) or radiation alone ($n = 70$), as well as a non-cancer control group ($n = 123$). We also examined whether Catechol-O-Methyltransferase (COMT) genotype modified the association between cancer treatment and cognitive performance. The results indicated that COMT Met/Val and Val carriers performed more poorly than Met carriers on Digit Span and the Controlled Oral Word Associates tests. Moreover, cancer survivors who were Met/Val or Val carriers treated with chemotherapy performed worse cognitively than those treated with radiation alone. Taken together the results indicate COMT genotype is related to cognitive performance and that persons with Met/Val or Val alleles who are treated with chemotherapy may be at greatest risk for cognitive deficits.

GENETIC AND LIFESTYLE INFLUENCES ON COGNITIVE DECLINE: APOE ε4, PERSONALITY AND WELL-BEING

B.J. Stiehler, D. Gerstorf, S. Willis, K. Schaie, *Human Development-Family Studies, Penn State University, University Park, Pennsylvania*

The APOE e4 allele is a well-established risk factors for cognitive decline in old age, but less is known about its role in middle age. Our study examines level and change differences in measures of fluid and crystallized abilities for APOE e4 carriers ($n = 261$) and APOE e4 non-carriers ($n = 696$) in the Seattle Longitudinal Study from age 40 to 100. Results indicate that small differences indeed already exist in middle age and become larger in old age. Follow-up analyses will target an often overlooked question, namely if and how other factors such as personality and well-being moderate the rate of decline for APOE e4 carriers. These findings suggest that cognitive decline may be occurring earlier than typically thought for APOE e4 carriers and cognitive intervention efforts may already target middle-aged adults.

SESSION 1140 (SYMPOSIUM)

WELL-BEING IN OLD AGE: AN INVESTIGATION OF SOCIAL AND PSYCHOLOGICAL PREDICTORS

Chair: *M. Ardeit, Sociology, University of Florida, Gainesville, Florida*

Discussant: *C. Elman, University of Akron, Akron, Ohio*

This symposium investigates the social and psychological predictors of physical, social, psychological, and subjective well-being in old age. The first presentation focuses on the role of educational attainment in later life physical well-being. Longitudinal data from the nationally-representative Health and Retirement Study show that disability trajectories of middle-aged and older adults differ by educational status even after controlling for health conditions, health behaviors, and demographic factors. The second presentation utilizes longitudinal data of older adults to demonstrate the value of proactivity. Specifically, the study indicates that behavioral adaptations, such as planning ahead and marshalling support, tend to have long-term positive consequences on the preservation of social and psychological well-being in old age. The third presentation uses data from the Institute of Human Development longitudinal studies of white men and women to explore adolescent predictors of hedonic well-being (life satisfaction and warm personal relations) and eudemonic well-being (personal growth) in old age. Results show that conscientiousness and openness to experience in adolescence predict hedonic and eudemonic well-being, respectively, at age 70. The last presentation tests the effect of wisdom (measured as a combination of cognitive, reflective, and affective personality characteristics) on subjective well-being in old age in three diverse samples: a community sample of older adults, a sample of older hospice patients and nursing home residents, and a Harvard-educated sample of white men. In all three samples, wisdom tends to be a stronger predictor of well-being than the objective conditions older adults encounter, such as physical health, socioeconomic status, and finances.

EDUCATION, HEALTH, AND DISABILITY IN OLDER AGE

L.A. Wray¹, C. Chiu¹, C.L. LaCoe¹, E. Beverly², *1. Biobehavioral Health, Penn State, University Park, Pennsylvania, 2. Joslin Diabetes Center, Boston, Massachusetts*

The absence of disability is key to well-being in older age. According to a growing literature, disability increases markedly with age and age-related health conditions, as well as for women, adults with less education, and for riskier health behaviors. While providing important evidence, existing studies are limited by cross-sectional or short-term longitudinal data, as well as small or unrepresentative samples. In this study, we utilize nationally-representative HRS data in 1998-2006 for middle-aged and older adults to assess: (1) differences in age-related trajectories of disability by education; and (2) if health conditions and health behaviors explain differences. We find that education strongly effects both level of and change in disability and the education effect remains significant net of demographic and health factors. All of the health conditions and risky health behaviors increased levels of disability, some increased change in disability, but few explained the education differences in disability level or change.

PROACTIVELY: PSYCHOLOGICAL AND SOCIAL WELL-BEING IN LATE LIFE

E. Kahana¹, B. Kahana², *1. Sociology, Case Western Reserve, Cleveland, Ohio, 2. Cleveland State University, Cleveland, Ohio*

This presentation will focus on proactive options available to current and future cohorts of elderly persons to deal with normative stressors of late life. As growing numbers of older adults live longer lives, they are also likely to encounter exposure to chronic illness, disability, and social losses. Based on a theoretical framework of Preventive & Corrective Proactivity (PCP) (Kahana & Kahana, 2003), we discuss behavioral adaptations such as health promotion, planning, helping others,

and marshalling support that can diminish adverse effects of stress exposure on quality of life outcomes. Emergent behavioral adaptations such as health care consumerism and technology use will also be noted as they present new options for proactive engagement. Findings of our longitudinal study based on 561 elders support the value of adaptations such as planning ahead and marshalling support for the subsequent maintenance of both social and psychological quality of late life.

ADOLESCENT PREDICTORS OF TWO TYPES OF WELL-BEING IN OLD AGE

P. Wink, *Psychology, Wellesley College, Wellesley, Massachusetts*

Whereas some older adults derive their well being from being satisfied with life and having warm personal relations (hedonic well-being), others tie their psychological welfare to personal growth (eudemonic well-being). In the Institute of Human Development (IHD) longitudinal study of men and women, hedonic well-being at age 70 was predicted by adolescent ratings of conscientiousness indicative of an emphasis on achievement, dependability, and self-control. This relationship held even after controlling for social class in adulthood which itself was positively related to life satisfaction. In contrast, eudemonic well-being in old age was characteristic of adolescents who were open to experience (showed wide interests, insight, and valued intellectual pursuits). This relationship was moderated by adult psychotherapy use and the development of spiritual interests. The IHD findings support Carol Ryff's contention that there is more than one type of psychological well-being and that hedonic and eudemonic well-being have their own distinct developmental trajectories.

WISDOM AND SUBJECTIVE WELL-BEING IN THE LATER YEARS OF LIFE

M. Ardeit¹, G.E. Vaillant², *1. Sociology, University of Florida, Gainesville, Florida, 2. Brigham and Women's Hospital, Boston, Massachusetts*

The effect of wisdom on subjective well-being was investigated in three different samples: a community-sample of 180 older adults (mean age = 71 years), a sample of 42 older hospice patients and nursing home residents (mean age = 77 years), and a sample of 96 Harvard-educated white men around the age of 80 years. In all three samples, wisdom (measured by cognitive, reflective, and affective personality characteristics) was a consistent and relatively strong predictor of subjective well-being in the later years, even after controlling for age, physical health, socioeconomic status, economic pressure, social involvement, gender, and race. The strength and significance of the other predictor variables varied across samples. Moreover, the inclusion of wisdom in the models tended to reduce the impact of the more "objective" predictors of subjective well-being. Hence, aging well might depend more on psychosocial growth across the life course than on objective conditions in old age.

SESSION 1145 (SYMPOSIUM)

WHAT CAN WE LEARN ABOUT AFFECT AND AGING FROM STUDIES USING REAL-TIME MOOD MEASUREMENT?

Chair: *D. Isaacowitz, Brandeis University, Waltham, Massachusetts*

Discussant: *D. Almeida, Pennsylvania State University, State College, Pennsylvania*

Early studies on affect and aging asked participants at one point in time to report on their emotional experiences in general or in retrospect, thus measuring people's generalized knowledge about their emotional experiences. More recently, studies increasingly have used Experience Sampling to capture emotional experiences as they occur, or close to their occurrence, and within the context of the person's daily life, to study the nature of affective experience in older and younger adults. The focus of this symposium is on still the next generation of research on

aging and affect: studies using real-time mood measurement to put momentary affect in context, by considering how it relates to other ongoing behavioral processes, such as cognition and physiological responding. Scheibe and colleagues will use data on real-time mood measurement to test for age differences in recall memory of that experience, consistent with positivity effects in older adults' cognitive processing. Isaacowitz will consider how gaze preferences facilitate real-time mood change, and how such gaze-mood links are moderated by trait-level variables such as attention. Blanchard-Fields will use time-sampling data with converging measures to evaluate the effectiveness of older and younger adults' emotion regulation. Riediger and colleagues will add measures of arousal to momentary assessment of both affect and cognition, to evaluate what can be learned by looking simultaneously across multiple streams of real-time data. Finally, our discussant David Almeida will pull together the talks by considering the conceptual advances that can be made when methodologies allow for real-time affect assessment.

THE ROLE OF STATE AND TRAIT ATTENTION IN PREDICTING OLDER AND YOUNGER ADULTS' REAL-TIME MOOD CHANGE

D. Isaacowitz¹, S. Neupert², 1. Brandeis University, Waltham, Massachusetts, 2. North Carolina State University, Raleigh, North Carolina

Previous eye tracking research has established age differences in gaze toward emotional stimuli, with older adults looking more toward positive stimuli and away from negative ones. Such findings have been interpreted as reflecting older adults' attempts to use their information processing to regulate how they feel, in line with the predictions of socioemotional selectivity theory. Actually linking gaze preferences to mood regulation, however, requires the ability to assess mood change in real-time, and to link changes in mood to simultaneous (or preceding) attentional patterns. In this talk, I will present recent evidence showing that older adults' gaze preferences (a "state" variable) can indeed predict their mood, but that this depends on the functioning of their general attentional system (a "trait" variable). Gaze-mood change links also vary as a function of the duration of the interval of mood change. Such real-time findings clarify the mood regulatory function of age-related gaze preferences.

A MULTI-METHOD APPROACH TO STUDYING THE AFFECT-BEHAVIOR-PHYSIOLOGY INTERPLAY IN EVERYDAY LIFE: FROM ADOLESCENCE TO OLD AGE

M. Riediger¹, C. Wrzus¹, V. Mueller¹, F. Schmiedek^{2,1}, G.G. Wagner^{3,1}, U. Lindenberger¹, 1. Max Planck Institute for Human Development, Berlin, Germany, 2. Humboldt University, Berlin, Germany, 3. German Socioeconomic Panel, Berlin, Germany

Age-related differences in the interplay between affective experiences, behavior, and physiology were investigated in 378 participants aged 14 to 86 years. Participants were provided with mobile phones that they carried with them in their natural environment, and that prompted participants six times a day to describe the current situation, and to report their momentary affect, affect-regulation goals and strategies, and potential affect-eliciting events. Participants furthermore completed two trials of a working-memory task. Assessments were obtained on 9 days distributed throughout 3 weeks. A subsample of 92 participants further participated in a 24-hours ambulatory bio-monitoring phase during which six additional experience-sampling assessments were obtained, and cardiovascular functioning, breathing, and physical activity were continuously monitored. We report results demonstrating age-related differences in the links between self-reported affective experiences, working-memory performance, and autonomous arousal. Implications of these findings for theoretical conceptualizations of age-related differences in affective functioning are discussed.

EMOTION RECALL AND AGING: OLDER ADULTS RECALL THE PAST MORE POSITIVELY (AND LESS NEGATIVELY) THAN YOUNGER ADULTS

S. Scheibe, R. Mata, L. Carstensen, *Psychology, Stanford University, Stanford, California*

A global sense of well-being likely depends on what people remember about their past emotional experiences. Life-span changes in motivation may lead to differential memory distortions in younger and older adults. Two studies investigated whether there is an age-related positivity effect in recall of past emotions. Study 1 compared affect ratings with recalled affect one month later and found older adults overestimated their past positive affect relative to younger adults. Study 2 compared affect ratings during a week-long experience sampling phase with recalled affect and again found older adults overestimated their past positive affect relative to younger adults. In addition, younger adults overestimated their past negative affect relative to older adults. Findings thus support a positivity effect in emotion recall with aging. From a methodological perspective, the results suggest that global self-reports of affect and well-being are differently biased in younger and older adults.

EMOTION REGULATION EFFECTIVENESS AND EVERYDAY PROBLEM SOLVING IN OLDER ADULTHOOD

F. Blanchard-Fields¹, C. Hoppmann², M. Sliwinski³, 1. Georgia Institute of Technology, Atlanta, Georgia, 2. Univ. of British Columbia, Vancouver, British Columbia, Canada, 3. Syracuse University, Syracuse, New York

Past research has showed that older adults are more effective at emotion regulation than young adults. The majority of these studies have employed self-report assessments which indicate that in comparison to young adults, older adults are more effectively context-driven in their strategy use, i.e., vary the use of emotion regulation strategies depending upon the emotional salience of the situation. These findings are corroborated by high peer ratings of strategies chosen by older adults in comparison to young adults. In addition, older adults demonstrate cognitive efficiency when regulating emotions in comparison to young adults. We used a time-sampling study approach to examine this process in real time. To further evidence of emotion regulation effectiveness we employed converging measures, both psychological and physiological, to evaluate the emotion regulation process as well as emotion-related outcomes in young, middle-aged, and older adults.

SESSION 1150 (POSTER)

BALANCE/GAIT

MAXIMUM STEP LENGTH TESTING IN OLDER ADULTS

S. Schepens¹, R. Carlesimo², M. Wallace², A. Goldberg¹, 1. Wayne State University, Program in Physical Therapy, Mobility Research Laboratory, Institute of Gerontology, Detroit, Michigan, 2. Wayne State University, Program in Physical Therapy, Mobility Research Laboratory, Detroit, Michigan

Background and Purpose: Maximum Step Length (MSL) has been shown to be related to balance impairment and falls risk in older adults. The purpose of this study was to obtain preliminary normative values of MSL in balance impaired and unimpaired older adult males and females for varying age groups (60-70 years; 71-80 years; 81+ years). Participants: 70 community-dwelling older adults (47 females, 23 males) participated in the study. Female participants' mean age was 72.9 ± 0.9 years and male's mean age was 76.4 ± 1.4 years. Methods: Participants reported their medical and falls history. Unipedal stance time (UST) and MSL was assessed. Balance impaired and unimpaired status was established by UST of <5 seconds or >20 seconds, respectively. Results: Significant differences in MSL were found between balance impaired and unimpaired individuals ($p < .001$). Among the 60-70 year age group, males had a significantly longer MSL than females ($p < .05$). For the two

older age groups, there were no significant differences in MSL between males and females. Additionally, balance impaired males and females did not differ significantly in MSL, however, unimpaired males had significantly greater MSL than unimpaired females ($p < .05$). Conclusion: These data, based on balance impairment and gender, will help establish MSL as a risk for falls in older adults. The ease of administering the MSL test, combined with minimal space usage and equipment may make the MSL test a useful screening tool in geriatric settings. Future studies should investigate the utility of the MSL test in predicting falls in older adults.

RELIABILITY OF THE GAIT STABILITY RATIO (GSR) IN HEALTHY COMMUNITY-DWELLING OLDER ADULTS

R.L. Cromwell¹, R.A. Newton³, R. Buccello-Stout¹, P. Meyers², 1. *Universities Space Research Association, Houston, Texas*, 2. *University of Houston Clear Lake, Houston, Texas*, 3. *Temple University, Philadelphia, Pennsylvania*

With age, older adults adapt their walking pattern by slowing down and taking shorter steps. This creates a more stable walking pattern that is less effective for moving the body forward. Gait Stability Ratio (GSR) is the ratio of cadence to walking velocity and assesses the degree to which walking is stabilized in older adults. This study examined intra-rater and inter-rater reliability of the GSR. Ten healthy, community-dwelling older adults aged 69 ± 10.3 years participated. For session 1, subjects walked 3 passes of a 10-meter walkway. After a 15-minute rest, subjects completed a second session by walking 3 more passes of the walkway. The central 5-meters of the walkway were used for data analyses. Two investigators each timed the duration of the 5-meter walk and counted the number of steps taken. Cadence was calculated as the number of steps per second. Walking velocity was expressed in meters per second. GSR was calculated by dividing cadence by velocity. Values were averaged across the three walking trials in each session. Intraclass Correlation Coefficients, ICC (3,3), were used to examine inter-rater and intra-rater reliability. ICCs within raters demonstrated excellent intra-rater reliability (rater #1, ICC = 0.993; rater #2, ICC = 0.991). ICCs also demonstrated excellent reliability between raters for each of the walking sessions (session 1, ICC = 0.986; session 2, ICC = 0.951). Results of this study indicate that GSR has excellent intra-rater and inter-rater reliability and can therefore, be used with confidence when assessing gait stability in older adults.

SITTING TAI CHI: BALANCE AND MOBILITY EFFECTS ON FRAIL OLDER ADULTS IN ASSISTED LIVING

L.W. Faulkner¹, V.F. Engle², 1. *Occupational Therapy, Univ. Tennessee, Memphis, Tennessee*, 2. *Univ. Tennessee HSC, Memphis, Tennessee*

Standing Tai Chi has documented benefits in community-dwelling older adults. Frail older adults unable to stand have rarely been studied. We evaluated balance and mobility effects of sitting Tai Chi for Arthritis (sTCA) classes, taught by certified instructors four times/week for 6 months, on frail older adults in two assisted living facilities. Eighteen participants (71% female; 85.7 mean age) attended 1 to 89 (37.5 mean) sTCA classes; 16 concurrently attended 1 to 120 (57.5 mean) pre-existing Sittercize classes offered five times/week. Balance was evaluated by the Sit and Reach Test (SRT) and standing Functional Reach Test (FRT). Mobility was evaluated by the Timed Up and Go (TUG) test components: total, sit to stand and 10-foot walk. Linear regression of baseline to 6-month difference scores for dependent variables (SRT, FRT, and three TUG components) evaluated sTCA attendance and other potential explanatory variables. Independent variables included sTCA attendance, Sittercize attendance, age, falls, and the baseline dependant variable. Only one regression model included sTCA class attendance: SRT 6-month difference = $-8.56 + .045$ sTCA attendance ($p = .022$) + $.191$ age ($p = .052$) - $.672$ baseline SRT ($p = .000$). No models included Sittercize attendance. Participants with poorer SRT improved with sTCA. While sTCA incorporates lower extremity movement, there was no significant

effect on standing balance or mobility. sTCA classes helped improve sitting balance necessary for ADLs such as dressing, feeding, and hygiene. Future research should use patient-centered and physiological outcomes rather than customary outcomes emphasizing standing balance, mobility, and falls. Funded by the H. W. Durham Foundation.

THE EFFICACY OF PHYSICAL THERAPY INTERVENTIONS FOR DIZZINESS AND THE CONVERGENT VALIDITY OF THE DIZZINESS HANDICAP INVENTORY AND THE DYNAMIC GAIT INDEX

E. Hood¹, K. Chui², M. Lusardi², M. Whitmire¹, M. Dour¹, 1. *Warren Hospital Balance Center, Phillipsburg, New Jersey*, 2. *Physical Therapy, Sacred Heart University, Fairfield, Connecticut*

Introduction: Dizziness is a common problem for aging adults receiving physical therapy (PT). This study evaluates the efficacy of PT interventions for dizziness and the clinometric properties (i.e., validity) of two outcome measures commonly used in PT: the Dizziness Handicap Inventory (DHI) and Dynamic Gait Index (DGI). Methods: Twenty-three consecutive community dwelling out-patients (mean age 69.78 ± 10.16 years, 65.2% female) participated in this case series. All patients reported dizziness (mean duration 44.74 ± 79.36 months). Interventions included: gait training, therapeutic activities, and neuromuscular re-education among others. Outcome measures included the self-reported DHI and the performance-based DGI. Correlations of total and subscale scores were used to examine the convergent validity between the outcome measures at evaluation and discharge. Paired t-tests were used to examine for differences in outcome scores following PT interventions. Results: Participants at evaluation had a low perception of handicap and increased fall risk. Significant ($p < .01$) correlations ($r = -.38$ -.52) were found between the DGI and DHI total and subscales at evaluation. Participants received PT for an average of 9.43 ± 4.12 visits. At discharge participants had a lower perception of handicap and were considered safe ambulators. Significant ($p < .04$) correlations ($r = -.38$ -.44) were also found between the DGI and DHI total and subscales at discharge. There were significant ($p < .00$) differences in the DGI (mean increase = 3.35 ± 2.23) and DHI (mean decrease = 18.96 ± 9.16) after PT interventions. Conclusions: Moderate correlations between the DGI and DHI demonstrate convergent validity. Significant differences in the DGI and DHI demonstrate the efficacy of PT interventions.

SESSION 1155 (PAPER)

CANCER - PAPER SESSION

THE INFLUENCE OF CANCER ON FALLS IN COMMUNITY DWELLING ELDERLY

S.L. Spoelstra, C.W. Given, B.A. Given, A. von Eye, *College of Nursing, Michigan State University, East Lansing, Michigan*

Cancer survivors are living longer, and encounter physical, psychosocial, and economic impacts until the end of life. However studies examining whether a cancer diagnosis alters the rate of falls in elderly survivors are rare. This retrospective, longitudinal cohort study examined community dwelling elderly in a home based waiver program to identify if individuals with a diagnosis of cancer experience falls at a higher rate than those without cancer. The Minimum Data Set in a State in the Midwest was used to examine cancer, age, gender, race and ethnicity, poor vision, reduced ADLs, reduced IADLs, cognitive skill, incontinence, pain, or depression in 7448 individuals in the year 2007. This study found a high frequency of falls, with 2125 having a fall; and of those 38% in the cancer group had a fall and 27% in the non-cancer group had a fall. The final hierarchical linear model suggests fall risk in community dwelling elderly included: race, gender, ADLs, incontinence, depression, and pain. While cancer was not a statistical predictor of an increased rate of falls in this study, findings on the rate of falls in cancer patients are clinically significant and needs consideration.

Consequently, fall prevention interventions will become more important as the elderly cancer survivor population increases in size and the need to contain health care costs continues to rise. This study will be used to examine the consequences of falls to determine the increased rates of injuries as a consequence of falls when cancer and non cancer patients are compared.

FACTORS AFFECTING RECOVERY IN OLDER ADULTS AFTER CANCER SURGERY

J.H. Van Cleave¹, M. Bourbonniere³, B.L. Eggleston⁴, R. McCorkle², 1. *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *Yale School of Nursing, New Haven, Connecticut*, 3. *Dartmouth-Hitchcock Medical Center, Lebanon, New Hampshire*, 4. *Fox Chase Cancer Center, Philadelphia, Pennsylvania*

Patients with newly diagnosed cancers are frequently 65 years of age and older. Functional status, an important predictor of morbidity and mortality in older adults, is likely to be affected in some manner. We explored relationships among functional status, age, cancer site and stage, comorbidities, symptoms, psychological status, treatment, and demographic factors in older adults with cancer for which surgery was required. Data were combined from five randomized, clinical trials testing nursing interventions at 3 urban cancer centers. The sample consisted of 316 subjects, ages 65 and over, diagnosed with digestive, thorax, genitourinary, and gynecologic cancers. Functional status, defined as performance of current life roles, was measured by the Enforced Social Dependency Scale and SF-36 Health Survey (using the physical component summary measures). A multivariable analysis, using Generalized Estimating Equations, demonstrated that functional status improved over time ($p<0.001$). On average, subjects with cancers of the thorax ($p=0.027$) and annual income of \$40,000 or more ($p=0.001$) were associated with improved functional status. Treatment with combined chemotherapy and surgery ($p=0.014$), symptoms ($p<0.001$), and three or more comorbidities ($p<0.001$) were associated with decreased functional status. Controlling for cancer site and stage, comorbidities, symptoms, psychological status, treatment, and demographic variables, the relationship between age and functional status was not significant suggesting that factors other than age affect recovery of functional status in older adults following cancer surgery.

PAIN FOLLOWING CANCER: PREVALENCE, SEVERITY AND DISPARITIES IN CANCER SURVIVORS

J. Chen, T.A. Hart-Johnson, C. Green, *Anesthesiology, University of Michigan, Ann Arbor, Michigan*

Disparities in cancer survival rates and pain rates exist for cancer patients; blacks die more often, and experience greater pain severity; however, little is known about pain in cancer survivors. Published rates vary widely. To date, studies focusing on disparities and the effect of chronic pain on quality of life (QOL) in survivors have not been done. Black and white survivors of breast, colorectal, lung and prostate cancer and multiple myeloma participated in this survey study. The surveys focused on current and past pain, physical and mental health, and QOL. Of the sample ($n=400$), blacks were more likely to have died before contacted (21% vs. 9%) and have bad addresses (10% vs. 5%). Of those reachable, agreement to participate was lower for blacks than whites (24% vs. 36%). Respondents were 65 ± 12 years old, 53% female, and 26% black, and breast (48%) or prostate (41%) cancer survivors. Seventeen percent currently experienced pain and 32% had pain since their cancer diagnosis. Rate of current pain did not differ by race, but was more common in women (30% vs. 3%, $p=.07$), as was pain since diagnosis (50% vs. 12%, $p=.03$). Although pain rates did not differ, blacks experienced greater pain severity (6.5 vs. 3.5, $p=.10$ at worst; 2.5 vs. 0.9, $p=.05$ at least; and 4.0 vs. 1.5, $p=.06$ right now; 0=no pain, 10=worst pain imaginable). Cancer pain in survivors is relatively common, highlighting the importance of assessment. Important disparities were found by race (severity) and by sex (prevalence) of pain in survivors.

RISK FACTORS FOR DELIRIUM IN A POPULATION OF ONCOLOGY PATIENTS

K. Petrovic^{1,2}, C. Waszynski^{1,2}, L. Allchin^{1,2}, M. Eanniello², 1. *University of Connecticut, Storrs, Connecticut*, 2. *Hartford Hospital, Hartford, Connecticut*

Delirium is described as a disturbance of consciousness and a change in cognition that develop over a short period of time. Particularly in the case of patients diagnosed with and dying from cancer, the etiology of delirium involves the direct effect of a toxin exposure and/or withdrawal from medication and related substances. A number of risk factors affects this population of patients, and our research points to specific risk factors. These include pre-existing risk factors such as dementia, hearing and vision loss, and prior history of substance abuse. Additionally, pharmacological agents are one of the most frequent causes of acute confusion in our population of cancer patients. Together, these and other risk factors contributed to a significant number of our cancer patients experiencing delirium, with 62.9% of patients displaying delirium within the first 24 hours of admission and 91.5% of patients displaying delirium within the first 48 hours. Thus, identifying risk factors for delirium in populations of cancer patients helps to ease symptoms and prevent adverse events at the end of life.

SESSION 1160 (POSTER)

DISABILITY/MOBILITY

AUTONOMIC DYSFUNCTION AND IADL DISABILITY IN COMMUNITY-DWELLING OLDER WOMEN: THE WOMEN'S HEALTH AND AGING STUDY I

J.A. Deal^{1,2}, P.H. Chaves^{1,2,3}, 1. *Department of Epidemiology, Johns Hopkins University, Baltimore, Maryland*, 2. *Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*, 3. *Department of Medicine Division of Geriatric Medicine and Gerontology, Johns Hopkins University, Baltimore, Maryland*

Context: Disability in older adults is a major public health problem. Whether autonomic dysfunction contributes to instrumental activities of daily living (IADL) disability has not been studied. Objective: To test the hypothesis that autonomic dysfunction, as measured by abnormal heart rate variability (HRV), is independently associated with IADL disability in community-dwelling older women. Setting and Participants: Pilot study ($N=280$) within the Women's Health and Aging Study I, a population-based, prospective cohort study of 1002 women representative of the 1/3 most disabled community-dwelling older women in Baltimore (1992-1995). Design: Cross-sectional. HRV was measured by 6 traditional time and frequency domain measures. IADL disability was defined as difficulty managing money, taking medications, using a telephone, doing light housework, or shopping for personal items. Results: Autonomic dysfunction was associated with IADL difficulty. The odds ratio of IADL disability, comparing the lowest tertile of HRV (indicating worse HRV) to the top two tertiles, was 1.97 (95% CI: 1.15, 3.37) for the standard deviation of normal-to-normal intervals (SDNN) index, and 2.79 (95% CI: 1.61, 4.80) for very low frequency (VLF) power, after adjustment for demographic variables. Adjustment for disease variables attenuated this association for time domain measures (SDNN, $p=0.08$), although the association for VLF ($p<0.01$), a frequency domain measure, persisted. Conclusion: Autonomic dysfunction was associated with IADL disability, although associations were heterogeneous by HRV index. These findings raise the hypothesis that autonomic dysfunction may be a potentially modifiable risk factor for IADL disability.

THE EFFECT OF GRIP STRENGTH AND EDUCATION ON IADL DISABILITY OVER TIME ACROSS GENDER AMONG OLDER MEXICAN AMERICANS

T. Reistetter^{2,1}, S. Al Snih¹, K. Markides¹, K. Ottenbacher¹, *1. Rehabilitation Sciences, University of Texas Medical Branch, Galveston, Texas, 2. East Carolina University, Greenville, North Carolina*

Objective: To examine the relationship between grip strength and instrumental activities of daily living (IADL) disability across gender among older Mexican Americans and secondarily to examine cognition as a potential moderator between grip strength and IADL. **Methods:** A 12-year cohort study of 1629 community dwelling men (48.7%) and women (51.3%) aged 65 and older from the Hispanic Established Population for the Epidemiological Study of the Elderly. Measures include socio-demographics, grip strength, cognition (MMSE), and comorbidities. IADL was measured with 7 items: telephone use, driving, shopping, meal preparation, light housework, taking medication, and handling money. General Estimation Equation was used to estimate IADL disability over time. **Results:** Mean age 71.6 ± 5.25 years, average highest grade completed was 5th, mean grip strength was $29.8 \text{ Kg} \pm 9.2$ for men and 19.8 ± 6.2 for women, mean MMSE 25.9. For men there was a significant protective effect of grip strength on becoming IADL disabled (OR=0.9945, CI 0.9901-0.9989). Higher education was associated with lower likelihood of becoming IADL disabled (OR=0.9891, CI 0.9789-0.9993). Similarly, significant protective effects of education (OR=0.9830, CI 0.9748-0.9913) and grip strength (OR=0.98, CI 0.9845-0.9955) was found for women, however depression was significantly associated with higher risk of becoming IADL disabled (OR=1.16, CI, 1.08-1.2). The relationship between grip strength and IADL was independent of cognition (MMSE). **Conclusion:** Grip strength and education have a protective effect on becoming IADL disabled for both men and women in older Mexican Americans. Depression increases the likelihood of becoming IADL disabled for women but not men.

SELF-REPORTS OF ACTIVITIES OF DAILY LIVING: THEIR CORRESPONDENCE WITH PERFORMANCE-BASED MEASURES

M. Ernsth Bravell¹, S.H. Zarit², *1. Institute of gerontology, School of Health Sciences, Jonkoping University, Jonkoping, Sweden, 2. Department of Human Development and Family Studies, Penn State University, State College, Pennsylvania*

Background: Many studies demonstrate relations between objective and subjective health measures where elderly individuals report chronic diseases and impairments and yet still estimate their health as good. Less is known about how objective performance based ADL-function might relate to widely-used self-reported ADL performance measures. **Aim:** The aim of this study is to analyze the relation between actual and reported ADL-function in a sample of people 80 and over. **Methods and sample:** Using a data set derived from the OCTO-Twin Study, the present investigation examined a sample of 291 individuals (192 women, 99 men) randomly selected from twin pairs. The mean age of the sample was 83 years. Interviews obtained performance-based measures related to ADL function (balance, flexibility, upper body strength), other objective measures of health (illnesses, medications) as well as three standard self-report measures (IADL, PADL, mobility). Measures of cognition, depression, age and gender were also obtained. **Results:** Using multiple regressions, we found that objective measures of performance and health had strong associations with the three subjective ratings of ADL. Other predictors (number of diseases and drugs, cognition, gender, age) differed for the three ADL measures. These results suggest that self-ratings of ADL are closely associated with performance of related functions, but are not consistently captured by other objective health measures. **Discussion and Conclusion:** Much of the research conducted with older people, as well as clinical assessment, relies on self-reports of ADL. The current findings indicate good cor-

respondence between these self-reports and performance-based assessments of related functions.

LATER LIFE EFFECTS OF POLIO: ONLY AGING OR SOMETHING ELSE?

H. Baker, *1. Psychology, Muskingum College, New Concord, Ohio, 2. Miami University, Scripps Gerontology Center, Oxford, Ohio*

Researchers examining the cause of later life effects of polio have yet to agree on a specific cause. One possible cause is that most people affected by polio are now reaching older ages. Post Polio Syndrome, the clinical name for the later life effects of polio, affects up to 60% of polio survivors between ten to forty years after their initial infection and is characterized by new muscle weakness, pain, and fatigue. A recent paper focused on polio survivors experiencing PPS (Sorenson, Daube, & Windebank, 2006). The conclusion of this study was that the underlying cause of new weakness and health declines of polio survivors was 'normal' aging and not the result of previous damage or overuse. This project seeks to refute their conclusion and to determine the relationship between aging and the development of Post Polio Syndrome in later life. The log-linear regression analysis, on data from the 1994/1995 National Health Interview Survey on Disability's Polio Survivor subset, resulted in an inverted U-shaped as a curve, indicating that there was a complex relationship between age and PPS symptoms. The maximum likelihood of developing the later life effects of polio peaks between the ages of 45 to 55 and then declines in later life. Other factors that may have contributed to the findings were controlled for in additional models and results indicate that severity of polio symptoms in conjunction with age were the greatest predictors of PPS symptoms.

CHARACTERIZATION OF THE HEAD STABILIZATION RESPONSE TO A LATERAL PERTURBATION DURING WALKING IN OLDER ADULTS

R. Buccello-Stout¹, R.L. Cromwell¹, J. Bloomberg², *1. Universities Space Research Association, Houston, Texas, 2. NASA Johnson Space Center, Houston, Texas*

A main contributor of fractures in older adults is from a lateral fall. The decline in sensory systems results in difficulty maintaining balance stability. Head stabilization contributes to postural control by serving as a stable platform for the sensory systems. The purpose of this study was to characterize the head stabilization response to a lateral perturbation while walking. A total of 16 healthy older adults, aged 66-81 years, walked across a foam pathway 6 times. One piece of the foam pathway covered a movable platform that translated to the left when the subject stepped on the foam. Three trials were randomized in which the platform shifted. Angular rate sensors placed on the center of mass of the head and trunk collected head and trunk movement in all three planes of motion. The roll plane was analyzed to examine motion in the plane of the perturbation. Subjects stepped onto the platform with the right foot. Recovery step time and distance were recorded. The first trial was analyzed to capture the novelty of the perturbation. Results indicate a significant difference in footfall distance $t=0.004$, $p<0.05$, as well as the speed of foot recovery $t=0.001$, $p<0.05$, between natural and perturbed walking. Results indicate that the head $t=0.005$, $p<0.05$, and trunk $t=0.0001$, $p<0.05$, velocities increase during perturbed compared to natural walking. Older adults place their recovery foot down faster when perturbed to re-establish their base of support. Head and trunk segments are less stable and move with greater velocities to reestablish stability when perturbed.

FEAR OF FALLING APPEARING AFTER POST-ACUTE REHABILITATION IS ASSOCIATED WITH REDUCED FUNCTIONAL STATUS

S. Rochat¹, E. Martin¹, K. Aminian², C. Piot-Ziegler³, C.J. Bula¹, 1. *Service of Geriatric Medicine, CUTR Sylva/ CHUV, Epalinges, Switzerland*, 2. *EPFL, Lausanne, Switzerland*, 3. *UNIL, Lausanne, Switzerland*

Objective: To investigate the association between fear of falling appearing within one month after discharge from post-acute rehabilitation and functional status in elderly patients. **Methods:** Participants (N=180, mean age 81.3±7.1 years, 75.6% women) were patients consecutively admitted to rehabilitation over a 6-month period. Demographics, functional, cognitive and affective status were assessed upon admission; functional status was assessed at discharge; history of falls since discharge, functional and affective status were assessed by phone one month after discharge. Fear of falling was assessed using the question: "Are you afraid of falling?". **Results:** Among patients without fear of falling at discharge (N=95), 20.0% (N=19) reported new fear of falling one month after discharge. Living alone (adjOR=4.9, 95%CI 1.04-23.16, P=.045), functional status at discharge (adjOR=0.5, 95%CI 0.32-0.88, P=.014), and depressive symptoms (adjOR=5.4, 95%CI 1.20-24.32, P=.028) independently predicted fear of falling at one month. There was weak evidence that history of falls since discharge (adjOR=4.1, 95%CI 0.81-21.31, P=.088) was associated with new fear of falling. Developing fear of falling was also associated with reduced functional status at one month (mean basic ADL score: fearful 5.2±0.8; confident: 5.8±0.4, P<.001). This association remained after controlling for demographics, functional status at discharge, depressive symptoms, and history of falls since discharge (coef=-0.4, 95%CI -0.73 to -0.16, P=.003). **Conclusion:** Fear of falling appearing within one month after discharge from post-acute rehabilitation was associated with reduced functional status in elderly patients. Further studies should determine whether early interventions targeting specifically fear of falling in these patients would improve their functional status.

SESSION 1165 (PAPER)

GERIATRIC CLINICAL ISSUES I

POST-SURGICAL COMPLICATIONS IN OLDER ADULTS: PREVALENCE AND ASSOCIATED FACTORS

H. Kim¹, E. Capezuti¹, C. Kovner¹, Z. Zhao¹, K. Boockvar², 1. *New York University, New York, New York*, 2. *Mount Sinai School of Medicine, New York, New York*

The purpose of this study was to examine patient and hospital factors associated with adverse events in older surgical patients during their hospitalizations. We used the California state inpatient data linked to the California hospital cost report, which included 82,898 surgical patients aged 65 or older who underwent 20 common major surgical procedures in 252 acute care hospitals in 2004. Four adverse events were measured using the Agency for Healthcare Research and Quality's Patient Safety Indicator (PSI) definitions with adjustment for presence on admission (POA). Generalized mixed models were used. After adjusting for POA, the adverse event rates per 1000 discharges were 1.9 for infections due to medical care, 4.7 for postoperative pulmonary embolism or deep vein thrombosis (DVT), 5.8 for decubitus ulcer, and 9.7 for postoperative respiratory failure. Patients with multiple chronic conditions and those who were admitted through the emergency department (ED) were more likely to experience 3 of the 4 adverse events. Patients admitted to for-profit hospitals were more likely to experience 2 of the 4 adverse events. There was no observed relationship between hospital nurse staffing and adverse events. Older surgical patients with greater chronic illness burden and those admitted through the ED are more likely to experience adverse events. Hospitals should develop and implement surgical safety interventions targeted to these patients.

FACTORS ASSOCIATED WITH IN-HOSPITAL DELIRIUM AFTER HIP FRACTURE

A.L. Gruber-Baldini¹, E. Marcantonio², D. Orwig¹, J. Magaziner¹, M. Terrin¹, J.L. Carson³, E. Barr¹, J.P. Brown¹, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *Beth Israel Deaconess Medical Center, Boston, Massachusetts*, 3. *UMDNJ-Robert Wood Johnson Medical School, New Brunswick, New Jersey*

Delirium is common after hip fracture, and is associated with poorer functional outcomes. We investigated factors associated with in-hospital delirium and subtypes of delirium in 124 hip fracture patients from 13 clinical sites recruited for the Cognitive Ancillary Study to the Transfusion Trigger Trial for Functional Outcomes in Cardiovascular Patients Undergoing Surgical Hip Fracture Repair (FOCUS). Delirium at baseline (before third post-operative day) was assessed using Memorial Delirium Assessment Scale (MDAS) and Confusion Assessment Method (CAM). Predictors included education, gender, marital status, and pre-fracture dementia (assessed by diagnosis history and Informant Questionnaire on Cognitive Decline in the Elderly (IQCODE)). Overall, 69.4% were female, 34.7% currently married, and education averaged 12.3+/-3.25 years. Dementia prevalence was 22.2% from history, 30.4% from IQCODE, and 33.7% combined. Delirium was observed in 27.6% meeting CAM criteria. Among CAM-defined delirious subjects (n=35), most were hypoactive (68.6%) or a combination of hypoactive and hyperactive (20.0%), and only 4 (11.4%) were hyperactive alone. The average MDAS score was 6.59+/-5.66, with 8% having severe delirium symptoms (MDAS>17). Additionally, 28.3% had delirium symptoms (MDAS 5+) but not CAM-defined delirium. Delirium did not differ by gender (p=0.252), education (p=0.386), or marital status (p=0.99). Dementia patients were more likely to have delirium (37.1% vs. 19.4%, p<.001) and had higher MDAS scores. The occurrence of hyperactive delirium did not differ by any predictor. Findings confirm that delirium is common in hip fracture patients, especially among those with dementia. Our use of proxy IQCODE to detect dementia increased our ability to identify dementia cases.

HIP FRACTURE MANAGEMENT IN ELDERLY AFFECTED BY DEMENTIA

G. Annoni¹, P. Mazzola¹, M. Gregorio¹, F. De Filippi¹, G. Castoldi², G. Zatti², 1. *Internal Medicine, Università Milano-Bicocca, Monza, Italy*, 2. *Department of Orthopaedics and Traumatology, Università Milano-Bicocca, Monza, Italy*

Background. Hip fracture in the frail elderly is commonly associated with severe clinical outcomes, including loss of ability and death. Since cognitive impairment is not an exclusion criteria to surgery, here we compared the clinical course of patients with and without dementia, admitted to the Orthogeriatric section of the University Hospital San Gerardo during the period March 2007-December 2008. **Materials and Methods.** 89 patients with cognitive impairment (group A, mean age 84.8 yo) and 86 non-affected ones (group B, mean age 81.9 yo) were observed. We considered the following aspects: living status at admission, functional level, comorbidities, time to surgery, length of stay, pre- and postoperative delirium, rate of main complications, preoperative mortality. **Results.** Characteristics Group A Group B P-value Age [mean] 84.8 81.9 .01 MMSE [mean] 16.3 26.2 .001 Living status home 70(78.7) 80(93.0).001 nursing home 18(20.2) 6(7.0) .001 Total functional dependence 64(71.9) 4(4.7) .001 Comorbidities [mean value] 5.6 4.4 .001 Time to surgery [days] 2.8 2.7 ns Length of stay [days] 13.57 12.56 ns Pre-operative delirium N=-(%) 13(14.6) 2(2.3) .001 Postoperative delirium N=-(%) 42(47.2) 9(10.5).001 Complications N=-(%) 16(18.0) 8(9.3) .01 In-hospital mortality Preoperative N=-(%) 2(2.2) - .01 Post-operative N=-(%) 2(2.2) 1(1.2) .01 **Conclusions.** The clinical course of hip fractured patients with dementia, when managed in an Orthogeriatric section, is similar to the non-affected ones, except for mortality.

PREDICTIVE MODELING OF PRESSURE ULCER DEVELOPMENT IN ELDERLY HIP FRACTURE PATIENTS

M. Baumgarten¹, D. Margolis², W. Hawkes¹, M. Shardell¹, P. Langenberg¹, S.E. Rich¹, D. Orwig¹, B. Kinoshian², 1. University of Maryland Baltimore, Baltimore, Maryland, 2. University of Pennsylvania, Philadelphia, Pennsylvania

BACKGROUND: Pressure ulcers can cause pain, diminished quality of life, serious complications, and increased health care costs. Accurate identification of patients at high risk of pressure ulcers is necessary if preventive interventions are to be appropriately allocated. **AIM:** To develop a predictive model relating patient characteristics to pressure ulcer incidence following hip fracture, and to compare the model's performance to that of standard tools used in research and clinical practice (Braden and Norton scales). **METHODS:** The study was conducted in 2004-2007 in nine hospitals participating in the Baltimore Hip Studies network. Patients age ≥ 65 years who underwent surgery for hip fracture were examined at baseline and on alternating days thereafter to ascertain development of ≥ 1 pressure ulcers stage 2 or higher within 10 days of hospital admission (n=600). Information on pressure ulcer risk factors was obtained by examination, interview, and chart review. Logistic modeling was used to select a set of variables that maximized area under the receiver operating characteristics curve (AUC), a measure of predictive accuracy. **RESULTS:** The AUC of a model including six variables (exposure to friction or shear, nutritional status, mobility, fecal incontinence, hemoglobin level, and history of diabetes) was 0.70. AUCs for the Braden and Norton scales were both 0.65. **CONCLUSION:** A simple model based on six variables provided somewhat more accurate prediction of pressure ulcers than conventional scales. More work is needed to develop predictive models that are more accurate than standard tools.

A PRACTICAL APPROACH TO REDUCING PRESSURE ULCERS IN NURSING FACILITIES: NY STATE'S EXPERIENCE IMPLEMENTING ON-TIME QI

S. Sharkey¹, E. Dichter⁴, S. Hudak¹, W. Spector², S.D. Horn³, 1. Health Management Strategies, Austin, Texas, 2. Agency for Health Care Research and Quality, Rockville, Maryland, 3. Institute of Clinical Outcomes Research, Salt Lake City, Utah, 4. NY State Dept of Health, Albany, New York

New York State's overall nursing home pressure ulcer (PrU) prevalence rate ranks 32nd nationally despite high Medicaid reimbursement rates. In 2008, NY Department of Health partnered with AHRQ to implement On-Time, an evidenced-based approach to prevent PrUs, over a two-year period. 15 nursing homes were selected to participate, ranging from 120-518 beds. Participants had: - Baseline PrU prevalence $>10\%$. - Motivation in PrU prevention - Capacity for multi-disciplinary QI effort - Willingness to purchase On-Time compliant CNA HIT Front-line teams consolidated forms and standardized data elements, accessed reports to improve clinical decision-making, and redesigned workflow to integrate process improvements into daily work. Seven HIT vendors supported the effort by customizing software and producing clinical reports per On-Time specifications. Results to date have been promising. In previous On-Time implementation efforts in three states, CA, AZ, and NC, pressure ulcer prevalence rates dropped by 20 percent; high performing facilities saw a decrease of 33 percent (from 13.1 % to 8.7%). We will present the NY On-Time results to date and lessons learned. For example: - Increased engagement of front-line caregivers: CNAs meet with unit coordinators to review documentation completeness reports; dietitians meet with CNAs weekly to discuss residents' nutritional risk. - Improved multi-disciplinary team communication. - Flagged high-risk residents more accurately and quickly. - Reduced weight loss. - Reduced pressure ulcer incidence.

SESSION 1170 (SYMPOSIUM)

IMPROVING QUALITY OF CARE IN NURSING HOMES: USING HEALTH INFORMATION TECHNOLOGY TO IDENTIFY, ASSESS, AND MANAGE PAIN IN NURSING HOME RESIDENTS WITH DEMENTIA

Chair: L. Spokane, NYAHS, Albany, New York

Discussant: M. Ersek, University of Pennsylvania, Philadelphia, Pennsylvania

There is a growing national focus on using technology to improve healthcare. With funding from the NYS Department of Health, researchers from New York Association of Homes and Services for the Aging and the University of Pennsylvania developed research-based informatics and web-based educational tools to address the problem of undiagnosed and undertreated pain in nursing home (NH) residents with dementia. A consortium of 15 rural NHs, serving over 1,000 residents with dementia, is currently using these tools to improve pain assessment and management in these residents. The objective of this program is to describe how informatics reports used in conjunction with web-based education and assessment tools can help all levels of NH staff be more effective and efficient in identifying and treating pain in residents with dementia thereby improving the quality of life for this growing population. Individual papers during this session will: 1. Demonstrate how resident information already available in every NHs Minimum Data Set (MDS) data can be used to identify risk factors (i.e. chronic conditions and diseases) for pain and identify behavior/mood problems and other negative outcomes associated with pain in nursing home residents with dementia. Two logistic regression models will be discussed: a. Predictive Model for Pain b. Mood and Behavior Related to Pain 2. Present an overview of the Dementia Pain grant project and discuss how the models were incorporated into decision-support software. 3. Describe and discuss the innovative web-based education program and new pain assessment tool being piloted under the Dementia Pain grant.

A MODEL TO IDENTIFY PAIN IN NURSING HOME RESIDENTS WITH DEMENTIA

L. Spokane, C. Teigland, Z. Pulungan, NYAHS, Albany, New York

Assuming that factors causing pain are the same for all residents, we tracked cognitively intact residents who can readily report pain over four quarters from 2005-2006 (n=107,384) using Minimum Data Set (MDS) data for 670 NHs. Logistic regression analysis was used to develop a predictive model. The model was then applied to dementia residents to help nursing staff identify at risk cognitively impaired residents with likely undetected pain. Key risk factors include major diseases and conditions causing pain (e.g., arthritis (OR=1.82; 95% CI: 1.76-1.88), end-stage kidney disease (OR=1.72; CI: 1.46-2.02), stasis ulcers (OR=1.85; CI: 1.57-2.18) and special treatments and therapies (e.g., physical therapy OR=1.58; CI: 1.53-1.64). The model was incorporated into informatics software to easily identify residents with probable undetected pain and generate individualized risk profiles. Residents at high risk but not coded as having pain can be assessed using a validated pain assessment tool for the cognitively impaired.

A MODEL TO IDENTIFY MOOD/BEHAVIORS RELATED TO PAIN IN COGNITIVELY IMPAIRED NURSING HOME RESIDENTS

Z. Pulungan, C. Teigland, L. Spokane, NYAHS, Albany, New York

Using MDS data over four quarters from 2005 - 2006, we developed a logistic regression model to estimate the effect of pain on each of the mood and behaviors common in residents with dementia. Since pain is underreported in residents with dementia, we used the probability of having pain estimated from our first pain model as a measure of pain. Our results show that pain significantly affects all indicators of delirium, periodic disordered thinking/awareness and all indicators of depression, anxiety, and sad mood (e.g. periods of lethargy, insomnia, with-

drawal from activities, making negative statements). But not all behavioral symptoms are significantly affected by pain (e.g. wandering and socially inappropriate/disruptive behavior), meaning these behaviors are not good indicators of pain. By understanding which mood and behavior symptoms are good indicators of pain, nursing staff may be able to improve their ability to assess and manage pain in their cognitively impaired residents.

STOP PAIN IN NURSING HOMES (SPINH): IMPROVING PAIN ASSESSMENT AND MANAGEMENT IN RESIDENTS WITH DEMENTIA THROUGH WEB-BASED EDUCATION AND SUPPORT

M. Ersek, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

We will discuss the integration of web-based education and support to guide NH staff in using the informatics reports to screen for pain, and to assess and manage the pain identified in cognitively impaired residents. The Stop Pain in Nursing Homes (SPiNH) website is designed to educate various groups of caregivers, including licensed nursing staff, prescribers, and nursing assistants evidence-based strategies for assessing and treating pain, particularly in residents with cognitive impairment. This presentation will focus on the SPiNH pain assessment protocol and accompanying decision-support tools related to pain therapies. Also included is a discussion of the challenges encountered in translating "best practice" guidelines into consistent NH clinical care.

PROGRAM OVERVIEW: NYS DEPARTMENT OF HEALTH DEMENTIA PAIN GRANT

L. Spokane¹, C. Teigland¹, M. Ersek², Z. Pulungan¹, *1. NYAHS, Albany, New York, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

We will present an overview of the goals and objectives of our project, "Pain Assessment and Management in Residents with Dementia Using Web-Based Education and Informatics in Rural Nursing Homes", and provide details on how the pain models were incorporated into easy-to-use decision-support software. Under this program, 15 rural nursing homes (NHs) in New York, serving over 1,000 dementia residents, are currently receiving 1) pain assessment tools and web-based education tailored to appropriate NH staff; 2) pain management guidelines and protocols; 3) support to promote diffusion of the information within the NH; and 4) resident-, unit-, and facility-level informatics reports to help staff identify cognitively impaired residents with high likelihood of undiagnosed pain. Examples of the research-based informatics reports will be shown and we will describe how NHs are using these reports to more accurately identify their dementia residents with probable unidentified pain.

SESSION 1175 (SYMPOSIUM)

MULTISYSTEM DYSREGULATION IN FRAILTY EMERGES IN RESPONSE TO DYNAMIC STRESSORS

Chair: *L.P. Fried, Mailman School of Public Health, Columbia University, New York, New York*

Discussant: *G. Kuchel, University of Connecticut, Farmington, Connecticut*

One conceptualization regarding frailty is that it is a medical syndrome presenting with an identifiable phenotype associated with dysregulated energetics, predicts mortality and disability, and, etiologically, results from dysfunction in multiple physiologic systems and, potentially, underlying biologic mechanisms. In theory, the vulnerability of frailty is a result of loss of complexity and effectiveness of physiologic responses, particularly manifested in the presence of stressors. To test this theory, we have conducted a series of nested substudies within the Women's Health and Aging Study II, in which women 85-95 years have undergone multiple low level physiologic stressors, each separated by weeks to months from the other. These include: 1. influenza vaccina-

tion; 2. glucose tolerance testing, resting metabolic rate and biomarker measurements pre and post; and 3. 31P MR-spectroscopy at rest and under conditions of isometric exercise of the leg, assessing association of frailty with impaired oxidative phosphorylation in muscle. We report here on associations of frailty status and related biomarkers with each of these objective measures, at rest and in response to the stressor. Findings provide the first evidence to support theory regarding the vulnerability of frail older adults to stressors, and the potential value of low level stress testing to unmask vulnerability.

FRAILTY IS ASSOCIATED WITH IMPAIRMENT IN VACCINE-INDUCED IMMUNE RESPONSE IN OLDER ADULTS

S.X. Leng¹, J. Bogdanovic¹, B. Resnick², Q. Xue¹, R.G. Hamilton¹, L.P. Fried³, *1. Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland, 2. University of Maryland School of Nursing, Baltimore, Maryland, 3. Columbia University, Mailman School of Public Health, New York, New York*

The objective of this study was to test our hypothesis that frailty is associated with impaired antibody response to influenza immunization. To accomplish this, we administered standard trivalent inactivated vaccine (TIV) to 71 community-dwelling older adults (mean age 84.5 yrs, range 72-95). Serum samples were collected before and 4 weeks after vaccination. Antibody titers were measured using standard hemagglutination inhibition assay. The results showed that participants overall had higher post- than pre-vaccination antibody titers against influenza H1N1 and H3N2 (geometric means: 260+2.1 vs 174+2.1, $p=.001$ and 408+2.6 vs 279+2.2, $p=.01$, respectively). Among frail participants ($n=17$), however, these differences were much smaller and statistically non-significant (222+2.3 vs 174+2.5, $p=.43$ and 377+2.3 vs 261+2.0, $p=.17$, respectively). In addition, frail participants had significantly lower post-vaccination antibody titers to H1N1 strain than non-frail participants ($n=22$) (387+2.0 vs 222+2.3, respectively, $p=.03$). These findings suggest that frailty is associated with impaired antibody response to TIV.

GLUCOSE METABOLISM AND THE FRAILTY SYNDROME

R. Varadhan¹, C. Weiss¹, L.P. Fried², A.R. Cappola³, *1. Johns Hopkins Medical Institutions, Baltimore, Maryland, 2. Columbia University Mailman School of Public Health, New York, New York, 3. University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania*

The response to a glucose challenge is poorly characterized in old-old adults and may provide insight into the physiologic processes underlying the frailty syndrome. In a substudy of 73 women aged 85-96 years without a diagnosis of diabetes in the Women's Health and Aging Study II, we performed a standard 75-g glucose challenge and examined the stimulus-response dynamics of glucose levels at 0, 30, 60, 120 and 180 minutes and their association with frailty. Only 27% of the sample had normal fasting and response glucose levels by American Diabetic Association guidelines; 25% had levels consistent with diabetes and 48% had either impaired fasting glucose impaired glucose tolerance or both. 120-minute glucose level was strongly associated with frailty status (OR 3.94 per 1 SD increase, $p=0.01$), whereas fasting glucose was not ($p=0.29$). Our data demonstrate the importance of challenge testing to identify physiologic vulnerability and frailty status in old-old women.

CHARACTERIZATION OF RESTING METABOLIC IN FRAIL AND NON-FRAIL OLD-OLD WOMEN

C. Weiss¹, A.R. Cappola², K. Kim¹, L.P. Fried³, *1. Johns Hopkins Medical Institutions, Baltimore, Maryland, 2. University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania, 3. Columbia Mailman School of Public Health, New York, New York*

A negative energy balance whereby expenditure is not matched by intake may explain the phenotype of frailty, unifying the previously-described associations with weakness, weight loss, inactivity and decreased food intake. What currently needs to be known is whether Resting Metabolic Rate (RMR), the largest component of energy expen-

diture, is decreased or increased in frailty. We hypothesize that RMR is higher on average in frail, compared to non-frail, older women after adjusting for body composition and confounders. In this study we characterize the association of frailty and RMR in 76 women aged 85-96 years in the Women's Health and Aging Study II. The association between frailty and RMR will provide a critical indication of whether RMR is downstream and follows muscle loss, if it is low, or an upstream factor that can cause cachexia-like wasting, if RMR is high. In addition, RMR level will be the basis of determining whether a negative energy balance

DYNAMICS OF PHOSPHOCREATINE RECOVERY IN THE SKELETAL MUSCLE OF FRAIL OLDER WOMEN

R. Varadhan¹, A. Horska¹, D. Russ³, C. Weiss¹, J.D. Walston¹, L.P. Fried², 1. *Geriatric Medicine, Johns Hopkins Center on Aging and Health, Baltimore, Maryland*, 2. *Columbia University, Mailman School of Public Health, New York, New York*, 3. *Ohio University School of Physical Therapy, Athens, Ohio*

Frail older adults, compared to non-frail, report more fatigue and are less active. Hydrolysis of phosphocreatine (PCr) in mitochondria provides an immediate source of small bursts of adenosine triphosphate (ATP), the main source of cellular energy. Depleted PCr is then replenished via oxidative phosphorylation (OP). OP is known to be impaired in aging. It is not known, however, whether alterations in OP explain the low-energy phenotype of frailty. We conducted a ³¹P magnetic resonance spectroscopy study at 1.5T to determine whether frailty is associated with impaired OP in muscle. Our analytic sample comprised 5 frail, 10 pre-frail, and 10 non-frail women (ages: 84–92, mean=87 years) from the Women's Health and Aging Study II. Across the three frailty status groups, we compared the dynamics of recovery of in-vivo concentrations of PCr in the tibialis anterior muscle after 30 seconds of maximal voluntary isometric dorsiflexion, adjusting for the force produced.

SESSION 1180 (SYMPOSIUM)

NURSES INVOLVEMENT IN NURSING HOME CULTURE CHANGE: OVERCOMING THE NURSING DILEMMA

Chair: *M. Mezey, College of Nursing, New York University, New York, New York*

Discussant: *D. Bakerjian, University of California San Francisco, San Francisco, California*

As nursing homes move from institutional to a more resident-directed care environment, the clinical care provided and directed by professional nurses remains critical and central to both the quality of care and quality of life of residents. Yet, these changes pose major challenges to traditional nursing practice in nursing homes, which could only be overcome with a serious examination of the real barriers. In response, The Hartford Institute for Geriatric Nursing, NYU College of Nursing, in collaboration with the Coalition of Geriatric Nursing Organizations and the Pioneer Network convened a panel of nursing and culture change experts for a day and a half to foster dialogue and surface facilitators for nurses' involvement in culture change. Since the goals and philosophy of culture change and nursing are highly compatible, this symposium will present the path toward adoption of culture change by nursing and other professionals, an examination of nursing and culture change practice domain compatibility, and a review of culture change research with recommendations for future research.

OVERCOMING THE NURSING DILEMMA

S.G. Burger, *Hartford Institute for Geriatric Nursing, New York University College of Nursing, Washington, District of Columbia*

As nursing homes move from an institutional to a more resident-directed care environment, the clinical care provided and directed by professional nurses remains critical and central to both quality of care and quality of life. The goals and philosophy of culture change and the goals of nursing are highly compatible. Nevertheless, culture change

poses a number of dilemmas for nurses, including challenges to nurses' traditional notions of accountability for the clinical care of residents and issues of whether nurses are practicing within their scope of practice with regard to delegation of nursing acts and violating professional and regulatory requirements. This presentation will discuss these and other issues and address the need for nurses' participatory role in developing a vision for nurses' role in the evolving culture change initiative.

CULTURE CHANGE DISSEMINATION: PATHWAYS AND CHALLENGES

B. Kantor, *Pioneer Network, Rochester, New York*

As it enters its second decade, the culture change movement is at a crossroads: although the true "pioneers" are on board, widespread implementation of resident-directed practice has not occurred. We are now ready to move from the demonstration stage to the broad-scale spread of this compelling innovation. Since Nursing is at the core of resident-directed care, nurses are key partners in this phase of the movement. While we know it's possible to deliver person-directed care that's both cost-effective and highly satisfying, the lack of clearly defined steps and pathways in culture change is a barrier to the broader spread of innovation. This presentation focuses on Pioneer Network's national initiatives and partnerships intended to speed diffusion of this innovation to nursing and other professions. Emphasis will be on data-driven efforts that accelerate adoption and support implementation and sustainability by articulating the operational linkages between person-directed care, quality of care, and financing.

STRUCTURES, PROCESS AND VALUES OF NURSING AND THE TENETS OF CULTURE CHANGE

C. Beck, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Although, resident centered care is a key value underlying all models of nursing practice, nurses have sometimes been viewed as resistant to culture change. This presentation will review the five domains of the Artifacts of Culture Change instrument (Bowman and Schoeneman, 2006) – care practices, the environment, family and community, leadership, and workplace practices. These domains will then be used to analyze points of synergy between the structures, process and values of nursing and the tenets of culture change, as well as potential causes of nurses' perceived resistance to culture change. Strategies for supporting these points of synergy and decreasing perceived resistance will be discussed.

RESEARCH RECOMMENDATIONS FOR NURSING HOME CULTURE CHANGE

C. Mueller, *University of Minnesota, School of Nursing, Minneapolis, Minnesota*

The findings of a systematic review of the literature on nursing home culture change (NHCC) research will address how far NHCC has penetrated current US nursing homes, valid and reliable measures of NHCC, evidence of the impact of NHCC on resident, staff and organizational outcomes, and the extent of research on nursing/nurses and NHCC. The review focuses on studies that evaluated the implementation of NHCC models. Rigorous study of NHCC is in its infancy and the majority of research to date is descriptive, yet points to desired staff, resident, and organizational outcomes in nursing homes. There remain significant questions about the role and responsibilities of licensed nurses in organizations that are integrating the NHCC philosophy and associated care practices. Recommendations for future research will be proposed.

OBESITY IN OLD AGE: DEFINITION AND CONSEQUENCES OF OBESITY SUBTYPES

Chair: A. Koster, *National Institute on Aging, Bethesda, Maryland*
 Discussant: M. Visser, *Institute of Health Sciences, VU University, Amsterdam, Netherlands*

Obesity is increasingly prevalent in older people and is associated with disability and poor health. This symposium will explore the existence of subtypes of obesity in old age and how these subtypes might affect the association of obesity with health outcomes. One subtype might depend on the duration of obesity over the lifetime. Snijder and colleagues present the role of weight history on functional limitations and strength in old age using data from the Longitudinal Aging Study Amsterdam (LASA). Another subtype may relate to body fat distribution which might be more important than weight, in particular increased abdominal fat. Al Snih and colleagues examined the effect of body mass index and waist circumference on 14 year all-cause, cardiovascular mortality, and cancer mortality among older Mexican Americans participating in the Hispanic Established Population for the Epidemiological Study for the Elderly. Feasible cut-offs of waist circumference in older adults are explored by Heim and colleagues in LASA. Finally the "healthy obesity" hypothesis is tested by examining subtypes of obesity based on the presence of metabolic alterations using data from the Health, Aging, and Body Composition Study. Koster and colleagues examine body composition differences among obese older persons with and without metabolic alterations. Stenholm and colleagues, lastly, evaluate the risk of mobility limitations among obese and non-obese persons with and without metabolic alterations.

THE ROLE OF WEIGHT HISTORY IN PERFORMANCE, FUNCTIONAL LIMITATIONS AND STRENGTH

M.B. Snijder¹, N. Heim¹, D.J. Deeg², J. Seidell¹, M. Visser^{1,2}, *1. Dept of Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, 2. EMGO-institute, VU University Medical Center, Amsterdam, Netherlands*

Our aim was to investigate the role of weight history in performance, functional limitations and strength at late middle-age. Current BMI, weight history, performance-score (1-12), function-score (7-35) and grip-strength (kgf) were determined at baseline (n=860) and after 3 years (n=770) in 59.9±2.9 y old participants of the Longitudinal Aging Study Amsterdam. Four overweight-patterns were found: never(reference), current, since age 40, and since age 25. Performance did not differ between groups. Functional limitations and strength increased significantly across the four overweight-patterns. For example, age- and sex-adjusted ORs (95%CI) for experiencing any difficulty on seven daily activities were 1.5(1.0-2.2), 2.5(1.6-3.8) and 2.6(1.6-4.0), respectively. Adjustment for smoking, education and physical activity did not materially change the results. Prospectively, there was a tendency of greater reduction in strength and more functional limitations with longer overweight history. Already at late middle-age, longer overweight history is associated with more and increasing functional limitations and greater reductions in strength.

BMI AND WC AS PREDICTORS OF 14-YEAR ALL-CAUSE, CARDIOVASCULAR, AND CANCER MORTALITY AMONG OLDER MEXICAN AMERICANS

S. Al Snih, K. Markides, K. Ottenbacher, J. Goodwin, *Division of Rehabilitation Sciences/Sealy Center on Aging, University of Texas Medical Branch, Galveston, Texas*

Objective: To examine the effect of body mass index (BMI) and waist circumference (WC) on all-cause, cardiovascular (CV), and cancer mortality among older Mexican Americans. Methods: A 14-year prospective cohort study of 2575 non-institutionalized aged 65 and older. Measures included socio-demographic, smoking, medical conditions, BMI,

and WC. Results: At baseline, the mean BMI (Kg/m²) for men and women was 27.1 and 28.4, respectively, and the mean WC (cm) was 101.7 and 99.4, respectively. When BMI and WC were examined simultaneously, high BMI was associated with lower risk of all-cause mortality in women, and WC was associated with high risk of all-cause mortality in men and women. High WC was associated with high risk of CV mortality only in women. High BMI and high WC were not associated with all-cancer mortality in either men or women. Conclusion: Obesity measured by WC is more predictive of mortality, especially among women, in older Mexican Americans than is obesity measured by the BMI.

FOUR HEALTH OUTCOMES RELATED TO LARGE WAIST CIRCUMFERENCE: CUT-OFFS SHOULD BE HIGHER IN OLDER ADULTS

N. Heim¹, M.B. Snijder¹, D.J. Deeg², J. Seidell¹, M. Visser^{1,2}, *1. Dept of Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, 2. EMGO-Institute, VU University Medical Center, Amsterdam, Netherlands*

Our aim was to explore applicable cut-offs of waist circumference (WC) in older adults. Data of 1789 participants aged ≥70 were collected at five subsequent triennial measurement cycles of the Longitudinal Aging Study Amsterdam (4996 observations). Cross-sectional associations of WC with pain, mobility limitations, osteoarthritis and diabetes were studied using GEE models fitted in restricted cubic spline functions. Model fits for applying different cut-offs to categorize WC in the association with all outcomes were assessed using the Quasi-likelihood Independence Criterion (QIC). Visual inspection of the spline regression curves suggested higher cut-offs of WC. Particularly in women, QIC confirmed a better model fit when using higher WC cut-offs. For example, applying a 98cm cut-off (instead of the current 88cm) for pain, the QIC improved considerably from 8418 to 8333. This study confirms that higher cut-offs for high-risk WC should be applied in older adults.

BODY COMPOSITION DIFFERENCES AMONG OBESE OLDER PERSONS WITH AND WITHOUT METABOLIC SYNDROME

A. Koster¹, S. Stenholm², D. Alley³, M. Visser⁴, E. Simonsick², B. Nicklas⁵, A. Kanaya⁶, T. Harris¹, *1. Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, National Institute on Aging, Bethesda, Maryland, 2. Longitudinal Studies Section, Clinical Research Branch, National Institute on Aging, Baltimore, Maryland, 3. Department of Epidemiology and Preventive Medicine, University of Maryland School of Medicine, Baltimore, Maryland, 4. Institute of Health Sciences, Faculty of Earth and Life Sciences, Vrije Universiteit, Amsterdam, Netherlands, 5. Center on Aging, Wake Forest University School of Medicine, Winston Salem, North Carolina, 6. Division of General Internal Medicine, University of California, San Francisco, California*

This study examined body composition differences in obese older persons with and without metabolic syndrome (MS). Data were from 729 obese men and women (BMI≥30 kg/m²), aged 70-79 participating in Health ABC. Among obese men and women, individuals with MS had significantly more abdominal visceral fat and less thigh subcutaneous fat than those without MS (p<0.01) adjusted for demographics and lifestyle factors. In obese men and women, the likelihood of MS increased by 33% in men (OR:1.33, 95%CI:1.02-1.73) and over 2-fold in women (OR:2.17, 95%CI:1.68-2.80) per standard deviation (SD) increase in visceral fat. In contrast, likelihood of MS decreased in both men (OR:0.75, 95%CI:0.59-0.95) and women (OR:0.73, 95%CI:0.59-0.89) with each SD increase in thigh subcutaneous fat. Even though total fat mass was similar in obese persons with and without metabolic alterations, fat distribution varied significantly, in particular increased visceral fat and decreased thigh subcutaneous fat were related to MS.

OBESEITY STATUS AND METABOLIC ALTERATIONS AS PREDICTORS OF INCIDENT MOBILITY LIMITATION IN WELL-FUNCTIONING OLDER PERSONS

S. Stenholm^{1,2}, A. Koster³, M. Visser⁴, A.B. Newman⁵, S. Satterfield⁶, A. Kanaya⁷, T. Harris³, L. Ferrucci¹, 1. *National Institute on Aging, Clinical Research Branch, Baltimore, Maryland*, 2. *National Institute for Health and Welfare, Helsinki, Finland*, 3. *National Institute on Aging, Laboratory of Epidemiology, Demography and Biometry, Bethesda, Maryland*, 4. *Vrije Universiteit Amsterdam, Amsterdam, Netherlands*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 6. *University of Tennessee, Memphis, Tennessee*, 7. *University of California, San Francisco, California*

This study aims to examine the “healthy obesity” hypothesis by estimating the risk of new mobility limitation among obese and non-obese older persons with and without metabolic syndrome (MS). Data are from 2993 well-functioning men and women aged 70–79 participating in the Health ABC study. Obesity was defined as BMI ≥ 30 kg/m² and MS as meeting ≥ 3 of the ATP III criteria. Mobility limitation was defined as any difficulty walking 1/4 mile or climbing 10 steps during two consecutive semiannual assessments over 6.5 years. 55% developed mobility limitation. Compared to non-obese/no MS group, the adjusted risk of incident mobility limitation was increased in the groups of non-obese/MS (HR 1.32; 95% CI 1.16–1.50), obese/no MS (HR 1.62; 95% CI 1.38–1.90) and obese/MS (HR 1.74; 95% CI 1.52–2.00). In conclusion, additional evaluation of MS may help to distinguish obese persons at higher risk of mobility limitation. This research was supported by the Intramural Research Program of the NIH, National Institute on Aging (NIA) and NIA contracts N01-AG-6-2101, N01-AG-6-2103 and N01-AG-6-2106.

SESSION 1190 (SYMPOSIUM)

PHYSICAL ACTIVITY AND DIABETES IN US OLDER ADULTS: PUBLIC HEALTH PERSPECTIVES

Chair: *N. de Rekeneire, Section of Geriatrics, Yale University School of Medicine, New Haven, Connecticut*

Discussant: *C.J. Caspersen, Centers for Disease Control and Prevention, Atlanta, Georgia*

Older adults are at higher risk of developing chronic diseases, especially diabetes. Observational and randomized controlled studies reveal that physical activity and/or exercise have a strong role in preventing and treating diabetes. This is important, because in 2007, almost 25% of non-institutionalized U.S. adults aged 60 years and older had diagnosed and undiagnosed diabetes. We use national data to describe physical activity levels among older U.S. adults with and without diabetes. The 2008 Physical Activity Guidelines (PAG) for Americans offer evidence for the many health benefits of physical activity, and the amount of physical activity needed to provide such benefits. Prevalence estimates from the 2007 Behavioral Risk Factor Surveillance Survey (BRFSS) show that only 51.45% of adults aged 65+ reported meeting minimum PAG standards. Among those with diabetes, 47.3% met the 2008 PAG, while 28.9% met 2007 American Diabetes Association recommendations. Using the 1997-2004 National Health Interview Survey (NHIS), we note that the prevalence of sedentary lifestyle among older adults is higher among those with- than without diabetes, with only modest temporal trends. Also, regional proportions from the 2000-2006 NHIS for inactive adults aged 50+ with diabetes provide estimates of frail, impaired and those having comorbidities, that when applied to 2000-2006 BRFSS data, project the need for state-based physical activity programs for these specific groups. Overall, sedentariness remains relatively high with little progress towards improving physical activity levels among older adult Americans. Physical activity programs are needed to decrease sedentariness in this population.

PHYSICAL ACTIVITY GUIDELINES FOR OLDER AMERICANS

J. Kruger, F. Loustalot, *PAHB, CDC, Atlanta, Georgia*

Participation in physical activity can reduce the risk of cardiorespiratory and metabolic disease, colon and breast cancer, and improve musculoskeletal and cognitive functioning among older adults. The 2008 Physical Activity Guidelines for Americans (2008 PAG), provides the most recent evidence-based guidelines for physical activity. This presentation will discuss the 2008 PAG, and provide prevalence estimates for those meeting minimum aerobic physical activity standards (≥ 150 min/week of moderate-intensity; 75 min of vigorous-intensity; or an equivalent combination). Data were obtained from the 2007 Behavioral Risk Factor Surveillance System, and SUDAAN was used for data analysis. In 2007, 110,891 respondents aged 65+ completed moderate- and vigorous-intensity physical activity questions, and 51.45% (95% confidence interval 50.9%-52.0%) reported meeting minimum aerobic 2008 PAG. Nearly half of older adults do not meet 2008 PAG minimum physical activity standards. Dissemination of the 2008 PAG among older adults would aid in implementation of evidenced-based public health interventions.

ARE U.S. OLDER ADULTS WITH DIAGNOSED DIABETES MEETING PHYSICAL ACTIVITY RECOMMENDATIONS?

G. Zhao, E.S. Ford, C. Li, L.S. Balluz, *Division of Adult and Community Health, Centers for Disease Control and Prevention, Atlanta, Georgia*

Physical activity is therapeutically important in diabetes control (i.e., promoting weight loss, improving glycemic control and insulin sensitivity, and reducing risk of diabetes complications). Currently several physical activity recommendations have been made both for people with diabetes (Standards of Medical Care in Diabetes-2007) and for the general public (Healthy People 2010 objectives; 2008 Physical Activity Guidelines for Americans). Using a large, nationally representative sample from the 2007 Behavioral Risk Factor Surveillance System, we estimated the prevalence and the likelihood of meeting physical activity recommendations among adults aged ≥ 65 years with diabetes ($n=18,370$) in comparison to those without diabetes ($n=80,802$) after multivariate adjustment. Our results showed that older adults with diabetes were significantly less likely to engage in physical activity at recommended levels compared to those without. Further research on the barriers for participating in regular physical activity and intervention efforts to promote physical activity are needed among older adults with diabetes.

CHANGE IN RATE OF SEDENTARY LIFESTYLE AMONG US OLDER ADULTS WITH AND WITHOUT DIABETES: 1997 - 2004

Y.J. Cheng¹, N. de Rekeneire², C. Caspersen¹, 1. *Centers for Disease Control and Prevention, Atlanta, Georgia*, 2. *Yale University School of Medicine, New Haven, Connecticut*

Decreasing sedentary lifestyle is an important public health goal for older U.S. adults with and without diabetes. Using 1997-2004 National Health Interview Survey data, we examined trends in sedentary prevalence (defined as performing no leisure-time physical activity during the last year). Among 48,811 participants aged 65 years or older (roughly 6,100/year), after adjustment for age, sex, and race/ethnicity, sedentary prevalence in 1997 (53.3%) was similar to that in 2004 (52.2%; $p=0.305$). However, among persons with diabetes sedentary prevalence decreased from 65.6% in 1997 to 60.5% in 2004 ($p=0.043$). Despite this decrease in 2004, people with diabetes still had a 10.1% higher sedentary prevalence than those without diabetes ($p<0.001$). Adjustment for self-reported fair/poor health status, however, eradicated differences in sedentary prevalence between persons with and without diabetes (all- $p>0.050$). Increased public health efforts are needed to reduce sedentary lifestyle among older adults, especially for persons with diabetes having poor health status.

PROJECTING THE NEED FOR STATE-BASED PHYSICAL ACTIVITY PROGRAMS FOR OLDER ADULTS WITH DIABETES

K. Kirtland^{1,2}, C. Caspersen², M. Zack³, 1. Northrop Grumman, Atlanta, Georgia, 2. Division of Diabetes Translation, Centers for Disease Control and Prevention, Atlanta, Georgia, 3. Division of Adult and Community Health, Centers for Disease Control and Prevention, Atlanta, Georgia

Physical activity helps diabetic older adults with physical impairments or comorbidities control their diabetes. Using 2000-2006 NHIS and BRFSS, we calculated synthetic state level estimates of the prevalence among inactive adults aged 50+ years with diabetes of being: Homebound, Frail (having difficulty to all of: walking a quarter of a mile, climbing ten steps, standing for two hours, stooping, bending, and kneeling); Impaired (some but not all of the above impairments); Comorbid conditions (arthritis, hypertension, cancer, visual problems, stroke, respiratory illness, cardiovascular diseases); or Healthy (no impairments or comorbidities). The estimated state-specific prevalences ranged from 2.2-2.8% (n=315-29,186) for Homebound, 6.1-9.2% (n=878-81,324) for Frail, 20.0%-26.3% (2,974-275,516) for Impaired, 36.0%-43.6% (n=5,390-499,360) for Comorbid conditions, and 4.0%-6.9% (n=923-85,528) for Healthy. State program planners can use their state's estimates to identify and deliver specific kinds of physical activity programs needed to enhance diabetes control among older adults with distinct functional limitations.

SESSION 1195 (SYMPOSIUM)

ADMINISTRATION ON AGING'S NURSING HOME DIVERSION INITIATIVE: EXPERIENCES FROM FOUR STATES

Chair: L. Alexih, The Lewin Group, Falls Church, Virginia

Discussant: J. Lugo, Administration on Aging, Washington, District of Columbia

The Administration on Aging's (AoA) Nursing Home Diversion (NHD) program enables states to use existing Older Americans Act (OAA) and state revenue funds in a more flexible manner to provide a greater range of support options for people with disabilities. The program gives consumers a greater role in determining the types of services and the manner in which they receive them. The competitive grant-funded program targets and assists individuals at risk of nursing home placement and spend-down to Medicaid. The intended outcome is to promote community living through the receipt of consumer directed home and community based services. The NHD program is administered through State Units on Aging, in partnership with Area Agencies on Aging and in collaboration with community aging service providers. The program encourages the Aging Services Network to modernize and transform the funding they receive under the OAA and other non-Medicaid sources, into flexible, consumer-directed service dollars. The program is designed to complement the CMS Money Follows the Person Rebalancing Demonstration. The inclusion of several state representatives on the panel will allow for a diverse discussion on how the aging services network is managing the diversion process including: identifying and assessing at-risk consumers, leveraging existing resources, and ensuring that the needs and preferences of consumers and their family caregivers are fully considered. This session will provide an opportunity to share early implementation experiences, methods of integrating transition with the existing service delivery system for older adults, challenges encountered, and evaluation strategies and early outcomes.

MASSACHUSETTS ADRCS: COMMUNITY FOCAL POINTS FOR NURSING HOME DIVERSION AND CONSUMER DIRECTION

H. Johnson, MA Executive Office of Elder Affairs, Lunenburg, Massachusetts

Massachusetts has moved steadily over the past several years to make community long-term care services and supports available, affordable, and accessible alternatives to institutional care. The State is building its nursing home diversion and Veteran's HCBS activities within the existing infrastructure of its 11 decentralized, "no wrong door" ADRCs statewide. Coupled with a desire to anchor ADRCs as community access points for long term services and supports, it is promoting options counseling as a core function within the ADRCs to educate consumers about all of their choices. In support of consumer choice, MA is also incorporating consumer direction service options within its home and community-based programs. Findings from the options counseling pilot project will be discussed, as well as recommended strategies for embedding consumer direction within existing programs and services.

INTEGRATING CASH AND COUNSELING INTO A CAREGIVER RESPITE PROGRAM: EARLY OUTCOMES

N. Shugrue¹, I. Reed¹, J. Robison¹, M. Morton², 1. University of Connecticut Center on Aging, Farmington, Connecticut, 2. Connecticut Department of Social Services, Hartford, Connecticut

Connecticut is implementing its cash & counseling program, Choices at Home (CAH), through two caregiver respite programs. Caregivers and care recipients may hire and pay an individual of their choice to provide care through CAH, or remain in the "traditional services" (TS) group. Individuals from the CAH and TS groups are interviewed at commencement of services, at 3 months, and at program discharge. Early data comparing CAH with TS recipients at 3 months shows no statistically significant differences between the groups. Both groups express high levels of satisfaction with services and paid caregivers, and similar levels of depression, caregiver burden, unmet need. The majority of the CAH group report a high likelihood that the care recipients would have entered a nursing home without these services. Even in its infancy, CAH appears to be a beneficial addition to the caregiver respite programs for people desiring to direct their own services.

BRIDGING THE VETERANS HEALTH ADMINISTRATION AND AGING SERVICE SYSTEMS IN NEW YORK STATE: NY

P. McCallion¹, L. Ferretti¹, G. Koser², 1. University at Albany, Albany, New York, 2. New York state Office for the Aging, Albany, New York

As part of its self-directed nursing home diversion modernization project New York is one of ten states selected to plan for the inclusion of veterans through veteran directed home and community based services. In this presentation, a process will be described from an aging services perspective of: (1) Identifying critical similarities and differences in services and service approaches; (2) Developing joint targeting, recruitment and care planning activities; (3) Training staff in both systems; (4) Ensuring compatibility between procedures and protocols; (5) Adding value to both service systems and most importantly to the veteran participants. Lessons learned and challenges confronted will be highlighted and next steps discussed.

NURSING HOME DIVERSION IN GEORGIA

K. Grier¹, C. Pellino², 1. GA Division of Aging Services, Atlanta, Georgia, 2. Atlanta Regional Commission, Atlanta, Georgia

Georgia's nursing home diversion program, Support Options, provides consumers with choices in the services they receive in order to remain at home. Through active participation, consumers enrolled in the program decide the combination of services and goods that will best meet their needs at home. Support Options is a departure from the traditional case management model, and embraces the concept and practice of self-directed care. This session will discuss the components of a

self-directed model of care, and elements that are necessary for true self-direction. This session will also discuss the assessment tool used in Support Options, the Determination of Need – Revised (DON-R), which is a standardized and automated screening tool to identify those persons who are at greatest risk for nursing home placement and in greatest need for support. This discussion will also include a description of the Aging Information Management System (AIMS), Georgia's data collection tool.

SESSION 1200 (POSTER)

ADULT PROTECTION AND ELDER ABUSE - SRPP POSTER SESSION

SILVER ALERTS: STATES' RESPONSE TO MISSING VULNERABLE ADULTS

A. Fernandes, K. Colello, *Congressional Research Service, Washington, District of Columbia*

A patchwork of alert systems to recover missing vulnerable adults is developing in several states. These systems, administered at the state and local levels, are intended to alert law enforcement and the public that adults with mental or physical disabilities are missing and may need assistance returning home. Recent media attention to cases of vulnerable missing adults, particularly missing seniors with Alzheimer's disease, has prompted policymakers to consider whether the federal government should expand its role in helping these individuals. Legislation was passed in the U.S. House of Representatives on February 11, 2009 that would establish a grants program to encourage states to develop, expand, and coordinate these alert systems. The proposed program is similar to a federal grants program that funds training and technical assistance for what are known as AMBER (America's Missing: Broadcast Emergency Response) Alert systems. In response to the increased congressional focus on alert systems for missing adults, the Congressional Research Service (CRS) gathered data in 11 states that were known to have developed such systems. This presentation will provide an overview of the alert systems in these 11 states, including detailed findings related to: legal authority; system implementation and administration; the target population; use of the alert system; and, information about outcomes. The presentation will also discuss issues for policymakers to consider with respect to the federal role, if any, in developing state alert programs for missing adults.

A COMPARISON OF THE DYNAMICS, RISK FACTORS, CONSEQUENCES AND OUTCOMES OF FOUR TYPES OF ELDER MISTREATMENT

S.L. Jackson, T.L. Hafemeister, *Psychiatry, University of Virginia, Charlottesville, Virginia*

Financial exploitation of the elderly is expected to proliferate over the next decade as the elderly population continues to grow rapidly, its relative wealth increases, and its social isolation becomes more pronounced. However, it has been suggested that financial exploitation often co-occurs with other forms of mistreatment such as physical abuse or neglect. This study examined four types of elder mistreatment: financial exploitation co-occurring with either physical abuse or neglect (i.e., hybrid cases), financial exploitation only, neglect only, and physical abuse only. Using semi-structured, in-depth interviews, 76 pairs of victims of elder abuse and assigned caseworkers from Adult Protective Services (APS) in Virginia were interviewed separately about the nature, causes, and consequences of the type of abuse the elder experienced. This presentation will describe the dynamics of these four forms of elder abuse (particularly co-occurring financial exploitation in comparison to the other three forms of elder mistreatment), the nature of this abuse (e.g., multiple cases involved the misuse of a power of attorney), differences in the risk factors involved, the consequences of the abuse (e.g.,

the amount of money lost and recovered as well as other losses), and case outcomes. Implications for policy and practice will be discussed.

A PROTOCOL TO ASSESS ELDER ABUSE AND NEGLECT

T. Peak, F. Ascione, *Social Work Program, Utah State University, Logan, Utah*

We present the two instruments we developed to screen for elder abuse in the context of animal welfare issues. With funding from the Kenneth A. Scott Charitable Trust and in collaboration with the Utah Division of Aging and Adult Services, we developed both a general protocol that assesses animal welfare issues in the lives of elder adults and a follow-up protocol that can be used in cases where elder adults have expressed concern about the welfare of their animals (including threatened and actual harm). Preliminary drafts of the protocols were reviewed and field tested by Utah Adult Protective Services personnel and then reviewed by experts in the field of gerontology. Extensive revisions resulted from these collaborative efforts, including shortening the original three part assessment protocol into one instrument that first explores the topic and that would identify the need for a more thorough follow-up for those cases that did describe a threat of harm to a pet. In addition, the assessment protocols are supplemented by a PowerPoint training presentation for professionals working in aging and adult services, adult protective services, and animal welfare agencies, that is posted on the Utah Division of Aging and Adult Services Website, the Utah State University Department of Psychology, and the Social Work Program websites. Our hope is that all these materials will enhance the welfare of animals and the elder adults with whom they live. Both the general and the follow-up protocols as well as parts of the powerpoint materials are presented and discussed.

COMPARATIVE STUDY OF ELDER ABUSE AMONG INDIVIDUALS WITH MENTAL, DEVELOPMENTAL, OR PHYSICAL DISABILITIES IN JAPAN FROM THE PERSPECTIVE OF THEIR FAMILY MEMBERS

K. Masuda, *Seigakuin University, Saitama, Japan*

The present study aims to 1)compare the extent of elder abuse among individuals with mental, developmental, or physical disabilities from the perspective of their family members, 2)analyze the factors affecting abuse among individuals with mental, developmental, or physical disabilities, and 3)assess the relationship between the type of disability and the type of abuse. In 2007, a mail survey was conducted on 3,495 family members of individuals with mental(n=1,4 3,495 family members of individuals with mental(n=1,495)and developmental(n=2,000)disabilities. Subsequently, in 2008, a mail survey was conducted on 4,300family members of individuals with cerebral palsy(n=1,000) and spinal cord injury(n=3,300). Valid responses were recieved from 503 family members of individuals with mental disabilities(valid response rate=33.6%),888family members of individuals with developmental disabilities(valid response rate=44.4%), 576 family members of individuals with cerebral palsy (valid response rate=57.6%), and 891 family members of individuals with spinal cord injury(valid response rate=27.0%). The results demonstrated the following:1)according to family members, the extent of abuse among individuals with developmental disabilities was severe,2)the abuse of individuals with mental disabilities occurred most often in the workplace, while the abuse of individuals with spinal cord injury occurred most often in the workplace,3) individuals with developmental disabilities were most often the victims of physical abuse. These and several other findings will be discussed in this session.

EXPLORING ORGANIZATIONAL FACTORS ASSOCIATED WITH REPORTING OF ELDER MALTREATMENT INCIDENTS TO THE ADULT PROTECTIVE SERVICE (APS) SYSTEM

S. Balaswamy, N.L. Fields, *College Of Social Work, The Ohio State University, Columbus, Ohio*

There is agreement in the APS field that only a small fraction of the incidence of elder maltreatment cases is reported. Studies have frequently cited lack of public awareness, knowledge of how to recognize signs and report, and absence of collaborative efforts between community agencies and APS as reasons for underreporting, but organizational deficits that may prevent reporting has not been studied. This study focuses on indicators related to organizational infra-structure that are likely to contribute to under-reporting of APS cases in Ohio. Data was collected from 88 APS staff through telephone interviews. In addition to interviews, census data and state agency data on reported incidents for each county were analyzed. A three-year review of incident reports from counties indicates a disproportionate variability in the number of APS referrals received by county. Some counties report no incidents of elder maltreatment, while others reported relatively few cases. Larger counties tend to consistently report receiving higher numbers of incidents. Further, the results suggest that having full-time APS staff positions, higher number of staff, APS staff handling only APS cases, having a well-publicized APS number, having access to APS staff after hours and existence of 24-hour abuse hotline significantly improves the number of maltreatment cases reported to the APS system. Consistency on reported incidences across three years by counties was observed. There is greater dependency on local law enforcement in absence of a formal access system for reporting. The importance of having a well-coordinated infra-structure for increasing reporting and policy implications are discussed.

ASSESSING CAPACITY: AN EXAMINATION OF THE PROCESS

H.L. Connors, *Sociology, College of the Holy Cross, Worcester, Massachusetts*

This study examines protective service case managers', elder law attorneys' and geriatricians' experience in assessing elders' decision-making capacity in Massachusetts. In-person, qualitative interviews with a total of twenty-four professionals working with elders in Massachusetts were analyzed to understand the tools professionals use to assess whether a person has capacity to make a specific decision. Respondents reported using a variety of techniques to determine their clients' decisional capacity, including formal assessment tools, informal assessments, and seeking other opinions. Physicians were more likely than protective service or lawyer respondents to report the use of cognitive exams to evaluate patients. Attorneys and protective service case managers reported that although they do not have the training required to formally administer neuropsychological evaluations, they will sometimes use variations of such tests to indicate the need to consult with other professionals. These respondents were more likely to use informal tools such as talking about current events, to see how well the person responded to everyday conversation. Although analysis of the different disciplines showed variation in methodologies, professionals in all three fields appeared to use a combination of formal assessment tools, informal observation of the elder's conversational ability and general functioning, and consultation with others when making an assessment of an elder's capacity. Respondents appeared flexible in the use of these methods in order to make the process as comfortable as possible for the elder while providing sufficient information to assess the elder's abilities.

THE LOS ANGELES COUNTY ELDER ABUSE FORENSIC CENTER: USING SYNERGY TO ADVANCE POSITIVE OUTCOMES

A.E. Navarro¹, K. Wilber¹, D. Schneider², *1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Keck School of Medicine, University of Southern California, Los Angeles, California*

Synergy is the close coordination of the efforts and resources of individuals working together so that the performance of the whole is greater than the sum of its parts (Dahl, 2000). This presentation focuses on outcomes from activities at the Los Angeles County Elder Abuse Forensic Center, the second such multidisciplinary center in the nation. Center goals are to: 1) improve communication and coordination between county staff, 2) increase opportunities to achieve justice and improved client welfare, and 3) improve awareness and knowledge about the crime of elder and dependent adult abuse and neglect. Mixed methods included statistical analyses of survey data from members and presenters, along with tracking of center activities among the team members. Over 313 clients have been reviewed, with 98 Office of Public Guardian investigations, 65 home-based medical assessments, 69 neuropsychological evaluations and 52 prosecutor reviews to date. Process evaluation found excellent attendance (83%), high presenter satisfaction (4.6/5) and broad reaching awareness and training activities (7,258 individuals in 2008). Next steps are to focus on improving the measure of outcomes to improve our understanding of the significance of the Center's impact. Following this presentation, participants will have a preliminary model for tracking and evaluating the outcomes of an elder abuse forensic center. Findings amassed to date, suggest this model has the potential of becoming a standard tool in the fight to combat elder and dependent adult abuse. This project includes private support from the Archstone and Uni-Health Foundations.

SESSION 1205 (SYMPOSIUM)

AGING IN PLACE: AGING AT HOME AND AGING IN COMMUNITIES

Chair: *E. Hwang, Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada*

Discussant: *G. Gutman, Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada*

The purpose of this symposium is to explore the roles of the different levels of the built environments in understanding aging-in-place. Aging-in-place has several connotations beyond the simple phenomenon that older adults remain in the same home and community for their life times. It refers changes in both the personal and built environments. There are changes in the built environments and these changes are generally accompanied by frailty as a person ages. Addressing this at the global level, the ultimate goal of the team funded by the British Columbia Network for Aging Research (BCNAR) Team Development Grants, Canada, is to produce a cross-level conceptual framework to study aging-in-place. The symposium will start with the various ways of defining "aging-in-place." Sixsmith will show the different scopes of aging-in-place at lifetime home and lifetime communities in the United Kingdom with theoretical aspects. Then, Ziebarth will look at issues at the community level discussing local regulations and community initiatives encouraging aging-in-place in Minnesota, the United States. Hwang will reflect what it is like to age in a foreign country taking examples from Chinese and Korean communities in Metro Vancouver area, Canada. Finally, from more macro-level, Gutman will conclude with implications for policy makers and reflection on aging-in-place.

CARE RESPONSIBILITY AMONG OLDER ADULTS IN SWEDEN: EVALUATING THE NEW REALITY

G. Sundström^{1,2}, M. Grafström², B. Malmberg¹, A. Davey³, 1. *Institute of Gerontology, School of Health Sciences, Jönköping, Sweden*, 2. *Swedish Association of Retired Persons, Stockholm, Sweden*, 3. *Temple University, Philadelphia, Pennsylvania*

Although older adults in Sweden have long enjoyed high levels of Home Help Services, demand has far outpaced availability. Recent declines in Home Help Services have resulted in a greater role for informal carers. We know little about how attitudes and perceptions correspond with this new reality. Using representative data from the First Survey of the Swedish Association of Retired Persons (SPF, 1,035 individuals, 98% 65+, collected in late 2008), we establish perceptions of responsibility for care, actual and preferred. Care involvement is high with 20% reporting they were current caregivers and 30% reporting past care responsibilities (9% both). Caregivers' help often (40%) overlaps with public support. Strains on carers are also indicated. Participants reported a strong preference to remain in their own home with a blend of family support and public services, and many more preferring private assisted living facilities than public residences. 23 % presently receive help themselves (14% from family alone, 3% public alone, 5% combined). Most perceive shared responsibility between family and state. Few (6%) perceive the family as solely responsible for elder care, 26% attribute main responsibility to family with public supports; 37% attribute main responsibility to public sources with family support, and 15% see the state as wholly responsible. Although most individuals endorse a mixed family-public solution, most want the point of balance moved in the public direction. Results suggest successful policies will need to simultaneously balance needs of older adults and their families.

PROMOTING AGING-IN-PLACE IN MINNESOTA, USA

A. Ziebarth, *Housing Studies Program, University of Minnesota, St Paul, Minnesota*

Aging in place with dignity requires more than an accessible dwelling that allows for on-going independent living. Housing satisfaction research clearly identifies neighborhood characteristics as key factors for the quality of life people experience as they grow older. Research conducted in Minnesota examines the state policies, local regulations, and community initiatives that are designed to encourage aging-in-place. The findings provide guidelines for effective policy directions and note concerns regarding the implementation of policies for truly creating livable communities. Following this session participants will be able to identify policies that promote aging-in-place and will be able to evaluate the effectiveness of these policies in creating livable communities for older residents.

A CONCEPTUAL FRAMEWORK FOR AGING-IN-PLACE

A. Sixsmith, *Simon Fraser University, Vancouver, British Columbia, Canada*

This paper takes a phenomenological perspective to develop a conceptual framework for the idea of aging-in-place and its relation to quality of life. The value of this conceptual modeling is that it allows researchers to make explicit all the relevant aspects of a problem area and provide ideas about inter-relationships between these different aspects. At its simplest level the model comprises three attributes of everyday experience- "being", "doing" and "meaning". "Being factors" refer to the attributes of the older person along with the context within which they live that have a direct bearing on well-being. "Doing factors" refer to the everyday activities of a person, such as activities of daily living (ADLs), leisure, social interaction, health related activities. Meaning factors refer to the subjective aspects of well-being, or the subjective meanings, associated with a person's everyday situation and activities and subjective well-being outcomes, such as happiness and life satisfaction.

GROWING OLD IN CANADA: CHINESE AND KOREAN SENIORS IN METRO VANCOUVER

E. Hwang, *Gerontology Research Centre, Simon Fraser University, Vancouver, British Columbia, Canada*

The purpose of this study was to analyze the characteristics of Chinese and Korean seniors residing in ethnic-concentrated neighborhoods in Metro Vancouver, Canada. The data were collected using both face-to-face interviews for 99 participants (50 for Chinese and 49 for Koreans) with structured questions and two focus group interviews with 15 participants. To compare group differences between Chinese and Koreans, t-tests were conducted and cultural uniqueness was highlighted. Chinese seniors tended to actually use/walk to various local amenities (e.g., community centres, ethnic grocery stores, parks, gyms, doctor's office, and library) more frequently than Korean seniors. On the other hand, more Koreans intended to plan to move out from their current housing in the next 3 years, but there was no significant difference in terms of overall satisfaction and sense of community in the two groups.

SESSION 1210 (SYMPOSIUM)

DIRECT CARE WORK ACROSS SETTINGS: COMPLEXITIES, CULTURES AND CONTEXTS IN CANADA, ISRAEL AND THE USA

Chair: A. Martin-Matthews, *Sociology, University of British Columbia, Vancouver, British Columbia, Canada*

Discussant: M. Gillis, *Health Human Resources Strategies Division, Health Canada, Ottawa, Ontario, Canada*

Direct care workers (nursing assistants, home health and home care aides, personal care workers, and personal service attendants) are considered the 'eyes and the ears' of the care delivery system. They provide hands-on care to millions of elderly people worldwide, in settings ranging from private homes, to assisted living and other residential care options, to nursing homes. In the USA, direct care workers provide an estimated 8 out of every 10 hours of paid care received by clients of long-term care services. While these workers are typically depicted as marginalized, poorly paid and (often) immigrant women of colour with little training and brief tenure working in this sector, their characteristics and circumstances are in fact more varied than this depiction. This Symposium compares and contrasts the nature of direct care work across settings, and examines workload and job configuration and the impact of worker characteristics on quality of care and relationships with clients. Four papers examine data: from direct care workers employed as home (domiciliary) support workers in two provinces of Canada; live-in foreign home care workers in Israel; and direct care workers in two work environments (community health centers and assisted living facilities) in two states of the USA. A senior policy analyst in Health Human Resources in the federal government of Canada will discuss the policy implications of these transnational comparisons. This Symposium informs the understanding of direct care work and characteristics of workers across jurisdictions, between public and private spheres of work, and across nations.

THE MANY ROLES OF FOREIGN HOME CARE WORKERS UNDER THE LIVE-IN SYSTEM IN ISRAEL

L. Ayalon, *Bar Ilan University, Ramat Gan, Israel*

PURPOSE: The present study evaluates the roles of foreign home care workers, who provide care to older adults, under the live-in system in Israel. METHODS: Qualitative interviews with 22 family members and 29 Filipino home care workers were conducted. Interviews were analyzed thematically. A survey of 259 Filipino home care workers about their working conditions also took place. RESULTS: The role of live-in foreign home care workers often includes not only physical care, but also emotional and social care. The blurred boundaries that characterize this profession account for some of the abuse experiences reported by workers. IMPLICATIONS: Foreign home care workers' job descrip-

tion needs to be redefined to acknowledge the substantial social and emotional care they provide. Greater clarity concerning their job description may result in a better work environment.

“WE DO IT ALL”: UNIVERSAL WORKERS IN ASSISTED LIVING

C.L. Kemp¹, M. Ball¹, C. Hollingsworth¹, M. Lepore², 1. *Georgia State University, Atlanta, Georgia*, 2. *Brown University, Providence, Rhode Island*

Assisted living (AL) is a burgeoning industry, but like the broader long-term care sector it is strained by an endemic shortage of direct care workers (DCWs). Yet, little has been written about these workers in AL, especially their job experiences. This paper explores DCWs' daily work using data from a state-wide study involving 45 AL facilities in Georgia. Our analysis draws on surveys with 370 DCWs and in-depth, qualitative interviews with 41 DCWs and 44 administrators. Across all facilities and job positions, DCWs are essentially universal workers who do much more than hands-on care. Workload varies, often by job configuration, but 42% of DCWs feel pressed to complete daily tasks. Facility size, staffing levels and resident impairment levels are among the factors influencing work experiences. Ultimately, task configuration and workload influence DCWs' relationships with residents, which are the most satisfying aspects of their job and contribute to retention.

HOME CARE SERVICES TO ELDERLY CLIENTS: THE LABOUR OF CAREWORK IN A CANADA

A. Martin-Matthews¹, J. Sims-Gould¹, J. Keefe², 1. *The University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Mount Saint Vincent University, Halifax, Nova Scotia, Canada*

Home Care is the fastest growing sector within health services delivery in Canada. Each province has its own home care program, with the result that where one lives, and not what one needs, determines the nature of service received. This paper focuses on the non-medical (sometimes called non-professional or unregulated) workforce within Home Care. Using data from semi-structured in-depth interviews with 119 home support workers in British Columbia and 40 in Nova Scotia, the nature of the care work, as shaped by the rules and regulations of provincial agencies, is examined. Work stress and job satisfaction are influenced by relationships with clients, safety concerns, scheduling and compensation, and the unpredictable nature of work marked by continual changes in the work schedule and environment. Ethno-cultural characteristics, immigrant status and skills training vary considerably among the workers from these two provinces, with implications for recruitment and retention of workers.

DIRECT CARE WORKERS IN COMMUNITY HEALTH CENTERS: PROVIDING CARE FOR UNDERSERVED POPULATIONS

J.C. Morgan¹, J. Dill^{2,1}, 1. *UNC Institute on Aging, Chapel Hill, North Carolina*, 2. *UNC Chapel Hill, Sociology Department, Chapel Hill, North Carolina*

Demographic and workforce aging is expected to lead to an increase in the demand for frontline healthcare workers, including those working in community health centers. Community health workers (CHWs), like most careworkers, play a critical yet under-recognized role in delivering needed care to underserved populations. The purpose this paper is to describe the work of CHWs, the demographic characteristics of this workforce, common barriers to giving good care, relationships with clients and how they find meaning in these jobs and their carework. The data for this paper come from focus groups and surveys with CHWs (6 FGs, 144 surveys) and supervisors (6 FGs) in community health centers in the U.S. We find that wages are generally low (\$11.40 median wage), workloads are high, and community members are over-represented in low level CHW work. CHWs have a strong community-needs

orientation, which can lead to challenges in maintaining professional boundaries.

SESSION 1215 (SYMPOSIUM)

DRIVING AND EARLY STAGE DEMENTIA: IMPROVING SAFETY WITH NATURALISTIC DRIVING DATA

Chair: D.W. Eby, *UMTRI, Ann Arbor, Michigan*, M-CASTL, *Ann Arbor, Michigan*

Discussant: M. Porter, *University of Manitoba, Winnipeg, Manitoba, Canada*

Driving presents a significant safety issue for persons with dementia. Because dementia impairs judgment and the ability to plan, driving decisions involve greater family and community input than with other older drivers. Fitness to Drive in Early Stage Dementia, an Alzheimer's Association-funded project, provides a unique interdisciplinary approach to examining driving decisions and driving performance in naturalistic settings utilizing vehicle instrumentation. Actual driving data will be used to identify and report problematic driving performance to drivers, their families, and therapists in order to supplement traditional assessments of fitness to drive. Thus the potential of onboard technology to augment current practice will be explored. The research team draws on expertise from gerontology, psychology, social work, and transportation engineering and technology. This symposium will report the results of Phase 1 of this 3-year study. Specifically, the co-investigators will describe the background of the study; state results of an expert panel meeting which identified critical behaviors associated with dementia that may impact safe driving; examine themes identified from a series of focus groups with drivers, family members and driver rehabilitation specialists; report on the development of algorithms to monitor on-road driving performance and in-vehicle instrumentation; and conclude with next steps of exploration.

DRIVING AND EARLY STAGE DEMENTIA: PROGRAM OVERVIEW

D.W. Eby, *SBA, UMTRI, Ann Arbor, Michigan*

Recent advances in technology provide a method for automatically collecting detailed information about a person's driving ability. This technology can be used to monitor the driving behavior of individuals diagnosed with early stage dementia and provide guidance on how often these drivers need to be assessed, and investigate the validity of recommendations of clinicians, family members, and self-screening. The specific aims of this exploratory study were to: 1) demonstrate the feasibility of using in-vehicle data collection to monitor driving actions of persons with early stage dementia; 2) compare the validity of multiple forms of assessment of driving skills with naturalistic driving in persons with early stage dementia; 3) bring greater visibility to deficits in driving performance unique to people with early stage dementia; 4) increase understanding of behaviors and issues of drivers with dementia and their families; and 5) inform decision-makers about appropriate intervals for checking driving competency.

USING OBJECTIVE DRIVING DATA IN COMPETENCE ASSESSMENT OF DRIVERS WITH EARLY STAGE DEMENTIA

N.M. Silverstein, A. Gottlieb, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

The perspectives of ten triads (persons with dementia, family members, and specialists in driving assessment/occupational therapy) were compared to empirical data on on-road performance gained through in-vehicle monitoring of the drivers' cars for at least one month totaling over 700 trips and 3000 miles. In-person pre and post instrumentation surveys were conducted with the persons with dementia and their family members. A post instrumentation survey was conducted in-person with the driving specialist. The triad attended a debriefing that

included a summary of how the driver performed on the instrumentation measures. Finally, a telephone follow-up was conducted post instrumentation with the family member to assess changes in driving status and recommendations followed. The research was useful in noting areas of validation of driving status across self-screening, family and specialized assessment as well as highlighting where greater sensitivity in measures may be needed.

COMPARING OBJECTIVE PERFORMANCE OF EARLY STAGE DEMENTIA DRIVERS TO MULTIPLE FORMS OF ASSESSMENT AND COGNITIVELY INTACT DRIVERS

L.J. Molnar, *Transportation Research Institute, University of Michigan, Ann Arbor, Michigan*

Findings from two sets of analyses are discussed in this presentation. The first set of analyses compared multiple forms of assessment of driving skills with naturalistic driving in individuals with early stage dementia. In these analyses, critical driving skills were used as the framework for comparing the assessments of the Certified Driving Rehabilitation Specialist (CDRS), the family member, and the driver, to the objective measures of driving obtained through the in-vehicle monitoring. Included in these analyses was the determination of whether or not the driver adhered to the driving recommendations provided by the CDRS in her initial assessment of the driver prior to enrollment in the study. The second set of analyses compared the objective driving measures obtained in the present study to similar measures obtained from previous in-vehicle monitoring studies of non-early stage dementia drivers to determine if drivers with early stage dementia exhibit unique driving characteristics.

DOES VEHICLE INSTRUMENTATION MAKE A DIFFERENCE? A COMPARISON GROUP PERSPECTIVE

G. Adler, *UH, Houston, Texas*

With additional support from the University of Massachusetts Transportation Center (UTC), a comparison group of drivers similar to those enrolled in the Alzheimer's Association project was recruited to participate in a comparison study. This group of drivers, like those enrolled in the prior project, were evaluated and deemed safe to drive by a driving specialist/occupational therapist following a formal assessment, however following their evaluation the drivers did not have their vehicles instrumented. They, along with a collateral source of information, completed surveys querying them about the drivers' habits and behaviors behind-the-wheel as well as driving decision-making. One month later a follow-up call was placed to the collateral source for information about the driver's situation and changes in status. The additional perspectives provide value-added benefit to the initial project further assessing the impact of instrumentation on driving behaviors and decision-making and the extent to which such instrumentation serves as an intervention.

INSTRUMENTING VEHICLES FOR OBJECTIVE MEASURES OF DRIVING

D. LeBlanc, *Univ of Michigan, Ann Arbor, Michigan*

Objective measures of travel patterns and driving performance were obtained for ten drivers by installing an instrumentation set on each of the drivers' own vehicles. This data set includes continuous capture of speed, geographic location, time of day, accelerations, yaw rate, brake use, transmission gear, turn signal use, distance to vehicles ahead, cabin audio, and video capturing in-vehicle and external situations and events. The performance measures include: travel pattern characteristics, wayfinding errors, following distances, negotiation of traffic signals and stop signs, pedal/gear confusion, and turn signal use. These metrics were presented to the driver, their caregiver, and their driving rehabilitation specialist to determine whether objective driving information influences their perspectives or decisions. This presentation describes

the instrumentation, measures, and highlights of the findings within the objective data analysis itself.

SESSION 1220 (PAPER)

FAMILY CAREGIVING - SRPP PAPER SESSION

SERVING RURAL GRANDPARENTS RAISING GRANDCHILDREN: A COMPILATION OF PROMISING PRACTICES

M.A. Adle, J. Crittenden, L.W. Kaye, *Center on Aging, University of Maine, Bangor, Maine*

There are 2.4 million grandparents raising grandchildren nationwide facing the challenges of caring for children while they, themselves, are aging. For these and other relative caregivers living in rural areas, those challenges are often compounded by a lack of accessible resources and too few services that effectively meet the unique needs of rural families. The UMaine Center on Aging, with funding from the Brookdale Foundation, undertook a study of the service delivery needs of rural relatives as parents. In addition to a review of program reports and research literature, an online exploratory survey was conducted with practicing professionals (N=48), interviews were conducted with 25 direct-service professionals/key experts in the field, an online follow-up survey (N=41) was administered to professionals in the field, and interviews with 10 caregivers were carried out to augment data collected from professional contacts. Findings confirm that a rural caregiver's isolation from needed services, as well as the unique social dynamics of living in a rural area, requires that service providers alter service provision to adequately address the needs of such families. Fierce family loyalty, strong informal support networks, and personal strength/resilience serve rural families well. Preferred rural-specific program strategies include the use of distance technologies, mobile service units, transportation and financial assistance, innovative collaborations and other customized methods of outreach and service provision. The final product of this translational research will be compiled into the Promising Practices Manual for Operating Rural RAPP Programs for practitioners who intend to develop grandfamily programming in rural areas.

CHANGING ATTITUDES TOWARD LONG-TERM CARE PROVISION FOR AGED PARENTS AMONG SANDWICH GENERATION

E. Yoon, *School of Social Work, Jackson State University, Jackson, Mississippi*

Despite social changes such as geographic mobility, weakened inter-generational cohesion, and women's participation in the labor force in South Korea, adult children remain the most reliable of instrumental social support to their parents. What accounts for the willingness of adult children to serve the needs of their aging parents? The specific aim of this research is to investigate the changing forces that guide adult children into their roles as providers of support to older parents. A study of 943 individuals between the ages of 20 and 59 addressed research questions throughout self-administered questionnaires. The study results discovered middle-aged adults' transitional norms toward family caregiving for aging parents: They still believed in the responsibility of families to care for their aging parents, but strongly expressed the needs for creating more affordable formal services and programs designed for physically and cognitively impaired old adults. The overall attitude and pattern of differences by gender is compatible with a traditional division of social support labor. Whereas sons expressed reluctant attitude toward using formal services such as respite care or nursing home care, daughters-in-law tended to have ambivalent sentiment of their roles as primary caregivers and willingness to use intervention programs. This study suggested that the amount of responsibility that adult children feel their generation should have for assisting elderly parents be a powerful predictor of helping behavior across generation.

THEY HAVE IT IN THEIR BLOOD, WE HAVE TO STUDY FOR IT: NOTIONS REGARDING MIGRANT CARE WORKERS' PRESUMED SUITABILITY TO PROVIDE CARE IN OLD AGE

S. Torres, 1. Linköping University, Norrköping, Sweden, 2. Mälardalen University, Västerås, Sweden

The globalization of international migration has changed the ethnic composition of Swedish society. The elderly care sector is no exemption since a large number of care recipients and care providers are not ethnic-Swedes these days and elderly care planners need nowadays to know how to diversity manage their workplaces. Departing from this state of affairs a project was launched to shed light on how assumptions regarding ethnic and culture-different 'Others' affect the quality and user-friendliness of Swedish elderly care. Ethnographic data has been collected over a period of sixty days resulting in 300 hrs of participant observation (generating 152 pages of observation protocols and an additional 30 pages of field notes including observation drawings, setting descriptions and context-specific debriefing notes) and a total of 37 semi-structured interviews (26 with care providers, 8 with care recipients and 3 with their relatives). This presentation will focus on the notions regarding migrant care workers' presumed suitability to provide care in old age that were uncovered and the implications that these have for ethnic relations between staff members. The division of labor between staff that these notions unintentionally bring about will also be discussed in an attempt to problematize how multiculturalism can challenge the manner in which we think about what constitutes high quality and user-friendly care in old age. The implications that globalization has on gerontological practice will also be explored since the project empirically shows how multiculturalism impacts everyday practice in nursing homes.

"GOING THROUGH THE STORM": THE RELATIONSHIP BETWEEN CAREGIVING GRANDMOTHERS AND INCARCERATED MOTHERS

P.W. Bell, Governors State University, University Park, Illinois

Purpose: In Illinois, 80% of incarcerated women were mothers to more than 7,500 children (LaLonde & George, 2002). As a result of maternal incarceration, grandmothers became the primary caregivers to over 50% of their grandchildren (Mumola, 2000; AIUSA, 2000). Despite the large number of grandmothers parenting, there is little known about the grandmother-mother relationships prior to incarceration. This study examines grandmother-mother relationships, and analyzes how grandmothers' inherited their caregiving responsibilities. Methods: Forty in-depth semi-structured interviews were conducted with 20 incarcerated mothers and 20 grandmothers. Data collection and analysis applied critical ethnography (Carspecken, 1996), and Relational Cultural Theory (Miller & Stiver, 1997). There were two stages of analysis: 1. Transcribed interview data were managed, coded and thematically analyzed through the use of qualitative analysis software NVivo (Richards, 1999); and 2. Clustered matrices (Miles & Huberman, 1994) were composed based on developmental stages and pivotal events. Results: The findings revealed grandmother-mother relationships changed based on the mothers' developmental stages. Factors related to the dyadic disconnections were: a) childhood and early adolescence substance abuse, b) sexual abuse, c) family violence, and d) exposure to gangs. The burden of substance abuse and arrest forced grandmothers to parent their grandchildren on a formal, informal, and temporary level. Implications: This study contributes to social work research by providing an in-depth analysis on how factors influence the grandmother-mother relationships across the mothers' lifespan, and how these relationships vary based on the grandmothers' health, levels of care-giving, and the resources received to help grandmothers raise their grandchildren.

SESSION 1225 (POSTER)

HOME AND COMMUNITY BASED CARE - POSTER

HOW OLDER ADULTS RESPOND TO HOME-BASE MONITORING: RESULTS OF A SURVEY FROM THE OREGON BIO-MEDICAL RESEARCH PARTNERSHIP STUDY

L. Boise, K. Wild, N.C. Mattek, M.E. Zenorini, Layton Aging & Alzheimer's Disease Center, Oregon Health & Science University, Portland, Oregon

Increasingly, researchers are using computers and home monitoring technologies to study older adult behavior and to identify changes in health and behavior in home settings. Yet, we have little information from older adults themselves about how they respond to such technologies. This poster will present results from a survey administered to 158 persons aged 69 - 92 at baseline in the Biomedical Research Project (BRP) funded by NIA (mean age: 84 years, mean education: 15 years, 74% female, 52% living alone). This survey asked study participants about their computer use, how important they thought monitoring was for assessing possible changes in behavior and functioning and concerns about privacy or possible misuse of data. Responses were compared according to gender, living status, and cognition (normal vs. mild cognitive impairment). The results showed that over half of the subjects used their computer daily, most often for email communication and playing games. Subjects thought monitoring for health changes was important overall, although about two-thirds reported being concerned that their information could be exploited. Subjects were overwhelmingly willing to have their activity monitoring information shared with their doctor (90%), less so for their computer (76%). Male participants were significantly more concerned about privacy than females. Subjects with normal cognition were more likely to be concerned about who might have access to their information than the cognitively impaired. The results of this survey have important implications for managing and controlling the growing use of computers and other technologies for researchers to study older adults.

POLICING A GRAYING POPULATION: A STUDY OF POLICE CONTACTS WITH OLDER ADULTS

C. Stelle¹, J. Liederbach², 1. Gerontology / Human Services, Bowling Green State University, Bowling Green, Ohio, 2. Bowling Green State University - Criminal Justice / Human Services, Bowling Green, Ohio

Over the course of the coming decades America will collectively turn "grayer" as members of the Baby Boom cohort join the ranks of older adults. These demographic trends will likely impact police organizations and the job of street-level patrol officers. Existing scholarship on police contacts with older adults has focused predominantly on the issue of criminal victimization; however very few studies have been designed to provide data on the typical interaction between police and older adults. The present study uses direct observation of police officers to offer a more complete description of these interactions than those developed through surveys or studies based on official records. Police interactions with a total of 340 adults age 60+ are described by reason for contact and role enacted by older adults within the encounter. Our findings demonstrate the importance of non-crime related service demands of older adults to community policing and the need to move beyond research approaches focused solely on responding to older adult victims of crime. Suggestions for future research and the policy implications of demographic shifts on police organizations are discussed.

CASE MANAGERS IN COMMUNITY-BASED CARE: PERCEPTIONS OF COMPLEXITY IN A REWARDING WORK ENVIRONMENT

E. Slominski, Miami University, Oxford, Ohio

As policies in the last two decades have shifted toward community-based care, case managers have become an increasingly important part

of the delivery system. Serving as the mediator between older adults needing care and the service providers, case managers often take two positions: an advocate for consumer needs and a regulator of care costs for adults experiencing a chronic disability (Dill, 2001; Applebaum and Austin, 1990). Due to this increasing level of job-related role complexity, understanding the experiences of community-based case managers is becoming even more crucial. Therefore, a qualitative approach is necessary to attain the voices of the case managers and how they personally view their experiences in community-based care. This study explored the perceptions of eleven case managers in two community-based care programs through the use of in-depth interviews. Empirical findings include: an increased level of complexity related specifically to working in community-based care (e.g., discretion and home visits) and also a general high level of variability in many facets of the job. However, there was a high level of support for both the shift to community-based care and the case managers' position within this area of long-term care. This high level of support appears to create both personal and professional rewards that counteract occupational stresses. Based on these findings, implications and future research possibilities will be discussed.

EMPOWERMENT AND PERSONAL CONTROL IN LATER LIFE: THE EXPERIENCE OF CONSUMER DIRECTION

K. Niles-Yokum, *Behavioral Sciences, York College, Sutton, Massachusetts*

In general, policy-makers and program developers have viewed age as a deciding factor when developing programs and services in the United States. The prevailing service philosophy has been that older adults, by virtue of age alone, are in need of intervention. The network of services for the aging has evolved primarily as an agency model, limiting the autonomy of the older person in favor of 'professional' judgments. This qualitative study was an exploration of the factors that influence the degree to which older adults actually direct their own care in a consumer-directed model of services and supports. Findings from interviews with consumers, caregivers and case managers across three states revealed four key factors that play a role older adult's empowerment (or lack of) in directing their own care. These include 1) whether the consumer had a family or non-family care worker, 2) attitudes about old age, 3) consumers perceptions of choice and control, and 4) prior care experiences. Results provide important insight into the planning and implementation of service models for the elderly and highlight the need for an increased awareness of the importance of empowerment and personal control in later life.

THE ROLE OF PSYCHOSOCIAL FACTORS IN LONG-TERM CARE UTILIZATION AMONG ELDERLY CHINESE

V. Lou¹, E. Chui¹, A. Leung¹, C. Kwan¹, I. Chi², E. Leung¹, *1. The University of Hong Kong, Hong Kong, Hong Kong, China, 2. University of Southern California, Los Angeles, California*

Aims: This study aims to examine the role of psychosocial factors associated with the choices of community-based long-term care services for elderly Chinese people in Hong Kong. **Method:** The survey method was adopted using multi-stage sampling. A standardized questionnaire was designed based on Anderson's Health Behavioral Model. A total of 435 elderly people were interviewed successfully. Among them, about 37% were male; close to 45% did not have formal education, and about 56% were not married. 23% were cared for by spouses; about half were cared for by children. **Results:** The study tested the expanded Anderson model empirically on its enhanced power to explain long-term care utilization by including psychosocial factors. As hypothesized, psychosocial factors contributed the largest explained variance (changedR² = 0.1663) to the differentiated utilization of long-term care services, followed by needs characteristics (changedR² = 0.1590) and enabling characteristics (changedR² = 0.1028). On top of needs factors (i.e. level of impairment in daily living and cognitive functioning), and enabling factors (i.e. financial considerations), older adults who

chose to stay in the community were more likely to have positive attitudes towards community-based services, higher levels of family solidarity (i.e. the availability of caregivers in the same household and the primary caregivers being economically inactive), and preferences for staying in the community. **Conclusion:** To achieve 'Aging in place' in a Chinese context such as Hong Kong, psychosocial factors in regards to attitude, family solidarity, and service preference need to be taken into consideration in program planning and policy development.

DEMOGRAPHY OF ASSISTIVE TECHNOLOGY USE AND PERSONAL ASSISTANCE: RACE, GENDER AND AGE FACTORS

S. Levien, J. Burr, *UMass Boston, Boston, Massachusetts*

The objective of this study is to describe the use of assistive technology (e.g., cane, wheel chair) and the receipt of personal assistance among middle-aged and older persons who report at least one mobility limitation. We focus on race and ethnic (Hispanic) differences and investigate whether the effects of race and Hispanic status are modified by age and gender. For cultural, economic, and health reasons, we expect differences in the (a) likelihood of using assistive technology, (b) number of devices used, (c) receipt of personal assistance and (d) unique combinations of device use and personal assistance. Understanding these differences may be helpful from a policy perspective (quantity and quality of long-term care) as well as for health care service providers. We use data from the 2006 Health and Retirement Study to estimate our models, controlling for health and disability status, health insurance, contact with health care service providers, family characteristics, and education. For assistive technology use, we find non-Hispanic blacks are more likely than non-Hispanic whites to use at least one device and to use more devices. Blacks are also more likely to receive personal assistance than non-Hispanic whites. Blacks are more likely than whites to use only devices as compared to using no devices or personal assistance only. Blacks are also more likely than whites to use both devices and personal assistance as compared to using neither a device nor personal assistance. No differences between Hispanics and non-Hispanic whites were found for either assistive device use or personal assistance.

USING NURSE PRACTITIONERS TO EVALUATE AND ADDRESS THE VISION CARE NEEDS OF THE HOMEBOUND ELDERLY OF NEW YORK CITY

A. Zaldivar, N. Brennan, T. Cortes, V. Torres-Suarez, *Lighthouse International, New York, New York*

Vision loss is one of the leading causes of disability and loss of independence among older adults. Vision impairment often prevents seniors from venturing outside their homes adding to rapidly growing pool of seniors with debilitating medical and mobility issues that are homebound. Seniors with vision impairment are also at high risk for falls and medication errors. The Lighthouse International has launched an innovative pilot program using nurse practitioners to evaluate and address the comprehensive eye and safety issues of the homebound elderly. This creative pilot program is executed by the only two Geriatric Nurse Practitioners (GNPs) in the country with a specialization in vision care. The GNPs' breadth of medical knowledge, combined with their intensive training in vision, puts them in an excellent position to deliver unprecedented holistic care to homebound elderly patients. To date, the Nurse Practitioner Homebound Elderly Program pilot has visited over 40 seniors throughout New York City. Initial data reveal a large percentage of homebound seniors that meet the criteria for being legally blind. The nurse practitioners were able to provide necessary at home vision testing to complete state mandated documentation. Completed documentation allowed seniors to access an array of services available to legally blind residents. Another subset of seniors seen through the pilot were provided with much needed updated eye glasses, allowing some participants to correctly read their medication labels. The Lighthouse International evaluation department is currently working to assess whether

this model of delivering vision care by nurse practitioners can contribute to the healthy aging of seniors who are confined to their homes.

BUILDING POSITIVE INTERGENERATIONAL RELATIONS: LESSONS FROM IRELAND

L.E. Carragher, A. Marron, P. Kerins, R. Bond, *DKIT, Dundalk, Ireland*

Introduction Loneliness is a common feature of the lives of many older people, and is linked to impaired quality of life, greater need for institutional care and increased mortality (Routasalo & Pitkala, 2003). This study explores a unique model of volunteering for health and social care students, aimed at improving intergenerational relations and contributing to a societal cultural shift linked to ageism whilst also improving the overall quality of life of older people. Testing new interventions to alleviate loneliness may be particularly important given societal loosening of social ties. Method Ten students enrolled on health and social care degree programmes were matched with twenty community-dwelling older people. Students visited participants in their homes each week to develop trust relationships, listen to their life stories and devise appropriate activities to improve participants' quality of life. Results Students engaged in a range of activities, such as taking participants to visit friends now living in nursing homes and with whom they had limited contact. "Browse shopping" was found to be particularly popular. Participants appreciated "having time" to browse rather than the usual "rushed weekly shopping and the noise from grandchildren." Overall, the programme was found to be a mutually beneficial. Students experienced positive changes in attitudes towards older people (measured on a 27-item scale), while older adults reported higher levels of quality of life. Conclusion Findings point to the importance of pedagogical strategies that cross professional disciplines and the positive impact this can have on intergenerational attitudes and ultimately service provision.

SESSION 1230 (SYMPOSIUM)

INVOLVING OLDER PEOPLE IN RESEARCH AROUND THE WORLD

Chair: K. Fitzgerald, *Swansea University, Swansea, United Kingdom*

Discussant: J.E. Phillips, *Swansea University, Swansea, United Kingdom*

This symposium will take an international look at how and why different countries are involving older people in research. In recent decades, disability movements have argued that people with disabilities have a right to be involved in research. One could similarly argue that both morally and ethically older people have a right to be involved in research about older people. Research findings impact on the development of policy and practice, and therefore affect the lives of those 'being researched.' Aside from the ethical and moral reasons for including older people, there are practical reasons. Older people are a valuable resource and have a wealth of lifetime experience on which to draw. Some have particular skills that can bring refreshingly new elements to a project. In addition, it is practical to include older volunteers as they are more likely to be able to interview peers with a lower refusal rate and have a personal understanding of the topic under study. The involvement of older people means that there are innovative approaches to research. Subsequently, older volunteers and academics as co-researchers can learn from each other. Governments and funding agencies are becoming aware of this and are beginning to require user-involvement in research proposals. Each of the presenters will discuss the moral, ethical and practical reasons why older people should be involved in research in their country and arguable around the world.

INVOLVING OLDER PEOPLE IN RESEARCH: WHAT HAVE WE LEARNT SO FAR?

J.E. Phillips, *Swansea University, Swansea, United Kingdom*

Placing older people at the heart of the research process is believed to be critical if services are to be tailored to the needs of communities

and individuals. Further advantages are seen through the acquisition of new skills and knowledge, increased self esteem and confidence amongst older people and researchers. Such participatory approaches also contribute to the interpretation of results and policy formation. The presentation will draw on the advantages from such engagement through a number of projects in the OPAN Wales network as well as look at the challenges that such engagement presents to older people as well as researchers. The presenter will also act as discussant to the papers submitted.

RURALWIDE: AN EXAMPLE OF ENGAGEMENT OF OLDER PEOPLE IN RESEARCH IN THE UNITED KINGDOM

V. Burholt¹, B.V. Riley², 1. *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*, 2. *None, Corris, United Kingdom*

This paper describes the Rural North Wales Initiative for the Development of Support for Older People (RuralWIDe). RuralWIDe was a participatory research project. Volunteer older co-researchers were actively involved in conducting the research. They were trained in research methods, designed the questionnaire, undertook the fieldwork, analysed the data, helped produce the reports and summaries and disseminated the findings. Furthermore, members of three Older People's Groups took part in focus groups (N=120), which provided an opportunity for them to actively participate in the formulation of the research recommendations. In this presentation, Beryl Riley will talk about her experiences of being involved in this participatory research project from the perspective of an older volunteer. Beryl discusses the difficulties associated with interviewing in rural areas, the benefits of face-to-face interviews and the achievements of the project. Vanessa Burholt explores the benefits for other stakeholders and concludes with an argument for emancipatory gerontological research.

PARTICIPATORY RESEARCH ON QUALITY OF LIFE IN DEMENTIA: ADVANTAGES OF A NEW APPROACH TO IMPROVE RESEARCH

M. Martin, H. Schelling, C. Moor, *University of Zurich, Zurich, Switzerland*

In a three-year project aiming at measuring the quality of life in individuals with dementia living at home, we applied a participatory roundtable procedure. The study with 97 affected individuals and their care network was planned, conducted, and interpreted jointly by relatives, practitioners, and researchers. It did lead to a number of improvements in research quality. The group developed new theoretical models of the active management of dyadic quality of life in progressing dementia, developed new observation measures to be used by the relatives, improved access to the study population and increased validity of data interpretation. The key elements of the roundtable procedure, the main theoretical propositions, findings, and recommendations for aging research in general will be presented.

INVOLVING OLDER PEOPLE IN RESEARCH IN GERMANY

E. Schnabel, *Institute of Gerontology at Technical University of Dortmund, Dortmund, Germany*

On the background of demographic change and the ageing society, a high demand for research on older people in different fields can be stated in Germany. Within the policy shift towards more participation and user involvement in order to ameliorate public services, technologies and products for older people, more and more studies focus older people not only as objects of research, but as experts to be involved in the research process. A lot of instruments, e.g. user surveys, participatory strategies or senior research groups have been implemented since. The presentation will give an overview over current developments in different fields of research (health and care sector, products and technologies for older people) and will also raise methodological issues.

AUSTRALIAN RESEARCH INVOLVING OLDER PEOPLE

H. Kendig¹, J. Warburton², M. Carroll¹, H. Bartlett³, P. Matwijiw⁴, 1. *Faculty of Health Sciences, University of Sydney, Concord, New South Wales, Australia*, 2. *La Trobe University, Albury, Victoria, Australia*, 3. *Monash University, Melbourne, Victoria, Australia*, 4. *National Seniors Association, Canberra, Australian Capital Territory, Australia*

This paper explores Australian experiences of involving older people in undertaking research that potentially influences both public policy and the way that older people are portrayed in the media. The paper draws on the authors' experiences, from both University and consumer peak body vantage points, to assess the value and potential pitfalls in conducting research involving older people. We present a guiding framework for involving older people in community-based research. The guidelines are based on six fundamental principles: to acknowledge research as a process; clarify roles and levels of involvement; communicate effectively; recognise different expectations; and ensure both representativeness and diversity. This work was undertaken by the ARC/NHMRC Research Network in Ageing Well and the Australasian Centre on Ageing in partnership with National Seniors Association. In presenting these guidelines, we consider some of the tensions between researchers, funders and older people and suggest ways to constructively address them.

SESSION 1235 (PAPER)

PATHWAY TO AND FINANCES IN RETIREMENT

ARE INDIVIDUAL ACCOUNTS-PENSION REFORMS RETRENCHING IN LATIN AMERICA?

E. Calvo Bralic¹, F.M. Bertranou², E. Bertranou³, 1. *Center for Retirement Research at Boston College, Chestnut Hill, Massachusetts*, 2. *International Labour Organization, Santiago, Chile*, 3. *Matrix Knowledge Group, London, United Kingdom*

In 1981, Chile initiated old-age pension reforms that introduced mandatory funded individual retirement accounts (IRAs) and moved away from public systems. During the 1990s, nine other Latin American countries followed in Chile's wake. In recent years, even before the onset of the financial crisis, a second round of pension reforms was initiated to strengthen the public component and address the problems created by individual accounts. This article addresses whether IRA pension reforms are retrenching in Latin America. Although the idea is provocative, we conclude that the concept of "retrenchment" alone is insufficient to characterize the new politics of old-age pension reform. As opposed to the politics of the 1980s and 1990s, pension reform in Latin America in recent years has combined retrenchment with improvement of IRAs. With the exception of Argentina, which has re-nationalized its pension system, the magnitude in the second round of reforms seems to be less radical compared to the path-breaking changes introduced by the first round. The dominant policy prescriptions in vogue during the first round of reforms in Latin America have been clearly re-evaluated. The World Bank and other organizations that promoted IRAs have recognized that more attention should be paid to poverty reduction, coverage and equity, and to protect participants from market risks. The experience faced by countries that introduced IRAs, the changes in international financing institutions policies, and the recent financial volatility and heavy losses experienced in financial markets have tempered the enthusiasm of other countries from applying the same type of reforms.

ALTERNATIVE PATHWAYS TO RETIREMENT IN KOREA

J. Chang^{1,2}, L. Wu¹, H. Lee¹, 1. *Korea Labor Institute, Cresskill, New Jersey*, 2. *New York University, Visiting Scholar, New York, New York*

In this paper, we examine the Korean paradox of high levels of labor market participation among older Korean workers. In spite of relatively early ages at mandatory retirement and even earlier ages at actual retire-

ment, the Korean labor market is also characterized by high labor participation rates at older ages, with Korean labor force participation at later ages among the highest of OECD nations. Self-employment may play a key role in the labor force participation of older workers, with previous research documenting high levels of self-employment among mid-career workers (Chang 2003) and longer spells of employment among the self-employed compared to their salaried counterparts (Shin 2009). We use data from the Korean Longitudinal Study of Ageing to examine the transitions of salaried workers to self-employment or to retirement using a competing risk framework. Of particular interest are the labor force transitions of retirement-age workers during the Korean economic recession of 1997. We use a competing-risk framework to compare the transitions of retirement-age of Korean workers into retirement or to a different salaried job, and to compare such workers with those remaining in the workforce past the usual ages of retirement. Because salaried jobs in the Korean labor market are characterized by exclusive and hierarchical characteristics, we will examine if such "push" factors play a more important role in retirement decisions than "pull" factors such as the widespread but declining availability of self-employment. Overall, our analyses provide important clues to understanding why self-employment remains prevalent in the older Korea population during a 20-year period in which self-employment and the small business market has become a smaller part of the Korean national economy.

SOCIAL SECURITY REFORM: WOULD THE ADDITION OF A NOTIONAL DEFINED CONTRIBUTION PILLAR MAKE SENSE?

P. Yu, J. Williamson, *Boston College, Chestnut Hill, Massachusetts*

The current financial crisis has re-awakened the public's discussion about relying on the combination of traditional Social Security benefits and a 401(k) plan to support their retirement. Most analysts agree that some changes do have to be made relatively soon to make Social Security financially sustainable in the decades ahead, but there is also a need to reduce the number of workers left with inadequate economic resources during their retirement years. One reform option that has not been given adequate consideration for the United States is the addition of a Notional Defined Contribution (NDC) component. In several countries (Sweden, Poland, Latvia, etc.) a pillar based on the NDC model has been added as one component of a multi-pillar scheme and preliminary reports suggest that the approach is being well received. This paper describes the NDC model including its strengths and limitations. It discusses how it could be integrated into the current U.S. Social Security program. Then a comparison is made with two other alternative models, (1) the current combination of social security and voluntary 401(k) plans and (2) the proposed partial privatization of Social Security. Evidence drawn from other countries that have introduced NDC pillars to supplement their public defined benefit scheme suggests that this alternative has a number of advantages over the other two alternatives. The NDC model is a better alternative, but it is not a silver bullet.

DEMOGRAPHY IS NOT DESTINY NOR IS IT A SOUND RETIREMENT STRATEGY: AN ANALYSIS OF TARGET DATE FUNDS

D. Gray, *Gerontology, University of Massachusetts Boston, Arlington, Massachusetts*

The combination of increasing life expectancy, concerns about insolvency of government managed pay-as-you-go programs, and the shift from defined benefit (DB) to defined contribution (DC) retirement savings vehicles has resulted in workers being more responsible for their financial security in retirement than ever before. Poor choices and lack of choice (inertia) on the part of workforce participants have contributed to inadequate levels of retirement savings. To address this issue, Congress passed the Pension Protection Act of 2006 (PPA). The legislation provided for automatic enrollment of employees in employer-sponsored retirement plans, automatic escalation of contributions, and qualified

default investment alternatives (QDIAs). This study evaluated the potential for target date funds (the current QDIA option) to provide income security. Two other options, customized target date funds and Treasury Inflation Protected Securities were analyzed. With their customized contribution rates, automatic escalation of contribution rates and greater diversification of funds the major finding was that Policy Option II, Customized target default funds would be the optimal choice of QDIA.

SESSION 1240 (SYMPOSIUM)

PROMOTING COGNITIVE HEALTH: A FORMATIVE RESEARCH COLLABORATION OF THE HEALTHY AGING RESEARCH NETWORK

Chair: J.N. Laditka, *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*

Discussant: W. Satariano, *University of California at Berkeley, Berkeley, California*

Growing evidence suggests healthy lifestyles may help maintain cognitive health, reducing risk of developing Alzheimer's disease and related disorders. The Healthy Aging Research Network (HAN), a group of 9 universities working collaboratively with their communities and the Centers for Disease Control and Prevention, is conducting formative research to design public health interventions promoting cognitive health. In 2005, the HAN began a four-year project to investigate: attitudes about healthy aging and cognitive health; language used to describe these issues; and attitudes about behaviors that have been associated with cognitive health. We examined the literature on promoting cognitive health, convened a national research meeting of experts in cognitive health and public health interventions, identified research questions, developed common focus group protocols, recruited and conducted focus groups, and analyzed resulting data. In 2006-2007, we conducted 80 focus groups and in-depth interviews with 614 participants at locations throughout the United States. Focus groups were in English, Spanish, Mandarin, Cantonese, and Vietnamese, and represented African Americans, American Indians, Asian Americans, Hispanics, non-Hispanic whites, caregivers, physicians and other health providers, and individuals with cognitive impairment. Each participant also completed a survey, with demographic and other information. This symposium provides selected results, focused on how people describe others with or without cognitive decline, concerns about memory and thinking, and beliefs about how to maintain our brains. The data provide a wealth of opportunities for better understanding healthy aging in the cognitive health context, and for designing effective public health interventions to promote cognitive health among diverse populations.

"MEDIA FOCUS ON ALZHEIMER'S AFTER THE LOSS": DIVERSE OLDER ADULTS' IDEAS ON KEEPING A HEALTHY BRAIN

D.B. Friedman¹, S.B. Laditka², J.N. Laditka², B. Wu³, R. Liu⁴, A.E. Mathews¹, W. Tseng⁵, S.J. Corwin¹, 1. *Health Promotion, Education, and Behavior, University of South Carolina, Columbia, South Carolina*, 2. *University of North Carolina at Charlotte, Charlotte, North Carolina*, 3. *University of North Carolina at Greensboro, Greensboro, North Carolina*, 4. *Epidemiology & Biostatistics - University of South Carolina, Columbia, South Carolina*, 5. *University of California, Berkeley, Berkeley, California*

Evidence suggests physical activity, heart-healthy diets, and social involvement may help maintain cognitive health. This focus group research examined diverse older adults' (50+, n=396) opinions on how to stay mentally sharp. We conducted thematic analysis of 42 focus groups, representing African Americans, American Indians, Chinese Americans, Latinos, non Hispanic whites, and Vietnamese Americans. All groups mentioned benefits of social involvement. Structured exercises (e.g., yoga) and leisure activities (e.g., gardening) were recommended. Chinese and Vietnamese participants suggested mental exer-

cises (e.g., puzzles), keeping a positive attitude, and the connection between physical and cognitive health. Chinese and American Indians recommended healthy diets. African Americans emphasized fruits and vegetables. Latinos stressed portion control. Participants' opinions reflect the growing science base on cognitive health promotion, but did not often include regular aerobic activity, which substantial evidence links with cognitive health. Cognitive health messages and interventions need to consider attitudes and beliefs of diverse populations.

'I JUST WANT TO BE SHARP ALL THE REST OF MY LIFE.' COGNITIVE CONCERNS IN AGING

J.N. Laditka¹, S.B. Laditka¹, R. Liu³, S. Corwin³, A.E. Mathews², B. Wu⁶, R. Hunter⁵, J. Sharkey⁴, 1. *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*, 2. *Furman University, Greenville, South Carolina*, 3. *University of South Carolina, Columbia, South Carolina*, 4. *Texas A&M, College Station, Texas*, 5. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 6. *University of North Carolina at Greensboro, Greensboro, North Carolina*

A greater understanding of concerns about cognitive health is useful for developing effective health communications. This focus group research examined diverse older adults' perceptions about cognitive concerns. We conducted thematic analysis of 42 focus groups (n=396, ages 50+), representing African Americans, American Indians, Chinese Americans, Latinos, non Hispanic whites, and Vietnamese Americans. Among other questions, we asked, "Tell us about any concerns you may have about your ability to keep your memory or ability to think as you age." The most prominent concerns in all groups except Latinos were forgetfulness (keys, names), memory loss, and Alzheimer's disease. Concerns about social isolation and loneliness were voiced more by American Indians and Vietnamese Americans. Groups expressed shared concerns about: social impact and family burdens, cognitive challenges of multi-tasking, fear and feeling helpless, effects of aging on social interactions. Findings suggest opportunities for public health messages to promote health behaviors that support cognitive health.

'THERE'S NORMAL DEMENTIA AS YOU GET OLDER, ISN'T THERE?' DESCRIPTIONS OF MEMORY LOSS

S.B. Laditka¹, J.N. Laditka¹, R. Liu², A.E. Mathews⁵, B. Wu³, D.B. Friedman², L.L. Bryant⁴, S. Corwin², 1. *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*, 2. *University of South Carolina, Columbia, South Carolina*, 3. *University of North Carolina at Greensboro, Greensboro, North Carolina*, 4. *University of Colorado, Denver, California*, 5. *Furman University, Greenville, South Carolina*

Understanding how older people describe memory loss and brain health can help develop effective health communications. We examined how people describe those with and without cognitive impairment, conducting thematic analysis of 42 focus groups (n=396, ages 50+) of African Americans, American Indians, Chinese Americans, Latinos, non Hispanic whites, and Vietnamese Americans. Among other questions, we asked: "What words do you use to describe older people who have a loss of memory or thinking ability?" "What words do you use to describe older people who do not have a loss of memory or thinking ability?" When describing people with memory loss, African Americans and whites most often used "Alzheimer's" and "senile." Most groups used "dementia," "senior moment," or "slow thinking," and said forgetfulness characterized memory loss. Older people without memory loss were described as "sharp," "alert," or "active." Findings suggest terms for use in public health messages to promote brain health.

“IS MY MIND ON OVERLOAD BECAUSE OF BEING A CAREGIVER?” COGNITIVE HEALTH AMONG DEMENTIA CAREGIVERS

S.B. Laditka¹, W. Tseng², A.E. Mathews⁶, B. Wu⁵, S.L. Ivey², D.B. Friedman³, R.L. Beard⁴, R. Liu³, 1. *Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina*, 2. *University of California at Berkeley, Berkeley, California*, 3. *University of South Carolina, Columbia, South Carolina*, 4. *Holy Cross, Worcester, Massachusetts*, 5. *University of North Carolina at Greensboro, Greensboro, North Carolina*, 6. *Furman University, Greenville, South Carolina*

Providing care to people with dementia is stressful emotionally and physically. This focus group research examined perceptions about cognitive health among caregivers of people with dementia. We conducted thematic analysis of 10 focus groups, representing African Americans, Filipinos, and non Hispanic whites (n=81, mean age=59); most were providing care to a spouse or parent. Among other questions, participants were asked: Is there anything about being a caregiver that concerns you when it comes to the health of your own brain? Whites emphasized concerns due to policies and laws (e.g., power of attorney, social security), and other family members being in denial and not providing help. African Americans and whites described lack of support from physicians. Filipino caregivers stressed concerns related to safety of the care recipient, and the need for caregiver rest and to reduce caregiver stress. Public health messages need to include ways to promote cognitive health among caregivers.

SESSION 1245 (POSTER)

BS POSTER SESSION III - FACE-TO-FACE TIME: 2:30 PM – 4:00 PM

IS MORTALITY RATE INCREASED IN A FRAIL MOUSE MODEL?

F. Ko, H. Yang, M. Zauher, J.D. Walston, *Division of Geriatrics and Gerontology, Johns Hopkins University, Baltimore, Maryland*

Background. Frailty in older adults is characterized by elevated serum IL-6, weakness, weight loss, and is predictive of mortality. The genetically altered IL-10tm/tm mice develop inflammation and early strength decline similar to frail humans. Therefore, we hypothesized that mortality is higher in IL-10tm/tm mice than C57BL/6J controls. Methods. Three months old age- and gender-matched IL-10tm/tm (25 males, 25 females) and C57BL/6J mice (25 males, 25 females) were longitudinally monitored for a total of 103 weeks. Incident mortality rate in each group was calculated as the number of mice that died over the total time in weeks at risk. Kaplan-Meier estimates of the survival function were calculated at times when death occurred. The log-rank test was used to compare survival curves in both groups of mice. Results. The first IL-10tm/tm mouse died at 43 weeks of age, compared to 61 weeks in C57BL/6J control. Twenty-seven IL-10tm/tm mice died by the conclusion of the study compared to 12 in C57BL/6J mice. The incident mortality rate ratio between the strains was 2.64 (95% CI: 1.29, 5.71). The Kaplan-Meier survival estimates demonstrated better overall survival in the C57BL/6J mice by log-rank test (p value < 0.001). Preliminary necropsy reports indicated that sinus and pulmonary infections were a leading cause of mortality. Conclusion. The IL-10tm/tm frail mouse has an earlier onset of death and higher mortality compared to C57BL/6J control strain, consistent with observations in frail older adults. Respiratory infections may be an important cause of this early mortality. Further biological characterization of this frail mouse model may help elucidate mechanisms of late life vulnerability.

DO STRUCTURAL MRI ANALYSES SHOW EVIDENCE FOR COGNITIVE RESERVE IN THE HEALTHY AGING BRAIN?

A.M. Peiffer, C.E. Hugenschmidt, J. Mozolic, P.J. Laurienti, *Radiology, Wake Forest University School of Medicine, Winston-Salem, North Carolina*

Number of years of education is an indicator of the cognitive reserve available as one ages. Increased education is also related to higher scores on several cognitive measures including the Digit-Symbol Substitution Task and Mini-Mental Status Exam. Behavior on these measures has been correlated to a variety of magnetic resonance imaging (MRI) structural measures, and in general, older adults also show several structural differences in their brain. In a recent study of 16 young (age: 18-39 years) and 16 older (age: 65-90 years) adults, young had greater fractional anisotropy than older adults throughout anterior white matter, which has been related to increased fluid intelligence and faster processing speed. Also, young had greater gray matter volume than older adults in several structures involved in the default mode network, a network known to deactivate more in younger than older adults during goal-directed behavior. Finally, young had greater perfusion than older adults in several structures including anterior and posterior cingulate and bilateral hippocampus. When perfusion results were correlated with years of education (age included as covariate), a weak positive correlation was evident in the left frontal cortex and right anterior cingulate. A follow up investigation is currently under way to assess the relationship between years of education and resting-state perfusion in a group of 140 healthy adults (young = 39 and old = 91).

DOES DIETARY INTAKE OF ANTIOXIDANTS CONTRIBUTE TO CHANGE IN MUSCLE STRENGTH AMONG OLDER PERSONS?

B. Bartali¹, S. Kritchevsky², A.B. Newman³, T. Harris⁴, M. Koster A. Cesari^{8,5}, D. Tykavsky F. Sellmeyer^{9,7}, N. Lee JS De Rekeneire^{6,1}, T. Allore H. Gill¹, 1. *Yale University, New Haven, Connecticut*, 2. *Wake Forest University School of Medicine, Winston-Salem, North Carolina*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *National Institute of Aging/NIH, Bethesda, Maryland*, 5. *Università Cattolica del Sacro Cuore, Roma, Italy*, 6. *University of Georgia, Athens, Georgia*, 7. *University of California San Francisco, San Francisco, California*, 8. *Universiteit Maastricht, Maastricht, Netherlands*, 9. *University of Tennessee Health Science Center, Memphis, Tennessee*

Introduction: The decline in muscle strength that occurs with aging represents a major risk factor for the development of frailty and disability in older persons. However, the preventive role of dietary antioxidants on age-related decline in muscle strength is unclear. The purpose of this study was to determine whether antioxidants intake is associated with change in muscle strength among community-living older persons. Methods and Materials: A food-frequency questionnaire was administered by trained interviewers to assess dietary intake of energy and nutrients, including the two main antioxidants vitamins C and E, in men and women aged 70-79 years enrolled in the Health, Aging, and Body Composition study. Grip strength was measured at baseline and the 2-year follow-up using an isometric dynamometer. The final analytical sample included 2105 persons. Results: The mean daily dietary intake of vitamins C and E was 144.8 (SD=76.7) mg and 11.04 (SD=6.8) mg, respectively. Using a general linear model adjusted for age, gender, race, body weight, physical activity and energy intake, we found a significant association between dietary intake of vitamins C (Beta=0.004, p=0.030) and E (Beta=0.059, p=0.007) at baseline and subsequent change in muscle strength (kg) over 2 years. Furthermore, the effect of these antioxidants on change in muscle strength did not depend on the initial level of muscle strength (Vitamins C/E*muscle strength at baseline; p>0.10). Conclusions: Dietary intakes of vitamins C and E are positively associated with muscle strength. These results suggest that dietary intake of antioxidants may play an important role in preserving muscle function in community-living older persons.

SMALLER CARDIOMYOCYTE SIZE AND REDUCED COLLAGEN CONFERS LONGEVITY BENEFIT IN THE HEARTS OF AMES DWARF MICE

S.A. Helms¹, G. Azhar^{2,1}, C. Zuo^{1,2}, S. Theus², A. Bartke³, J.Y. Wei^{1,2}, *1. University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Health Services and Geriatrics and Extended Care, GRECC, Little Rock, Arkansas, 3. Southern Illinois University, Springfield, Illinois*

Purpose: To test the hypothesis that cardiac morphologic differences between Ames dwarf and wild-type littermates might correlate with the increased longevity in the Ames dwarf mice. **Methods:** Hearts from young adult (5-7 mo) and old (24-28 mo) Ames dwarf and wild-type littermates underwent histological and morphometric analysis. Measurements of cell size, nuclear size, and collagen content were made using computerized color deconvolution and particle analysis methodology. **Results:** In the young age group, mean cardiomyocyte area was 46% less in Ames dwarf than in wild-type mice ($p < 0.0001$). Cardiomyocyte size increased with age by about 52% in the wild-type mice and 44% in the Ames dwarf mice ($p < 0.001$). There was an age-associated increase in the cardiomyocyte nuclear size by approximately 50% in both the Ames and wild-type mice ($p < 0.001$). The older Ames dwarf mice had slightly larger cardiomyocyte nuclei compared to wild-type (2%, $p < 0.05$). The collagen content of the hearts in young adult Ames dwarf mice was estimated to be 57% less compared to wild-type littermates ($p < 0.05$) but there was no significant difference at 24 months. **Conclusions:** In wild-type and Ames dwarf mice, nuclear size, cardiomyocyte size, and collagen content increased with advancing age. While cardiomyocyte size was much reduced in young and old Ames dwarf mice compared with wild-type, collagen content was reduced only in the young adult mice. These findings suggest that Ames dwarf mice may receive some longevity benefit from the reduced cardiomyocyte cell size and a period of reduced collagen content in the heart during adulthood.

(G/A) TNF-ALPHA GENE POLYMORPHISM AND RISK OF DEPRESSION LATE IN THE LIFE

G. Annoni¹, A. Cerri¹, B. Arosio², C. Viazoli², R. Confalonieri¹, F. Teruzzi¹, C. Vergani², *1. Internal Medicine, Università Milano-Bicocca, Monza, Italy, 2. Department of Internal Medicine, U.O. Geriatrics, Ospedale Maggiore Policlinico, Mangiagalli e Regina Elena, Fondazione IRCCS, Milan, Milano, Milano, Italy*

Background: major depression (MD) has been indicated as a promoting factor for Alzheimer's Disease (AD). Inflammation plays a key role in the mechanisms underlying both these pathologies. In particular, single nucleotide polymorphisms (SNPs) in cytokines genes, that are responsible for protein levels, have been associated with neurodegeneration and its clinical evolution. In our experience, SNPs in IL-10(-1082 G/A), IL-6(-174 G/C) and TGF-beta1(+10 T/C) genes were considered risk factors for AD; while A allele carriers of -308 G/A SNP in TNF-alpha gene showed an earlier age at onset than non-carriers. The aim of this study was to investigate possible association between late-onset MD and cytokine genes, to confirm if their genetic variants are involved in the disease. **Methods:** 50 subjects (age range 65-85) were recruited, after screening with Geriatric Depression Scale (GDS ≥ 15) and Mini-Mental State Evaluation (MMSE ≥ 24). The -1082(G/A) IL-10, -174(G/C) IL-6, +10(T/C) TGF-beta1, -308(G/A) TNF-alpha, +874(T/A) IFN-gamma SNPs were genotyped by SSP-PCR amplification. Control subjects were age-matched healthy volunteers, free from psychiatric illness or dementia. **Result:** We identified different genotype and allele distributions only for -308(G/A) TNF-alpha SNP, evidencing a higher percentage of GG genotype in depressed subjects (84% vs 68,3%; $p = 0.007$) and consequently of the G allele (92% vs 81,9%; $p = 0.05$). GG genotype raised the risk of developing MD (O.R. 2.433, C.I. 1.09-5.43). **Conclusion:** The investigated cytokine SNPs may have a different impact on neurodegeneration and MD. However, TNF-alpha

gene polymorphism may: 1) affect MD susceptibility; 2) be involved with a distinct role both in AD and MD development.

NOT ALL GENES WITH CLASSIC CARG ELEMENTS ARE DIFFERENTIALLY REGULATED BY SRF IN MOUSE HEARTS

X. Zhang¹, S.A. Helms¹, G. Azhar^{1,2}, J.Y. Wei^{1,2}, *1. Donald W Reynolds Department of Geriatrics, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Healthcare System, Little Rock, Arkansas*

Objective: The transcription factor serum response factor (SRF) regulates cardiac genes during development, maturation and aging. The age-related increase of SRF expression in senescence has been implicated in the altered gene expression in rodent hearts. Since SRF target genes are regulated by SRF, in addition to other transcription factors, we hypothesized that all SRF binding genes must have a significant role in the heart. **Methods:** We utilized affymetrix microarray to analyze the gene expression in a transgenic cardiac-specific mouse model which over-expresses wild-type SRF, in which the young adult heart resembles that of the typically aged heart. **Results:** We identified 207 cardiac genes that were differentially expressed in response to SRF regulation in vivo. We also analyzed 30 genes that were least affected by SRF overexpression. The promoter region (10,000 base pairs) of those genes was searched using bioinformatic software for the presence of multiple transcription factors binding sites that include cardiac muscle-related factors, SRF, GATA-4, Nkx2-5, MEF-2 and MyoD; forkhead transcription factors, TCF-1, NF-kappaB and YY1. We found that the classic SRF binding site (CARG element) was also found in 10 genes least affected by SRF over-expression. However, these 10 genes have not been reported to be important in cardiac physiology. **Conclusions:** The extent to which SRF target genes are regulated by SRF is dependent upon the physiological and pathological stress and tissue type. Hence, over-expression of SRF in the heart, might not impact all CARG containing genes which might not have significant relevance to cardiac structure and function.

NEGATIVE SIGNALING CONTRIBUTES TO THE ALTERED T CELL FUNCTIONS WITH AGING

T. Fulop, C. Fortin, *Research Center on Aging, Sherbrooke, Quebec, Canada*

Introduction: Aging is accompanied by a decrease in immune functions, called immunosenescence. The exact cause is still not known. Changes in T cell sub-populations, thymic involution were invoked. We have demonstrated that the signal transduction is altered with aging. In the present work we studied the negative regulatory molecules in the T cell signaling to explain the altered activation of T cells with aging leading to decreased clonal expansion. **Methods:** 25 healthy young and elderly subjects were studied. Lymphocytes were separated by Ficol-Hypaque. The molecules participating in the negative control loop of Lck were studied by Western blot and confocal microscopy. The surface expression of CTLA-4 has been studied by FACScan. The translocation of the molecules in the membrane lipid rafts (MLR) was also studied by Western blot. **Results:** We found that the phosphorylation of PAG was altered with aging explaining the decreased release of Csk from MLR and the decreased Lck activation. The activation of FynT was also altered. The phosphatase activity studies showed an increase in their activities with aging. The CTLA-4 expression was higher after stimulation in T cells of elderly. **Conclusion:** These results suggest that the negative regulation is preponderant in T cells with aging on the positive activation and as such explaining the defect in T cell functions with aging. This opens new therapeutic avenues in the future.

NEUROPROTECTION THROUGH INTERACTIONS BETWEEN MICROGLIA AND PROSTAGLANDIN RECEPTORS

N.G. Carlson^{1,2,4}, M.A. Rojas^{4,2}, J.W. Redd⁴, B.L. Wood^{4,2}, P. Tang^{4,2}, K.E. Hill^{4,2}, J.W. Rose^{3,4,2}, 1. GRECC, VA SLC HCS, Salt Lake City, Utah, 2. University of Utah, Salt Lake City, Utah, 3. VA SLC HCS Neurology, Salt Lake City, Utah, 4. VA SLC HCS Neurovirology Lab, Salt Lake City, Utah

There is an urgent need for therapies that promote neuronal survival for age-related neurodegenerative diseases. A promising area for potential new neuroprotective therapies may be directed at modulating components of inflammation in the brain that contribute to the injury of neurons. We have found that a resident inflammatory cell type in the brain, microglia, may protect neurons by changing how neurons respond to other inflammatory molecules called prostanoids. Prostanoids are made by the enzyme cyclooxygenase 2 (COX-2) and inhibitors of COX-2 can protect neurons. However, therapies utilizing COX-2 inhibitors are problematic because of cardiovascular complications associated with their use. As such, recent efforts have begun to identify targets down stream of COX-2 such as the prostanoid receptors. One such target is the EP1 receptor that binds to prostaglandin E2 (PGE2) and contributes to neuronal death. We have used a neuronal culture system to demonstrate that microglia can change how neuronal EP1 receptors contribute to neuronal death. We have also observed that microglia induce changes in distribution of EP1 expression in neurons that may contribute to neuronal viability. We hypothesize that microglia mediate neuroprotective effects through modulation of the EP1 prostaglandin receptor.

SESSION 1250 (SYMPOSIUM)

NUTRITION INTERVENTION, AGING AND CANCER

Chair: A.R. Heydari, Nutrition, Wayne State University, Detroit, Michigan

Over 70 years ago, McCay and his colleagues demonstrated that a reduction in food intake significantly increased both mean and maximum life span of laboratory rodents demonstrating the impact of food on phenotypes of aging and cancer. Recent studies demonstrate that alterations in components of food independent from caloric restriction could impact ageing and cancer. It has been proposed that alterations in the balance of stress response genes are the key factors in the effectiveness of functional food. For example, life-long methionine restriction in rodents has been shown to increase life span and inhibit age-related disease processes, while impacting oxidative stress. These findings, while controversial, have raised great excitement among researchers. Currently, "there are great opportunities for the expanded use of functional foods to achieve genetic potential and reduce the risk of disease; the real challenge is to identify the population who will benefit the most and identifying those who may be placed at risk with dietary intervention". In other words, there are genetic and environmental differences which precipitate into conditions impacting aging and disease. In this session, Dr. John Richie would discuss the impact of methionine restriction on aging and cancer; and Drs. Diane Cabelof and Eva Schmelz would present their findings on impact of folate and sphingolipids on aging and cancer. Dr. John Milner would conclude this session by presenting a seminar discussing challenges with regard to translational approach of the recent discoveries and identifying population in need.

SPONTANEOUS GENOMIC INSTABILITY IN THE AGING COLON: DNA REPAIR AND FOLATE

D. Cabelof, Wayne State University, Detroit, Michigan

Aging is a strong risk factor for development of colorectal cancer (CRC), with over 90% of diagnoses occurring in individuals over the age of 50. By an unknown mechanism, the aging colon becomes folate

depleted, and this does not appear to be a function of diet. Whether loss of colonic folates with age explains the age-related increase in CRC is an open question. Because chromosomal instability and copy number changes occur in sporadic CRC and in response to folate depletion, we have evaluated the impact of aging on spontaneous copy number variation in mouse colon. We find highly significant copy number changes in old colon as compared to young colon with near total overlap of regions between animals, suggesting a non-random mechanism of genomic instability. Copy number changes are one of the most frequent genomic aberrations seen in solid tumors, and to my knowledge this is the first observation that normal aging exhibits this phenotype. We are investigating the roles that DNA repair and p53 function may play in this process. Further, because folate depletion results in uracil accumulation in DNA we are investigating repair of uracil in the aging colon. We have found that uracil excision is strongly upregulated in the aging colon, and suggest that uracil is a critical initiator of genomic instability in the aging colon. Uracil excision is known to generate DNA double strand breaks, and we propose that poor resolution of uracil-derived double strand breaks in the face of p53 dysfunction facilitates copy number change.

REGULATION OF GENE EXPRESSION BY BIOACTIVE SPHINGOLIPID METABOLITES IN A MOUSE CELL MODEL FOR PROGRESSIVE OVARIAN CANCER

E.M. Schmelz, P.C. Roberts, Virginia Tech, Blacksburg, Virginia

Ovarian cancer is the most deadly gynecological malignancy with a survival rate of only 47%. It is mostly a disease of aging women and despite tremendous efforts to prevent or cure ovarian cancer, its incidence and high mortality has remained largely unchanged. There are no proven methods of early prevention, and chemotherapeutic agents often are highly cytotoxic and can cause severe side effects. We have generated novel mouse ovarian surface epithelial (MOSE) cell lines that mimic early stages of ovarian cancer that progress to intermediate and late stages upon continual passage in cell culture. Aberrant gene expression—identified by Affimetrix cDNA arrays—accompany the progression of these cells. Many of these genes affect the cytoskeleton, adhesion, metabolism and survival. The treatment of MOSE cells with non-toxic concentrations of sphingolipid metabolites can in many cases prevent or reverse the aberrant expression of these genes. This may be crucial for the suppression of MOSE tumor growth in vivo in immunocompetent mice, and for the development of a strategy using orally administered sphingolipids in the prevention and possibly treatment of ovarian cancer.

METHIONINE RESTRICTION AGING AND CANCER

J.P. Richie, Public Health Sciences, Penn State University College of Medicine, Hershey, Pennsylvania

Methionine restriction (MR), the feeding of a diet low in methionine, was found to extend mean and maximum life span by 40-50% in F344 rats. While MR is associated with decreases in body weight, pair-feeding and metabolic studies have indicated that the beneficial effects of MR are not due to a restriction in caloric intake. More recent studies have indicated that MR was also effective at increasing longevity in mice and drosophila, and at delaying or inhibiting a number of aging-related diseases and pathologies including cancer. Also, in the rat, MR dramatically reduced azoxymethane-induced colon carcinogenesis. Both in vitro and in vivo studies have indicated that the anti-aging properties of MR may be mediated, in part, by reductions in oxidative stress driven by decreased production of reactive oxygen species (ROS). Overall, these data indicate MR as an important new tool for anti-aging research with potential clinical implications.

OPPORTUNITIES AND CHALLENGES IN NUTRIGENOMICS, CANCER PREVENTION AND AGING

J.A. Milner, *Nutritional Science Research Group, National Cancer Institute, Rockville, Maryland*

Inappropriate dietary habits are implicated in the major causes of death of individuals living throughout the world. Chronic diseases, including heart disease and cancer, are intimately linked to aging, weight and the foods that are consumed. This presentation will focus on the use of nutrigenomics which includes nutrigenetics (genetic profiles that modulate the response to food components), nutritional epigenetics (influence of food components on DNA methylation and other epigenetic events and visa versa) and nutritional transcriptomics (influence of food components on gene expression profiles) and associated changes in proteomics and metabolomics for developing predictive models for evaluating the benefits and risk associated with dietary change. While many uncertainties exist about the precise role of diet in health, the use of “omic” technologies holds great promise in determining who will benefit most and who will be placed at risk from dietary change and the most appropriate timing for intervention.

SESSION 1255 (SYMPOSIUM)

CAREGIVING IN CONTEXT: INDIVIDUAL AND RELATIONAL DIFFERENCES IN THE CAREGIVER EXPERIENCE

Chair: C.W. Sherman, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Providing care for an aging relative is an increasingly common, even inevitable, experience for spouses and adult children. While family caregiving has been recognized as a significant stressor on family members, contributing to increased isolation, depression, physical and emotional difficulties and even morbidity, we are increasingly sensitive to the fact that the experience and effects of providing care for a family member vary by individual (e.g., gender) and contextual factors (relationship type and quality). In this symposium, we bring together four papers which highlight new insights into the family caregiving experience. Sorensen and Pinquart present findings from their large-scale meta-analysis of caregiving literature to describe key differential effects of caregiving on spouse and adult children's well-being. Next, Haley, Roth, Wadley, Clay and Howard examine how caregiving strain differentially contributes to increased spouse caregiver risk of stroke by gender and race. Third, Blieszner and Roberto focus on interview data to reveal the effects of gender on coping with the early stages of care by family members for a relative with mild cognitive impairment. Last, Sherman examines positive and negative social support networks and care experiences among late-life remarried wives who are caregiving for husbands with Alzheimer's disease. Finally, symposium discussant, Calasanti, explores the ways in which the findings presented shed light on how gender, role history and identity shape the caregiving experience, and how awareness of contextual factors can contribute to tailoring future caregiver interventions.

THE ROLE OF GENDER IN COPING WITH MILD COGNITIVE IMPAIRMENT

R. Blieszner, K.A. Roberto, *Human Development, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Gender shapes life experiences and influences responses to significant life challenges. We assessed the effects of gender on the pre-caregiving “care partner” stage of assisting a relative with mild cognitive impairment (MCI) using interview data from 17 male and 17 female care partners from a larger sample (matched on key demographic characteristics including relationship status and living arrangements). Examples of the coding categories analyzed were care partner's role and role changes, coping, interaction dynamics, household responsibilities, inti-

macy, managing MCI, and social support. Results are presented in terms of gender similarities and differences on eight themes that emerged from the analysis: effects of care partner role on personal identity, willingness to solicit help, emotion regulation, external engagement, coping with worry, and relationship history. The findings reveal the complexity of responses to MCI and of strategies for managing MCI, and point to interventions that could assist care partners.

COMPLEX CARING: DEMENTIA SPOUSE CAREGIVING IN THE CONTEXT OF REMARRIAGE

C.W. Sherman, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Families are increasingly heterogeneous, as reconstituted structures are more common across the life span. While such trends influence aging issues, such as family caregiving, most caregiver research has not accounted for Americans' more complex marital and family histories. Findings from a study of 50 late-life remarried Alzheimer's wife caregivers are presented. Examination of structure and quality of social relations and positive and negative support networks suggest traditional sources of support (close family members) provide minimal assistance in caregiving duties and responsibilities to these caregivers, while adult stepchildren play a preponderant role in negative support networks. Remarried wife status and gender may contribute to reported lack of support. Salient qualitative themes reveal that for many remarried caregivers, stepfamily structures are associated with a lack of involvement, trust and increased suspicion concerning the motivations of the spousal caregiver. Potential avenues for targeted interventions for this potentially vulnerable population of caregivers are discussed.

CAREGIVING STRAIN AND ESTIMATED RISK FOR STROKE AND CORONARY HEART DISEASE AMONG SPOUSE CAREGIVERS: DIFFERENTIAL EFFECTS BY RACE AND GENDER

W.E. Haley¹, D. Roth², G. Howard², M. Safford², *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Participants in the REasons for Geographic and Racial Differences in Stroke (REGARDS) study who were providing in-home caregiving assistance to a disabled spouse reported on caregiving strain, depressive symptoms, social support, education, and age, and were evaluated on the Framingham Stroke Risk (N=716) and Framingham CHD Risk (N=607) scales of estimated 10-year disease risk. Caregiving strain was associated with a 23% higher covariate-adjusted estimated stroke risk (11.06% for caregivers with no strain versus 13.62% risk for high strain caregivers). This association was stronger in men, particularly African American men. African American men with high caregiving strain had a 26.95% estimated 10 year stroke risk. Caregiving strain was not associated with CHD risk scores. Caregiving strain is significantly associated with higher estimated stroke risk, with greatest effects for men, particularly African American men, providing highly stressful caregiving to their wives.

THE EFFECTS OF CAREGIVING ON SPOUSES AND ADULT CHILDREN: A META-ANALYTIC COMPARISON

S. Sorensen¹, M. Pinquart², *1. Psychiatry, University of Rochester School of Medicine and Dentistry, Rochester, New York, 2. University of Marburg -Psychology, Marburg, Germany*

The number of family, friends and neighbors providing care to persons 65+ who need assistance with everyday activities has reached 6 - 7 million. A quarter of caregivers are spouses while the rest are adult children, grandchildren, other relatives, or friends. Spouses account for about 62% of primary caregivers, but only 16% of secondary caregivers. First, we will review the ways in which caregiving is a chronic stressor that places caregivers at risk for physical and emotional problems. Then we will report findings from a meta-analysis of 141 studies

published between 1983 and 2009, comparing spouses and non-spouses. Spousal caregivers are significantly more likely to report depression symptoms, and less likely to report uplifts of caregiving. They report less social support, lower income, less employment, more hours of caregiving, but fewer CR behavior problems. Additional analyses will evaluate the relation of external stressors to levels of distress among caregiving spouses.

SESSION 1260 (POSTER)

CROSS NATIONAL

PREDICTORS AND CONSEQUENCE OF HEALTH BEHAVIORS: TESTING THE ANDERSEN MODEL USING KLOSA

S.K. Kahng, K. Boo, *Department of Social Welfare, Seoul National University, Seoul, Korea, South*

In the year of 2006, the Korean government launched “Korean Longitudinal Study on Aging (KLOSA),” which is similar to the Health and Retirement Study and is the first nationally representative data on Korean elderly. Due to the lack of data, little is known about the characteristics of Korean elderly and much less is known about their health status and behaviors. Following the propositions of the Andersen Model (Andersen, 1995), this study examines the predictors and consequences of health behaviors using Structural Equation Modeling (SEM). Pre-disposing predictors include age, gender, and education. Enabling predictors include income, informal social networks, and formal social networks. Need predictors include chronic health conditions and pains. Health behaviors include days in a hospital, numbers of doctor visits, and exercise. Consequence variable is depression. Samples consist of 10,254 adults age 45 and over who participated in the first wave of KLOSA. All fit index indicate that the model fits the data well. Results indicate that (1) outpatient medical service uses are correlated with age(+) and chronic health conditions(+); (2) inpatient service uses are correlated with male gender(+), informal social networks(-), and pains(+); (3) exercise is correlated with age(+), education(+), income(+), informal social networks(+), formal social networks(+), chronic health conditions(+), and pains(-); (4) all three health behavior variables were significantly associated with depression – inpatient service use(+), outpatient service use(+), exercise(-). In addition to introducing KLOSA, the meaning of findings, the findings of mediational paths, and implications for future research and practice will be discussed.

LONG-TERM CARE AND SOUTH ASIAN ELDERLY AMERICANS

I. Amin, S.S. Jesmin, *University of Louisiana at Monroe, Louisiana, Louisiana*

As the minority population is aging in the United States, ethnically-specialized long-term care facilities and care giving have become an increasing focus of research. Compared to other ethnic groups, little is known about how the South Asian American families (Bangladeshis, Pakistanis, and Indians) are dealing with the challenge of providing long-term care for their elderly. Although filial piety is a strong value in Asian culture, for many second generation or third generation Asian Americans it is quite a challenge to provide informal care to their parents when they are dual earner couples and acculturated to the mainstream culture. The objectives of this study were to understand: for South Asian Americans what is the need for long-term care? Where do they receive long-term care and from whom? What role does the family and informal caregivers play? How much are they dependent on home and community-based care or nursing home care? What is their attitude toward formal long-term care? And finally who pays for it? Data were collected from 200 South Asian families. The sample was selected through purposive sampling technique. Descriptive statistics and multivariate regression analysis were conducted to analyze the results. Addi-

tionally, 10 case studies were done to explore the major long-term care issues for this community. This study demonstrates a growing need for ethnically-specific and culturally sensitive long-term care facilities for the South Asian elderly.

RISK ASSESSMENT: CULTURAL PRACTICES IN PACIFIC ISLANDER, AFRICAN AMERICAN AND ASIAN AND HEALTHY AGING

M.E. Davis, H.F. Vakalahi, E.S. Ihara, *Social Work, George Mason University, Fairfax, Virginia*

A comparative analysis of cultural practices and beliefs, of Pacific Islanders, African Americans and Asians using a risk assessment model to evaluate cultural practices that may serve as risk or protective factors. Implications for healthy aging and positive health outcomes will be explored. Cultural practices, and beliefs are integral components of high quality health care. (Kilbourne, et al. 2006). They impact patient preferences, health beliefs and interventions. This paper features a comparative analysis of cultural practices that impact health care in African Americans, Pacific Islanders and Asians. What is unique is these cultural practices are viewed from a risk assessment perspective. Cultural practices have their basis in helping groups adapt to their environment. When population groups move outside their country of origin, many cultural practices, traditions and values can become maladaptive. These same cultural practices can become risk factors, if they pose an obstacle to receiving health care or block compliance with treatment to improve health outcomes. Elderly African Americans, Asians and Pacific Islanders along with those of other ethnic groups tend to have a stronger adherence to cultural practices. They play an integral role in intergenerationally transmitting these practices to the young. If however these beliefs, traditions, values and behaviors are in effect risk factors associated with poor health outcomes, efforts should be targeted toward moderating harmful cultural practices and promoting those that serve as protective factors. This paper explores criteria to identify cultural practices, beliefs and values that are associated with increased risk for negative health outcomes. These criteria can also identify cultural practices that can potentially protect against negative health outcomes. Examining cultural practices from a risk assessment perspective provides insights for intervention and healthy aging and the identification of practices that may be more transient and amenable to change

WHITE BLOOD CELL COUNT, SELF-RATED HEALTH, AND PHYSICAL PERFORMANCE AMONG OLDER JAPANESE

J. Liang¹, L. Nyquist², J.M. Bennett¹, A.E. Aiello¹, S. Shinkai³, Y. Fujiwara³, Y. Yoshida³, *1. Health Management & Policy, University of Michigan, Ann Arbor, Michigan, 2. Institute of Gerontology University of Michigan, Ann Arbor, Michigan, 3. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

There are few studies which integrate bio-measures with psychosocial variables in predicting how physical functioning evolves over time. This research examines the trajectories of physical performance among older Japanese with a focus on their linkages with white blood cell count (WBC) and self-rated health (SRH). Data came from the annual health examinations from 2002 to 2006 in Kusatsu in eastern Japan. The participants included 1,048 Japanese aged 60 or over with 2,405 observations. The dependent variables were measured by tests of hand grip strength, length of time standing on one leg, and usual and maximum walking speed. Nonfasting blood samples were collected from which WBC was obtained. SRH was indexed by a rating of health as excellent, good, fair, and poor. Hierarchical linear models with time-varying covariates were applied to examine changes in physical functioning over a period of up to 5 years. Linear as well as nonlinear trajectories were evaluated. Grip strength, one-leg stand, and walking speed all showed slight but significant linear decline over time. Women exhibited a lower level of functioning and a greater rate of decline. With age, gender, education, height, weight, and attrition adjusted, higher WBC was nega-

tively associated with walking speed (WBC 4th quartile, $b=-.035$, $p<.05$) and one-leg stand (WBC 4th quartile, $b=-3.110$, $p<.01$). In contrast, self-rated poor health was significantly associated with poorer grip strength ($b=-.447$, $p<.05$), one-leg stand ($b=-2.686$, $p<.001$), and usual walking speed ($b=-.045$, $p<.001$). In summary, trajectories of physical performance are significantly correlated with WBC and SRH.

DISPARITIES IN MENTAL HEALTH SERVICE USE AMONG ETHNIC MINORITY ADULTS

D. Jimenez^{1,2}, B. Cook², C. Chen², M. Alegria², 1. Dartmouth Medical School, Lebanon, New Hampshire, 2. Center for Multicultural Mental Health Research, Somerville, Massachusetts

The Institute of Medicine disparities definition, that disparities are all differences except those due to clinical need and preferences, is implemented to identify patterns of mental health service use in a multi-racial/ethnic older adult (age 50+) sample. We hypothesize that mental health service disparities exist between older non-Latino whites and older Latinos, Asians, African-Americans, and Afro-Caribbean. Pooled data from the Collaborative Psychiatric Epidemiological Studies, the most current and comprehensive national data source, is used. The World Health Organization Composite International Diagnostic Interview was used to identify the presence of lifetime and 12-month psychiatric disorders. Access to mental health treatment is defined as at least one visit in the past year to a specialty mental health or general medical provider for mental health or substance abuse issues. Results indicate considerable disparities in mental health care services between older Asians and older non-Latino Whites, even after adjustment for ethnicity, age (50-64), chronic conditions (2+), and income (\$15,000 - \$34,999). No service disparities were observed between African-Americans and Latinos, in contrast to Whites. Consistent with previous research (Miltiades and Wu, 2008), older Asians may disdain Western medicine and may resort to traditional Asian medicine to deal with their depression. Alternatively, Asian elders might be less likely to recognize their mental illness which might exacerbate disparities in care. The information gathered in this study may be used to develop programs to increase access to mental health services for Asian elders.

AGING IN GUATEMALA: AN ETHNOGRAPHY OF A LONG-TERM CARE FACILITY

M.A. Perkinson, Saint Louis University, St. Louis, Missouri

Guatemala's relatively young population (median age=19 years) is expected to undergo a sharp fall in fertility rate (from 5.2 in 1995 to 2.4 in 2025) and increase in life expectancy (from 65 years in 1995 to 75 years in 2025), putting it on track for an accelerated demographic and epidemiological transition similar to that of other developing countries (U.S. Census Bureau, International Data Base, 2008). Aging represents "one of the biggest challenges that Latin American and Caribbean societies face during the 21st century" (PAHO 2007). Guatemala currently directs its limited public health resources toward infants, children, and mothers. However, needs of Guatemalan aged are becoming more visible, reflected in growing numbers of "abandoned elders" in its few available residential care facilities. An ethnographic study of one long-term care facility in Antigua, Guatemala, based on participant observation, interviews, and life histories, describes decisions that led to placement and provides accounts of everyday life among its residents.

AN EXPLORATIVE STUDY IN PROMOTING THE QUALITY OF RETIREMENT LIFE OF THE COHORT BORN IN THE 1950S IN URBAN CHINA

J. Liang, Sociology and Gerontology, Miami University, Oxford, Ohio

China is now one of the most rapidly aging countries in the world. With an increasing number of post-retirement years expected, identifying ways to improve the quality of retirement life is an important issue. However, little research has been done on this topic. The first Chinese "baby-boomers" who were born in the 1950s are the parents of the first

only-child generation. This cohort is relatively healthy and well-off, and therefore has great potential to live a satisfying and meaningful post-retirement life. This study seeks to examine the challenges and practical needs associated with retirement among this cohort. 10 semi-structured, in-depth interviews were conducted in Xi'an City, Shannxi Province, China. Three major themes emerged from the data. Both current and prospective retirees expressed some shared concerns, although there are differences based on current family structure (empty nest vs. collocation). First, loneliness due to the shrinking social network after retirement was a problem. This situation was worsened for empty-nest families. Second, the feeling of meaninglessness directly related to the loss of work roles was commonly indicated. Desires for staying active through participation in some kind of informal work (part-time reemployment, volunteering) and maintaining personal growth in later life through life-long education were expressed. Third, parents living with their children were facing a monotonous time-use pattern (helping children with housework and taking caring of grandchildren). More senior centers and organized community activities for increasing the opportunities of individual leisure and social engagement were identified as urgent needs.

HEALTH AND AGING IN A CHINESE POPULATION: URBAN AND RURAL DISPARITIES

I.E. Chang¹, M. Simon², X. Dong¹, 1. Rush University, Chicago, Illinois, 2. Northwestern Medical Center, Chicago, Illinois

Background: China is the most populous country in the world, with over 900 million people currently living in rural settings. With the rapidly aging Chinese population, there are still vast gaps in our knowledge about health and aging in rural Chinese population. The objective of this study is to compare the rural and urban differences in sociodemographic characteristics, health conditions and psychosocial factors associated with aging in a Chinese population. Methods: Cross-sectional descriptive study of 135 rural and 269 urban subjects aged 60 years or greater was performed in a community-dwelling Chinese population. Variables collected included sociodemographic, medical comorbidities, health-related quality of life and psychosocial measures of depressive symptomatology, loneliness and social support. Findings: Rural subjects, compared with urban subjects, were significantly younger (70.4 ± 6.9 vs. 68.4 ± 6.3 ($T=2.76$, $df 402$, $p=0.006$)), more likely to be women (27.5% vs. 48.9% ($\chi^2[2]=18.14$; $df 1$, $p<0.001$)), and have lower education and income ($p<0.001$). Rural subjects also reported significant lower overall health status, lower quality of life, and worse change in recent health. In addition, rural subjects compared with urban subjects, had significant higher proportion of depressive symptomatology ($p<0.001$), feelings of loneliness ($p<0.001$) and lower levels of social support measures ($p<0.001$). Conclusion: In this older Chinese population, rural subjects had significant poorer characteristics of health and wellbeing. These differences in characteristics were found across sociodemographic, health-related quality of life and psychosocial measures. Future studies are needed to explore in-depth the social context of these findings. 3

COMMUNITY BASED APPROACH TO CARING FOR ELDERLY EMPTY-NESTERS IN CHINA

G.Q. Zhan¹, G. Guo², 1. psychology, Kennesaw State University, Kennesaw, Georgia, 2. Montgomery Blair High School, North Potomac, Maryland

The fast growing Chinese economy and changing views have brought many changes to people's lives, particularly family structure. For example, young people in rural areas migrate to cities for work, setting up nuclear families, whereas those in urban areas move into their own apartments after marriage, establishing nuclear families as well. As a result, the number of elderly empty-nesters has skyrocketed. One estimate puts it as high as 40% of all the elderly population. Clearly, this phenomenon is a far cry from the longstanding Chinese tradition of "Three Generations under One Roof" family structure. It has also created tremen-

dous challenges for families, community and society to explore effective ways to best serve these elderly people. This poster will report our systematic analyses of several types of community based programs in China. Our conclusion is that an effective and successful program needs to have most of the following components: 1) is initiated by the local government at the township level for rural areas and district level for urban areas; 2) recruits volunteers as caregivers from the same or nearby community; 3) sets up "pair systems" so the volunteers and the elderly people become bonded over the time; 4) provides physical care/help as well as companionship; and 5) actively seeks feedback from volunteers and the elderly people to improve the program.

EFFECTS OF CULTURE, AGE, AND PERCEIVED EXCHANGE OF SOCIAL SUPPORT RESOURCES ON SELF-ESTEEM

D.D. VonDras, *University of Wisconsin-Green Bay, Green Bay, Wisconsin*

This research examines how cultural orientation, age, and the perceived exchange of social support resources may moderate self-esteem in young, mid-life and older adults. As noted by Kim (1995) and others (e.g., Markus & Kitayama, 1991), acculturation processes lead to the development of a self in an individualistic culture that is discrete, independent, and abstract, whereas in a collectivist culture the self is embedded, ensembled, and situated within the social group. To investigate the influences of culture, age, and perceived exchange of social support resources on self-esteem, a survey was administered to 128 individuals in the United States ranging in age from 19 to 70 years, and 153 individuals in Japan ranging in age from 18 to 68 years. The survey included measures of self-esteem and the exchange of social support resources in the interpersonal contexts of significant other, family, friends, and co-workers. Results indicated lower self-esteem scores in the Japanese sample. Further, intra-cultural MRC analyses predicting self-esteem score revealed a significant contribution of the Age by Perceived Exchange of Social Support Interaction set in the Japanese sample, Change-in-R square = .06, $p < .05$. Within this variable set, the Age by Perceived Exchange with Friends Interaction was found to be the primary contributor, Beta = .34, $p < .008$. Similar MRC effects were not observed in the US sample. Overall, these findings suggest cultural variation in effects of age and perceived exchange of social support resources on self-esteem of adults in the United States and Japan.

THE GENDER GAP IN DEPRESSION AMONG ELDERS IN THE UNITED STATES AND JAPAN: SOCIAL SUPPORT AS A MEDIATOR OR CAUSE?

A. Tiedt, *Sociology, Fordham University, Bronx, New York*

The literature on aging and depression describes a consistent gap in depression between elderly men and women, with women reporting higher levels of depression overall. While complications with physical health resulting from female longevity have a direct correlation with mental well being, the role of social support as a mediating variable is ambiguous. This research examines the role of informal social support and its inverse state, isolation, in protecting or exacerbating depression among elderly men and women. Data was used from the Health and Retirement Study and the Nihon University Longitudinal Study of Aging. The cross-national context of this study lends insight into the relationship between cultural norms regarding gender, family support and elder health.

QUALITY OF LIFE IN URBAN NEPALI WOMEN - DOES CONTEXT MATTER?

S. Shrestha, S.H. Zarit, *Pennsylvania State University, University Park, Pennsylvania*

Social norms in Nepal prescribe that elders in families are cared for by younger family members. However, in recent years, a different social structure, old age home (OAH), has emerged in urban areas to accom-

modate the segment of the old population that does not receive care in the family. The establishment of OAH that provides shelter, food and support, which traditionally were functions relegated to family indicates a change in the social contract in caring for the elderly. The proposed study will compare quality of life of women living in Birdhaashram (OAH) (N=20) and women living with their families (N=21). The two groups were found to be significantly different in age, social support and activities of daily living (ADL), such that women living in OAH were older and had more difficulty with ADL than those living with families. Women who lived with their families reported higher levels of social support. Univariate analysis was used to examine the relation between the two groups (DV) and levels of quality of life (IV) reported. Age, social support, subjective health and ADL were used as covariates. The results show that quality of life of women who lived in OAH was significantly different compared to those who lived with their families with women in OAH reporting lower levels of quality of life after controlling for age, social support, subjective health and ADL.

SIMILARITIES AND DIFFERENCES IN DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS IN THE UNITED STATES AND EUROPE

B. Peyrot, M. Turner, *University of Arkansas, Fayetteville, Arkansas*

The relative percentage of the population over the age of 65 years in the United States and Europe is projected to be 21% and 30% respectively by 2050. Mediating factors related to their long-term well-being, i.e., depression and health, is of increasing concern. Using the European Study of Health and Retirement in Europe (SHARE) and the Health & Retirement Study in the United States (HRS; N=8,869), this study examines factors related to depressive symptoms among older adults on both continents. The SHARE data were divided into three regions: Central Europe (N=3,124), North Europe (N=2,792), and South Europe (N=2,774) (Prince, et al., 1999). Because of cultural and social differences, it is likely that different factors predict depressive symptoms within these nations. The study examined similarities and differences among demographic, social, and health factors relative to self-reported depressive symptoms. Although many similarities were observed, some noteworthy differences were found. Being female and/or widowed were consistent predictors of increased depressive symptoms. Income and assets were only significant to those from the United States. Being unmarried was related to increased depressive symptoms only in the United States and South Europe. Further, the amount of variance accounted for varied widely from 36% in South Europe to 13% in the United States. Participants in this presentation will gain increased knowledge about factors related to self-reported depressive symptoms in the United States and Europe.

CREATIVE APPROACHES: SUPPORT FOR GROWING OLD IN AUSTRALIAN ABORIGINAL SOCIETY

A.S. Leichthammer, E.H. Thompson, *Sociology & Anthropology, College of the Holy Cross, Worcester, Massachusetts*

This study examined how Aboriginal culture affects the way elders seek care and how care is delivered. Observations were conducted at the Hetti Perkins Indigenous Retirement Home in Alice Springs, Northern Territory, Australia. Aspects of Aboriginal culture that emphasize spirituality and family structure strongly account for a distinct outlook on the meaning of growing old within Aboriginal society. Aboriginal culture places a stigma on seeking help beyond one's immediate family and holds totems including personal freedom, respect, and gender. Many of these cultural traditions are found institutionalized within the architecture and layout of care facilities which strongly represent the "dreaming stories"- the foundation of traditional Aboriginal spirituality. The Hetti Perkins facility's circular shape is symbolic of the circles in Aboriginal art, representing meeting places, campsites, or rockholes. Techniques, similar to the Eden Alternative, minimize the stigma associated with going beyond the family. Similarly, the manner in which the eld-

ers are treated and their relationships with caretakers within Hetti Perkin's convey the totems within their society, as evident through their liberal schedules, maximum autonomy, and gendered quarters. It is evident that to make care work as effective as possible, it needs to be modified to respect the cultural beliefs of the population receiving care, as On Lok has for San Francisco Chinese elders. Older nursing home residents have had a lifetime living with and fostering personal and cultural values which were key to their earlier coping and define their reaction to differing care delivery methods.

AGE AND ETHNIC DIFFERENCES BETWEEN AFRICAN AMERICAN, LATINO AMERICAN AND CAUCASIAN VETERANS PRESENTING FOR TREATMENT OF ERECTILE DYSFUNCTION

T. Rideaux¹, C. Preuss¹, S.A. Beaudreau², 1. PGSP-Stanford PsyD Consortium, Palo Alto, California, 2. Palo Alto Veterans Administration Health Care System and Stanford University School of Medicine, Palo Alto, California

Rationale. Erectile dysfunction (ED) is a significant public health issue for men of all ages and ethnic groups. Ethnic differences in the perception of ED, however, may exist due to differing cultural standards of sexual performance.¹ For instance, compared with Caucasians, older African American adults experience greater distress over ED.² Depression also poses a greater risk for ED for middle-aged and older Latinos compared with African Americans and Caucasians.³ We hypothesized that Latino and African Americans with ED would report greater distress (performance anxiety, major depression) despite better erectile functioning at time of treatment compared with Caucasians. **Participants.** 613 Caucasian, 128 African American, 97 Latino veterans seeking treatment for ED at the Palo Alto VA Andrology Clinic between 1980 and 2003. Median age in years was 63 (23-87). **Results.** Age by ethnicity interactions were detected for distress, but not erectile functioning. Specifically, older African Americans reported performance anxiety less often compared with younger adults of all ethnicities and older Caucasians and Latinos; older Caucasians reported performance anxiety less often compared with younger Caucasians. Younger and older African Americans were less likely to have depression at time of treatment compared with younger Caucasians. Only older age was associated with erectile functioning. **Conclusion.** Distress was less often reported by older African Americans possibly due to underreporting, resiliency, or reduced likelihood for those with high performance anxiety to seek treatment. Older Caucasian men also reported less distress compared with younger Caucasian men, whereas Latino men of all ages reported similar levels of distress.

PREDICTORS OF PSYCHOSOCIAL DEVELOPMENT OF GEROTRASCENDENCE AMONG JAPANESE OLDER ADULTS

K. Hoshino¹, S.H. Zarit², M. Nakayama³, 1. Shizuoka University, Shizuoka, Japan, 2. Pennsylvania State University, State College, Pennsylvania, 3. Nagoya University, Nagoya, Japan

1.Purposes:This study has two objectives;(1)to test a conceptual model of psychosocial development among Japanese older adults using the Gerotranscendence Scale Type2 Japanese Version(GST2J), and(2)to examine physical, social, and psychological predictors of psychosocial development. **2.Methods:**Participants were 525 community dwelling Japanese older adults(Male=260, Female=265). The age range was from 60 to 94 years old(Mean Age=69.28 years old, SD=4.77). The questionnaire included the GST2J, the Short-Form-36 Health Survey Version2, the OARS Multidimensional Functional Assessment Questionnaire, Social Support Scale, CES-D, LSI-A, Erikson's Psychological Stage Inventory, and questions of social characteristics. **3.Results and Discussion:** A factor analysis confirmed the three factor structure of the GST2J(Cosmic Dimension, Coherence Dimension, and Solitude Dimension), as originally reported by Tornstam. Multiple regressions were

computed for each dimension of the GST2J. The Cosmic Dimension was significantly associated with age and social support($R^2=.03$, $p<.001$). Education, social support(provide), and EPSI were significantly associated with the Coherence Dimension($R^2=.40$, $p<.001$). LSI-A, social support(provide), and EPSI each had significant associations with the Solitude Dimension, although living style(not to live in own home) had a significant positive relation with it($R^2=.14$, $p<.001$). Age and EPSI were significantly associated with the total scale($R^2=.06$, $p<.001$). These findings provide support for use of the GST2J as a measure of psychosocial development among Japanese older adults, and suggest that the three dimensions of Gerotranscendence are associated with unique predictors.

COGNITIVE PERFORMANCE AND EMOTIONAL WELL-BEING OF OLDER PEOPLE IN VIETNAM

S.H. Zarit¹, H. Chuong³, N. Ngoc³, A.N. Leggett¹, H. Nguyen², 1. Human Development & Family Studies, Penn State University, University Park, Pennsylvania, 2. Wake Forest University, Winston-Salem, North Carolina, 3. National Technical College of Medicine No. II, Da Nang, Viet Nam

As in many developing countries, Vietnam has a rapidly aging population, with few formal services to supplement traditional assistance from families. The current cohort of older people may face special vulnerabilities, having experienced war and social upheaval during their youth. The health authorities are expanding services, but often lack reliable information about the status of older adults. This paper reports findings on cognition and emotional well-being from a study of functioning of older adults living in Da Nang and surrounding rural areas. A representative sample of 600 people 55 and over was recruited, stratified by rural versus urban, gender and age. The sample was 50% women, 50% rural, and had a mean age of 70.33 (sd 9.10). Interviews were conducted in people's homes by trained interviewers. Measures were Vietnamese versions of widely used instruments or were back translated to determine fidelity to the original items, including the MMSE, the CES-D to measure depression, a measure of worry developed for this study, and ADL functioning. Mean scores indicated somewhat lower MMSE scores and higher scores of depressive and worry symptoms than typically found in Western samples. Linear regressions were used to examine predictors of the cognitive and emotional variables. Independent variables were age, gender, urban-rural and ADL limitations. Older people, women, rural residents and people with ADL limitations had higher rates of depressive symptoms and worries and lower cognitive performance. These results indicate considerable potential need in the older population, with cognitive and emotional symptoms likely to accompany ADL limitations.

A HIERARCHICAL MODEL OF GEROTRASCENDENCE AMONG THE OLDEST OLD IN THE AMAMI ARCHIPELAGO

K. Tomizawa², M. Takahashi¹, 1. Northeastern Illinois University, Chicago, Illinois, 2. Kobe University, Kobe, Japan

Two separate studies were carried out to explore the conceptual formation of gerotranscendence among the oldest old in the Amami Archipelago where the centenarian ratio is higher than that of the neighboring island of Okinawa (66.06 vs. 42.49 centenarians per 100,000). In Study 1, an 11-item Gerotranscendence Scale (GTS) was created, and 102 oldest old (mean age=90) responded to this questionnaire along with a series of questions including life satisfaction, sense of attachment to local community, self perception of own aging, activity level, and loneliness. An exploratory factor analysis extracted three psychological factors from the GTS: ego transcendence, material transcendence, and cosmic transcendence. In general, the findings indicate that overall gerotranscendence is closely associated with "positive" aspects of aging such as higher levels of self-maintenance and lower levels of one's own sense of aging. Further, while 92.8% perceived themselves

as “quite old,” they reported low levels of loneliness (26.7%) and high levels of life satisfaction (93.4%) and attachment to the community (93.7%). In study 2, 11 oldest old were interviewed. The transcribed qualitative data were then analyzed by a Modified Grounded Theory Approach (M-GTA). The overall results reveal a hierarchical model of gerotranscendence consisting of three layers: 1) the psychological layer (i.e., ego, material, and cosmic transcendence); 2) the phenomenological layer (e.g., a strong will to live until 100), and 3), and the experiential layer (e.g., histo-cultural characteristics).

LIFE SATISFACTION AS A PREDICTOR OF LONG-TERM MORTALITY AMONG OLDER PEOPLE IN THE UK AND TAIWAN

P.A. Bath, C. Li, *Information Studies, University of Sheffield, Sheffield, United Kingdom*

There is limited evidence of the relationship between quality of life and mortality among older people. The relationship between quality of life and mortality may be mediated through different demographic, health, and social factors that may interact over time, and affect the impact on long-term survival. The present study aimed to examine the relationship between life satisfaction (as a component of quality of life) and long-term mortality among older people in the UK and Taiwan. Data were derived from the 1989 wave of two nationally-representative samples of older people: the Nottingham Longitudinal Study of Activity and Ageing (NLSAA) in the UK, and the Survey of Health and Living Status of the Elderly in Taiwan (SHLSET). Mortality data for the 14-year follow-up period (1989-2003) were obtained from the two studies. Cox regression analysis was used to determine the role of life satisfaction in predicting mortality, in unadjusted models and when controlling for demographic characteristics, physical and mental health, and social engagement. Life satisfaction score was significantly associated with 14-year mortality in both countries, the higher the score the longer the survival. In the Taiwan sample, this relationship was explained by physical and mental health and social engagement, while in the UK the relationship was independent of demographics, physical and psychological health and social engagement. The study provides evidence on the importance of life satisfaction in relation to long-term mortality in older people. Cross-cultural differences may be important in explaining the relationship.

SESSION 1265 (SYMPOSIUM)

FACILITATING COGNITIVE PERFORMANCE IN OLD AGE: COGNITIVE AND PHYSICAL INTERVENTIONS

Chair: *B. Godde, Jacobs Center on Lifelong Learning, Jacobs University, Bremen, Germany*

Discussant: *C. Hertzog, Georgia Institute of Technology, Atlanta, Georgia*

With aging populations in most industrialized societies the question of how older adults can maintain or improve their cognitive functioning has gained increasing importance. Decades of cognitive training research have demonstrated that improvement is possible but also that training gains are highly specific. More recently, cardiovascular fitness interventions showed general effects on cognitive functioning in old age. This Symposium will provide latest evidence on different types of training and their effects on cognitive functioning in old age and discuss the specificity and generality of such effects. We aim to get together researchers working on different types of cognitive training interventions. Thus, the symposium will contribute to answering the question what successful and sustainable interventions should look like and what the specific advantages of the different types of training are. Claudia Voelcker Rehage will present data from a one-year longitudinal intervention study with older adults trained in physical fitness or motor coordination and tested for differential effects of these interventions on cognition and related brain activations. Florian Schmiedeck will talk about

the intra-person dynamics during cognitive training. Lars Nyberg's presentation will focus on the question whether and under which conditions transfer results from cognitive training interventions. In her contribution, Denise Park will report about the beneficial effects of social activities on cognitive functioning of older adults. Finally, Christopher Hertzog will discuss the presented findings from the perspective of the specificity and generality of training interventions in old age.

CARDIOVASCULAR AND COORDINATION TRAINING DIFFER IN THEIR EFFECT ON COGNITIVE PERFORMANCE IN OLDER ADULTS

C. Voelcker-Rehage, B. Godde, U. Staudinger, Jacobs University Bremen, Bremen, Germany

Recent studies revealed a positive influence of physical activity on cognition in older adults. Studies, however, that investigate the effects of different types of interventions and longer-term effects are missing. We performed a 12-month longitudinal study to investigate the effects of cardiovascular and coordination training (control group: relaxation and stretching) on cognition in older adults. 49 Participants (age: 62–79 years) were trained 3 times a week. On the behavioral level, both experimental groups improved in executive functioning but with differential effects on speed and accuracy. In parallel, neurophysiological results also revealed different changes (increases and reductions) in brain activity for both interventions in frontal, parietal, and sensorimotor cortical areas. Our data suggest that besides cardiovascular training also other types of physical activity improve cognition of older adults. The mechanisms, however, that underlie the performance changes seem to differ depending on the intervention.

THE COGITO STUDY: PLASTICITY OF COGNITIVE ABILITIES DUE TO 100 DAYS OF COGNITIVE PRACTICE

F. Schmiedek^{2,1}, M. Lövdén^{3,2}, U. Lindenberger², 1. Humboldt-Universität Berlin, Berlin, Germany, 2. Max Planck Institute for Human Development, Berlin, Germany, 3. Lund University, Lund, Sweden

In the COGITO study, 101 younger (20-31 years) and 103 older (65-80 years) adults practiced a battery of cognitive tasks for an average of 100 daily sessions. The cognitive battery comprised three working-memory, three episodic-memory, and six perceptual-speed tasks evenly distributed over verbal, numerical, and figural-spatial domains. Before and after practice, ten pretest and ten posttest sessions included a comprehensive assessment of near and far transfer tasks to investigate whether practice-related improvements are confined to trained skills or enhance intellectual functioning in a more general way. We present analyses of practice effects on trained tasks and near and far transfer at the task level as well as at the ability level defined by latent factors of transfer tasks. Furthermore, we investigate correlates of transfer at the behavioral (correlations of transfer effects with improvements on practiced tasks) and at the neuronal level (fMRI, MRI, DTI).

LEARNING AND TRANSFER IN RELATION TO COGNITIVE PROCESSES AND UNDERLYING BRAIN SYSTEMS

L. Nyberg, Umea University, Umea, Sweden

In an fMRI study we found that younger adults activated striatal regions during both criterion and transfer tasks at a pre-training session, and they showed training-related striatal activity increases for both tasks after 5 weeks of updating training along with significant performance enhancements. In contrast, older adults showed weak striatal recruitment pre-training, and training-related performance changes and striatal activation increases were limited to the training task. Follow-up analyses revealed that elderly with larger striatal activation changes showed positive transfer effects. These findings suggest (a) that generalization of learning required that the criterion and transfer tasks engaged overlapping processes (updating) and brain regions (striatum), and (b) that aging imposed constraints on transfer by affecting striatal systems. Preliminary support for these suggestions comes from a recent study

of training of another executive process (switching), and from a multimodal imaging study of how age-related dopaminergic alterations relate to age-related changes in fMRI activity.

THE SYNAPSE PROJECT: EXPERIMENTALLY MANIPULATING AN ENGAGED LIFESTYLE TO ASSESS ITS EFFECT ON COGNITION

D.C. Park, J. Lodi-Smith, *Center for Brain Health, University of Texas at Dallas, Dallas, Texas*

The Synapse Project is designed to assess the impact on cognition of changing an older adult's lifestyle from passive to one of social and/or intellectual engagement. The project involves random assignment of adults 60 and older to one of six environments for 15 hours a week or more for 12 weeks. The environments include (a) professional quilting instruction; (b) professional photography instruction; (c) combination of quilting and photography; (d) social engagement without instruction; (e) a placebo control that works on passive projects at home; and (f) a no treatment control. All subjects are well-characterized behaviorally and with functional MRI pre- and post-engagement. Methodological and design issues in designing an "engaged lifestyle" study will be discussed.

SESSION 1270 (SYMPOSIUM)

INCREASING GERIATRIC NURSING CAPACITY: ACADEMIC EXEMPLARS

Chair: *L.E. Benefield, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Discussant: *D. Wallace, University of North Carolina - Greensboro, Greensboro, North Carolina*

The aging population is growing dramatically and older adults will have unprecedented health and illness needs, calling for expert leaders, educators, and practitioners in geriatric nursing. These consumers and their families require specialized nursing support and services. At a time when consumer need is increasing, the shortage of qualified geriatric nurses is becoming more acute. This shortage of nurses skilled in geriatric care is two-fold: a severe shortage of expert geriatric nursing faculty and a growing shortage of practicing geriatric nurses. This symposium describes academic exemplars developed by five U.S. colleges of nursing aimed at increasing the number of highly qualified new and existing faculty and practitioners who will provide leadership in geriatric nursing. Initiatives will be detailed including necessary leadership and structure, strategic planning, customer and market analysis, implementation process and timeline, costs and results. Exemplars include: 1) creation of a statewide geriatric nursing education network of 22 faculty champions and shared-use educational materials, 2) a systematic and focused curriculum enhancement across programs of geriatric-focused RN-BSN completion, post-BSN certificate, and specialized course at graduate level, 3) a public/private university partnership with educational activities including student/faculty publications and a jointly designed online course and seminars, 4) development of a RN-BSN geriatric education model specifically focused on urban, rural and medically underserved populations, and 5) a novel post-master's certificate in advanced practice gerontological nursing to enhance skills of advanced practice nurses. These initiatives provide accessible and affordable geriatric-focused mechanisms required to prepare nurses to better care for older adults.

OKLAHOMA GERIATRIC NURSING EDUCATION WORKGROUP: COLLABORATION TO INCREASE STATEWIDE GERIATRIC NURSING CAPACITY

L.E. Benefield, C.M. Lyons, R. Loar, P. Smith, K. Broussard, B.J. Holtzclaw, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

As part of the newly formed Reynolds Center of Geriatric Nursing Excellence at the University of Oklahoma, a unique faculty collabora-

tion and training model was created to translate emerging gerontologic knowledge to inform optimum care of older adults. The statewide Oklahoma Geriatric Nursing Education Workgroup (OGNEW) includes faculty selected by their institutions to serve as champions for evidence-based geriatric nursing education with goals to improve quality and availability of geriatric nursing education statewide. OGNEW participants attend meetings and videoconferences designed to disseminate best practices on implementing geriatric content in their nursing curriculums and access on-line shared-used educational materials from the Center. First six months outcomes include a successful statewide geriatric liaison across 20 nursing programs, a user-friendly website designed with and for the champions, identified strategic methods for on-line dissemination of best-evidence educational materials, and specific methods of communication among champions. Implications for use across other academic settings are detailed.

AN INNOVATIVE PUBLIC/PRIVATE PARTNERSHIP FOR ENHANCING GERIATRIC NURSING EDUCATION

A.M. Kolanowski¹, K. Richards², N. Strumpf², L.K. Evans², J. Penrod¹, D.M. Fick¹, *1. School of Nursing, Penn State University, University Park, Pennsylvania, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

The Schools of Nursing at Penn State and the University of Pennsylvania both have Hartford Centers of Geriatric Nursing Excellence. The geographic proximity of the two schools, their complementary missions, and their unique strengths in geriatric nursing opened an unprecedented opportunity to enhance "collective productivity" toward preparing increased numbers of outstanding geriatric nursing educators. In this paper we describe the planning, leadership and structure, and support garnered for an innovative partnership between the two universities and centers. A number of collaborative activities enhance students' educational experience, such as the jointly designed online educational course (Teaching Translational Science) that is taught across both universities, co-authored student/faculty publications, and combined Hartford Scholars Seminars. Through these experiences and others, students are exposed to world-renowned faculty and have the opportunity to consider and pursue graduate/post-graduate study at the institution which most closely matches their career goals.

THE GERIATRIC WORKFORCE ENHANCEMENT PROJECT

B.E. Barba, *School of Nursing, Community Practice Department, University of North Carolina at Greensboro, Greensboro, North Carolina*

The goal of the project was to establish an academic education model in which RNs pursuing baccalaureate degrees were prepared to assume leadership roles in the provision of culturally competent geriatric care in urban, rural, and medically underserved populations. In addition to augmented courses, a variety of gerontology learning activities were provided to meet the individual learning needs, including seven elective gerontology academic courses. All participants completed the educational program Teaching Geriatric Nursing Care, a geriatric teaching project, and geriatric-focused clinical experiences. Accomplishments toward project goals were monitored, including evaluation of early impact on professional nursing roles and employment issues. Project staff facilitated leadership roles of graduates as Geriatric Nursing Care Trainers in their employing facilities and as faculty in geriatric training programs. Individual-level outcomes and system-level impacts, such as geriatric training of other nursing personnel and unit policy changes were determined.

POST-MASTERS CERTIFICATE OPTION IN ADVANCED PRACTICE GERONTOLOGICAL NURSING

T.A. Harvath¹, H.M. Young³, L. Lee², 1. *School of Nursing, Oregon Health & Science University, Portland, Oregon*, 2. *Portland VA Medical Center, Portland, Oregon*, 3. *University of California-Davis, Davis, California*

Most older adults receive care from health professionals whose educational preparation focused on younger adults. Older adults have very complex health care needs, and increased numbers of advanced practice nurses are urgently needed to provide leadership and high-quality care to this growing and vulnerable population. To meet these unmet needs, we developed an online Post Master's Certificate in Advanced Practice Gerontological Nursing to enhance the capacity to serve older adults. Graduates of this program are prepared to function in a variety of roles with a diverse clientele of older adults, their families and caregivers within a variety of settings. Unique to this program is an emphasis on health issues of vulnerable older adults and a particular focus on rural health and long term care. The program consists of 9 credits of didactic and up to 7 credits of clinical practica. Arrangements for clinical placements are tailored to individual student needs.

ENHANCING BASIC AND ADVANCED GERIATRIC NURSING COMPETENCE

G. Pepper, P.H. Berry, V.J. Flattes, J. Abramson, *College of Nursing, University of Utah, Salt Lake City, Utah*

While the shortage of registered nurses is projected to increase nationally through 2030, the shortage of nurses prepared for clinical and academic roles in geriatric nursing is even more severe. To enhance the clinical competence in geriatric nursing of baccalaureate, master's, and doctoral graduates, the curriculum of each program was augmented and evaluated. The Geriatric Nursing Leader program is a transcribed geriatric emphasis consisting of all 31 credits of geriatrics-focused baccalaureate completion (RN-BS) or 14-credit post-baccalaureate certificate, including coursework in interdisciplinary research, evidence based practices, and organizational change capstone project. At the graduate level adult care specialties were universally enhanced with three credits in geriatrics tailored to the specialty (teaching nursing, nurse practitioners (adult, family, women's health, acute care, psychiatric mental-health), and informatics. While only 3% of advance-practice nurses are geriatric specialists, over 10% graduates in our MS and DNP programs graduate with a 9-15 credit geriatric sub-specialization.

SESSION 1275 (POSTER)

LIFE COURSE

SAFE PASSAGE OF GOODS AND SELF IN LATER LIFE: A RECONSIDERATION

D.J. Ekerdt¹, M. Luborsky², C. Lysack², 1. *University of Kansas, Lawrence, Kansas*, 2. *Wayne State University, Detroit, Michigan*

"Safe passage" is a term for special dispositions of possessions that aim to protect the physical and symbolic properties of things. In later life, the finitude of life time and the desire to leave a legacy may propel such special dispositions. Safe passage, thus, can be an activity on behalf of the self as well as the thing. This study investigated the role of safe passage as a divestment technique during the course of residential relocation from larger to smaller quarters. As part of an ongoing study in the Midwest, we interviewed 39 individuals aged 62 to 89 about their possession management during the course of a community-based move. Interviews considered the disbandment of the whole household, not just selected, cherished possessions (a common technique in possession studies). Our informants did relay rounded accounts of safe passage, but it was not a dominant mode of disposition. More common were partial stories about the satisfactory disposition of things. These expressed contentment with the fate of the thing but with little detail

about the initiative that brought the safe passage about, any intention toward legacy, or any cherishing by the new owner. Some transfers came about as family and friends claimed things in ways that were unexpected and even surprising. We conclude that safe-passage stories can reconstitute the self as agentic, supporting a presentation of the self as conscientious and careful with belongings despite having released them.

LONELINESS AMONG DISABLED MARRIED OLDER ADULTS: DOES MARITAL QUALITY MATTER?

D.F. Warner, J. Kelley-Moore, *Sociology, Case Western Reserve University, Cleveland, Ohio*

We find that married persons with more limitations report greater loneliness. Marital quality is related inversely to loneliness: positive marital quality is associated with lower loneliness scores and negative marital quality associated with higher loneliness scores. Consistent with our hypothesis, marital quality significantly moderates the association between functional limitations and loneliness—although this effect is limited to positive marital quality. Older adults with above average positive marital quality are buffered from the negative consequences of functional limitations for loneliness, while those with below average marital quality are substantially lonelier with more functional limitations. This pattern of findings is robust in the face of demographic, socioeconomic status, and social integration controls. We find that these associations are similar for women and men. Overall, our findings suggest that quality of an older adult's marriage has important consequences for coping with functional limitations, at least in terms of loneliness.

DISENTANGLING INSURANCE-MARITAL STATUS INTERACTION EFFECTS AS PREDICTORS OF THE LIFE COURSE OUTCOME EARLY RETIREMENT: AN EXAMINATION OF WOMEN AS A NEGLECTED POPULATION COMPARED TO MEN

A. Daub, *CWRU, Cleveland Heights, OH, Ohio*

Whether or not one has employment-based health insurance has become recognized as a factor relevant to remaining employed. Prior research looked at either only samples of men or mixed gender samples. In this study, how women who decide to stay in the labor market differ from those who leave the labor market and from men is analyzed utilizing interactions of employment-based health insurance status and marital status. In two additional models I classify variables according to family and household-oriented and gender-relevant resources in order to explore the extent to which "female" life course predictors play a role in early retirement for women compared to men. Longitudinal data from the Rand version of the Health and Retirement Study are utilized, using time waves 2004 and 2006.

EXPLORING AND EXAMINING THE EXPERIENCE OF REGRET AMONGST MID-LIFE AND OLDER ADULTS

E. Hollywood, O. Ann, J. McEvoy, R. Bond, *Nursing, Dundalk Institute of Technology, Dundalk, Ireland*

People are living longer than ever before and with extra years comes more time to experience errors and losses relating to the self and others. Regrets about the past can be a common psychological phenomenon experienced by up to 90% of older American adults (Wrosch, 2007). Individuals who ruminate about regrets can also experience higher levels of anxiety, anger and depression (McKee 2005). This study describes the development of a new tool to assess regrets amongst mid-life (age 50+ years) and older Irish adults. From the survey, the prevalence of regrets are discussed, as well as the relationships between regrets and bio-psychosocial well-being. This study is part of the larger Nestling Project survey which aims to provide a better understanding of the health and well-being of older Irish adults, and to understand the ways more integrated service delivery, and community cooperation can facilitate ageing-in-place. Regrets can impact adversely on health and quality of life of older adults and further research is needed. This presentation

can contribute to this field through the discussion of a new regrets scale, detailed analyses about the prevalence and consequences of regrets, and the use of in-depth interviews exploring the nature and complexity of later life regrets.

HEALTH DISPARITIES IN HEALTH STATUS ACROSS THE LIFE COURSE

C. Unson, *Public Health, Southern Connecticut State University, New Haven, Connecticut*

Objective: This study investigates whether health disparities pertaining to health status persists throughout the life course. **Methods:** The sample from the BRFSS 2007 of a New England state was categorized into three age groups: 18-39, 40-59, 60 and older. The weighted sample was estimated at 2.6 million based on a sample of 7,360. Proportions reporting fair to poor health by race/ethnic groups and age groups were estimated using SUDAAN. Relative risk ratios comparing self-reported non-Hispanic whites to non-Hispanic blacks and Hispanics for each age group were estimated and compared. **Results:** The proportions reporting fair/poor health were 10% for the first two age groups and 20% for the oldest age groups. For non-Hispanic whites, the proportions were 7%, 8%, 18% respectively; for non-Hispanic blacks, 13%, 19%, 37% respectively, and for Hispanics, 26%, 24%, 46%. The proportions by race/ethnic groups were significantly different across the age groups ($p < .001$). Non-Hispanic blacks were about twice as likely to report fair/poor health in all age groups compared to non-Hispanic whites ($RR=1.93, 2.37, 1.99$ respectively). Hispanics were almost four times as likely in the youngest age group ($RR=3.89$), three times in the middle age group ($RR=2.97$), and twice in the oldest age group ($RR=2.5$). **Conclusion:** More Hispanics and non-Hispanic blacks report fair to poor health than non-Hispanic whites, especially in the oldest age groups. Hispanics fare worse than non-Hispanic blacks. Disparity measures between non-Hispanic whites and non-Hispanic blacks are similar across the age groups. Disparity measures between non-Hispanic whites and Hispanics decrease with increasing age.

DIFFERENCES IN SELF-RATED HEALTH TRAJECTORIES BETWEEN GENDER AMONG ELDERLY JAPANESE PEOPLE

T. Nakata, *Department of Welfare, Hokusei Gakuen University, Sapporo, Japan*

The aims of this study is to examine the differences in self-rated health patterns between males and females from 60 years among Japanese people. 60 years was a key age among Japanese, because the mandatory retirement was conducted at 60 among almost all the companies and older people were obliged to deduce both their status and income at 60. And 'male breadwinner model' comprises a large part of households in Japan. Therefore, disparities in the pattern of worsening health between retired males and their housewives merit careful examination. This study employed the National Survey of the Japanese Elderly, from wave I to wave III, which was conducted by Michigan University and Tokyo Metropolitan Institute of Gerontology. Fixed/random effect models applying pooling data constructed from panel data was used. The dependent variable was Self-rated health and duration from 60 years and, dummy variable of occupational status and marital status were used as the independent variables. The results are as follow; 1) continue to work after 60 has had an impact on self-rated health for both gender. 2) 'married' males tend to feel healthier, but female don't. 3) duration after 60 years and its square term affect the health for women only. These facts reveal that there are some differences in health pattern between the genders and these are reflected by the Japanese characteristics in work and retirement. These results showed that there are transformations even later in life, though some traditional theories among gerontology seem to capture elderly people statically.

LIFE HISTORIES REVEAL CHANGING STRATEGIES TO COPE WITH COMBAT-INDUCED PTSD

E. Covan, *Health and Applied Human Sciences, UNC Wilmington, Wilmington, North Carolina*

Personal attributes, stratification, birth cohort and period effects among aging Vietnam combat veterans, reveal the impact of combat (1966-1971) on subsequent life history. Haunted by memories of war and rejection by contemporaries, veterans who suffer from chronic combat-induced PTSD note trial and error strategies to control symptoms change as they get older. Risk-taking, self-medication, and escaping condemnation through avoidance in young adulthood are supplemented with attempts to fit in through workaholicism or building a family. The latter strategies do not help with anger management, failing in middle-age if not before, when neither employers nor family members approve. In early aging, physical illnesses and changing social climate may encourage combat veterans to seek professional help, although they still engage in self-initiated strategies to control their own behaviors. The fortunate find a modicum of peace, accompanied by combat brothers with whom they review the meaning of survival and commit to helping the next generation of warriors.

PHYSICAL ABUSE IN CHILDHOOD, DAILY WELL-BEING, AND THE ROLE OF DAILY STRESSORS

L. Pitzer, K. Fingerman, D. Mroczek, *Child Development and Family Studies, Purdue University, West Lafayette, Indiana*

Prior research established that victims of childhood physical abuse are at risk for lower well-being in adulthood. The effects of such abuse on daily well-being have not been considered in detail, particularly considering the effects of daily stressors. This study examines the association between childhood physical abuse and daily indicators of well-being and how daily stressors (interpersonal vs. work/home) may account for individual variation in this association. The sample included participants from the National Study of Daily Experiences (NSDE), an 8-day daily diary study. This study included participants aged 25 to 74 ($M = 47$, $SD = 13.07$) who indicated that they were either severely physically abused (kicked, bit, hit with a fist; burned or scalded) by their parents or that they never experienced such abuse ($n = 931$). Multilevel models were used to examine the association between childhood physical abuse and daily negative affect and physical symptoms. Results revealed that childhood physical abuse was associated with poorer physical (estimate = .11, $p < .01$) and psychological (estimate = .12, $p < .01$) health. Interactions showed that on heightened work/home stressor days, levels of negative affect were exacerbated for victims of childhood abuse (estimate = .06, $p < .05$). Consistent with other literature, this study shows that work/home stressors, and not interpersonal stressors, are more salient to individuals in midlife. These results also give evidence for cumulative disadvantage. Individuals who are abused may be particularly more reactive to work/home stressors in part due to other disadvantages experienced over the life course.

MODERATORS OF THE RELATIONS BETWEEN SELF-REPORTED AND DIRECTLY OBSERVED FUNCTIONAL CAPACITY IN CENTENARIANS

J.L. Woodard¹, P. Martin², P.E. May¹, E.E. Richardson¹, L. Miller³, A. Davey⁴, L. Poon³, 1. *Psychology, Wayne State University, Detroit, Michigan*, 2. *Iowa State University, Ames, Iowa*, 3. *University of Georgia, Athens, Georgia*, 4. *Temple University, Philadelphia, Pennsylvania*

The purpose of this study was to examine whether centenarians' self-report of their ability to perform basic and instrumental daily living (BADL and IADL) skills was congruent with their actual performance of these tasks. Because multiple factors are known to moderate the relationship between subjective appraisal of performance competency and objective performance, we investigated cognitive (Mini-Mental State Examination) and personality variables (NEO, Geriatric Depression Scale (GDS), Affect Balance Scale (ABS)) that could potentially mod-

erate this relationship. Participants consisted of 244 centenarians from the Georgia Centenarian Study. Participants were administered the GDS and the Direct Assessment of Functional Status (DAFS) and estimated their predicted ability on each task from the DAFS. Proxy report data were used for the ABS and NEO. Moderated multiple regressions evaluated the significance of each putative moderator of the relationship between objective score on the DAFS IADL or BADL scale and the subjective appraisal of IADL or BADL performance. Cognitive impairment, elevated depressive symptoms, higher affect balance ratios and lower levels of conscientiousness appear to distort subjective appraisals of self-competence in performing instrumental daily living skills. Only lower conscientiousness appears to distort self-appraisal of basic ADL competence. While most trait level factors did not moderate the relationship between subjective appraisal of performance and actual performance of IADL skills, state factors (current depressive symptoms, affect balance, and cognitive functioning) exerted a greater moderating influence on this relationship.

MODELING REDUCTION OF OUTCOME REACTIVITY IN ADAPTATION TO HEALTH AGGRAVATIONS IN VERY OLD AGE

O.K. Schilling, *Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*

Psychological concepts of adaptation imply some kind of reduction of stimulus responsiveness, as the stimulation continues. With respect to adaptation to irreversible loss of physical health in very old age, this implies an attenuation of relationships between health constraints and psychological outcomes when the health adversities accumulate. Moreover, in very old age, functional abilities of the old individuals affected by health adversities may play a crucial role in mediating health impacts on psychological outcomes. Thus, this study presents methods to model such reduced responsiveness due to adaptation, implying functional ability as mediator, by the use of latent growth curve modelling techniques. To demonstrate the strategies, longitudinal data (4 measurement occasions) from the research project ENABLE-AGE (N=450 German elders, aged 80-89 at baseline 2002), followed up since 2008 with the project LateLine, was used. Changes in life satisfaction and functional abilities were modelled depending on health status at baseline (number of health symptoms, diagnoses). Results confirmed expectations of a general mediator role of functional status, and an adaptive weakening of the modelled relationships with growing accumulation on health problems. Summing up, the study proposes analytical strategies which appear promising for the study of adaptive dynamics of adverse health consequences in very old age,

SESSION 1285 (PAPER)

NEIGHBORHOODS INFLUENCES AND AGING

NEIGHBORHOOD DYNAMICS OF SOCIAL ENGAGEMENT AND WELL BEING AMONG OLDER ADULTS

J.A. Ailshire, *Sociology, University of Michigan, Ann Arbor, Michigan*

A growing number of studies show that neighborhoods play a central role in shaping the social experiences and well being of residents. However, research on the role of the neighborhood social environment in shaping social relationships and psychological well being among older adults has been largely absent. Using data from the Chicago Community Adult Health Study (2002), I examined the role of the neighborhood structural characteristics on social engagement and psychological well being among adults age 45 and older (N=1133). Neighborhood structural characteristics come from the 2000 Census and include socioeconomic disadvantage, percent non-Hispanic black, population density, age structure, and residential stability. Social engagement is determined by respondent's reports of their level of social participation, integration, and support and psychological well being is assessed using respondent

reports of loneliness and depressive symptoms (CESD). Multilevel regression models are estimated separately for different aspects of social engagement and psychological well being and control for age, gender, race/ethnicity, marital status, education, and income. I found that higher socioeconomic disadvantage is associated with lower levels of informal social support ($p<.05$) and higher levels of loneliness ($p<.10$) and depression ($p<.05$). In addition, individuals living in more residentially stable neighborhoods report higher levels of social support ($p<.05$) and lower levels of loneliness ($p<.05$). Neighborhood structural characteristics had no effect on social participation or social integration. These results highlight the important associations between structural aspects of the neighborhood social environment and social engagement and psychological well being among older adults.

URBAN NEIGHBORHOODS AND HEALTH DISPARITIES IN LATE MIDDLE AGE

R.G. Wight, M. Ko, C. Barrett, C. Aneshensel, *Community Health Sciences, UCLA School of Public Health, Los Angeles, California*

This study utilizes a life course conceptual framework to evaluate the longitudinal impact of urban neighborhood socioeconomic disadvantage on self-rated health among pre-retirement age persons as they grow older. Neighborhood-related health disparities will be examined with multilevel growth curve modeling using data from the original Health and Retirement Study (HRS) cohort, consisting of persons aged 51-61 years at their 1992 baseline assessment. Neighborhood context is operationalized with U.S. Census tract data from both 1990 and 2000. The presence of information about neighborhoods at two points in time enables us to make stronger inferences about the probable health impact of neighborhood than is possible with the cross-sectional design of most neighborhood research. By assessing dynamic neighborhood health effects, we capture the time interval leading up to age 70, an interval often characterized by important life course transitions, including retirement, spousal bereavement, and the emergence of underlying clinical manifestations of physical illness. We hypothesize that the most negative health effects of living in areas of socioeconomic disadvantage will be among those who consistently live in such areas over time, and those who live in areas that deteriorate over time. We also hypothesize that the health effects of neighborhood will be contingent upon individual-level characteristics due to differential vulnerability of poor persons.

NEIGHBORHOOD ENVIRONMENT AND PERCEIVED HEALTH STATUS FOR OLDER ADULTS: FINDINGS FROM THE CHICAGO HEALTH AND AGING PROJECT

I. Yen¹, S. Gregorich¹, A. Stewart¹, K.A. Skarupski², C.F. Mendes de Leon², *1. University of California, San Francisco, San Francisco, California, 2. Rush University, Chicago, Illinois*

Neighborhood environment is associated with health behaviors and health status for older adults. We investigated the association between neighborhood environment and perceived health status for older adults using data from the Chicago Health and Aging Project (CHAP). CHAP is a longitudinal population-based study of Blacks and Whites, over age 65 (n=5512). There were three types of neighborhood data: 1) perceptions: participants were asked about the perception of their neighborhood environment; 2) census block group demographic data and; 3) direct observation: systematic observation of street blocks within each census tract. We used exploratory factor analysis to identify clusters of related variables. Five factors emerged: 1) "socioeconomic status"; 2) "commercial services"; 3) "unemployment"; 4) "social cohesion"; 5) "social disorder." For each factor, we calculated the mean of the z scores of the variables that clustered. Perceived health status as fair or poor=1 vs. rest. We used multivariate logistic regression models, adjusting for age, sex, race/ethnicity, education, marital status, and smoking. "SES" and "unemployment" are associated with perceived health status. People who live in the lowest "SES" quartile had 34% higher odds of reporting fair/poor health than those living in the highest quartile (OR=1.34

; 95% CI: 1.01,1.78). People who live in second lowest quartile of census block group unemployment have 29% increased odds of fair/poor health compared to people in the highest quartile (OR=1.29; 95% CI: 1.07,1.56). The other neighborhood factors were not associated with perceived health status. Neighborhood composition emerges as more important than services and perceived environment for older adults.

NEIGHBORHOOD CONTEXT OVER ADULTHOOD AND HEALTH IN LATER LIFE

A. Pienta¹, D. Ghimire², 1. ICPSR, University of Michigan, Ann Arbor, Michigan, 2. University of Michigan, Ann Arbor, Michigan

Numerous studies have examined the extent to which neighborhood characteristics affect health outcomes in later life. One of the limitations of past research, however, is that neighborhood context typically involves a set of measures from a single point in time. The life course perspective suggests that later life health is shaped and influenced by a wide range of factors throughout one's life. Using longitudinal data from Nepal, a place that has undergone rapid social changes which can be measured at the neighborhood level, we examine how neighborhoods in a rural area have changed throughout adulthood and into later life. We estimate both fixed-effects (OLS regression models) and mixed models. In the Chitwan Valley of Nepal, we find that even in just the last 10 years, neighborhoods have undergone extensive social changes such that there is better access to schools, employment opportunities, markets, bus transportation, movie theaters, and health care. Further, we find the time-lagged (10 years prior) neighborhood measures are actually better predictors of health outcomes in later life. Specifically, we show that people who lived further from health posts and markets in adulthood have poorer self-rated health and functional health status in later life. After attending this presentation, participants will better understand how health outcomes are influenced by neighborhood factors over the life course.

GEOGRAPHICAL ACCESS TO HEALTHY/UNHEALTHY FOODS IN OLDER POPULATION: SPATIAL ANALYSIS USING GEOGRAPHIC INFORMATION SYSTEM (GIS)

T. Yamashita^{1,2}, S. Kunkel^{1,1}, 1. Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio

The association between diet and health has been well-established. Poor nutrition is related to obesity, heart disease and other leading causes of death. Access to healthy food options is a critical component of a healthy diet. Older adults are more likely to be disadvantaged in this regard due to limited mobility which can affect geographic access to healthy foods. Little is known about geographical accessibility of foods in the community-dwelling older population; measurement problems and underdeveloped assessment methods contribute to the lack of information on this topic. In this study, geographical access to healthy and unhealthy foods in older populations living in a mixed urban/suburban county in Ohio is assessed using the Geographic Information System (GIS). Using data obtained from the U.S. Census Bureau and local health departments, road network distance and travel time to different kinds of food outlets are quantified and visualized in a map format. The x2 test of independence, OLS regression and map overlay analysis are used to assess the relationship between proportion of population that is older and accessibility of healthy and unhealthy food outlets. While accessibility of healthy and unhealthy foods are positively associated ($r^2 = 0.35$), areas with higher number of older populations are more likely to be more than 0.5 mile (walking distance) away from healthy food outlets compared to unhealthy food outlets ($x^2 = 410.4$, $p < 0.001$). In addition to these statistical analyses, two- and three-dimensions maps are created to visually present the locations of disadvantaged healthy food access areas.

SESSION 1290 (SYMPOSIUM)

QUALITATIVE INQUIRY AND RESEARCH DESIGN: EXPLORING A DIVERSITY OF METHODS

Chair: C.M. Gallogly, St. Joseph's College, Patchogue, New York
Discussant: A. Kydd, University of the West of Scotland, Hamilton, Scotland, United Kingdom

The Qualitative Research Interest Group discovered during the 2008 meeting that members wanted to explore in more depth the diverse methods that were being utilized in qualitative inquiry. Given the challenging questions that qualitative researchers ask, the methods have had to expand and diversify in order to handle the unusual data and the sources of that data. This symposium will bring together four researchers who are exploring different techniques for analysis. These four methods include the analytical process of photo elicitation; the Boyatzis method of analyzing themes using ATLAS.ti; and two studies that interrelate numerous sources of data in order to advance their research questions.

CREATIVE MOVEMENT IMPROVISATION AS AN INTERVENTION FOR ADULT DAUGHTERS PROVIDING CARE TO FRAIL MOTHERS

L.K. Donorfio¹, M. Vracevic², 1. Human Development and Family Studies, University of Connecticut, Waterbury, Connecticut, 2. University of Connecticut, Storrs, Connecticut

This research used creative movement improvisation as an intervention technique to explore its impact on relieving stress for adult daughters providing informal care to their frail mothers. Two other intervention techniques were also used for comparison purposes. The final three intervention techniques were creative movement improvisation, a home based "tip of the week, and a caregiver's support group. Because the first two intervention techniques were relatively new to the caregiving intervention literature, it was unclear as to how to most effectively collect and analyze the data. Using various qualitative collection techniques can pose a challenge to researchers as to how the data could best reported, collected, and analyzed. This presentation will focus on the research design and the steps taken to effectively collect the data of each of the intervention techniques. All the intervention groups were considered successful to some degree with all participants indicating that they would enroll in their respective intervention group again in the future. Challenges specifically using creative movement improvisation as an intervention technique with adult daughters providing care to frail mothers will be discussed, as well as what changes will be made to better utilize and measure this intervention technique in future research.

USING THEMATIC ANALYSIS TO EVALUATE PARTNERSHIPS BETWEEN PUBLIC HEALTH AND PRIMARY CARE

C. Irmiter¹, J. Bates², M. Gadon¹, P. Sloane², 1. American Medical Association, Chicago, Illinois, 2. University of North Carolina Chapel Hill, Chapel Hill, North Carolina

Objective: To identify and describe successful collaborations between public health organizations and medical practices in terms of development, structure, barriers/facilitators, and keys to sustainability. Methods: Based on a three-step approach, we interviewed staff of 48 partnership, with a subsample of 16 were purposively selected for in-depth interviews with both staff members and a participating physician. Boyatzis' (1998) thematic analysis was used along with ATLAS.ti. Results: Most programs met a community or clinical need. Barriers to the partnerships include: time/budget constraints, poor communication, and staff turnover. Keys to overcoming barriers include: finding common ground, having champions, creating win-win situations, addressing public health needs, using feasible communication methods, and obtaining funding. Sustainability was attributed to committed leadership, organizational buy-in, multimodal communication, funding, evidence of cost-

effectiveness, clear benefits to medical practices, and a vision for expansion. Conclusion: Existing models provide many lessons as to how such partnerships can be initiated and sustained.

USING MULTIPLE QUALITATIVE METHODS FOR EXPLORATORY RESEARCH

M. Calkins, *1. IDEAS, Kirtland, Ohio, 2. IDEAS Institute, Kirtland, Ohio*

While there is greater understanding of the clinical benefits of private rooms in hospitals, less attention has been focused on the full range of potential outcomes of private rooms in nursing homes. This exploratory study used multiple qualitative methods to lay a foundation for more in-depth future research efforts. An analysis of literature, including research-based, expert opinion and anecdotal sources, was used to develop a preliminary framework and identify potential outcomes of private versus shared rooms. The framework suggested four broad domains impact a variety of outcomes: clinical, psychosocial, operational, and building construction costs. This was followed by focus groups held in a number of facilities, which particularly focused on areas where the research was thin or non-existent. Finally, a detailed construction cost analysis was conducted using 189 bedroom plans to assess differences and significance of construction cost differences between private and shared bedrooms.

PHOTO ELICITATION: PHOTOGRAPHY IN QUALITATIVE INTERVIEWING

H.L. Bell¹, H. Gibson¹, J. Singleton², *1. Tourism, Recreation and Sport Management, University of Florida, Gainesville, Florida, 2. Dalhousie University, Halifax, Nova Scotia, Canada*

Sometimes a picture is worth 1,000 words! This paper focuses on using photography to help research participants build positive rapport with the researcher and provide rich descriptions by eliciting memories and stimulating deep discussion (Harper, 2002). This paper provides an overview of the purpose and technique of photo elicitation, its advantages and areas that need to be enhanced. Collier (1967) identified this as an approach that can be used to gain further insights when understanding the participant's perception of an experience. Examples of studies that have used photo elicitation from a variety of academic fields are discussed. This protocol has different names in various fields of study, such as photo voice and visitor-employed photography. Confusion surrounding differing terminology is addressed. It is hoped that the paper generates ideas among the audience for future research with older individuals.

SESSION 1295 (POSTER)

SENIOR SERVICES AND EVALUATION

FOCUS GROUPS CONTRIBUTING TO DEVELOPMENT OF A SAFE DRIVING BEHAVIOR MEASURE

S. Winter¹, S. Classen¹, M. Bedard², B.J. Lutz³, C.A. Velozo¹, D.N. Lanford¹, B. Brumback⁴, *1. Univ of Florida -Dept. of Occupational Therapy, Gainesville, Florida, 2. Lakehead University -Psychology Dept., Thunder Bay, Ontario, Canada, 3. Univ of Florida - College of Nursing, Gainesville, Florida, 4. Univ of Florida - Dept. of Epidemiology and Biostatistics, Gainesville, Florida*

Background: Older adults and caregivers may benefit from a self-report/proxy measure designed for accurate assessment of driving behaviors and safety. As part of a larger study, we developed a measurement tool, the Safe Driving Behavior Measure (SDBM), with older driver and caregiver/proxy versions. To further develop and refine the items, we conducted focus groups with the target populations. Methods: We held three focus groups (FG) with older drivers / family members from North Florida (FG2 & FG3) and Thunder Bay, Ontario (FG1) to generate safe driving behavior items and obtain SDBM feedback. FG1 and FG2 examined driving situations (e.g., left turn against traffic) and drivers'

responses (e.g., avoiding risky turns). FG3 reviewed the SDBM providing feedback on items (e.g., formatting or clarity) and the SDBM's relevance and utility. Focus groups were audio-recorded and transcribed verbatim for analysis using ATLAS.ti. Our team used content and thematic analyses, and an iterative review process, to code responses as those supporting existing items, those indicating item revisions (e.g., change wording), or those providing general feedback. Results: Findings from FG1 (n=6) and FG2 (n=14), supported the relevance and content validity for 46 of 72 SDBM items and generated 16 items based on 22 new themes. Findings from FG3 (n= 11) supported 40 SDBM items and suggested 13 item revisions. Conclusions: Respondents described their lived driving experiences. From their responses, we generated items that captured key driving behaviors, or revised items to improve the relevance, clarity, appearance, and utility of the self-report and proxy report SDBM.

MEASURING THE RESPONSIVENESS OF ALTERNATE TRANSPORTATION SERVICE PROVISION FOR SENIORS: A COMPARISON BETWEEN TRADITIONAL 'NOT-FOR-PROFIT' MODELS AND THE ITN AMERICA® MODEL

B.M. Dobbs, P. Bhardwaj, *Family Medicine, University of Alberta, Edmonton, Alberta, Canada*

Despite the well-recognized demand for alternate transportation for seniors, there is, overall, a paucity of literature in this area. Notably, there is a scarcity of literature on different models of alternate service provision for seniors, with a further dearth of empirical research investigating the responsiveness of different models in terms of service provision. To address that gap, we compared 'benchmarks' of alternate transportation for seniors (ATS) service provision between ATS service providers (primarily small, not-for-profit organizations) in a large metropolitan area in Canada (Edmonton, Alberta: 2006 Census population of 1,034,945) with that of the Independent Transportation Network (ITNAmerica®) model of ATS. The ITNAmerica® model is based on a social entrepreneurial approach which leverages public sector resources through collaboration with the private and not-for-profit sectors. All service providers were rated across 5 domains: Availability, acceptability, accessibility, adaptability, and affordability (identified as the 5 A's of Senior Transportation by the Beverly Foundation, 2001), using a standardized tool known as the 'Senior Friendliness Calculator' developed by the Beverly Foundation. Scores can range from 0 to 25 with higher scores representative of more 'senior friendly' alternate transportation. The mean score for service providers in Edmonton & Area (n = 33) was 11.15 (SD = 2.94) compared to a mean score of 23.00 (SD = 0) for two ITNAmerica® affiliates. Although the sample size is limited, the results are striking. Perhaps most notable is the difference in approach. The Edmonton area ATS providers rely primarily on a traditional approach that is dependent on the availability of resources and volunteer drivers, resulting in little flexibility in service. The ITNAmerica® approach, which utilizes technological advances and community involvement enterprises, allows for services that enable accommodation, on an individual level, of the desires and needs of the population served.

OLDER DRIVERS' COMFORT SCORES AND NATURALISTIC WINTER DRIVING BEHAVIOR

A. Myers¹, A. Trang⁴, R.A. Blanchard³, A. Crizzle², *1. University of Waterloo, Waterloo, Ontario, Canada, 2. University of Waterloo, Waterloo, Ontario, Canada, 3. University of Waterloo, Waterloo, Ontario, Canada, 4. University of Waterloo, Waterloo, Ontario, Canada*

Previously we demonstrated that older drivers' perceptions were strongly associated with driving exposure and patterns using in-vehicle recording devices. The purpose of this study was to extend the investigation to winter driving behavior. The Canadian sample consisted of 34 drivers (53% female), ranging in age from 65 to 91 (mean 77) who drove at least once a week during the study period (late November to

late February). Each person completed the Day and Night Driving Comfort (DCS) and Perceived Driving Abilities (PDA) Scales, ratings of typical driving habits, as well as activity trip logs. A data logger (CarChip®) and GPS unit were installed in their vehicle for a consecutive two week period. Archives were used to examine hours of daylight, snowfall and extreme temperatures. Consistent with prior findings on summer driving, DCS scores were significantly related to PDA scores ($p < .01$) and self-report measures of restriction: situational frequency and avoidance ($p < .001$). Similarly, frequency and avoidance scores were significantly related to total driving time and distance (km), as well as night driving (number of days, trips and duration). Comfort level (both day and night) was significantly associated with total driving time and distance (km), while nighttime comfort level was related to distance driven at night ($p < .01$). The findings provide further evidence that older drivers' perceptions play a key role in self-regulation. Daytime comfort scores were more strongly related to driving exposure than in prior (summer) studies, possibly due to having to deal with more adverse road conditions (snowfall and freezing rain).

DRIVING BEHAVIORS AMONG THE OLDER OLD AND OLDEST OLD

J. Gaines¹, K. Marx¹, S.M. Hannum², S. Ballew², K. Burke¹, J.M. Parrish¹, 1. *The Erickson Foundation, Baltimore, Maryland*, 2. *University of Maryland-Baltimore County, Baltimore, Maryland*

The number of drivers over the age of 75 is increasing each year though our knowledge of driving behaviors for this population remains negligible. An anonymous, randomized survey was sent to 2850 older adults. The survey consisted of demographics, medical conditions, and a Driving Questionnaire for Driver respondents. 926 older adults responded (32.5%) including 680 (73.4%) Drivers. Drivers were significantly different from Non-Drivers ($p < .05$) on most demographic variables: age (80.2 yrs vs. 85.2 yrs); male (47.5% vs. 27.8%), married (59.9% vs. 41.2%), income of \$50,000 or higher (60.6% vs. 42.5%), college level education (56.0% vs. 38.1%) and medical conditions (1.8 vs. 2.4). In response to the Driving Questionnaire, 90% of the Drivers indicated a preference for driving themselves 3.6 days/week (sd = 1.8). Within this sample, 97.7% responded that driving was very important and 48.9% would be very upset if they couldn't drive. There is evidence of self-regulation of driving behaviors: (1) 40.4% no longer drive to distant towns; (2) 53.2% do not drive out of state; (3) 26.4% do not parallel park; and (4) 26.3% do not drive at night. About half of the sample thought that their driving ability could become a problem within 5 years (52.2%). However, less than half of the sample (43.9%) has given "some" and only 5.1% have given "a lot" of thought to stopping driving. Further study is needed to examine the self-regulation processes that lead to the decision to limit driving in the face of the importance of driving for older adults.

AGE-RELATED DIFFERENCES IN FUNCTIONAL SCANNING IN A SIMULATED DRIVING ENVIRONMENT

R.R. Goodenough¹, J.O. Brooks¹, M. Crisler¹, W.C. Logan², 1. *Clemson University, Clemson, South Carolina*, 2. *Greenville Hospital System, Greenville, South Carolina*

Among physicians who evaluate older adult driver fitness, there is belief that older adults tend to reduce the degree to which they scan the environment when driving. This change in scanning behavior might lead to an increased risk of crashes in complex traffic situations. This study seeks to develop an objective evaluation in a simulated driving environment. After measuring functional axial rotation, visual acuity, and contrast sensitivity, differences in the scanning behavior/ability of older (N=33) and younger (N=10) adults were examined. Participants were asked to respond to the brake lights of a lead vehicle while reporting the locations of targets presented at 14 different locations along the horizon. Older adults' reaction time rose more rapidly as the target locations moved laterally from the forward field of view.

BEST PRACTICES IN MEDICAL REVIEW AMONG STATE AND PROVINCIAL DMVS

T.M. Meuser¹, M. Berg-Weger², P. Niewoehner³, A. Harmon¹, J. Kuenzie¹, D. Carr⁴, P.P. Barco⁴, 1. *University of Missouri - St. Louis, St. Louis, Missouri*, 2. *Saint Louis University, St. Louis, Missouri*, 3. *St. Louis VA Medical Center, St. Louis, Missouri*, 4. *Washington University, St. Louis, Missouri*

This project compared all-inclusive medical evaluation forms utilized by 52 State and Provincial Departments of Motor Vehicles (DMVs) in the US and Canada. Forms were collected in Fall 2008. Comparisons focused length, format, content, instructional quality, medical coverage, ease of use, and other qualitative characteristics. Median page length was 2 (range 1-10), and mean word count was 1,083 (494-3,884). Common response options included open-ended (98%), forced choice (87%), and check box (81%). While the majority of forms (77%) required driver consent, only 24% requested other information from the driver. Less than half (46%) included text on confidentiality. While all forms requested general medical information, just a little more than half included a specific sections for vision (54%) and cognitive/neurological conditions (56%). Most forms (81%) required that a judgment be made concerning driver safety, and half prompted for possible license restrictions. Quality ratings were assigned on a 5-point Likert scale by group consensus. A full third of forms were rated as marginal or poor in overall comprehensiveness and utility, and just two garnered an excellent rating. Findings are discussed relative to current research on driver fitness and a model form for potential adoption. Best practice recommendations include a page length limitation, emphasis on in-person evaluation (i.e., as opposed to a records only review), prompts for driving history information, clear instructions and stepwise format, content prompts across relevant medical categories, options to record functional status and impairment levels, and emphasis on relative (vs. absolute) clinical judgments of overall driver safety.

WHAT FACTORS INFLUENCE THE RELATIONSHIP BETWEEN FEEDBACK ON COGNITIVE PERFORMANCE AND SUBSEQUENT DRIVING SELF-REGULATION?

M.L. Ackerman¹, M. Crowe¹, V.G. Wadley¹, D. Vance¹, J. Edwards², K. Ball¹, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *University of South Florida, Tampa, Florida*

Older drivers may not be aware of sensory or cognitive deficits, and yet self-monitoring of such abilities is required for safe driving. Providing feedback regarding sensory or cognitive abilities could lead to changes in driving self-regulation. However, in a recent study, 42% of participants who received negative feedback (based on UFOV® test score) did not subsequently regulate their driving. These analyses examine moderators of the relationship between feedback regarding cognitive abilities and self-regulation. Participants included 131 older drivers (75-93) who took part in the Senior Driver Research Project. Participants received a discount on their auto insurance based on their UFOV® test performance, and were informed whether they had or had not qualified for the discount. Change in driving self-regulation over 3 months was measured with difference scores on a composite of self-reported avoidance of 7 challenging driving situations (i.e. driving at night, driving in bad weather) across baseline and a follow-up assessment. We investigated potential moderators of the association between this feedback and subsequent driving behavior, including age, gender, education, global cognitive status (TICS-M), depressive symptoms, personality (neuroticism) and baseline driving exposure (measured by z-score composite of self-reported days per week and miles per week driven). Younger participants were less likely to subsequently alter their avoidance of challenging driving conditions ($p = .031$). Participants with greater than median baseline driving exposure tended to be less likely to alter their subsequent driving habits ($p < .057$). These results have important implications for encouraging older adults to make informed decisions about appropriate driving behavior.

TAKING AWAY MY FREEDOM: EMOTIVE RESPONSES FROM IN-DEPTH INTERVIEWS WITH OLDER AND FORMER DRIVERS

L. Kostyniuk¹, D.K. Robling², C.M. Connell², M. Janevic², *1. Transportation Research Institute, University of Michigan, Ann Arbor, Michigan, 2. University of Michigan School of Public Health, Health Behavior and Health Education, Ann Arbor, Michigan*

Reducing driving and, particularly stopping driving, is a stressful and even traumatic experience for many older adults, with adverse consequences for mental health and quality of life. This qualitative study used in-depth structured interviews to explore the circumstances associated with the process of driving reduction and cessation and attitudes and emotions associated with the transition from driving to not driving. Ten interviews (5 men, 5 women; 6 drivers, 4 former drivers; age range 65-88; recruited from Department of Motor Vehicle records) were conducted by trained interviewers. Qualitative analyses of verbatim transcripts resulted in several major themes — reluctance to stop driving, avoidance of particular traffic and weather conditions, perceived importance of driving for independence and convenience, unwillingness to acknowledge declining driving capability, lack of perceived risk to other motorists, and lack of preparation for the time they will no longer drive. Several highly emotionally charged stories about the importance of the ability to continue to drive are presented to illustrate the themes exemplified by statements such as “[driving cessation] locks you in a cage.” Participants who attend this session will better understand the range of attitudes and emotions associated with the common markers of the driving reduction and cessation process.

VISUAL ACUITY, VISUAL SPEED OF PROCESSING, AND PHYSICAL ACTIVITY IN THE OLDEST DRIVERS

J. Gaines¹, G. Dagnelie², K. Marx¹, S. Ballew³, S.M. Hannum³, K. Burke¹, J.M. Parrish¹, *1. The Erickson Foundation, Baltimore, Maryland, 2. The Johns Hopkins University, Baltimore, Maryland, 3. University of Maryland-Baltimore County, Baltimore, Maryland*

Normal age-related changes in visual acuity, visual speed of processing and physical activity have been related to the complex task of safe driving. 73 participants (M age = 82 years) in the Viva! Study on Successful Aging participated in a set of driving-related screenings using the Dagnelie Visual Screening Software (DVSS) that centered on: 1) visual acuity; 2) contrast sensitivity; and 3) visual fields. 54 participants (74%) self-identified as Drivers and also completed the Useful Field of View (UFOV™). Compared with Drivers, Non-Drivers were significantly older (86.5 years vs. 79.9 years, $p < .001$) and lived alone (86.7% vs 57.7%, $p = .021$). Physically, the Non-Drivers took fewer steps (2856 steps/day) at a moderate pace than Drivers (4254 steps/day; $p = .013$). Drivers had significantly better visual acuity (20/26) and contrast sensitivity (2.1%) in the better eye than Non-Drivers (acuity = 20/38, $p = .013$; contrast sensitivity = 3.7%; $p < .019$). 49.1% of the Drivers were placed in the UFOV categories of very low to low driving risk. The UFOV category was significantly correlated with balance ($r = .51$, $p = .007$); speed of walking ($r = -.36$, $p = .043$); total daily step count ($r = -.40$, $p = .030$); and high intensity walking ($r = -.37$, $p = .048$). In this study, older adults who are Drivers are younger and are more physically active than Non-Drivers. A relationship was found between the UFOV risk category and balance and walking activity. Further study is needed to examine the roles of visual acuity, processing speed, and physical activity in safe driving by the older-old and oldest old adults.

PREDICTORS OF DRIVING CESSATION IN OLDER ADULTS WITH VISION LOSS

J.P. Reinhardt, B.E. Gibson, K. Boerner, A. Horowitz, *Research, Jewish Home Lifecare, New York, New Jersey*

Driving and mobility have long been considered important factors influencing well-being among older adults. However, most prior studies have focused on demographic and medical factors associated with

driving cessation, and much of this work has been atheoretical. Therefore, this study uses a health behavior change model to examine psychological, social, and environmental factors that may influence driving cessation. From this theoretical perspective, a major barrier to behavior change (i.e., driving cessation) is the perception that the change would interfere with important goals. We use data from a larger, prospective, longitudinal study with participants interviewed at baseline and every six months for 2 years. All participants were 55 or older, driving, and experiencing vision problems at baseline. This paper presents findings from the first 200 participants for whom we have complete year 1 follow-up data. By year 1, 35 (17%) participants had stopped driving. After controlling for demographic variables, measured and subjective vision problems, health, and cognitive functioning, results of logistic regression showed providing rides to family and friends reduced the odds of driving cessation. In addition, as predicted by our theoretical model, higher perceived interference with important goals was associated with reduced odds of driving cessation. Receiving rides from family and friends and using more types of alternative transportation did not affect the odds of driving cessation. Implications for understanding driving transitions and for programming are discussed.

WHEN “MOM” WON’T HANG UP THE KEYS: DEVELOPING A GUIDE FOR FAMILIES IN CRISIS

A. Harmon, T.M. Meuser, *Gerontology, University of Missouri—St. Louis, St. Louis, Missouri*

Families with older drivers are often hesitant to discuss driving retirement until a crisis situation requires immediate action. Resources are available in the literature and on the Internet, yet no single guide currently exists to help families in crisis consider the family dynamics involved, as well as the practical, legal, and ethical concerns that go into managing this situation effectively and responsibly. With the support of a 2009 Student Scholar Grant from the National Center on Senior Transportation, this project was initiated to develop a directive, evidence-based guide to address this need. The following steps were taken: (1) review of existing resources; (2) meeting with a panel of experts in the field of aging and mobility to obtain advice and guidance and; (3) piloting the guide with groups of older adults and their family members, with revisions to enhance clarity and utility. The guide is designed to provide a “reality check” for families in crisis, allowing them to step back, to assess current needs and risks, and to develop a collaborative plan for ongoing mobility. Included are specific concerns of individuals in rural environments and suggestions for professionals on how to use the guide. The poster will detail the development of this guide and its application in supportive care and public health settings.

TRAINING PHYSICIANS TO DISCUSS DRIVING FITNESS WITH OLDER ADULTS: IMPACT OF A WEB-BASED COURSE

E. Dugan¹, S. Tennstedt², N. Gee², *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. New England Research Institutes, Watertown, Massachusetts*

Background: Driving a personal vehicle is by far, the most preferred means of personal mobility. The number of older drivers is increasing and expected to double by 2030. Yet uncertainty about driving fitness is common. Healthcare providers are often asked to intervene but not trained to deal with driving issues in their patients. We investigated if provider knowledge and communication about driving safety could be improved via an interactive web-based continuing medical education course. The learning objectives were to: enhance knowledge of the epidemiology and predictors of crashes in older adults; describe the health, legal, social, and emotional factors related to driving cessation; and develop effective driving safety communication skills. Methods: A pre/post test design was used. 44 primary care physicians (mean age 42; 51% female; 79% non-Hispanic White; 84% Board Certified) participated in the study. To test knowledge acquisition, pre/post multiple choice questions were administered online. To assess improvement in com-

munication skills, pre and post interviews with different standardized patients were conducted, recorded, and analyzed. Results: Paired t-tests were used to compare pre-test and post-test scores. There was a significant increase in post-test knowledge scores of 13.3 points ($p < 0.001$) and significant gains in general communication behaviors (6 points, $p < 0.001$) and communication related to driving safety (6.7 points, $p < 0.001$). Half of the physicians reported that, as a result of training, they would incorporate assessment of driving safety in routine visits. Conclusions: Web-based instruction is effective in improving provider skills to address driving safety issues. Supported by NIA grant #R44AG23366.

OLDER ADULTS' DRIVING REDUCTION AND CESSATION: IMPLICATIONS FOR ADULT CHILDREN

C.M. Connell¹, D.K. Robling¹, L. Kostyniuk², M. Janevic¹, 1. *Health Behavior and Health Education, University of Michigan School of Public Health, Ann Arbor, Michigan*, 2. *University of Michigan Transportation Research Institute, Ann Arbor, Michigan*

With the aging of our population, increasing numbers of older adults will need to limit and stop driving, despite a strong preference to continue. For many families, this transition places additional burden on adult children who play an informal caregiving role for their parents. This qualitative study examined the process of driving reduction and cessation from the perspectives of older adults and their adult children. Twelve focus group interviews were conducted; 4 each with groups of older drivers, former drivers, and adult children; the number of participants averaged 9 per group. Structured interview protocols were used to assess changes in driving, perceived risk of driving, the process of cessation, and the impact of cessation on adult children. Among the barriers to driving reduction and cessation that emerged were two related themes — reluctance on the part of older adults to increase the burden on their children; reluctance on the part of children to initiate the role of caregiver by assuming responsibility for transportation. Participants attending this activity will better understand the complex and interrelated family dynamics that shape decision making about when older adults' should limit or stop driving and how much and what type of support adult children can provide during this transition.

SOCIAL SERVICE PROVIDERS: WHAT ARE THEIR PERSPECTIVES ON DISORDERED GAMBLING AMONG SENIOR CITIZENS

K.L. Stansbury, D.R. Davis, S.R. Allen, *School of Social Work and Human Services, Eastern Washington University, Cheney, Washington*

The purpose of this study was threefold: a) determine if social service providers have observed an increase in problem gambling in older adults; b) explore what types of specific gambling-related problems have been brought to social service providers; and 3) examine whether social service providers and/or their clients have received training on disordered gambling. Using a cross-sectional survey design, questionnaires were mailed to social service providers who provide services to adults 60 and over. Of the 210 social service providers contacted, 73(35%) returned completed questionnaires. The questionnaire covered six areas: social service providers' demographics, agency-sponsored trips to casinos, reasons older adults engage in casino gambling, prevalence of gambling addiction, and training. Descriptive statistics were used to summarize findings. Descriptive analyses revealed that one-third of social service providers sponsor monthly trips to casinos. Over ninety percent had not encountered an older adult with gambling problems. Of the few who reported an encounter, it generally involved a client's family member experiencing problems with gambling. More than three-fourths had not received training on screening, treating, or educating their clients about disordered gambling. Only one-third of respondents were interested in receiving training on disordered gambling. The most common reason offered for lack of interest in training was that problem gambling is not a concern for their clients. Findings from this study indicate that

social service providers do not believe disordered gambling is a major concern for their clients. However, disordered gambling is a "silent addiction" and social service providers may underestimate the problem.

A STUDY OF THE OUTPATIENT MEDICAL SERVICE QUALITY TO THE ELDER PATIENTS' SATISFACTION

S. Huang, *Chang Jung Christian University, Tainan, Taiwan*

In this research, we build a multi-level model for evaluating the medical services quality in the view point of the patients and their companies, based on both the theorem "structure-process-outcome" from Donabedian in 1980, and on the documents relating to the models of services quality measurements and medical services quality measurements. We select outpatients for exploratory factor analysis at random to get the service factors. The questions included three types: medical service structure, medical service process, and medical service outcome. Some factors are extracted by using exploratory factor analysis. These factors are treated as the indexes of the medical service quality. This research differs from those using a single-dimensional method. According to the verification of this model, the measurements of the medical service quality are multi-layers and multi-dimensional, including the medical technologies, the medical art, the environment and the results. In fact, many hospitals in Taiwan use the THIS (Taiwan Healthcare Indicator Series) to compare the service quality, but forget the real feelings of the customers about the service quality. This research shows that not only emphasizing on the technical skill, hardware facilities does interest the elder in the aspect of the service quality, but also paying more care, more attentive to the patients does improve the elder patient's satisfaction. This model provides a systematic measurement to evaluate the importance of medical service quality indexes, which may have different point of view between the customers and the hospitals.

HUMAN RESOURCES AND SERVICE UTILIZATION OF OLDER PEOPLE AFFECTED FLOOD DISASTERS; A COMPARISON OF YOUNG-OLD AND OLDER-OLD

S. Chong, G. Kim, B. Oh, J. Kim, J. Moon, *Ewha Womans University, Seoul, Korea, South*

This study was intended to observe the human resources and service utilization of the elderly who affected by flood disasters in Gangwon province, Korea and to suggest the ways to support them. A total of 184 elderly people aged 60 and over who were directly or indirectly damaged by flood disasters of 2006 in Gangwon province, Korea were selected for the study subject. For the comparison, entire elderly subjects were divided into two parts by age 75; young-old and older-old. According to the study results, in human service utilization, a statistically significant difference was found between them. In other words, although young-old are more likely to use informal human resources such as friends and relatives than older-old, older-old are more likely to depend on formal human resources like military officers and volunteers in disaster situations. In service utilization, there was no statistical difference in used services and services supposed to be used in the future between them, however, a statistically significant difference was found in life saving. Older-old are more likely to use life saving services than young-old. Although entire elderly, in used services, have used services like basic life supplies and medical care or medicine, they, in services supposed to be used in the future, wanted to use services like family news service concerning their safety, accurate information, and psychological stability. In conclusion, older-old should be considered as most vulnerable group to use human resources and services and age-based approach is necessary to take measures in resource utilization.

THE EFFECTIVENESS OF THE SERPER METHOD™: A COGNITIVE STIMULATION FOR PERSONS WITH MILD TO MODERATE DEMENTIA

R.L. Berman¹, M.A. Iris¹, R. Bode², C. Robinson¹, S. Brenner¹, L. Factor¹, I. Leonard Schanfield Research Institute, CJE SeniorLife, Chicago, Illinois, 2. Department of Physical Medicine and Rehabilitation at Northwestern University, Chicago, Illinois

Researchers and practitioners increasingly recognize the potential benefits of stimulating, meaningful activities for those with cognitive impairment. This evaluation study assessed the effectiveness of The Serper Method™, a cognitive stimulation program for persons with dementia. We documented participant outcomes and assessed the feasibility of implementing the intervention in three long term care settings. We hypothesized that the intervention group would demonstrate maintenance or improvement in cognitive function using the MMSE and the Nexade© exam, as well as improvements in self-reported quality of life and self esteem. Thirty-five individuals with mild to moderate cognitive impairment were assigned to either an intervention or a waiting-list comparison group. Intervention participants attended two 1 ½ hour Serper Method™ study groups twice a week for 24 weeks. Outcomes were assessed at baseline, three months, and six months; the intervention group was also assessed two months after the end of the intervention. For the 30 participants who completed the study at six months, the intervention group (n=18) but not the comparison group (n=12) demonstrated statistically significant improvements in several domains of cognitive function on the Nexade© exam, including: sustained attention, visuospatial learning, short-term memory, executive function, and mental flexibility. Gains in cognitive function were retained at eight months for the intervention group. Results suggest that three months may be an insufficient dose of the intervention. While there were no significant changes in other outcomes and no between group differences, site staff reported behavioral changes in intervention group participants that confirm findings regarding gains in cognitive function.

WHERE HAVE WE BEEN AND WHERE ARE WE GOING? CONTENT ANALYSIS OF NON-FAMILIAL INTERGENERATIONAL RESEARCH

S.E. Jarrott, A.P. Weintraub, *Human Development (0416)*, Virginia Tech, Blacksburg, Virginia

Human services providers increasingly turn to intergenerational programs to meet client and community needs. Intergenerational programs, which purposefully engage youth and elders for mutual benefit, include tutoring for immigrant elders and respite for parents of disabled children. Intergenerational scholars frequently note a dearth of theoretical grounding and psychometrically sound instruments in the literature. We conducted a content analysis of journal articles addressing non-familial intergenerational relationships to depict the field, discover research methodology trends, and identify new questions to explore. We analyzed 220 peer-reviewed articles in research databases. Most were research studies (66%) or program descriptions (26%). For each research article, we coded the theoretical foundation, sample and methodological characteristics, and findings. Nearly 50% were atheoretical. Most involved well elders (82%) and youth ages 11+ (58%); children's experiences were more commonly measured (86%) than elders. Sample sizes were typically less than 25 persons; other stakeholders were rarely assessed. Pre-post analyses of children's attitudes towards aging were the most commonly analyzed outcomes, typically revealing benefits of contact. Intergenerational research can improve by specifying theoretical bases, including multiple stakeholders, and moving beyond attitudinal measures. Because intergenerational programs often serve small groups of participants, research can improve by gathering more points of data, adding to the sample with data on subsequent cohorts, and following participants beyond the intervention period. Such studies were identified and must become prevalent if intergenerational practices and outcomes are to be optimized. Session participants will comprehend the

state of intergenerational programming research and consider next steps to advance the field.

RE-THINKING ELDER NEEDS THROUGH INTERPRETIVE NEEDS ASSESSMENT: A CASE FOR IMAGE-DRIVEN RESEARCH

E. Kearns, V. Parker Callahan, D. Collier, A. Miller, D.W. Scott, R. Pennellatore, *Greater Lynn Senior Services, Lynn, Massachusetts*

This paper examines the impact of an image-driven methodology on the assessment of elder needs. Informed by critical gerontology and conducted by Greater Lynn Senior Services to fulfill its mandate of delivering optimal social and health service support choices to more than 30,000 elders residing in its catchment area, the assessment aims to: avoid "expert" presuppositions and pre-determined answers, invite discourse around what may actually be occurring, and deconstruct existing categories of analyses. Describing an ongoing elder needs assessment process, the authors present an interpretivist approach that enhances community dialogue and informs policy decisions around resource allocation and service delivery. Central to the methodology are image-driven focus groups that: include community participants often ignored or under-represented by traditional needs assessment methodologies, break from traditional survey-based processes that frequently present pre-determined needs for ratification, and eschew conventional focus group approach of generating topic guides from pre-determined themes. Rather, initiating discussion around diverse images of elders in daily situations and asking participants what they see captures greater diversity and nuance, transfers control from "provider-expert" to the community, and allows the multiple realities of the aging experience to emerge more fully. Preliminary findings indicate consumer needs emerge that traditional assessments missed. Participants identify various emotional and social needs as priorities that may trump a medical model's depiction of physical health as the dominant aging need. Participants in this paper session will be introduced to a realistic alternative model for needs assessment consonant with the time and resource constraints commonly faced by non-profit organizations.

A PRELIMINARY LOOK AT MEDICARE D: SENIORS LEVEL OF SATISFACTION

M.M. Newton, *Sociology and Social Work, Jacksonville State University, Jacksonville, Alabama*

Medicare Part D is the voluntary prescription drug benefit offered by the federal government/Medicare through individual prescription drug plans. The Centers for Medicare and Medicaid Services reported that as a result of the complexity of the plan and the multitude of options available, there were initial start-up problems in early 2006. Several of these problems included extended telephone wait time for potential enrollees, inadequate plan information for pharmacies, transition problems for dual-enrollees (Medicare and Medicaid), and overall program confusion (Bach & McClellan, 2006). This paper presentation is a discussion of a pilot research project conducted in small communities of mid-east Alabama over a two year period from 2006, year of Medicare D full implementation, through spring 2008. The research involved collecting data on knowledge of and satisfaction with the new Medicare D prescription drug benefit. The current data support early findings that the majority of Medicare PDP enrollees are currently satisfied with their new prescription drug coverage and it also illuminates areas of future concern, including: gender differences, differences in beneficiaries with greater need for prescription drugs, Prescription Drug Plan differences/changes, policy revisions/program changes, and the impact of the "doughnut hole" on enrollee satisfaction. After attending this session, participants will be able to define factors related to consumer satisfaction with the federal Medicare D prescription drug benefit, including potential concerns that may need to be addressed regarding social policy and direct practice with seniors and their families.

AN ASSESSMENT FOR THE NEED OF SENIOR SERVICES IN MAHONING COUNTY OHIO: HOW DO WE GET A LEVY PASSED?

J.L. Iudicani, D.J. Van Dussen, *Youngstown State University, Youngstown, Ohio*

The purpose of this study was to assess the need for senior service programs in Mahoning County Ohio to gain further insight for a future senior service levy. In this study, a senior services needs assessment survey was given to determine the types of programs needed, funding levels of the programs, the need for funding of new services, and new program development. The research was conducted in conjunction with the Area Agency on Aging Chapter 11, Alzheimer's Association Greater East Ohio Chapter, Hands on Volunteer Network of the Valley and Youngstown State University. The survey was completed by a systematic sample of registered voters in Mahoning County. Paper and pencil surveys of 297 registered voters in Mahoning County were collected between December 2008 and March 2009. The results indicate the mean age of respondents is 59 and 61.8 percent of the respondents are female. The three most commonly suggested senior programs of importance to the voters are prescription drug assistance programs, emergency response systems, and caregiver services. Bivariate analysis indicated a significant correlation between prescription drug assistance programs and gender. Results indicate that voters are unaware of the services available to them. The next step may include a public awareness campaign of senior issues and planning for a future levy.

SESSION 1300 (SYMPOSIUM)

THE HOSPICE CAREGIVING EXPERIENCE: EXPLORING THE TRAJECTORY OF CAREGIVING

Chair: *G. Demiris, University of Washington, Seattle, Washington*

Discussant: *E. Wittenberg-Lyles, University of North Texas, Denton, Texas*

Family members, friends, spouses or others who assume the informal caregiving role are essential to the delivery of hospice services to patients at the end of life. The caregiving role does affect caregivers' own mortality. Informal caregivers often struggle with the physical and psychological demands of caregiving and their own needs often are not addressed. The hospice philosophy is based on the notion that both the patient and the informal caregiver constitute the unit of care. The ACT (Assessing Caregivers for Team Interventions) promotes the holistic assessment of caregivers' needs and stressors and the design of individualized interventions that are to be delivered by the hospice interdisciplinary teams. This symposium provides an insight into the complexity of the caregiving role and demonstrates how the history of the caregiver-patient relationship, caregivers' occupational and personal health histories, previous caregiving experience and support affect the strategies and approaches caregivers adopt during the hospice experience. Furthermore, it includes the presentation of a problem solving intervention delivered to hospice caregivers aiming to increase their problem solving skills, improve caregiver quality of life and reduce anxiety. Finally, the symposium also covers the last stage of caregiving, namely bereavement, where caregivers deal with grief and loss and are still in need of personalized cognitive behavioral interventions.

ASSESSING CAREGIVER NEEDS IN HOSPICE: A PROBLEM SOLVING INTERVENTION

G. Demiris, University of Washington, Seattle, Washington

Informal caregivers of hospice patients often face several challenges as they take care of a loved one at the end of life. A problem solving intervention can support caregivers as they cope with the tasks and challenges of caregiving and allow them to develop strategies to prioritize and address issues. We present the findings of a pilot study funded by the National Institutes of Health that examines the delivery of a problem solving intervention to hospice caregivers and explores its delivery both in person and using videophone technology. Outcomes include

caregiver anxiety, quality of life and problem solving inventory. Findings indicate the value of problem solving tools for hospice caregivers and the need for further interventions that target hospice caregivers.

EXAMINING THE PAST: FACTORS AFFECTING HOSPICE CAREGIVERS' STRATEGIES AND ATTITUDES

K. Washington, University of Louisville, Louisville, Kentucky

Individuals receiving home-based hospice services often rely upon family members and friends to serve as informal caregivers responsible for managing emotional, psychological, spiritual, and physical pain. The purpose of this in-depth, grounded theory study was to generate a model describing how psychosocial factors influence informal hospice caregivers' management of pain. Findings revealed that caregivers' pain management strategies are influenced by the history of the caregiver-patient relationship, caregivers' occupational and personal health histories, previous caregiving experiences, caregivers' individual personalities, support from others, and competing demands. Findings support the inclusion of informal caregivers in thorough psychosocial assessments conducted by hospice social workers in an effort to maximize the potential for effective pain and symptom management.

SUPPORTING CAREGIVERS IN THE BEREAVEMENT PHASE

D. Parker Oliver, Family and Community Medicine, University of Missouri, Columbia, Missouri

In addition to existing interventions for hospice caregivers who are taking care of a loved one, hospice services should address caregiver needs in the bereavement phase. During that phase, caregivers struggle with loss and grief as well as practical issues that often require immediate response. This presentation demonstrates the adoption of the problem solving intervention described earlier to address caregiver needs in the bereavement phase, where caregivers no longer struggle with the physical demands or practicalities of caregiving but have to face several challenging aspects as they go through bereavement. The presentation demonstrates how the ACT framework (Assessing Caregivers for Team Interventions) can be applied to assist caregivers during the bereavement phase.

SESSION 1305 (SYMPOSIUM)

THE IMPACT OF SPOUSAL BEREAVEMENT ON LATE LIFE HEALTH: NEW DIRECTIONS IN THEORY, RESEARCH, AND PRACTICE

Chair: *D. Carr, Rutgers University, New Brunswick, New Jersey*

Discussant: *J. Ha, University of Chicago, Chicago, Illinois*

The death of one's spouse in later life is typically accompanied by at least short-term symptoms of depression, anxiety, and some physical health symptoms. However, widow(er)s reveal tremendous heterogeneity in the type, time course, and intensity of symptoms. The five papers in this panel explore the factors associated with physical and emotional adaptation to loss, and identify potential paths to treatment. Utz, Lund, Caserta, & deVries track the physical health symptoms at 2, 6, and 16 months among the 329 bereaved persons who participated in the "Living After Loss" (LAL) study. Richardson, Carr, Bennett & Gallagher use data from the Changing Lives of Older Couples (CLOC) study to explore the short-term effects of spousal loss on a range of biomarker indicators, including inflammatory markers. de Vries, Lund, Caserta & Utz use data from the LAL study to explore the protective effects of social support in early widowhood. Carr & Sharp examine the extent to which beliefs in the afterlife protect against grief symptoms and yearning among participants in the CLOC study. Shear, Guesquire, Fox, Alston & Kishon investigate the effects of a targeted psychosocial intervention for bereaved persons suffering from complicated grief. Implications for policy and practice are highlighted.

THE HEALTH AND HEALTH BEHAVIORS OF THE BEREAVED

R.L. Utz¹, D. Lund³, B. De Vries², M. Caserta¹, 1. *University of Utah, Salt Lake City, Utah*, 2. *San Francisco State University, San Francisco, California*, 3. *California State University San Bernardino, San Bernardino, California*

This presentation focuses on the physical health symptoms and health behaviors among recently bereaved older adults (2 to 6 months post-loss). It also explores the relationship between physical and mental health over the course of bereavement (up to 16 months post-loss). Drawing on the experiences of 329 bereaved persons who participated in the "Living After Loss" (LAL) study, we first documented common physical symptoms and reported health behaviors that may be related to grief. We then explored the strong and consistent positive correlation between reported health symptoms and measures of grief and depression; these relationships persisted over the course of bereavement, but the lagged effect of prior physical health predicting future mental health, and vice versa mental health predicting physical health, was less clear. Our results remind us that bereavement is a multi-faceted experience that involves both physical and mental health adjustment.

HOW DOES WIDOWHOOD GET UNDER ONE'S SKIN?: AN EXPLORATION OF BIOMARKER RESPONSES

V.E. Richardson¹, D. Carr², K.M. Bennett³, S. Gallagher⁴, 1. *The Ohio State University, Columbus, Ohio*, 2. *Rutgers University, New Brunswick, New Jersey*, 3. *University of Liverpool, Liverpool, United Kingdom*, 4. *Staffordshire University, Staffordshire, United Kingdom*

We use data from the Changing Lives of Older Couples (CLOC) study to investigate whether the experience of spousal loss and specific grief symptoms are associated with physiological responses, as measured with biomarker indicators including epinephrine, norepinephrine, and cortisol levels. We compared widowed persons with matched married controls, and also explored heterogeneity among the bereaved subsample. We found no significant differences between widowed persons and matched controls with respect to the biological outcomes. However, among the bereaved-only sample we found that those involved with extensive caregiving evidenced high cortisol and epinephrine levels especially at Wave 2. Bereaved persons who experienced sudden deaths and high levels of numbness also revealed heightened cortisol levels. Some circumstances evoke physiological reactions soon after the death while others emerge later. Our results suggest the need for greater attention to biological responses during bereavement and to interventions that might prevent or reduce these potential adverse reactions.

SOCIAL SUPPORT IN EARLY WIDOWHOOD

B. De Vries¹, D. Lund², M. Caserta³, R. Utz³, 1. *San Francisco State University, San Francisco, California*, 2. *California State University, San Bernardino, California*, 3. *University of Utah, Salt Lake City, Utah*

This study explored the relative contributions of friends and family to the lives and welfare of women and men in the first two to six months following the death of their spouse or partner. Three hundred and twenty-nine widowed men (39%) and women age 50 and older completed a self-administered questionnaire that included measures of contact and satisfaction with friends and family as well as measures of coping and psycho-emotional well-being. Regression analyses revealed that satisfaction with friendship support was associated with lower grief and higher self-esteem, and satisfaction with both friend and family support was associated with higher mastery and lower depression and loneliness. These analyses further articulate the role of social support in bolstering individuals during stressful life transitions and advance our understanding of the under-examined and particularly distinct functions of friendship in the early phases of spousal loss. (Funded by the National Institute on Aging R01 AG023090) 90)

DO BELIEFS IN THE AFTERLIFE PROTECT AGAINST BEREAVEMENT-RELATED DISTRESS?

D. Carr¹, S. Sharp², 1. *Rutgers University, New Brunswick, New Jersey*, 2. *University of Wisconsin, Madison, Wisconsin*

Recent theory suggests that maintaining "continuing bonds" with one's deceased spouse is associated with better psychological adjustment to loss. One strategy for maintaining such bonds is to subscribe to the belief in the afterlife, and the belief that loved ones are ultimately reunited in the afterlife. We use data from the Changing Lives of Older Couples (CLOC) study to explore whether such beliefs are associated with better psychological adjustment to loss. We find that general beliefs in the afterlife are not associated with depressive symptoms among the bereaved, yet among married match controls, persons who "do not know" whether an afterlife exists report significantly elevated depressive symptoms. Our results suggest that existential doubts among older married persons may make it difficult to face impending loss. However, in the early stages of bereavement, the belief that one will be reunited with the decedent does not provide protection against depressive symptoms.

COMPLICATED GRIEF AND ITS TREATMENT IN OLDER ADULT WIDOWS

K. Shear, *School of Social Work, Columbia University, New York, New York*

Complicated grief is a recently identified prolonged grief reaction that causes significant distress and impairment. Estimated prevalence of this condition among older widows is about 10%. We developed a targeted psychosocial intervention for people suffering from CG and are currently testing it in an NIMH study of older adults. This presentation will present baseline data for older widows regarding demographic information, number of previous losses and associated symptoms of sleep disturbance, disruption in daily activities, functional impairment and levels of hope. We will describe the treatment approach using a vignette of an older widow to illustrate how this works.

SESSION 1310 (SYMPOSIUM)

THE USC WELL ELDERLY STUDY II: BROAD-BASED IMPLICATIONS FOR FUTURE GERONTOLOGICAL RESEARCH

Chair: *F. Clark, Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

Discussant: *S.M. Stahl, National Institute on Aging/NIH, Bethesda, Maryland*

In 1997 our investigative team completed the USC Well Elderly Study (Well Elderly I), a randomized clinical trial that demonstrated the efficacy of a comprehensive individualized lifestyle intervention in slowing down age-related declines among independently living adults. As the next step in our research program, Well Elderly II was undertaken to go beyond Well Elderly I, an efficacy study, to test the intervention's effectiveness under less favorable conditions for maximizing effect size, but delivered in more natural, real world circumstances. A second aim of Well Elderly II was to investigate longitudinally the mediating mechanisms that account for the intervention's positive effects. In Well Elderly II, an initial sample of 460 subjects was repeatedly assessed at 6 month intervals over an 18 (treatment group) or 24 (control group) month period on measures of meaningful activity, perceived control, social support, stress-related biomarkers, cognitive functioning, depression, life satisfaction, and physical and mental health. Not only did this study enable analyses of intervention outcomes and their mediating mechanisms, but it also made available an exceptionally rich data set for investigating a wide range of methodological and theoretical issues pertinent to gerontological research. In this panel we will present the findings of a series of studies which collectively address factors that influence outcomes in gerontological clinical trial research. These topics concern the recruitment and retention of ethnic minorities in RCTs, the role

of mediators in linking interventions to targeted benefits, the measurement and conceptual role of biomarkers, and problems of reverse-coded items in self-administered assessments

MEASUREMENT DIFFICULTIES AND CORRECTION PROCEDURES ON REVERSE SCORED ITEMS FOR OLDER ADULT RESPONDENTS

M. Carlson, R. Wilcox, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

Reverse-coded items contained on assessment scales potentially create measurement problems for older adult respondents. Using data from a clinical trial involving 460 multi-ethnic older adults, we hypothesized that the reversed items on the Center for Epidemiologic Studies Depression Scale (CES-D): are less reliable than non-reversed items; disproportionately lead to intra-individually atypical responses; and induce atypical responses more frequently among elders more likely to have information processing difficulties. The results supported these expectations. Relative to non-reversed CES-D items, the four reversed items were less internally consistent, exhibited low item-scale correlations, and were more often answered atypically especially by elders who were male, less educated, or had lower cognitive functioning. Additionally, the use of imputation to replace atypical responses enhanced the predictive validity of the set of reverse-scored items. We conclude that reverse-scored items induce measurement difficulties among older adult respondents, and that the application of correction procedures can reduce such difficulties.

A BIOSOCIAL MODEL OF HEALTH AND WELL-BEING DERIVED FROM WELL ELDERLY II

B. Cherry¹, D.A. Granger², D. Mandel³, 1. *Psychology, California State University, Fullerton, Fullerton, California*, 2. *Pennsylvania State University, University Park, Pennsylvania*, 3. *University of Southern California, Los Angeles, California*

A minimally invasive and multi-system measurement approach (using salivary analytes) was used to examine associations between the psychobiology of the stress response and physical health, psychosocial well-being, and cognitive functioning in a large ($n = 206$; ages 60 to 94 years; 64% female) ethnically diverse sample of well older adults. Test sessions at senior centers/residence facilities were conducted during which assessments of health, well-being, cognitive functioning, activity, social support, coping and perceived control were obtained. On a subsequent day, saliva was collected at each individual's home upon waking, 30 minutes post-waking, midday, and in the early evening and assayed for cortisol, DHEA, and alpha-amylase (sAA). Structural equation models confirmed associations between individual differences in the cortisol awakening response and health and well-being, as well as moderation of these effects by DHEA and sAA. The results will be discussed with respect to advancing biosocial models of health and well-being.

RECRUITMENT AND RETENTION OF OLDER ETHNIC MINORITIES

J. Jackson, D. Mandel, J. Blanchard, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

Recruiting and retaining minority older adults as study participants is critical in attempting to address health disparities through scientific research. Using strategies identified by the Resource Centers on Minority Aging Research, 460 ethnically heterogeneous older adults (32% African American, 20% Hispanic, 37% white, and 11% other or unspecified) were recruited for participation the Well Elderly II clinical trial. Overall, study retention was 78% and 67% at 6 and 12 months, respectively. Although retention rates did not differ between the three main ethnic groups, the predictors of retention varied among the groups. African Americans who were female or more active, Hispanics with compromised physical health, and Whites who were less depressed were

more likely to continue study participation (all p 's $< .05$). The results are discussed relative to RCMAR guidelines for improving minority recruitment and retention in health care research.

MEDIATING MECHANISMS OF THE WELL ELDERLY II INTERVENTION EFFECTS

C. Chou¹, F. Clark², 1. *Institute For Prevention Research, University of Southern California, Alhambra, California*, 2. *University of Southern California, Los Angeles, California*

A key purpose of the Well Elderly II study was to document the mediating mechanisms that link broad-based lifestyle interventions to positive outcomes in older adults. Using baseline and posttest data from a clinical trial involving 460 ethnically diverse elders, we tested the hypothesis that the intervention increases healthy activity, active coping, and social support, which in turn lead to enhanced physical health, psychosocial well-being, and cognitive functioning. To assess this hypothesis, structural equation modeling was used to evaluate both the direct effect of the intervention on outcomes and the indirect effect of the intervention on outcomes through the proposed mediators. The results indicated that the intervention's positive effects were mediated through healthy activity, but not active coping or social support. This result is discussed in terms of its implications for basic theory as well as for the development of enhanced lifestyle interventions for older adults.

FACTORS THAT IMPACTED EFFECT SIZE IN THE WELL ELDERLY II CLINICAL TRIAL

F. Clark, M. Carlson, *Occupational Science and Occupational Therapy, University of Southern California, Los Angeles, California*

The USC Well Elderly Study (Well Elderly I) demonstrated that, under favorable research conditions, a lifestyle intervention can forestall declines associated with aging and in some domains lead to positive gains in health or well-being. Moving beyond this prior result, which demonstrated the intervention's efficacy, a second trial (Well Elderly II) was conducted to test the intervention's effectiveness rather than efficacy through the incorporation of the following design features: 1) expansion of the number and type of sites from two locations with considerable agency "buy-in" to twenty-one with varying degrees of administrative investment; 2) a shortened treatment duration; and 3) sampling of more elders at highest risk for health disparities. Results of the intent-to-treat analysis demonstrated a diminished intervention effect for Well Elderly II relative to Well Elderly I. In this paper, we present an analysis of the set of factors that were identified as significantly related to effect size.

SESSION 1315 (SYMPOSIUM)

TRANSLATING COMMON-SENSE MODEL THEORY TO PRIMARY CARE PRACTICE

Chair: E.L. Idler, *Institute for Health, Rutgers University, New Brunswick, New Jersey*

Discussant: H. Leventhal, *Institute for Health, Rutgers University, New Brunswick, New Jersey*

The prevalence of chronic disease in older populations continues to grow, and with it, the need for patients' expert self-management of often complicated treatments. Physicians and patients must communicate effectively to establish and maintain such practices. The session will provide an overview of the Common-Sense Model approach to understanding physician-patient interactions in primary care – the extent to which they agree on the identity, cause, duration, consequences, and control of the presenting problem. The PProcesses of Illness Management (PRIM) Study and the Asthma Providers Study seek to understand patients' common-sense models of illness, physicians' efforts to take the patient's point of view, and the integration of common-sense models with effective action plans to help patients manage their acute and chronic illnesses successfully. PRIM primary care patients ($N=378$) were inter-

viewed and followed for one month; PRIM physicians completed questionnaires, and audio-recorded visits. Asthma providers (N=197 physicians) were interviewed to determine compliance with national practice guidelines. In the first of four papers, E. Leventhal reviews research on the Common-Sense Model and its application in primary care practice. Idler presents research on the use of global self-ratings of health in clinical settings, comparing physicians' and patients' ratings. Phillips discusses the factors affecting physicians' perceptions of patients' models of both illness and treatment. Musumeci-Szabó reports on the ability of physicians to effectively demonstrate inhaler use to asthma patients and their adherence to national practice guidelines. Finally, H. Leventhal draws the links between theory, research, and practice in this critically cost-sensitive area of chronic illness management.

TRANSLATING THE CSM THEORY INTO PRACTICE: INSIDE THE CLINIC: HOW TO DO AND TEACH IT

E.A. Leventhal, *1. Rutgers University, New Brunswick, New Jersey, 2. University of Medicine and Dentistry of New Jersey, New Brunswick, New Jersey*

Medicine's basic goal is to help patients maintain optimal health and functional independence. Effective management of chronic conditions that are inevitable with advancing age depends upon the congruence between the patient's Common Sense (CS) perceptions and beliefs and the bio-medical condition. The clinician's challenge is to perceive and connect the patient's CS perceptions to a framework that more closely reflects biomedical realities. Effective management requires motivation and skills to adhere to practices targeting objective outcomes; e.g., blood pressure and blood glucose. Good psychosocial relationships with patients form a context for acquiring the perceptual and instrumental skills for effective self management but are insufficient to achieve objective outcomes that will reduce the costs of unneeded office and emergency room visits and the risks to patients of unnecessary hospitalizations. Improving management of chronic illness requires minimal change in provider behavior and can be taught to future providers.

PATIENT-PHYSICIAN AGREEMENT ON GLOBAL RATINGS OF HEALTH: MORE PERCEIVED THAN REAL?

E.L. Idler, *Institute for Health, Rutgers University, New Brunswick, New Jersey*

The patient's health is an object of concern to both physician and patient. Physician visit interactions about specific problems take place in the context of global evaluations of health on the part of both actors. A theory of mind approach examines how well patients and physicians agree on overall ratings of health, and how well they perceive the other's point of view. PRIM data on patients' self-rated health, patients' views of how the physician sees their health, physicians' ratings of patients' health, and physicians' views of how patients see their health are compared. Patient and physician ratings are identical only 38 percent of the time. Patients perceive their doctors to share their rating 62 percent of the time, but they are correct only 40 percent of the time. Physicians perceive that patients share their rating 70 percent of the time but are correct only 47 percent of the time.

THOSE WHO CAN, DO NOT TEACH: RECOGNIZING AND CAPITALIZING ON TEACHABLE MOMENTS IN MEDICAL ENCOUNTERS

T.J. Musumeci-Szabó¹, L.A. Phillips¹, J.P. Wisnivesky², E.A. Halm³, H. Leventhal¹, *1. Rutgers University, New Brunswick, New Jersey, 2. Mt. Sinai School of Medicine, New York, New York, 3. Univ. of Texas SW Medical Center, Dallas, Texas*

Asthma in adults requires sophisticated self-management. While inhaler technique is a vital component of asthma management, studies suggest proper technique needs to be taught – to both patients and physicians. This study used quantitative and qualitative data to describe how and when physicians demonstrate inhaler technique in office visits,

and to examine factors associated with optimal inhaler technique. In five general-medicine practices, we administered survey interviews to determine physician's application of national treatment guidelines and ability to demonstrate proper inhaler technique. Among 197 physicians, training level ranged from first-year resident to attending (residents=78.7%). Consistent with prior research, no association was found between physician training level and proper technique; on average, physicians correctly performed five of seven steps. Skilled physicians were as likely as unskilled to ask to observe a patient's technique. Intervention is needed, as demonstrating inhaler technique represents a unique opportunity to impact patients' models of asthma and its treatment.

SHARED PHYSICIAN AND PATIENT COMMONSENSE MODELS: REQUIRED FOR SUCCESSFUL INTERVENTIONS

L. Phillips, H. Leventhal, *Institute for Health, Rutgers University, New Brunswick, New Jersey*

Patients hold commonsense models of illness—beliefs about illness/treatment labels, symptoms, causes, consequences, timeline, and control of the problem and its treatment. How well a physician addresses the patient's model has been shown to predict adherence and outcomes. To know when a patient's model needs to be addressed, a physician must be able to perceive when there is disagreement between the patient's model and what the physician is diagnosing and prescribing. The current, longitudinal study assessed the accuracy of physician-perceptions of disagreement between the patient's and the medical model. The sample included 402 primary-care patients of 34 physicians. It was hypothesized and found that the same ability that allows physicians to address patient-models is related to how well they can detect disagreement. Results indicate that a patient-intervention to improve adherence and outcomes through addressing patient-models would be better implemented if preceded by a physician-intervention teaching physicians how to detect model-disagreement.

SESSION 1320 (SYMPOSIUM)

ACTIVE MAINTENANCE OF HEALTHY LIFESTYLES: UNDERSTANDING AND PROMOTING RESILIENCE IN THE FACE OF AGING'S CHALLENGES

Chair: P.G. Clark, *Program in Gerontology, University of Rhode Island, Kingston, Rhode Island*

Discussant: B. Resnick, *University of Maryland, College Park, Maryland*

The promotion of healthy aging should be based on the concept of active maintenance, "proactive strategies used by an individual to continue a behavior in the face of physical, psychological, social, or environmental changes that may threaten that maintenance." Having older adults anticipate and respond to the inevitable challenges encountered as they get older is the core of this concept. This symposium explores interdisciplinary perspectives on active maintenance, including both its theoretical foundation and its practical implementation in specific interventions. The first paper develops a conceptual framework and explores its relationship to resilience and its promotion with older adults. The remaining papers report on longitudinal data from the two-phase SENIOR Project—a research study assessing interventions to promote increased physical activity and healthier diet in a large sample of community-dwelling older adults. In Phase I, 1277 participants were recruited at time 0, and 968 completed the time 24-month assessment; Phase II (ongoing) recruited 470 at time 66 months from the initial assessment. The second and third papers report demographic and behavior change variables predictive of maintaining key elements of healthy lifestyle and buffering older adults from "going off track" in response to a range of setbacks. Finally, an intervention component based on a telephone coaching call methodology and the psychological concepts used to develop it are presented. Qualitative data establishing a typol-

ogy of active maintenance “trajectories” are summarized; relationships to quantitative measures are also reported. Recommendations for further research and the development of healthy aging interventions are explored and discussed.

ACTIVE MAINTENANCE AND RESILIENCE IN HEALTHY BEHAVIORS: AN INTERDISCIPLINARY CONCEPTUAL FRAMEWORK

P.G. Clark¹, P. Burbank¹, E. Estus¹, B. Evans², D. Martins¹, N. Owens¹, *1. Program in Gerontology, University of Rhode Island, Kingston, Rhode Island, 2. Rhode Island College, Providence, Rhode Island*

The concept of “active maintenance” is proposed as an organizing framework for understanding and promoting healthy aging. It is defined as “proactive strategies used by an individual to continue a behavior in the face of physical, psychological, social, and environmental changes that may threaten that maintenance.” The related concept of resilience has been described as the “capacity to maintain high well-being in the face of adversity.” Resiliency is the ability and speed at which an older adult is able to overcome an adverse event and to return to their previous level of function. This paper presents an interdisciplinary conceptual framework exploring the linkages between these two concepts, incorporating (1) the public health concept of tertiary prevention, (2) the transtheoretical model of health behavior change, (3) the compression of morbidity, and (4) the chronic disease trajectory model. Potential applications to interventions and recommendations for further research are explored.

FACTORS PREDICTING THE MAINTENANCE OF PHYSICAL ACTIVITY: RESULTS FROM THE SENIOR PROJECT

D. Riebe¹, B. Blissmer¹, M. Greaney^{2,3}, *1. Kinesiology, University of Rhode Island, Kingston, Rhode Island, 2. Dana-Farber Cancer Institute, Boston, Massachusetts, 3. Harvard School of Public Health, Boston, Massachusetts*

Identifying variables that predict the long-term maintenance of physical activity in older adulthood is critical. We examined data from the end of SENIOR I, when the study population (N = 328, age = 73.8 years) were all regularly active, to attempt to differentiate individuals who were able to maintain that activity over the subsequent 42 months prior to the SENIOR II project (48.9%) versus those who relapsed to a pre-action stage (51.1%). Physiological variables that predicted the maintenance of physical activity included higher Yale Physical Activity Survey summary scores, greater participation in vigorous activity, lower timed Up & Go scores, and younger age. Behavioral variables that predicted maintenance included higher confidence and greater use of experiential and behavioral processes of change. Understanding variables that predict long-term participation in physical activity in older adults can inform intervention strategies to help sustain successful behavioral changes.

KEEPING ON TRACK WITH A HEALTHFUL DIET: WHAT WE HAVE LEARNED FROM THE SENIOR PROJECT

G. Greene, N. Fey-Yensan, *Program in Gerontology, University of Rhode Island, Kingston, Rhode Island*

Fruits and vegetables (FV) are important components of a healthful diet. To investigate factors associated with maintenance of FV intake, we utilized baseline assessments for Senior II (66 months) of 431 older adults (mean age=80 years) who reported consumption ≥ 5 servings FV/day at the end of the Senior I Project (24 months). Maintainers of ≥ 5 servings (n=258) consumed more servings FV, used the transtheoretical processes of change of consciousness raising and planning ahead to a greater extent, and had greater self-efficacy at 24 months than non-maintainers (n=159). Those who had maintained a high FV intake throughout Senior I (76%) were more likely to be consuming ≥ 5 servings at 66 months than those who progressed to action or maintenance by 24 months. It is important to understand factors associated with long-

term maintenance of healthful eating habits and to target them in interventions to enhance maintenance in older adults.

USING COACHING CALLS TO PROMOTE ACTIVE MAINTENANCE

M. Mlinac¹, T. Sheeran², F. Lees², J. Saint², *1. VA Boston Healthcare System, Boston, Massachusetts, 2. University of Rhode Island, Kingston, Rhode Island*

As part of a transtheoretical model-based intervention to preserve healthful eating and exercise behaviors, older adults (N=239) were coached to overcome the threats to maintenance of these behaviors. Participants received individualized coaching phone calls to address psychosocial and health-related factors that interfered with active maintenance. These scripted calls were anchored in the concepts and methods of selective optimization with compensation, goal-setting, motivational interviewing, and empowerment. Based on self-efficacy, motivation, and response to individualized coaching calls, several phenotypes or trajectories of active maintenance emerged: (1) those participants readily maintaining behaviors (50%); (2) those benefiting from guidance in coping with adversity (25%); (3) those stymied by adversity (15%); and (4) those with low motivation to maintain behaviors or participate in the intervention (10%). Identifying those vulnerable individuals for whom resilience to adverse events might be strengthened has important implications for targeting future interventions.

SESSION 1325 (POSTER)

AGING PERSPECTIVES AND EDUCATION

MEDICAL AND PHARMACY STUDENTS' PERCEPTIONS OF CARING FOR OLDER ADULTS: IMPACT OF THE HIDDEN CURRICULUM

L. Tomasa, *Department of Family & Community Medicine, University of Arizona, Tucson, Arizona*

Background and Purpose: The number of older Americans is increasing and becoming more diverse. With increasing longevity, older adults will have more frequent contact with various health professions and will utilize more health care services. In order to prepare a skillful and caring workforce, academic training programs must develop appropriate curriculum and activities to increase interest and comfort in caring for older adults. The purpose of this study was to explore the potential role and impact the hidden curriculum plays in student attitudes towards older adults; and to identify perceptions about aging. **Design and Methods:** Second year medical students and pharmacy students enrolled in a Geriatrics Perspectives completed the Caring for Older Adults survey. This survey adapted items from commonly used aging attitude scales in addition to questions about preceptor and peer behaviors towards older adult patients. **Results:** The results indicate that pharmacy students identify a greater need for expanded curriculum in geriatrics; pharmacy students perceive older adults to be less compliant; medical students perceive having less contact with older adults in their future practice; and experience preceptors making less jokes about older patients. **Conclusions:** Exploring the health care training environment and the hidden curriculum provides helpful information in designing appropriate curriculum and training.

A COMPARISON OF TRAINED STAFF ATTITUDES TOWARD DEMENTIA CARE MAPPING IN THE U.S. AND U.K

A. Keddie¹, C. Douglas¹, D. Brooker², C. Surr², *1. Northern Illinois University, DeKalb, Illinois, 2. University of Bradford, Bradford, United Kingdom*

Background: Dementia Care Mapping (DCM) is an observational method for assessing the degree to which the care received by people living with dementia in long-term care is person-centered and supportive of their emotional well-being. Trainees learn to conduct DCM, ana-

lyze the results and deliver feedback to staff in their institution with the aim of creating an environment that is respectful of the personhood and emotional needs of people with dementia. Begun in the U.K. by the Bradford Dementia Group, DCM has spread to 22 countries, yet has not gained widespread use in the U.S. This study compares the results of similar surveys of former trainees in the U.K. and U.S. Methods: In 2001 and 2003, respectively, surveys were distributed in the U.K. (n=79) and U.S. (n=82) to assess the impact that training sessions had on staff and their respective attitudes toward DCM. Results: Our findings indicate that American trainees were over twice as likely to report lack of organizational backing (odds ratio = 2.63, 95% confidence interval (CI): 1.03, 6.71) and over four times as likely to report feeling unclear about codes used to evaluate the emotional states of individuals with dementia (odds ratio = 4.24, 95% CI: 1.48, 12.13). Both British and American trainees indicated that time constraints were a problem. Conclusion: While these findings are suggestive of modifications that may help DCM gain more acceptance in the U.S., further study of the reasons for lack of organizational backing of DCM in the United States should be carried out.

FACULTY LEARNING ABOUT GERIATRICS (FLAG) PROGRAM: INCREASING THE CAPACITY FOR GERIATRIC NURSING EDUCATION

M.J. Kaas, K. Krichbaum, C. Mueller, J. Disch, B. Westra, J. Wyman, *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

As one of 4 new Hartford Centers of Geriatric Nursing Excellence, the Center at University of Minnesota, School of Nursing (MnHGCNE), has as a primary goal to increase the number of new and existing faculty who will provide academic leadership in geriatric nursing at associate and higher degree programs in the Upper Midwest region, including Tribal Colleges. The purpose of this poster presentation is to describe the design, implementation and outcomes of one of our key initiatives, Faculty Learning About Geriatrics (FLAG) program. The year-long FLAG program includes three components: a five day intensive Summer Institute, ongoing mentorship of FLAG Fellows to support individual academic teaching projects in geriatric nursing, and continued learning opportunities offered by the MnHGCNE. The FLAG program includes four areas of focus: 1) geriatrics and nursing care of elders; 2) learning theory and teaching strategies for geriatric nursing; 3) health care informatics; and 4) leadership for curriculum change. FLAG outcomes are based on evaluations of the Summer Institute, self-evaluations of teaching expertise in geriatric nursing, implementation of individual curricular leadership and teaching projects, and satisfaction with the 2008-2009 FLAG experience. This poster will highlight outcome data from the inaugural program obtained from the 24 FLAG participants from 4 states. Examples of the FLAG Fellows' geriatric nursing teaching and leadership projects and modifications to the 2009-2010 FLAG program will also be presented.

BUILDING GERIATRIC NURSING EXCELLENCE THROUGH A TRANSLATIONAL INTERDISCIPLINARY INSTITUTE

B. Holtzclaw, L.E. Benefield, *University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Emerging discoveries in aging science offer new insights and challenges for geriatric care across disciplines. National interdisciplinary initiatives encourage cross-disciplinary partnerships in biomedical interpretation for clinical research in Translational Science approaches. Earliest efforts are aimed at bench-to-bedside translation of research, but opportunities for interdisciplinary discussion and problem-solving beyond medicine have been sparse. Doctorally prepared nurse educators in rural areas require innovative approaches to acquire advanced geriatric education and research training. Planned dissemination and follow-up are necessary to promote translational geriatric science. In an effort to stimulate and enrich collaborative cross-disciplinary research

to promote community-based aging-in-place, a 1 1/2 day Summer Geriatric Interdisciplinary Translational Research Institute was developed by the Center of Geriatric Nursing Excellence. Faculty from nursing, medicine, allied health, and related professions met to learn and discuss: 1) emerging scientific findings in aging, 2) processes of interdisciplinary interpretation, 2) reconciling cultures across disciplines, and 3) mapping out researchable questions and strategies for collaborative research. Interdisciplinary faculty and experts offer cutting-edge information from aging science, while facilitators lead discussions on interpretive and collaborative strategies. Outcomes: Participants shared research questions, resources, and ideas for collaboration. Expressed needs for proposal writing, research consultation and inclusion of other disciplines will form basis for next year's summer Institute.

DEVELOPING AND FIELD-TESTING A WEB-BASED EDUCATIONAL PROGRAM FOR GERONTOLOGICAL HOME-CARE NURSING

N. Yamamoto-Mitani, Y. Chiba, Y. Takai, A. Okumura, A. Honda, M. Ooki, H. Fukahori, *Tokyo Medical and Dental University, Tokyo, Japan*

Mechanisms of quality improvement/assurance have been poorly developed for home-care nursing in Japan. Most home nursing stations are small with on average 4.3 full-time equivalent staff, and it is difficult to send their staff to outside educational programs. Approximately 75% of clients are 65 years old or older. This study is aimed at developing and field-testing a web-based educational program for quality improvement/assurance based on quality indicators of gerontological home-care nursing. The quality indicators have been developed by our research group for the quality improvement/assurance purpose. They focus on the care processes of commonly-practiced 16 gerontological nursing areas; they are intended for nurses to learn essential gerontological home-care nursing practice. The website is designed so that practicing home-care nurses and university nursing faculties can communicate via the website, i.e., asking questions and adding comments to facilitate the practitioners' learning by the indicators. So far we have included the areas of dementia care and family support in our website. Currently it is open to 5 home nursing stations with 35 registered nurses, and it is overall affirmatively accepted. However issues include: four out of 5 home nursing stations have only one personal computer that is connected to internet, and it is mostly occupied by a secretary; many home visit nurse are not familiar with using computers, especially keyboards; and home-care nurses are very busy with visits and reports and do not have time to check the website. We are continuing our exploration to improve the website for easier access and handling.

SESSION 1330 (PAPER)

BALANCE

LOSSES OF BALANCE DURING DOWNWARD REACH AND PICK-UP MOVEMENTS IN OLDER ADULTS

M. Hernandez¹, J. Ashton-Miller^{1,2}, N. Alexander^{2,3,4}, 1. *Biomedical Engineering, University of Michigan, Ann Arbor, California*, 2. *Institute of Gerontology, University of Michigan, Ann Arbor, Michigan*, 3. *Internal Medicine, University of Michigan, Ann Arbor, Michigan*, 4. *VA Ann Arbor Health Care System GRECC, Ann Arbor, Michigan*

Reaching downward to pick up an object off the floor has been associated with falls in older adults but few studies have explored the mechanisms underlying this risk. This study tested the hypothesis that, when reaching down and picking up an object from the floor and compared to young women, older women lose their balance more often, particularly during return-to-stance movements. Healthy young (Y, n = 13, mean±SD age 23±3, BMI 23±4) and healthy older women (O, n = 12, age 76±6, BMI 25±5) volunteers were recruited from the local community to perform symmetric two-handed downward maximal reaches

to a target on the ground. Analysis of joint motion using optoelectronic cameras provided an assessment of the mean number of losses of balance (LOBs), defined as a stepping response, occurring during 1) the downward reach, or 2) the return-to-stance movement. Both reach distance (measured along the floor) and LOBs were normalized by a percent of body height, so as to normalize for reach effort. O had shorter normalized reaching distances ($p < .001$) and tended to have more LOBs upon return to stance. After normalization, O had significantly increased normalized LOBs upon return to stance when compared to Y ($p = .03$). In conclusion, these data suggest that when reaching down and picking up an object from the floor, older women, compared to young, are more likely to lose balance when returning to a stance position. These findings provide one mechanism whereby older women may fall when bending down to the floor.

THE EFFECTS OF TAI CHI ON FALL PREVENTION, FEAR OF FALLING, AND BALANCE IN ELDERLY PEOPLE: A SYSTEMATIC REVIEW AND META-ANALYSIS

I. Logghe^{1,2}, A. Verhagen^{2,1}, A. Rademaker¹, S. Bierma-Zeinstra², E. Van Rossum^{3,4}, M. Faber⁵, B. Koes², 1. Avans Hogeschool University of Applied Sciences, Breda, Netherlands, 2. Erasmus MC University Medical Centre Rotterdam, Rotterdam, Netherlands, 3. Department of Health Care Studies, Faculty of Health, Medicine and Life Sciences Maastricht University, Maastricht, Netherlands, 4. Professional University Zuyd, department of Physiotherapy, Heerlen, Netherlands, 5. Scientific Institute for Quality of Healthcare, Raboud University Nijmegen Medical Centre, Nijmegen, Netherlands

Falls are a common problem among older people. Tai Chi (TC) is a promising exercise intervention to prevent falls and fall risk factors as impaired balance and fear of falling. We performed a systematic review and meta-analysis to give an overview of evidence on fall prevention, fear of falling and balance in healthy elderly people were in outcomes were analysed in relation to each other. We used a broad computerised literature search on TC interventions. We assessed risk of bias of included trials with the Delphi criteria list and used a standardised form to extract the data. When we considered studies clinically homogeneous concerning intervention, study population and outcome measures we performed statistical pooling with random effect models. We sought sources of heterogeneity affecting estimates through subgroup analysis according to setting, intervention dose and duration of follow-up. We included 12 trials with a total of 2284 elderly people of 50 years and older. Preliminary results showed a pooled estimate of the Incidence Rate Ratio (the effect of TC on fall rates) of 0.79 (95% confidence interval (CI) = 0.60-1.03). We found a medium effect of TC on fear of falling: Hedges' adjusted $g = 0.49$ (95% CI 0.15-0.81) and a large effect of TC on static balance: Hedges' adjusted $g = 0.82$ (95% CI 0.20-1.45). This systematic review provides evidence that Tai Chi can reduce fear of falling and improve static balance in elderly people. No evidence was found for the effect of Tai Chi on fall rates and dynamic balance.

CUMULATIVE SOMATOSENSORY IMPAIRMENT INDEX PREDICTS GLOBAL POSTURAL CONTROL OVER THREE YEARS

N. Deshpande¹, E. Metter², L. Ferrucci², 1. University of Kansas Medical Center, Lenexa, Kansas, 2. National Institute on Aging, Baltimore, Maryland

Somatosensory information from the lower limbs is critical for postural control. However, it is not known whether clinically derived lower limb somatosensory information can independently predict global postural control over time. This study developed Cumulative Somatosensory Impairment Index (CSII) for the lower limbs and evaluated its construct validity for discriminating relevant groups (based on age and pathology) and predictive validity for predicting global postural control over 3 years. Cognitively intact InCHIANTI study participants ($n = 960$, age 21-91 years) were included. CSII was derived from baseline per-

formance on clinical tests of pressure sensitivity, vibration sensitivity, proprioception and graphesthesia. Global postural control was assessed using Frailty and Injuries Cooperative Studies of Intervention Techniques (FICSIT) balance test, time to complete 5 repeated chair stands and fast walking speed, at baseline and at 3-year follow-up. In participants without prevalent neurological conditions ($n = 799$) CSII was significantly different in age-groups classified by decades ($p < 0.001$). Compared to participants without prevalent conditions, CSII was significantly higher in persons with diabetes ($p = 0.017$), peripheral arterial disease ($p = 0.006$) and stroke history ($p < 0.001$). In overall population ($n = 960$), in multiple regression models adjusted for baseline performance and multiple confounders, CSII independently predicted deterioration in FICSIT scores ($p = 0.002$), time for 5 repeated chair stands ($p < 0.001$), and fast gait speed ($p = 0.003$) at 3-year follow-up. In conclusion CSII is a valid measure that detects relevant group differences in lower limb somatosensory impairment and is an independent predictor of decline in postural control over 3 years.

THE EFFICACY OF PHYSICAL THERAPY INTERVENTIONS TO IMPROVE BALANCE AND THE CONVERGENT VALIDITY OF THE ACTIVITIES-SPECIFIC BALANCE CONFIDENCE SCALE AND TINETTI'S PERFORMANCE ORIENTED MOBILITY ASSESSMENT-BALANCE SUBSCALE

E. Hood¹, K. Chui², M. Lusardi², M. Whitmire¹, M. Dour¹, 1. Warren Hospital Balance Center, Phillipsburg, New Jersey, 2. Sacred Heart University, Fairfield, Connecticut

Introduction: Impairments of postural control are frequent and problematic for many aging adults receiving physical therapy (PT). The precision of strategies to evaluate the efficacy of PT interventions targeting balance ability has not been adequately examined. This study evaluates the efficacy of PT interventions for balance and the clinometric properties (i.e., validity) of two outcome measures of balance commonly used in PT: The Activities-specific Balance Confidence Scale (ABC) and Tinetti's Performance Oriented Mobility Assessment-Balance subscale (POMA-B). Methods: Thirty-four consecutive community dwelling out-patients (mean age 78.3 ± 7.0 years, 64.7% female) participated in this case series. All participants had diagnoses that impaired their balance (mean duration 17.4 ± 16.4 months). Interventions included gait training, balance exercises, and strength training among others. Correlations examined the convergent validity between the ABC and POMA-B at evaluation, discharge, as well as percent change. Age, gender, diagnoses, and duration of symptoms were examined as possible covariates. Paired t-tests were used to examine for differences in outcome scores following PT interventions. Results: Mean number of PT sessions was 11.6 ± 3.5 visits. Statistically significant ($p < .01$) correlations were found between the ABC and POMA-B at evaluation ($r = .46$), discharge ($r = .41$), and the percent change ($r = .64$). No covariates were identified. There were significant ($p < .00$) differences in the ABC (mean increase = 14.47 ± 12.59) and POMA-B (mean increase = 4.24 ± 2.73) after PT interventions. Conclusions: Moderate correlation between the ABC and POMA-B demonstrate convergent validity. Significant differences in the ABC and POMA-B demonstrate the efficacy of PT interventions to improve balance.

ESTABLISHING THE MINIMUM DETECTABLE CHANGE (MDC) FOR THE BERG BALANCE SCALE AND THE DYNAMIC GAIT INDEX

S. Romero, VA/RORC, Gainesville, Florida

The goal of this study was to investigate minimal detectable change (MDC) for two clinical instruments used to assess gait and balance in the elder population, the Berg Balance Scale (BBS) and the Dynamic Gait Index (DGI). The standard error of measure (SEM) was employed to calculate the amount of change in a given measure that must be obtained for a clinician to determine that true change has occurred.

The MDC is expressed as a confidence interval around the SEM, indicating the values that are within the range of error attributable to the measuring instrument. The MDC is expressed in the same unit of the original instrument, providing clinicians useful and easy to understand criterion for change in patients' performance. The results of this study indicated that for the BBS and DGI, 6.6 and 3.1 points respectively were required to be 95% confident that "genuine" change had occurred between 2 testing occasions. In addition, MDC values changed based on the ability level of the persons assessed. An advantage of using the standard error of measure to determine MDC is that this method provides information about individual scores. Traditional methods of statistical significance often rely on group differences. Group differences are relevant for researchers, but must be considered with caution when decisions must be made about an individual patient. Knowing the amount of error associated with these instruments can help clinicians make decisions about individual's performance and monitor change overtime.

SESSION 1335 (SYMPOSIUM)

PHYSICAL ACTIVITY GUIDELINES FOR AMERICANS: IMPACT ON OLDER ADULTS

Chair: M. Nelson, Tufts University, Boston, Massachusetts

In October 2008, the U.S. Government released the first ever Physical Activity Guidelines for Americans. In addition to recommendations for children and adults, the guidelines provide targeted recommendations for older adults. Though the guidelines for older adults are similar to those for adults including endurance exercise and strength training, there are some key differences. Older adults should be as active as abilities allow and include balance exercises for those at risk for falls. Also of note is that older adults without chronic conditions do not need to consult a health care provider before participating in physical activity. Dr. Nelson will provide an overview of the evidence that was used to develop the guidelines for older adults in addition to strategies for increasing physical activity. Older adults have the lowest participation rates of any age segment in the population, yet they may have the most to gain by being physically active.

OBESITY, DIABETES AND AGING IN MINORITY POPULATIONS: IMPLICATIONS FOR PREVENTION

K. Markides, University of Texas, Galveston, Texas

Prevalence rates of diabetes are exceptionally high among United States minority populations especially African Americans, most Hispanic groups, and most Native American populations. Although it is believed that genetic factors are involved it is also apparent that high rates of obesity are also involved especially among women. It is also known that immigrants from Africa and Latin America (especially Mexico) have lower rates of both obesity and diabetes, which have been linked to significantly lower mortality rates among immigrants. It also appears that the apparent immigrant advantage in overall health declines with time in the United States a decline that is faster among women. Health advantages disappear in the children of immigrants. While African and Hispanic immigrants may enjoy a mortality advantage both immigrants and native-born African Americans and Hispanics are characterized by significantly higher rates of disability in old age partly because of high rates of obesity and diabetes in middle age. Disability rates due to obesity and diabetes appear to be exacerbated by high rates of depression in old age especially among women. Implications for prevention of both obesity and diabetes earlier in life as well as depression in old age are discussed. All three health conditions are preventable and successful efforts to address them are reviewed based on current programs.

HEALTHY AGING - PREVENTION APPROACHES THAT WORK

A.B. Newman, *Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*

More and more men and women are reaching old age in good health and many have high expectations for remaining very active and engaged in life. Active life expectancy is threatened by many different conditions, including but not limited to stroke, dementia, heart disease, osteoarthritis and osteoporotic fracture. Life span is threatened by cancers and infections, many of which are now highly preventable. Although motivation and interest in healthy aging is high, progress towards optimal risk factor management has been less than ideal. Creative approaches are needed that focus effort on proven screening and treatment for risk factors that can be modified. Targets, gaps, and opportunities for prevention along with new paradigms for enhancing healthy aging will be highlighted.

CREATIVE APPROACHES TO PREVENTION AND HEALTHY AGING

J. Magaziner¹, L. Anderson², 1. *Epidemiology and Preventive Medicine, School of Medicine University of Maryland, Baltimore, Maryland*, 2. *Center for Disease Control and Prevention, Atlanta, Georgia*

Preventing disease and disability in the aging population is of great importance and will become even more so as the cost of health care continues to rise and there is increasing recognition that incorporating prevention into health care systems can be beneficial. Creative approaches are necessary to implement preventive interventions to reduce the burden of disease and disability in this growing segment of the adult population. The purpose of this Presidential Symposium is to highlight some of the key areas for preventive interventions and to identify strategies that are likely to be translated to the community that will have beneficial effects for large numbers of older persons. Three experts on prevention will highlight areas where prevention efforts with older persons are needed and discuss approaches to addressing them. The first presenter will discuss the new national guidelines for physical activity and its impact on older persons; the second will describe the importance of preventive efforts in obesity and diabetes for older minority populations; and the last will consider clinically relevant interventions that have been shown to work for older persons. An "open mic" question and answer period and panel discussion, led by Lynda Anderson, PhD, Director, Healthy Aging Program, Division of Adult and Community Health in the CDC, will conclude this symposium.

SESSION 1340 (POSTER)

MEDICATION ISSUES

CARDIOVASCULAR (CV) EFFECTS OF DARIFENACIN (DAR) AND TOLTERODINE (TOL) IN HEALTHY VOLUNTEERS: RESULTS OF TWO RANDOMIZED CROSSOVER STUDIES

B. Olshansky¹, E.L. Spierings², J.M. Brum³, M. Egermark⁴, L. Mongay⁵, Y. Seifu⁵, S. Facchini⁵, 1. *University of Iowa Hospitals, Iowa City, Iowa*, 2. *MedVadis, Wellesley Hills, Massachusetts*, 3. *Procter & Gamble, Mason, Ohio*, 4. *Novartis Pharma, Basel, Switzerland*, 5. *Novartis, East Hanover, New Jersey*

Background: The prevalence of OAB and CV co-morbidities increases with age. Elevated heart rate (HR) and decreased HR variability (HRV) have been linked with increased CV risk. The effects of DAR and TOL on HR and HRV in healthy volunteers were evaluated in two studies (S1 and S2). **Methods:** Healthy subjects (≥50 years) underwent three 7-day dosing periods (DAR 15mg, TOL 4mg, placebo) separated by 14-day washouts in 2 placebo-controlled, crossover, double-blind studies. Endpoints included mean HR per 24 hours (h) using 24-h

Holter monitoring and 24-h HRV parameters. **Results:** 140 and 108 subjects completed all three treatment periods in S1 and S2, respectively. In both studies, change in mean 24-h HR was significantly higher with TOL, compared with DAR (difference=1.84 and 2.24bpm, respectively; $p<0.0005$) and placebo (difference=1.42 and 1.84bpm; $p=0.0009$ and $p=0.0037$) but was comparable for DAR and placebo. HRV parameters were comparable for DAR and placebo (PBO). Whereas TOL significantly reduced SDDN Index, a measure of HRV, compared with DAR in S1 ($p<0.05$) and in S2 ($p<0.01$) and compared to placebo in S1 ($p<0.05$). Post-hoc categorical analysis of S1 and S2 showed that higher proportions of subjects had HR increases on TOL vs PBO than on DAR vs PBO. These observations are supported by the distribution of the differences from placebo in mean 24-h HR using a mountain plot. Most common adverse events were dry mouth and constipation. **Conclusion:** TOL but not DAR significantly increased HR and reduced HRV in healthy volunteers compared with placebo.

COST-RELATED MEDICATION NON-ADHERENCE AND FOOD INSECURITY IN LOW-INCOME OLDER ADULTS IN GEORGIA

R.A. Bengt¹, S.J. Sinnott¹, A. Brown³, T. Johnson², M. Johnson¹, J. Lee¹, 1. University of Georgia, Department of Foods and Nutrition, Athens, California, 2. Presbyterian College School of Pharmacy, Clinton, South Carolina, 3. Georgia Department of Human Resources, Division of Aging Services, Atlanta, Georgia

Low-income older adults are at risk of cutting back on basic needs, including food and medication. This study examined the relationship between food insecurity and cost-related medication non-adherence (CRN) in a sample of low-income older adults in Georgia. This study used data from the Georgia Advanced Performance Outcomes Measures Project to evaluate new Older Americans Act Nutrition Program (OAANP) participants and waitlisted people in July through November 2008. The study sample includes individuals who completed all study-related variables in a self-administered mail survey ($n=1000$, mean age 75.0 ± 9.1 years, 68.4% women, 25.8% black). Food insecurity was assessed using the 6-item USDA Household Food Security Survey Module. Practice of 5 CRN behaviors (delaying refills, stopping medicines, avoiding new prescriptions, taking smaller doses, and skipping doses) over the last month were evaluated. About 49.7 % of participants were food insecure, while 44.4 % had utilized ≥ 1 CRN strategy in the last month. Those who were food insecure and/or who practiced any CRN strategy in the last month were more likely to be black, low-income, younger, less educated, and to report poorer self-reported health status. Food insecure participants were 2.9 (95% CI 2.2,4.0) times more likely to practice ≥ 1 CRN behaviors than their counterparts even after controlling for potential confounders. Food insecure older adults were more likely to restrict medication use due to cost. Improving food security is important for low-income older adults in order to promote adherence to recommended prescription regimens.

SEASONAL VARIATION OF WARFARIN EFFECT IN RURAL GERIATRIC PATIENTS IN JAPAN

Y. Ooe^{1,2}, S. Iwasaki², K. Okada³, 1. Internal Medicine, Yao Municipal Hospital, Yao, Osaka, Japan, 2. Shinseikai-Santo Clinic, Ohda, Japan, 3. Ohda Municipal Hospital, Ohda, Japan

Background: There has been a clinical speculation that an anticoagulant warfarin may show a seasonal variation. We therefore investigated the possible seasonal variation of anticoagulation activity of warfarin in elderly patients living in Japanese rural area. **Method:** Retrospective study was carried out for outpatients in warfarin treatment, using medical records available in August 2007 to survey administration dates, dose and anticoagulation activity (PT-INR). Next, frequencies of dose increase and decrease were counted by month. In addition, monthly variation of PT-INR by each patient was analyzed. **Results:** Data was analyzed for seventeen patients, with an average age

of 75.0, including 5 females. Underlying diseases that necessitated warfarin treatment included atrial fibrillation (9 cases), previous cerebral infarction (7), pulmonary infarction (2), prosthetic valve (1) and pacemaker implantation (1). Observation period averaged 4.2 years, and total observation points were 598. Doses of warfarin showed a tendency to be increased from January to April and decreased from May to September. Finally, PT-INR for individual patient was well controlled, showing monthly variations within ± 0.5 . **Conclusion:** It was considered that increased doses of warfarin were administered in the period when the warfarin effect was lower, and decreased doses were administered when the effect was higher. Seasonal variation of warfarin effect was observed in elderly patients who were administered with warfarin and living in Japanese rural area. The seasonal variation is considered to be attributed to factor(s) related to vegetable crops harvesting period.

IMPROVING HEALTH CARE OUTCOMES FOR ELDERLY

D. Antimisiaris, J. O'Brien, *Family and Geriatric Medicine, University of Louisville, Louisville, Kentucky*

We present a case that illustrates the value of a comprehensive Geriatric Evaluation when confronted by an elderly patient with multiple medical problems and failure to respond to conventional therapies. With the dwindling amount of time allotted for physician office visits or hospital consults, the successful management of patients living with multiple chronic diseases is becoming increasingly unattainable. Studies report that the median primary care office visit lasts 15.7 minutes covering a median of 6 topics (Tai-Seale). Given that 88% of adults over the age of 65 live with chronic health problems and the mainstay of management of chronic diseases are medications, the challenges of effective management are likely to increase with the aging of the general population. The presentation of this case in which a Geriatric Evaluation Team consisting of a social worker, psychologist, pharmacist, the patient and the family worked for three hours to solve a significant medical problem that improved the patient and their family's quality of life to a significant degree. The family, who had resources and access to the best available medical care had been seeking a solution to this problem for one year utilizing traditional consults by individual specialists. Despite a neurologist making the correct decision for the most appropriate atypical antipsychotic to control agitation in a demented patient with Parkinson's Disease, a failure to associate a new symptom complex with the chosen drug led to the present dilemma. The quick resolution via an interdisciplinary team suggests that this approach should be an essential element in future systems of health care for elders.

SESSION 1345 (PAPER)

PAIN - HS PAPER SESSION

OLDER ADULTS' PAIN COMMUNICATION: THE EFFECT OF INTERRUPTION

D.D. McDonald, J. Fedo, *School of Nursing, University of Connecticut, Storrs, Connecticut*

The effect of interrupting older adults as they talk about their osteoarthritis pain was examined in a secondary analysis using a non-randomized two-group design. Participants were part of a study in which older adults orally responded to a series of three pain questions asked by a videotaped practitioner presented on a computer screen. The initial 96 participants were given visual and auditory cues to touch the computer screen to continue to the next question. The remaining 216 participants received only the visual cue after the auditory cue was noted to interrupt participant responses. Older adults' pain communication was audio-taped, transcribed and content analyzed using a priori criteria from the American Pain Society (2002) Guidelines for the Management of Pain in Osteoarthritis, Rheumatoid Arthritis, and Juvenile Chronic Arthritis. Older adults in the uninterrupted group responded with significantly more pain information, $M = 6.3$ ($SD = 3.69$), than

the interrupted group, $M = 5.3$ ($SD = 3.22$), $F(1,300) = 4.49$, $p = .04$, $\eta^2 = .004$. Adjusting for sample size differences, older adults in the interrupted group described 56% less information about the source of their pain, 41% less about the quality of their pain, 29% less about their pain treatments, 24% less about the timing of their pain, and 15% less about their pain intensity. The brief, innocuous interruption diminished the amount of important pain information communicated by the older adults. Deliberate interruptions by practitioners might further reduce communication of important pain information.

CHRONIC PAIN, EXECUTIVE FUNCTION, AND DUAL TASK MOBILITY IN OLDER ADULTS

S.G. Leveille^{1,2}, J. Hausdorff^{3,2,1}, T. Herman³, W. Milberg^{4,2}, N. Giladi³, 1. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Tel-Aviv Sourasky Medical Center, Tel-Aviv, Israel, 4. VA Boston Healthcare System, Boston, Massachusetts

Since research has found that chronic pain (CP) may contribute to cognitive deficits, and changes in executive function (EF) may alter gait and fall risk, we tested the hypothesis that CP may act as a distracter or "dual task", interfering with EF and gait in older adults. We studied 245 community-living older adults (mean 76.4±4.2 yrs). Testing included the Mini-Mental State Exam (MMSE) and a neuropsychological battery (Mindstreams) measuring global cognition, EF, motor ability, memory, and visual spatial orientation. Mobility tests included single and dual task gait speed and Timed Up and Go. The SF-36 pain subscale classified subjects with low levels of CP (score >75) and high levels of CP (score <50). CP was associated with lower EF (95.3±9.9) compared to those with low CP (100.2±10.6). There were no differences in other cognitive domains. Gait speed tended to differ by pain group during usual walking ($p=0.06$), and group differences became significant during dual tasking (high CP: 104±19cm/s; low CP: 113±21cm/s; $p<0.03$). There was a modest increase ($p=0.015$) in Timed Up and Go times with high CP (10.0±1.6sec), compared to low CP (9.2±1.5sec). After adjusting for the EF index in multivariate analyses, Timed Up and Go times and dual task gait speed were no longer related to pain. In contrast, adjusting for memory did not change these associations. These findings support the idea that pain may alter EF and gait in older adults, especially under distracting conditions, and that the route from pain to an increased fall risk may involve cognition.

DIFFERENCES IN PAIN BEHAVIOR BETWEEN NURSING-HOME RESIDENTS WITH SEVERE OR MILD DEMENTIA

S. Zwakhalen¹, J. Hamers¹, M. Berger², 1. Maastricht University, Faculty of Health, Medicine and Life Sciences, School for Public Health and Primary Care (CAPHRI), Maastricht, Netherlands, 2. Maastricht University, Department of Methodology and Statistics, Maastricht, Netherlands

Pain represents a major problem with serious consequences for the patient's quality of life. Pain prevalence rates in elderly people with dementia vary enormously between 28% and 83%. This study aims to investigate (1) the under-treatment of pain in nursing-home residents by measuring pain using an observational pain scale and (2) explore the differences in used pain expressions between resident suffering from severe dementia compared to residents with mild/moderate dementia. A cross sectional study was conducted in which a total of 179 nursing-home residents were invited to participate. During 5 minutes of morning care the residents were observed using the pain assessment checklist for seniors with limited ability to communicate (PACSLAC-D). Cognitive status of all residents was evaluated using the Mini-Mental State Examination (MMSE). In total, 117 resident (mean years of age=82.8; $SD=6.1$) were enrolled. 44 % had a PACSLAC-D score ≥ 4 , indicating pain. Overall pain intensity scores were relatively mild (mean=6.3; $SD 2.8$; range 4-13). Of all residents, 39 were mild/moderately demented ($MMSE > 7$) and 68 were severely demented

($MMSE \leq 7$). 10 residents were unable to complete the MMSE. Severely demented residents had overall lower pain scores (mean 5.86; $SD 2.55$) compared to residents who were less severely impaired (mean 7.36; $SD 3.20$). Of the 3 subscales covered (facial and vocal expression, resistance/defense and social-emotional aspects/mood), pain expressions belonging to the 'social emotional/mood' category of the PACSLAC-D were expressed significantly more often by severely demented residents. This study confirms that pain is frequently prevalent in nursing-home residents and that the pain cues differ between severely demented residents compared to residents with mild/moderate dementia.

COGNITIVE IMPAIRMENT AND NON-CANCER PAIN: A PHYSICALLY DISABLING RELATIONSHIP?

J.W. Shega¹, J. Paice², S. Bilir¹, W. Dale¹, K. Rockwood³, 1. Medicine-Section of Geriatrics and Palliative Medicine, The University of Chicago, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois, 3. Dalhousie University, Halifax, Nova Scotia, Canada

Background: Cognitive impairment (CI) and non-cancer pain (NCP) are both common conditions associated with functional impairment, yet research has not evaluated their independent and interactive contributions to an older person's functional status. Methods: Cross-sectional analysis of the Canadian Study of Health and Aging was used to evaluate the relationship between cognitive status and pain with functional status. Cognitive status and pain were assessed using the Modified Mini Mental State Exam and the 5-point Verbal Descriptor Scale, respectively. Function was ascertained using a summary score of self-report on 7 ADLs and 5IADLs with severity scores ranging from 0=independent to 2=complete impairment. Results: Participants ($n=5397$) were on average 80.2 (6.4 SD) years old, 96.7% Caucasian, and 68.5% had a high school education. 16.6% had mild to moderate CI and 35.9% reported moderate or greater NCP. Summary ADL and IADL scores were 0.5 (1.32 SD) and 1.05 ($SD 1.76$), respectively. Linear regression analysis found CI and NCP were independently associated with poorer ADL CI 0.24 (0.14-0.34), $P<0.001$ and NCP 0.17 (0.10-0.23), $P<0.001$ and IADL CI 0.69 (0.53-0.84), $P<0.001$ and NCP 0.30 (0.20-0.40), $P<0.001$ function. Additionally, CI and NCP displayed a significant interaction with IADLs (CI*NCP) 0.25 (0.01-0.49), $P=0.05$. Conclusion: Cognitive impairment and non-cancer pain are independently associated with poorer ADL and IADL measures and, when present concurrently, are may be associated with even greater functional impairment. Non-cancer pain appears to represent a treatable cause of functional impairment in older adults, particularly for those with cognitive impairment.

SESSION 1350 (POSTER)

PAIN - HS POSTER SESSION

PAIN, PAIN MEDICATIONS, AND FUNCTIONAL OUTCOMES AMONG OLDER ADULTS WITH ARTHRITIS

U. Onubogu¹, A.L. Horgas², M. Marsiske², 1. Florida A&M University, Tallahassee, Florida, 2. University of Florida, Gainesville, Florida

Pain is associated with negative functional outcomes in older adults, but is often under-treated. In a secondary analysis of data from the randomized controlled trial of cognitive training in older adults (ACTIVE: Advanced Cognitive Training for Independent Vital Elderly), we examined whether the adequacy of prescribed pain medication influences the relationship between pain and pain outcomes (physical, social, and emotional functioning) among elders with arthritis over 5-years. Participants ($N=1,409$, female=81.6%, mean age=74 years) were sampled from 2,802 community-dwelling older adults in ACTIVE (Willis et al., 2006). Measures included a demographic and health conditions checklist; MOS SF-36 (functioning); CES-D scale, and Pain Management Index (adequacy of prescribed medications). Data were analyzed from three time points: baseline (from 1998-2000), and 3 and 5 years later. Results indicated that over 40% of participants experienced pain that interfered with

activities, over 70% were prescribed inadequate pain medications, and 36% to 85% had moderate to severe functional limitations, across times. In addition, more pain at baseline was significantly related to worse outcomes 5 years later: physical functioning ($r=-.30$), physical role ($r=-.32$), social functioning ($r=-.28$), emotional role ($r=-.21$), vitality ($r=-.30$), and depression ($r=.21$). These relationships were partially mediated by the less adequate pain medication regimen at each measurement. However, longitudinally, participants demonstrated improved physical, social, and emotional functioning as the adequacy of prescribed pain medications increased. These results highlight pain as a significant problem in older adults with arthritis, as well as the importance of adequate pain medication in the management of pain-related functional outcomes.

PHARMACOLOGICAL AND NONPHARMACOLOGICAL PAIN MANAGEMENT IN COMMUNITY-DWELLING OLDER ADULTS

J. Park, *School of Social Work, University of Maryland, Baltimore, Maryland*

The purpose of this study is to describe chronic pain in older adults and their pharmacological and nonpharmacological pain therapies in community-dwelling older adults with chronic pain. A total sample of 163 surveys was completed by community-dwelling older adults in outpatient clinics affiliated with University of Maryland Medical Systems and the Baltimore VA Medical Center. Approximately one third of the participants (36.2%, $n = 59$) reported more than five painful conditions (injured body parts or illness) and a majority of the participants reported suffering from low back pain (60.1%, $n = 98$), knee pain (54.6%, $n = 89$), or hip pain (29.4%, $n = 48$). Of the total of 112 male respondents, only 31.3% ($n = 35$) had utilized nonpharmacological treatment, while more than twice as many (68.8%, $n = 77$) had not yet used nonpharmacological treatment. In contrast, a total of the 51 female respondents, 26 (51%) had used nonpharmacological treatment and a similar proportion (49%) had not utilized the treatment. About one third of the total participants (37.4%, $n = 61$) had received in the past or were receiving nonpharmacological pain therapy (e.g., physical therapy, TENS machine, acupuncture, water exercise) in addition to taking opioid medication. A majority of the participants (62.6 %) had never received nonpharmacological pain therapy and had depended on pain medication alone. In general, the participants appeared to depend on pharmacological therapy and they did not seem to trust the effect of nonpharmacological pain therapy and were reluctant to initiate a new therapy.

SESSION 1355 (SYMPOSIUM)

THE CURIOUS PHENOMENON OF CREATIVITY AND MULTIPLE MASTERY

Chair: D. Sheets, *Health Sciences, CSU Northridge, Pine Mountain Club, California*

Discussant: G. Hanna, *The National Center for Creative Aging (NCCA), Washington, District of Columbia*

Individuals who produce creative accomplishments in a singular genre are relatively common. Less common and rarely examined are the meta-creatives, exceptionally creative individuals who achieve much in two or more areas. These people capitalize on their strengths, intrapersonal knowledge, and interpersonal skills to conceptualize new challenges, overcome adversities, and increase their range and level of mastery. Theoretical perspectives addressing this nexus of creativity include research on the neurology of creativity, hemispheric asymmetry reduction in old age, multiple intelligences, vital involvement, and the experience of “flow.” This symposium draws on these theoretical perspectives as they inform understanding of the lives and works of individuals whose multiple masteries have transcended singular genres of artistic expression (e.g., visual arts, music, literature, dance, design) to include such additional domains as scholarship, activism, and exploratory science – over the course of their adult and later life development.

CREATIVITY, NEUROLOGY, AND SOCIAL-PSYCHOLOGICAL PERSPECTIVES

J. Maier, *RTI, International, Waltham, Massachusetts*

This first presentation in the symposium provides a theoretical foundation for subsequent discussions of several meta-creative individuals. The presentation begins with an overview of what is known from current neurological studies of the brain and creativity, with particular emphasis on music and art. Further investigation into the relationship of neurobiology and the creative process reveals aspects of neurogenesis and neuro circuitry that suggest insight into the meta-cognitive processes that are fundamental to the multiple creativities and masteries demonstrated by the iconic figures to be discussed in the rest of the symposium. The presentation ends with a brief introduction to the social-psychological perspectives of multiple intelligences, mature creativity, “flow,” and vital involvement.

META-CREATIVES: THE TRANSFORMATIVE EFFECT OF THE ARTS

D. Sheets¹, P.B. Schmidt², *1. Health Sciences, CSU Northridge, Pine Mountain Club, California, 2. Bunker Hill Community College, Boston, Massachusetts*

The novels and paintings of Herman Hesse, poetry and paintings of e.e. cummings, prose and illustrations of Edward Gorey, and poetry and drawings of Alan Ginsberg provide a rare view into the dimensions of the meta-creative mind. Each of these talented individuals exemplifies verve, innovation, and creative transpersonal development throughout their lifetimes, receiving critical acclaim for their work. Today, the creative legacy of these individuals sustains an avid following throughout the world. Theoretical perspectives from Howard Gardner, Gene Cohen, and Mihaly Csikszentmihalyi are considered in understanding the creative process and its implications for personal growth and development.

CARRY IT ON

H.Q. Kivnick, *University of Minnesota, Minneapolis, Minnesota*

Pete Seeger is an acclaimed musician, recording artist, and “sing-along-leader.” He is also widely recognized as a stalwart activist and grassroots organizer. Pete has been “meta-creative” at least since the time he departed from his family’s elite academic path and entered the “flow” of his inner convictions. He developed extraordinary musical skills and competencies. He also had considerable impact on progressive social movements whose other spokesmen were not necessarily either artists, in general, or musicians, in particular. Now turning 90, he remains engaged in musical and political spheres, in ways that reflect his considerable genetic gifts, life experience, and indomitable vital involvement in multiple domains of the world around him. The presentation explores the multiple creative masteries of this American icon through the theoretical perspectives of vital involvement and multiple intelligences, highlighting themes that can inform creative approaches to healthy aging in general.

SESSION 1360 (PAPER)

WORKFORCE/STAFFING

STRESS, BURNOUT, COMPASSION FATIGUE AND COPING IN MINNESOTA HOSPICE WORKERS

R.R. Whitebird¹, S.E. Asche¹, G.L. Thompson², *1. HealthPartners Research Foundation, Minneapolis, Minnesota, 2. Allina Home and Community Services, Minneapolis, Minnesota*

Hospice care is becoming increasingly important as the population ages and preferences shift toward less invasive end-of-life care. This study examined burnout, compassion fatigue, and coping among MN hospice staff. A one-time anonymous survey was distributed to 931 staff from 13 hospice programs throughout MN with a 60% response rate. Analyses described the data and examined associations. Respondents

were predominately female (91%), white (97%), well-educated (75%), with mean age of 49 years, and median of 6 years working in hospice; 46% worked in urban/suburban settings, 20% rural, and 34% mixed. Fifteen percent of respondents scored high on depression, 14% for anxiety, 60% moderate to high stress, 14% on compassion fatigue, and 5% as high on burnout. Respondents overall reported high levels of job satisfaction and very high levels of social support. Compassion fatigue appears to affect a significant but small group of hospice workers; burnout mean scores were higher, but fewer passed the cut score for burnout. There is a strong correlation between compassion fatigue, depression, anxiety, and burnout. Increased opportunities to connect with co-workers, convenient opportunities for physical activity, and changes to organizational structure were most frequently reported ways to help reduce burnout and stress. Overall satisfaction with work is high among hospice staff with the majority of those looking for work outside of hospice located in rural settings. Social support was a key factor for the majority of respondents in managing stress and may be a key factor in navigating compassion fatigue and burnout.

SHOULD I STAY OR SHOULD I GO? RETENTION OF SUPERVISORS IN LONG-TERM CARE

K. McGilton¹, V. Boscart^{1,2}, B.J. Bowers³, A. Tourangeau², W. Wodchis^{1,2}, 1. *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*, 2. *University of Toronto, Toronto, Ontario, Canada*, 3. *University of Wisconsin-Madison, Madison, Wisconsin*

Research on staff retention in long term care focuses primarily on certified nursing assistants, leaving the equally challenging problem of supervisors' retention relatively unexplored. This paper presents findings from a study designed to explore potential factors contributing to retention of supervisors (i.e., licensed nurses) in long-term care facilities. In-depth interviews were conducted with 29 licensed practical nurses and 26 registered nurses in 9 Canadian nursing homes. All data was transcribed and a qualitative analysis was conducted. Four categories reflecting the reasons why supervisors remain in their role were derived: caring relationships with residents and co-workers; accessibility of opportunities; perceived benefits; and a fit between administrative policies and personal life of the nurse. The supervisors' willingness to stay was juxtaposed with their perceptions of why they should leave. Three main categories which were derived included: disrespect from management; a struggle to renegotiate their role in accordance with regulations; and inequities between full and part time staff. This paper will present findings and discuss the implications of retaining supervisors in long-term care as they deal with the tension of whether they should stay or whether they should go.

THE RELATIONSHIP BETWEEN PROPORTIONS OF LPN AND RN STAFFING AND NURSING HOME SURVEY DEFICIENCIES

M. Toles, K. Corazzini, L. Dick, L. Justin, J. Levy, R. Anderson, *Duke University, Chapel Hill, North Carolina*

Professional staff mix is theorized to be a significant component in the quality of nursing home outcomes. Since 2000, nursing facility use of LPN hours per resident per day are essentially unchanged, while RN hours are reduced by 25%. Because of the interdependent nature of LPN and RN collaboration, this change in staff mix may impact nursing home quality. The purpose of this longitudinal study was to explore the relationship between proportions of LPNs in nursing staff mix (LPN / LPN + RN) and the quality of nursing home performance, as measured by survey deficiencies in U.S. nursing homes between 2003 and 2007. Using data from the Online Survey Certification of Automated Records (OSCAR), a mixed model was constructed 1) to control for structural characteristics of nursing homes and 2) to determine whether counts of survey health deficiencies vary over time with changes in proportions of nursing staff. In a sample of U.S. nursing homes (n=14,930), our results indicate that greater proportions of LPNs in the LPN and RN

staffing mix are associated with significantly greater ($p=0.0001$) counts of nursing home health survey deficiencies. These results suggest that optimal nursing home performance may require special attention to staffing mix. Specifically, attention to the non-substitutability of LPNs for RNs in clinical nursing expertise is essential to avoid poorer quality of care.

GERONTOLOGICAL PEARLS: DESCRIBING EXPERIENCES OF WORKING WITH OLDER ADULTS

J. Klein, L. Liu, *University of Alberta, Edmonton, Alberta, Canada*

Global aging creates the need for increasing numbers of health professionals who are trained and skilled in working with older adults. Rather than a challenge, this trend can be viewed as an opportunity for service providers to hone their expertise and examine the values in gerontological work. There is research on work with older adults in medicine and nursing, but very little is published in the rehabilitation literature. This study investigated experiences of working with older adults according to occupational therapists. A description of characteristics specific to the senior population, compared to younger populations, as well as how these traits impact working with older clients are explored. This qualitative research study used the interpretive descriptive approach (Thorne et al., 1997). Data from 16 interviews with occupational therapists and written responses were used. Constant comparison was used to analyze the data. Due to the complexity of care, participants appeared to require both a broad array of knowledge, as well as a significant depth of knowledge regarding age-related conditions and issues, 'a jack-of-all-trades and a master-of-all' concept. According to participants who worked with older adults, three key client characteristics that defined gerontological specialization were medical complexity, stage of life, and cohort-specific features. An emphasis on these characteristics within gerontological curriculum can assist with preparation of health professionals to master both generalized and specialized requirements for this type of work. Findings can inform clinical practice and curriculum development and may be examined in future research on a framework for gerontological practice.

WHO ATTENDS TRAINING IN LONG-TERM CARE SETTINGS? UNDERSTANDING STAFF AND FACILITY LEVEL CORRELATES OF ATTENDANCE

A.S. Beeber, C. Mitchell, S. Zimmerman, *The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

More than half of assisted living (AL) and nursing home (NH) residents have dementia, which requires that staff be familiar with behavioral and cognitive manifestations of the disease and able to provide care accordingly. While training can provide tools to help staff in this regard, staff must attend the training for it to be effective. Virtually no studies of dementia training in long-term care have examined staff participation in training and related correlates. This paper describes staff attendance at a six session dementia care training program based on the Alzheimer's Association Foundations of Dementia Care delivered in NH and AL settings. Study Setting and Sample: Training was conducted in 16 settings in 4 states (7 AL and 9 NHs). Attendees included 8 administrators, 279 supervisors, and 390 direct care workers. Methods: Analyses of the relationships among organizational characteristics, facility variables, and training attendance were conducted. Findings: On average 62% of staff attended at least 1 session, and participants attended 43% of all sessions offered. Attendance correlated with strong leadership, timeliness of response to issues and communication, and higher acceptance of resident behavioral symptoms. Discussion: Long-term care staff attended less than one-half of the training sessions offered to them. It appears that a "culture of training" related to the coordination of care fosters attendance, as does perceived need reflected by residents with more behavioral symptoms. These results suggest strategies to increase training attendance, and also the utility of providing training when it is likely to more relevant to need.

SESSION 1365 (PAPER)

ACADEMIC AND PROFESSIONAL ORGANIZATIONS' RELATIONSHIPS TO STATE POLICIES AND PRACTICES

TRANSLATING RESEARCH INTO STATE POLICY: LESSONS LEARNED FROM STATE AGENCY/UNIVERSITY COLLABORATION

R.K. Chapin, *School of Social Welfare, University of Kansas, Lawrence, Kansas*

State agency staff and university faculty, who collaborate to complete research focused on health and social services for older adults, often do so with the intent that their findings will help inform state policy. However, the path by which research actually influences state policy making is not clearly understood, and young researchers are frequently discouraged because they perceive that their studies simply gather dust on policy makers' shelves. This presentation examines both barriers to and successful strategies for facilitating the translation of research into policy that have been identified during twenty years of state agency/university collaboration. Barriers include: non-involvement of policy makers in conceptualizing and developing research; policy makers' need for immediate results; mistrust of findings reliant on less than ideal state data bases; ineffective dissemination practices. Successful strategies include: tested approaches to effectively engaging policy makers; focusing research to provide insight into recurring issues; methods for supplementing and improving state data bases; strategies for disseminating tailored research briefs to the governor's office, legislators, and advocacy organizations; and involvement in policy shaping events where faculty research can gain a wide audience. These barriers and strategies will be discussed in the context of specific examples that illustrate how research on services for older adults has been successfully translated into policy in one Midwestern state.

PROFESSIONAL CONFERENCE EFFECTS ON ORGANIZATIONAL PRACTICES AND INDIVIDUAL WORK: FINDINGS FROM THE AGING NETWORK

K. McGrew, *Sociology and gerontology, Miami University, Oxford, Ohio*

Professional conferences have multiple objectives, including the exchange of information; the development of professional networks; and the support of the sponsoring professional association(s). Organizations and individual professionals invest resources in the expectation that conference attendance will lead to some form of change in organizational practices or individual work. How is that expectation best met? This paper presents findings from the evaluation of a set of small-scale national conferences designed to improve the performance of organizations in the aging network. With over six hundred area agencies on aging and over two hundred Title VI American Indian, Alaska Native and Native Hawaiian programs, the aging network is playing an increasingly central role in the provision of services that promote the capacity of individuals to remain in their homes and communities. To enhance that role, the National Association of Area Agencies on Aging (n4a), with funding from the Administration on Aging, contracted with Scripps Gerontology Center to design and implement four conferences of approximately thirty-five agency directors each. In a two-day conference, participants learned models and strategies for improving their organizational practices; they also engaged in structured sessions to promote networking. Semi-structured telephone interviews were conducted with each participant six months to one year following their conference. We explored the effects of conference structure, content, and process on subsequent changes in organizational practices and individual work. The evaluation identified several factors that promote the translation of conference content into organizational and individual action and change.

AGING-UNITED COALITIONS: AAA'S AND COLLEGES/UNIVERSITIES TO THE RESCUE

L. Force, J. Kahana, V. Capalbo, *Center on Aging and Policy, Mount Saint Mary College, Newburgh, New York*

The needs of the aging population in the 21st Century will be compounded by the expansion of demographics and the decline of caregiving support systems. Traditional service delivery systems, e.g. the Area Agencies on Aging (AAA's) (N=655) will be expected to address the needs of a new generation, i.e., the elderly cohort of the 21st Century. As a result, innovative approaches and coalitions of support will be required; the opportunity to establish and strengthen intergenerational connections will be essential. College and university settings can be an invaluable resource for AAA organizations. The development of "Aging-United" coalitions can be useful resources in combining the knowledge-base of aging with college students and formal delivery systems. This research project is grounded in the work of Force and Kahana (2006, 2007, 2008) demonstrating how AAA's in partnership with academic settings can create innovative problem-solving strategies and programs related to the aging population. This research provides a model, demonstrating how linkage between the AAA's and college students presents an opportunity to develop dialogue and program development in the aging service field, i.e., AAA agency directors and college students developing meaningful application-based partnerships. This research is part of a larger NIH funded project that supports the training of undergraduate students as researchers in the field of aging. The results from this innovative model, has far reaching implications for resource development of AAA's in the 21st Century.

COMMUNITY-RESEARCH PARTNERSHIPS: PRINCIPLES, PRACTICES AND BENEFITS

D.B. Kaplan¹, E. Gonzales², B. Berkman¹, *1. Social Work, Columbia University, New York, New York, 2. Washington University in St. Louis, St. Louis, Missouri*

PURPOSE: This study documents the principles, practices, and benefits that gerontological social work researchers regard as necessary for engaging community partners throughout the research process. **METHODS:** A focus group of geriatric social work researchers identified principles and practices related to community involvement in scholarly research. Based on these findings, a 30-item electronic survey was distributed to 91 gerontological social work researchers. Eighty-four surveys were completed (92.3%). **RESULTS:** Essential principles of community-research partnership were identified as beneficence, collaboration and trust. Practices of partnership include the hiring and training of community members, as well as the involvement of community members in identifying key stakeholders and informants, identifying research questions, designing methodology, recruiting subjects, implementing research activities, gathering, analyzing and interpreting data, disseminating findings, and more. Despite varied conceptualizations of "community," study participants reported numerous mutual benefits of community partnership. Community members received free education, training, and development, research skills, substantive knowledge, improved status, and gained subsequent employment from the experience. Researchers gained access to local knowledge, received methodological consultation, review of instrumentation, and help with data collection and analysis. Research projects benefited from access to research participants, and built community investment and stake in research. Finally, local communities gained voice, learned about needs and problems, and identified solutions to community issues. **IMPLICATIONS:** With a growing need for research efforts related to healthy aging, many benefits are achieved by research-community partnerships that uphold the principles and practices of community-based research. Further research is necessary to gain insights from the perspective of the community.

CIVIC AND SOCIAL PARTICIPATION

CIVIC ENGAGEMENT FOR OLDER ADULTS WITH PHYSICAL AND COGNITIVE LIMITATIONS

H. Dabelko-Schoeny, K.A. Anderson, *College of Social Work, The Ohio State University, Columbus, Ohio*

Civic engagement, often defined as the interaction and involvement of individuals with their communities, has been found to be associated with a number of benefits for older adults, including lower depression levels, higher levels of well-being, and slower declines in self-perceived physical and emotional health. Unfortunately, much of the literature that examines civic engagement for older adults has focused exclusively on healthy, able populations. As our society ages, a growing number of older adults will experience physical and cognitive limitations. These limitations can significantly impact their ability to participate in traditional activities that promote civic engagement. Additionally, societal barriers, such as ageism and disabilityism, further limit the opportunities for older adults with disabilities. The civic engagement opportunities that do exist for this group tend to cast them as passive recipients rather than active participants in the engagement process. In this paper, we examine the potential benefits of active civic engagement programs designed specifically for older adults with physical and cognitive limitations. Using the adult day service setting as an example, we explore the roles and responsibilities of geriatric professionals in promoting opportunities for and addressing barriers to civic engagement for this important and growing sector of our society. Preliminary findings from an engagement intervention designed specifically for this population will also be detailed and discussed.

TIME AND MONEY VOLUNTEERING AMONG OLDER ADULTS: CORRELATES OF CHANGE AND STABILITY

N.G. Choi¹, R. Chou², *1. University of Texas at Austin, Austin, Texas, 2. University of South Carolina, Columbia, South Carolina*

Based on data from the first and second waves of the Midlife Development in the United States—MIDUS1, 1995-1996, and MIDUS2, 2004-2006, the dual purposes of this study were to examine the relationship between volunteering behaviors over a 9-year period and to examine correlates of change and stability in both time and money volunteering behaviors among persons age 55 and older ($n=917$). We focused on the changes in volunteering status from no volunteering at T1 to volunteering at T2 and on the stability in volunteering status (i.e., volunteering at both T1 and T2). The multivariate regression results show that a majority of older volunteers of time and/or money were repeat volunteers, and the extent of T1 volunteering was one of the most significant predictors of the extent of T2 volunteering. A higher proportion of older money than older time volunteers tended to be repeat (and possibly persistent) volunteers. Age was not a significant factor for money volunteering, while it was a significant factor for time volunteering. The level of education was a consistent predictor of the extent of both time and money volunteering and of new engagement and stability in volunteering behaviors. Social network size, represented by the number of various meetings attended, was a significant predictor not only of the hours of time volunteering, but also of new engagement and stability in both time and money volunteering behaviors. A high degree of religious identification also appears to provide motivation for money volunteering and affect its extent.

INTERGENERATIONAL ACTIVITY SATISFACTION AND IMPACT ON ELDERS

J.A. Krout, *Gerontology Institute, Ithaca College, Ithaca, New York*

This research examines the level of participation in intergenerational activities with college students for older independent living residents of a senior housing facility. Data on the correlates of involvement and its

perceived impact are also reported. Data were collected via in-person interview from a purposeful sample ($N=52$) residents in 2005. The mean age of the sample was 85, three-quarters were women and had more than a high school education, one-half were widowed, and they had lived in the facility an average of four years. The sample reported relatively high life satisfaction and health and indicated they participated in seven intergenerational activities in the last year. While some findings did vary with the activity type, overall participation was higher for those residents who: were under age 85 and more likely to have a college education; reported fewer IADLs and higher self-reported health; and noted higher levels of social integration and support. More than two-thirds of respondents agreed or strongly agreed that activity involvement resulted in: being more active in life; making more friends at the facility; and improving their knowledge. They were much less likely to agree that participation lead to learning new skills, staying healthy or sharing their knowledge. These findings suggest that residents who might benefit most from intergenerational activities were involved in fewer ones and greater efforts need to be made to identify and include those residents. More opportunities for residents to share as well as receive knowledge should be provided.

THE PERCEIVED HEALTH OF THE RECENTLY WIDOWED AND THE EFFECT OF VOLUNTEER WORK

K.J. Johnson, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

In this study I examine whether formal volunteering moderates the negative stress-related outcome of decreased self-rated health associated with the death of a spouse. Prior research suggests that older adults who engage in volunteer work experience positive effects on their physical health, and it is plausible that the benefits from volunteering will extend to moderating the effects of stress. Using data from four waves of the Health and Retirement Study, married respondents 60 and older in 1998 are followed over 6 years ($n = 7698$), and the self-rated health of married and widowed respondents is compared at follow-up. The baseline sample is 52.0% male, has a mean age of 69.9 years, and reports a mean self-rated health level of 2.9 indicating very good health. During the study period, 1120 respondents reported the death of their spouse, and 30.0% of the recently widowed respondents reported volunteering. Bivariate results comparing the mean self-rated health of the recently widowed volunteers and nonvolunteers showed a mean difference of 0.57 ($T = 8.13$ $p < .00$) with volunteers reporting better health status. Multivariate analyses involving hierarchical stepwise multinomial logistic regression are used to estimate the moderating effect of volunteering on self-rated health with potential baseline confounding variables held constant. The results reveal a meaningful relationship between the transition to widowhood, volunteering and self-rated health. The findings contribute to the literature on the value of social engagement for maintaining the health and well-being of the recently widowed.

THE EFFECTS OF VOLUNTEERING ON OLDER ADULTS' WELL-BEING IN TAIWAN

T. Kuo, *Central Taiwan University of Science and Technology, Taichung, Taiwan*

This paper examines the effects of volunteering on older adults' well-being by studying 100 older volunteers participating in senior services in Taichung City, Taiwan. It is a mixed-method study gathering both quantitative and qualitative data to examine how volunteerism affects one's life satisfaction, relationship with others, physical, psychological and social well-being, and self growth. The results showed that older volunteers, age 60 to 78 years old, participated in services such as the adult day care centers, exercise and nutritional programs, and friendly visitor or telephone assurance programs. The quantitative results indicated that older volunteers rated their health better, lived their lives more satisfied and were interested in doing more activities in the future. The qualitative data showed that older volunteers' lives were changed some-

what by quitting bad health behaviors and living a healthier lifestyle, learning challenging skills that one would not expect to learn, improving relationships with family and spouse, and becoming an active participant in the community. Current literature suggests that older adults engaged in volunteer works because of several factors such as giving back, killing time, fulfilling satisfaction, learning new skills and having self growth. In conclusion, the older volunteers who participated in senior services in Taiwan not only reflected those factors but also carried unique cultural reasons. As Taiwan's population faces one of the fastest aging rates in the world, this paper will discuss implications for creating a culturally-appropriate volunteer policy/structure to train willing older adults to be para-professionals for future aging services.

COMMUNITY PARTICIPATION OVER THE LIFE COURSE: A PARTICIPATORY PATHWAY TO HEALTHY AGING

A.N. Titus-Love, *Sociology, Texas State University-San Marcos, San Marcos, Texas*

This study examines older women's community participation throughout the life course. Current literature lacks information on the life-course and social dynamics of community participation within this growing segment of the population. To fill this gap, the present study addresses the following research questions: What are the patterns of community participation among older women over the life course?; What are the motivators and barriers of community participation for these older women?; What are their perceived well-being?; What are recommendations for increasing community participation levels? Several theories including activity theory, continuity theory and life course perspective inform this study. Thirty women over the age of sixty years living in the Southwest of the United States are interviewed to explore various areas of community participation including voting and participation in community, school and faith-based organizations and local government. Semi-structured interviews are used to guide participants to recollect and describe their community participation as a child, a young adult, and an older adult. This study provides a deeper awareness of the intersection between older women's lived experiences of community participation and their perceived well-being. Community participation is often embedded in social connections, which are known to be associated with successful aging. We can build upon the knowledge of the benefits of community participation for a healthier older adult population. After attending this session, viewers of this poster will be able to obtain a richer understanding of the life-course patterns of community participation among older women.

VOLUNTEERING AS SOCIAL CAPITAL AMONG RESIDENTIAL AND NON-RESIDENTIAL GRANDPARENTS

L.A. Martin, K.J. Johnson, *Gerontology Department, University of Massachusetts Boston, Boston, Massachusetts*

This study examines the extent to which certain grandparent caregivers possess social capital using the activity of volunteerism. Activities likely to involve social capital—membership in social networks and community engagement—must include some form of social contact, and community-based volunteering is consistent with this conceptualization. The purpose of this study is to examine differences in social capital among grandparent caregivers living with the grandchildren, non-residential grandparent caregivers, and non-caregiving grandparents. It is plausible that the different caregiving responsibilities of these groups of grandparents are related to their level of social capital (hours of volunteering). This study uses data from the 2004 Health and Retirement Study (HRS) to investigate the level of volunteering between the three grandparenting groups. The sample consists of 12,268 grandparents with an average age of 68.2. The sample is primarily female 78.8%, white non-Hispanic 72.2%, and 32% report being a volunteer. Compelling findings from preliminary multinomial logit results indicate that the non-residential caregivers have the least amount of volunteering time when other factors are controlled. This may be due to extensive travel,

unforeseen occasions of needed care, or an aspect of the caregiving responsibilities themselves. The intermediate grandparent fundamentally has to modify their life around caregiving priorities. These findings expand current descriptions of grandparent caregivers by contributing to a greater understanding of the social support and social resources available to them.

LESSONS LEARNED FROM A THREE YEAR INTERGENERATIONAL SERVICE LEARNING PROGRAM

C. Hegeman, D.A. Buzanowski, A. Davenport, *Foundation for Long Term Care, Albany, New York*

This poster session will (a) explicate the concept of intergenerational service learning and (b) highlight "lessons learned" based on experiences of five colleges and multiple community agencies in engaging college students, baby boomers, and older adults in highly diverse intergenerational service learning (IGSL) projects. There will be a focus on how other programs can be developed. The college/community partner projects included: two varied and comprehensive fall prevention programs (Stony Brook University and SUNY Brockport); varied intergenerational service learning programs involving multiple disciplines and services, including a program for recovering stroke victims (Ithaca College); a program to prevent relocation stress syndrome (Molloy College); and a clothing, furniture and outdoor design service to address needs of the elderly (Cornell University). Highlights will include: (1) differential definitions of traditional service learning and elder care and IGSL programs; (2) summary of "Intergenerational Service Learning: Linking Three Generations," funded by the Learn and Service division of the Corporation for National and Community Service; (3) profiles of the projects at the five participating colleges and how each project evolved and strengthened over two years; (4) recommendations for running an IGSL classroom; (5) overview of sl pedagogy; (6) evaluation findings and challenges for these IGSL programs; (7) other ways to develop IGSL programs; and (8) update on any funding for such programs.

MATCHING SKILLS AND VOLUNTEER ACTIVITIES AMONG OLDER VOLUNTEERS: A CONCEPTUAL MODEL

J. Park, A.E. Fortune, *School of Social Welfare, University at Albany, State University of New York, Albany, New York*

The Baby Boom generation (born between 1946 and 1964) has unique characteristics and is vastly different from previous generations (Einolf, 2008; Robert, M., Vanderburg, J., Leake, R., & Prieto, A., 2007; The Urban Institute, 2007). They have overlooked and undervalued skills that non-profit organizations can tap for service to their community and for civic engagement. To do so, non-profit organizations can develop a more strategic approach to managing the match between volunteer skills and volunteer activities. An appropriate and efficient matching system will use vast skills, knowledge, and experiences accumulated through the boomers' history of employment. A good match between skill sets and volunteer activities may help older volunteers to experience more satisfaction and more commitment through performing volunteer activities as a means of role expansion and role enhancement beyond their retirement. This paper presents a hypothesized conceptual model for volunteerism among the Baby Boom generation. The conceptual model could be utilized to integrate and coordinate boomer's volunteer activities in non-profit organizations as well as dissemination of a prototype "skilled and professional volunteer" model for community. The model explores the satisfaction and commitment of volunteer activity and later life well-being as a foundation for enhancing the participation of boomers in non-profit organizations. Furthermore, this model can enable organizations to decrease the turnover rate and increase the retention rate of volunteers.

SESSION 1375 (SYMPOSIUM)

DIRECT CARE WORKERS IN NURSING HOMES: QUALITY, IMMIGRANTS, AND CULTURE CHANGE

Chair: *J. Wiener, RTI International, Washington, District of Columbia*
Discussant: *P. Kemper, Pennsylvania State University, University Park, Pennsylvania*

Direct care workers, such as certified nurse assistants, are the backbone of the formal long-term care delivery system. These “frontline” workers help people by assisting with activities of daily living, such as eating, bathing dressing, and toileting, and with instrumental activities of daily living, such as taking their medication and meal preparation. This symposium addresses three important workforce issues in nursing homes. First, what is the relationship between the workforce characteristics in nursing homes and quality of care? Although the recent policy focus on the long-term care workforce is motivated by the belief that it affects quality of care, few studies have examined the effect of workforce factors on quality of care in nursing homes. Second, what are the differences between immigrant and native-born certified nurse assistants? As an increasing number of certified nurse assistants in nursing homes are immigrants, it is important to understand the similarities and differences between the two groups of workers. Third, what can be done to improve the organizational culture of nursing homes? Changing organizational culture is an increasingly common strategy simultaneously to improve quality of care and the working experience of certified nurse assistants.

EFFECT OF WORKFORCE CHARACTERISTICS ON QUALITY OF CARE IN NURSING HOMES

J. Wiener, W.L. Anderson, G. Khatutsky, RTI International, Washington, District of Columbia

Although the recent policy focus on the long-term care workforce is motivated by the belief that it affects quality of care, few studies have examined the effect of workforce factors on quality of care in nursing homes. This study uses data from the National Nursing Home Survey, the National Nursing Assistant Survey, the Centers for Medicare & Medicaid Services (CMS), and the Area Resource File to examine this issue. We analyzed the effect of possible workforce policy initiatives, including higher wages and better fringe benefits, increased training, higher levels of staffing, a more collegial work environment, and turnover, on quality of care. Outcome measures are the individual CMS nursing home quality measures and composite quality measures that are roughly similar to CMS’s 5-Star Nursing Home Ratings. These findings will help policymakers and providers understand whether changes in certain workforce practices may have an impact on nursing home quality.

THE EXPERIENCE OF IMMIGRANTS AS CERTIFIED NURSE ASSISTANTS IN US NURSING HOMES

G. Khatutsky, Aging, Disability and LTC, RTI, International, Waltham, Massachusetts

The growing immigrant population plays an important role in supplying direct service workers to LTC settings, yet little is known about how immigrants compare to native-borne workers. This study analyzes 2004 National Nursing Assistant Survey (NNAS) data to examine immigrant experience of working as Certified Nursing Assistants (CNAs) in nursing facilities across the country. We examine differences between immigrants and native-borne workers on personal characteristics, recruitment factors, working conditions, extrinsic rewards, work place experiences, tenure, job satisfaction and discrimination. Our findings indicate that immigrant CNAs were better educated and less likely to use public assistance programs, used friends and family more as a source of job information, felt better prepared for work in nursing facilities, and expressed higher job satisfaction than non-immigrant CNAs. The presentation will also discuss policy issues that arose from the increase in the use of immigrant and non-citizen labor in LTC.

WORKPLACE RESTRUCTURING FOR NURSING HOME QUALITY OF LIFE: LABOR AND MANAGEMENT PARTNER TO TRANSFORM WORK AND CARE

C.E. Bishop¹, W. Leutz¹, L. Dodson², I. Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts, 2. Boston College, Chestnut Hill, Massachusetts

High-commitment management for workplace restructuring engages frontline workers in transforming labor processes to improve quality and efficiency in numerous sectors of the economy. Its greatest success has been with high-value products and services where customization and quality are central. When focused on frontline workers’ engagement in providing quality of life for residents, the nursing home culture change or person-centered care movement appears to share important features with this approach. In other sectors, some labor unions have hindered workplace transformation while others have actively engaged their members in change. Our case study of a labor-management partnership between a labor union and a group of New York City nursing homes places culture change in a high-commitment management context and considers the role of a labor union in transforming nursing home work. We conclude that management partnership with an organization representing frontline workers can effectively support authentic transformation of nursing home work processes.

SESSION 1380 (SYMPOSIUM)

ENHANCING CARE TO MAXIMIZE HEALTHY AGING FOR PEOPLE WITH DEMENTIA AND THEIR FAMILIES: BUILDING ON THE 2009 ALZHEIMER’S STUDY GROUP REPORT

Chair: *R. Fortinsky, Center on Aging, University of Connecticut Health Center, Farmington, Connecticut*

Discussant: *K. Maslow, Alzheimer’s Association, Washington, D.C., District of Columbia*

The non-partisan Alzheimer’s Study Group (ASG), created in 2008 to assess America’s readiness to address the rapid growth of Alzheimer’s disease and other dementia and to develop a national strategic plan, recently released its final report and recommendations. This symposium will feature the ASG report’s “Alzheimer’s Care Improvement Initiative” in which recommendations focus on “reinventing dementia care by 2012” for people with dementia and their family caregivers. Robert Egge, ASG Executive Director, will explain the ASG’s mandate, its approach to report formulation, and recommendations related to delivering improved dementia care, and to empowering families through community care. Panelists with extensive research, clinical, and advocacy experience in Alzheimer’s care and public policy will discuss implications of the ASG’s recommendations for creatively maximizing healthy aging for people with dementia and their families. Kathleen Buckwalter will react to the ASG recommendations from the perspective of nursing practice and research. Christopher Callahan will provide remarks from his perspective as a physician investigator who has tested the value of enhancing collaborative care teams and uniform protocols to help manage dementia-related symptoms. Lisa Gwyther will present remarks based on her long history of community-based and clinical research and practice with family caregivers. Katie Maslow will serve as symposium discussant by responding to ASG recommendations and to key points made by panelists from her perspective as a public policy expert and advisor to numerous health and social service trials designed to improve the lives of people with dementia and their families.

A FAMILY-FRIENDLY ALZHEIMER’S STRATEGIC PLAN

L.P. Gwyther, 1. Duke University Center for Aging, Durham, North Carolina, 2. Bryan Alzheimer’s Disease Research Center, Durham, North Carolina

Creative approaches to healthy aging must address the public health consequences of continued, almost exclusive reliance on family care for

persons with dementia. The Alzheimer's Strategic Plan recommends expanded access to family information, training and support programs in the context of a value-based reimbursement system of coordinated health and social care for persons with dementia. Appropriate timely and sufficient family education and support may be the missing link in proposed and recent studies of coordinated chronic care. There are evidence-based models for family education and support which have been shown to reduce negative health consequences and increase the skills and effectiveness of family members as defacto care coordinators. This presentation offers recommendations for expanded community translation and uptake of evidence-based or at least evidence-guided practice in community settings to integrate value-added family assessment, training and supports through transitions in care for persons with dementia.

RESPONSE TO THE NATIONAL ALZHEIMER'S STRATEGIC PLAN FROM THE PERSPECTIVE OF NURSING

K.C. Buckwalter, *College of Nursing, University of Iowa, Iowa City, Iowa*

This presentation highlights and discusses ASG Recommendations from the National Alzheimer's Strategic Plan that are most relevant for the nursing profession, in concert with other health care providers and scientists. Specifically, elements of the Alzheimer's Care Improvement Initiative designed to reinvent dementia care by 2012 will be examined in light of potential contributions and leadership roles played by nurses. These include, for example the areas of care coordination, development of patient and family centered quality care measures, delivery of improved dementia care, empowering families through community care initiatives, especially those for persons in the early-mid stages of dementia, and training and support for family caregivers.

REINVENTING DEMENTIA CARE: HOMES, HUBS, CENTERS, AND HOME AGAIN

C. Callahan, *1. Indiana University, Indianapolis, Indiana, 2. Regenstrief Institute, Inc, Indianapolis, Indiana*

The Alzheimer's Study Group urges "a swift transition to a health-care system that encourages and rewards the provision of quality care to those with Alzheimer's disease." Core pillars of this system are envisioned as: (a) an electronic infrastructure to support coordinated care; (b) valid quality of care indicators; and (c) a workforce capable of providing collaborative, team-based care. Recent controlled clinical trials provide evidence for the effectiveness of these core pillars, but there remain multiple barriers to the implementation of coordinated care within primary care. While reimbursement represents one important barrier, there are multiple other barriers ranging from limited treatment options to physical space within primary care. This presentation will examine the potential and pitfalls of several approaches to redesigning primary care including the patient-centered medical home, hub and spoke designs, and specialized referral systems. In addition, the promise and limits of intensifying care in the home will be explored.

THE ALZHEIMER'S STUDY GROUP: A SUMMARY OF THE ASG'S PRINCIPAL FINDINGS AND RECOMMENDATIONS REGARDING CARE

R. Egge, *Alzheimer's Association, Chicago, Illinois*

The Alzheimer's Study Group (ASG) was a blue ribbon task force co-chaired by former House Speaker Newt Gingrich and former Nebraska Senator Bob Kerrey. It was created to assess the impact of Alzheimer's disease and other dementias on the nation and to propose a national strategic plan in response. The ASG delivered this strategy to Congress on March 25, 2009. A central focus of the Alzheimer's Study Group was on the challenges of care coordination for individuals with dementia under Medicare Fee-for-Service. Mr. Egge, who served as the ASG's executive director, will describe the group's care coordination findings and the policy framework proposed to address them.

SESSION 1385 (SYMPOSIUM)

ENVIRONMENTAL CIVIC ENGAGEMENT: IT'S WORKING

Chair: K.E. Sykes, *OCHPEE, US EPA, Washington, DC, District of Columbia*

Discussant: H. Moody, *AARP, Washington, District of Columbia*

Making a difference for the environment and public health is becoming more evident. Four presentations will illustrate elders as community leaders and engaged in making the environment a better place. Although the Baby-Boomer cohort is best known for their activities, environmental and otherwise, during the first Earth Day in the U.S., some of us now beyond the 6th decade of life have been engaged in saving the environment, in protecting air and water, and in fighting global warming. This presentation will summarize activities of several elders who were nominated for the Purpose Prize. Rural communities often find their economic mainstay in the harvesting timber and extracting minerals. Home to a disproportionate number of elders, informing rural communities of the potential health risks associated with mining activities is important. A case study of a rural community in the Midwest will highlight these issues. The Center for Civic Partnerships helps cities use the Healthy Cities and Communities Model to collaborate with residents planning for future needs. Older adults are surveyed about what they think would be important to age in their communities. Results are shared with decision-makers highlighting needed changes for housing, mobility, and other aspects of community life. A state-wide initiative to responsibly dispose of unwanted household prescription drugs that otherwise may have gone directly into ground water and landfills is an excellent vehicle to civically engage older adults as both program planners/implementers and program consumers. This Maine mail-back program is a precedent-setting statewide consumer mail-back program for expired/unused medications.

AGING AND ENVIRONMENTAL ISSUES: USING EPA AGING INITIATIVE MATERIALS TO EDUCATE A RURAL COMMUNITY

P. Cianciolo, *Sociology & Social Work, Northern Michigan University, Marquette, Michigan*

Rural communities have often found their economic mainstay in harvesting timber and mineral extraction, both industries having significant environmental impacts. These communities are also home to a disproportionate number of older adults. There are a number of health conditions where environmental exposures are known or suspected to impact the health of older adults; two prominent pathways for exposure are air and water pollution. This session uses a case study approach involving a rural community in the Midwest. EPA Aging Initiative materials have been used as one means of educating the community about the vulnerability of older adults to environmental toxins that are likely to result if a metallic sulfide mine is cleared for operation.

PRESCRIPTION DRUG RETURN AND DISPOSAL PROGRAMMING AS A VEHICLE FOR OLDER ADULT CIVIC ENGAGEMENT

J. Crittenden¹, L.W. Kaye¹, S. Gressitt², *1. Center on Aging, University of Maine, Bangor, Maine, 2. Maine Office of Adult Mental Health Services, Augusta, Maine*

A state-wide initiative to responsibly dispose of unwanted household prescription drugs that otherwise may have gone directly into ground water and landfills is an excellent vehicle to civically engage older adults as both program planners/implementers and program consumers. The Safe Medicine Disposal for ME program is a precedent-setting statewide consumer mail-back program for expired/unused medications that insures all such drugs will be disposed of in a safe manner. Well over 1,000 lbs. of medications have been mailed back for disposal with the average participant approximately 58 years of age. Almost 50% of these individuals would have flushed their medicine and an additional

25% placed it in the trash if this program was not available. Elders engaged evidence strong commitment to serving as environmental stewards either as participants or program volunteers. Specialized program components that succeed especially in promoting older adult engagement are identified. Supported by US EPA Grant #CH-83336001-0.

APPLYING THE "HEALTHY CITIES AND COMMUNITIES" APPROACH TO CREATING A LIVABLE MAIN STREET FOR OLDER ADULTS

D.C. Smith, *Center for Civic Partnerships, Sacramento, California*

The Center for Civic Partnerships is engaged in a multi-pronged statewide educational program using the Healthy Cities and Communities Model. California provides optimal testing ground for these efforts given the projected growth in the number of people over 60 years old, rising from 14% currently to 20% of the total population by 2020. Successful collaboration among residents and city leadership in planning for the future needs of their aging communities has resulted in action. Cities have conducted resident surveys and focus groups to learn about what older adults think would be important for them to age in their communities. The results were presented to city councils to raise awareness and expedite planning with regard to housing, transportation, and other aspects of community life. The effort provides ideas and strategies for application in planning and allocating resources to create more livable communities for older adults and therefore, people of all ages.

SESSION 1390 (POSTER)

EXPERIENCES WITH DEMENTIA

TAKING CONTROL OF ALZHEIMER'S DISEASE: EVALUATING TRAINING FOR EARLY STAGE PERSONS AND CARE PARTNERS

N.M. Silverstein, R. Sherman, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Taking Control of Alzheimer's Disease was developed under the philosophy that educating persons with early-stage Alzheimer's disease about the cognitive disorder would empower them to actively participate in the decisions affecting their lives. The program is presented in either a series of four two-hour meetings on consecutive weeks or one-six and half hour session. Persons with Alzheimer's disease attend together with their care partner(s). Gerontology undergraduate students conducted the research. The Community Partner was the Alzheimer's Association, Massachusetts/New Hampshire chapter. Questionnaires were mailed in March 2009 to 150 sets of dyads, triads, or in some cases, quaternions of persons with dementia and their care partners. All persons were included that participated in one of twenty training sessions held between 2004 and 2008. Separate questionnaires were designed to assess the impact of the training in terms of recommendations followed such as knowledge of Alzheimer's disease, and recommendations followed on a series of domains regarding life style changes and future planning. Moreover, questions were included on the format, logistics, resource materials shared, and training content. Questions for the person with dementia did not require fact or history retrieval but focused on the individual's current feelings. The study builds on the work of Roberts and Silverio who evaluated the program in 2003. The former study focused on patient outcomes. This study serves more as a process evaluation and will assist the Alzheimer's Association to make refinements to the curriculum and program to better serve early stage individuals and their care partners.

FACTORS RELATED TO SERVICE BARRIERS EXPERIENCED BY RURAL CAREGIVERS FOR PATIENTS WITH ALZHEIMER'S DISEASE

H. Li¹, G. Kyrouac², *1. School of Social Work, University of Illinois at Urbana and Champaign, Urbana, Illinois, 2. School of Medicine, Southern Illinois University, Springfield, Illinois*

Home and community based services are increasingly available in rural communities. The utilization of these services has been limited. Although there are studies on service barriers in rural communities, very few studies have examined the specific service barriers experienced by older adults with AD. Using the data collected in rural Illinois, this study describes the service barriers reported by rural caregivers and identifies factors related to these service barriers. Considering older adults' cognitive impairments, this study was conducted with 110 primary caregivers for older adults diagnosed with probable or possible AD who needed assistance with one or more activities of daily living (ADL) or instrumental activities of daily living (IADL). Univariate analysis was used to describe the service barriers, and ordinary least square regression was used to identify the factors related to service barriers. In this sample, 80 percent of caregivers reported at least one of the service barriers. The three most frequently reported service barriers were costs (40.0%), unavailability (40.0%), and preference to self-care (38.1%). The study also found that caregiver's marital status ($p=.007$) and family income ($p=.01$) were statistically significant predictors of the service barriers. Caregiver burden only marginally contributed to the service barriers ($p=.07$). These findings have implications to social service providers in rural communities. Social service providers need to carefully identify specific service barriers encountered by each family. Special attention should be given to the caregivers who had limited financial resources, were unmarried, and were burdened by their caregiving responsibilities.

CARING FOR PERSONS WITH DEMENTIA-RELATED BEHAVIORS: A FAMILY PERSPECTIVE ON AN INNOVATIVE MODEL OF CARE

R.J. Karasik¹, J. Berry², J.M. Tasto¹, A. Takamatsu¹, *1. Community Studies, St. Cloud State University, St. Cloud, Minnesota, 2. Dementia Care Foundation, Darwin, Minnesota*

Finding a place that can provide satisfactory and appropriate care for persons with significant dementia related behavioral issues (e.g., wandering, aggression, combativeness) is an on-going challenge for families. The current study examined the impact of an innovative model of care on family members' levels of stress and satisfaction. The model focuses on meeting residents' emotional and spiritual needs, as well as their physical needs in order to reduce challenging behavioral issues and thus the need for behavior-related medications and hospitalizations. Respondents ($n=89$) indicated that prior to the current care model, their family members with dementia lived in a variety of settings, including: assisted living (46%), nursing homes (43%), independent senior living (11%), and geriatric psychiatric units (9%). Dementia-related behaviors included anger (40%), hallucinations (33%), combativeness (32%), and paranoia (30%). While research suggests that outplacement does not necessarily relieve family stress (McLean, 2007; Watari, et al., 2006), family caregiver stress and burden has been associated with a number of variables including the quality of care families perceive their loved one is receiving (Robison, 2007; Tornatore & Grant, 2004). In this study, respondents overwhelmingly indicated high levels of satisfaction with their family member's current care and relatively low to moderate levels of stress. Cost was the only factor that brought a more mixed level of satisfaction. In addition to examining factors related to levels of stress and satisfaction, the current study provides a qualitative analysis of family members' recommendations for coping with challenging behaviors, finding appropriate care, and managing levels of stress.

A CHANGING LANDSCAPE: PERSONS WITH EARLY-STAGE DEMENTIA AND THEIR EXPERIENCES IN SOCIAL INTERACTIONS

J.E. Ataie¹, R. Logsdon², 1. *Portland State University School of Social Work, Vashon, Washington*, 2. *University of Washington School of Nursing, Seattle, Washington*

Although it is widely acknowledged that relationships have a significant impact on the subjective experience of dementia, few studies have asked persons with dementia about their experiences with others. The present study explored how persons with early-stage dementia understand their relationships and interactions with others and how they view the role that increasing memory loss and decreasing discursive capabilities play in this context. Data were gathered from 13 women and 6 men living with early-stage dementia through 8 individual and 4 focus group interviews. Interview transcripts were analyzed using thematic analysis. Although most participants viewed their relationships positively, some expressed anger and resentment about specific experiences, and some voiced fear and frustration about anticipated experiences. Shared activities were viewed as important to social and family relationships. Participants expressed a preference for social activities within a familiar environment with familiar people, and within the small network of family, friends, and neighbors, participants felt their contributions were valued. Almost all participants reported that their social interactions had changed due to increasing difficulties with memory and language. However, most participants reported that these changes were the result of their own choices because previously valued activities or relationships no longer contributed to a sense of wellbeing. Living with dementia meant opening a new chapter and taking on a new role in the story of life. All participants in this study were able to successfully re-story their lives to create new meaning and life satisfaction.

COMMUNICATION BREAKDOWN DURING CARE COORDINATION OF RESIDENTS WITH DEMENTIA IN ALFs

T. Sharpp, *Betty Irene Moore School of Nursing, University of California, Davis, Sacramento, California*

Significance: Assisted living facilities (ALFs) are a prominent source of housing for seniors in the United States. It is estimated that over 50% of the residents in ALFs have some form of cognitive impairment. The only requirements for caregivers in ALFs in California are to have a criminal background check and to receive ten hours of training at the facility. **Purpose:** The purpose of this presentation is to highlight the ways communication broke down during the coordination of care for residents with dementia in an ALF. **Methods:** An ethnographic study was conducted in a 30-bed ALF specializing in dementia care. Over 100 hours of participant observation was conducted over 6 months. Focus groups and informal and formal interviews were conducted with the 20 employees and 5 family members. **Results:** Flaws in communication regarding the care of residents with dementia were noted between many groups including: family members and employees, caregivers and supervisors, health care professionals and supervisors, and residents and caregivers. **Implications:** As elders with dementia are completely dependent on others for their care, it is imperative that communication is successful between all participants in the residents' care.

SESSION 1395 (SYMPOSIUM)

KNOWING THE PERSON IN PERSON-CENTERED DEMENTIA CARE: TACIT KNOWLEDGE, LIFE STORIES, AND BLENDED PERSPECTIVES

Chair: P.C. Kontos, *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*

Discussant: H. Chaudhury, *Simon Fraser University, Vancouver, British Columbia, Canada*

Person-centred dementia care has had considerable influence on the policy, practice and academic literatures. However, whilst the use of

the term is commonplace, there is little research on the sources of knowing that are critical for the individualizing of care that is the hallmark of this approach. The purpose of this symposium is to broaden the discourse on person-centred dementia care by exploring the oft neglected context-specific knowledge required for its implementation in long-term care. Kontos and Naglie's paper highlights the importance of tacit knowledge for tailoring care. Their paper explores how embodied self-expressions by persons with dementia as well as dementia care practitioners' own bodily dispositions facilitate identification that gives practitioners empathic connection with their care recipients and allows them to individualize care. Another important source of knowing explored by de Medeiros and colleagues is the conceptions of self by persons with dementia. Despite that residents with dementia were found to provide significant information about themselves, there was a notable absence of this information in the residents' care plans. Knowing the person in person-centred approaches to care is further explored by Hung in her study of mealtimes in two care facilities. She highlights the importance of practitioners' knowledge of residents' opinions, and habits and personal preferences for supporting their individuality. Collectively these papers give definition to various sources of knowing that facilitate empathic connection and the implementation of person-centred strategies for care.

THE IMPORTANCE OF TACIT KNOWLEDGE FOR PERSON-CENTRED DEMENTIA CARE

P.C. Kontos, G. Naglie, *Toronto Rehabilitation Institute, Toronto, Ontario, Canada*

In the age of scientific objectivity, epitomized by the rise of evidence-based medicine, the importance of qualitative dimensions of clinical decision-making have received insufficient attention. To explore the importance of the body as a source of knowledge that informs clinical decision-making in dementia care we conducted focus groups with forty-three dementia care practitioners from three care facilities located in Toronto, Canada. Our data capture how decision-making in the interpersonal moments of clinical practice is informed by practitioners' understanding of how residents' tendencies and inclinations to move and behave in a particular manner were linked to their previous vocation as well as to their awareness of, and respect for social conventions. In addition, practitioners use their own bodily dispositions to make meaningful connections with their care recipients in the course of providing dementia care. Tacit knowledge provides a novel and indispensable contribution to evidence-based dementia care practice.

RESIDENTS' VIEWS OF SELF: FILLING THE GAP IN PERSON-CENTERED PERSPECTIVES

K. De Medeiros^{1,2}, P. Saunders³, A. Mosby¹, P.J. Doyle⁵, M.E. Jeresano⁴, K. Van Haitma⁶, 1. *The Copper Ridge Institute, Sykesville, Maryland*, 2. *The Johns Hopkins University School of Medicine, Baltimore, Maryland*, 3. *Georgetown University, Washington, DC, District of Columbia*, 4. *Towson University, Towson, Maryland*, 5. *University of Maryland Baltimore County, Baltimore, Maryland*, 6. *Polisher Geriatric Research Center, Philadelphia, Pennsylvania*

A major challenge in person-centered care is knowing who the person with dementia is in order deliver appropriate care. Family members (if present) may know a person's biography, premorbid personality and other details while staff may know residents through mannerisms, preferences, and the stories they tell. Missing, however, is the resident's view of self. The purpose of this paper is to critically examine this gap in knowledge and to evaluate various perspectives of self in light of care plans for two residents with moderate dementia. Residents Bob and Ellie were selected from an observational study on the social environments of people with dementia because of their ability to articulate their self views and the presence of family and staff insight. Information on the person from the three sources was then compared to care plans. Find-

ings suggest that the resident's perspective is key but often overlooked in the understanding of personhood.

MEALTIMES PROVIDE PRIME OPPORTUNITY FOR STAFF TO GET TO KNOW THEIR RESIDENTS WITH DEMENTIA AND BUILD RELATIONSHIPS

L. Hung, *Gerontology, Simon Fraser University, Richmond, British Columbia, Canada*

Mealtimes in care facilities are often described as depersonalized and task-oriented. Knowing the life habits and personal preferences of residents are the foundation of providing person-centered care at mealtimes. Meals are the basis of significant social encounters and are inherently social events that sustain personal identities in significant ways. My paper explores the dining experience of residents with dementia in two care facilities in British Columbia, Canada. Findings from interviews with residents with dementia and observations on a dementia care unit reveal how mundane activities at mealtimes can be extraordinary avenues for staff to get to know their residents and build relationships. Listening to the opinions of residents with dementia and using knowledge of their life history to interpret the psychosocial needs behind behavioural symptoms are critical to supporting the individuality of residents and to fostering person-centred care.

SESSION 1400 (SYMPOSIUM)

MEDICATION MANAGEMENT IN RESIDENTIAL CARE/ASSISTED LIVING SETTINGS

Chair: P. Carder, *Institute on Aging, Portland State University, Portland, Oregon*

Discussant: J.T. Hanlon, *Institute on Aging, Portland State University, Portland, Oregon*

Older persons are prescribed and consume more medications than any other age group. It is not surprising, then, that a major reason that people move into residential care/assisted living (RC/AL) settings is to receive assistance with their medications. As many as 50-80% of residents require such assistance, with most taking an average of almost nine different medications. The four papers in this symposium present findings from three recent research projects that examine medication administration and management practices in RC/AL. The first study (Zimmerman et al) compares medication error rates of licensed and unlicensed care staff in 11 settings in two states. Data include direct observation of medication administration and questionnaires on medication administration knowledge and practices completed by staff members. The second paper (Sloane et al) presents statistical findings on the potential clinical severity of specific medication errors based on data from the same study. The third paper (Carder et al) reports on an ethnographic study of medication administration in three dementia care settings. It includes a typology that describes how direct care workers determine whether or not to administer as-needed (PRN) medications to persons with dementia. The final paper (Schumacher et al) focuses on relations between physicians and RC/AL staff regarding their mutual experiences and satisfaction with medication-related communications and responsiveness. Each paper includes policy and practice implications for medication management in RC/AL.

THE ADMINISTRATION OF AS-NEEDED MEDICATIONS TO ASSISTED LIVING RESIDENTS WITH DEMENTIA

P. Carder, L. Tata, J. Coffee, H. Guenin, A. Lawrence, *Institute on Aging, Portland State University, Portland, Oregon*

This focused ethnography examined how unlicensed direct care workers in assisted living settings make decisions to administer as-needed (or pro re nata (PRN)) medications to residents with dementia. Data include fieldnotes recorded while shadowing staff during consecutive shifts for five days at three settings (resulting in over 300 hours of direct observation), interviews with direct care workers (n=18), and medica-

tion record review. Fieldnotes were coded and analyzed with a grounded theory approach and a registered nurse reviewed medication records. On average, residents had five PRN medications listed in their medication records; the most commonly administered medication was for pain relief. Direct care workers' decisions about whether to administer PRN medications are based on resident request, interpretation of resident behavior, facility norms, and written parameters. Communication is the key concept. Clinical, staff training, and policy implications for administration of PRN medications to individuals who have dementia will be provided.

MEDICATION ERRORS AND STAFF TRAINING IN ASSISTED LIVING

S. Zimmerman¹, L.W. Cohen¹, K. Love², D. Reed¹, P. Sloane¹, T. CEAL-UNC Collaborative², 1. Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. The Center for Excellence in Assisted Living, Falls Church, Virginia

The majority of assisted living (AL) residents have chronic illnesses and require multiple medications. Various types of AL staff administer or assist with administering medications, which has resulted in concern about errors and debate as to whether or not licensed nurses should be required to administer medications. In a study of 4403 medications observed being given to 320 residents in 11 settings, 35% involved an error, with 71% of errors related to timing, which rarely has the potential to cause harm. Fewer than 3% of all medications involved errors with moderate to significant potential for harm. Medication technicians did not have a higher rate of medication errors than did licensed nurses, but staff who were less trained than technicians and were "assisting" residents to administer medications caused more errors than licensed nurses (p<.01). These individuals represented 42%-65% of those who handled medications. Conclusions will address implications for policy and practice.

COMMON SOURCES OF MEDICATION ADMINISTRATION ERRORS IN ASSISTED LIVING

P. Sloane¹, J. Ivey², S. Zimmerman¹, 1. Cecil G. Sheps Center for Health Services Research, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. School of Pharmacy, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

As part of a study of medication administration in assisted living, over 4,400 medication passes were observed in 11 communities in two states. Most observed errors involved administration outside a 2-hour timing window, which our study's expert panel judged to be clinically unimportant in the majority of instances. Relatively few errors were judged by the panel to constitute a significant possibility of causing harm. Those that did included insulin (9 events), ipratropium (7 events), warfarin (5 events), risperidone (3 events), levodopa/carbidopa (2 events), galantamine (2 events), and oxybutynin, glyburide/metformin, and albuterol (1 event each). In addition, the study found that eye drops and inhalants were particularly likely to be subject to errors compared with other medications (OR = 2.7, p<0.001). We conclude that although administration errors appear to pose a lower risk than prescribing errors in these settings, targeted training toward the medications associated with serious errors is warranted.

UNDERSTANDING MEDICATION ADMINISTRATION IN ASSISTED LIVING: VIEWS OF PHYSICIANS AND HEALTH CARE SUPERVISORS

J. Schumacher¹, S. Zimmerman², P. Sloane², J.K. Eckert¹, B. Harris-Wallace¹, R. Perez¹, P.J. Doyle¹, C. Mitchell², 1. University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of North Carolina, Chapel Hill, Chapel Hill, North Carolina

As a supportive living environment, assisted living (AL) settings typically provide assistance with residents' medications. Data from

the Physician Care in AL Study, an NIA funded study of 90 AL settings and associated physicians, obtained information regarding physicians' understanding of the qualifications of AL staff who administer and monitor medications, physicians' involvement in self-medication competency decisions, and physicians' satisfaction with the information exchanged/communication with AL staff regarding medications. These data and the corresponding perspectives of 90 AL health care supervisors (HCSs) will be presented. Preliminary analyses indicate over 90% of ALs obtain the medications for residents but report difficulty filling physicians' immediate medication requests. The data also suggest the majority of ALs do not use nurses for medication administration and do involve physicians in assessing self-administration competency. Conclusions propose areas for improvement in medication information exchange and strategies for enhancing care for both physicians and AL HCSs.

SESSION 1405 (SYMPOSIUM)

THE MORAL ECONOMY OF RETIREMENT

Chair: *L. Polivka, Florida Policy Exchange Center on Aging, Tampa, Florida*

Discussant: *E. Kingson, Syracuse University, Syracuse, New York*

The failure of the U.S. and global financial systems over the last several months threatens to erode the retirement security of many current and future retirees by driving the economy into a deep recession and undermining the private retirement accounts and other investments and savings workers were relying on to sustain their standard of living in retirement. These system failures have required the federal government to spend upwards of a trillion dollars in bailout funds to prevent a complete meltdown of the financial system, which could cause a depression in the U.S. and global economies. This spending has added to the federal deficit, which may diminish the government's capacity to maintain the main federal retirement security programs, especially Medicare, which would further erode retirement security for future retirees. These failures are largely a result of policies implemented over the last 30 years, especially deregulation of financial markets. This session will shift the focus on these events from the technical and mechanical aspects of the financial collapse and the recession to the underlying moral dimensions of the crisis—from the political economy to the moral economy of what Robert Reich has called the new turbo capitalism that has shed the shackles of regulation and shared prosperity policies like progressive taxation over the last 30 years. This shift in the moral framework of contemporary capitalism has major implications for the future of retirement security, which must be explicitly addressed as part of any effort to restore economic security for future retirees.

THE NEOLIBERAL MORAL ECONOMY AND CLASSICAL CONSERVATISM

L. Polivka, Florida Policy Exchange Center on Aging, Tampa, Florida

This presentation will argue that the deregulation, privatization, and tax-cut policies of the last 30 years were at least partially legitimized by a neoliberal moral economy that not only departed from the moral framework of welfare state capitalism, but also from the moral philosophy of classical conservatism from Adam Smith to Burke, Oskenshott, and Whitaker Chambers. These conservative thinkers cannot be interpreted to support the dominance of the "disembedded" market (Polany) over all other institutions as occurred with the ascendance of neoliberal capitalism, under the guidance of the political economy theories of Hayek and Friedman, over the last 30 years. They would not have been surprised that the distortions in the moral economy caused by unchallenged primacy of the market now threaten our hard-earned system of retirement security and other "life world" institutions.

THE MORAL ECONOMY OF RETIREMENT

H.C. Moody, AARP, Washington, District of Columbia

This presentation will address the moral economy underlying the current financial crisis and its implications for the future of the U.S. retirement system. The presentation is based on several questions designed to provide a framework for constructively engaging issues at the heart of the crisis. In order to rebuild our seriously eroded system of retirement security, we must begin by examining the moral economy of retirement from its origins in the New Deal of the 1930s to its partial disintegration over the last several years. The organizing questions for this inquiry include "Where did my money go? Who is to blame? Who can I trust? What will happen next? and What do I do now?" Addressing these questions can help us restore the ethical norms of truth telling and promise keeping that any viable retirement system requires.

SESSION 1410 (SYMPOSIUM)

THE REPRESENTATION OF WOMEN IN CLINICAL TRIALS: IS NOTHING NEW UNDER THE SUN?

Chair: *P. Herd, University of Wisconsin-Madison, Madison, Wisconsin*

Congress approved the NIH Revitalization Act in 1993, which directed the NIH to establish guidelines to include women and minorities in clinical research. While the overall number of women included in clinical trials has increased substantially over the past 15 years, in certain areas women are still under-represented. In particular, they are not well represented in cardiovascular trials. Heart disease, like for men, is the number one cause of mortality for women. But the underlying patterns of heart disease differ for women and men. Sponsored by the GSA Women's Task Force, this panel, which includes academics and a representative from the NIH, explores the causes and implications of this lack of representation in clinical trials. Moreover, the panelists explore what might be done to address the problem.

ELDERLY WOMEN IN CLINICAL TRIALS WITHIN NIH/NIA

M. Bernard, National Institute on Aging, Bethesda, Maryland

Marie Bernard will provide an overview of the inclusion of elderly women in clinical trials within NIH/NIA.

UNDERREPRESENTATION OF FRAIL ELDERLY WOMEN IN CLINICAL TRIALS

B. Messinger-Rapport, Geriatric Medicine, Cleveland Clinic, Cleveland, Ohio

Older women are under-represented in several major cardiovascular trials. In this session we will discuss impact of this problem on the ability of clinicians to advise their older women of cardiovascular risks and treatments; causes of the under-representation; and, possible solutions.

SESSION 1415 (SYMPOSIUM)

IMMUNOSENESCENCE

Chair: *R.B. Effros, Pathology & Laboratory Medicine, David Geffen School of Medicine at UCLA, Los Angeles, California*

This symposium is designed to cover several cutting edge areas of research, each of which addresses a major facet of the effect of aging on the immune system. Dr. Rita Effros (David Geffen School of Medicine at UCLA) will open the session by providing some introductory remarks on the increasingly recognized role of the immune system in several age-related pathologies. The first speaker, Dr. Gregory Sempowski (Duke Univ., Durham, NC) will then discuss problems and mechanisms of thymic involution, together with approaches his lab has taken to develop novel strategies for thymic reconstitution to enhanced immune function. Dr. Janet Lord (Univ. of Birmingham, Birmingham, UK) will review her research on the neutrophil killing and links to emotional stress

during aging, emphasizing some new findings regarding bereavement effects. Dr. Prakash Sambhara (Centers for Disease Control and Prevention, Atlanta, GA) will discuss the importance of innate immunity with regard to both infection and vaccination in the elderly. Finally, Dr. Jack Gorski (Blood Center of Wisconsin) will introduce some novel molecular techniques used in his research to analyze the changes in the memory cytotoxic T cell responses to influenza in the elderly.

MODULATION OF THYMOPOIESIS ACROSS THE LIFESPAN

G.D. Sempowski, *Medicine/Human Vaccine Institute, Duke University Medical Center, Durham, North Carolina*

Thymus is a primary lymphoid organ responsible for education of T cells, and plays a pivotal role in host response to diverse antigens by generating a broad repertoire of T cells. Aging involutes the thymus and dramatically reduces naïve T cell output. We have characterized this process in both human and mouse thymus tissue, and defined an active cytokine-driven mechanism by which the IL-6 gene family suppresses thymopoiesis. Thymic atrophy is a major factor leading to immunosenescence and decreased efficacy of vaccination in the aged. We have further demonstrated that the thymo-stimulatory agent keratinocyte growth factor enhances humoral responses to influenza HA-whole protein immunization, stimulates thymopoiesis, and increases the frequency of naïve T cells in young and aged mice. These studies suggest that thymic function is malleable in the aged, and targeting this central lymphoid organ may be a viable strategy to effectively modify immune responses in the elderly.

MODULATING INNATE IMMUNITY IN OLDER ADULTS TO ENHANCE DISEASE RESISTANCE AND VACCINE EFFICACY

P. Sambhara, *Influenza Division, Centers for Disease Control and Prevention, Atlanta, Georgia*

A number of protective immune functions decline with age along with physiological and anatomical changes, which contribute to the increased susceptibility of the older adults to infectious diseases and also sub-optimal protective immune responses to vaccination. We have shown earlier that innate immune function is altered with age leading to poor adaptive immune responses to infection and vaccination. I will present recent findings from our studies that indicate altered expression and function of pathogen sensors leads to delayed migration of antigen presenting cell and T cell and subsequent interactions. I will discuss a number of strategies including utilizing newly discovered ligands of pathogen sensors as molecular adjuvants, novel formulations and delivery systems to overcome poor immune function in older adults.

WHEN IMMUNE MEMORY BECOMES FORGETFUL: STUDIES ON FLU-SPECIFIC CYTOTOXIC T CELL REPERTOIRES IN OLDER POPULATIONS

J. Gorski¹, M. Yassai¹, Y. Naumov³, E. Naumova², 1. *BloodCenter of Wisconsin, Milwaukee, Wisconsin*, 2. *Tufts University School of Medicine, Boston, Massachusetts*, 3. *University of Massachusetts Medical School, Worcester, Massachusetts*

The role of the immune system is to protect the host from pathogens and other “insults” to normal health. The adaptive arm of the immune system utilizes specialized cells, B and T lymphocytes, that generate clonal receptors by undergoing a gene rearrangement process. If a lymphocyte’s receptor can recognize a pathogen, the cell can be selected into the immune memory pool for that pathogen. Together the various lymphocytes that respond to the pathogen constitute the memory repertoire. The major effect of aging on the T cell immunity is the increasing reliance on the memory T cell pool due to thymic involution, which decreases and stops production of new T cells. We are analyzing the temporal changes in CD8 T cell memory to influenza at the clonal level. This includes comparison of different age cohorts and longitudinal stud-

ies. In healthy individuals the process can be described as “degrading gracefully.”

NEUTROPHILS: ROLE IN IMMUNESENESCENCE AND FRAILTY

J. Lord, E. Sapey, *Immunology, Birmingham University, Birmingham, United Kingdom*

Susceptibility to infectious disease increases with age and infection related mortality accounts for almost 15% of deaths amongst those aged over 85 years. Moreover, older adults take longer to recover from both infections and physical trauma. These data suggest a decline in the functioning of the immune system with age and an altered response to stress leading to frailty. Neutrophils are the first line of defense against bacterial infections and previous work has shown that several aspects of their bactericidal function are reduced with age, including reduced phagocytic ability. Importantly neutrophil senescence is further compounded by a stress such as hip fracture and we have proposed that this is as a direct result of age-related alterations to the Hypothalamic-Pituitary-Adrenal (HPA) axis. New data showing defects in neutrophil migration and the consequences for recovery from injury and infection will be discussed.

SESSION 1420 (PAPER)

ANALYZE THIS: PERSONALITY AND AGING

THE IMPACT OF PERSONALITY ON DEPRESSIVE SYMPTOM PROFILES IN MIDDLE-AGED AND OLDER ADULTS

L.E. Best, *Andrus Gerontology Center, University of Southern California, Los Angeles, California*

Recent literature shows an increasing interest among researchers in studying the role of personality in the incidence and prevalence of depressive symptomatology. Much of this research has attempted to address the relationship between specific personality traits and depressive symptoms. However, most studies analyzing the link between personality and depressive symptoms utilize small sample sizes, therefore, making it difficult to decipher any population-level variation in personality among those suffering depressive symptoms. Using the Participant Lifestyle Module of the 2006 and 2008 waves of the Health and Retirement Study, I conduct a latent profile analysis in order to decipher profiles of depressive symptoms among a nationally representative sample of older adults in the United States. In addition to socio-demographic variables, I incorporate the Big Five Factor Model for personality to examine the impact of personality traits in creating risk profiles for depressive symptoms. Preliminary results suggest that personality traits such as conscientiousness are a significant characteristic of individuals reporting low levels of depressive symptoms. The results of this study demonstrate the increasing need to examine personality and psychological wellbeing at the population level.

THE EXPERIENCE OF PACE OF TIME: AGE AND CROSS-CULTURAL DIFFERENCES

D. Gruehn¹, J. Dirk², 1. *Psychology, NC State University, Raleigh, North Carolina*, 2. *University of Geneva, Geneva, Switzerland*

Some people have the feeling that time goes by quickly whereas for others time goes by slowly. A common stereotype is that time passes by more quickly as people age. In contrast to this popular belief empirical findings are mixed. To address some inconsistencies in the literature, we asked 142 subjects (18-74 years) to complete an ongoing web-based survey. Eventually, we will recruit 200 subjects for each of three language versions: English, French, and German. In preliminary analyses, we attempted to address three aspects of the experience of pace of time: First, we determined different components in the experience of pace of time (e.g., speed of time, amount of time, future time perspective, and

time orientation). Second, we investigated age differences in these components. In agreement with other studies, we found no consistent age differences. Finally, we examined potential factors that influence the experience of pace of time. In particular, we examined the impact of daily activities and affect on the experience of pace of time. In our preliminary analyses, time passes by more quickly when participants were happier or when they performed more daily activities. This pattern of findings suggests that social and emotional aspects play an important role in the experience of pace of time. If the initial pattern remains significant with the larger sample, the impact of affect and daily activities on the pace of time needs further consideration. In addition, with the larger sample, we will be able to examine cross-cultural differences in pace of time.

AGE PREDILECTIONS FOR PERSONALITY FACETS: INCONSISTENCIES AND POSSIBLE THREATS TO HEALTH RESEARCH

K.T. Petway, E. Zelinski, *Psychology, University of Southern California, Los Angeles, California*

The debate over whether longitudinal changes in personality exist continues with no true consensus. It is likely that personality changes with age may depend largely on what aspects of a personality variable are measured. We administered Costa's & McCrae's (1992) NEO-PI-R to a sample of 56 men and 61 women from the Long Beach Longitudinal Study who completed the measure two times (in 1994 and 2000; mean age at T1 = 64 years). The NEO-PI-R is an application of the five-factor model of personality where each personality factor (Extraversion, Openness to Experience, Neuroticism, Conscientiousness, and Agreeableness) has six lower-order facets. Three conditions were tested: condition 1, using the three facets (per factor) with the lowest age correlation; condition 2, using the three facets with the highest age correlation; and condition 3, using sum scores. In condition 1, only Agreeableness and Openness to Experience at time 2 could be predicted by time 1 ($\beta_A = .685$, $\beta_O = .391$, $p < .05$). In condition 2, performance on the first three factors at time 2 could be predicted almost perfectly by time 1. The relationship between time 1 and time 2 for Agreeableness and Openness to Experience did not change notably in condition 2. Finally, in condition 3, Extraversion was the only factor notably predictable at time 2 using time 1 scores. These analyses suggest that relative to Agreeableness and Openness, identifying how people change over time for Neuroticism, Conscientiousness, and Extraversion is more dependent on how those factors are defined within the measure.

NEUROTICISM AND STRESS: INFLUENCES ON DAILY EXPOSURE, APPRAISAL, AND NEGATIVE AFFECT

S. Scott, B. Baird, C. Bergeman, *University of Notre Dame, Notre Dame, Indiana*

Neuroticism is believed to be an important predictor of stress exposure and reactivity. Event appraisal may be a key component of this relationship; how individuals appraise the threat an event may influence their reactions to it and differences in this appraisal may be related to Neuroticism. In a 56-day diary study of 288 older adults, Neuroticism was positively related higher average negative affect (NA) across days, exposure to higher number of negative events per day, and higher average appraised severity of negative events. In Multilevel Modeling Analyses, we found a significant interaction between appraisal and Neuroticism, in which the effect of severity on NA was higher for those high in Neuroticism. In contrast, although NA was higher on days of higher exposure, the effect of exposure on NA did not vary depending on level of Neuroticism. Both exposure and appraisal predicted NA and were related to Neuroticism, however, they appear to be unique components of the stress process.

OPTIMISM, PESSIMISM, DEPRESSION, AND QUALITY OF LIFE IN ELDERLY PATIENTS WITH HEART FAILURE

C.J. Burant^{1,2}, R.A. Siders¹, R.S. Boxer³, *1. Case Western Reserve University, Bedford, Ohio, 2. Carl Stokes VA Medical Center, Cleveland, Ohio, 3. University Hospitals at the Case Medical Center, Cleveland, Ohio*

Depression in elderly patients with heart failure (HF) increases the risk of death, rehospitalizations, and nonadherence to treatments. Personal resources, such as optimism, pessimism, and self-efficacy may improve HF outcomes. Of special interest is how high levels of optimism, low levels of pessimism, and high levels of self-efficacy may not only impact HF, but also decrease the deleterious effects of depression on patients with HF and improve quality of life. The current project is a pilot study to determine the relationships among personal resources, depression, HF severity, and quality of life (measured by the Kansas City Cardiomyopathy Questionnaire (KCCQ)). Data were collected from 30 subjects at a heart failure clinic located at a large Midwest university affiliated hospital. Considering the small sample size a medium effect size of $<.30$ was used to determine potential relationships among the variables of interest. Based on these criteria, optimism was negatively related to depressive symptoms, KCCQ scores of symptom burden and total symptoms, and New York Heart Association (NYHA) Classifications. Pessimism was negatively associated with self-efficacy and positively related to depressive symptoms. Self-efficacy was positively associated with the KCCQ score of self-efficacy and Quality of Life and negatively associated with NYHA Classifications and ejection fraction. Depression was negatively associated with the KCCQ scores of symptom stability, self-efficacy, social limitation, and overall summary, and positively associated with NYHA Classifications and ejection fraction. Preliminary findings suggest that HF and its associated dimensions of quality of life may be influenced by personal resources and depression.

SESSION 1425 (POSTER)

COGNITION II

AGE DIFFERENCES IN FACE-NAME ASSOCIATION MEMORY ARE MODIFIED BY CONTEXTUAL CHARACTERISTICS OF THE STIMULUS

A.R. Bender^{1,2}, N. Raz^{1,2}, *1. Institute of Gerontology, Wayne State University, Detroit, Michigan, 2. Department of Psychology, Wayne State University, Detroit, Michigan*

Recognition memory declines with age, and some studies have found a disproportionately greater impairment to recognition of associations between items than for the items alone. Naveh-Benjamin and colleagues (2004, 2009) demonstrated support for this using face-name pairs. In an effort to replicate and extend those findings, two similar versions of the face-name task that differed primarily in the contextual richness of the face stimuli were administered to young and older adults. One version used face stimuli with low visual context at study and test, and the other used face stimuli with richer and more variable visual context. In both, participants first studied face-name pairs with instructions to remember the names, faces, and associations; they were subsequently administered four separate 2-alternative, forced-choice recognition tests on the items and associations. Recognition performance with the high context stimuli closely replicated the earlier findings, with older adults performing disproportionately worse on the association recognition task than the item task, relative to younger adults. However, results from the low context stimuli did not replicate these findings: despite demonstrating age-related recognition decrements overall, older adults did not differ from the young participants on item and associative recognition tests. The findings, while supporting age-related associative deficit hypothesis (Naveh-Benjamin, 2000), indicate that the deficit may depend on age differences in use of the context surrounding the face stimuli.

AGE RELATED DIFFERENCES IN THE FACTORS WHICH INFLUENCE ON PROSPECTIVE MEMORY

N. Renge, Y. Gondo, D. Ueno, Y. Ishioka, I. Kurokawa, A. Fujita, *Osaka University, Kyoto, Japan*

Background and aim Previous researches on prospective memory (PM) revealed an age-related paradox, that is, younger participants performed better than older participants in laboratory settings, whereas older participants performed better than younger participants in naturalistic settings (Henry et al., 2004). However factors which cause the paradox are unknown. The purpose of the present study is to explore the factors which influence good PM performance in older people in naturalistic setting. Methods and Material The questionnaire survey was administered to young (N=352 age range; 18-24), middle-age (N=325 age range; 55-64), young old (N=564 age range; 65-74). All participants answered to the following questionnaires, self reported PM failures as dependent variable, physical and mental state, visual and hearing impairment, life style; how busy or how routinely pass one's days, Big-5 personality, and meta-memory; positive attitude to memory, cognition to memory task as independent variables, age, sex, living condition, education, frequency to go out as control variables. Results Separate multiple regression analyses for each age group was performed. Neuroticism and busy life style have influenced on PM failures in all age groups. Influences of visual and hearing impairment and positive attitude to memory on PM failures were observed in middle-age and young old. Only in young old, routinely life style have influenced on PM failures. Score of routinely life style for middle-age and young old were higher than young. Conclusion Our results showed that causal relationship between PM and relating factors were different in different age groups. In addition, life style was important only for young old. Life style might be a core factor for older people to have good PM in naturalistic settings.

THE RELATIONSHIP BETWEEN AGE, INTRUSIVE THINKING, LIFE STRESS, AND COGNITIVE PERFORMANCE

C.B. Rosnick, *Psychology, Southern Illinois University Edwardsville, Edwardsville, Illinois*

There is a good deal of evidence that stress is linked with cognitive functioning; however, there are many unanswered questions about the nature of this relationship. Previous findings suggest that moderate amounts of stress are beneficial but high amounts of stress may be detrimental to performance. One possible explanation for this curvilinear relationship is that people cannot inhibit thoughts about the stressors in their lives once they reach a certain threshold. In support of this notion, prior research suggests that individuals reporting more intrusive thinking demonstrate poorer performance on cognitive tasks compared to individuals reporting less intrusive thinking but it has yet to determine whether or not the link between life stress and IT differs between young and older adults. In the current study, a total of 260 men and women between the ages of 17 and 98 years agreed to participate. The young adult sample comprised of 160 individuals between 17 and 39 years of age and the older adult sample consisted of 100 individuals over the age of 60. We will present cross-sectional findings that suggest that the effects of stressful life events may be more pronounced for older adults who report more intrusive thinking compared to older adults who report less intrusive thinking. The current findings support the notion of an inhibitory deficit/ decrease in attentional control across the lifespan.

CONFRONTATION NAMING IN HEALTHY AGING, MILD COGNITIVE IMPAIRMENT AND ALZHEIMER'S DISEASE. INSIGHT FROM THE BOSTON NAMING TEST

N. Galdona, D. Facal, M. Gonzalez, C. Buiza, U. Diaz, A. Etxaniz, E. Urdaneta, J. Yanguas, *Fundación Instituto Gerontológico Matia - INGEMA, Research & Development Department, San Sebastian, Spain*

INTRODUCTION Visual confrontation naming is the ability to pull out the correct word of an item visually presented. Cognitive impair-

ment produces decline in this naming ability bigger than effects founded in other language measures, although it remains unclear the performance in very early stages of the disease. Both general cognitive measures such as memory span or visuo-perceptual speed and age could be also play a role in this relation. **METHODOLOGY** The sample was composed of 322 older adults belonging to the Donostia Longitudinal Study sample, ranging from 2 to 4 in the Global Deterioration Scale (GDS). According to the aims of this work, Boston Naming Test (naming), WAIS Inverse-digit span (memory span) and Trail Making Test A time performance (visuo-perceptual speed) scores were analyzed. **RESULTS** Kruskal-Wallis test shows significant between-group differences in the Boston Naming Test ($p < .001$). Stepwise regressions were then carried out taking naming capability as dependent variable. The following variables entered in the model: for GDS2, visuo-perceptual speed ($p < .001$; $R = .374$; $R^2 = .140$) and memory span ($p < .001$; $R = .455$; $R^2 = .207$); for GDS3, memory span ($p < .005$; $R = .402$; $R^2 = .162$); for GDS4, memory span ($p < .005$; $R = .332$; $R^2 = .110$) and age ($p < .001$; $R = .426$; $R^2 = .181$). **DISCUSSION** The Confrontation naming ability measured with the Boston Naming Test shows changes through cognitive status even in very early stages. Memory span seems to play a role in these changes, while speed is only relevant in older adults without objective cognitive impairment.

COGNITIVE SCREENING TOOLS DIFFERENTIALLY RELATE TO IADL DIFFICULTY ACROSS LEVELS OF READING ABILITY

T. O'Brien¹, M. Crowe¹, D. Vance¹, P. Sawyer¹, R. Allman^{2,1}, *1. University of Alabama, Birmingham, Birmingham, Alabama, 2. VA Geriatric Research, Education, and Clinical Center (GRECC), Birmingham, Alabama*

We investigated the association of the Mini-Mental State Examination (MMSE) and Clock Drawing Task (CLOX) with impairments in instrumental activities of daily living (IADLs) across levels of reading ability. The MMSE and spontaneous clock drawing (CLOX1), Wide Range Achievement Test-3 (WRAT-3) Reading subtest, and self-reported IADL difficulty were administered during an in-home assessment at four-year follow-up of the UAB Study of Aging, a longitudinal study of community-dwelling older adults. The 589 participants with complete data were 53% white and 54% female, with mean age of 77.5 years ($SD = 5.75$). Participants were stratified into quartiles based on WRAT-3 reading scores. After controlling for age, gender, race, and urban/rural residence, multiple regression analysis revealed a significant interaction between level of reading ability and MMSE ($p = .008$) as well as CLOX1 ($p = .012$) in predicting self-reported IADL difficulty. To further examine these interactions, we investigated associations between screening tests and IADLs within the different levels of reading ability. In multiple regression models adjusted for demographic variables, despite the significant interaction, MMSE was found to be a significant predictor of IADL difficulty in all four reading levels (from lowest to highest quartile: $B = -.275$, $p = .002$; $B = -.161$, $p = .045$; $B = -.202$, $p = .028$; $B = -.273$, $p < .001$). For CLOX1, performance was significantly associated with IADL difficulty in only the lowest reading ability group ($B = -.189$, $p = .031$). In this sample of community-dwelling older adults, the MMSE appeared to be associated with impairments in IADLs regardless of reading ability, while CLOX1 score may be most useful in detecting potential IADL difficulty among those with lower reading ability.

COFFEE, SODA, AND TEA: THE EFFECTS OF CAFFEINE CONSUMPTION ON COGNITION

M. Steers¹, L.N. Anderson¹, J. Crumlin², M. Kenny², *1. University of Colorado, Colorado Springs, Colorado, 2. CU Aging Center, Colorado Springs, Colorado*

Research on the effects of caffeine consumption on cognition has yielded inconsistent findings (Johnson-Kozlow, Kritz-Silverstein, Barrett-Connor, & Morton, 2002). While some researchers have discovered

that caffeine has positive effects on memory performance, others posit that caffeine has deleterious effects on cognition (Lieberman, Tharion, Shukitt-Hale, Speckman & Tulley, 2002). The present study examined the effects of caffeine consumption on memory test outcomes in 107 community-dwelling older adults (mean age = 68.84 years; 66.7% female, 33.3% male; 93% European-American; 56.8% married) who underwent a brief memory screen due to self-reported concerns about memory loss. Results revealed no significant differences due to level of caffeine consumption (none, low, medium, high) on the MMSE, $f(3, 37) = .75, p = .53$; verbal memory $f(3, 37) = .62, p = .60$; attention/processing speed $f(3, 37) = .22, p = .88$; executive function $f(3, 37) = .16, p = .92$; visual memory $f(3, 37) = .33, p = .80$; or depression/anxiety $f(3, 37) = .82, p = .49$. These findings provide support for the notion that caffeine consumption may have little to no effect on cognition in older adulthood. Interestingly, the current data indicate that older women may be able to maximize global cognitive functioning by increasing caffeine intake.

A CARIBBEAN TALE: THE USE AND ADAPTIVE FUNCTION OF AUTOBIOGRAPHICAL MEMORY IN ADULTHOOD

N. Alea, S. Ali, M.J. Arneaud, *Behavioural Sciences, University of the West Indies, St. Augustine, St. Augustine, Trinidad and Tobago*

A growing body of work has examined the relative frequency of using autobiographical memory for self, social, and directive functions across adulthood. Less work has examined the adaptive value of these memory functions for individuals' psychological health. Thus, the goals of the study were to: (i) extend work on the use of the functions of memory to a lifespan sample from Trinidad and Tobago, and (ii) examine whether using the functions of memory predicts psychological well-being differentially by age. Participants ($n = 178$) ranged in age from 18 to 61 years old, and race was representative of the population. Participants completed the Thinking About Life Experiences questionnaire which assesses how often individuals think and talk about the past in general, and for self-continuity, social-bonding, and directing-behavior functions. They also completed psychological well-being scales: positive relations with others, purpose in life, and self-acceptance. Increasing age was related to less frequently using autobiographical memory functions. Although talking and thinking about the past predicted positive relations with others and self-acceptance, respectively, self and social functions of memory did not predict well-being. The directive function of autobiographical memory, however, predicted the extent to which people reported having purpose in life, regardless of age. Results are discussed in terms of the role that thinking and talking about the personal past has on the psychological well-being for individuals of all ages, and how using memory to direct behavior and find purpose in life may be particularly salient in a multicultural, developing society.

OLDER ADULTS' DESCRIPTIONS OF COGNITIVE DECLINE AND CONCERNS ABOUT BRAIN HEALTH

R. Liu¹, S.B. Laditka², J.N. Laditka², D.B. Friedman¹, S. Corwin¹, A.E. Mathews¹, 1. Rui Liu, *University of South Carolina, Columbia, South Carolina*, 2. *University of North Carolina at Charlotte, Charlotte, North Carolina*

Cognitive health is a major concern of our aging population. A better understanding of this concern and the terms older adults use to talk about cognitive decline will help develop effective health communication promoting cognitive health. Understanding how culture and ethnicity affect the content and expression of cognitive concerns will make future communication more effective. We conducted nine focus groups with ages 50+ (mean 72) in South Carolina, five with African Americans ($n=42$) and four with non-Hispanic whites ($n=41$). The majority reported at least high school education. Trained moderators asked: "1. What words do you use to describe seniors/older people who have a loss of memory or thinking ability?" "2. Tell us about any concerns you may have about your ability to keep your memory or ability to think as you

age." Three researchers independently coded verbatim transcripts. Grounded theory identified themes. African Americans most often used the words "Alzheimer's" and "senile," and expressed concern that depression commonly accompanies memory loss. African Americans were more likely to say that memory loss is a part of normal aging. Two prominent concerns, more frequently expressed by African Americans, were forgetfulness and genetic risk. Whites predominately used "senior moment" and "dementia." Primary concerns for whites included social impact and end-of-life issues. Shared concerns included loss of memory and physical abilities. Results will help in the design and implementation of tailored communication interventions to promote cognitive health.

INTERACTION BETWEEN EXECUTIVE FUNCTION AND MOTOR SPEED AMONG OLDER ADULTS

E.M. Williamson, *Physical Therapy, Missouri State University, Springfield, Missouri*

Purpose: Obesity is associated with poor performance on executive function and motor speed tests. This study examined potential interaction between executive function and motor speed in obese and non-obese older adults. Subjects: Participants were 11 healthy, non-obese and 11 healthy, obese older adults as categorized by the Body Mass Index. Methods and Materials: Participants controlled a computer generated disc with leg movement while viewing a sine wave which moved across a monitor at a slow or fast rate. They were instructed to keep the disc within the sine wave. In one executive function condition (non-challenged), moving of the leg caused the disc to move in the same direction as the leg. In the other condition (challenge), moving the leg in one direction caused the disc to move the opposite direction. Data analysis was a mixed design 2 (obese, not obese) x 2 (non-challenged, challenged) x 2 (slow, fast) analysis of variance with absolute average deviation from target as the dependent variable. Results: Analysis revealed main effects for executive function (non-challenge, Mean=3.44, challenge, Mean=10.90, $F(1,20) = 46.81, p < 0.05$) and speed (slow, Mean=6.06, fast, Mean=8.35, $F(1,20) = 12.58, p < 0.05$) and interaction between executive function and motor speed ($F(1,20) = 20.95, p < 0.05$). No significant findings were related to obesity. Discussion: Challenges to executive function affected accuracy of movement especially at fast speed. Obesity did not affect accuracy of movement in any condition. Obesity findings must be questioned due to low statistical power (0.20).

THE EFFECTS OF RESOURCE ALLOCATION AND FLUID ABILITY ON TEXT MEMORY CHANGE THROUGH LATER ADULTHOOD

S. Noh, X. Gao, E. Stine-Morrow, *Beckman Institute, University of Illinois at Urbana-Champaign, Urbana, Illinois*

Age deficits in text memory may be partly due to older adults' reduced resource engagement for conceptual processing (i.e., textbase strategy) that supports memory for content (Stine-Morrow et al., 2006). We investigated the effects of fluid ability, verbal ability, and conceptual processing developmentally on text memory within an older sample. Participants [young-old (YO; 60-70 yrs, $n=91$); old (O; 71-80 yrs, $n=74$); oldest-old (OO; 81-94yrs, $n=32$)] read a series of sentences for recall. Word-by-word reading times were measured and regression was used to isolate attentional resources allocated to textbase processes, controlling for word-level factors. While fluid ability showed monotonic declines with age ($YO > O > OO$), $F(2, 180) = 16.81, p < .001$, verbal ability, $F(2, 180) = 1.90, p = .15$, and textbase allocation, $F < 1$, were relatively stable, as was text recall, $F(2, 180) = 1.99, p = .14$. Even though the textbase strategy predicted recall in the sample as a whole, this was not true for the OO group. For the YO and O, both textbase allocation ($\beta = .44$ and $\beta = .19$, respectively) and verbal ability ($\beta = .46$ for both) were significant predictors of recall. However, in the OO group textbase allocation did not predict recall; rather, their recall was predicted only by fluid ability ($\beta = .50$). These data suggest that resource allocation to conceptual pro-

cessing and age-related growth in verbal ability may support text memory among older readers, but that among the oldest-old fluid ability may be the limiting factor in remembering text.

WHY REMEMBER? ADULT AGE DIFFERENCES IN FUNCTIONAL USE OF THE PERSONAL PAST

S. Bluck¹, N. Alea², 1. *University of Florida, Gainesville, Florida, 2. University of the West Indies, St. Augustine, St. Augustine, Trinidad and Tobago*

The study goal was to investigate the adaptive functions of thinking and talking about the personal past in older and younger adults. The specific aims were to examine adult age differences in: (i) overall frequency of thinking and talking about the personal past, and (ii) using autobiographical memories of one's past to serve self, social, and directive functions. Possible mediators were assessed to explain any age differences. Using a standard instrument (TALE, 2009), younger and older men and women (N = 185) provided reports of the frequency with which they think and talk about their personal past in general, and to serve each of three major psychosocial functions: maintaining self-continuity, creating social-bonds with others, and directing current and future behavior. They also completed measures of Self-concept Clarity and Future Time Orientation. All participants reported thinking about the past more than talking about it. In keeping with their developmental life phase, younger adults reported more often using autobiographical memories to create self-continuity, and to direct future behavior. The relation of age to the functional use of memory is mediated by older adults' having greater self-concept clarity than the young (self-continuity function), and to younger adults having a more open-ended future time perspective than older participants (directing-behavior function). Younger and older adults equally endorsed using memories to maintain social bonds. Findings are discussed in terms of how autobiographical memory is adaptively used to serve developmental tasks at different points in the adult lifespan.

THE IMPACT OF SOCIAL EXPERTISE AND SITUATIONAL GOALS ON SOCIAL COGNITIVE FUNCTIONING IN ADULTHOOD

T.M. Hess, D. Kotter-Gruehn, *Psychology, North Carolina State University, Raleigh, North Carolina*

Inconsistent with hypothesized positivity biases in old age, research on social cognition has suggested that middle-aged and older adults are more likely than younger adults to focus on negative behavioral information when such information is diagnostic with respect to underlying traits (e.g., morality). This appears to reflect a type of social expertise which may "trump" chronic emotional goals thought to bias attention toward positive information. It is possible, however, that older adults will exhibit more bias in judgments in spite of higher levels of expertise when emotional goals, such as interacting with a person, are consciously activated. To test this idea, adults aged from 20 to 85 (N = 115) read two descriptions of fictitious people that were composed of positive and negative behaviors relating to either morality or competence. Of interest was the extent to which participants' ratings of competence and morality were influenced by activated impression-formation versus social-interaction goals. Consistent with past work, negative information was weighted more in making morality judgments, whereas positive information was weighted more in judging competence. This effect was particularly strong in middle-aged adults, suggestive of high expertise. When social goals were activated by having participants choose one of the described targets as a potential interaction partner, all trait judgments became positively biased, with this effect being disproportionately great in older adults. Activation of social goals did not, however, affect older adults' attention to diagnostic information. This suggests that responses in later adulthood may reflect both expert behavior and chronic emotional goals.

AGE AND RACE DIFFERENCES IN THE BENEFIT OF DAILY CONTROL BELIEFS ON COGNITION

S. Neupert, M. Heflin, V. Rojas, A. Davis, G.E. Ennis, *Psychology, North Carolina State University, Raleigh, North Carolina*

Studies using cross-sectional designs typically find a beneficial effect of control beliefs on cognitive performance (e.g., Miller & Lachman, 2000). We sought to extend these findings by implementing a daily diary study of control beliefs and performance with younger and older adults from various racial and educational backgrounds. Specifically, we were interested in the within-person association between control beliefs regarding memory and performance on a number comparison task and whether that association depended on individual differences in age and race. Fifty younger adults and 43 older adults participated in an 8-day daily diary study assessing control beliefs and cognitive performance. Multilevel models, controlling for education, indicate that daily increases in control beliefs are equally beneficial to performance for White younger and older adults. However, non-White older adults experienced more benefit from increases in control beliefs compared to non-White younger adults.

THE ROLE OF STRESS AND PHYSICAL ACTIVITY IN OLDER ADULTS' EVERYDAY MEMORY PERFORMANCE

L. McDonald-Miszczak¹, B. Wise¹, S. Neupert², R. Walsh¹, 1. *Psychology, Western Washington University, Bellingham, Washington, 2. North Carolina State University, Raleigh, North Carolina*

The present study assessed the role of stress and physical activity in older adults' adherence to an everyday memory task. For 2 weeks, 20 older adults (M=74, SD=6.42) were asked to remove 1 placebo pill 4 times per day at specified time intervals from a medication monitor to track the accuracy of adherence. Self-reported stress and control levels along with pedometer data were also collected daily. Multilevel modeling, used to examine the daily predictors of adherence, showed that 21% of the variance in everyday memory was between people ($\tau_{00} = .09$, $z = 2.42$) and 79% was within-people ($\sigma^2 = .35$, $z = 11.38$), indicating significant fluctuations over time. Although there were no main effects of daily steps per hour ($\gamma_{10} = -.0002$, $t = -.86$, $p = .39$), total number of daily stressors ($\gamma_{20} = -.16$, $t = -.97$, $p = .33$) or daily control ($\gamma_{30} = -.09$, $t = -.86$, $p = .39$), there was a significant 3-way interaction of Steps X Control X Stressors ($\gamma_{13} = -.0002$, $t = -1.92$, $p = .05$). The interaction revealed that the best adherence occurred on days when control was high, the number of steps taken was high, and no stressors occurred. The pattern was different on days of low control; when the number of steps taken was high on low control days, adherence increased in response to stressors. These results suggest that the stressor- and control-related context of activity is important for adherence to a challenging everyday memory task.

SCREENING FOR COGNITIVE DEFICITS IN THE ELDERLY SUBACUTE PATIENT: A COMPARISON BETWEEN THE TICS-M AND MMSE

C.Y. Tarshish, A. Horowitz, A. Cegelka, J.P. Reinhardt, K. Boerner, J. Rodriguez, *Research, Jewish Home Lifecare, New York, New Jersey*

Admission-related physical limitations/frailty of the elderly subacute population make it prudent to utilize instruments to assess cognition that are brief and dependent on minimal physical responses. In this study, we compared the Telephone Interview of Cognitive Status-Modified (TICS-M; items not dependent on physical abilities including vision) with the Mini-Mental State Examination (MMSE; some items dependent on physical abilities including vision). The MMSE and TICS-M were administered to 49 subacute clients. Cognitive Performance Scale (CPS) scores were computed from the Minimum Dataset. Subjects had a mean age of 78 ± 7 , were predominately female (71%), White (69%), with a high school education or more (98%). TICS-M and MMSE total test scores were highly correlated ($r = .78$, $F(1,47) = 74.5$, $p < .001$). Education was correlated with both measures and increased the asso-

ciation to $r=.83$ ($F\text{Change}(1,46)=12.1, p<.001$). We computed 5 cognitive domain scores within each test and observed the strongest relationship for Orientation ($r=.68, p<.001$) with Registration ($r=.12, ns$) being the lowest. Correlations between the tests for Attention/Calculation, Comprehension, and Delayed Recall were moderate ($r=.36$). When controlling for education, only the relationships for Comprehension and Delayed Recall were reduced ($r=.17$ and $r=.04$, respectively). We also compared the sensitivity of the TICS to detect dementia and observed only 1 misclassified case when defined by the CPS (score > 2) as compared to the MMSE with 2 cases misclassified. The TICS was sensitive for the detection of dementia. However, a number of individual cognitive domains showed weak correlations when compared to the MMSE and require adjustment in this population.

SESSION 1430 (POSTER)

DEPRESSION

POSITIVE ADAPTATION, ACTIVITY PARTICIPATION AND SPIRITUALITY: EFFECTS OF COPING STRATEGIES ON DEPRESSIVE SYMPTOMS AMONG AFRICAN AMERICAN AND WHITE RESIDENTS OF CONGREGATE HOUSING

K.B. Adams, A. Roberts, *Mandel School of Applied Social Sciences, Case Western Reserve University, Cleveland, Ohio*

Self-reported coping strategies and the relationship of types of coping to depressive symptoms among African American and White residents of six independent living or assisting living facilities were examined. The following research questions were addressed: How do older adults who live in congregate housing report coping with stressors of aging? Does self-reported coping differ between white and African American older adults? Finally, do coping strategies directly affect the level of depressive symptoms experienced, taking into account potentially important individual differences? Five coping categories emerged from two open-ended questions about how older adults cope with aging in congregate housing: a) Positive adaptations, b) Socio-emotional support, c) Instrumental support, d) Activity participation, and e) Spiritual or religious coping. Scores on the Geriatric Depression Scale (GDS) were similar for African Americans and whites. Similar proportions of these two groups reported each coping type, with the exception of spiritual coping (reported by 25% of African Americans compared with 9% of whites). Hierarchical multiple regression analysis examined the associations of the coping categories to depression, after controlling for demographic and health variables related to depressive symptoms, measured by GDS scores. Positive adaptations and activity participation were the only coping strategies that demonstrated independent effects on depressive symptoms. Regardless of age, gender, health status, marital status or race, older residents of congregate housing who can adapt to their current living circumstances and take advantage of activities offered may avoid depressive symptoms. Active, problem-focused coping competencies may decrease the likelihood of depression among vulnerable older adults.

NON-PHARMACOLOGICAL INTERVENTIONS FOR TREATMENT OF POSTSTROKE DEPRESSION: A REVIEW OF LITERATURE

N. Hadidi, *Nursing, University of Minnesota, Minneapolis, Minnesota*

Stroke is a devastating crisis. It is the third leading cause of death and the number one cause of long-term disability. Each year about 700,000 people suffer a new or recurrent stroke in the United States and over 150,000 of victims die. Seventy five percent of annual stroke victims are over the age of 65. Poststroke depression (PSD) is a common consequence of stroke with the estimated prevalence ranging from 25%-79%. Depressed elderly patients see their primary health care provider more frequently; have higher rates of emergency room visits, and longer hospital stays than their younger counterparts. While there have been

several studies investigating the impact of pharmacological interventions (i.e. drugs) on PSD, there is a significant gap in research on non-pharmacological measures. The purpose of this paper is to present the results of a critical review of literature focused on the efficacy of non-pharmacological interventions for treatment of PSD. Key words used were "Stroke" and "Depression." Subcategories under depression were "Treatment" including "drug" or "non-medication" and limited by age ≥ 65 . Search engines utilized were Medline, CINAHL and Psychinfo, limited to 2000-2008. Several important articles from reference lists of relevant articles were identified. Eliminating pharmacological treatments resulted in 15 articles. The result of this critical review suggest that although psychosocial interventions have not been extensively studied, the preliminary findings indicate a promise of reducing depressive symptoms in stroke population.

BEHAVIORAL ACTIVATION THERAPY TO MANAGE DEPRESSION IN OLDER ADULTS WITH DIABETES

A. Jay, S. Anderson, M. Steers, L. Feliciano, *Department of Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Type II diabetes is one of the most common chronic diseases among older adults in the United States. Research suggests that the occurrence of depression is significantly higher in individuals with diabetes compared to the general population. The onset of depressive symptoms may make diabetes self-care activities more challenging, and may influence one's ability to comply with medication regimens, exercise routines, nutrition plans, and glucose monitoring tasks. Research literature suggests that depression management interventions can produce better diabetes related outcomes, increase individual life-expectancy, and improve quality of life. The standard treatment for managing depression is the use of anti-depressant medications. However, these medications are often associated with unwanted side effects, particularly in older adults. An alternative intervention for managing depression is Behavioral Activation (BA). Behavioral Activation is an empirically supported treatment that has comparable effectiveness to antidepressant medications, but does not produce undesirable side effects. Behavioral Activation involves focusing on the relationship between meaningful activities and changes in mood. This treatment emphasizes the role that contextual and behavioral factors play in contacting environmental rewards that have an antidepressant effect. This treatment focuses on tailoring interventions to an individual's specific needs, and giving people the tools to become more active and engaged in their life. An overview of the BA model will be presented, as well as specific applications to working with clients with diabetes. Data will be presented from an ongoing research study using BA with individuals that have diabetes and depression.

CHRONIC DISEASE AND HEALTHY LIFESTYLE AS A FUNCTION OF DEPRESSION SYMPTOMS, 2003 BRFS

L. McGuire, T. Strine, L. Anderson, *CDC, Atlanta, Georgia*

Current depression and its association with modifiable healthy lifestyle behaviors, use of preventive services, having a healthy weight, and presence of chronic health conditions were examined among adults ≥ 65 years-old. Participants ($N=45,534$) were obtained from the 2006 Behavioral Risk Factor Surveillance System (BRFSS), a list-assisted random-digit-dialed telephone survey of the noninstitutionalized U.S. adults. The Patient Health Questionnaire 8 (PHQ-8) was completed to assess current depressive symptoms (PHQ score ≥ 10) and information about self-reported modifiable healthy lifestyle behaviors (not smoking, consuming ≤ 1 alcoholic beverage per day, participating in moderate-to-vigorous physical activity during the average week), use of preventive services (receiving an annual influenza immunization and ever receiving a pneumococcal immunization), having a healthy weight (body mass index $18.5-24.9\text{kg/m}^2$), and chronic health conditions (asthma, heart diseases, diabetes) was obtained. People with current depressive

symptoms were less likely than those without current depressive symptoms to be nonsmokers, to participate in moderate-to-vigorous physical activity during the average week, and to consume ≤ 1 alcoholic beverage per day. People with current depressive symptoms were more likely to have more chronic health conditions than those without current depressive symptoms. However, no differences were found for the consumption of alcoholic beverages, having a healthy weight, receiving an annual influenza immunization, and ever receiving a pneumococcal immunization. Older adults with current depressive symptoms were less likely to engage in many health behaviors and have more chronic health conditions than those without current depressive symptoms, having implications for the delivery of preventive services and the management of chronic disease.

DEPRESSED NURSING HOME RESIDENTS' ACTIVITY PARTICIPATION AND AFFECT AS A FUNCTION OF STAFF POSITIVE ENGAGEMENT

S. Meeks¹, S.W. Looney², 1. *Dept. of Psychological & Brain Sciences, University of Louisville, Louisville, Kentucky*, 2. *Medical College of Georgia, Augusta, Georgia*

Nursing homes often provide limited opportunity for meaningful engagement in fulfilling activities. Lack of engagement may be a critical factor in maintaining negative affective states that are prevalent in nursing homes. Often residents obtain most of their social contacts from staff members. We present intra-individual correlations among positive staff engagement, resident affect, and resident activity participation from behavior stream observations of residents who were participants in an ongoing trial of an intervention for depression. Residents had been observed for at least 12 weeks. Five minute observations occurred randomly on weekday mornings and afternoons, 6 times a week. Positive staff engagement during the observations was significantly correlated with resident engagement/interest for all residents except one. Positive staff engagement was also related to resident pleasure during the observations for most. Positive staff engagement was strongly related to resident participation in organized group activity; only for a few residents was positive staff engagement related to informal group activities. However, residents tended to be more engaged and show more pleasure when in informal group activities. Positive staff engagement was not related to resident participation in activities of daily living, which is surprising given that much staff contact occurs during such activities. In sum, when residents experience positive staff attention, they are more engaged and experience more pleasure. They are most likely to receive positive staff attention in organized group activities, but residents appear to enjoy and be more interested in informal group activities. Results have implications for enlisting staff help with interventions for depression.

A STUDY OF WELL-BEING AND DEPRESSION IN COMMUNITY DWELLING ELDERLY

S.H. Gueldner^{1,2}, C.S. Pierce², E.N. Austin², 1. *Bolton School of Nursing, Case Western Reserve University, Cleveland, Ohio*, 2. *Binghamton University, Binghamton, New York*

The dual purpose of this study was to assess the prevalence of depression in a sample of elders who live independently in the community, using the Geriatric Depression Scale (GDS), and to test the ability of the simple Well-Being Picture Scale (WPS) to screen for depression in this population. The sample consisted of 215 community dwelling older adults who were attending lunch at Senior Centers in a non-urban county in upstate New York. The range of scoring for the GDS is 0-15, with a score of 5 or above suggesting risk for depression and a score of 11 or higher indicating depression. The scoring range for the Well-Being Picture Scale (WPS) is 10-70, with 70 indicating a high sense of well-being. The sample was 64% female and 36% male, with a mean age of 75.8 years and a range of 55-97 years. One-fourth of the sample scored within the range of concern for depression: 39 (18%) scored 5 or higher on the GDS, suggesting risk for depression; twelve (5%) scored 9 or higher

on the GDS, raising serious concern for depression; and 7 (3 %) scored 10 or higher on the GDS, indicating the presence of depression. The scores of the two instruments were significantly negatively correlated ($r = -.585$; $p = .01$), providing evidence that the WPS is a reliable screening device for depression in independently dwelling elders. This study was supported in part by a Robert Wood Johnson Community Development Grant.

DEPRESSED OLDER ADULTS IN THE UNITED STATES: WHO IS AT RISK FOR DEPRESSION?

G. Kim¹, J. Allen², 1. *Aging and Mental Health Disparities, University of South Florida, Tampa, Florida*, 2. *School of Aging Studies, University of South Florida, Tampa, Florida*

Depression is one of the most prevalent, serious psychiatric disorders in the United States. The present study was designed to examine risk factors for depression among older adults. Demographic characteristics, physical health-related factors (i.e., number of chronic conditions, difficulties in mobility, and self-assessed health), and mental health-related factors (i.e., any anxiety disorders, any substance disorders, and self-assessed mental health) were considered as potential risk factors for depression. Using a nationally representative sample drawn from the Collaborative Psychiatric Epidemiology Surveys (CPES), 3562 older adults were selected for the present analysis. Results from logistic regression analysis showed that the likelihood of being depressed was increased with poor physical health (i.e., having more chronic conditions, difficulties in mobility, and poor self-assessed health). Having poor mental health was identified as an important set of risk factors for depression: older adults with any anxiety disorders and poor self-assessed mental health were more likely to be depressed. The findings demonstrate the distinct physical and mental health-related correlates of depression among older adults.

TRAJECTORIES OF DEPRESSION AND THEIR RELATIONSHIP WITH HEALTH STATUS AND SERVICE USE

H. Chiu¹, C. Chen², J. Mullan³, D. Griffiths⁴, I. Kreis⁵, 1. *Graduate Institute of Healthcare Administration, Kaohsiung Medical University, Kaohsiung City, Taiwan*, 2. *School of Health Sciences, University of Wollongong, Wollongong, New South Wales, Australia*, 3. *Graduate School of Medicine, University of Wollongong, Wollongong, New South Wales, Australia*, 4. *School of Mathematics and Applied Statistics, University of Wollongong, Wollongong, New South Wales, Australia*, 5. *Centre for Educational Developments and Interactive Resources, University of Wollongong, Wollongong, New South Wales, Australia*

This longitudinal study was conducted between 1994 and 2004 in a cohort of southern Taiwan community-living elderly residents. The study aims to explore the trajectories of depression and how these patterns differed between respondents who survived and those who died during data collection phases; this study also investigated how health status change and health/social service use predicted the different trajectories of depression. Depression, chronic disease, disability and health/social service usage data were collected over six waves. Clusters of depression were used to define a categorical response variable. Baseline levels and new occurrences of chronic disease and disability, and the frequency of health/social service use during this period were chosen as the predictors of depression trajectories. Changes in levels of depression during the ageing process were identified. Different trajectories clearly reflected heterogeneity within depression and the association with mortality. The study highlighted that diabetes, gastrointestinal problems, heart disease and disability, whether at baseline or as new occurrences, were predictors of health decline. High use of health/social services were also predictive of increased depression. These findings identified depression as a highly dynamic process, characterized by different trajectories of depression between states of no, mild and severe depression. Greater

awareness of these various trajectories should potentially improve the prevention and/or management strategies of depression.

GENDER DIFFERENCES IN THE TRAJECTORIES OF DEPRESSIVE SYMPTOMS AMONG OLDER JAPANESE

J.M. Bennett¹, J. Liang¹, B. Shaw³, N. Krause¹, E. Kobayashi², T. Fukaya², Y. Sugihara², 1. *Health Management & Policy, University of Michigan, Ann Arbor, Michigan*, 2. *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*, 3. *School of Public Health, University at Albany, Rensselaer, New York*

This research examines the trajectory of depressive symptoms among older Japanese with a focus on gender differences. Data came from the National Survey of Japanese Elderly, which involves a national probability sample of Japanese aged 60 and over at the baseline in 1987, which was followed up in 1990, 1993, 1996, 1999, 2002, and 2006 with periodic supplements of respondents. The dependent variable was a six-item count CES-D (range 0 to 6) of negative affect and somatic symptom items. Hierarchical linear models with time-varying covariates were applied to examine changes in depression over a period of nineteen years for 3,992 self respondents. Linear, quadratic, and cubic functions were evaluated with the linear specification fitting the unconditional model best (intercept = 1.039***; linear slope = .038***) indicating that on average the number of depressive symptoms increases slightly over time. Females reported a significantly higher level of depressive symptoms, but there were no gender differences in the rate of change. Time varying covariates (i.e., lagged measures and/or change scores) for marital status, financial strain and physical health were associated with greater depressive symptoms. Interestingly, the effect of being married on depressive symptoms was less beneficial for women relative to men. The effect of functional status on depression was smaller for women than men.

DEPRESSIVE SYMPTOM CLUSTERS AND THE RELATIONSHIP TO COGNITIVE FUNCTIONING

E. Corsentino¹, N. Sachs-Ericsson¹, D. Blazer², 1. *Florida State University, Tallahassee, Florida*, 2. *Duke University Medical Center, Durham, North Carolina*

A complex relationship exists between depression and dementia, with high comorbidity between the two diagnoses. There are theories that depression causes dementia and conversely that dementia causes or is a prodromal symptom of depression. Data were drawn from the Duke EPESE, a multi-center investigation of community-dwelling older adults to determine if depressive symptom clusters on the Center for Epidemiological studies of Depression (CES-D) were differentially predictive of cognitive decline (CD) at different points in time. The CES-D is represented by four factors: depressed affect (DA), positive affect (PA), somatic complaints (SC), and interpersonal problems (IP). At baseline, higher DA, SC, and IP- but not lower PA- were related to poorer cognitive functioning. The same clusters predicted CD three years later. These factors may represent prodromal signs of dementia or factors that may be a reaction the initial loss of cognitive abilities. Additionally, poorer cognitive functioning at baseline was related to greater IP three years later, indicating that IP may be a specific reaction to declining cognitive abilities. Lastly, over the course of ten years, greater DA was the only symptom cluster to predict poorer CD. Therefore, consistent with the theories that depression may cause CD, it appears that DA may be a key factor in the etiology of dementia. Depression may manifest differently during different points in time in relation to cognitive functioning. These findings may have implications for treatment and identification of at-risk individuals.

THE RELATION BETWEEN SELF-DISCLOSURE AND SUICIDE IDEATION IN YOUNGER AND OLDER ADULTS

S. Nazem, M. Smith, A. Fiske, M. Nadorff, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

Self-disclosure, the ability to communicate feelings, is theorized to be an essential part of mental health and well-being. Previous research indicates that lack of self-disclosure may be an important factor in the development of serious suicidal behavior. Low levels of self-disclosure have been found to differentiate among individuals with serious suicide attempts, non-serious suicide attempts, and suicide ideation. The current study examined the relation between self-disclosure and suicide ideation in young and older adults. Participants were 88 older adults and 637 college students. Levels of self-disclosure, averaged across all relationships, were similar for men, $M = 2.03$, $SD = .41$, and women, $M = 2.14$, $SD = .34$, and for older adults, $M = 2.03$, $SD = .33$, and younger adults, $M = 2.12$, $SD = .38$. Self-disclosure was negatively correlated with suicidal ideation in both older adults, $r = -.18$, $p = .11$, and younger adults, $r = -.11$, $p < .01$; the correlations were small and therefore not significant in the smaller sample of older adults. Regression analysis in the full sample revealed a significant interaction with gender. Among women, a higher level of self-disclosure was associated with less reported suicidal ideation, $F(1,465) = 14.74$, $p < .0001$, whereas for men, there was no significant effect, $F(1,219) = .06$, $p = .81$. This pattern was found in the older and younger adult samples, but effects were not significant in the smaller older adult sample. The relation between self-disclosure and suicidal ideation differs by gender across the lifespan.

DETECTION OF DEPRESSION IN OLDER ADULTS BY FAMILY AND FRIENDS: GAUGING THE EYE OF THE BEHOLDER

P. Bamonti, J. Lyness, X. Tu, Y. Ma, P. Duberstein, *University of Rochester, Rochester, New York*

Depression is often missed in primary care. Friends and family informants might be attuned to depressive symptoms in older adults and aid the diagnostic process. We examined the accuracy of informant-reported mood disorder in patients 65 years and over, hypothesizing that the accuracy of informant reports would vary with informant personality and attitudes toward depression. Gold-standard psychiatric diagnoses were established based on a review of medical records and a structured interview with the patient. Informant diagnostic accuracy was defined in terms of sensitivity and specificity. Sensitivity refers to the proportion of lifetime mood disorders correctly identified by informants. Specificity refers to the proportion of patients without a lifetime mood disorder correctly identified by informants. We conducted multivariate analyses predicting sensitivity and specificity. Predictors of interest were informant personality (assessed by NEO-FFI) and informant attitudes toward depression, including beliefs in a biomedical model of depression (e.g., "I believe depression is a medical problem") and emotional acceptance (e.g., "people who have emotional problems are not to blame"), rated on a 5-point scale. Mean patient age was approximately 75; mean informant age was approximately 61. Most patients (65%) and informants (71%) were women. Higher informant scores on the emotional acceptance scale were associated with better sensitivity (Beta = 1.36, 95% C.I. = .09, 2.6) and specificity (Beta = .36, 95% C.I. = .02, .69). Informant personality was not associated with accuracy. Friends and relatives of older adults who are emotionally accepting of mental illness will provide more valid reports about mood disorders in primary care.

THE BIASING EFFECTS OF AGE AND HEALTH ON A 10-ITEM SHORT FORM OF THE CES-D

K. Kosloski¹, K. Kercher², R. Montgomery³, 1. *Gerontology, University of Nebraska at Omaha, Omaha, Nebraska*, 2. *University of Nebraska at Omaha, Omaha, Nebraska*, 3. *University of Wisconsin - Milwaukee, Milwaukee, Wisconsin*

Past research has identified item bias in the CES-D due to the effects of age and disability. As a result, depression scores are likely to vary due to differences in these extraneous factors rather than to a change in the level of depression per se. Since the CES-D has been shown to contain a first-order factor that taps somatic effects, the potential for bias by health and age on these somatic items is substantial. The purpose of the present study was to evaluate a 10-item short form of the CES-D to determine if there was item bias associated with health and age, particularly with respect to the somatic items of the scale. A secondary goal was to provide a more rigorous test of the differential effects of age and health on depression (net of item bias), since previous studies did not include global measures of health or adequate variation on age. Confirmatory factor analyses suggested a three-factor structure for this short form of the CES-D. Next, a MIMIC model was estimated individually for each of the 10 items. The results indicated that self-rated overall health had a residual bias on four of the five somatic items, but no bias with respect to the items tapping dysphoria or positive affect. Age exerted a unique biasing effect on two of the items tapping positive affect and on one somatic indicator. In addition, there was a direct effect for health on all three first-order factors; age affected only the somatic factor.

A PILOT STUDY OF A BEHAVIORAL ACTIVATION GROUP THERAPY PROTOCOL IN A STATE GEROPSYCHIATRIC FACILITY

M.J. Norton, M. Crowther, F. Scogin, M. Machac-Burleson, A. Austin, *The University of Alabama, Tuscaloosa, Alabama*

More than 2 million of the 34 million Americans age 65 and over experience some form of depression each year. Behavioral activation therapies strive to bring individuals into contact with positive reinforcement in their environment through increasing participation in pleasant, personally rewarding activities. Very few studies to date have examined behavioral activation therapies in state psychiatric facilities, especially with older adults. In the present study, five patients at a state-run geropsychiatric inpatient facility participated in pilot testing of a manualized behavioral activation group therapy protocol to alleviate depression (age range 66-75). All participants scored at least 9 on the Geriatric Depression Scale and at least 20 (adjusted for education) on the Telephone Interview for Cognitive Status-modified, indicating at least mild depressive symptoms and no more than mild cognitive impairment. The protocol consisted of 8 30-minute group therapy sessions, in which participants selected goals, chose activities based on those goals, and tracked participation in their chosen activities. The group met 4 times per week for two weeks. This pilot study indicates that patients at a state geropsychiatric facility can participate successfully in a behavioral activation therapy group. Four of 5 participants were able to successfully track their participation in activities. At the conclusion of the pilot group, three participants no longer met criteria for inclusion in the study, as their GDS scores had dropped below 9. One participant experienced a slight improvement on the GDS (2 pts) and one participant worsened slightly.

ROLE OF PERCEIVED SOCIAL SUPPORT IN THE RELATION BETWEEN FUNCTIONAL DISABILITY AND DEPRESSION OVER TIME

M. Smith, A. Fiske, S. Branstetter, *West Virginia University, Morgantown, West Virginia*

Older adults with functional disabilities are at an increased risk for experiencing depressive symptoms. Studies using cross-sectional analyses have reported that social support mediates the relation between

depressive symptoms and functional disability in older adults. However, few studies have investigated this model over time. The present study used latent growth curve modeling to investigate the potential mediating role of perceived social support within the relationship between disability and depression. Participants (mean age = 74.05, SD = 6.52) were from the Swedish Adoption/Twin Study of Aging, a subsample of the Swedish Twin Registry. Four waves of mailed questionnaires were examined, spanning sixteen years. We analyzed twins ($n = 656$) and co-twins ($n = 678$) separately to cross-validate the results through a nonindependent replication. The overall model yielded a marginal model fit ($\chi^2 = 272.792$, $df = 72$, $p < .001$, CFI = .786, and RMSEA = .065). Level of disability and level of perceived support were significantly related to level of depressive symptoms, ($\beta = -.477$, $SE = .104$; $\beta = -1.664$, $SE = .260$). However, level of perceived support was not a significant mediator. Change in disability predicted change in depressive symptoms in twin 1 ($\beta = -.332$, $SE = .145$), but change in support was not a mediator. In twin 2, the relation between disability slope and depressive symptoms slope was not significant, but the relation between perceived support slope and depressive symptoms slope was significant ($\beta = -1.124$, $SE = .375$). Perceived support did not act as a mediator, but instead may have a direct impact on depressive symptoms.

AGREEMENT BETWEEN SELF-REPORT AND INTERVIEW-BASED DIAGNOSES OF DEPRESSION IN COMMUNITY-DWELLING OLDER ADULTS

K. Gapinski, E. Farrington, *College of the Holy Cross, Worcester, Massachusetts*

This study compares the rates of depression diagnoses in a sample of 345 randomly-selected older adults dwelling in the Worcester community made using a screening instrument, the Center for Epidemiological Studies Depression scale (CES-D > 17) and using a clinical interview, the Schedule for Affective Disorders and Schizophrenia (SADS) and the Research Diagnostic Criteria (RDC). The CES-D is known to be sensitive but not specific way to assess depression in younger samples; little is known about its sensitivity, specificity, or overall reliability in older samples. Specificity of the CES-D was 82% with respect to SADS/RDC diagnoses of major depressive disorder in our random sample; sensitivity was 89%. The CES-D demonstrated an alarmingly high rate of false positives in this sample: 56%. We examine this high false positive rate in light of the limits of self-reports more generally, and in terms of age-specific biases relating to self-reporting of somatic symptomatology.

REDUCING DEPRESSIVE SYMPTOMS AND BLOOD PRESSURE IN ELDERLY ALZHEIMER'S CAREGIVERS: A BRIEF BEHAVIORAL ACTIVATION INTERVENTION

R. Moore^{1,2}, I. Grant¹, P. Mills¹, T.L. Patterson^{1,3}, R. von Kanel^{1,4}, M.G. Ziegler⁵, B. Mausbach¹, 1. *UCSD Department of Psychiatry, La Jolla, California*, 2. *Alliant International University, San Diego, California*, 3. *San Diego Veterans Affairs Healthcare System, San Diego, California*, 4. *Department of General Internal Medicine, University Hospital Bern, Switzerland*, 5. *UCSD Department of Medicine, La Jolla, California*

The objective of this study was to examine the potential benefits of a brief behavioral activation intervention, known as the Pleasant Events Program (PEP), on reducing depressive symptoms and blood pressure (BP) in elderly Alzheimer's disease (AD) caregivers. In this preliminary study, participants were 24 caregivers (mean age = 73+/-8.2 years) providing in-home care to a spouse with AD. Participants were randomly assigned to a control condition ($n = 11$), in which they received supportive psychotherapy + skills-based information, or the PEP condition ($n = 13$), which emphasized increased engagement in social and recreational activities via structured homework assignments. In both programs, participants received four one-hour individual sessions followed by two "check-in" phone calls to emphasize practice of learned mate-

rial. Repeated measures ANOVA was used to assess pre- to post-intervention change in depressive symptoms (brief CES-D) and BP. For depressive symptoms, results indicated that participants in the control condition did not significantly improve from pre- to post-intervention (mean pre = 12.8+/-4.5; mean post = 11.5+/-5.3; $p=.205$). In contrast, participants in the PEP intervention significantly improved (mean pre = 12.4+/-4.6; mean post = 9.2+/-6.6; $p=.014$), with Cohen's d indicating a medium effect size of 0.50. No group differences were found for change in BP, although a significant main effect of time was found in resting systolic BP ($F=6.76$, $p=.017$), diastolic BP ($F=18.95$, $p<.001$), and mean arterial pressure ($F=15.05$, $p=.001$). These results suggest that the PEP intervention is potentially efficacious for reducing depressive symptoms in AD caregivers.

VASCULAR RISK AND MAJOR DEPRESSION IN OLDER PRIMARY CARE PATIENTS RECEIVING MENTAL HEALTH TREATMENT

A.R. Azar^{1,2,3}, L.Y. Cho^{2,3,4}, M.P. Chopra^{2,3,4}, 1. Brigham and Women's Hospital, Boston, Massachusetts, 2. VA Boston Healthcare System, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts, 4. Boston University School of Medicine, Boston, Massachusetts

Introduction: The vascular depression hypothesis contends that vascular disease can "predispose, precipitate, or perpetuate" depressive syndromes in late-life. Findings on vascular depression treatment outcome are mixed. This project examined the role of vascular risk on treatment outcome in older adults with depression. **Methods:** Secondary analysis of data from the Primary Care Research in Substance Abuse and Mental Health for the Elderly (PRISM-E; Levkoff et al., 2004) study were utilized. Participants with baseline MDD and in mental health care were included in the analyses ($n=819$). Self-report vascular risk factors included hypertension, diabetes, heart trouble, atherosclerosis, and smoking. Depression diagnosis was based on psychiatric interview. Three-month outcome was defined by the absence or presence of MDD. In addition to univariate analyses, multivariate logistic regression was used to examine the effect of vascular risk (low/high) on depression outcome while accounting for additional factors related to depression (i.e., medical conditions, anxiety disorder). **Results:** Thirty-seven percent of participants with low vascular risk attained remission at follow-up compared to only 27% of those with high risk ($p=.018$). However, in the multivariate model, number of comorbid medical conditions, physical function, baseline anxiety disorder diagnosis, and baseline depression severity independently predicted outcome, while vascular risk did not. **Conclusions:** Findings suggest that depression outcome is better accounted for by factors such as comorbid anxiety or medical conditions. That said, future research should further examine the relationship between vascular risk and depression outcome using broader risk factor profile while also accounting for the role of cognitive impairment (i.e., executive dysfunction).

DEPRESSIVE SYMPTOM PROFILES AS PREDICTORS OF TRAJECTORIES OF FUNCTIONAL LIMITATIONS IN OLDER ADULTS

C. Hybels¹, L.R. Landerman², 1. Dept of Psychiatry, Duke University Medical Ctr, Durham, North Carolina, 2. Duke University Medical Ctr, Durham, North Carolina

The purpose of this research was to explore longitudinal outcomes associated with profiles of depressive symptoms. Using data from the Duke Established Populations for Epidemiologic Studies of the Elderly (EPESE), a sample of 4162 adults 65+ followed for up to 10 years, we used latent class analysis to identify discrete clusters of participants who shared similar profiles of depressive symptoms at the time of the baseline survey. Depressive symptoms were measured using a modified version of the CES-D. Functional limitations included 5 items measuring basic activities of daily living (ADLs), 5 items measuring instrumental

ADLs, and 3 items measuring mobility. A model with four clusters provided the best fit to the data. Those in Cluster 1 (56%) had few depressive symptoms while those in Cluster 4 (11%) had the highest probability of endorsing each of the 20 items. Those in Cluster 2 (18%) endorsed primarily somatic symptoms while those in Cluster 3 (15%) endorsed primarily negative affect symptoms. Using a repeated measures mixed model controlling for age, sex, marital status, race, education, health status and cognitive functioning at their baseline status, cluster membership was a significant predictor of functional status over time. While the average trajectory for each cluster showed an increase in functional limitations, the trajectories for Clusters 2, 3 and 4 showed a steeper increase in limitations and were significantly different from the trajectory for Cluster 1. Negative affect symptoms and somatic symptoms alone as well as in combination can predict an increase in functional limitations over time.

SESSION 1435 (SYMPOSIUM)

EVERYTHING OLD IS NEW AGAIN: CURRENT APPROACHES IN AGING AND PERSONALITY

Chair: S.K. Whitbourne, Psychology, Univ. of Mass.Amherst, Amherst, Massachusetts

Discussant: U. Staudinger, Psychology, Univ. of Mass.Amherst, Amherst, Massachusetts

The field of personality and aging forms one of the hallmark areas of psychological gerontology, and can be traced back to the landmark works of such prominent theorists as Erikson, Neugarten, Havighurst, Britton, and Buhler. Their theories of adaptation and aging formed the cornerstone of numerous studies published in the 1950s and 60s. In recent decades, research and theories have moved away from these traditional approaches, particularly with the advent of other theories and models, which cover much of the same ground, but emphasize issues as personality traits and their relationship to health and behavior. The purpose of this symposium is to trace the evolution of the field and to point to the continuities with these earlier approaches in contemporary views. Presenters will discuss, within their own areas of expertise, the benefits of integrating the "old" to the "new." The session will include presentations that focus on successful aging, stress and coping, and personality. Chiriboga and co-authors will link stress research to its roots in Selye, Holmes and Rahe, and Lazarus. In addition to life events and stress, they will examine the role of acculturation. Mroczek and co-authors will examine affect balance, stress reactivity, and mortality in longitudinal data from the Normative Aging Study, applying methods that model within-person variation. Finally, Whitbourne and Mathews will trace the evolution of personality research from the work of Neugarten, Britten, and Lowenthal, examining the concept of pathways of development within a longitudinal data set examining psychosocial development from college through midlife.

AFFECT VARIABILITY PREDICTS MORTALITY

D. Mroczek¹, R.S. Stawski², D. Almeida², A. Spiro³, N. Turiano¹, 1. Purdue University, West Lafayette, Indiana, 2. Pennsylvania State University, State College, Pennsylvania, 3. VA Boston Healthcare System, Boston, Massachusetts

Research on psychological well being has a long heritage, going back at least as far as the life satisfaction scales of Neugarten and colleagues. Subsequent work on well-being has focused more on the latter's positive and negative domains. In the current study, we looked at the balance between negative and positive affect as well as stress reactivity—itsself with a long history—to predict mortality. We used 333 older men and women from the Normative Aging Study who participated in an 8-day daily diary study conducted in 2004. Of the 333 participants, 21 died from 2004 to 2007. Daily negative affect predicted mortality, as did the affect balance (ratio) of positive to negative affect. Additionally, stress reactivity predicted mortality. Within-person slopes that quan-

tify the daily association between stressors and negative affect were used to estimate stress reactivity, and these slopes were significantly predictive of mortality. Those who were more reactive were more likely to die. Findings are consistent with Neugarten's argument that affect is central to well-being.

TRACING PERSONALITY PATHWAYS THROUGH ADULTHOOD: REVIVING "PATTERNS OF AGING"

S.K. Whitbourne, M.J. Mathews, *Psychology, Univ. of Mass. Amherst, Amherst, Massachusetts*

The concept of personality pathways can be traced to the work of Neugarten, Havighurst, and Tobin (1965) who presented data suggesting that adaptation to aging varies by personality "type," referred to as "patterns of aging." In previous research, pathways of psychosocial development were examined in 182 midlife adults followed from college through the late 50s. Five pathways were identified corresponding roughly to four of the Neugarten et al personality types. A pathways questionnaire based on this research was administered to 140 midlife relatives of students in a psychology of aging class. Additionally, those students completed the questionnaire based upon their perceptions of the adult participant; congruence between participants and relatives in pathway ratings were used as a means of contrasting self with other perceptions of adaptation. Advantages of using these ratings to supplement self-report will be discussed in terms of understanding defensiveness and adaptation, concepts central to Neugarten's early work.

THE MANY FACES OF STRESS: A STUDY OF DIVERSE RACIAL/ETHNIC GROUPS

D.A. Chiriboga¹, Y. Jang¹, G. Kim¹, J. Salmon^{2,1}, *1. Aging and Mental Health Disparities MHC 1418, University of South Florida, Tampa, Florida, 2. Aging Research Group, Clearwater, Florida*

This paper links a current application of stress research to its historical roots, beginning with Selye's 1950s studies of physiological stress and the associated General Adaptation Syndrome. Others whose work continues to exert an influence include Holmes and Rahe (who developed an early life event inventory in the 1960s) and Lazarus (who developed hassles and coping scales in the 1970s). More recent studies have focused on chronic strain, as well as the physiological consequences of stress. Drawing on this past work the present investigation includes measures of acute and chronic stressors, but also proposes that level of acculturation can be considered as a source of both. A statewide study (N = 1,433) in Florida sampled older non-Hispanic Whites, Blacks, Cuban Americans, and other Hispanics/Latinos. Results indicate the continuing relevance of classic stress measures for mental and physical health status, and ethnic/racial differences in exposure and its consequences.

SESSION 1440 (SYMPOSIUM)

FAMILY TRANSITIONS IN LIFE: MAINTAINING RESILIENCE AND CREATIVITY DURING PALLIATIVE CARE

Chair: R.S. Allen, *Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*
Discussant: W.E. Haley, *The University of South Florida, Tampa, Florida*

Although health decline is a ubiquitous aspect of living through the course of palliative care, older adults and their families display resilience during periods of transition by employing positive coping strategies. These coping strategies serve to maintain the patient's life message for future generations through generative and creative activity. This symposium explores individual and family transitions during the receipt of palliative care and engagement in a psychosocial community-based intervention called LIFE. First, continuing assessment of patient reported outcomes via paper-and-pencil or computer-based assessment in one outpatient clinic will be reported. These outcomes may be used to refer palliative care patients to further psychosocial interventions such as

LIFE. Second, a grounded theory approach explored outcomes reported by intervention dyads in the original Legacy Project (Allen et al., 2008), designed to decrease palliative caregiving stress and improve patient quality of life. Using the constant comparative method, identified themes include the search for meaning and the importance of continuing the life story through creative activity. Third, process data from the Legacy Project were reviewed for suggestions on improving this family-focused intervention. Families reported that receiving training materials prior to the first intervention session would be helpful in completing the activity. Finally, initial data regarding recruitment, retention, and success of retired senior volunteers as Legacy interventionists with community-based palliative care patients and caregivers in the LIFE project will be presented. Discussion will address family transitions and the benefits of and barriers to engagement in psychosocial interventions near the end of life.

WHAT'S IMPORTANT? PERSONAL AND FAMILY LEGACY DURING FAMILY TRANSITIONS

R.S. Allen, K.L. Payne, C. Lowery, *Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*

We identify themes emerging during mutual reminiscence from the first session of the Legacy Project intervention, designed to decrease caregiving stress and increase family communication among individuals with chronic, life-limiting illnesses and their family caregivers living in the community. Two researchers coded transcript data with fourteen dyads using the constant comparative method. Fifty-seven percent of participants were parent-child dyads. Themes corresponded with two of the four tenets of Legacy Theory: (a) the search for meaning and (b) generativity - the importance of sharing life lessons for personal and familial continuity. These themes emerged as the dyads planned to engage in a creative activity (Legacy Theory tenet three) to produce a product representing the palliative care patient's life message. As older adults begin to lose physical functioning through disease processes or normal aging, interventions focusing on the ways in which these individuals can still contribute to family life are increasingly important.

USING FAMILY-BASED INTERVENTIONS TO OPTIMIZE RESILIENCE IN PALLIATIVE PATIENTS AND THEIR CAREGIVERS

R.S. Pruthi, L.L. Dunn, *Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*

The literature has demonstrated a definite link between chronic stress and diminished resilience (i.e. decreased immunity, hypertension, heart disease, stroke, Alzheimer's, and depression). Palliative patients and their family caregivers are a high-risk group for diminished resilience. Legacy interventions are family-based life review and creative activity projects that decrease caregiving stress, increase family communication, and diminish symptom burden among palliative patients. We reviewed treatment process data (N=31 dyads; Response rate=.7) from the Legacy Project (K01AG00943). Of the 14 treatment dyads, 9 dyads reported the intervention helped in relieving stress and found the coping strategies "very helpful." Suggestions for improvement included providing informational materials to treatment families prior to the initial intervention session. Facilitating resilience can improve physical and psychological attributes of patients and caregivers living in the community with life-limiting chronic illness. Future research is needed to refine the intervention for use by lay-persons such as community based volunteers.

MEASURING PATIENT REPORTED OUTCOMES IN PALLIATIVE CARE BEHAVIORAL STUDIES: RECEPTIVENESS TO COMPUTER-BASED APPROACH

E. Kvale^{2,1}, L. Lloyd², S. Meleth², H. Kuo², C. Huang², C. Ritchie², I. Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama, 2. The University of Alabama at Birmingham, Birmingham, Alabama

The routine assessment of patient reported outcomes (PRO's) often generates important primary or secondary endpoint data in behavioral studies in palliative care populations. Specifically, response burden has been identified as a crucial factor of instrument selection and data collection methodology. To explore the impact of response burden on PRO's in palliative care populations, we undertook a randomized controlled trial to compare computer-based assessment to paper and pencil assessment of PRO's in an outpatient palliative care clinic between April and December 2008. Sixty participants were randomized into two groups to complete a battery of patient self-report instruments using a paper and pencil approach (N=30) or a computer kiosk with a web-based application that presented the same battery (N=30). Factors related to reducing response burden were analyzed by using age as a predictor variable. Findings on selecting suitable assessment approach and referring palliative care patients to further psychosocial interventions will be presented.

SENIOR VOLUNTEERS AS INTERVENTIONISTS IN A LEGACY INTERVENTION

E.L. Csikai, H. Shin, Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama

Reminiscence and life review interventions are often used with older adults and those experiencing severe chronic and life-limiting illnesses. Legacy activities and other types of family exchanges can increase life satisfaction and perception of meaningful life for individuals and their family caregivers (Allen, et al., 2008). Typically such interventions are implemented by trained mental health professionals making its benefits out-of-reach for many who do not encounter such trained personnel during the course of illness. Following a community partnership participatory action research model, the Legacy Intervention Family Enactment (LIFE) project is assessing the efficacy of the Legacy intervention delivered by trained senior volunteers. Recruitment, including informational sessions and focus groups with community senior volunteers was followed by professional training sessions including content volunteers identified as important for success. Positive outcomes are realized by all involved in the process: older adults with life-limiting illness, family caregivers, and the senior volunteers.

SESSION 1445 (SYMPOSIUM)

GLOBALIZING GERONTOLOGY: CULTURE IN THE CLASSROOM

Chair: S.R. Kunkel, Scripps Gerontology Center, Miami University, Oxford, Ohio

With a sharpened focus on global aging and increased attention from around the world to issues of aging, the field of gerontology is benefiting from growing opportunities for international education and cross-national research collaborations. In light of this significant trend, it is useful to reflect on the extent to which our international commitments are reflected in cultural awareness and sensitivities. In this symposium, we will explore the cultural norms that international students bring with them to gerontology classrooms in the U.S.; learn about the experiences of international and U.S. students in a culturally diverse gerontology classroom; and review successful strategies for creating an inclusive, participatory atmosphere in the classroom. Specific topics for the symposium include: classroom behavior norms regarding eye contact, non-verbal cues, participation, and peer communication; the impact of hier-

archy within educational systems on interactions between faculty and students; expectations for writing papers; using discussions about aging-related policies as effective instruction and as a formal invitation to participate in classroom dialogue; and, establishing common gerontology language among students from countries in which terms such as volunteerism, discretionary time, nursing home, family caregiving, and pension scheme have vastly different meanings and connotations. Presenters include gerontology students and faculty from different parts of the world. The symposium will include time for input from those in attendance regarding their own experiences, challenges, and strategies for creating and participating in an inclusive classroom.

FROM AN INTERNATIONAL STUDENT TO A FACULTY MEMBER TEACHING INTERNATIONAL STUDENTS: A PERSONAL JOURNEY

B. Wu, Gerontology, University of North Carolina at Greensboro, Greensboro, North Carolina

International students are a visible and valuable component of the student body on campus in the U.S. From faculty perspective, it is important to create a supportive and culturally sensitive classroom for students and work with students in order to overcome barriers to learning. In this presentation, the author shares her professional experience of working with students and her personal experience as an international student in the past. Taken together, her experiences suggest that the following strategies are critical in effectively educating and mentoring international students: (1) understanding the challenges students face, (2) sensitivity to students' cultures of origin, (3) encouraging students to arrange individual meetings with their instructor, (4) making certain that students comprehend the lectures and questions discussed during class, and (5) making concerted efforts to encourage students to feel comfortable participating in class discussions.

CULTURAL CLASHING AND CULTURAL LEARNING: LESSONS FROM THE INTERNATIONAL CLASSROOM

F. Whittington, George Mason University, Fairfax, Virginia

The international classroom is quickly becoming the norm in American universities. Gerontology courses seem no exception, especially on those campuses that have active international programs of research or global recruitment efforts. When students from different cultures mingle in the classroom, especially when the instructor is culturally unaware or attempting to be culturally neutral, the potential exists for misunderstanding, mis-learning, and personal embarrassment for both majority and minority students. However, insightful, culturally competent instructors can help students avoid such failures and turn clashing expectations into opportunities for learning, understanding, and appreciation. I will present three strategies gerontology instructors can use to transform classroom differences into learning opportunities: 1) present personal philosophy of education and expectations for classroom behavior and performance; 2) present personal view of cultural difference and global awareness; and 3) acknowledge, identify, and discuss cultural differences among students in career and educational goals and classroom styles.

WHAT NOW?: INTERNATIONAL STUDENTS' PERSPECTIVES ON CULTURE IN THE GERONTOLOGY CLASSROOM

J. Liang, S. Mwangi, Sociology and Gerontology, Miami University, Oxford, Ohio

In this presentation, international students will describe their experiences in U.S. gerontology classrooms, with a focus on the surprises and challenges of learning the student role in a new culture. Panelists will discuss the expectations they brought with them regarding norms of classroom participation, formal and informal interactions with peers and professors, and the interpretation of non-verbal cues. Presenters will also discuss some of the "language of gerontology" that has different

meanings around the world. For example, volunteerism is receiving increasing attention in U.S. and Western European gerontology research. However, volunteerism is not relevant in many cultures, because it depends on the existence of discretionary time as a concept and a commodity, which in turn requires an economic system and a life course dominated by formal paid labor. This presentation is intended to raise awareness about the deep impact of culture on classroom behavior and on the substance of gerontology.

SESSION 1450 (SYMPOSIUM)

GRANDPARENTS RAISING GRANDCHILDREN: 15 YEARS OF RESEARCH, THEORY, POLICY AND PRACTICE

Chair: C. Musil, *School of Nursing, Case Western Reserve University, Cleveland OH, Ohio*

The topic of grandparents raising grandchildren emerged as a focus of research and practice in the mid-1990s. Over the past 15 years, substantial progress has been made in the area of kinship caregiving, including in the policy arena. This symposium brings together four papers on research, theory, practice and policy about custodial grandparents to provide a "state of the science" in each of these domains. The first paper, by Esme Fuller-Thomson, draws on her secondary analyses of national data sets to summarize the current state of knowledge on custodial caregivers' health and well being, with an emphasis on racial/ethnic and cultural variations. The second paper, by Bert Hayslip, considers the theoretical perspectives that have been used to frame research on grandparents raising grandchildren. He identifies ongoing theoretical questions and analytical issues requiring attention in order to advance research in the area. The third paper, by Fred Strieder, discusses the research and practice interface, and the innovations in service delivery models to meet the unique needs of grandparent caregivers. In the fourth paper, Donna Butts and Jaia Lent from Generations United document the progress in policy for supporting grandparents raising grandchildren and other kin caregiver families. Current initiatives and partnerships between caregivers with policy makers are highlighted. In the discussion, Carol Musil weaves together the intersections of theory, research, policy and practice, and underscores the interdisciplinary nature of the field. Future directions for work in this area are noted.

GRANDPARENT CAREGIVING RESEARCH: RECENT PROGRESS & FUTURE PROSPECTS

E. Fuller-Thomson, *University of Toronto, Toronto, Ontario, Canada*

In the past 15 years, there has been a burgeoning of research on grandparents raising grandchildren. This presentation will review this literature focusing on health outcomes and racial and ethnic variations. Particular attention will be paid to factors associated with resiliency. Using the nationally representative 2006 American Community Survey, the author will provide documentation on the important but neglected role played by poverty. There is a clear socioeconomic gradient with the percentage of grandparent caregivers experiencing functional limitations decreasing from 41% for those living in poverty to 11% for those with incomes at 500% or more of the poverty line. Findings indicate that impoverished African Americans have 4.5 times the odds of being grandparent caregivers in comparison to African Americans in the highest income group (OR=4.46). We will discuss practice and policy implications of these findings in light of the current economic crisis and identify important areas for future research.

THEORETICAL AND METHODOLOGICAL ISSUES IN CUSTODIAL GRANDPARENTING RESEARCH

B. Hayslip, *University of North Texas, Denton, Texas*

Despite the growth of research in custodial grandparenting over the past two decades, little attention has been paid to theoretical and methodological issues influencing such work. This presentation will explore

the applicability of numerous conceptual frameworks that might guide such research, emphasizing contextualism, wherein custodial grandparents are understood at multiple levels, consistent with Bronfenbrenner's ecological perspective, and a life span approach emphasizing the understanding of grandparent caregiving in an antecedent – consequent framework, stressing the dual demands of parenting a grandchild and adjusting to the life changes that the acquisition of this new role brings. Methodologically, this presentation will argue that a pluralistic approach to collecting grandfamily data is most desirable, stressing the integration of findings from multiple methods that target grandparent caregivers. The need for prospective, longitudinal data, intervention-based work, and research examining the short-term and long-term consequences of caregiving for both the grandparent and the grandchild will be discussed.

THE INTERFACE BETWEEN RESEARCH AND PRACTICE

F. Strieder, *University of Maryland Baltimore - School of Social Work, Baltimore, Maryland*

Over the past 15 years research on grandparents raising grandchildren families has yielded information about the custodial caregivers and their circumstances, the impact of caregiving, and the benefit to the children living in skipped generation households. This paper will address how the current research interfaces with informed program development and the implementation of designs targeting grandparent-headed families' needs within the context of their own community. It will include the development of practice models that give a clear direction and insight into what must be considered in the provision of services. The presentation will identify the significant risk and protective factors pertinent to grandparent-headed households as well as outcomes to incorporate into program evaluation. Existing service models will be used as examples of current practice strategies that have included an evaluation in their designs.

GRANDPARENTS AND OTHER RELATIVES RAISING CHILDREN: THE STATE OF SUPPORTIVE PUBLIC POLICIES

D. Butts, J. Lent, *Generations United, Washington, District of Columbia*

Public policies to support grandparents and other relatives raising children (or grandfamilies) emerged with the development of child welfare laws and Aid to Families with Dependent Children, however, much of this early policy was not created with grandfamilies in mind. Recognizing that laws were failing to most effectively address their unique challenges and needs, over the last decade Congress has developed federal legislation specifically designed to support grandfamilies such as intergenerational housing laws, the inclusion of grandfamilies in the National Family Caregiver Support Program, and the recently passed Fostering Connections to Success and Increasing Adoptions Act of 2008. States are leading the way for additional supportive policies through the passage of educational and medical consent and specialized custody laws. Research documenting how children fare in relative care, the factors contributing to the phenomena, and effective policies and supportive services is critical to the development of further supports for these families.

SESSION 1455 (SYMPOSIUM)

HEALTHY AGING WITH CREATIVE USE OF SELF REGULATION AND SELF EFFICACY BY OLDER ADULTS

Chair: C. Shawler, *University of Louisville, Louisville, Kentucky*
Discussant: S.Y. Hawkins, *University of North Carolina, Chapel Hill, North Carolina*

Older adults utilize creative ways to regulate their lives to balance biological, social, and psychological functioning. The biological perspective of successful aging is often described as the avoidance of disease or disability. The social psychological perspective of successful

aging involves a process of adaptation. In this symposium, researchers explore older adults' self-regulation of high blood pressure and proactive decision making regarding self efficacy to manage environmental disasters. It is essential to understand how older adults, with health risks, contribute to the community, maintain active productive lives, and sustain their life satisfaction. Nurse scientists have contributed knowledge to facilitate robust healthy aging. High blood pressure self-management strategies of older mothers and adult daughter dyads are the focus of the first paper. Physical functioning and quality of relationship can be indicators for quality of life and symptom control. The second paper reports how older adults are at disproportionately high risk during natural disasters and findings provide essential factors that influence decision making for older adults to manage their lives during imminent natural disasters. The third paper describes recruitment strategies of older adults assisting in elementary schools. Findings indicate that despite health risks in the older population, they maintain involvement in the community and participate in research. The last paper explores how various levels of resources affect family caregivers of people with dementia. High levels of resourcefulness enable caregivers to be prepared and less anxious. All of these papers represent research conducted by participants of the Hartford Institute for Geriatric Summer Scholars Program.

HEALTH RELATED QUALITY OF LIFE WITH OLDER MOTHERS AND ADULT DAUGHTERS: SUBTLE AND IMPORTANT NUANCES

C. Shawler, *Nursing, university of louisville, Louisville, Kentucky*

The purpose of this longitudinal predictive study is to determine the impact of inner strength, perceived control, and quality of the mother-daughter relationship of older mothers and their adult daughters on blood pressure self management behaviors and health related quality of life (HRQOL). In this paper several findings from the first wave of data collected from 37 mothers and 37 daughters will be presented. Measures for this analysis include the Autonomy Relatedness Scale (ARI) for quality of the mother-daughter relationship and the SF-36 for HRQOL. Data were analyzed using paired t-tests. Results indicate a significant difference between mothers' and daughters' total scores on HRQOL but no differences on the total ARI score. Subscale analysis of SF-36 and ARI revealed significant variations. Findings suggest that thorough assessment of physical functioning, perceptions of vitality and quality of relationship are essential to thorough and accurate health care of older mothers and adult daughters.

FACTORS INFLUENCING OLDER ADULTS' WILLINGNESS TO EVACUATE IN TIMES OF DISASTER

J.C. Langan, *School of Nursing, Saint Louis University, St. Louis, Missouri*

Older adults are at a disproportionately high risk during disasters. Hurricane Katrina caused the deaths of at least 506 senior citizens. This study took place on the Gulf Coast of Mississippi. This area represents those most frequently ravaged by tropical storms, hurricanes, and flooding. The modified Rosenkoetter Older Adult Disaster Evacuation Assessment tool was used as well as audio recordings of stories the participants shared about their disaster experiences. Participants were members of three church congregations and two senior centers. Subject characteristics are described using descriptive statistics. The Chi square statistical method was used and Backward Logistic regression to identify the combination effect of various predictors determined by the Pearson Chi Square test as being statistically significant. This presentation will discuss the factors older adults consider when deciding whether they should evacuate or shelter in place during imminent natural disasters.

PREPAREDNESS, DEPRESSION, AND ANXIETY IN FAMILY CAREGIVERS WITH VARYING LEVELS OF RESOURCEFULNESS

E.W. Gonzalez¹, C.F. Lippa², M. Polanski³, *1. Nursing, Drexel University, Philadelphia, Pennsylvania, 2. Drexel U. College of Medicine, Philadelphia, Pennsylvania, 3. Drexel U. School of Public Health, Philadelphia, Pennsylvania*

Background: Approximately 10.4 million family caregivers of people with Alzheimer's and other dementias provide care to their loved ones in the community. Family members assume caregiving responsibilities without preparations. The purpose of this study was to examine the differences between highly resourceful and less resourceful family caregivers on preparedness for caregiving, anxiety and depression. Method: A comparative descriptive design was used on baseline data of 70 family caregivers who were living with and caring for person diagnosed with Alzheimer's disease. The data is part of an ongoing intervention study to enhance resourceful skills in family caregivers. Findings: The results showed that family caregivers with low SCS scores were significantly less prepared, more anxious and reported less gratification in caregiving than those who were highly resourceful. There was no difference in depression between groups. Implications will be discussed. Funded by NINR to Elizabeth W. Gonzalez, PhD (PI)

RECRUITING AND RETAINING HIGH-RISK OLDER ADULTS FOR A HEALTH PROMOTION RANDOMIZED CLINICAL TRIAL

E. Tanner¹, E.J. Tan¹, M. Carlson¹, R. Piferi¹, T. Seeman², L.P. Fried³, K.E. Whitfield⁴, G. Rebok¹, *1. School of Nursing and Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland, 2. University of California Los Angeles, Los Angeles, California, 3. Columbia Mailman School of Public Health, New York, New York, 4. Duke University, Durham, North Carolina*

Experience Corps is a health promotion program in which older volunteers assist in city elementary schools, and health outcomes are evaluated in a randomized controlled trial (RCT). Outcomes of recruiting vulnerable, high-risk older adults to engage in this health promotion program with strong appeal for a diverse, underserved population will be discussed. 1755 older adults were recruited and screened and 534 were enrolled and randomized into this RCT during the first 3 years of the Baltimore Experience Corps Trial. The sample, 85% female, 90% African American, and median age of 67 (60-88), reports the following: 76% hypertension, 32% diabetes mellitus, 12% emergency department visits (past month), 18% one+ falls (past 12 months), 48% smoking (past/current), and median BMI of 31.1. The study findings of recruitment efforts demonstrate the ability to successfully recruit a vulnerable population with significant health risks and behaviors for a community-based health promotion program.

SESSION 1460 (SYMPOSIUM)

HOW DO OLDER MEN'S OVERCOME THE CHALLENGES OF LATER LIFE?

Chair: K.M. Bennett, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Discussant: L.K. Soulsby, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Older men face a variety of challenges in later life including widowhood, caregiving and negotiating identity. This symposium brings together exciting work that considers the ways that masculinity aids men to overcome these challenges. Van den Hoonaard examines how older North American widowers discuss their wives' deaths. She focuses on the modes of speech that enable the men both to discuss these distressing events and at the same time maintain their masculinity. In a British study Bennett and Evans also examine the ways older widowers discuss the immediate events prior to death. They emphasise the ways in

which masculinity is maintained through factual reporting and demonstrations of control and competence. Stelle and Watson examine the coping styles of older widowed men and women and find that the variety of grief and grief-related behaviors is varied. Many widowed men have been carers for their wives prior to death, and Russell's paper focuses on men's caregiving experiences. He examines their narratives and focuses on two masculine characteristics: self-confidence and competence. He highlights the individual and temporal differences in the caregiving context. Finally, Black discusses another feature of masculinity this time amongst older African American men: success. She focuses on both whether these older men view themselves as successful and the ways in which expectations of success have been modified in later life. Soulsby will provide a critical analysis of these papers and the ways in which masculinity assists older men to face the challenges of later life.

WIDOWED MEN'S NARRATIVES OF THE DEATHS OF THEIR WIVES

K.M. Bennett, E. Evans, *Psychology, University of Liverpool, Liverpool, United Kingdom*

Bennett and Vidal-hall (2000) analysed the death narratives of older widowed women. This paper extends that work to those told by older widowers. Interviews with 60 widowers were initially compared with those from 66 widows, with a view to identifying similarities and differences. A key difference was the way in which widowers tell the stories of their wives' deaths within the framework of masculinity. Widowers are found to 'report' the events, describing the deaths in an objective way. When widowers did discuss the emotional aspects of their wives' deaths they did so in subtler and less elaborative ways than widows. Their death narratives highlighted their control over and competence in these death related events. However, it is important to note that the manner in which these death narratives are told can disguise the real emotional impact of their wives' deaths.

BECOMING A WIDOWER: MEN'S STYLES OF TALKING ABOUT THEIR WIVES' DEATHS

D.K. van den Hoonaard, *St. Thomas University, Fredericton, New Brunswick, Canada*

This paper looks at strategies that older widowers used in their narratives about the deaths of their wives during an in-depth interview study. Twenty-six widowers in Atlantic Canada and Florida who were between 56 and 91 years of age participated in the study. The researcher analyzed the interviews using discourse analysis with a symbolic-interactionist perspective. The participants told stories that had definite plot lines which they used to situate themselves as husbands, caregivers, and men. They recounted the discovery of their wives' impending deaths and their own place in the process using the same four modes of speech, factual, familistic, destiny, and agency speech, identified by Kirsi et al. (2000) in their study of men's written stories of caring for their wives. This paper will use quotations from the interview to illustrate the men's use of these four modes of speech and argue that the men used them to assert their masculinity.

PATTERNS OF GRIEF FOLLOWING SPOUSAL BEREAVEMENT: INTUITIVE AND INSTRUMENTAL STYLES OF COPING

C. Stelle, W. Watson, *Gerontology / Human Services, Bowling Green State University, Bowling Green, Ohio*

Studies of bereavement have often treated gender as a variable of interest in the analysis of coping and adaptation but have not adequately examined both the between group and within group variability in how men and women cope with spousal loss. This study examines the patterns of grief experienced by 153 bereaved older adults in the Changing Lives of Older Couples (CLOC) dataset by investigating the experience of loss, expression of grief, and adaptation to grief based on the concepts of intuitive and instrumental styles of coping (Martin and Doka,

2000). Factor and cluster analysis is used to create five patterns of grief and examine differences in outcomes such as well-being, depression, support, and social integration. This study underscores the need for research and intervention to move beyond the gendered stereotypes of what grief should look like to the many variations in grieving and behaviors in response to spousal bereavement.

HOW DO I KNOW IF I KNOW WHAT I'M DOING?: NARRATIVES OF SELF CONFIDENCE AND COMPETENCE AMONG ELDERLY MEN CAREGIVERS

R. Russell, *SUNY Brockport, Rochester, New York*

The complexity of caring for an ill family member is evident in a number of varied ways. For elderly men caregivers, such complexity is further exacerbated by gender scripts and role expectations, yet their experiences remain under examined. Among the increasing ranks of elderly men caregivers are those who care for spouses and partners with debilitating cognitive impairment. For these men, the daunting tasks of caregiving consistently challenge their sense of self confidence which, in turn, impacts perceived competence in their caregiving roles. Data for this paper are taken from an ongoing qualitative study of elderly men caregivers begun in 1997, and explores caregivers' perception of competence relative to their sense of self confidence. Findings from their contextually rich narratives suggest that differing levels of self confidence directly impact perceptions of competence, and that both levels often fluctuate significantly for many caregivers individually, as well as across the entire sample.

LINKS AMONG EXPECTATIONS, PERSONAL SUCCESS, AND WELL-BEING IN AFRICAN AMERICAN MEN

H. Black, *Jefferson Center for Applied Research on Aging and Health, Thomas Jefferson University, Philadelphia, Pennsylvania*

Our paper investigates the relationship between youthful expectations in life, personal meanings of success, and feelings of well-being in a sample group of African American men. We conducted in-depth interviews with 16 African American men, aged 70 and over. Our qualitative methodology elicited in-depth accounts of how individuals, when young, thought their lives would unfold and what "success" meant to them in the past and currently. A finding in our research is how early expectations and notions of success are related to well being in old age. A sense of well-being occurs not only because an individual believes he has achieved success and met or exceeded youthful expectations, but also because, throughout life, he has actively modified expectations and meanings of success in order to maintain or regain well being in late life.

SESSION 1465 (SYMPOSIUM)

INTERGENERATIONAL EXCHANGES IN THE CONTEXT OF OTHER RELATIONSHIPS AND CULTURE

Chair: K. Fingerman, *Purdue University, West Lafayette, Indiana*

Discussant: S.H. Zarit, *Pennsylvania State University, State College, Pennsylvania*

Most support of younger and older generations is provided by middle-aged adults, rather than government programs. Although researchers have documented middle-aged adults' perspectives on support they provide to family members, there has been little attention to relationship contexts of intergenerational transfers or to cultural variability in transfer patterns. This symposium considers these factors. Lee and colleagues compare marital couple's views of support to young adult offspring. By considering each member of the couple's perspective on helping their children, they address implications of the parent and offspring relationship for each spouse's well-being. Greenfield considers the support that grandparents provide to young parents. She finds that different types of support from grandparents mitigate stress for parents in African American, Latino, and White families. Levitzki presents a qualitative narra-

tive analysis of parents' views of intergenerational exchanges in Israel. She considers the subjective meaning parents attribute to providing help to grown children. Finally, Kim and colleagues examine expectations of future inheritance from the perspective of both the aging parent and the middle-aged offspring. By examining each party's expectations of this future event, they are able to understand the final transfer parents may give children in the context of ongoing support patterns. Collectively, these papers provide a more nuanced understanding of intergenerational transfer by considering: (a) support exchanges in the context of other relationships (i.e., grandparents/Greenfield, marital couples/Lee), (b) cultural settings of that support (i.e., American ethnic groups/Greenfield, Israel/Levitzki), and (c) multiple perspectives on these transfers (i.e., marital couples/Lee, parent and offspring/Kim).

GRANDPARENT INVOLVEMENT AND PARENTING STRESS AMONG UNMARRIED MOTHERS WITH YOUNG CHILDREN

E.A. Greenfield, *Rutgers, The State University of NJ, New Brunswick, New Jersey*

Drawing on an intergenerational solidarity model, this study examined the extent to which greater grandparent involvement in terms of three related-yet-distinct dimensions (frequency of contact between grandparents and grandchildren; intergenerational co-residence among grandparents, adult children, and grandchildren; and grandparents' provision of childcare for grandchildren) is associated with less parenting stress among unmarried mothers of children ages five and under. Multivariate regression models were estimated using data from the Fragile Families and Child Well-Being Study. Results indicated that frequency of contact was associated with less parenting stress, but only among African American mothers. Co-residence was associated with less parenting stress, but only among White and Latina mothers. Findings suggest the importance of examining multiple aspects of grandparent involvement, as well as potential differences by race/ethnicity, when examining the implications of grandparent involvement for individual and family well-being.

AGREEMENT BETWEEN AGING PARENT'S BEQUEST INTENTION AND MIDDLE-AGED CHILD'S INHERITANCE EXPECTATION

K. Kim, D.J. Eggebeen, S.H. Zarit, *Department of Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania*

Inheritance is the final transfer between generations, but aging parents usually have made plans for bequests well in advance, and their adult children form their own expectations of receiving an inheritance. Prior studies have examined separately the correlates of parents' bequest intentions and children's inheritance expectations. This study investigated the agreement between parent's intention of leaving a bequest and child's expectation of receiving an inheritance. Among 327 dyads of aging parents and their middle-aged children, 54% showed agreement about inheritance. Another 44% were discordant; parents said they intended to leave a bequest, but their child did not expect any inheritance. Factors associated with agreement or discordance over the likelihood of receiving an inheritance were income, co-residence, family size and past patterns of support. These results suggest that inheritance/bequest expectations should be understood as a continuation of support exchanged between generations, but which may also be circumscribed by parent's financial resources.

TO GIVE OR NOT TO GIVE, THIS IS THE QUESTION; ISRAELI OLDER PARENTS NEGOTIATE THE PROVISION OF SUPPORT TO ADULT CHILDREN

N. Levitzki, *Andrus Gerontology Center, University of Southern California, Los Angeles, Israel*

The purpose of this study was to explore the meanings and experiences of healthy older parents with regard to providing inter-vivo resources to their adult children. The narrative-qualitative mode of inquiry was chosen to examine the experiences and meanings of the older parent's role, as they emerge from the subjective stories of parents. Narrative analysis of face-to-face in-depth narrative interviews with 23 healthy Israeli older parents, aged 56 to 69, was conducted. Parents' inter-vivo financial, instrumental, and emotional transfers to their adult children were constructed through negotiating tensions that take place within a dialectical framework of conflicting forces. By questioning how they should reshape their support in order to adjust it to their children's adult status, aging parents negotiated conflicting attitudes and motives as well as their experiences of intergenerational relationships. This study uncovers the underlying meanings and experiences involved in a well-known dimension of the family in later years.

IS IT STRESSFUL OR REWARDING TO HELP GROWN OFFSPRING? THE COUPLE'S PERSPECTIVES

J. Lee, S.H. Zarit, M. Rovine, *Human Development and Family Studies, Penn State University, State College, Pennsylvania*

Married couples give and receive support from their offspring. Using data from the Family Exchange Study, we examined the support exchanges between married couples and their offspring, as well as the couple's perceived stress and reward in their relationships with offspring. A total of 384 couples (ages 49 to 69) reported independently from one another on their relationship with 511 adult children. Regression analysis revealed that the unbalance in exchange between couple and adult children was negatively associated with couple's perceptions of stress and rewards. In addition, we examined whether relationship quality affected the couple's perceptions concerning help exchanges with offspring. Mediation analysis revealed that the association between a couple's perception of reward and stress and unbalance in help exchanges was mediated by couple's ambivalence toward children. These results underscore how a couple's relationship with their offspring contributes to the link between intergenerational exchange and parental well-being.

SESSION 1467 (SYMPOSIUM)

LONGITUDINAL DATASETS TO INFORM TRANSPORTATION AND MOBILITY AS A CREATIVE APPROACH IN HEALTHY AGING

Chair: *S. Classen, University of Florida, Gainesville, Florida*

Discussant: *D. O'Neill, Centre for Mobility Enhancement, Dublin, Ireland*

There is considerable interest among members of the Transportation and Aging Formal Interest Group, Gerontological Society of America, and many others, in longitudinal datasets pertaining to aging and transportation issues. This interest is due to the potential for longitudinal data to: inform on the safe and independent transportation and mobility choices of the older drivers; shape the transportation planning policies; inform researchers on trends, patterns and demographic influences of transportation use; and provide information to agencies charged with meeting the transportation and mobility needs of an aging society. We are pleased to offer this timely and important symposium on longitudinal datasets. Recognized experts in the field of aging and transportation, with published work on analyzing secondary databases, will present in this symposium. Objectives for the symposium are to: (a) impart knowledge on the availability of and access to existing longitudinal datasets that collect data on transportation variables for older adults; (b) understand the pearls and the perils of working with exist-

ing and longitudinal data; (c) be cognizant of the results and implications of such data for transportation policy, research, and service; and (d) conceptualize the core messages from experts who have analyzed data from longitudinal datasets. The symposium will conclude with a discussant's summary on the critical concepts explained in the individual presentations.

CROSS-SECTIONAL AND LONGITUDINAL EVALUATION OF AGE-BASED TESTING ON DRIVING IN OLDER AUSTRALIANS

L.A. Ross, K. Anstey, *Centre for Mental Health Research, Australian National University, Canberra, Australian Capital Territory, Australia*

OBJECTIVES: To investigate the impact of age-based testing (ABT) for licensing renewal on driving status using the DYNOPTA study (n=5206). Logistic regression revealed that after accounting for demographic and health characteristics, participants not eligible for ABT (based on age and state of residence) were 2.65 (95% CI: 2.04-3.45, $p < .0001$) times more likely to drive than those participants who were eligible to receive ABT. Additional longitudinal models examined the robustness of ABT on later driving status trajectories and the impact of ABT on driving in persons with visual and cognitive impairments. **CONCLUSION:** The effectiveness of current visual and medical ABT on vehicular crashes is debated. However, growing evidence suggests that ABT impacts driving mobility, a key component of independence for older adults. Further investigation of ABT policies on crash rates and driving mobility/safety, and the use of other scientifically designed ABT strategies is needed.

THE FATALITY ANALYSIS REPORTING SYSTEM: CRASH DATA SINCE 1975

M. Bedard^{1,2,3}, S. Dubois³, *1. Public Health Program, Lakehead University, Thunder Bay, Ontario, Canada, 2. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada, 3. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

The Fatality Analysis Reporting System (FARS) contains data on all crashes resulting in at least one fatality in the United States since 1975. Collected in a standardized format by the National Highway Traffic Safety Administration, FARS is accessible for free. While not a true longitudinal database (it does not track the same individuals over time) it allows the examination of transportation-related trends of interest to researchers and policy-makers. We have used FARS to: document fatality trends and project an increase among adults (65+) but a decrease among younger adults (aged less than 30); illustrate older adults' susceptibility to crash trauma compared to younger adults; demonstrate passengers are beneficial to older drivers; examine the risk associated with medications. While FARS is limited to crashes resulting in fatalities it remains one of few ethical approaches to examine certain issues (e.g., seatbelts) and contains data that provide evidence and help formulate research questions.

DRIVING PREVALENCE AND CESSATION IN THE 65-PLUS: RESOURCES IN THE HEALTH AND RETIREMENT STUDY

J. Smith, *1. University of Michigan, Ann Arbor, Michigan, 2. Institute for Social Research, Ann Arbor, Michigan*

The NIA-funded Health and Retirement Study (HRS) is a longitudinal panel study of the population over age 50. Since 1992, more than 27,000 people have participated. This major resource, which is located in the Institute for Social Research at the University of Michigan, is available for public use. Data and documentation can be downloaded from the HRS website. In biennial waves, participants aged 65 and older are asked whether or not they drive. Those who do drive provide information about the typical distance of their trips. HRS also includes information about age, gender, race, geographic region (rural versus urban), education, household composition, change in marital status, work status, volunteer status, illnesses, IADL-ADLs, functional limitations,

medications, personality, lifestyle, beliefs, change in living arrangements, household income, consumption, and financial assets. Cross-sectional and longitudinal HRS data can be used to examine multiple questions about the correlates and consequences of driving restriction and cessation.

PEARLS AND PERILS OF LONGITUDINAL DATASETS: PERSPECTIVES FROM AN EPIDEMIOLOGIST

A. Dellinger, *Injury Center, CDC, Atlanta, Georgia*

A common situation that we find ourselves in when conducting research on transportation and mobility among older adults is the "what we want versus what is available" problem. Most existing data are from cross-sectional studies. This is particularly problematic in areas where a broader view of health and safety is most appropriate. For example, "what we want" are data from different types of sources simultaneously (e.g., motor vehicle records, miles driven, health status, functional status and other information). Usually "what is available" are data in one of these domains that cannot be linked to data in others. Moreover, using cross-sectional data, it is not possible to follow participants over time to illuminate causal relationships, we report results that are "statistical associations." Longitudinal data reveal causal relationships. Once causal relationships are revealed, developing prevention programs is facilitated, and health, safety and mobility can be maximized.

SESSION 1470 (SYMPOSIUM)

NEW RESEARCH DIRECTIONS IN THE STUDY OF DISABILITY AND THE AGING LIFE COURSE: THE NATIONAL LONG TERM CARE SURVEY AND BEYOND

Chair: J. McNally, *NACDA, University of Michigan, Ann Arbor, Michigan*

This symposium will present the final research papers emerging from the "The 2004 Wave of National Long Term Care Survey: New Research Directions" meeting held at the National Institutes on Aging (NIA) in May of 2009. The May meeting represented a forum for new and established researchers to discuss research designs and offer preliminary findings that used the 2004 Wave of the National Long Term Care Survey in combination with other studies. The NLTCs, led by Dr. Kenneth Manton of Duke University, will present the final research papers emerging from the "The 2004 Wave of National Long Term Care Survey: New Research Directions" meeting held at the National Institutes on Aging (NIA) in May 2009. The meeting presented a forum for new and established researchers to discuss research designs and preliminary findings that used the 2004 Wave of the National Long Term Care Survey in combination with other studies. The NLTCs, led by Dr. Kenneth Manton of Duke University, is a nationally-representative sample both of the community and of institutional populations that has been collected approximately every five years, and consists of six waves (1982, 1984, 1989, 1994, 1999, and 2004) and has generated a body of research significantly contributing to our understanding of disability and the aging life course. After preliminary review and presentations in May the authors are finalizing the papers emerging from this NIA sponsored meetings and the proposed symposium will allow the work to be presented to interested members of the research community within a structured format. The proposed symposium will look at both the pace and pattern of disability across time as well as methodological issues associated with the use of longitudinal data to study the disability process and the provision of care. Finally, the proposed symposium will allow researchers to learn of potential bridges between the existing NLTCs studies and the recently funded "National Study of Disability Trends and Dynamics" which continues the study of disability and the aging lifecourse begun by the NLTCs.

IDENTIFYING INDIVIDUALS IN NEED OF FULL-TIME CAREGIVING

L. Sands, H. Xu, *Purdue University, West Lafayette, Indiana*

Many persons who are disabled in basic activities of daily living (ADL) such as dressing, bathing, eating, transferring and toileting are dependent upon others to carry out these activities needed for health and survival. Evidence is needed to help caregivers, clinicians, and policy makers plan the amount of care that will be needed by ADL disabled older adults. The purpose of this study is to classify patients according to their probability of needing full-time care based on four common clinical indicators: number of ADL dependencies, level of cognitive impairment, presence of depressive symptoms, and history of stroke. Using the NLTCS the results show that patients can be classified according to their probability of whether or not they need full-time care. Such a classification would facilitate counseling informal caregivers about the caregiving needs of their care receiver and would facilitate planning long-term care resources needed by ADL disabled older adults.

BALANCING ELDERCARE AND WORK: THE EFFECTS OF A FAMILY-FRIENDLY WORKPLACE ON WORK

J. Kim, B. Ingersoll-Dayton, M. Kwak, *NACDA, University of Michigan, Ann Arbor, Michigan*

The purpose of this study is to examine the mediating effects of family-friendly work environments on the relationship between employed caregivers' stress and work performance. The sample consists of primary caregivers who are currently participating in paid jobs ($n=652$) from the 2004 National Long-Term Care Survey. Using structural equation modeling (SEM), we investigate relationships among four latent variables: caregivers' stress, supportive employers, utilization of work accommodations, and work productivity. The results show that caregivers' stress has the largest total effect (2.18) on their low work performance most of which (80.8%) is due to a relatively large indirect effect (1.76). The indirect effect is accounted for by the utilization of work accommodations which are negatively ($\beta = -.025$) affected by employers' informal supports. The findings suggest that a family-friendly supervisor mitigates the effects of caregivers' stress on their work performance, helps them balance work and elder care, and enhances their work performance.

THE EFFECTS OF FORMAL SERVICE UTILIZATION ON INFORMAL CAREGIVERS' PHYSICAL AND PSYCHOLOGICAL HEALTH

J. Kim, *University at Albany, Albany, New York*

This study examines how the 1997 Balanced Budget Act and the 2000 National Family Caregiver Support Program affect formal service utilization by the frail elderly and the caregivers; and how these two formal service utilizations influence the caregivers' health outcomes. Although relationships between formal and informal care have long been debated in health economics or public policy, and they clearly exist as substitution or complementary, this relationship was not studied in caregiving stress research. Using data drawn from the 2004 National Long Term Care Survey, this study examines paths of relationships among stressors, appraisals, formal service utilizations and the caregivers' health outcomes in a structural equation modeling using LISREL 8.8. Conceptually, this study applies a theoretical framework that incorporates relations between formal and informal care. Results from this research will inform researchers to expand a theoretical framework by exploring the roles of formal service utilization in the caregiving process.

PREDICTORS OF CAREGIVER STRAIN AMONG CAREGIVERS OF FRAIL ELDER

S. Kang, *The University of Texas at Arlington, Arlington, Texas*

Family members play a main role in providing caregiving to America's frail elders. Many studies demonstrate that stress caused by care-

giving can have adverse effects on family caregivers' psychological, social, and physical well-being (Gatz, Bengtson, & Blum, 1990; Light, Niederehe, & Lebowitz, 1994; McKinlay, Crawford, & Tennstedt, 1995; Toseland, Rossiter, Peak, & Smith, 1990; Zarit, 1987). This makes the development of interventions aimed at reducing caregiver stress an important social issue and understanding the caregiving experience in national samples is crucial to development of effective programs and interventions. Utilizing the role theory framework (Goode, 1960) and the stress process framework (Pearlin, Mullan, Semple, & Skaff, 1990), the paper examines variances in caregiver strain (emotional, physical, and financial) and identifies the predictors of caregiver strain. The results of this study provide crucial information for professionals to develop effective caregiver support and intervention programs that target specific causes of caregiver strain.

DOES DISABILITY PROGRESSION AFFECT ASSISTIVE DEVICE USE?

K. Pallone, K.F. Ferraro, *Purdue University, West Lafayette, Indiana*

This study seeks to identify predictors of assistive device use based on panel data from the 1994, 1999, and 2004 waves of the National Long Term Care Survey (NLTCS). Respondents identified what assistive devices they used for transferring, getting around indoors, toileting, and bathing. Variables to predict assistive device use in 2004 included demographic variables, body mass index (BMI), previous history of assistive device use count, and disability progression in the form of an increase in lower body impairment between 1994 and 1999. Results reveal that age, obesity, assistive device use in earlier waves, and disability progression between 1994 and 1999 are consistent significant predictors of the number of assistive devices used in 2004. Increases in lower body impairment had a greater effect on number of assistive devices used among the middle-old, compared to the young-old and oldest-old.

SESSION 1475 (SYMPOSIUM)

PROVIDING RISK AND DIAGNOSTIC INFORMATION ABOUT DEMENTIA: RESEARCH ON IMPACT AND IMPLICATIONS

Chair: B. Carpenter, *Psychology, Washington University, St. Louis, Missouri*

Because of demographic and epidemiologic trends, in the coming decades more people will receive risk and diagnostic information about dementia. Given these trends, more needs to be known about the process and outcome of sharing risk and diagnostic information. The objective of this symposium is to present results from recent research on how dementia risk and diagnostic information is shared with patients and family members and the effect of that disclosure. The symposium begins with results from research on the impact of disclosing genetic risk information to adult children whose parents have dementia. A second presentation examines videotaped interactions during which a clinician delivers an actual dementia diagnosis, using discourse analysis to examine features of the diagnostic conversation. A subsequent presentation describes the use of a standardized observational analysis system to examine clinician's patient-centered language during these diagnostic conversations. Once a diagnosis of dementia has been established, different challenges then arise. An additional presentation explores discrepancies between patients and family members about potential causes of mild cognitive impairment symptoms. And finally, qualitative interviews with patients and family members highlight wide variability in the extent to which families process and discuss a dementia diagnosis once they leave the clinic office. As a set, results from these studies provide information that can guide future research questions as well as clinical recommendations for healthcare providers, people with dementia, and their companions about how to approach dementia risk and diagnosis conversations to maximize psychological and functional outcomes.

PHYSICIAN USE OF PATIENT-CENTERED TECHNIQUES DURING DISCLOSURE OF A DEMENTIA DIAGNOSIS

A.K. Zaleta, B. Carpenter, *Psychology, Washington University, Saint Louis, Missouri*

Clinician use of patient-centered techniques when delivering a dementia diagnosis may influence a variety of outcomes. We analyzed 54 videotapes in which a physician delivered a dementia diagnosis to patients and their companion using an adaptation of the Roter Interaction Analysis System. Clinicians used a wide range of facilitative and rapport building techniques. The mean level of positive rapport building techniques was high relative to emotional rapport building techniques. Among facilitative techniques, the most common were back channeling, checking physician understanding, and checking patient/companion understanding. There was more variability in the use of patient-centered techniques across clinicians compared to within clinicians. Patient-centered techniques were not associated with post-diagnosis patient/companion depression, anxiety, or satisfaction. Clinicians used similar patient-centered techniques regardless of patient dementia severity. Clinician use of facilitative techniques predicted patient participation. Our results suggest that clinician use of patient-centered techniques may affect the process of diagnostic disclosure.

ANALYSIS OF KEY LINGUISTIC FEATURES IN A TRIADIC DEMENTIA DIAGNOSIS CONVERSATION

E. Sakai, *Psychology, Washington University, St Louis, Missouri*

Collaborative communication is critical to successful dementia care. This study examined linguistic characteristics of conversations among physicians delivering a dementia diagnosis to patients and companions. Fifty-six triadic conversations were coded using the Linguistic Inquiry and Word Count software. Physicians spent the most time talking during the interactions (mean proportion = 83%) compared to patients (8%) and companions (8%). Patients and companions underestimated the time the physician spent talking and overestimated the time they themselves spent talking, with patients more extreme in their misestimations. Physicians talked a comparable amount of time regardless of patients' dementia severity, but patients talked less and companions more when dementia was more severe. There was wide variability in the frequency with which physicians used the terms "dementia" and "Alzheimer's." Diagnostic language was not associated with psychological distress among patients and companions. Dementia diagnostic conversations appear to reflect an evolving multiparty adaptation to cognitive impairment.

GENETIC SUSCEPTIBILITY TESTING FOR INDIVIDUALS AT RISK FOR ALZHEIMER'S DISEASE: FINDINGS FROM THE REVEAL STUDY

S. Roberts, *University of Michigan, Ann Arbor, Michigan*

Advances in research on Alzheimer's disease (AD) have made possible genetic susceptibility testing for asymptomatic individuals. Although such risk assessment is not recommended for use in clinical practice, it has recently become available via direct-to-consumer genetic testing companies, raising a need for empirical data to inform policy and practice decisions. The Risk Evaluation and Education for Alzheimer's Disease (REVEAL) Study is a multi-center, NIH-funded series of three successive clinical trials examining the impact of using APOE genotyping to help inform interested individuals about their chances of developing AD. This session will review findings from the project across domains including 1) psychological impact of testing, 2) health and insurance behavior changes prompted by testing, 3) effects on risk perceptions, and 4) differential impact across various methods of genetic education and counseling (e.g., extended vs. condensed vs. telephone protocols). The implications of study findings for practice and policy will be discussed.

DO PATIENTS AND THEIR FAMILY MEMBERS AGREE ABOUT WHAT MIGHT BE CAUSING MCI?

J. Lingler, L.A. Garlock, L. Garand, A. Ercius, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Background: Mild cognitive impairment (MCI) is a known risk state for dementia. We examined illness representations among persons recently diagnosed with MCI and their family members. Methods: Forty-three patient and family member dyads were recruited from a university-based memory disorder clinic. As part of the Illness Perception Questionnaire, each ranked the importance of 25 factors as potential causes of the patient's MCI symptoms. Results: Patient and family member dyads exhibited only fair levels of concordance in their rankings of the primary cause of MCI symptoms ($\kappa = .37$). For both patients and family members, heredity was the most frequently cited cause. Nearly half of the relatives but only one third of the patients attributed symptoms to potentially controllable factors (e.g., diet, mental attitude). Conclusions: Within dyad disagreement about the likely causes of MCI symptoms is not uncommon. Interventions to minimize misconceptions about MCI should target both patients and family members.

UNMENTIONED AND UNMENTIONABLE: HOW FAMILIES MAKE SENSE OF A DIAGNOSIS OF DEMENTIA

C. Bamford, K. Brittain, J. Bond, M. Eccles, L. Robinson, *Institute of Health & Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

Existing studies have focused on the role of professionals in disclosing a diagnosis of dementia. Research suggests that many carers find it difficult to discuss the illness with the person with dementia. Using secondary analysis of interviews with 17 people with dementia and 22 family carers, this paper explores how families make sense of a diagnosis of dementia. The data indicate wide variability, with dementia being accepted as a 'normal' topic of conversation in some families, but being unmentioned and unmentionable in others. Three key themes emerged from the data: the exclusion of the person with dementia from key conversations; the projection of thoughts and feelings onto the person with dementia; and the avoidance of opportunities to explore the diagnosis. The findings highlight the limited opportunities for many people with dementia to share their thoughts and fears. Interventions are needed to support people with dementia and families after disclosure.

SESSION 1480 (POSTER)

SPIRITUALITY AND RELIGIOUSITY

RELIGIOUS CREATIVITY AND THE VITALITY OF COLLECTIVE MEMORY

J. Spannari, *University of Helsinki, Helsinki, Finland*

Creativity of older adults is often viewed as influencing or empowering the individuals in question. The creative activities could have an effect also on the surrounding community. Collective memory is something communities need for identity building and giving meaning to the past, present and future events. Collective memory is constructed through social processes and is often linked with the shared religious or other meaning system of the group. Some studies suggest that sustaining and mediating the collective memory would be one of the designated tasks of old age. This paper aims to show that by their creative approach to religious texts the older writers support, renew and sustain the collective memory of the community. The examination is based on a qualitative analysis of short religious poems, prayers and aphorisms (N=943) written by Finnish elderly persons in the study groups of Pension Union, the biggest pensioners' organization in Finland, in year 1999. In the texts the writers communicated their personal views and experiences by using religious language deeply rooted to their Finnish and Lutheran cultural heritage. In their texts the older writers combined, quoted and interpreted different kinds of religious texts and construc-

tions. The texts were used in most ingenious ways to create new landscapes where not only the history but also the interpretations of current events are visible. The collective memory is adapted and renewed in a two-way negotiative process. This study shows that through religious creative group activities this process could be facilitated and inspired.

RELIGIOSITY, SPIRITUALITY AND PERCEPTION OF FAMILY AND FRIEND SUPPORT

V. Hamm Baugh, *Psychology, Kean University, Union, New Jersey*

The purpose of the present study was to examine the relationship between religious and spiritual beliefs and practices and their relationship to perceptions of social support among older adults (65 years and older). Results suggest that private religious practices, such as praying and viewing or reading religious materials, are positively correlated with the amount of support older adults believe they would receive from family if faced with a problem or difficult situation. However, a larger number of variables were positively correlated with the amount of support anticipated from friends including; daily spiritual experiences, considering oneself to be a religious or spiritual person, believing religion to be a source of strength and comfort, believing one's whole approach to life is based on religion, and feeling God's love through others. Friend support may be a more tangible and readily available source of support than family for older adults and therefore religious belief systems and practices may be experienced more through the friendship relationship. Additionally, friends may serve an important role in supporting the religious activities of older adults. These results support the inquiry into the role of key relationships in the quality of life of older adults.

PREDICTIVE FACTORS OF GENERATIVITY IN MIDLIFE: EXAMINING THREE ELEMENTS OF RELIGIOSITY

L. Schlosnagle, J. Henrie, *West Virginia University, Morgantown, West Virginia*

Using MIDUS 2 data (N = 2363, 58.9% female, mean age = 57.01, SD = 12.52), the current study investigated whether three sub-domains of religiosity (religious identification, religious support, and private religious practice) (George, Ellison, & Larson, 2002) were predictors of generativity. A hierarchical regression was conducted. Initially, religious identification ($\beta = .13, p < .001$) was a significant predictor ($R^2 = .017$; $F(1, 2361) = 40.54, MSE = 13.57, p < .001$). In the second model, religious identification ($\beta = .10, p < .001$) and religious support ($\beta = .08, p < .001$) were significant predictors ($R^2 = .022$; $F(2, 2360) = 26.98, MSE = 13.50, p < .001$; $F\Delta(1, 2360) = 13.21, p < .001$; $R^2\Delta = .005$). In the final model, religious identification ($\beta = .04, p = .084$) was not a significant predictor, but religious support ($\beta = .07, p = .002$) and private religious practices ($\beta = .11, p < .001$) were ($R^2 = .031$; $F(3, 2359) = 25.32, MSE = 13.39, p < .001$; $F\Delta(1, 2359) = 21.52, p < .001$; $R^2\Delta = .009$). The findings were unexpected, as others have found a relation between generativity and religious identification (e.g., Mattis et al., 2004; Musick et al., 2000; Ruiter & De Graaf, 2006). This may be due to the Loyola Generativity Scale's emphasis upon perceived generativity rather than frequency of generative behaviors (McAdams & de St. Aubin, 1992).

UNDERSTANDING THE IMPACT OF FAITH COMMUNITIES ON SOCIAL CAPITAL: A QUALITATIVE ANALYSIS

M. Chandlee, H. Pope, R.E. McKeown, *Epidemiology and Biostatistics, University of South Carolina, Columbia, South Carolina*

A study funded by Duke University called Understanding Social and Personal Aspects of Faith and Practice Related to Health, is currently being conducted to explore the complex relationships among social capital, religious faith and practice, and health using qualitative research methods (in-depth interviews). In 2008, two of the researchers (MC and HP) interviewed a total of 48 persons across the state of South Carolina. Eligible participants were African American (AA) and Caucasian adults over the age of 50 classified as regular attendees of religious services

or infrequent or non-attendees of religious services. The interviewers asked questions related to the participants' group participation, their level of trust in social networks, and their outreach to the community. A qualitative analysis was performed using QSR- Nvivo software to identify themes in participant responses. There were major differences in responses between regular attendees of religious services and infrequent or non-attendees of religious services in the areas of social support, trust levels, impact of community outreach efforts, and dissemination of health information. These results support that religious institutions can be a source of social capital by providing a variety of needs and positively impacting the health and well-being of older adults. Based on these findings and existing literature, researchers will develop a survey instrument to assess the mechanisms of social capital, health outcomes, and multiple dimensions of faith and practice for use in future research.

THREE FACTOR MODEL OF RELIGIOUS ORIENTATIONS: MEANS, ENDS, QUEST

E. Farrington, K. Gapinski, E.H. Thompson, A. Futterman, *Psychology, College of the Holy Cross, Worcester, Massachusetts*

Using measures of religious orientation derived from Allport and Ross (1967) and Batson (1991), we describe a three-factor model of religious motivation in a random sample of 345 older adults living in Worcester, MA., and examine the convergent/discriminant validity of the three religious motivation factors. Three religious factors in keeping with the religious orientations "religion as an end in itself" (Ends), "religion as a means to other ends" (Means), and "the search for purpose and meaning of life in a religious context" (Quest) emerged from exploratory factor analyses, and were confirmed in randomly selected halves of the sample. Means and Quest were associated ($r > .25$), as were Ends and Means ($r > .20$), but Quest and Means largely independent of one another ($r = .05$). Ends and Means religious orientations were differentially related to religious involvement, belief, experience, and knowledge; Quest religiousness was largely unrelated to religious measures with the exception of positive correlations with self reported religious experience. By contrast, Quest was predicted by background characteristics (e.g., married, higher levels of Quest), personality characteristics (e.g., Neuroticism, Extroversion, Openness on the NEO), by functional impairments (e.g., ADLs), and by other non-religious measures.

A COMPARISON OF RELIGIOUS AND NON-RELIGIOUS OLDER ADULTS ON WELL-BEING AND CONTRIBUTING VARIABLES

S.M. Horning, R.E. Cornwell, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Religiosity has been reported as being advantageous to mental health and well-being (Parker et al., 2004; Shkolnik et al., 2001). Previous studies, however, fail to include non-religious individuals, comparing those high and low on religiosity. The present study aimed to compare religious and non-religious older adults on well-being, social support, and meaning in life. Participants (N = 134), including atheists, agnostics, low on religiosity, and high on religiosity, completed an online questionnaire assessing well-being, presence and search for meaning in life, and satisfaction with and number of social supports. To analyze differences between groups, five one-way ANOVAs were conducted. No significant difference between groups was found on levels of well-being or satisfaction with social support. A significant difference between groups was found on the presence of meaning in life ($F[3, 86.78] = 6.97, p < .01$) with the high religiosity group having higher levels of perceived meaning than the non-religious groups ($p < .01$). A significant difference was found for the search for meaning in life ($F[3, 123] = 3.42, p < .05$), with the high religiosity group endorsing greater search for meaning than the atheists. Also, a significant difference between groups was found on total number of social supports ($F[3, 61.10] = 5.28, p < .01$), with

the religious groups having greater numbers of supports than the agnostics. The findings suggest that being religious does not inherently increase well-being; however, religiousness appears to encourage older adults to search and obtain meaning in life. Additionally, although religiosity may promote larger social networks, religious and non-religious seniors share comparable levels of satisfaction with their support.

DIFFERENCES BETWEEN RELIGIOUS AND NON-RELIGIOUS OLDER ADULTS ON COPING BEHAVIORS

S.M. Horning, R.E. Cornwell, *Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Using religion to cope is highly prevalent among older adults (Koenig et al., 1992), especially those hospitalized or suffering from a medical illness (Burker et al., 2004). However, little is known regarding the coping styles of non-religious older adults. The present study explored coping behaviors among a sample of 134 religious and non-religious older adults. Self-identified atheistic, agnostic, low religiosity, and high religiosity participants completed an online questionnaire assessing coping behaviors. Participants rated their utilization of 14 common coping behaviors, including self-distraction, active coping, denial, substance use, emotional support, instrumental support, behavioral disengagement, venting, positive reframing, planning, humor, acceptance, religion, and self-blame. Fourteen one-way ANOVAs were conducted to explore group differences. A significant difference between groups was found for substance use, $F(3, 102.21)=7.68, p<.01$. Atheists were more likely to endorse using substances to cope compared to the low and high religiosity participants ($p<.01$). A significant difference resulted for the use of religious-oriented coping, $F(3, 52.51)=83.99, p<.01$. The high religiosity group endorsed greater rates of religious coping compared to all other groups ($p<.01$). Additionally, a significant group difference was found for the use of humor to cope ($F(3, 118)=3.06, p<.05$), with the atheists endorsing greater use of humor to cope compared to the low religiosity group ($p<.01$). No other group differences on coping behaviors were found. The results of the study suggest that working with religious and non-religious older adults in clinical settings should focus on how the person's beliefs interact with their interpretation of the event and subsequent coping style.

HOW CONTROL IMPACTS THE RELATIONSHIP BETWEEN RELIGIOSITY AND SUBJECTIVE WELL-BEING

B. Jackson, C. Bergeman, *Psychology, University of Notre Dame, Notre Dame, Indiana*

Research addressing how and why some individuals age better than others and identifying characteristics that promote optimal outcomes in later life is increasingly important as greater numbers of adults live well into their eighties and beyond. The present study looks at the positive relationship between religiosity and subjective well-being (SWB) in middle-aged and older adults, hypothesizing that this relationship is indirect and mediated by perceived control. The 539 participants were from the Notre Dame Study of Health and Well-Being (aged 31-88, mean age 58.5; 56% female; 87% Caucasian). Data were collected via self-report questionnaires and composite scores for religiosity, perceived control, and SWB were created. Results of regression analyses revealed that perceived control moderates the impact of religiosity on SWB; perceived control was also found to partially mediate the effect of religiosity on SWB, lending initial support to the hypothesized mediational role of perceived control. These findings suggest that individuals higher in perceived control experience greater benefits from religious and spiritual beliefs and practices; they also indicate that a portion of religiosity's effect on SWB may be indirect, operating via enhanced perceptions of control. This study presents one mechanism by which the beneficial effects of religiosity on SWB are conveyed.

GRANDPARENTS' INFLUENCES ON COLLEGE STUDENTS' RELIGIOUSNESS: DOES DEMENTIA MATTER?

S.H. McFadden, R. Subramony, B. Mullins, K. Maguire, *Psychology, University of Wisconsin Oshkosh, Oshkosh, Wisconsin*

College students whose grandparents do not have dementia ($n = 91$) and students with at least one grandparent with dementia ($n = 86$) completed surveys that included measures of students' religiousness, closeness to grandparents, grandparents' religiousness, and attitudes about older people. Participants also wrote answers to 3 questions about grandparents' influence on religiousness/spirituality, religious questions resulting from relationships with grandparents, and beliefs about how grandparents influence young adults. No significant differences were found in religiousness, nor in emotional closeness with the grandparents. Grandparents with dementia were described as showing a significant drop in their own religiousness ($p = .02$) since the onset of memory loss. Their grandchildren reported that witnessing changes in these grandparents increased their prayer frequency, stimulated theodicy questions, and produced increased acceptance of older persons. This was confirmed by comparison of the two groups on a measure of patience with older adults, with the students whose grandparents have dementia reporting greater patience ($p = .005$). The majority of students whose grandparents do not have dementia answered the narrative questions by stating that there had been no specific grandparent influence on their religiousness, but rather a more general influence as role models. Students in both groups pointed to closeness as the key factor in grandparent influence. These findings suggest that young adults' observations of changes in grandparents due to progressive forgetfulness can motivate religious behaviors like prayer and religious questioning.

THE ROLE OF FAITH IN STROKE RECOVERY

S. Ostwald, L.K. Derkits, K. Janssen, *University of Texas at Houston, Houston, Texas*

Faith has been suggested as an important coping strategy for some persons who live with chronic illness. This mixed method research collected data from 10 couples (average age of 70.6), approximately 5.3 years after a stroke. The couples were interviewed about the impact of their belief system on their recovery; and completed the R-COPES and F-COPES questionnaires. The interviews were transcribed; questionnaires were entered into SPSS for analysis. Code words and phrases were identified from the transcripts and combined into themes. Two major themes were identified – personal relationship with God (spirituality) and connection to the church community (religiosity). Most stroke survivors and their spouses reported a positive relationship with God, although some described earlier feelings of anger and questioning. A few continued to question the role of God in their lives. Couples described both strong connections and disconnections with their church communities. While churches helped some couples cope with the stroke by giving emotional and physical support, other couples felt abandoned by the church. Individual scores on the subscales of the R-COPES and Acquiring Spiritual Support (ASS) on the F-COPES were consistent with the interview data. Stroke survivors reported lower ASS subscale scores and higher negative coping than their caregivers. Stroke survivors with greater disabilities experienced more obstacles and insensitivity to their needs by the church community. Some experienced the sense of “the church dropping all around” them. Healthcare professionals should recognize the personal role of faith in long term recovery and provide opportunities for couples to explore their feelings.

RELIGIOUSNESS/SPIRITUALITY, AND SOCIAL SUPPORT ON DEPRESSION AMONG KOREAN IMMIGRANT OLDER ADULTS

S. Roh, *New York University, New York, New York*

Aim of study: The objective of this study is to understand the multidimensional aspects of religiousness/spirituality, and social support

on depression among Korean immigrant older adults with a primary focus on examining how much the effects of religiousness/spirituality and social support can account for depression. Method: The study utilized cross-sectional survey design. 196 participants who were age 65 years or older were recruited from Korean senior centers in the New York City metropolitan area. The Brief Multidimensional Measures of Religiousness/Spirituality (BMMRS) was used to measure various domains of religiousness/spirituality, including daily spiritual experiences, values/beliefs, forgiveness, private religious practice, religious/spiritual coping, and religious support. In an attempt to measure a broad range of social support, Lubben Social Network Scale-Revised (LSNS-R) was used. Depression was assessed using Geriatric Depression Scale-30 Korean version (GDS-K). Results: Multivariate analyses found religious and spiritual coping was associated with decreased depression after controlling for socio-demographic variables. In addition, social support was negatively related to depression. Conclusion: This study's findings have the potential to enhance our understanding of the multidimensional aspects of religiousness/spirituality and social support among older adult immigrants including Koreans. The findings can be used to foster greater collaboration between the healthcare system and faith communities in order to improve quality of life of older adults. This study was supported by John A Hartford Foundation.

ALTERNATIVE THEMATIC ANALYSIS AND REPRESENTATION: A GRANDMOTHER AND GRANDDAUGHTER READ-TOGETHER

D.M. Seponski, D.C. Lewis, *University of Georgia, Athens, Georgia*

When examining the transmission of values between grandmothers and granddaughters, research has generally been restricted to a unidirectional approach. However, Seponski and Lewis (2009) demonstrated that the effects are bi-directional, with mutual influence and co-learning between the generations. The current study further examines the bi-directional transmission of values by identifying the most salient value transmitted. Semi-structured interviews were conducted with four grandmother-adult granddaughter dyads ($n = 8$). The analysis followed the constant comparative method as described by Strauss and Corbin (1990). The emerging data suggests that the most salient values are religion and spirituality. Furthermore, the transmission of religion and spirituality between grandmothers and granddaughters is a bi-directional process whereby the grandmother teaches the granddaughter through religious studies at a young age and through behavioral modeling as an adult; the granddaughter demonstrates her adherence to the values through action and religious participation, and thus affirms the grandmother's values. Emerging themes will be described in detail. Uniquely, an additional intention of the presentation is to provide an alternative representation of findings on the relationship between grandmothers and their granddaughters. This alternative representation is a book targeted toward the participants and other grandmothers and granddaughters that is reader-friendly, has no professional jargon, and is illustrated. It is important to produce alternative representations of research findings to allow for creativity, expressiveness, and give voice to the participants. Thus, the results will be presented in the standard scientific format as well as a format that is readable and usable to the participants.

PSYCHOSOCIAL INDICATORS OF FORGIVENESS AMONG OLDER MALE OFFENDERS

A. Bishop, *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma*

The purpose of this study was to identify key psychosocial predictors of forgiveness among aging male offenders. Participants included $N = 261$ male offenders, age 45 and older, incarcerated in state managed prison facilities in Oklahoma. Hierarchical linear regression models were computed to determine whether psychosocial variables including stress, depressive symptomology, perceived closeness to God, and social support predict forgiveness beyond demographic and covariate

indicators. Although demographic indicators such as age, race, and education did not emerge as significant predictors of forgiveness, serving a life sentence as well as functional health status were relevant covariate indicators. Serving a life sentence ($B = .13, p < .05$) and functional health status ($B = .11, p < .05$) were positively associated with greater feelings of forgiveness. However, stress, closeness to God, and social support maintained significant associations with forgiveness above and beyond demographic and covariate influences. In particular, stress had a significant negative association with forgiveness ($B = -.29, p < .01$), whereas perceived closeness to God ($B = .34, p < .01$) and social support ($B = .15, p < .05$) were positively associated with forgiveness. It appears that serving a life sentence, maintaining functional health abilities, deriving a close relationship with God, and greater social support are related to greater feelings of forgiveness among aging male offenders, but greater stress diminishes forgiveness. The results have implications relative to the pastoral care and spiritual ministry of older male offenders.

RELIGIOUSNESS AND TRAJECTORIES OF PAIN INTENSITY AMONG COMMUNITY DWELLING OLDER ADULTS

N. Park¹, F. Sun², L. Roff³, D. Klemmack¹, M. Parker¹, H. Koenig³, P. Sawyer⁴, R. Allman⁴, *1. University of Alabama, Tuscaloosa, Alabama, 2. Arizona State University, Glendale, Arizona, 3. Duke University, Durham, North Carolina, 4. University of Alabama, Birmingham, Alabama*

Previous work indicates that individuals rely on religiousness in dealing with pain, but few studies have examined longitudinal trajectories of pain intensity and how religiousness may be associated with trajectories of pain. Further, no study has considered heterogeneity in trajectories of pain intensity. The purposes of this study were to: (1) test hypotheses about the multiple trajectories of pain intensity; and (2) examine how religiousness is related to different pain trajectories. A total of 720 community-dwelling adults aged 65 and older, participants in the UAB Study of Aging, were interviewed annually over three years. Pain intensity was assessed by a five point Likert scale, ranging from no pain to agonizing. Growth mixture modeling was used to classify trajectories of pain intensity. Three measures of religiousness (service attendance, prayer, and intrinsic religiousness) as well as age, gender, race, and rural residence were considered. Overall, intensity of pain decreased over three years. Most of community older adults reported no increase or decreasing pain intensity and some experienced increasing pain. Fit indices suggested a three-class model: (1) increasing ($n = 47$); (2) unchanging ($n = 292$); and (3) decreasing ($n = 381$). Higher levels of intrinsic religiousness were associated with higher levels of pain at baseline and were associated with a lower slope of pain trajectory among those with increasing pain ($p < .05$). Higher baseline service attendance was associated with a higher probability of decreasing pain ($p < .05$). Intrinsic religiousness and church attendance may have moderating effects on one's pain experience.

BENEFITS OF THE HEART, SOUL, MIND, AND STRENGTH PROGRAM: A QUALITATIVE ANALYSIS

M. Chandlee, H. Pope, R.E. McKeown, *Epidemiology and Biostatistics, University of South Carolina, Columbia, South Carolina*

From 2004-2007 the Heart, Soul, Mind, and Strength (HSMS) program was implemented in United Methodist churches in South Carolina. HSMS emphasized spiritual, mental, physical, and social health for adults 50 years of age and older. African American and Caucasian participants met weekly in small groups to promote overall health and embrace racial diversity. Each meeting began with a guided meditation accompanied by deep breathing and stretching to reinforce the holistic focus of the program, integrating spiritual, physical, emotional, and mental dimensions. It also provided a natural transition to the physical activity component which combined education, motivation, and brief exercise routines, after which the group moved on to mental exercises. The second half of each session was devoted to a curriculum for spiri-

tual growth. Additional activities included a community outreach effort. In 2008, researchers interviewed a total of 24 HSMS participants (12 African American (AA) and 12 Caucasian) across the state of South Carolina. The interviewers asked questions related to the participants' involvement in HSMS, social support received from participation, and outreach to the community. A qualitative analysis was performed using QSR- Nvivo software to identify themes in participant responses. The results showed that HSMS participation provided social support, spiritual perspective, and increased race relations in the group, the church, and community. In addition, the HSMS program facilitated participation of community outreach. These results support that faith communities may benefit from incorporating programs like HSMS to improve supportive networks, spiritual growth, community outreach, and health among a diverse older adult population.

CONCEPTS FOR INCORPORATING THE STUDY OF SPIRITUALITY INTO GERONTOLOGY

R.C. Atchley, *Miami University, Lafayette, Colorado*

Despite rapidly growing interest among elders in spirituality as an inner experience, motivator, and organizing principle for life-styles, gerontology has been slow to acknowledge the distinction between spirituality and religion and to adopt a nonsectarian language of spirituality into gerontological research. This poster will present concepts and language concerning the nature of spiritual experience and spiritual development, and the importance of spirituality in self-concept and identity for a major proportion of the aging population of the United States. It will also describe ways that spirituality motivates service and fosters community among aging adults.

METHODS OF SELF-FORGIVENESS AND EMOTIONAL RESPONSES IN OLDER ADULTS

M.M. Lee¹, G.M. Workman¹, D.E. Workman², V.L. Christian³, *1. Behavioral Medicine, Midwestern University, Downers Grove, Illinois, 2. Northwestern University, Evanston, Illinois, 3. Nationwide Children's Hospital, Columbus, Ohio*

Self-forgiveness can contribute to improved psychological well-being by increasing self-acceptance and reducing guilt in older individuals (Ingersoll-Dayton & Krause, 2005). This pilot study examined which methods of self-forgiveness are associated with enhanced emotional well-being (increased relief and decreased guilt). Community dwelling older participants (n= 49) completed a survey on self-forgiveness based on themes identified from previous research (Ingersoll-Dayton and Krause, 2005). Participants were presented with a structured list of cognitive and behavioral components of self-forgiveness and asked to indicate how often they use each method (0=not at all, 10=extremely often). They also rated how relieved and how guilty they felt after trying to forgive themselves (0=not at all, 10=extremely). Older adults who reported greater feelings of relief after trying to forgive themselves tried more often to forgive themselves unconditionally ($r = .70$), to correct their actions ($r = .64$), to be less self-critical ($r = .57$), and to consider good intentions related to their actions ($r = .44$). No significant correlations were found between feeling decreased guilt after trying to forgive oneself and the frequency that a particular self-forgiveness method was used. Results, though preliminary, suggest that certain methods of self-forgiveness endorsed by older adults are associated with an increase in the positive feeling of relief, but not necessarily with a decrease in the negative feeling of guilt. Clinical implications include teaching older adults such self-forgiveness methods to help elicit greater relief. In contrast, more research is needed to identify which methods help older adults reduce guilt in forgiving themselves.

SESSION 1485 (SYMPOSIUM)

VARIOUS WAYS OF INTEGRATING QUALITATIVE AND QUANTITATIVE METHODS IN CONDUCTING MIXED METHODS AGING RESEARCH

Chair: L.K. Donorfio, *Human Development and Family Studies, University of Connecticut, Waterbury, Connecticut*

Discussant: G.D. Rowles, *University of Kentucky, Lexington, Kentucky*

Last year the Qualitative Research Interest Group sponsored a symposium on the importance of using qualitative methods in mixed methods aging research. It was highly successful, with the audience suggesting a follow-up symposium this year undertaken cooperatively with the Measurement, Statistics, and Research Design Interest Group. An objective of the cooperative symposium is to highlight the advantages of being formally trained in both qualitative and quantitative disciplines. This symposium will present a balanced panel of researchers from both interest groups who have conducted aging research using mixed methods designs. The strengths and challenges of using both methods together will be discussed. Also addressed will be the thought processes that motivate the choice of a mixed method design, the ordering of the qualitative and quantitative components, and the integration of the qualitative and quantitative results. The symposium discussant will consider inherent challenges and barriers to conducting and communicating effective mixed methods research and will elaborate on how using mixed methods designs can deepen our understanding of aging issues.

MIXED METHODS AND LONGITUDINAL DATA

P.H. Van Ness, *1. Internal Medicine/ Geriatrics, Yale Program on Aging, New Haven, Connecticut, 2. Yale University School of Medicine, New Haven, Connecticut*

It is commonly noted that qualitative and quantitative data analysis can be complementary undertakings. This presentation provides an argument, a description, and an illustration regarding how one mixed method challenge can be most productively pursued. First, it is argued that calculating statistics on purposeful samples gathered for qualitative studies is usually misguided. Second, a description is given regarding how qualitative data analysis fits within a spectrum of "non-inferential" biostatistical procedures. Finally, the value of nesting a qualitative study within a quantitative study of longitudinal data is illustrated with reference to Dr. Terri Fried's qualitative study of functional disability among older adults conducted on a subsample (N=36) of participants from the 108-month wave (N=378) of Dr. Thomas Gill's Precipitating Events Project (PEP). The objective of this illustration is to show how qualitative and quantitative methods for longitudinal data can best be "mixed" to contribute to a rigorously self-corrective process of analytical reasoning.

QUALITATIVE RESEARCH STRATEGIES THAT FACILITATE QUANTITATIVE RESEARCH

D.J. Schulman-Green¹, R. McCorkle¹, E. Bradley², *1. Yale University School of Nursing, New Haven, Connecticut, 2. Yale University School of Public Health, New Haven, Connecticut*

In mixed methods studies, the qualitative component of the research can be used to inform the quantitative component. Qualitative research strategies can assist with accessing a study population, obtaining informed consent, and collecting high quality data. Such strategies are particularly valuable when employed in studies involving vulnerable populations by helping to reduce attrition and by limiting the need for proxy data. Specific qualitative research strategies will be presented and illustrated using examples from actual qualitative, quantitative and mixed methods research studies. Exemplary studies include an interview study with seriously ill individuals about the end of life, and a randomized controlled trial of women newly diagnosed with ovarian cancer.

SCIENTIFIC RIGOR: QUALITATIVE, QUANTITATIVE, AND MIXED METHODS DESIGNS

C. Irniter, *American Medical Association, Chicago, Illinois*

The objective of this presentation is to identify and describe successful collaborations between positive scientists and post-positive scientists and how to focus on answering the question. A case study of two research projects will highlight the importance of answering the research question with a rigorous scientific methodology, whether it is quantitative, qualitative or mixed method approach. Researchers are committed to investigate, evaluate, and synthesize phenomena; however, they are guided by demands of appealing to funders, policymakers, and review boards. This case study highlights the strengths and barriers to discover phenomena while using scientific rigor. Case A was designed as a mixed method approach, then redesigned to use only quantitative methodology. Case B was designed using a qualitative methodology to appeal to the funders, but required a mixed method design. It is evident that it is not about a “sexy” or “cutting edge” project, rather using the best methodology to answer the question.

ADDING QUALITATIVE DEPTH TO QUANTITATIVE DATA

A.B. Kydd, *Health Nursing and Midwifery, University of the West of Scotland, Hamilton, Lanarkshire, United Kingdom*

Quantitative research is useful for accessing large numbers of participants. Such an approach can address randomisation, control and manipulation. In a mixed methods study on health care professionals' attitudes towards health care professionals working with older people, 800 questionnaires were distributed. 360 completed questionnaires were returned. One finding was that 73% of respondents reported that professionals working solely with older people were deemed to have a lower professional status than those who worked in high technology areas. A variety of reasons were given. However, each questionnaire had an invitation for participants to be interviewed by the researcher. 27 participants were interviewed. The interviews explored the findings which revealed that professionals working with older people had high professional esteem. This and other findings added depth to the whole study and served to inform replication of the project which addressed these findings in the quantitative part of the new study.

SESSION 1490 (SYMPOSIUM)

WISDOM: INTEGRATION OF COGNITION, EMOTION, AND MOTIVATION

Chair: J. Gluck, *Alpen-Adria University Klagenfurt, Klagenfurt, Austria*

Discussant: U.M. Staudinger, *Jacobs University, Bremen, Germany*

Although the psychology of wisdom is still a relatively small field, several definitions of wisdom have been suggested. All of them emphasize that a high-level integration of cognitive, emotional, and motivational strengths is central to wisdom. The main goal of this symposium is to present empirical work on both the development of wisdom through life experience and on manifestations of wisdom in complex real-life situations. A common theme is the idea that a full understanding of wisdom (its development as well as its manifestations) will require going beyond one-sided wisdom conceptualizations that emphasize particular aspects of wisdom rather than its integrative nature. The broader aim of the symposium is to discuss the benefits of studying integrative concepts of wisdom in addition to more specific human strengths such as emotional maturity, superior information processing capabilities, or prosocial motivational orientations. In the symposium, Ardel and Vaillant present two longitudinal case studies investigating how level of wisdom may influence how individuals deal with life stressors. Glück et al. found in a nominator study that the manifestation of wisdom in real life requires cognitive and non-cognitive wisdom components. Kunzmann presents a study suggesting that the integrative nature of wisdom entails intellectual reflection and deep emotional experiences in response to exis-

tential life problems. Nicks and Blanchard-Fields show that adaptive self-regulation of emotional experience may require more cognitive resources in young than in older adults. Finally, Labouvie-Vief presents an integrative model of wisdom as a result of increasingly more complex emotional and cognitive schemes.

THE PRESENCE AND ABSENCE OF WISDOM IN EVERYDAY LIFE: EVIDENCE FROM TWO LONGITUDINAL CASE STUDIES

M. Ardel¹, G.E. Vaillant², *1. Sociology, University of Florida, Gainesville, Florida, 2. Brigham and Women's Hospital, Boston, Massachusetts*

How does the presence and absence of wisdom affect individuals' everyday lives over their life course? To find out, we conducted in-depth analyses of two white men who entered the 65-year longitudinal Study of Adult Development when they were sophomores at Harvard and who scored relatively high or low on measures of wisdom at both age 50 and 80. The basic characteristic of the high wisdom exemplar was a giving and generous attitude toward others even in times of crises. He saw life as beautiful and appeared genuinely happy throughout most of his life. The low wisdom exemplar, by contrast, was mainly concerned about his own well-being and social standing. As a consequence, he experienced feelings of anxiety, depression, and insecurity throughout his life. Although he attended psychotherapy since young adulthood, it seems that his self-centeredness prevented him from growing wiser. Paradoxically, only other-centeredness might ultimately lead to personal well-being.

COGNITIVE COSTS OF DOWN-REGULATING AND SUPPRESSING EMOTIONS IN OLDER ADULTS

B.S. Nicks, F. Blanchard-Fields, *Psychology, Georgia Institute of Technology, Atlanta, Georgia*

Emotion regulation is an adaptive process of self-regulation of emotional experience that may require cognitive resources. We examined the differences in performance on a working memory task (the 2-Back task) between older and young adults, when presented with different emotion regulation instructions. Preliminary findings on the data suggest that the cognitive costs of down-regulating and suppressing emotions are higher for young adults than for older adults. Effective emotion regulation in older adults will be discussed in terms of the wisdom gained for promoting emotionally satisfying interpersonal interactions.

COGNITIVE AND AFFECTIVE ASPECTS OF WISDOM AS PERCEIVED BY OTHERS: EVIDENCE FROM A NOMINATION STUDY

J. Gluck¹, S. Bluck², I. Strasser¹, S. Koenig¹, K. Naschenweng¹, U. Redzanowski¹, *1. Alpen-Adria University Klagenfurt, Klagenfurt, Austria, 2. University of Florida, Gainesville, Florida*

In a new model of the development and manifestation of wisdom, Glück and Bluck have proposed four interactive resources which dynamically interact over the life span in fostering the growth of wisdom through experience of and reflection upon difficult life events. Currently, the model is being tested in two research projects at Alpen-Adria University Klagenfurt by interviewing wisdom nominees about challenges they have encountered in their life. Participants were recruited by media calls for nomination of wise individuals, and nominators were interviewed elaborately about the person they have nominated. The data show that while some nominators' general characterizations of the nominees tend to emphasize cognitive aspects, accounts of personal experiences with them almost always emphasize the interaction of cognition with non-cognitive aspects such as empathy and value orientations.

EMOTIONAL DEVELOPMENT AND THE EMERGENCE OF WISDOM: A LIFE-SPAN VIEW

G. Labouvie-Vief, *University of Geneva, Geneva, Switzerland*

In this talk I examine wisdom developmentally, as a life-long process of increasing integration of cognition and emotions. Each life stage of wisdom brings a mutual of these two systems, resulting in the formation of schemas that are both complex cognitively and integrated emotionally. Cognitively, original automated emotion schemas oriented towards self-preservation are progressively empowered by increasing capacities of intentionality, meta-awareness, and self-other differentiation and awareness of commonality-within-diversity. Emotionally, these understandings are integrated by deeply felt emotions about core human values that tie together diversity in self and others. That transcend self and extent to progressively generalized "others" I illustrate this progression with research examples of the development of empathy and morality to propose a developmental trajectory of levels of wisdom from early childhood to late life. These levels, although somewhat idealized, also aid in defining sources of cognitive and social-emotional variability that prevent the emergence of true wisdom.

WISDOM: THE INTEGRATION OF COGNITION AND EMOTION

U. Kunzmann, *University of Leipzig, Leipzig, Germany*

Recent wisdom models suggest that wisdom entails an integration of reflection and emotion, but empirical evidence is still sparse. In this talk I present a study in which wisdom has been assessed by asking participants to "think aloud" about existential life problems presented in hypothetical vignettes. The responses were rated according to several wisdom criteria, including awareness of uncertainty, value relativism, contextual thinking. Subsequent to the assessment of the reflective aspects of wisdom, participants were asked to view films of adults adjusting to existential losses and their actual emotional reactions to these films were assessed. Individuals high on reflective wisdom responded with greater sadness to the films than individual low on reflective wisdom; they also showed greater empathic concern and higher empathic accuracy. Together these findings support the idea that the wise individual not only reflects upon negative emotions, but also endures actual negative emotions in the self and others.

SESSION 1495 (SYMPOSIUM)

CULTURAL, RELIGIOUS, AND PHYSICIAN-RELATED BARRIERS TO END OF LIFE CARE

Chair: S. Enguidanos, *Davis School of Gerontology, University of Southern California, Los Angeles, California, Partners in Care Foundation, San Fernando, California*

Discussant: R.D. Brumley, *Kaiser Permanente, Downey, California*

Similar to other disparities experienced in our health care system, numerous barriers exist that prohibit access to end of life care programs such as Hospice and palliative care for minority populations. While several studies have investigated patient-related barriers such as cultural, religious, and educational, little attention has been given to physician barriers that impede access to end of life care. This symposium will begin by providing a conceptual framework that describes the interrelated factors associated with accessing end of life care. Following this presentation, findings will be presented from quantitative and qualitative studies investigating the relationship between (1) physician perceived barriers to referral of patients to an inpatient palliative care program, (2) relationship between physician religious background and spirituality and self-reported patient referral to end of life care, and (3) the relationship between ethnicity and perceived quality of life among terminally ill individuals enrolled in a home-based palliative care program. Implications of these models and studies will be discussed in terms of physician and hospital roles in improving access to end of life care services for terminally ill patients, and in particular, minority pop-

ulations. In addition, indications for future research and interventions will be presented.

THE IMPACT OF PHYSICIAN RELIGION AND SPIRITUALITY ON PERCEIVED BARRIERS TO PALLIATIVE & HOSPICE CARE

M. Siciliano¹, S. Enguidanos¹, R.D. Brumley², *1. Leonard Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Kaiser Permanente, Downey, California*

This research examines the influence of physician-reported religion and spirituality on physician perception of patient barriers to receiving end-of-life (EOL) care. Although many patients desire palliative or hospice care at EOL, barriers limit referral of patients to these programs. A survey administered to 554 physicians working in a managed care organization in Southern California revealed four types of barriers: physician-related, patient-focused, family-oriented, and administrative. Ranging in age from 30 to 74 years old, these physicians represented a variety of medical specialties, including family medicine (29.1%), internal medicine (21.7%), surgery (7.8%), and other specialties (41.4%). Physicians rated their own spirituality using a 5-point scale ranging from "not at all" to "extremely," and indicated their membership in one of the following religions: Protestant, Roman Catholic, Jewish, Muslim, Buddhist, Hindu, unaffiliated with any religion, or "other." We will examine the associations between religion and spirituality and perceived patient barriers to EOL care.

PHYSICIAN AND NURSE PERCEPTIONS OF A NEW INPATIENT PALLIATIVE CARE CONSULTATION PROJECT

P. Housen¹, S. Enguidanos^{2,1}, R. Goldstein³, *1. Partners In Care Foundation, San Fernando, California, 2. University of Southern California, Los Angeles, California, 3. Kaiser Permanente Bellflower Medical Center, Bellflower, California*

The purpose of this paper is to report the perceived impact of a new inpatient palliative care team consultation service on hospital practice after one year. We conducted focus groups drawn from a purposive sample of physicians (2 groups; total n=16) and nurses (2 groups; n=17) at a large urban managed care medical center. Structured interview protocols elicited participant perceptions regarding the impact of implementation. Focus groups were audiotaped and transcribed verbatim. We analyzed the data using grounded theory techniques to elicit themes and sub themes. Four overarching themes emerged regarding the positive and/or transformational impact of the program on: patient/family services, medical staff, the hospital, and quality of care. Two additional themes, time and barriers, pertained to perceived challenges. The findings are potentially useful for improving services at hospitals where palliative care consult services are offered, or provide guidance for hospitals where such programs are being considered.

RACIAL AND ETHNIC BARRIERS TO END-OF-LIFE CARE: A CONCEPTUAL MODEL

J.R. Laguna, S. Enguidanos, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Current literature indicates that most minorities do not receive end-of-life care. Additionally, evidence of barriers to health care for minorities, as well as related outcomes, has been well documented. However, minimal work has described the interconnectedness of multiple variables associated with access to end-of life care. Drawing from this pool of research, we propose a conceptual model in which service use and related patient outcomes are the product of patient-level, provider-level, and system-level barriers. Notably, the model introduces an innovative mediating factor: provider personal characteristics. Wherein, provider personal characteristics (e.g. gender, religion) are considered key in explaining minority access disparities to end-of-life care. This model offers a significant contribution to the literature by synthesizing much

of the previous research to propose a series of explanatory factors that account for the disparities in end-of-life care usage.

WILL A HOME-BASED PALLIATIVE CARE PROGRAM IMPROVE THE QUALITY OF LIFE AMONG TERMINALLY ILL PATIENTS?

T. Yan, S. Enguidanos, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

This study assessed the effectiveness of a home-based palliative care program, a randomized controlled trial, on improving the quality of life among terminally ill patients with cancer, heart disease, and chronic obstructive pulmonary disease with a life expectancy of one year or less. Data were analyzed using a pretest-posttest design to compare changes in the intervention group to changes in the control group and by race/ethnicity. The Functional Assessment of Cancer Therapy (FACT-G) Scale was used to measure quality of life. 208 patients were included in the pretest analysis. No statistically significant improvements were found on the overall quality of life at the 30-day ($p=.69$) and 60-day ($p=1.00$) posttests. Minorities, however, significantly improved their physical well-being at the 30-day ($p=.008$) and the 60-day ($p=.02$) posttests. The study suggests that there is an ethnic difference in improving palliative care at the end of life.

SESSION 1500 (SYMPOSIUM)

DON'T GO THERE: PREVENTING EXCESS HOSPITALIZATION (2009 REP SYMPOSIUM)

Chair: T. Teasdale, *Dept of Geriatric Medicine, University of Oklahoma, Oklahoma City, Oklahoma*

Discussant: N. Giunta, *Hunter College School of Social Work, New York, New York*

Failures to effectively manage chronic conditions and recognize early signs of diminished capacity may increase the need for hospitalization. Poorly handled care transitions often lead to re-hospitalization. This symposium uses an interactive panel discussion format to examine ideas and approaches for reducing hospitalization among the elderly. Speakers from Nursing, Social Work, and Medicine have expertise in home care, assisted living, long-term care, acute care, and care transitions. Backgrounds include research, education, clinical practice, and program administration. Each will give a brief discipline-specific perspective of the major drivers of excess hospitalization. These will be followed by a dynamic, moderator-led, question/answer discussion designed to advance audience understanding of precipitating factors, how the problem is being approached, and what solutions are on the horizon. Audience commentary will be encouraged. For example, improvements in home and community based care mean that more people can avoid or delay living in skilled nursing homes, but it also means that residential care facilities now serve people with higher acuity. When hospitalization is required, the benefits of treatment, preventive care, and early recognition of new symptoms may be lost without appropriate transitional care to minimize re-hospitalization. Panelist examples of new approaches include Community Partnerships for Older Adults, funded by the Robert Wood Johnson Foundation, which helps communities meet the needs of older adults by identifying gaps in essential services and developing ways to fulfill unmet needs. Also, improvements in care transitions, including new coaching models and tool-kits to reduce hospitalizations from LTC will be described and assessed.

MODELS OF CARE TRANSITION INTERVENTIONS TO REDUCE RE-HOSPITALIZATION

P. Boling, *Virginia Commonwealth University, Richmond, Virginia*

Depending on the diagnosis, re-hospitalization within 30 or 60 days occurs in 5 to 30 percent of Medicare patients; in home health care patients overall, 1 in 7 is hospitalized within 2 weeks of starting home care. 3-fold variations are noted between providers and systems after

adjusting for case mix which tells us of opportunities for improved outcomes. Correctable causes of failed care transitions center on problems with medication reconciliation, care continuity, communication, and access to care providers empowered to modify the plan of care on an active, ongoing basis. The presentation will address the respective benefits of coaching models and more intensive care management by medical transitional care teams, and targeting of appropriate patients for the different models. Cost savings ranging from \$500 per patient within 6 months to \$5,000 per patients within a year have been reported in robust clinical trials.

TOOLS AND TIPS FOR NURSES TO REDUCE HOSPITALIZATIONS IN THE NURSING HOME

E. Flaherty, *Village Care of New York, New York, New York*

This discussion will focus on best nursing practice in long term care to help reduce avoidable hospitalizations. This can be accomplished through the use of specific everyday tools that facilitate decision making and help to identify early warning signs of illness in the nursing home. Imbedding these tools into everyday practice requires a comprehensive education program for all nursing bedside staff.

THE ROLE OF COLLABORATION AND COMMUNITY PARTNERSHIPS IN TRANSITIONAL CARE AND PREVENTING EXCESSIVE HOSPITALIZATION

N. Giunta^{1,2}, J. Fecondo³, 1. *School of Social Work, Hunter College, New York, New York*, 2. *Brookdale Center for Healthy Aging & Longevity, New York, New York*, 3. *University of California, San Francisco, San Francisco, California*

Collaboration and coordination among home and community-based service providers has been receiving increased attention in both research and practice. Evidence is growing that there is substantial value-added when collaboration occurs through partnerships, including in the area of care transitions and prevention of hospitalization. As the moderator of this symposium, I will facilitate the interactive panel discussion by posing questions to presenters to ensure multidisciplinary perspectives on preventing excess hospitalization. During the discussion, illustrations of best practices nationwide in care transitions and collaborations for preventing excess hospitalizations will be shared.

HOSPITALIZATIONS FROM AN ASSISTED LIVING FACILITY OVER A FIVE YEAR PERIOD

A. Pruchnicki, *St. Vincent's Hospital, New York, New York*

At the Lott Assisted Living Facility in New York City, over five years, hospitalizations decreased from 149 per year to 96, but then gradually increased to 121 by the end of the period. Total hospital days dropped from 1377 to 809 before increasing to 1672 over the same period. Although the decreases may have been due to increased on-site physician presence, the reason for the subsequent increases is not clear. Possible increasing physician obligations, nursing and other staff turnover, or increased resident nursing and medical needs may be responsible. The last point of increasing resident needs is now being examined by a chart by chart review of resident histories. In the future, there may be significant conflict between resident wishes to avoid hospitalizations and nursing home placement, and increased medical conditions which necessitate them.

FAMILY CAREGIVING - HS PAPER SESSION

EFFECTS OF REIKI INSTRUCTION ON DEMENTIA CAREGIVERS' STRESS MANAGEMENT

D.L. Morris, C.B. Warner, *University Center on Aging & Health, Case western Reserve University, Cleveland, Ohio*

The purpose of the study was to explore the effects of teaching REIKI relaxation techniques to family caregivers to manage stress related care of a loved one with dementia. Classes were taught once a week for four weeks. Pre- and post-test, one group study was carried out. Participants completed self-administered questionnaires on the first and last day of class; mailed questionnaires were completed 4 weeks after class ended. The convenience sample of 81 caregivers included 73 women. Age ranged from 28 to 90 with an average age of 61. The average time as a caregiver was 5 years with a median of 4 years; 34 were daughters; 31 were spouses; 7 other; 4 daughters-in-law, 1 son; 1 sibling; and 1 cared for a friend. Care recipients' mean age was 80.7 years with a range of 58 to 96 years; with 41 females and 39 males. Eighteen lived in a nursing home; 37 lived with the caregiver; 16 another family member; 5 in assisted living; and, 3 lived alone. There were no significant changes in caregiver stress and burden scores. The depressive symptoms scores increased at Time 2 but were not different at the end of the study. There was a decrease in caregiver perceived stress and burden. The caregivers' quality of life scores increased. Caregivers' reported of reaction to care recipients' behaviors decreased for behaviors related to depression and memory problems. A larger, comparison group study is being developed.

CHILD HEALTH OUTCOMES IN SKIPPED GENERATION GRANDPARENT FAMILIES

H.B. Shakya^{1,2}, P. Usita¹, S. Liles¹, C. Eisenberg¹, J. Weston¹, *1. Public Health, SDSU, San Diego, California, 2. University California San Diego, San Diego, California*

Recent attention by the public health community to the role of grandparents in raising grandchildren has increased awareness of the prevalence of grandparent families, but research on the health outcomes of grandchildren in these unique families has been sparse. Furthermore, exploration of health promoting behaviors of grandparent caregivers as it relates to their grandchildren has been equally neglected. The purposes of the present study were (1) to explore grandchild health outcomes in grandparent families, (2) to explore grandparent concerns about grandchild health, and (3) to assess grandparent parenting habits which could affect grandchild health. Focus groups and individual interviews were conducted with grandparent caregivers and grandparent medical/social service providers from a large metropolitan city in the west in order to learn more about improving grandchildren's health. A health survey asking questions about grandchild health and grandparent parenting habits was also distributed. Participants included: 14 grandparent caregivers in two focus groups; 7 grandparent caregivers in individual semi structured interviews; and 4 key informants serving grandparent families in individual semi structured interviews. 52 grandparents completed surveys on grandchild health and family dynamics related to health outcomes. Our findings show that grandparent caregivers were greatly concerned about behavioral and mental health problems as well as child development and learning. Grandchildren had high prevalence rates of ADHD (25%), depression (16%), and asthma (18%). A health promoting environment for grandchildren was frequently inhibited by lack of financial resources and knowledge of the subject matter. Implications of the findings for interventions are discussed.

LIVING WITH ALZHEIMER'S DISEASE: CAREGIVERS' DEEPEST FEELINGS

H.C. Bursch, H. Butcher, *Nursing in Aging, University of Iowa College of Nursing, Iowa City, Iowa*

Aim: The purpose of this analysis of caregiver journals was to extract themes spontaneously occurring in reflections about their deepest feelings regarding the caregiving experience. **Background:** Caring for the patient with Alzheimer's disease presents existential and ethical challenges to family caregivers. Healthcare providers' understanding of the caregiver experience is derived mainly from surveys, closed-ended questions and standardized psychometric instruments, leaving the internal discourse of caregivers unexplored. **Method:** 24 journals were analyzed in the framework of Paul Ricoeur's philosophy of ethics based on the concept of personal identity. In keeping with Ricoeur's theory of interpretation, text analysis proceeded through distanciation, naïve reading, structural analysis, critical reflection and appropriation. **Results:** All caregivers spontaneously reflected upon the illness story and themes in friendship, self esteem, capacity to act, authenticity of the patient and the ethical intention. Relationship conflict as well as negative states in self perception and autonomy were associated with depression and/or anger and resulted in the caregiver's inability to find human fulfillment and self actualization. **Implications:** Findings are interpreted in philosophical frameworks of ethical demands and natural love between humans. Engaging the text within Ricoeur's ethically sensitive philosophy and methodology yielded transformative understanding of the essence of caregivers' deepest feelings regarding their daily discourse with Alzheimer's Disease.

TIME TRAVEL: THE EXPERIENCE OF MEALTIMES FOR FAMILY CAREGIVERS OF INDIVIDUALS WITH DEMENTIA

E. Amella¹, R. Lopez², *1. Medical University of South Carolina, Charleston, South Carolina, 2. MGH Institute of Health Professions, Boston, Massachusetts*

Mealtimes are governed by a rich and ancient set of rituals set by culture and refined by family practice. When meals are defined only by nutritional intake, the larger experience of meals is neglected. The purpose of this phenomenological study was to describe the essential structure of the lived experience of mealtimes for family caregivers of persons with dementia. Twenty family caregivers who fed loved ones with late stage dementia (GDS 6-7) were recruited from the community (n=8) and two nursing homes (n=12), and were interviewed regarding their subjective experiences using unstructured, open-ended interviews. Using Colaizzi's method, data were analyzed: significant statements were extracted, clustered into themes, and integrated. Findings indicated that mealtimes served as a time machine, propelling caregivers backward and forward from pleasing memories of the past, to all consuming tasks of the present, to a foreboding and uncertain future. Three themes emerged. First, food and meals was a vehicle that triggered memories of past events, relationships, and the world before dementia. Second, meals and feeding provided stark evidence of their current world, which consisted of concern about the provision of adequate nutrition and a desire to nurture and love through food. Finally, mealtimes propelled caregivers to the future for which they felt sorrow and uncertainty. Healthcare providers can serve as guides as caregivers journey through time, helping them bridge the world that once was with the reality of the present, and provide anticipatory guidance to navigate future and complex decisions about feeding at the end of life.

COMPARATIVE PSYCHOLOGICAL HEALTH OF PRIMARY CAREGIVERS OF HOME-BASED OLDER ADULTS WITH DEMENTIA

M.R. Tomita, *Rehabilitation Science, University at Buffalo, Buffalo, New York*

Currently, approximately 30 million people are estimated to have dementia worldwide with a new case diagnosed every seven seconds. The majority of individuals with dementia are cared for by their family or informal caregivers. Across the world, caregiving is a challenging task and the impacts of caregiving have been identified as financial and physical, as well as psychological. This cross-national study sought similarity and differences of the psychological health (caregiver burden, depression, loneliness, and caregiver reward) of primary caregivers of home-based older adults with dementia in India, Taiwan, and the United States. The study was guided by the Framework for Psychological Health of Caregivers of Adults with Dementia. A sample of 167 participants was interviewed by native occupational therapists. Through ANOVA it was found that caregivers in the three countries vary in their characteristics, but their caregiving characteristics were similar. Using ANCOVA, Indian caregivers had the lowest level of all aspects of adverse psychological health outcomes: Caregiver burden ($F=13.983, p<.001$), depression ($F=10.623, p<.001$), loneliness ($F=15.103, p<.001$). Although statistically similar, Taiwanese caregivers exhibited clinically worse outcome than American caregivers. Economic development does not necessarily improve psychological health of caregivers of adults with dementia. Where new lifestyles do not sustain traditions, caregivers especially suffer financially and psychologically to keep their care recipients with dementia at home. Society will continue depending on these caregivers for the care of older family members. Effective unique to each country as well as common interventions for the three countries were identified for the purpose.

SESSION 1510 (POSTER)

HEALTH CARE

MEETING THE HEALTHCARE NEEDS OF OLDER VETERANS IN RURAL AREAS: THE ELKO DEMONSTRATION PROJECT

M. Luptak¹, M. Juretic², R. Hill², N.K. Dailey³, R. Rupper³, B. Hicken³, B. Bair³, 1. *University of Utah College of Social Work, Salt Lake City, Utah*, 2. *University of Utah Department of Educational Psychology, Salt Lake City, Utah*, 3. *George E. Wahlen Department of Veterans Affairs Medical Center, VA Salt Lake City Health Care System., Salt Lake City, Utah*

Providing meaningful healthcare services to persons living in rural communities is a major public health concern that involves re-defining the traditional facility-based model of care delivery commonly employed in urban areas. This issue has important public health implications for the Veterans Administration (VA) since it is estimated that approximately two million veterans—40% of the overall veteran population—live in areas defined as rural or highly rural. The Elko demonstration project represents an effort to build a collaborative infrastructure between local rural community leaders and the VA to meet the needs of older rural veterans. Older veterans in Elko, Nevada set the project in motion when they voiced their needs for greater access to VA healthcare resources despite their geographic distance (>230 miles) from the Salt Lake City VA Medical Center. The project utilized an expanded Community-as-Partner model as a basis for coordinating local community resources and VA services to open a clinic that provided limited healthcare services (e.g., medication management, prescription refills, and routine lab tests) one-half day per week in Elko. Veterans ($N = 84$; Male- $N = 82$; Service in Vietnam- $N = 41$; Mean Age = 64.57) averaged 2.84 visits to the clinic during its first year of operation. Initial outcomes suggest this model has potential for meeting the healthcare needs of older rural

veterans. Recommendations for expanding this model to address a greater range of healthcare needs among veterans in Elko, and for implementing this model in other rural settings, are provided.

OPTIMIZING INTERDISCIPLINARY DEMENTIA CARE IN AN ACADEMIC OUTPATIENT SETTING

D.S. Geldmacher, R. Nathan, A.A. Thompson-Heisterman, C. Manning, *University of Virginia, Charlottesville, Virginia*

Current principles for dementia care (e.g. from the American Association of Geriatric Psychiatry) emphasize the roles of combined pharmacologic and nonpharmacologic approaches to “improve quality of life, support dignity, control symptoms, and provide comfort.” A novel interdisciplinary outpatient approach was developed at the University of Virginia to address these principles in longitudinal dementia care. The approach represents a partnership between the Schools of Medicine and Nursing, the hospital, and the local chapter of the Alzheimer’s Association. In this model, clinicians from multiple disciplines are onsite during the clinic day. The primary team consists of a Neurologist, Neuropsychologist, Geriatric Psychiatrist, Geriatric/Mental Health Nurse Practitioner, Nurse Coordinator, Social Worker and Alzheimer’s Association representative. The historical and conceptual foundations for the model, based on needs assessment of the patients and their family caregivers will be addressed. Case examples will demonstrate how patient and family-completed questionnaires facilitate individualized approaches to care, using case conferences to assign the appropriate disciplines to each patient/family and ongoing formal and informal (curbside) interactions among staff to flexibly address changes in needs and priorities. Steps taken to achieve economic viability in this clinic will be reviewed in light of its intensive use of professional personnel operating on both fee-for-service and salary bases. Specific clinical examples will illustrate the complex team interactions. Using this intensive interdisciplinary team approach allows establishment of meaningful relationships with patients and their caregivers, facilitating beneficial diagnostic and treatment outcomes, while remaining economically feasible in an academic health center outpatient setting.

READMISSION RISK FACTORS IN OLDER HOSPITALIZED PATIENTS: EFFECT OF FRIDAY DISCHARGE ON READMISSION

L. Graham^{1,2}, A.I. Arbaje¹, 1. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Background: To identify factors that are associated with readmissions in elderly adults. Inpatient discharges occurring on Friday may be associated with increased hospital readmission due to 1) larger discharge volume 2) decreased time for discharge planning and 3) increased wait time to receive care at home. **Methods:** A retrospective cohort of patients 65 years old and older admitted to Johns Hopkins Hospital in 2007 was created from administrative data ($n=6610$). Records were abstracted for 180 days post-discharge to determine readmission rates. A multivariate Cox proportional hazards model was used to assess time to first readmission comparing patients discharged on Friday to all others, adjusting for demographics, healthcare utilization and multimorbidity. **Results:** The most discharges were performed on Friday (20%), and the majority of patients were discharged home with self-care only (72%). Overall, 1582 of 6610 patients (24%) were readmitted within 180 days. Multivariate Cox proportional hazards model showed Friday discharge was associated with an increased hazard of readmission $HR=1.07(.94-1.22)$, but was not statistically significant ($p=.303$). In our study, African-American race ($HR=1.16(1.02-1.33) p=.029$), admission in the prior month ($HR=1.95(1.42-2.68) p<.001$), discharge home with self-care only ($HR=1.21(1.05-1.38) p=.007$), and admission to medical service ($HR=1.45(1.30-1.63) p<.001$) were independent predictors of readmission. **Conclusions:** While the study did not find Friday discharge to be an independent risk factor for readmission, the results suggest that

there is increased risk in sending vulnerable patients home prior to the weekend.

UNDERSTANDING THE DISCHARGE PROCESS: AN OBSERVATIONAL, TIME-AND-MOTION STUDY OF AN INPATIENT GERIATRICS UNIT

S. Ramsaroop, C. Reid, E. Siegler, *Geriatrics, Weill Cornell Medical College, New York, New York*

Background/ Purpose: Hospital discharge is often a poorly understood and chaotic process that is vulnerable to miscommunication and errors. This study sought to identify and describe all the participants, elements and workflow of the discharge process at our institution. **Design:** A continuous quality improvement study of the geriatrics unit of a tertiary care hospital. **Methods:** This study consists of two phases: 1) Shadowing unit personnel to describe workflow, identify and quantify tasks performed in the discharge process and 2) Focus groups with unit staff to investigate attitudes about the discharge process. Independent observers used process mapping and time-motion study techniques for phase one. **Results:** Thus far, observations (n=14) reveal an average of 7 people interact for each patient discharge (range= 4 to 11). There is substantial variation between order of steps and delegation of responsibilities (e.g., medication reconciliation, informing patients of discharge), so that one process map cannot adequately capture the discharge process. Time- motion analysis reveals significant variation in the time required to complete discharge tasks. For example, medication review with patients ranges from 10 minutes to 45 minutes, and completion of a Patient Review Instrument for nursing home placement requires between 15 and 60 minutes. For each task initiated the average number of interruptions is 3 (range 0 to 7). **Conclusions:** Our current discharge process is complex and time-consuming, leading to variability in its execution. Analysis of our current processes will allow us to create interventions that can streamline the discharge process, minimize error, and ultimately improve patient outcomes.

SESSION 1515 (SYMPOSIUM)

MEN WITH HIP FRACTURE, AN INCREASING PROBLEM: HOW ARE THEY DIFFERENT FROM WOMEN WHO FRACTURE?

Chair: D. Orwig, *Epidemiology and Preventive Medicine, University of Maryland School of Medicine, Baltimore, Maryland*

Over the next 40 years, the number of men sustaining hip fractures in the United States will more than double, from approximately 65,000 today to 140,000 in 2050. Despite this rapid increase, little is known about the consequences of hip fracture in men, with most current practice based on clinical experience and research on women. In this symposium, we will describe initial findings from two NIA-sponsored studies designed to increase knowledge about hip fractures in men to the same level as it is in women or beyond, by studying 200 men and 200 women aged 65 and older admitted for surgical repair of a hip fracture. Using the newest technologies available, all subjects undergo an extensive questionnaire including cognitive measures, a comprehensive assessment of function (self-report and performance tests), body composition using bone densitometry (DXA) and computed tomography (CT), and have blood drawn. Data are collected at baseline (within 22 days of admission) and again at 2, 6 and 12 months post-admission. Preliminary data based on 82 men and 82 women with a mean (SD) age of 80.6 (8.5) and 82.8 (7.3) years, respectively enrolled as of May 31, 2008 will be presented. Preliminary data show that there are interesting differences in baseline demographics, cognitive status, other psychosocial factors, frailty, and body composition between men and women at time of fracture which may play a role in eventual recovery 1 year later. These data will be discussed by Dr. Jack Guralnik, National Institute on Aging.

SEX DIFFERENCES IN BONE MINERAL DENSITY IN A HIP FRACTURE POPULATION

J. Chan, M. Hochberg, R.R. Miller, M. Shardell, W. Hawkes, J. Magaziner, D. Orwig, *Epidemiology and Preventive Medicine, University of Maryland, Baltimore, Maryland*

Men achieve a greater peak bone mass resulting in a lower risk for hip fracture than women, yet they experience higher rates of morbidity and mortality post-fracture. Gender comparisons of bone mineral density (BMD) following fractures are limited. 113 participants (51 men, 62 women) had baseline BMD measures of the contralateral hip (femoral neck [FN] and total hip [TH]) using bone densitometry. More women had used bone-active medications in past 6 months than men (72.0% vs 27.9%, 72.0% vs. 56.3%, and 40.2% vs. 6.1% calcium and vitamin D, and bisphosphonates, respectively). The average BMD T-scores for women were lower than men (-2.46 vs -2.08 and -2.27 vs. -1.72 for FN and TH, respectively). Although men had higher mean BMD than women at the time of fracture, the small number of them on bone-active therapies indicates more attention should be focused on treating men both before and following hip fracture.

BASELINE PSYCHOSOCIAL DIFFERENCES BETWEEN MEN AND WOMEN AFTER HIP FRACTURE

A.L. Gruber-Baldini, M. Matheny, J. Lloyd, N. Chiles, D. Orwig, M. Hochberg, J. Magaziner, *University of Maryland School of Medicine, Baltimore, Maryland*

Baseline data were collected within 22 days of hospitalization in 80 men and 84 women with hip fracture. Variables examined included age, education, marital status, Modified Mini-Mental Status (3MS), Trails A & B, Hooper Visual Organization Test (HVOT), Center for Epidemiologic Studies Depression Scale, Resilience Scale, Life Orientation Test (Optimism), and pre-fracture ratings of Yale Physical Activity Survey (YPAS), social activities, social contact, activities of daily living (ADLs), and instrumental ADLs (IADLs). Women were more cognitively impaired on Trails B/A ratio (46.3% 3+ vs. 28.3%), although men were slower on Trails A (104.5+/-72.7 vs. 83.4+/-51.6 seconds) and more impaired on HVOT (16.2+/-6.0 vs. 18.2+/-6.4). Men were more often married (52.5% vs. 26.8%), less often lived alone (27.5% vs. 48.8%), had less social contact (22.3+/-13.8 vs. 29.9+/-15.0), less physically active (YPAS 2667+/-2616 calories vs. 4272+/-4486) and more IADL impaired (2.3+/-1.5 vs. 1.8+/-1.6) than women. Other variables were not significantly different.

THIGH MUSCLE COMPOSITION FINDINGS 2 MONTHS AFTER ADMISSION FOR HIP FRACTURE

M. Eastlack¹, R.R. Miller², G. Hicks³, B. Goodpaster⁴, 1. *Physical Therapy, Arcadia University, Glenside, Pennsylvania*, 2. *University Of Maryland School of Medicine Department of Epidemiology and Preventative Medicine, Baltimore, Maryland*, 3. *University Of Delaware Department of Physical Therapy, Newark, Delaware*, 4. *University Of Pittsburgh, Pittsburgh, Pennsylvania*

No data exist on thigh muscle composition and quality following hip fracture. CT scans of the mid-thigh were obtained in 43 subjects (25 men) two months after admission to the hospital post-hip fracture. The thigh musculature on the ipsilateral (fractured) compared to contralateral side demonstrated significantly lower muscle attenuation and smaller total cross-sectional area (CSA), including CSA of normal density (NDM) and low-density muscle (LDM) (P<0.0001 for all comparisons). Compared to women, men had significantly higher measures of muscle attenuation (P<0.0003) and greater muscle CSA: total CSA (P<0.001) and NDM (P<0.0001), but not LDM (P= NS). Significant differences between the fractured and non-fractured thighs were observed consistent with muscle atrophy and fatty-infiltration on the side of fracture. These changes may be important in the poor functional recovery after hip fracture.

PRE-FRACTURE MARKERS OF THE FRAILTY SYNDROME AMONG MEN AND WOMEN WHO FRACTURE A HIP IN THE BALTIMORE HIP STUDY 7 (MALE HIP) COHORT

D. Andersen, D. Orwig, *University of Maryland Baltimore, Baltimore, Maryland*

Prevalence of frailty markers prior to hip fracture in both men and women were retrospectively examined in 80 male and 82 female hip fracture patients using standardized operationalizations to identify possible gender differences. Overall, 28%, 28%, 17%, and 32% of the sample scored positively for weight loss, low physical activity, weakness, and exhaustion, respectively. Low physical activity ($p=0.06$) and weakness ($p=0.04$) were reported more often for men than for women. Complete frailty data were available for 129 participants. Sixty percent of men and 51% of women had at least one of four frailty markers present prior to the fracture. More men (35%) than women (36%) had exactly one component present; the proportion of men and women with >1 component were almost identical. Important differences exist between men and women for individual components. Whether these differences influence frailty incidence or outcomes post-fracture will be subsequently determined during follow-up assessments.

SESSION 1520 (POSTER)

METHODS

FACTORS THAT AFFECT THE CRITERIA FOR ASSESSING VO2MAX IN MIDDLE AND OLD AGE POPULATIONS

F. Iguchi¹, K. Hashizume², K. Yamaji³, Y. Kusaka¹, *1. Fukui University, Fukui, Japan, 2. Toyama University, Toyama, Japan, 3. Ritssho University, Kumagaya, Japan*

PURPOSE: The purpose of this study was to clarify the factors that affect the criteria for assessing VO2 max in middle and old age populations. **METHODS:** The total of 25 members of middle and long distance male runners ranging in age from 46 years to 69 years old. Each participants run on treadmill for 3 minutes at a constant speed, starting speed of 150m/min, followed by 1 minute rest, and the stages proceeded with increasing speed for 30m/min each until the participant was exhausted. O2 consumption, CO2 excretion, ventilation rate, CO2/O2ratio, blood lactate level, and heart rate were monitored. Criteria for assessment of VO2 max included: 1) HR in excess of age-predicted maximum ($220 - \text{age}$), 2) respiratory exchange ratio (RER) >1.1 , and 3) plateau ($<2.0\text{ml/kg/min}$ increase) in VO2 with an increase in workload. If at least two of the three criteria were met, the highest VO2 measured was chosen as the subject's VO2 max. Multiple regression analysis was used for factors to explain if the participants meet the criteria to reach VO2 max. **RESULTS:** There were 3 participants who reached all three criteria to assess VO2max, 14 participants reached 2 criteria, 6 participants reached only 1 criteria, and 2 participants did not reach any criteria with this study. Therefore, 17 participants reached the criteria, and 8 did not. CO2/O2 ratio was chosen as the factor that can explain if the person reach the VO2max. (independent variables; CO2/O2 ratio, estimated maximum heart rate- actual heart rate, the improvement of VO2 after the exercise.) Moreover, the factors to explain the criteria for CO2/O2 ratio was maximum ventilation volume and blood lactate level (independent variables; VO2max, maximum heart rate, maximum running speed, age). The participants who reached the criteria of VO2 max had higher HR, CO2/O2 ratio, blood lactate level compared with participants who did not when they reached the exhaustion. **CONCLUSIONS:** Respiration function was the factor affecting the criteria of assessing VO2max with middle and old age populations.

ADDRESSING DATA ANALYSIS CHALLENGES IN A PRELIMINARY CLINICAL DRUG TRIAL

D.S. Geldmacher¹, T. Fritsch², M. McClendon³, S.M. Debanne³, *1. University of Virginia, Charlottesville, Virginia, 2. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 3. Case Western Reserve University, Cleveland, Ohio*

Phase-II clinical trials of pharmacologic agents are used to assess drug safety and tolerability in the target treatment population. They also support sample-size estimation for further efficacy trials. These exploratory efficacy analyses are problematic for several reasons related to small samples: randomization may not result in similar groups; subject attrition effects are magnified, especially in longer-term longitudinal trials; and distributions of outcome measures are often non-normal. We report our approach to these challenges in the analysis of an 18-month, double-blind, randomized, controlled trial of a potential Alzheimer's disease treatment. At baseline, treatment-group $N=15$ and control-group $N=14$; four subjects withdrew before study completion. To address subject attrition, the "Last Observation Carried Forward" approach was used, resulting in a more conservative test of group-differences. Six clinical outcomes were assessed; most had highly skewed distributions. Traditional transformations of the data (e.g., square root) did not satisfactorily improve the shapes of the distributions. To make the data distributions more normal, the percentage change from baseline to 18-months was computed for each outcome. The technique offered improvement over traditional transformations. Groups differed in age, despite randomization. Age was therefore dichotomized and included as a factor in analyses. Data were subjected to a series of 2×2 between-subjects ANOVAs with factors being group and age. This overall approach proved responsive to: (1) small sample-sizes; (2) subject attrition; (3) baseline differences between groups; and (4) non-normal distributions. This approach also allowed computation of sample sizes needed for sufficient power to establish the treatment's efficacy in future trials.

AN EXAMINATION OF SALIVARY CORTISOL SAMPLING PROTOCOL FOR ASSESSING IMPACT OF STRESS ON CAREGIVERS

J. Henry¹, B.B. Shadden¹, R. DiBrezzo¹, I. Fort¹, M. Powers², *1. University of Arkansas, Fayetteville, Arkansas, 2. University of Central Oklahoma, Edmond, Oklahoma*

Biomarkers show great promise in research concerning links between health and well-being and a host of potential stressors in older persons, and there is a need to calibrate and validate the connections between self-reporting methods in conjunction with biomarkers. One such biomarker is salivary cortisol, a reliable and noninvasive measure of hypothalamic-pituitary-adrenal (HPA) axis function. Cortisol sampling protocols vary considerably across studies. This presentation describes a pilot investigation of salivary cortisol sampling protocols to determine efficient and meaningful schedules for examining the impact of stresses associated with managing work and caregiving. Employed caregivers ($N=12$) and noncaregivers ($N=19$) completed psychosocial self-report measures (e.g., personality, work demands/rewards, caregiving demands/rewards, coping and SF-36 perceived health). Subjects provided cortisol samples at 6 specified daily intervals across a full week (7 days) and additional measures were calculated (e.g., awakening, work cessation, mean daily cortisol, and area under the curve (AUC)). Cortisol measures were examined for: a) ability to distinguish the two groups, and b) relationships with psychosocial measures. Some correlations between psychosocial variables and cortisol could be identified even with a relatively small sample of 31. Differential weekday and weekend cortisol response profiles were evident. Discrete cortisol measures were correlated with different variables, but no one set of measures yielded meaningful comparisons with most work or caregiving variables. Session attendees will be able to discuss the value of salivary cor-

tisol in assessing stress patterns in caregivers, efficient cortisol sampling strategies, and further research needs.

IS SELF-REPORTED BODY MASS INDEX A VALID AND RELIABLE MEASURE IN OLD AGE? FINDINGS FROM THE LONGITUDINAL SWEDISH ADOPTION/TWIN STUDY OF AGING

A. Dahl¹, L.B. Hassing², E. Fransson¹, N.L. Pedersen^{3,4}, 1. *Institute of Gerontology, School of Health Sciences, Jönköping, Sweden*, 2. *University of Gothenburg, Gothenburg, Sweden*, 3. *Karolinska Institute, Stockholm, Sweden*, 4. *University of Southern California, Los Angeles, California*

The objective of the study was to evaluate the validity and reliability of self-reported height, weight, and body mass index (BMI) over time in old age. Seven hundred seventy-four men and women aged 40 to 88 at baseline (mean age 63.9) participated in the Swedish Adoption/Twin Study of Aging. Height and weight were self-reported in a questionnaire and measured by experienced research nurses five times over 20 years. BMI was calculated as weight (kilos)/height*height (meter). There were high correlations between self-reported and measured height (0.97-0.98), weight (0.97-0.98), and BMI (0.93-0.95) at each measurement occasion, and substantial agreement for BMI as a categorical variable (Kappa coefficient 0.72-0.81). Mean differences ranged from 0.9-1.2 cm for height, 0.5-1.7 kilogram for weight, and 0.5-1.0 kg/m² for BMI. Latent growth curve modeling showed a significant but small increase in mean difference between self-reported and measured values over time for height (0.4 mm/year), and BMI (0.02 kg/m²/year), but not for weight. Women underestimated their weight and BMI, and tended to overestimate their height to a greater extent than men. Overweight and obese elderly persons underestimated their BMI to a greater extent than their normal weight counterparts. In old age, there is an increase in the mean difference between self-reported and measured BMI, which is likely due to unawareness of changes in height. However, the increase in mean difference for BMI is small, 0.4 kg/m² over twenty years. The inaccuracy of BMI does not substantially increase over time.

NORMAL RECTAL, ORAL, EAR-BASED AND AXILLARY TEMPERATURE IN THE SENIOR DWELLERS OF NURSING HOMES

S. Lu^{1,2}, Y. Dai^{2,3}, 1. *Mackay Medicine, Nursing and Management College Department of Nursing, Taipei, Taiwan*, 2. *National Taiwan University College of Medicine Department of Nursing, Taipei, Taiwan*, 3. *National Taiwan University Hospital Department of Nursing, Taipei, Taiwan*

Purpose: The purpose of this study was to verify whether the older is colder. We examined the effects of measurement routes, gender and age on normal body temperature values of senior dwellers in nursing homes. Design: A prospective, descriptive and correlational design. Method: A total of 308 subjects between 65 and 102 years old were recruited from 17 nursing homes in Taiwan Taipei city during November 2007 to March 2008. Rectal, oral, ear based, axillary and ambient temperatures were simultaneously measured between 8 a.m. to 10 a.m. by electronic infrared thermometer and electrical thermometer. Results: The average rectal, oral, ear based, and axillary temperatures were 37.00, 36.86, 36.41, and 36.52°C, respectively. Both ear-based (SD=0.45, range= 34.3~37.3°C), and axillary (SD=0.40, range= 35.3~37.5°C) temperatures have higher variability (wide range and large standard deviation). The body temperature measured from four different sites had statistically significant difference between males and females. Females' body temperatures were higher than males. Weak relationship between age and rectal temperature ($r = 0.194$, $p = 0.028$) was found. There was no significant relationship between age and body temperature taken from other routes. Conclusion & Suggestions: The hypothesis "the older is colder" was not confirmed. The senior dwellers of nursing home were not certainly lower in body temperature. In addition, body tempera-

tures taken from rectal sits and of female were slightly higher. The results of this study can be assessing body temperature of the elders in geriatric setting. Keywords: Axillary temperature, Ear based temperature, Nursing home, Oral temperature, Rectal temperature, Senior

PAIN RESEARCH GONE BAD: CONFESSIONS FROM SOMEONE WHO SHOULD HAVE KNOWN BETTER

P.H. Berry, *College of Nursing, University of Utah, Salt Lake City, Utah*

Significant pain is common among community dwelling elderly and nursing home residents. While it is likely that pain is common among assisted living (ALF) residents, it has not been studied. Practice guidelines suggest the use of the Brief Pain Inventory Short Form (BPI-SF), a multidimensional assessment originally developed for use with cancer outpatients, to assess pain in older adults. The aims of the study were to: 1) estimate the prevalence and characteristics of pain among ALF residents; 2) estimate the prevalence of dementia as measured by the mini-cognitive assessment; 3) assess the usefulness of the BPI-SF in assessing pain in ALF residents; and 4) explore the relationships of pain and pain intensity with age and cognitive status. 64 residents from 4 ALFs completed the Mini-Cognitive Assessment, The BPI-SF, and demographic questionnaires. Assistance was provided if needed. Then mean age was 81; most were Caucasian (91%) and female (86%). 53% reported pain; of those, nearly half reported severe pain. A significant relationship existed between the presence or absence of pain as reported on the BPI and the mini-cognitive assessment score. While the 0-10 scale is thought to be appropriate for most older adults, the initial long and complicated screening question on the BPI may not be suitable for many older adults. A simpler screening question may be more appropriate, especially for those who are older, frail and cognitively impaired. There is clearly a need for pain management improvement for this older and often frail population which should begin with accurate assessment.

SESSION 1525 (SYMPOSIUM)

OBJECTIVE PHYSICAL PERFORMANCE IN GENERAL POPULATION SAMPLES AND CLINICAL PATIENTS: PROGNOSTIC VALUE AND CLINICAL UTILITY

Chair: S. Volpato, *Clinical and Experimental Medicine, University of Ferrara, ITALY, Ferrara, Italy*

Discussant: J. Guralnik, *Laboratory of Epidemiology, Demography, and Biometry, Bethesda, Maryland*

In older people, objective measures of physical performance are an excellent way of identifying patients at risk of future adverse events. There is convincing evidence that different measures of physical performance, including walking speed, balance, and strength are sensitive tools to identify older community-dwelling adults and primary care patients at higher risk of functional decline, hospitalization, and mortality. Functional evaluation is a cornerstone of multidimensional geriatric assessment; however, performance-based measures have not been incorporated in routine clinical evaluation of older patients so far. This symposium investigates the prognostic value of different performance measures (4-meter gait speed, 400-meter walk test, Short Physical Performance Battery, grip strength) in different settings, including population-based samples and acutely ill clinical patients. Data from five large population-based cohort studies will be presented to examine the prognostic value of walking speed for survival (NHANES, Iowa EPESE, Hispanic EPESE, PEP and InCHIANTI). Furthermore, data from the InCHIANTI study, the ALIVE Study, and the PEGASO study will be presented to demonstrate the potential role of objective physical performance measures as indicators of disease severity and as prognostic tools in hypogonadal men, HIV-infected patients and geriatric inpatients, respectively. This symposium will provide new evidence to increase our understanding of the utility of performance-based measures as clinical instruments for in-depth functional evaluation and risk stratification as

well as early warning signs of impending problems in different clinical scenarios.

GAIT SPEED PREDICTS LONG TERM SURVIVAL: A META-ANALYSIS

S. Studenski¹, S. Perera¹, K.V. Patel², J. Chandler³, J. Guralnik², *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. NIA, Bethesda, Maryland, 3. Merck Co, Blue Bell, New Jersey*

Gait speed (GS) might be a useful predictor of survival in older humans. We pooled data from 4 cohort studies: NHANES (n= 3958), Iowa EPESE (n= 2128), Hispanic EPESE (n=1905) and PEP (n= 491), all followed for 10-15 years. Baseline GS was calculated from a 4M walk or converted from an 8-foot walk. Survival was ascertained by national and social security death indices. Age-adjusted HRs were computed by study, and then combined using random effects models. Of 8482 subjects (age 76.4±6.6, 55% F, 9.3% B, 29.9% Hispanic), every 0.1 m/sec increase in GS reduced mortality risk by 12% (HR=0.88±.05, p<0.0001). GS predicted survival in subgroups; age, gender, race, education, BMI, hospitalization, self-reported health, arthritis, heart disease and diabetes. HRs ranged from 0.85-0.91. GS is a powerful predictor of survival in older adults with consistent effects in subgroups. GS could be useful in the clinical setting for estimating life expectancy.

WALKING PERFORMANCE AND SUBSEQUENT MORTALITY RISK IN OLDER ADULTS

S. Vestergaard¹, K.V. Patel^{1,2}, S. Bandinelli³, L. Ferrucci⁴, J. Guralnik¹, *1. Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, Bethesda, Maryland, 2. MedStar Research Institute, Hyattsville, Maryland, 3. Geriatric Unit, ASF, Florence, Italy, 4. Longitudinal Studies Section, Clinical Research Branch, National Institute on Aging, Baltimore, Maryland*

Objective: To examine the relationship between performance in the 400 meter walking test and mortality. Methods: Participants are ≥ 65 years, from the InCHIANTI study (n=948). Time to complete the 400-m walk, 20-m lap time coefficient of variation(CV), need to rest during the test, and ability to complete the walk were assessed. All-cause mortality was ascertained over a 6-year follow-up period. Data were analyzed with proportional hazard logistic and linear regression analyses. Results: In age- and sex-adjusted analyses all 400-m walking test variables except need to rest were associated with mortality. After further adjusting for cognitive function, symptoms of depression, education, smoking, body mass index, being sedentary/minimally active, disease burden, and lower extremity performance, both time to complete the 400-m walk and lap time CV were significant independent predictors of mortality. Conclusion: Multiple aspects of performance in the 400-m walk test provide complementary information on mortality prognosis in older persons.

HIV INFECTION, IMMUNE FUNCTION, AND PHYSICAL PERFORMANCE AMONG INJECTION DRUG USERS

K.V. Patel¹, M. Ahmed², M. Salter², S. Mehta², J. Guralnik¹, G. Kirk², *1. Epidemiology, Demography, and Biometry, National Institute on Aging, Bethesda, Maryland, 2. Johns Hopkins School of Public Health, Baltimore, Maryland*

Background: HIV has evolved into a chronic condition; however, the functional consequences of infection and the increasing burden of age-associated comorbidity have not been well characterized in this aging population. Methods: Cross-sectional data on 1,279 injection drug users (IDUs) in Baltimore, Maryland participating in the ALIVE Study were analyzed using linear regression to examine hand grip strength and walking speed. Results: Participants were 48 years old on average (IQR: 43-52), 34% women, 90% black, and 29% HIV infected. Adjusting for age and sex, HIV infection was associated with decreased grip strength (b = -2.7 kg; p<0.001) and decreased walking speed (b = -0.06 m/s; p=0.047). In those infected with HIV (n=373), lower CD4 cell counts

were significantly associated with decreased grip strength; whereas, higher plasma viral load was significantly associated with decreased walking speed. Conclusion: HIV infection and progression of immune dysfunction is associated with poor physical function among IDUs.

GONADAL STATUS AND PHYSICAL PERFORMANCE IN OLDER MEN

M. Maggio¹, G. Ceda¹, F. Lauretani¹, S. Bandinelli², S. Basaria³, J. Guralnik⁴, G. Valenti¹, L. Ferrucci⁵, *1. University of Parma, Department of Internal Medicine, Section of Geriatrics, Parma, Italy, 2. Rehabilitation Unit, Azienda Sanitaria di Firenze, Florence, Italy, 3. Division of Endocrinology & Metabolism, Boston University School of Medicine, Boston, Massachusetts, 4. Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, National Institutes of Health, Bethesda, Maryland, 5. Longitudinal Studies Section, Clinical Research Branch, National Institute on Aging Intramural Research Program, National Institutes of Health, Baltimore, Maryland*

Male aging is characterized by decline in testosterone levels and physical performance that may facilitate poor mobility and disability. Despite many recent consensus reports on hypoandrogenism, the relationship between physical performance and gonadal status has not been investigated. We evaluated 410 older men of InCHIANTI Study (Italy) with complete data on testosterone, muscle strength and short physical performance battery (SPPB). According to testosterone, 3 different groups were created: 1) severely hypogonadal (N= 20) with testosterone <230 ng /dl; 2) moderately hypogonadal (N=75) (testosterone >230 and <350), and 3) eugonadal (N=297) (testosterone > 350). In age and BMI adjusted analysis, we found a significant difference in hand grip strength and SPPB score (p for trend<0.001) among three groups, with severely hypogonadal men having lower levels of these parameters. In older men, hypogonadal status defined as testosterone levels below 230 ng/dl is associated with lower objective measures of physical performance measures, independently of age and BMI.

PREDICTIVE VALUE OF PERFORMANCE-BASED FUNCTIONAL ASSESSMENT IN OLDER HOSPITALIZED PATIENTS

S. Volpato¹, F. Sioulis¹, M. Cavalieri¹, G. Guerra¹, R. Fellin¹, J. Guralnik², *1. Clinical and Experimental Medicine, University of Ferrara, ITALY, Ferrara, Italy, 2. Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, NIH, Bethesda, Maryland*

We assess the ability of the Short Physical Performance Battery (SPPB) to predict hospitalization, death and functional decline in older patients in the year after discharge from the hospital. We enrolled 92 women and men aged 65 and older able to walk and with a MMSE score ≥ 18, admitted to the hospital for an acute medical event. Participants were evaluated with SPPB (range 0-12) at hospital admission, were re-evaluated the day of hospital discharge. The mean age of the sample was 77.2±6.3 years; 51.2% were women. Mean SPPB score at discharge was 7.12±3.0. After full adjustment, the SPPB score at hospital discharge was inversely correlated with the rate of decline in ADL performance over the follow-up (p=0.022). Forty-eight (55.8%) patients were re-admitted to the hospital and 11 (12.8%) have died over the follow-up. In multivariable logistic regression analysis, patients with better SPPB score at hospital discharge (score:8-12) had a lower risk of hospitalization or death (OR: 0.19, IC 95% 0.06-0.62) compared to patients with the lowest SPPB score (0-4). In older acute geriatric patients the SPPB provides important prognostic information. Lower-extremity performance-based functional assessment might identify older patients at high risk of poor outcomes after hospital discharge

SESSION 1530 (SYMPOSIUM)

THE USE OF IN-HOME MONITORING SYSTEMS TO ENHANCE AGING-IN-PLACE

Chair: *C.M. Galambos, School of Social Work, University of Missouri, Columbia, Missouri*

Discussant: *E.S. McConnell, Duke University School of Nursing, Durham, North Carolina*

This symposium examines the use of in-home monitoring systems to detect and monitor changes in the health status of older adults residing in an independent living facility. Three specific technologies will be discussed. The first paper will present the use of an integrated sensor network to detect early illness through the use of motion and bed sensors that identify patterns of activity and behavior. This data can be used to generate alerts and monitor health status. Density map visualization is another system that can be used to track activity including time away from home. Using motion sensor data, different color schemes are created which represent varying activity levels. The third method uses an automated estimation of activity levels based on silhouettes extracted from video data. The symposium will include information on the successes and pitfalls of using these methods to enhance aging-in-place and quality of life.

USING INTEGRATED SENSOR NETWORKS FOR EARLY ILLNESS DETECTION

M.J. Rantz, M. Skubic, G. Alexander, M. Aud, B.J. Wakefield, S.J. Miller, J.A. Krampe, *University of Missouri, Columbia, Missouri*

Integrated sensor networks have been installed in 19 apartments of residents at TigerPlace, a specially designed senior living facility affiliated with the University of Missouri. The integrated sensor network includes motion sensors and a bed sensor which measure presence in the bed as well as restlessness, qualitative pulse, and qualitative respiration while the participant sleeps. A non-clinical research associate examined sensor data before and after known adverse health events such as falls, hospitalization, and emergency room visits with a goal of detecting patterns which could be used to generate alerts and monitor on-going health status of the residents. In several cases, there were patterns in the data that were confirmed by a nursing expert which could be used to prompt registered nurse care coordinators to assess the resident further and offer early interventions which may have delayed or prevented the adverse health event.

AUTOMATED ESTIMATION OF ELDER ACTIVITY LEVELS FROM ANONYMIZED VIDEO DATA

N.M. Harvey, Z. He, Z. Zhou, J.M. Keller, *University of Missouri-Columbia, Columbia, Missouri*

Significant declines in quality of life for elders living in assisted living communities are typically triggered by health events. Given the necessary information, such events can often be predicted, and thus be avoided or reduced in severity. Overall activity levels may be a useful predictor of these events. Quality of life may be improved through automatic assessment and activity level tracking of older adults. This paper presents a method of automated estimation of activity levels based on silhouettes segmented from video data. This method involves subsequent extraction of higher order information from the silhouettes. Through the building of a regression model based on higher order information, this system can automatically track elder activity levels.

MONITORING ACTIVITY LEVEL WITH DENSITY MAP VISUALIZATION

S. Wang, C.M. Galambos, M. Aud, M. Skubic, *University of Missouri, Columbia, Missouri*

This paper describes on-going work in capturing and analyzing sensor data from sensor networks deployed in the homes of older adults, at TigerPlace senior living facility. Sensor data is visualized in the form

of activity density maps which tracks activity including time away from home. Different colors are used to represent different levels of density in motion sensor data. Various activity levels of residents can be observed from density maps ranging from sedentary lifestyles to active lifestyles. Changes in activity level can be linked to physical and mental health declines. This presentation will also include a computational method to calculate similarity of density maps used to determine changes in activity patterns over time.

SESSION 1535 (POSTER)

CAREGIVING AND INTERGENERATIONAL RELATIONSHIPS

THE EFFECTS OF FAMILISM AND CULTURAL JUSTIFICATION ON THE MENTAL AND PHYSICAL HEALTH OF FAMILY CAREGIVERS

P. Sayegh, B.G. Knight, *Department of Psychology, University of Southern California, Los Angeles, California*

This study used path modeling on the data of 95 African American and 65 White caregivers to examine how burden and coping styles mediate the relation between 3 specific cultural values (the Familial Obligations and Perceived Support from the Family factors of familism and the Cultural Justification factor) and caregivers' mental and physical health. Main outcome measures included depression and other psychological symptoms and physical health (self-report and cardiovascular indicators). Consistent with the hypothesis, Familial Obligations had an indirect effect on poor mental and self-reported physical health outcomes via avoidant coping. Contrary to the hypothesis, Perceived Support from the Family had no effect on any health outcomes. Cultural Justification was associated with active coping yet did not demonstrate the hypothesized protective effect on health outcomes. This cultural value was unexpectedly associated with avoidant coping as well, which resulted in poor mental and self-reported physical health outcomes. None of the cultural values had significant associations with burden or had any effect on cardiovascular indicators. These findings suggest that Familial Obligations may account for a significant proportion of the negative effects of familism on caregivers' health in the stress and coping process and that Perceived Support from the Family's impact may be relatively inconsequential. Additionally, Cultural Justification's unanticipated negative effect on caregivers' health may also stem from feelings of obligation to provide care based on strong cultural values and beliefs. It also appears that cultural values do not operate through burden to affect caregivers' health outcomes in the stress and coping process.

MAKING AN IMPERFECT MATCH: ASSESSING RESIDENTIAL LIVING FACILITY RESIDENTS' PHYSICAL ACTIVITY PROGRAM EXPECTATIONS

M. Roe, D.B. Bradley, *Western Kentucky University, Bowling Green, Kentucky*

Village Manor is medium sized independent retirement community in rural Kentucky. When the community was built in the late 1980's, designers did not anticipate residents' long term physical activity needs. In order to meet the needs of current and future residents, both resident physical activity levels and their expectations were examined. The Physical Activity Scale for Elderly (PASE) was administered ($n = 96$) to develop a profile of current physical activity. Three focus groups were held to develop themes relating to residents' current physical activity program desires. Results showed that compared to the theoretical physical activity recommendations for this age group (mean age = 88; 64-98), resident's current activity levels were less. At the same time, their desires for specific physical activity programs (type, length, intensity) were not being met. This presentation concludes with recommendations for fitness area enhancement to increase the likelihood of residents meeting proposed physical activity levels.

THE PROTECTIVE ROLE OF A LIVING SSPOUSE OR PARTNER AGAINST NURSING HOME ENTRY FOLLOWING A FALL IN OLDER ADULTS

J.R. Laguna, B. Steinman, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Falls in older adults often act as catalysts to nursing home entry. Whereas, some studies have shown that size of support networks may delay or preempt entry into nursing homes, others point to the importance of compositional quality of the support network (i.e., the type of relationship) in avoiding institutionalization. To determine the relative effect of marital status (composition) compared to number in household (size) with respect to their protection against nursing home entry, following a fall, data from five consecutive waves (1998 thru 2006) of the Health and Retirement Study were analyzed. Participants were included in analyses if they were 70 years or older and reported having fallen in the two-year period preceding the 1998 wave. Controlling for sociodemographic variables, and medical conditions, we used Cox regression to determine risk of entering a nursing home in subsequent waves. The effects of two levels of support network (spousal/partner and number in household) were tested. Results suggest that the presence of a spouse/partner provides greater protection from entry into nursing homes after a fall than size of network. Consequently, older unmarried/unpartnered persons may benefit from public support services that enhance compositional quality of support networks, potentially resulting in reduced future costs to the health care system.

THE LARIMER COUNTY ALLIANCE FOR GRANDFAMILIES: AN EVALUATION OF A COLLABORATIVE APPROACH

C.A. Fruhauf, K. Bundy-Fazioli, J. Miller, A. Bruce, *Human Development & Family Studies, Colorado State University, Fort Collins, Colorado*

Grandparents who raise grandchildren have specific needs that often are not met by service providers. In an effort to meet the needs of grandparents who live in Larimer County, Colorado, in 2007 a team of committed community members and grandparents established the Larimer County Alliance for Grandfamilies (LCAG). The LCAG's mission is to support the health and well-being of grandfamilies through community education, development of support systems, and advocacy for change. To better understand the LCAG's collaborative approach, an evaluation was conducted measuring the impact on individuals and the community 13 months after the initiation of the LCAG. Of the 36 community members who attended the annual planning meeting, 28 participants completed the survey. A majority of respondents stated that the LCAG has had a moderately high to high impact on their knowledge of grandfamily needs and resources, skills to influence public policies, ability to solve and respond to grandfamily problems, and knowledge of services/best practices for grandfamilies. Further, participants' answers to open-ended questions, included a variety of positive impacts including community coordination of financial resources, increased community awareness of grandfamily issues, building partnerships, and grandparent empowerment. Based on responses to survey questions, the LCAG has benefited individuals who serve grandfamilies, the community, and the grandparent providers in the county.

GRANDPARENTS RAISING GRANDCHILDREN: ETHNIC AND HOUSEHOLD DIFFERENCES IN HEALTH AND SERVICE USE

E. Namkung, *School of Social Work, Washington University in St. Louis, St. Louis, Missouri*

Purpose: The purpose of this study was to compare the characteristics of grandparent caregivers from different ethnicities and household structures, and to explore the associations between these two factors and their health or the use of public income support programs. Design and Methods: With the 2005-2007 American Community Survey (ACS), White, African American, Asian American, and Hispanic grandparent

caregivers in skipped generation and three-generation households were compared. In multivariate analysis, sequential three models for each measure of health (medical problems, ADLs limitation, limitation in working, limitation in going out, and cognitive impairment) and public program use (recipient of public financial assistance and food stamp) were executed. Results: Even though higher rates of health limitations in African Americans and grandparent caregivers living in skipped generation household were evident, these negative aspects were positively shifted when their demographic and caregiving duration factors were adjusted. Only Hispanics in skipped generation households continuously showed higher limitations in health compared to Whites in the households. African Americans and Asian Americans in skipped generation households were less likely to receive public financial assistance compared to Whites and Hispanics in the households. Implication: Findings suggest that health or social service practitioners and public policy makers should approach to at-risk ethnic grandparent caregiver groups in a culturally competent manner. Public income support programs could be considered to outreach to underserved groups such as African Americans and Asian Americans in skipped generation household.

MATERIAL HARDSHIP IN HOUSEHOLDS HEADED BY GRANDPARENTS CARING FOR GRANDCHILDREN

H.H. Park, *Social Welfare, Kangnam University, Yongin, Gyeonggi-do, Korea, South*

Previous research suggests that grandparent-headed households are at high risk for poverty. Debate continues about measures to appropriately capture economic condition and material hardship is one of the alternatives to the traditional federal poverty threshold (FPT) approach. Nevertheless, little is known about the prevalence of hardship in grandparent-headed households. This study examines the extent to which grandmothers experience hardship, considering the presence of grandchild's parent and poverty status, and explores factors of likelihood of hardship. Data on a pooled sample of 1,647 grandmothers from the National Survey of America's Families are analyzed. Ten measures of hardship are identified in four areas: food insecurity, housing issues, unmet health care needs, and telephone disconnection. Overall, food insecurity appears to be the most prevalent hardship (41%), followed by housing instability (25%), unmet health care needs (14%) and telephone disconnection (13%). Poor and low-income single grandmothers are vulnerable to food insecurity whereas across poverty level, substantial percentages of skipped-generational households report experiencing housing hardship (from 33% of those living in poverty to 12% of those with income >300% of FPT). Multivariate logistic regression results show that greater likelihood of hardship is significantly associated with grandmother's younger age, membership of racial minority group, being single, poor physical health, having a disability, raising grandchildren with behavior problems, and living in poverty. Findings suggest that public policymakers and practitioners should consider the measures of material hardship in order to identify grandparent-headed households most in need of help and provide needs-based services to alleviate their economic problems.

THAI FAMILIES CARING FOR DEPENDENT OLDER ADULTS: BEYOND HANDS-ON-CARE

N. Wongsawang¹, B.J. Bowers², *1. Mahidol, Bangkok, Thailand, 2. University of Wisconsin-Madison, Madison, Wisconsin*

As life expectancy increases, Thai families are decreasing in size, and Thai women are entering the workforce in large numbers. Consequently families in Thailand face increasing challenges in caring for dependent older adults. With few external resources to assist caregiving families, and a strong sense of family obligation, Thai families continue to provide most of the care. The purpose of this pilot study was to explore how Thai families care for dependent older adults and the consequences of caregiving. A grounded dimensional analysis was used to conduct the study. Data were collected through face to face and tele-

phone interviews. Several members of three Thai families participated in this pilot study. Findings suggest a complex set of strategies used to engage in several distinct types of caregiving, and a carefully orchestrated system of taking on, adapting and relinquishing caregiving roles. This study precedes an ongoing research project comparing family caregiving in traditional families with caregiving that occurs in transitional families which tend to be smaller with few family members available to provide hands-on care. The study has implications for public health providers and policy makers in designing strategies to support families and prevent the negative impact of family members. This has important health implications for both caregiving families and dependent older adults.

COMMUNICATION IN LIFE-LIMITING ILLNESS: CAREGIVERS' VIEWS ON THE TIMING OF FAMILY CONFERENCES

D. Waldrop, *School of Social Work, University at Buffalo, Buffalo, New York*

Family conferences are important means for helping caregivers understand the progression of a life-limiting illness. This poster will present the results of a study in which family caregivers' were asked about when, during the course of a terminal illness, they received information and guidance from healthcare providers. During in-depth interviews, 59 caregivers of people who were over age 65 and died from cancer within two weeks of hospice admission were asked open-ended questions about when they had conferences with providers and how they gained awareness that the illness was terminal. Qualitative data analysis was used to develop themes which describe participants' experiences of what was supportive, how providers helped or hindered the family's decision-making process about hospice admission and for their suggestions on improving communication between healthcare providers and families. The poster presents an illness trajectory framework from diagnosis through death with key waypoints that caregivers identified as important times for meaningful conversation with healthcare providers. Each waypoint will be illustrated by the themes that emerged from participants' descriptions about what was needed at that time on the trajectory of a loved one's illness. Specifically, the type and timing of family-provider communication needed are illustrated in caregivers' words. Family caregivers' retrospective reflections on how they developed awareness that a loved one's illness was terminal are a central aspect of patient-centered and family focused care. The results present implications about the importance of understanding of how family conferences can help families understand and prepare for an approaching death.

INTERGENERATIONAL SOCIAL SUPPORT, CONFLICT AND MENTAL HEALTH OF OLDER ADULTS IN NEPAL: EVIDENCE OF SYNERGIC EFFECTS

R. Gautam, *University of Massachusetts Lowell, Lowell, Massachusetts*

The aim of this study was to examine the association of late life intergenerational relationships on depression in older adults. The study also explored how the association between conflict and depression was moderated by the solidarity variables. A cross-sectional quantitative study of 489 (247 males; 242 females) older adults aged 60 and older in Nepal was conducted with face-to-face interviews using structured instruments. The dependent variable, depression, was measured by the widely used Geriatric Depression Scale with a Cronbach's reliability coefficient of 0.93 in the present study. The multiple regression analyses illustrated the main and synergic effects of support and conflict on depression. The results illustrate that those women who received lower emotional ($b = 1.03$, $\beta = .08$, $p < .05$) and instrumental ($b = 1.27$, $\beta = .09$, $p < .05$) support from their son were significantly more likely to be depressed compared to men receiving lower support. Women reporting lower anticipated support ($b = 1.33$, $\beta = .10$, $p < .05$) and higher conflict ($b = -.055$, $\beta = -.08$, $p < .05$) were likely to be more depressed than

men. The second-order synergic effect of conflict by emotional support received ($b = -.21$, $\beta = -.08$, $p < .05$) and emotional support provided ($b = -.30$, $\beta = -.12$, $p < .005$) indicated that emotional support received and provided buffered against the deleterious effects of conflict with depression in older adults. The health and policy implications are discussed in the context of an Asian developing country.

CAREGIVING AND AGE: HOW DO THESE FACTORS SHAPE OUR DAILY TIME USE?

K.J. Johnson, J. Mutchler, J. Burr, E. Johns, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

We examine the time adults spend in informal caregiving at different ages and compare the time-use patterns of informal caregivers and noncaregivers in different age groups. Previous studies have investigated the time use of mothers and fathers, and have shown that mothers spend more time caring for children than fathers, who spend more time in paid work. However, these studies have not taken into account additional forms of caregiving, such as childcare by grandparents and adult caregiving. The data for this study come from pooling the 2005 and 2006 American Time Use Study, which collects time-diary information on the amount of time persons spend on a wide range of activities during a 24-hour period. The study sample consists of adults 18 and older ($N = 23,131$). Daily activities are grouped into seven categories: caregiving (physical care to an adult and any care of a child), productive (excluding caregiving), social, physical, personal, domestic, and leisure. As expected, on an average day a greater number of adults are providing care to a child compared to an adult: 37% and 3% respectively. The results show that child caregivers have a mean age of 39 and spend an average of 2.2 hours caregiving per day, while people providing adult caregiving have a mean age of 52 and spend 1.4 hours caregiving per day. Controlling for gender, different time distributions emerge between caregivers and noncaregivers of different ages, particularly in the productive and leisure activity areas. The findings are discussed using the index of dissimilarity.

TIES THAT LEGALLY BIND: HOW GRANDPARENTS MAKE DECISIONS REGARDING THEIR LEGAL RELATIONSHIPS WITH THE GRANDCHILDREN THEY ARE RAISING

T. LaPierre, *The Gerontology Center, University of Kansas, Lawrence, Kansas*

According to the 2000 census, 5.7 million grandparents lived with their grandchildren and 42% of them reported that they had primary responsibility for minor co-resident grandchildren (Simmons & Dye, 2003). While many of the grandparents raising their grandchildren have informal caregiving arrangements there are a number of options for more formal legal relationships including formal kinship care, adoption, legal custody, legal guardianship, and legal consent (George, 2003). Each of these options affords different legal rights to the grandparents and the biological parents, and in the absence of a legally recognized relationship the grandparents have no rights as caregivers and may have difficulty accessing financial assistance, health insurance and healthcare for the grandchild, enrolling them in school, and protecting them from the child's parents (Wallace, 2000). In-depth interviews with 20 grandparents raising their grandchildren were analyzed to explore what factors influence grandparent caregivers' decisions regarding the legal relationship they have with the grandchild they care for. Particular attention was paid to how the legal and policy climates surrounding grandparent caregivers interact with individual and family level characteristics in making these important decisions. The choice of legal relationship was highly influenced by family context, knowledge and beliefs about available options, financial constraints, procedural requirements that include declaring their child an unfit parent or going after them for child support and level of involvement with social services. The positive and negative consequences of having a particular legal relationship are also discussed, as well as implications for policy and practice.

SESSION 1540 (SYMPOSIUM)

OLLIE RANDALL SYMPOSIUM: CREATIVE APPROACHES TO INTEGRATING FALL PREVENTION RESEARCH, POLICY AND PRACTICE INTO HEALTHY AGING

Chair: C. Cicero, *Gerontology, University of Southern California, Los Angeles, California*

Discussant: M. Tinetti, *School of Medicine, Yale University, New Haven, Connecticut*

Invoking the theoretical framework from the classic public administration work of John Kingdon, this symposium recognizes the open policy window of opportunity created jointly by the new Obama administration and its interest in health reform, the imminent agedness of the Baby Boomer cohorts, and the nation's growing financial burden caused by escalating health care costs and governmental budget deficits. Solutions to the public health problem of older adult falls require creative approaches to integrating prevention into healthy aging policies. Fall Prevention, in the social, political, and economic contexts of a Healthy Aging Agenda, encourages positive personal behaviors, promotes disease and injury prevention, and addresses the significant costs of demographic change. Specifically, this session will address the three strands of agenda setting and policy formation as they relate to building a case for fall prevention in creative approaches to healthy aging. Analysis of the current prevalence and projected costs of the public health problem of falls will set the stage for a responsive healthy aging agenda. An exploration of advocacy and interest groups' political influence will support an expert consensus for building a fall prevention infrastructure into neighborhood, local, state, federal programs and policies, including health care reform. Presenters will feature evidence-based interventions implemented in interdisciplinary practice settings including community based public health, geriatric medicine, exercise science, and urban planning/housing. The distinguished discussant will integrate concepts presented and offer final suggestions for capitalizing on the policy window of opportunity and incorporating fall prevention into a healthy aging agenda.

EVIDENCE-BASED ADVICE FOR INCORPORATING FALL PREVENTION INTO HEALTH REFORM: A VIEW FROM THE VETERANS ADMINISTRATION

L.Z. Rubenstein, *GRECC, UCLA-VA, Sepulveda, California*

As a government run health insurer with reported higher levels of customer satisfaction than the private sector, the Veterans Administration (VA) has been cited as a model for health care reform. This presentation will outline evidence-based fall prevention strategies implemented by geriatric physicians in the VA and discuss how they might fit into the practice of a broad healthy aging agenda incorporated into health care reform. Included will be descriptions of the VA system, pioneering fall-prevention research conducted in the VA, system-wide fall prevention initiatives and active local programs incorporated into the computerized medical record.

BUILDING THE AGENDA: THE BURDEN AND IMPACT OF FALL INJURIES

J.A. Stevens, *Centers for Disease Control, Atlanta, Georgia*

Older adults want to live independently and age while remaining in their own homes. A third of people aged 65 and older fall each year and fall-related injuries are a major threat to older adults' health, independence and quality of life. This presentation will focus on the burden of falls in the United States. It will address the epidemiology of both fatal and nonfatal fall injuries from a national perspective, including the prevalence of fall injuries and trends in fall injury rates. It will describe the economic impact that these injuries have on society, as well as the effect of falls on older adults' quality of life. It will include a discussion of the personal, behavioral, and environmental factors that increase fall risk, and finish with a brief summary of proven fall prevention strategies.

FALL PREVENTION POLICIES AND PRACTICES IN THE CONTEXT OF THE LOCAL COMMUNITIES WHERE OLDER ADULTS LIVE

J. Pynoos, *USC Andrus Gerontology Center, Los Angeles, California*

In addition to traditional healthy aging and physical activity programs, local communities can develop fall prevention policies and practices that are imbedded in broader housing design and home modification programs as well as neighborhood planning, street and sidewalk maintenance. This session will analyze the types of policies that communities have created that lessen the risk of falls for older persons, the underlying forces for changes, the progress to date, and what needs to be done to raise the issue higher on the agenda.

HEALTHY SGING AND FALL PREVENTION ADVOCACY ON THE NATIONAL AND STATE LEVELS: THE ROLE OF INTEREST GROUPS

B. Beattie, *National Council on Aging, Washington, District of Columbia*

In 2004, the National Council on Aging convened 58 national organizations, professional associations and federal agencies to develop a consensus document of evidence-based strategies to reduce falls and fall-related injuries in older adults. Under what is now termed the Falls Free™ Initiative, legislation was introduced at the national level enfold-ing key strategies from the consensus document. Realizing legislative action required activating a grass roots advocacy network that was greatly facilitated by the National Falls Free™ Coalition and an effective state coalitions' workgroup focused on fall prevention. The State Coalitions on Fall Prevention Workgroup in turn has been serving to promote state advocacy and awareness as well as regulatory and policy initiatives to advance fall prevention in the face of growing numbers of older adults and associated long term care costs. State Coalitions are also serving to facilitate partnership and infrastructure building in local communities, and to take initiatives to the national scale.

RESEARCH, POLICY, AND PRACTICE IMPLICATIONS OF LINKING FALL PREVENTION TO COMMUNITY BASED HEALTHY AGING AND PHYSICAL ACTIVITY PROGRAMS

D. Rose, *Kinesiology, California State University, Fullerton, Fullerton, California*

Physical activity, usually in the form of structured exercise, is a core component of any intervention strategy designed to lower an older adult's risk for falls. Similarly, regular engagement in physical activity is important for preventing or delaying the onset of disability and promoting healthy aging. Considerable research has been conducted to better understand the primary, secondary, and tertiary roles of physical activity as well as the motivators and/or barriers to initiating and maintaining enrollment in physical activity programs. Embedding fall prevention research within the broader context of healthy aging has the potential to stimulate new research questions and more fully address the benefits of physical activity across the continuum of functional levels. At a practical level, linking fall prevention to healthy aging preserves available community resources, expands and shifts the focus of programming while increasing the number of programs addressing both issues. Developing community-based physical activity programming that better addresses the needs of a heterogenous segment of the population and maximizes the available resources will also provide the impetus for new policies and federal mandates related to community-based programming initiatives.

SESSION 1545 (SYMPOSIUM)

EVERYONE'S GOT AGING: USING ART TO EXPLORE COMMUNITY

Chair: D.B. Bradley, *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*

Discussant: A. Barusch, *University of Otago, Dunedin, New Zealand*

In this symposium, we take an interdisciplinary look at the role that art can play in capturing the experience of old age and aging. We explore ways of using the arts to engage citizens, discover the challenges and opportunities of aging in a community and develop inclusive strategies for community change. We will show that effective use of the arts in community planning can take many forms and act as a catalyst for meaningful discussion and creative community growth. Our objective is to explore how participatory art can lead to a deeper understanding of "realistic aging" in communities undergoing rapid demographic change. The panelists recreate the creative energy experienced by community members as experienced by diverse age groups. Katherine Daneski will explain how short digital stories stimulate debate. Laura Stephenson will explain how elder generated photographs are an effective catalyst to help the community address its challenges. Dana Bradley will discuss how a photographic exhibition of international elders brought together members of a diverse community. Tina Kruger will describe the use of community photographs in a social marketing campaign and Shoshana Bardach will discuss how images and narratives of individuals aging positively sparked change in expectations about aging. Finally, John Migliaccio will explore how transformative music performance enhances community awareness of aging. Amanda Barusch concludes by discussing the themes of realistic aging reflected in the presentations and opportunities for crafting a deeper understanding of community through creativity.

NARRATIVES OF AGING

K.A. Daneski¹, P. Thimbleby², S. Jones², 1. Swansea University, Swansea, Ceredigion, United Kingdom, 2. Swansea Digital Stories, Swansea, Wales, United Kingdom

Digital stories are short videos that capture the stories which represent their tellers – in this case we present stories of people whose voices are not often heard: those of older people. These stories allow us to enter their world as they reflect on issues such as the freedoms or restrictions that characterised their younger lives, key events that shaped their lives, the realisation of their dreams and ideas about fulfilment. Between individual stories, we hear the views of both older and younger people on themes that appear to resonate with both generations, perhaps challenging stereotypes of intergenerational disharmony. The presentation will stimulate discussion of the value of using this method when researching ageing as it allows participants control of what is said in contrast to the more usual and perhaps intrusive approaches. Attendees of this session may also wish to consider its value in training programs or therapeutic work.

MY COMMUNITY, MY VOICE, STAYING ACTIVE FOR A LIFETIME: OLDER ADULTS SPEAK THROUGH PHOTOGRAPHY

L. Stephenson, *University of Kentucky, Lexington, Kentucky*

A community-based participatory research project in rural Kentucky, featured elder participants' creativity in photographic reflection of their community surroundings. Eight retired adults aged 55 and older were given cameras to visually capture barriers and opportunities to physical activity in their local community. Their photographs revealed that local environmental challenges included broken sidewalks, washed-out trails, and unsafe roadways for walking and biking. Their community pictures identified the local walking track, neighborhood exercise classes, and close proximity to a state park and national forest trail system as beneficial supports for physical activity. Thirty of the 250 pho-

tographs and participant quotes were designed into a booklet authored by the elders entitled *My Community, My Voice: Staying Active for a Lifetime*. The booklet, which showcases the elders' visual interpretation of barriers in striking visual starkness, served as a catalyst to stimulate civic dialogue to raise awareness of community support for physical activity.

ALL THE WORLD IS OUR STAGE: USING IMAGES TO CROSS GEOGRAPHIC BOUNDARIES

D.B. Bradley, *Center for Gerontology, Western Kentucky University, Bowling Green, Kentucky*

This presentation explores the use of a public exhibition of international elder images to create interest and heighten awareness of global aging and diversity. Held in a rural southern region of the United States, this montage of 30 photographs was used as a catalyst to assist aging service planners in their efforts to introduce the issue of globalization and increasing diversity of elders into the local planning process. Historically the region has self identified as primarily "Caucasian," yet the reality has often been much more diverse across both racial and ethnic dimensions. Discussion will include the process for including the exhibition as part of the policy planning process, constituents reactions generated through attendance and an evaluation of the effectiveness of the exhibition.

CREATIVE SOCIAL MARKETING OF MENTAL HEALTH MESSAGES: PROMOTING HEALTHY AGING THROUGH PHOTO-BASED CAMPAIGNS

T. Kruger, F. Zanjani, D. Murray, T. Brown-Hughes, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Maintaining mental health (MH) is an important component of healthy aging. Research aimed at protecting the MH of aging individuals is difficult due to stigma associated with MH issues. Interventions in this area must creatively incorporate ideas relevant to the target audience with the key health messages (e.g., MH problems are not normal aging.) The Mental Healthiness in Aging Initiative did that by creatively integrating photographs of members of the target communities in a social marketing campaign, which included both a television spot and a calendar. To ensure that the target audience would relate to the photos and attend to the key health messages, actual pictures of diverse residents engaged in MH promoting activities (e.g., exercising, visiting, and engaging in hobbies) were selected. Telephone survey results (N=356) indicate that the social marketing efforts resulted in more awareness that MH problems are not a normal part of aging.

THE INFLUENCE OF PHOTOGRAPHS AND NARRATIVES DEPICTING POSITIVE AGING ON FUTURE EXPECTATIONS

S. Bardach, T. Clinkinbeard, C.C. Gayer, *Gerontology, University of Kentucky, Lexington, Kentucky*

Context: Many people are apprehensive about old age and their future years. Purpose: We sought to improve people's expectations for and sense of possibility in old age. Methods: Students and middle-aged volunteers completed a survey including the Expectations Regarding Aging-38 item questionnaire (ERA-38) and a possible selves questionnaire. Following the initial survey, all participants viewed a short presentation that combined images and short narratives of individuals aging positively. After the presentation, participants completed an identical survey. Results: Responses to the ERA-38 demonstrated an improvement in expectations about aging, with a larger improvement among the younger respondents. The possible selves questionnaire demonstrated a decrease in total number of possible selves identified, but the changes varied by domain and age group. Implications: This study demonstrated the potential for media presenting positive aging to have an impact upon expectations for the future. Implications for older adults' decision making and health choices are discussed.

ISSUES IN ASSISTED LIVING

RESIDENT AND STAFF PERSPECTIVES ON QUALITY OF LIFE IN INDEPENDENT AND ASSISTED LIVING SETTINGS

E. Schuster, *Eastern Michigan University, Ypsilanti, Michigan*

The Association of Homes and Services for the Aging (AAHSA) developed a philosophy of quality known as Quality First. Through Quality First, AAHSA members "work in partnership with all stakeholders—government, consumers and the people we serve and their families—to create quality of care and Quality of Life in aging services." This study explored resident, staff, and administrator perspectives on quality of life issues at two continuum of care facilities located in rural southeastern Michigan. One site was small in size and strove to create a "home-like" setting. The other site was much larger and adhered closely to regulatory guidelines and annual survey results to guide future planning and development. Six focus group sessions sought to determine the participants' perspectives on quality of life issues. Findings reflecting staff and administrators' perspectives indicate that institutional philosophy, size, and mission, directly impact the way in which quality of life is defined and practiced. Internal cultural transformations were based on respect for the caregivers, team building and management, continuous quality improvement, and resident centered care. Another important finding indicated that both staff and residents were concerned about staff response to situations where residents are no longer able to function at full capacity in the Independent Living environment due to mental and physical decline. Residents felt that the lack of effective responsiveness to the consequences of an aging-in-place approach directly negatively impacted their quality of life. The paper will provide a discussion on these and other findings regarding communication, customer service, and programming issues.

WORKER-ON-WORKER RACISM IN ASSISTED LIVING

M. Lepore¹, M. Perkins³, S. Miller¹, M. Ball², 1. *Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island*, 2. *Gerontology Institute, Georgia State University, Atlanta, Georgia*, 3. *Rollins School of Public Health, Emory University, Atlanta, Georgia*

Purpose: Racial diversity exists among direct care workers (DCWs) in long term care (LTC). Nationally, White DCWs are the racial minority. LTC worker-on-worker racism has been documented, but little research examines how organizational factors influence such racism. Furthermore, no known studies focus on coworker racism in assisted living (AL). We fill these gaps. Design and Methods: Forty-five AL facilities in Georgia were studied. Organizational data were collected, prevalent race of DCWs and residents determined, and each facility categorized as racially matched or mismatched according to the racial difference between DCWs and residents. Interviews were performed with DCWs, and questions asked about experiences with coworker racism. Multivariate logistic regression tested the associations between DCW race and a facility's racial match or mismatch on the experience of coworker racism. Results: Overall, minority and White DCWs experience racism from coworkers at similar rates. These rates vary by worker-resident racial match: In facilities where the prevalent race of DCWs and residents is matched, minority DCWs are almost five times more likely than White DCWs to experience coworker racism, but in facilities where DCWs and residents are racially mismatched, minority DCWs are almost seventy percent less likely than White DCWs to experience coworker racism. Implications: Organizational racial diversity among LTC staff and residents is an important consideration when assessing the potential for worker-on-worker racism. Anticipating coworker racism based on broader organizational racial dynamics might allow providers to prevent such racism in their facilities. Methodological transferability to different settings is discussed.

STAFF TURNOVER IN ASSISTED LIVING: WHO LEAVES AND WHY?

E. Sikorska-Simmons, H.L. Remh, *Sociology, University of Central Florida, Orlando, Florida*

High staff turnover has been recognized as a major problem in assisted living (AL). Little is known, however, about the reasons for staff turnover and characteristics of "stayers" and "leavers." The purpose of this study was to examine three types of staff turnover (i.e., voluntary, involuntary, and job abandonment), compare how "stayers" differed from "leavers" (i.e., age, sex, race, foreign-born status, job type, and employment status), and identify those characteristics that best discriminated among different types of "leavers." Methods. The sample consisted of 950 staff in 22 AL facilities. All staff members who were hired and paid by the facility during a 12-month period were included. Turnover data were collected (at the individual level) in interviews with administrators and through the review of facility records. Descriptive statistics and logistic regression were used to compare "stayers" and "leavers." Results. Of the 950 staff members, 560 (58%) were "stayers" and 390 (41%) were "leavers." Compared to "stayers," "leavers" tended to be younger and were less likely to be foreign born. Of those who left, 44% were voluntary leavers, 27% were involuntary leavers, and 29% abandoned their jobs. Compared to voluntary leavers, those who abandoned their jobs were younger, less likely to be white, foreign-born, and more likely to occupy paraprofessional jobs and work full-time. Implications. These findings suggest that "leavers" are not a homogenous group. In particular, those who abandon their jobs are different from voluntary leavers. Efforts to reduce turnover might be more effective if they target different types of turnover.

ASSESSING FACTORS ASSOCIATED WITH OUTDOOR USAGE AT ASSISTED LIVING FACILITIES

S. Rodiek, *Architecture, Texas A&M University, College Station, Texas*

Contact with the outdoors has been associated with multiple benefits to health and well-being in older adults, yet outdoor space in residential care settings is commonly reported as underutilized. The purpose of this study was to determine whether environmental and programmatic features were associated with levels of outdoor usage, walking behavior, and frequency and duration of family visits. At 68 randomly selected assisted living facilities in three climatically diverse metro-regions (Houston, Chicago, Seattle), a 63-item environmental assessment scale was used to evaluate a wide variety of outdoor areas, while residents and staff were surveyed (N=1599). Resident ratings of specific environmental qualities agreed with researchers' evaluations on four of the five principles tested. Outdoor usage was significantly associated with levels of walking and physical activity, and residents in all regions reported a strong preference for walking outdoors. Outdoor areas at the front of buildings were reported as most often used by residents, and having developed front areas was found to be positively associated with outdoor usage. Other factors strongly associated with levels of outdoor usage were horticultural therapy programs, paving conditions, and the force required to open doors. Frequency and duration of visits by family and friends correlated significantly with visitors' usage of outdoor areas. Findings suggest that outdoor usage, walking, and family visitation may be increased by specific environmental features and activity programs. Checklists and educational materials are now available to help assisted living and long term care administrators assess and identify best practices.

SESSION 1555 (SYMPOSIUM)

PROMOTING HEALTHY AGING: BRINGING HOME LESSONS LEARNED FROM ABROAD

Chair: *M.B. Neal, Institute on Aging, Portland State University, Portland, Oregon*

Discussant: *M. Pelaez, Health Foundation of South Florida, Miami, Florida*

Less developed countries are experiencing rapid population aging and face the problem of meeting the needs of impoverished older persons without the safety nets in place in developed countries such as the United States (U.S.). According to the 2008 United Nations Revision Population Database, those aged 60+ will comprise almost 9% of the population in 2010 in countries designated as less developed, in contrast to about 18% in the U.S. By 2050, these proportions are expected to be 20% and 33%, respectively. This symposium will introduce a Global Aging Initiative funded in 2008 at Portland State University (PSU) and its partnership with the Jessie F. Richardson Foundation (JFR) to develop service learning and community development models for identifying and addressing some of the needs of vulnerable older adults. It will discuss how the models evolved, the lessons learned, and how those efforts may be useful in addressing needs of low-income, chronically underserved elders in the U.S. The first presentation will describe the models and their components, key elements of which are partnership creation and a multi-disciplinary integrated approach. The second will focus on local factors that must be considered in the application of these models to the local context and obstacles encountered. The third will present findings from one of the program's activities – a Nicaraguan elders' needs assessment. The discussant will offer suggestions for adapting the models to the American context and for guiding service learning and community development efforts in rural areas and communities with high levels of poverty.

LOCAL PARTNERSHIPS: A KEY ELEMENT FOR INDIGENOUS CAPACITY BUILDING TOWARD HEALTHY AGING

M. Lopez Norori, Universidad Nacional Autónoma de Nicaragua, Managua, Nicaragua

In less developed countries, partnerships often rely on a model of aid givers and receivers. Often, the recipients are viewed primarily as instruments of aid distribution; sometimes they are asked to identify their needs. This approach can create a culture of dependency and a negative view of aid recipients. This presentation describes a partnership model based on reciprocity among multiple groups. Partnerships based on common interest are crucial for creating leverage that increases the capacity of local communities to address the needs of older persons in less developed countries. Local representatives established a planning and development council. Community-based participatory research methods were used to inventory needs, resources, priorities and intervention strategies. The council had input into the design and implementation of short- and longer-term interventions. This presentation discusses the process and some of the results, including training, public service activities, awareness creation and micro-enterprise activity.

NEW APPROACHES TO INTERNATIONAL AID: SUSTAINABLE STRATEGIES FOR LESS DEVELOPED COUNTRIES

K. Wilson, Jessie F. Richardson Foundation, Clackamas, Oregon

Three approaches to support older individuals in need living in less developed countries are presented: direct aid, cooperative activity and capacity building. Each focuses on something unique: immediate response to basic needs, interventions for ongoing needs, and building sustainable indigenous capacity. Each is targeted to yield short-, medium- and longer-term benefits. Historically, international aid has been consistent with the first two approaches. Of growing concern, however, is

that these approaches require repeated interventions and may serve to delay more permanent solutions. More recently, more sustainable solutions have gained attention. Sustainable interventions are responses that can be maintained and expanded with fewer, smaller and shorter infusions of external resources. This approach involves indigenous capacity building and is viewed as having potential for longer-term impact in improving the lives of older persons who are living in extreme poverty. Examples of each approach are given as well as an analysis of their outcomes.

USING SERVICE LEARNING TO IDENTIFY AND ADDRESS ELDERS' NEEDS IN NICARAGUA

M.B. Neal, Institute on Aging, Portland State University, Portland, Oregon

Approaches taken as part of a multi-year service learning program to gain an understanding of conditions, resources, and needs of elders in three Nicaraguan communities are presented. They included personal interviews with community elders using a survey instrument and information gathering through community meetings. The findings were then used to develop training and materials concerning basic health problems associated with aging. Strategies that can be taken when resources are scarce to maximize healthy aging were also developed and shared with health professionals and community members, including school children. The average age of participants in the survey was 74.6; 40% were illiterate, 54% rated their overall health as not very good or bad, and 84% reported not having enough money for food and health care. Similar to the U.S., being poor and illiterate were associated with poor self-perceived health, lack of resources, and transportation barriers to accessing to health care services.

SESSION 1560 (SYMPOSIUM)

RECENT RESEARCH ON PRIVATE LONG-TERM CARE INSURANCE: FINDINGS AND POLICY IMPLICATIONS

Chair: *P. Doty, OS/ASPE/DALTCP, U.S.DHHS, Washington, District of Columbia*

Discussant: *J. Cutler, Office of Personnel Management, Washington, District of Columbia*

Because of the existing eligibility and coverage restrictions on public financing of long-term care services, private long-term care insurance is currently the only way for most Americans to plan ahead to ensure that if they become disabled, they will be able to afford paid services in the settings (home, assisted living, or nursing home) that they prefer. This session will provide an overview of recent research on private long-term care insurance sponsored by the Office of the Assistant Secretary for Planning and Evaluation at the U.S. DHHS. The research findings to be presented will include: (1) results of a 28 month follow-up of a representative sample of private LTCI claimants from ten companies that account for 80 percent of market share, (2) a study of the effects of alternative approaches to inflation protection on lapse rates by policyholders, and (3) data on states that have, under the legislative authority of the 2005 DRA, have established Medicaid/private long-term care insurance partnerships and the impact on insurance sales in partnership states. The session will conclude with a discussion of public policy implications and brief mention of other research still underway.

DECISIONS AND CHOICES AMONG AN ADMISSIONS COHORT OF PRIVATELY INSURED DISABLED ELDERS

J.S. Miller, M. Cohen, LifePlans, Inc., Waltham, Massachusetts

The number of individuals requiring assistance with personal care activities will rise dramatically in the years ahead. Even in the presence of reported declines in age-specific disability rates, the number of individuals age 65 and over who will need assistance with everyday activities will grow from about 5 million (today) to 7 million (by 2020) (The Lewin Group, 2002). While currently available data helps to uncover the factors related to observing someone in a particular state of disability

or service modality, it does not facilitate an understanding of the factors behind the decision to begin using a particular service. Attendees will learn about the demographic, health and attitudinal profile of individuals with private long-term care insurance policies at the time that they begin using paid services, as well as the factors involved in the decision about how and why to use paid services in particular care settings.

FINDINGS FROM A STUDY OF LONG-TERM CARE INSURANCE CLAIM DECISIONS

M. Cohen, J.S. Miller, *LifePlans, Inc., Waltham, Massachusetts*

Recent publicity in the New York Times has raised the issue of the long-term care insurance industry engaging in inappropriate denials of long-term care claims. The article raises a broad question about industry practice: is the long-term care insurance industry paying benefits appropriately? This broad question can really only be answered by focusing on two sub-questions: (1) Is the denial of benefits to policyholders making claims on their policy appropriate, and (2) Is the payment of benefits to policyholders making claims on their policy appropriate? Attendees of this session will learn about the findings from a study of claims across the long-term care insurance industry that were both denied and accepted based upon clinical criteria. These claims were audited and the documentation reviewed by clinical staff to determine the "appropriateness" of the initial decision.

SESSION 1565 (PAPER)

THE ROLE OF GENDER

THE RELATIONSHIP BETWEEN WOMEN'S WORK HISTORIES & INCOMES IN LATER LIFE IN THE UK, US & WEST GERMANY

M. Evandrou¹, J.C. Falkingham¹, T. Sefton², A. Vlachantoni¹, *1. centre for Research on Ageing, University of Southampton, Southampton, United Kingdom, 2. London School of Economics, London, United Kingdom*

Women typically fare worse economically than men in retirement. This reflects their roles within the family and the labour market, and consequently their ability to build up an adequate income in retirement. Different welfare regimes may act to ameliorate or compound the impact of interrupted work histories on income in later life. This paper investigates the relationship between older women's work histories and their personal incomes in later life in UK, US and Germany, using data from large scale longitudinal surveys (BHPS, PSID & GSOEP). Comparing three countries with different welfare regimes provides insight into the interaction between the life course, pension system and women's incomes in later life. The analysis shows that the association between work histories and women's income in later life is strongest in Germany and weakest in the UK. In the UK, work history was found to have a positive relationship with income in later life for only those women with predominantly full-time employment histories, whereas in Germany and to a lesser extent in the US, part-time and irregular full-time employment also had a significant and positive association with later life incomes. The results provide evidence of a pensions poverty trap in the UK, whereby women with partial employment histories (eg up to 15 years in full-time employment, and up to 25 years or more in any employment), do not appear to benefit in pension terms from their participation in the labour market. The implications of the findings are discussed within the context of pensions legislation.

THE FAMILY CAREGIVING BURDEN: THE ROLE OF GENDER AND CARE RECEIVER/CARE PROVIDER RELATIONS

V. Lou, *Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, China*

Aims: This study aims to examine the gendered role, and care receiver/care provider relations on the family caregiving burden in a Chinese context in Hong Kong. **Method:** The survey method was adopted using multi-stage random sampling. A standardized questionnaire was administered via face-to-face interview with 435 caregivers who are caring for frail elders in Hong Kong. Results showed that among the 435 respondents, 23% were spouses and 64% were children. Results: The burden of family caregiving was found to be higher among spouse caregivers than child caregivers ($p < .01$); higher among female caregivers compared to male caregivers ($p < .01$). Such differences were found on the overall burden and the five aspects of burden (i.e. Time-dependent, Developmental, Physical, Social and Emotional), as measured by the Chinese version of the Caregiver Burden Inventory. Consistent with the literature, the highest burden was reported in the area of time-dependent, followed up developmental and physical burden; while the lowest burden was in the area of emotional. Gender and caregiver/care receiver relations seemed to have an independent contribution to the caregiving burden without significant interaction effect with gender of the caregivers. **Conclusion:** The findings of the study revealed that gender and care receiver/care provider relations, seemed to work independently. Hence, not only the observations on the gender of the family caregiver, but also on the phenomena of 'nuclear family caregiving,' meaning the different and higher burden experienced by a spouse versus a child caregiver, are worthy of notice in service planning and policy development.

THE RISING SIGNIFICANCE OF MARITAL STATUS: TRENDS IN POVERTY AMONG THE ELDERLY, 1968-2007

P. Herd, *University of Wisconsin-Madison, Madison, Wisconsin*

Since 1959, poverty among the elderly has dropped by nearly 25 percentage points, from 35 percent to 9.5 percent. Whereas elderly Americans used to be the age group most likely to experience poverty, they now have lower poverty rates than either children or working age adults. Despite these positive trends, however, there are wide economic differences among older Americans. Women are twice as likely to be poor compared to older men. African Americans are nearly three times as likely to be poor as are whites. But have these differences changed over time? Are poverty gaps among the elderly closing or widening by sex, race, marital status and educational attainment? In short, have differences in poverty between groups of elderly Americans shrunk, stayed the same, or expanded over the past 40 years? Using the Current Population Survey data from 1968-2007, I explore how gaps in poverty among those aged 65 and over, by sex, race, educational attainment, and marital status, have changed over time. In sum, I find that while differences in poverty have shrunk by race and educational attainment, gender gaps have remained relatively stagnant, and gaps by marital status have grown.

OLDER WOMEN'S MORAL REASONING: AN ANALYSIS BASED ON CAROL GILLIGAN'S THEORETICAL FRAMEWORK

E.K. Dakin, *School of Social Work, Colorado State University, Fort Collins, Colorado*

This study examined moral reasoning among older women, a group that has received little attention in moral development and reasoning research and theory, based on the female moral development model developed by psychologist Carol Gilligan. This model was developed as a result of the finding that females are deficient in comparison with males when tested within the framework of Lawrence Kohlberg's moral development theory (Gilligan, 1982). Gilligan's alternate theoretical understanding of female moral development was developed through

research with subjects diverse in gender, ethnicity, age (6 through 60), and socioeconomic status. This research emphasizes real-life decision making, for instance reasoning around the decision of whether or not to have an abortion (Gilligan; Gilligan & Attanucci, 1988). One limitation of Gilligan's model, however, has been the lack of research on older adult (i.e., over age 60) subjects. This study addressed this gap by assessing the utility of Gilligan's model among 88 African American, Latina and Caucasian women age 60 and over from varying socioeconomic backgrounds who participated in eight focus groups that examined ethical dilemmas within adult protective services (APS) related to mandatory reporting, involuntary protective services, and criminalization of elder maltreatment (Dakin & Pearlmutter, 2009). The participants' reasoning in responding to the dilemmas reflected underlying decision-making processes based in an ethic of care and responsibility and recognition of the limitations of autonomy. This type of reasoning is clearly consistent with Gilligan's description of the care perspective, an orientation emphasized by females in responding to ethical dilemmas (Gilligan & Attanucci).

ELDER ABUSE AND WOMEN: A HUMAN RIGHTS PERSPECTIVE TO INTERNATIONAL SOCIAL WORK PRACTICE

D. Mukherjee, *Social Work, Southern Illinois University Carbondale, Carbondale, Illinois*

Elder abuse is worthy of interest for epidemiologist, clinicians, social workers, and health-service workers. The incidences of elder abuse across cultures and nationalities have a gender bias; elderly women are far more likely to find themselves at the receiving end of abuse than their male counterparts. This is further accentuated by the disproportionate rise of females within the elderly population. Women outnumber men by 2 to 1 at age 80 in developing countries. A majority of these women are widows, many with mental health conditions, with limited economic resources and social support. The break down of the multigenerational co-resident families has further eroded the kinship support systems for the elderly women, who live longer and outnumber men in the old-old category (75 and above). The human rights perspective as mandated by the University Declaration of Human Rights has been used to identify social work practice models for elder abuse victims (Reichert, 2003). In 2002, the Madrid International Congress had recognized elder abuse as human rights violation and has urged international multilateral organizations to form specific task force to address the problem. The paper draws quantitative data from the Help Age International, an international non-governmental organization working with the elderly in India, and the United Nations data on developing countries. The paper ends with discussing various practice models on elder abuse informed by human rights perspective.

SESSION 1570 (SYMPOSIUM)

THE SOCIAL WORK WORKFORCE: LEGISLATIVE AND POLICY INITIATIVES TO CARE FOR AN AGING AMERICA

Chair: N. Hooyman, *Council on Social Work Education Gero-Ed Center, Alexandria, Virginia, University of Washington School of Social Work, Seattle, Washington*

Discussant: R. Golden, *Rush University Medical Center, Chicago, Illinois*

The 2008 Institute of Medicine (IOM) report called for immediate investments in preparing the health care system to care for older Americans and their families (IOM, 2008). The social work workforce needs to increase recruitment, retention, and training of gerontologically competent social workers. The proposed symposium will consist of a cross-section of voices from the social work field including education, service provision, informal caregiving, and public policy. The symposium will highlight the intersections between informal and formal care providers, and social work's role in caring for older adults and their fam-

ilies. Federal legislation and regulatory changes affecting social work training and models of care for older adults will be examined. The panel will also describe social work's role in the new Eldercare Workforce Alliance, which aims to implement IOM recommendations for recruitment, retention, training, and compensation issues across the direct care and professional health care workforce, including social work. The current economic situation, the insufficient number of formal and informal care providers, and the overall demographic imperative present a challenge and an opportunity. The social work field needs to be politically engaged during this time to ensure that more gerontological social workers are prepared and retained, are competent in working effectively with family caregivers and direct care staff, and are providing leadership in developing new models of care. Institute of Medicine. (2008). *Retooling for an Aging America: Building the Health Care Workforce*. Committee on the Future Health Care Workforce for Older Americans, Washington, DC: The National Academies Press.

HEALTH AND SOCIAL SERVICE WORKFORCE POLICY INITIATIVES TO SUPPORT OLDER ADULTS AND THEIR FAMILIES

L. Feinberg, *National Partnership for Women & Families, Washington, District of Columbia*

American families are concerned about quality of care for their older relatives and friends. According to the Institute of Medicine, severe workforce shortages in the care of older adults results in too few health and social service providers equipped in skills or numbers to provide older adults and their families with the best possible care. There is also a need for professionals to adopt a family-centered care approach as well as patient-centered, so that family caregivers are supported throughout policies and programs. Current federal legislation and advocacy initiatives addressing the health care workforce, including informal family caregivers and aging issues, will be discussed.

CRISIS IN ELDERCARE: GENDER AND RACIAL INEQUITIES

N.R. Hooyman, *School of Social Work, University of Washington, Seattle, Washington*

The crisis in care for older adults and their families cross-cuts three levels of caregivers: professional health care providers, with the focus here on gerontological social workers, underpaid direct care workers, and unpaid family caregivers. Dynamics shared across these formal and informal caregivers intensify the eldercare crisis in four ways: 1) The intersections with race/immigration, gender, social class, and sexual orientation underlie caregiving's low status; 2) Poorly paid or unpaid caregiving intensifies gender and racial inequities in old age; 3) The impact of changes in healthcare and the economy intensifies pressures on caregivers, especially women of color; and 4) The challenges of recruiting and retaining gerontological social workers and direct care workers. This presentation suggests policy and programmatic changes to support the legitimate but undervalued work by formal and informal sectors and makes the case for policy and advocacy collaboration between formal care providers and informal caregivers, congruous with the Eldercare Workforce Alliance's approach to geriatric workforce needs

EXPLORING NEW MODELS OF CARE FOR OLDER ADULTS

P.J. Volland, *The New York Academy of Medicine, New York, New York*

Several key facts support the need for new models of care for meeting the needs of older adults and their families: 1) a desire to stay independent and in the community as long as possible; 2) the presence of multiple chronic conditions that restrict functional ability and need coordinated management; 3) the fact that over 60% of all care in the community is provided by unpaid informal caregivers; 4) the fact that the number of professionals trained to work with older adults is not increasing - especially in medicine and nursing; and 5) the need to coordinate both health and social services to fully meet the needs of this popula-

tion. For these reasons, the IOM Report strongly recommends developing and disseminating new models of care; some promising models, the policy activities necessary to support them and their implications for social work will be examined.

SESSION 1575 (SYMPOSIUM)

CAPITOL HILL UPDATE: HOW BUDGET AND POLICY DECISIONS ARE SHAPING THE FUTURE OF MEDICAL RESEARCH

Chair: *A. Gafni, Biophysics, University of Michigan, Ann Arbor, Michigan*

Discussant: *G. O'Neill, The Gerontological Society of America, Washington, District of Columbia*

Reinvesting in medical research was one of President Barack Obama's most prominent campaign themes and an early focus of his new administration. This session will reflect on how much progress the President has made in fulfilling his campaign promise to significantly increase federal funding for research and explain the role Congress plays in making decisions about spending priorities. It will also explore emerging policy issues that are shaping the future of medical research, including a new report from the Institute of Medicine (IOM) concluding that the HIPAA Privacy Rule does not protect privacy as well as it should and is currently impeding important health research. The report recommends an entirely new approach to protecting privacy in health research and also suggests a series of changes to improve the rule and the guidance that the Department of Health & Human Services provides on how to comply with the existing regulations. Participants in this session will gain an understanding of how they can use their expertise as researchers to advocate for and influence Congress and policymakers as well as learn about tools and resources that are available to help individual citizens monitor key legislative and policy developments affecting medical research.

SESSION 1580 (SYMPOSIUM)

ADAPTING AND TRANSLATING EVIDENCE-BASED CAREGIVING INTERVENTIONS: CONCEPTUAL ISSUES, PRACTICAL CHALLENGES, AND FUTURE CONSIDERATIONS

Chair: *J.E. Gaugler, School of Nursing, University of Minnesota, Minneapolis, Minnesota*

Discussant: *S.H. Zarit, The Pennsylvania State University, University Park, Pennsylvania*

Multi-component psychosocial interventions appear effective in enhancing caregivers' psychosocial outcomes and delaying institutionalization of cognitively impaired older adults. The current challenge facing researchers and practitioners is to devise viable strategies to translate and/or adapt these intervention models to meet the needs of diverse caregivers. The objective of this symposium is to highlight these ongoing efforts. The initial speaker, Dr. Louis Burgio, will provide an overview of conceptual and practical issues related to the translation of caregiving interventions. Dr. Burgio is at the vanguard of this issue based on his ongoing research to apply translational science to the study of caregiving interventions. The 2nd speaker, Dr. Mary Mittelman, is the principal investigator of the pioneering New York University Caregiver Intervention (NYUCI). Dr. Mittelman will summarize some of the issues and challenges that have arisen based on various stakeholders' efforts to translate the NYUCI. The 3rd speaker, Donna Walberg, is project director of an Administration on Aging sponsored effort to translate the NYUCI for spouse caregivers across the state of Minnesota; an overview of the process of implementation will be emphasized. Dr. Joseph Gaugler will then summarize the ongoing challenges in modifying the parent NYUCI for replication in a different geographical context and target sample. The symposium will conclude with Dr. Steven H. Zarit as

discussant. As an internationally-renowned researcher of dementia caregiving, Dr. Zarit will offer frank insights into the challenges posed by these presentations, in addition to providing key strategies for researchers and practitioners to consider when translating caregiver interventions.

IS THERE A SCIENCE OF TRANSLATION?

L.D. Burgio, School of Social Work, University of Michigan, Ann Arbor, Michigan

In 2002, Dr. Elias Zerhouni, then Director of NIH, referred to translation as an emerging science, and called for a concerted effort to develop new procedures, methods, and designs to develop translation into a mature science. Seven years after Zerhouni's call for action, there is still no consensus on strategies for translating interventions found efficacious in randomized clinical trials (RCT), for feasible use in the community settings. There are several reasons for this slow rate of progress. Two major reasons are: 1) social-behavioral RCTs are almost always tests of treatment packages using multiple treatment components. To develop a scientific process of translating interventions, it is extremely important to know which Treatment components are critical and which are not. Unfortunately, not a single caregiver intervention has used a component analysis design to identify critical treatment components; 2) an effectiveness study would provide valuable information to investigators prior to community implementation. Again, however, no caregiver intervention package has been run as an effectiveness trial. To demonstrate these points, the presenter will describe a study where community-based participatory research methods were used to translate the REACH II RCT for feasible use in the community. After attending this event, participants will gain knowledge regarding the challenges facing translation efforts, and they will be able to define one strategy for translating interventions.

THE NYU CAREGIVER INTERVENTION, THE ORIGINAL STUDY AND ISSUES IN EARLY TRANSLATIONS IN DIVERSE COMMUNITY SETTINGS

M.S. Mittelman, C. Epstein, Psychiatry, NYU Langone School of Medicine, New York, New York

The NYU Caregiver Intervention (NYUCI) has demonstrated efficacy for spouse-caregivers in a randomized controlled trial in a major metropolitan area, and is now being replicated with adult-child caregivers and translated in communities in several geographic areas and socio-economic (SES) groups. The original intervention had significant effects on social support, symptoms of depression, reactions to patient behavior and self-reported health of spouse-caregivers, which resulted in major delays in nursing home placement of patients. We will describe the design and results of the original intervention and challenges to translation in community pilot studies in rural Vermont and New York City (Medicaid Managed Care participants and Latino caregivers). Challenges include dispersed families in Vermont and requirements for case-management services among participants in low SES families in New York. Education and ongoing communication between the researchers and social service and health care providers have overcome many barriers and increased utilization of the NYUCI.

THE MINNESOTA TRANSLATION OF THE NEW YORK UNIVERSITY CAREGIVER INTERVENTION

D. Walberg, Minnesota Board on Aging, Minnesota Department of Human Services, St Paul, Minnesota

Minnesota was selected by the US Administration on Aging as AoA's first translation site for the groundbreaking New York University Caregiver Intervention (NYUCI). This project, known in Minnesota as Family Memory Care, is attempting to translate the NYUCI to rural Minnesota. It is the goal of Family Memory Care to embed the NYUCI into existing caregiver coach practice as a component in the continuum of caregiver supports. This session will outline the steps taken from planning through implementation. This session will also highlight the range

of challenges and strategies devised to address translation of the NYUCI within the RE AIM framework. The RE AIM framework is a guide and method of documenting the process and impact of the translation in addition to key original outcome measures. Participants will be able to identify the key issues of translating a multi component research intervention to a successful community based intervention while maintaining results similar to the original study.

ADAPTING THE NEW YORK UNIVERSITY CAREGIVER INTERVENTION FOR ADULT CHILD CAREGIVERS: KEY CHALLENGES AND ISSUES

J. Gaugler, K. Kellis, M. Reese, *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

The New York University Caregiver Intervention (NYUCI) has yielded consistent success in reducing caregiver psychosocial distress and delaying nursing home admission for cognitively impaired care recipients. Among the NYUCI's strengths are its multi-component treatment strategy, randomized controlled design, and long-term follow-up. However, findings are limited to one experimental site and spouses of Alzheimer's patients. This presentation will summarize an ongoing research effort at the University of Minnesota that is attempting to expand the scope of the NYUCI by focusing on adult child caregivers (called the NYUCI-Adult Child protocol). This presentation will summarize the overall design of the NYUCI-Adult Child project and highlight how this intervention model has deviated or aligned with the original NYUCI design. Attendees will gain an appreciation of the benefits and challenges of adapting an evidence-based caregiver intervention for a target sample that varies from the original evaluation in terms of geography and clinical need.

SESSION 1585 (SYMPOSIUM)

AGING AND THE LIFESPAN: LONGITUDINAL STUDIES IN THE 21ST CENTURY – THE NEW LOOK

Chair: N. Ram, *Pennsylvania State University, University Park, Pennsylvania, Max Planck Institute for Human Development, Berlin, Germany*

Discussant: F. Blanchard-Fields, *Psychology & Aging, Washington, District of Columbia*

The study of aging is moving from more static representations of phenomena to more dynamic ones. The need for articulating and testing such process-oriented perspectives on human functioning and development has demanded the revision of existing or the proposal of new theoretical approaches, methodologies, and types of longitudinal data collections. In this symposium, we explore what the "post-modern" longitudinal study looks like, and illustrate how such designs can be used to capture the dynamic and complex changes in behavior that occur with time and age. N. Ram introduces concepts of intraindividual variability and change and considers the substantive and methodological possibilities they offer for studying dynamic aspects of human function. S. MacDonald highlights new methods for examining the aging of the neuro/biological sub-systems that support everyday function, second-by-second. F. Schmiedek illustrates how capturing and modeling hour-to-hour and day-to-day changes in function can provide new clues about aging processes. M. Sliwinski discusses the contemporary advances in ambulatory data collection and longitudinal design that allow for expanded examination of how momentary stress translates into health, function, well-being, and ultimately disease and decrement. F. Blanchard-Fields integrates the four papers and highlights from the Editor's perspective the trends toward intensive longitudinal data collection and process-oriented inquiry she sees emerging in the literature across a broad array of substantive areas. Together, we attempt to provide a broad overview of the leading edge in the study of aging as a dynamic process unfolding over days and decades.

INTRAINDIVIDUAL VARIABILITY AND CHANGE: TOOLS FOR EXAMINING THE AGING OF DYNAMIC CHARACTERISTICS AND PROCESSES

N. Ram, D. Gerstorf, *Pennsylvania State University, University Park, Pennsylvania*

This paper provides an introduction to and descriptive frame for the combined study of intraindividual variability and aging. At the conceptual level, we highlight that the study of intraindividual variability provides access to dynamic characteristics – construct level descriptions of individuals' capacities for change (e.g., plasticity), and dynamic processes – the systematic changes individuals' undergo to adjust to endogenous and exogenous challenges (e.g., regulation). At the methodological level, we review how quantifications of gross intraindividual variability (e.g., iSD) and models of patterned intraindividual variability (e.g., time series) are being used to measure and describe dynamic characteristic and processes. Finally, at the research design level, we point to the benefits of measurement burst study designs, wherein data are obtained across multiple time scales, for the study of aging.

NEURAL UNDERPINNINGS OF WITHIN-PERSON VARIABILITY IN COGNITIVE FUNCTIONING AND AGING

S.W. MacDonald¹, S. Li², L. Bäckman³, *1. Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. Max Planck Institute for Human Development, Berlin, Germany, 3. Karolinska Institutet, Stockholm, Sweden*

Intraindividual variability (IIV) reflects systematic but transient within-person changes in performance, such as trial-by-trial fluctuations in response latency. Increased IIV in cognition is associated with aging-related processes including cognitive decline, physiological deficits, and neurodegenerative pathology. Despite advances in the study of IIV, there has been little examination of underlying neural correlates and virtually no synthesis of extant findings. The present talk summarizes accumulating empirical evidence that links age-related increases in IIV to neural correlates at the anatomical (gray- and white-matter integrity), functional (BOLD activation), neuromodulatory (dopamine), and genetic (COMT) levels. Alterations in dopamine (DA), for example, are of particular interest as populations that exhibit neuromodulatory DA changes also exhibit increased behavioral IIV (the elderly, ADHD children, schizophrenics, Parkinson patients); recent findings clearly link IIV to DA D2 receptor binding. We conclude by highlighting important challenges and outstanding research issues that remain to be answered in the study of IIV.

INTRAINDIVIDUAL VARIABILITY WITHIN AND ACROSS DAYS

F. Schmiedek^{1,2}, M. Lövdén^{3,1}, M. Riediger¹, G. Wagner^{4,1}, U. Lindenberger¹, *1. Max Planck Institute for Human Development, Berlin, Germany, 2. Humboldt-Universität, Berlin, Germany, 3. Lund University, Lund, Sweden, 4. German Institute for Economic Research, Berlin, Germany*

When investigating age differences in variability of cognitive performance from day to day, it is important to also take variability at faster time scales into account, because age differences in such lower-level variability can influence results at the daily level. Here, data from two studies with repeated measurements across many occasions are reported: (a) the COGITO Study, in which 101 younger (20-31 years) and 103 older (65-80 years) adults worked on a battery of 12 cognitive tasks and self-report measures for 100 daily occasions, and (b) a study with 378 participants (14-86 years) who completed 54 assessments of performance on a working memory task as well as self-report measures via cell phones in their daily lives. Methodological approaches to take into account variability at different time scales within a multilevel modeling framework as well as approaches based on formal models from cognitive psychology are presented and discussed.

MEASUREMENT BURST DESIGNS IN DEVELOPMENTAL HEALTH RESEARCH

M. Sliwinski, *Pennsylvania State University, University Park, Pennsylvania*

Questions about variability and change in human behavior lie at the heart of the developmental sciences. This presentation examines the use of the measurement-burst design as an approach to study within-person processes that transpire over very different temporal intervals. Consisting of repeated bursts of intensive (i.e., daily or momentary) assessments, the burst design can augment the type of information obtained from conventional daily diary and prospective longitudinal designs. Discussion will examine how the measurement-burst approach can improve detection of long-term intraindividual change, and how it can be used to link intraindividual variability and change observed over short-term temporal periods (e.g., daily stress processes) with long-term developmental and health outcomes.

SESSION 1590 (POSTER)

ATTITUDES & VALUES

THE PERCEIVED AGEISM AND DISCRIMINATION OF THE ELDERS AFTER HIP FRACTURE

Y. Huang^{3,1}, S. Tang⁴, L. Chen^{3,2}, L. Tsai¹, H. Cheng¹, I. Yu^{3,1}, Y. Li¹, Y.L. Shyu³, 1. *Chang Gung Institute of Technology, Taoyuan, Taiwan*, 2. *Yuanpei University, Hsin-Chu, Taiwan*, 3. *Chang Gung University, Taoyuan, Taiwan*, 4. *Ming Chuan University, Taoyuan, Taiwan*

Hip fracture is one of the causes that tremendously affect daily activities and walking abilities of elders. After hip fracture, patients often reduce their activity function for a period of recovery time. Previous researches have proved that good family and social support would improve the physical and psychological outcomes of the elders with hip fracture. The other studies demonstrated that ageism or disable discrimination would impact the elders' mental and physical functions. However, little is known about these experiences of the fractured elders. Purpose. The purpose of this research is to understand (1) the perceived ageism or discriminations, and (2) the uncomfortable feelings and responses to these experiences of the elders with hip fracture. Data and Methods. This is a qualitative follow-up study. Patients above 60 year-old with hip fracture were recruited at Chang Gung Medical Center in northern Taiwan. Interviews were conducted in 1st, 2nd, and 3rd month after discharge by home visiting. Transcribed information was analyzed using content analysis technique described by Miles and Huberman. Results. Four male and seven female hip fractured elders complete the interviews during Jun 2007 to Dec 2008. Two categories of ageism experiences were identified, be thought feeble and isolated. Three categories of responses, aloofly neglected, acceptance, and active rehabilitating, were identified. Conclusion. All cases have experienced more or less ageism, but can manage it. The experiences, feelings and responses are no difference by sex and age. During the period, the ageism experiences still exist, but the uncomfortable feelings and responses gradually diminish.

CROSS-CULTURAL INTERGENERATIONAL COMPARISONS OF ATTITUDES TOWARDS AGING AND PHYSICAL ACTIVITY

L.K. Josyula, R.M. Lyle, *Purdue University, West Lafayette, Indiana*

An online cross-sectional survey examined 475 adults (239 men and 236 women) on physical activity (PA) level, personal and environmental barriers to PA, and attitudes towards personal aging. Participants were classified by citizenship and residence, as 'Indians in India' (II) (n = 146), 'Indians in USA' (IA) (n = 119), or 'Americans in USA' (AA) (n = 210). Groups differed on self-rated general health (II < IA and AA), occurrence of preventive examinations (II < IA < AA), and several barriers to PA. II reported the barriers to PA 'inadequate access' and 'lack

of inexpensive facilities' more than did IA. With 'country raised in' rather than citizenship as the classifier, it was observed that participants raised in India reported lower PA levels (2.94+1.99 vs 3.58+2.27) and more optimistic attitudes towards aging (12.11+14.52 vs 9.05+ 13.85) than did those raised in USA. Residents of USA reported higher levels of PA (3.42+ 2.20 vs 2.70+1.87), and lower overall barriers to PA (4.95+3.62 vs 5.77+4.14) than did residents of India. With participants classified by country raised in, and residence, rather than citizenship, results suggest considerable influence of upbringing on attitudes towards aging and personal barriers to PA, and the impact of residence on environmental barriers to PA. Correlations indicate that enhanced PA may hold the key to a more positive evaluation of personal health and expectations of aging. Barriers reported call for PA-promoting improvements in the built environment and cultural support, particularly in India, where access and affordability of facilities are suboptimal.

PREDICTORS OF MEDICAL STUDENTS' ATTITUDES AND PREPARATION TO COMMUNICATE WITH PATIENTS ABOUT END-OF-LIFE CARE

E. Bower, *Psychology, West Virginia University, Morgantown, West Virginia*

Excellent communication between physicians and patients about end-of-life care (EOLC) is a hallmark of patient-centered care. However, medical students receive limited training on how to communicate with patients about EOLC, and may graduate with negative attitudes about EOLC (Sullivan, Lakoma, & Block, 2003). To be able to improve curricula, first it is important to characterize the current training experience. Medical students at the West Virginia University School of Medicine (n = 169) completed measures about EOLC, including the students' self-rated preparation to provide care, attitudes, knowledge, learning experiences, and perception of a "hidden curriculum" or informal messages about the value of dying patients. Results indicated that didactic education and hidden curriculum predicted students' self-rated preparation to provide care, for example. Knowledge of EOLC predicted attitudes about communicating with patients about EOLC. The findings suggest that in the future, didactic education, hidden curriculum, and knowledge are worthy of further examination, and may be areas to target to improve medical student education.

DO POSITIVE PERCEPTIONS OF AGING INFLUENCE WELL-BEING IN OLDER ADULTS?

J. Morack, L. Ryan, J. Smith, *University of Michigan, Ann Arbor, Michigan*

It has been suggested that feeling positive about how you are aging has important implications for health and longevity. We extended previous research on correlates of personal experiences of aging among older adults by examining associations with personality and a general sense of well-being. To do this we used a 2004 subsample aged 50 and over from the representative Health and Retirement Study (N = 3113). Two stepwise hierarchical regressions were used to evaluate correlates of aging satisfaction and life satisfaction. The predictors in both analyses included sociodemographic variables, health indicators, psychosocial factors, and personality [optimism, control]. The final step of the analysis predicting life satisfaction included aging satisfaction as a covariate. Greatest satisfaction with aging was associated with greater optimism together with better subjective health, less loneliness, and more positive and less negative social support. In the second model examining life satisfaction, it was found that aging satisfaction contributes over and above all other predictors included. Aging satisfaction uniquely explained three percent of the variance in life satisfaction. This provides evidence that positive perceptions of aging influence well-being in older adults. These findings indicate that feeling positive about how you are aging is not simply an artifact of an optimistic personality and health. Future research should investigate the mechanisms underlying pathways that contribute to people feeling satisfied with their aging.

ATTITUDES TOWARD AGING AMONG A POPULATION OF CLINICAL PSYCHOLOGY STUDENTS

S.A. Ogbeide¹, C.A. Neumann¹, K.H. Sorocco², 1. *The School of Professional Psychology at Forest Institute, Springfield, Missouri*, 2. *The University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Sources of disinterest in geropsychology have been attributed to negative stereotypes toward aging and graduate programs being slow to adopt gerontology and geropsychology courses into their curricula (Hinrichsen & McMeniman, 2002). This study examined the attitudes of clinical psychology graduate students toward personal aging. Age and gender were assessed in relation to attitudes towards aging. One-hundred seventy students ($n = 170$) participated in the study. The Reactions to Ageing Questionnaire (RAQ) was used to assess personal reactions to aging. Data on contact with an elderly individual was also collected to assess the effects on attitudes. Of the three aging categories (gerophobe, neutral, and gerophile), the results show that most students were in the neutral category ($n = 164$, $M = 103.27$, $SD = 7.09$), a limited amount were in the gerophile category ($n = 6$, $M = 122.00$, $SD = 1.41$), and none were in the gerophobe category. A factorial ANOVA showed that there was not a significant interaction between age, gender, and aging attitudes ($F(2, 164) = 1.95$, $p = .14$). The results also showed no difference in the degree of contact with an elderly individual ($F(1, 168) = 2.51$, $p = .11$). Educators aiming to incorporate gerontological learning opportunities into their curricula should not assume that student attitudes are in accord with traditional aging attitudes in the United States. If negative attitudes are decreasing, why is there reluctance for geropsychology practice? Implications for gerontology training and curriculum development in order to encourage positive aging attitudes are examined.

“OLD TALK”: AN INITIAL EXPLORATION OF THE PREVALENCE OF AGEIST SELF-TALK

A.M. Stripling, M. Heesacker, *Psychology, University of Florida, Gainesville, Florida*

This investigation researched adults' use of self statements about or related to being old. Participants' "old talk" was captured through the use of Flanagan's Critical Incident Technique. Participants 18-80 years old ($n = 140$) recalled incidents in which they uttered or thought phrases identifying them as old. Fifty-six percent of participants recalled at least one incident of "old talk". Statements appeared to fall into three categories of being old (a) specific *illnesses, pains, or physical limitations* as indicators (35.4% of the sample; "My back hurts-I feel like an old lady"), (b) *social* indicators (11.4% of the sample; "You're dating an old man"), and (c) *mental* indicators (9.2% of the sample; "My memory isn't what it used to be, I must be getting old"). The most prevalent incidents within the *illnesses, pains, or physical limitations* category involved experiencing pain and stiffness. The most prevalent ones in the *mental* category involved memory and recall. Those in the *social* category frequently identified decreases in stamina as affecting participants' social life. The number of reported incidences of "old talk" was linearly related to age: $F(1,135) = 6.01$, $p < .02$. Younger adults reported less "old talk" than older adults. There was also a curvilinear relationship $F(3,133) = 5.76$, $p < .01$ comprised of two upward linear trends, one from teens to adults under 30 and another from adults in their 30's to the oldest-sampled adults. These two linear trends parallel the shift from time lived to time left that reportedly occurs around middle age.

WHAT CONSTITUTES TRUST WHEN INCLUDING PAID CAREGIVERS IN THE HOME-BASED CAREGIVING TEAM?

D.C. Lewis, W. Cho, *Child and Family Development, University of Georgia, Athens, Georgia*

Paid caregivers can be valuable assets in relieving family caregivers from many of the tasks associated with providing care for aging family members; yet, including paid caregivers in the home-based caregiving

team also can increase family caregivers' stress. While it has been argued that increasing the numbers of paid caregivers in the home-based caregiving team is important, it is equally important to understand positive and negative effects the introduction of paid caregivers have on family caregivers' stress and on family relationships. To explore family caregivers' experiences in utilizing paid caregivers, in-depth interviews were conducted with nine family caregivers. This study found that family caregivers defined satisfaction with paid caregiving and trustworthiness as the belief that paid caregivers would always act in the best interest of care recipients. Paid caregivers' abilities to perform care-related tasks were not primary contributors of family caregivers' satisfaction and trustworthiness in paid caregivers. Instead, family caregivers identified personal characteristics as critical components for a satisfactory experience in use of paid caregivers. Some of these features were personality and previous relationships with the paid caregiver, the formation of relationship characteristics between the care recipient and the paid caregiver (i.e., developing friendships), and family caregivers' accessibility to paid caregivers' background and references. Finally, a focus by the paid caregiver on safety in the physical environment influenced family caregivers' levels of stress. Trust of the paid caregiver was critical for family caregivers to achieve emotional/psychological relief and satisfaction with the inclusion of paid caregivers in the home-based caregiving team.

“IT MAY NOT BE THE IDEAL LIFE, BUT IT’S OUR LIFE”: PRIVACY, SAFETY & CONTROL AMONG CAREGIVERS

L. Reddecliff, E. Slominski, J. Kinney, C. Kart, *Gerontology, Miami University, Oxford, Ohio*

Researchers have amply documented that an overarching concern for family members who provide care for a person with dementia is assuring the safety of that individual. This research explores the perceptions and values of safety, privacy, and personal control among family members who care for a relative with dementia. Following an interview guide, researchers conducted individual interviews with 27 people (19 female) who ranged in age from 40 to 88 years old and had provided care for an average of 50.185 months (range = 6 – 264). Audio taped interviews were transcribed and analyzed using ALTASti software. Findings include: 1) social scientists define safety, privacy and control differently than do caregivers; 2) caregivers do not/can not think of these key values with respect to themselves, but rather in the context of their role as caregiver and/or their relationship with the person with dementia; and 3) there is a disconnect such that caregivers claim that they do not have "issues" with these values, but then elaborate a multitude of ways in which they proactively confront these values in caregiving. For example, one caregiver said that she has no safety concerns in the house, but then stated "I worry about her wandering out and then I don't feel I can leave her alone at any time actually." Another stated that he has no issues with safety, "but 'I'm checking constantly (on her)." [Funded by NIA AG029224]

CAREGIVERS' ACTUAL TIME USE: WHAT DO THE BEHAVIOR DIARIES SAY?

M. Kaschak, S. Tarrant, J. Kinney, C. Kart, *Gerontology, Miami University, Oxford, Ohio*

Despite frequent characterization of family caregiving to a relative with dementia as 24 hours/day, 7 days/week, relatively little research has investigated caregivers' actual time use. Eleven caregivers, predominantly female (81.8%), completed a time diary in which they reported, for the immediate past 24 hours, the activities in which they engaged and other descriptive information about each activity. Prior to completing the diary, caregivers were asked the average number of hours per day they typically spend caring for their relative. We hypothesize that any overestimation of time spent caregiving likely reflects preoccupation with the amount of mental energy invested in the caregiving role. Although five caregivers reported spending an average of 24 hours

per day caregiving ($M(11) = 14.27$ hours), the diaries indicated that, on average, caregivers spent more time apart from their relative than with her/him, 6.05 hours per day with their relative. During these hours, caregivers spent more time physically in their relative's presence than actually interacting with her/him ($M_s = 3.74$ and 2.13 hours, respectively). Activities performed while "physically with" the relative with dementia include discretionary activities such as watching television, resting, and visiting with others – activities in which the individual with dementia was not an involved participant. Most time spent interacting with the individual with dementia included helping with basic ADLs and IADLs (e.g., eating, bathrooming, morning and evening routine) and socializing. This distinction lends additional insight into the time commitment of caregivers. Results have implications for the design of interventions for family caregivers.

DOMAINS OF QUALITY OF LIFE: WHAT MATTERS MOST IN THE CAREGIVING CONTEXT?

E. Slominski, M. Kaschak, J. Kinney, C. Kart, *Gerontology, Miami University, Oxford, Ohio*

Despite considerable research and, practice and interest in technology-based intervention to reduce the burden associated with family caregiving to a relative with Alzheimer's disease, the literature is virtually silent on the most fundamental issues introduced by these interventions: the potential conflict/contradiction among individual values of privacy, safety and personal control. As part of a larger evaluation of an Internet-based monitoring intervention, caregivers to a relative with dementia completed quantitative scales designed to assess twelve domains of quality of life (e.g., spiritual well-being, having meaningful relationships, security/safety; Kane et al., 2003) and completed qualitative interviews that included questions about the values of privacy, safety and control in the context of caregiving. Participants were 27 caregivers (19 female) who ranged in age from 40 to 88 years old and had provided care for an average of 50.185 months (range = 6 – 264 months). Results indicated that, Although caregivers indicated that all twelve domains of quality of life were at least somewhat important to them, when asked to indicate which single domain was most important, spiritual well-being ($n = 9$) and having meaningful relationships ($n = 4$) emerged as most important. Interestingly, whereas 3 caregivers each indicated that security/safety and autonomy was the single most important domain of quality of life, the remaining domains of quality of life that we conceptualized to be most important in the caregiving context (i.e., personal control and privacy) were not identified as the most important domain of any of the caregivers. Results are supplemented with excerpts from the qualitative interviews. [Funded by NIA AG029224]

EXPLORING PREFERENCE FULFILLMENT IN A NURSING HOME SAMPLE

K. Van Haitsma¹, K. Curyto², G. Towsley^{1,3}, 1. *Polisher Research Institute, North Wales, Pennsylvania*, 2. *VA Western NY Healthcare System, Batavia, New York*, 3. *University of Utah, Salt Lake City, Utah*

Psychosocial preferences (e.g., type and amount of social contact, activities, control and independence, caregiver characteristics, and routines) make up the quality of daily life but are not assessed systematically or comprehensively in long-term care. This project builds upon the development of the Preferences for Everyday Living Inventory (PELI) with cognitively intact community elders. The PELI includes 57 items that relate to five preference domains: Caregivers and Care (10 items), Diversionary Activities (8 items), Growth Activities (14 items), Self Dominion (15 items), and Social Contact (10 items). Twenty residents with dementia completed the PELI with the help of a research assistant. Twelve residents scored as moderately impaired ($MMSE=13-24$) and 8 residents scored as mildly impaired ($MMSE=24-29$). Participant profiles were generated graphically and in care planning goal formats and analyzed by residents and nursing home staff qualitatively. The PELI was extended to examine level of preference fulfillment in a

sample of nursing home residents ($N=40$) with and without cognitive impairment. Nursing homes deliver care through multiple disciplines and to ensure content validity of PELI fulfillment, 16 experts were identified: Eight with research expertise and eight with clinical experience in the areas of direct care, nursing, activity therapy, occupational therapy, dietary, social work, environmental services, and administration. These experts rate item relevance to determine content validity based on $p=.05$ standard error to determine level of agreement to ensure the most relevant domains and items were included. Results of this feasibility trial will be discussed in light of implications for person-centered care in nursing homes.

OLDER COMMUNITY DWELLING ADULTS' BELIEFS ABOUT OLD AGE AND SELF-ASSESSED HEALTH EXPECTATIONS

J. Cunningham¹, J. Sirey², M.L. Bruce², 1. *Yale University, New Haven, Connecticut*, 2. *Weill Cornell Medical College, White Plains, New York*

BACKGROUND: Beliefs that functional and cognitive decline are inevitable consequences of increasing age are challenged by findings of the importance of health behaviors and lifestyle factors in late-onset morbidity and disability. Negative aging beliefs can have implications for the mental and physical functioning of older adults. **METHODS:** 149 congregate meal program participants were asked to list words that came to mind when they thought of 'a typical old person' (Freelist method) during a telephone interview. At an earlier in-person interview, respondents' ratings of present health and health expectations were collected. **FINDINGS:** 81% of subjects ($N=120$) were female, 37% Black, 48% had >1 IADL impairment, with a mean age of 78. Respondents offered more negative to positive age beliefs at a ratio of 2:1. Most (80%) rated their health expectations as good/excellent. Those respondents who rated their health expectations as poor/fair gave more negative old age associations than those respondents who rated them as good/excellent ($p<.01$). Among those adults who rated their expectations as poor/fair, 73% offered no positive aging beliefs versus 51% of those who rated their expectations as good/excellent ($p<.05$). Logistic regression found health expectations for all respondents were associated with number of negative beliefs, even after controlling for number of IADL impairments and present health. **CONCLUSION:** The potential role of positive aging beliefs to influence the association of negative beliefs with health expectations and to encourage health promotion activities (e.g., physical activity, diet, fall assessment) warrants further investigation.

SESSION 1595 (PAPER)

CANCER IN THE LIVES OF OLDER ADULTS

OLDER MINORITY BREAST CANCER SURVIVORS: OUTCOMES OF A BEHAVIORAL INTERVENTION

R.F. Young¹, Z. Djuric², 1. *Wayne State University-Medicine, Detroit, Michigan*, 2. *The University of Michigan, Ann Arbor, Michigan*

African American women have higher breast cancer mortality than whites and are more likely to be obese. Recent clinical trials that tested the impact of lifestyle interventions on cancer recurrence included few older African Americans. This study enrolled 37 African American breast cancer survivors (mean age 60) in need of behavioral change (mean body weight = 190 lbs.; BMI = 32; 33% of calories from fat). A 12-month population-specific lifestyle change intervention included group sessions (4 months) and telephone counseling (8 months). Questionnaire and anthropometric data were collected at entry, post classroom, and at exit. 12-month study completers (68%) improved exercise behavior (+ 3.5 hrs. weekly, $p < .05$), and reduced dietary fat (2.37%) and body weight (1.4 lbs). Over three data collection points weight and BMI showed curvilinear patterns, but both were slightly lower at study exit than at entry. In contrast, exercise gains were maintained over 12 months.

Other gains were: quality of life ($p < .05$); cancer and obesity awareness, motivation, coping ability ($p < .10$). Age effects included: inverse association with study completion ($p < .05$); higher motivation among women aged 60+ ($p = .09$), fewer adverse effects of cancer or its treatment ($p < .05$), and better quality of life than younger women ($p = .08$). Conclusion: Older African American breast cancer survivors benefited from a population-specific lifestyle change program. Weight loss was more difficult to achieve than improvements in physical activity. Age effects were found primarily in study retention and quality of life.

PATIENT-PROVIDER COMMUNICATION: HISPANIC ELDERS AND COLORECTAL CANCER SCREENING

T. Cadet¹, P. Maramaldi^{1,2,3}, 1. Simmons College, Boston, Massachusetts, 2. Massachusetts General Hospital, Boston, Massachusetts, 3. Harvard Medical School, Boston, Massachusetts

We conducted a secondary analysis of focus group data, collected from rural Hispanic and Caucasian elders aged 65 and older living in the Mountain West, regarding their attitudes toward colorectal cancer and colorectal cancer screening. The original study sample ($N=24$) included 11 Hispanic and 13 Caucasian participants, with a mean age of 75.2 (SD 7.38). The purpose of our secondary analysis was to develop approaches using cultural communication theory to promote healthy behaviors among Hispanic and Caucasian elders. This analysis focused on the role of cross-cultural communication between patients and providers as a factor influencing Hispanic elders' knowledge of colorectal cancer screening. Constructs from international cross-cultural communication theory, collectivism, time orientation, and power distance, underscore the importance of culturally nuanced communication among Caucasian and Hispanic elders. Furthermore, findings provide formative data that suggest approaches to enhance culturally and linguistically relevant communications when non-Hispanic providers or investigators interact with Hispanic elders. Our findings resulted in specific recommendations for using cross-cultural communication theory to promote colorectal cancer screening, and supported the IOM health disparities report (2004), which recognized the relationship between cultural health beliefs and a range of health behaviors, including preventive measures such as screening.

CANCER LITERACY IN ELDERLY REFUGEES: HOW MUCH DO THE FIRST HMONG GENERATION KNOW ABOUT CANCER?

H.Y. Lee, P. Yang, School of Social Work, University of Minnesota, Twin Cities, St. Paul, Minnesota

Studies investigating cancer in Hmong Americans are extremely limited. Existing literature has mainly focused on cancer epidemiology, including mortality and incidence. To close the knowledge gap, this paper aims to examine cancer literacy which encompasses meaning, beliefs, etiology, treatment, and prevention of cancer in elderly Hmong refugees. Qualitative research was conducted with a total of 30 face-to-face in-depth interviews. The interviews were recorded and translated into English. Using Atlas ti, 5.0, data was analyzed by utilizing grounded theory. Five themes emerged from the qualitative data: 1) no term or concept on cancer in Hmong language, 2) cancer as death sentence, 3) illiteracy on cancer prevention, 4) spiritual cause of cancer, and 5) shaman ceremony as cancer coping and treatment. Cancer literacy on etiology, treatment, and prevention were tremendously low in this population. The findings suggest that the elderly Hmong have unique cultural views on cancer which is grounded on their socio-cultural backgrounds. The provision of cancer education to this population is urgently needed to improve cancer literacy. Cancer education needs to be disseminated using multiple outlets, as many Hmong are illiterate in their own language and has no term or concept on cancer. The venues of education should be also evidence-informed and/or based and culturally competent, as the Hmong may not believe in the education or intervention offered, especially if it does not share many of the core tenets

of Hmong beliefs in regard to meaning, etiology, prevention, and treatment of cancer.

BARRIERS TO CERVICAL CANCER PREVENTION AMONG MIDDLE-AGED AND OLDER RURAL APPALACHIAN WOMEN

N.E. Schoenberg, C. Studts, J. Hatcher, K. Dollarhide, S. Wright, M. Dignan, Behavioral Science, University of Kentucky, Lexington, Kentucky

Although cervical cancer rates in the U.S. have declined sharply over the past decades, certain groups of women remain at elevated risk, including middle-aged and older women in central Appalachia. As a part of our community-based, participatory intervention, we examined factors mentioned by Appalachian women as barriers to receiving Pap tests. Using the TTM and PRECEDE/PROCEED models, we administered questionnaires to 432 Appalachian women aged 40-64, years when Pap testing declines and cervical cancer rates increase. 69%, 30%, and 1% of participants had not received a Pap test for 2-5 years; over 5 years, and never, respectively. Barriers include predisposing factors (belief that cervical cancer would have symptoms, not wanting to know Pap test results, and perceiving that Pap tests are too embarrassing, upsetting, and time consuming); reinforcing factors (not having a regular source of medical care, not receiving a physician's recommendation, having a family situation preventing them from engaging in screening, having a male physician); and enabling factors (not knowing where to get a Pap test, not using the health department, not having health insurance, perceived Pap tests to be costly, lack of transportation, and having to take time off from work). We discuss descriptive and correlational analyses from our baseline questionnaire and describe how our CBPR intervention is addressing these barriers. This CBPR project, "Faith Moves Mountains" employs a faith-placed, lay health advisor approach to reduce these barriers to Pap tests for traditionally underserved rural women.

SESSION 1600 (PAPER)

CHARACTERIZING MENTAL HEALTH IN DIVERSE POPULATIONS

MENTAL HEALTH SERVICES STRUCTURE: ON COMMUNITY SENIOR SERVICES AND PUERTO RICAN OLDER ADULTS

D. Velez Ortiz, School of Social Work, University of Illinois at Urbana-Champaign, Urbana, Illinois

Objectives and Significance: To examine how the structure of mental health services influences understanding and utilization of those services by Puerto Rican older adults in community senior centers. Having exposure and access to mental health services in community contexts may lead Puerto Rican older adults who use community-based services to lesser stigma toward mental health services and increased service use. **Methods:** The total sample was 167 Puerto Rican older adults in Puerto Rico and New York City. A mixed methods design was used with semi-structured interviews on mental health awareness and mental illness perceptions as well as quantitative measurement instruments containing questions about migration activity, mental health need, awareness and use of mental health services. Regression analyses were performed on quantitative data and thematic analysis on qualitative data. **Results:** Findings indicated that the structure of mental health service is significant for Puerto Rican older adults utilizing senior centers. The significance of the services structure on awareness of mental health services is associated with migration, age, and mental health status. Significance of service structures on utilization of mental health services is associated with age and mental health status while modified by the type of housing where participants reside. Narratives of mental illness differed by structure. **Implications:** A major implication from the results is that to better integrate the delivery of mental health services for older Puerto Ricans in community senior centers, it may be important to conduct a

focused intervention using mental health assessments to identify those with mental health needs.

CONGRUENT VERSUS INCONGRUENT LEVELS OF MENTAL AND PHYSICAL HEALTH: PERSONALITY DIFFERENCES

C.J. Jones¹, C.M. Aldwin², 1. *Psychology, California State University, Fresno, Fresno, California*, 2. *Oregon State University, Corvallis, Oregon*

While physical and mental health are generally positively correlated, the connection is far from absolute, and may become weaker in later life (Aldwin, Gilmer, & Levenson, 2004). The ability to maintain positive mental health in the face of physical declines appears to be a factor in optimal aging. Here, data from members of the longitudinal Berkeley Growth, Berkeley Guidance, and Oakland Growth Studies (N=85) are explored to examine personality differences between those with congruent (high-high or low-low) and incongruent (low-high) levels of physical and mental health. Self-report SF-36 data, collected from participants in 2006, when they were either age 77 (Berkeley Growth or Berkeley Guidance Studies) or 85 (Oakland Growth Study), allow us to classify individuals as either both physically and mentally healthy (44; 52%), both physically and mentally unhealthy (11; 13%), or physically unhealthy but mentally healthy (30; 35%). Personality was assessed via the 20 "folk scales" of the California Psychological Inventory. MANOVA analyses, with Bonferroni post hoc tests, indicate that personality characteristics appear to primarily differentiate those who are both physically and mentally unhealthy from the remaining two groups. Those who report both poor physical and mental health are noteworthy in their low levels of Capacity for Status, Social Presence, Self-Acceptance, Independence, Empathy, Responsibility, Well-Being, Achievement via Conformance, Achievement via Independence, and Intellectual Efficiency. Classification into health type group does not vary by gender, cohort, or marital status. Results indicate the value of disentangling the independent effects of physical and mental health in older individuals.

INTERDISCIPLINARY APPROACH TO ENHANCE RURAL BEHAVIORAL HEALTH CARE: A UNIVERSITY/ACADEMIC PARTNERSHIP

M.R. Crowther, *Psychology, The University of Alabama, Tuscaloosa, Alabama*

About 20% of the US population live in rural areas, which are usually Mental Health Professional Shortage Areas. Across the 3075 counties of the country, 55% have no practicing psychologists, psychiatrists, or social workers. To provide competent and needed behavioral healthcare requires a willingness and an ability to draw on community-based values, traditions, and customs to work with persons of and from the community in developing interventions, support groups, and outreach efforts. In rural and frontier family practice clinics, between 50 and 70% of the patients present with symptoms that are complicated by or due entirely to behavioral health problems. In spite of the need, less than 10% of the healthcare training programs in the US provide training in interdisciplinary collaborative healthcare. To address this gap, our Interdisciplinary team provides healthcare screens on a mobile unit, extensive behavioral healthcare assessments, individual therapy, and an anti-stigma campaign targeting African American elders. The goal of the project is to address issues common to rural mental health, minority aging, and training by supporting: a) community-based approach directed to both enhance the training of scholars and contribute to the well-being of rural elders; b) interdisciplinary collaboration between geropsychology, Rural Medicine, and Social Work; and c) the dissemination of promising practices in rural education and issues related to rural mental health and aging. This proposed presentation will provide an overview of the collaborative process between the different University disciplines and the Rural Community Mental Health Center including resource sharing, program implementation and planned assessment.

SOCIOCULTURAL INFLUENCES ON MENTAL HEALTH SERVICE USE FOR DEPRESSION BY LATINO OLDER ADULTS: EXPLORING THE MEDIATING AND MODERATING ROLE OF SOCIAL SUPPORT

M. Hansen, *University of Southern California, Los Angeles, California*

Background and Objectives: The study investigated the underutilization of mental health services by low-income Latino older adults. The mediation and moderation effects of support on service use were explored while accounting for dimensions of support and sociocultural factors. **Methods:** Secondary data analysis of a cross-sectional survey of older Latinos (n=235) was conducted using path analysis with Poisson regression to assess mediation and moderation models by type of support (emotional and instrumental). **Results:** Findings revealed significant moderation effects across models. Under conditions of low support, low linguistically acculturated Latinos used fewer services. Small variations by type of support emerged with emotional support presenting the best model fit. The direct effects of language acculturation and age remained after controlling for need. **Conclusions:** Findings reveal limited support as a risk factor for the underutilization of mental health services by low acculturated older Latinos as they increase in age. Integrating support resources that assist in navigating service systems and address language barriers can enhance service use by Latino older adults. Implications for outreach and screening are discussed.

SESSION 1605 (PAPER)

CONTEXTUAL INFLUENCES IN NURSING HOMES

THE ROLE OF LEADERSHIP IN FACILITATING SUSTAINABLE CULTURE CHANGE IN IRISH NURSING CARE SETTINGS

L.E. Carragher, A. Coyle, R. Bond, B. Lynch, *DKIT, Dundalk, Ireland*

Introduction The Irish Health Service Executive is supporting an evaluation of the Teaghlach Model on the culture of two of its nursing homes. The Teaghlach Model promotes person-centred care in a home-like environment, with domestic style units or households where residents direct their own lives, supported by consistent and valued teams. While person-centred care is acknowledged as the best outcomes for patients (Farley, 2001) and nursing care staff are increasing expected to deliver the necessary changes in the culture of organisations (Health Information and Quality Authority, 2008), sustainable cultural change remains largely an aspiration for nursing homes. The aim of this study is to explore the role of leadership in facilitating sustainable culture change in nursing home settings. **Method** A mixed-methods approach was used to gather data pre-and-post implementation, involving interviews, observations, and focus groups with staff, residents and family members to provide an insight into working practices and attitudes to interventions. Data analysis was based on grounded theory. **Results** Preliminary results suggest care staff are supportive of the underlying ethos linked to culture change, but have many concerns around health and safety issues. **Discussion** Preliminary findings from this study point to a need for more open debates on the tensions between health and safety and quality of life of residents. Ongoing support has emerged as an important factor in terms of the meaningful engagement of resident and staff and the sharing of values, beliefs and norms.

TOWARD AN UNDERSTANDING OF AND SOLUTIONS FOR HOME MAINTENANCE AND MANAGEMENT NEEDS FOR SUCCESSFUL AGING IN PLACE

C.B. Fausset, A.J. Kelly, W.A. Rogers, A.D. Fisk, *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*

A goal of many older adults is to remain in their own homes as they age (Beyond 50.05 Survey, 2005). However, age-related changes can make living independently (aging in place) a difficult task for many older adults. For example, older adults have described problems and

frustrations in everyday activities including leisure activities, transportation, housekeeping, and home maintenance (Rogers, Walker, Meyer, & Fisk, 1998). The goal of the current study was to specifically explore the arena of home maintenance and management, which is essential for people to successfully age in place. We conducted focus group interviews to determine the specific tasks older adults must perform to manage and maintain their homes. There were multiple groups of six to seven adults per group between the ages of 73 and 85 years (mean age 78.8; 19 women, 7 men). All participants were living independently. Participants described performing a wide range of routine home maintenance tasks and the difficulties encountered when performing these activities. Transcripts were coded using both top-down and bottom-up qualitative coding techniques. We classified participants' solutions to manage these difficulties into three broad categories: "Cessation," "Perseverance," and "Compensation." Exploring these categories offers opportunities for interventions that facilitate older adults to remain living independently in their homes. We discuss the nature of home maintenance problems older adults encounter, provide suggested interventions to those problems and human factors design solutions to alleviate the major problems. Finally, we discuss helping older adults to recognize and predict the difficult home-based tasks.

MEASURING BARRIERS TO IMPLEMENTING EVIDENCE-BASED PRACTICES INTO NURSING HOMES

L.M. Brown¹, K. Hyer¹, L. Polivka-West², *1. Aging and Mental Health Disparities, University of South Florida, Tampa, Florida, 2. Florida Health Care Association, Tallahassee, Florida*

A number of large-scale, multi-site studies have identified factors that influence the use of research and implementation of evidence-based practices by nurses and other clinical staff in medical settings. Because existing measures used by these studies to assess various barriers are not suitable for use with multidisciplinary nursing home staff, the goal of this study was to develop and validate an instrument that was appropriate for use in long-term care settings. The Evidence-Based Practice in Nursing Home Scale consists of 28 items that respondents' rate using a Likert scale format to assess barriers to using research findings and implementing evidenced-based practices in nursing homes. This presentation will describe the steps to develop and validate the measure, identify potential barriers in nursing homes, and provide methods to increase uptake of research and evidence-based interventions by nursing home staff. Because it is unknown what barriers hinder adoption and wide spread use of new interventions by nurses and certified nursing assistants, this measure has the potential to inform researchers, clinicians, and administrators about perceived constraints relative to the culture and resources available within nursing homes. Knowledge of personal and environmental factors affecting implementation is the first step toward developing programs that can enhance and facilitate use of research and evidence-based practices in long-term care settings. Implications for the use of the Evidence-Based Practice in Nursing Home Scale in practice will be discussed.

EVALUATING THE HOMES OF OLDER ADULTS TO ENHANCE AGING IN PLACE

M. Teaford, S. Zavotka, *Allied Med, The Ohio State University, Columbus, Ohio*

Over 90% of older adults want to remain in their long time homes and "age-in-place" (AARP, 2000). Reasons include attachment to home, location, and being close to family members (Hartje, 2004). With arthritis and heart disease, however, they have diminished functional health. Many live in older multi-story homes that pose safety problems. Yet they are reticent to make the changes to their homes due to negative perceptions of aging (Miller and Olson, 2006). The purpose of this study was to determine 1) how well current housing occupied by older adults meets the Universal Design standards that would allow them to age in place and 2) to discover what strategies would encourage making changes

to their homes. Researchers conducted interviews and universal design home assessments with older homeowners living in a major metropolitan area. The sample consisted of 61 homeowners who ranged in age from 65 to 91 years old (median age = 77.6). The majority had several chronic health problems. Average age of homes was 45.1 years. Results of this study indicate that the majority of older adults were living in houses that would not support their desire to age in place. Based on an adaption of a rating system developed by Andes and Beamish (2005), each home was assigned a total universal design score and subtotal scores for safety, accessibility, and convenience. Total universal design housing assessment scores ranged from 10 to 63 out of 100 (mean 40.5).

PLACE-BASED HOUSING ASPIRATIONS OF OLDER ADULTS?

L.E. Carragher, R. McKeever, D. Getty, R. Bond, *DKIT, Dundalk, Ireland*

Introduction We live in an ageing society where people are living longer and have higher expectations for quality of life during old age. These changing demographics and attitudes to old age have profound implications for housing policy. Lifestyle choices need to be taken into account alongside concerns for increases in frailty and dependence. Yet much of the housing literature directed at later life is concerned with increasing frailty, while the housing needs of the majority of well older people has been little remarked upon (Appleton, 2002). This doctoral study uses a multi-dimensional place attachment model to explore the housing aspirations of older people across tenures and in different locations. **Method** A predictive model will be used to explore differences in older adults' housing aspirations and attitudes to place. This model will comprise: age of respondent, number of people living in property, tenure, location (urban/rural), condition of property, perceptions of neighbourhood, and age-friendliness. Data will be generated via a large questionnaire survey (n=1000). This questionnaire will include sections comprising questions on home and community, and health and psychosocial well-being. A 40-item age-friendliness measure has been developed, comprising 8 subscales. **Results** Comprehensive results from this study will be available in June 2009. Preliminary results indicate that the 8 subscales of the age-friendliness measure have good psychometric properties. **Conclusion** Changing attitudes among the older age group present considerable challenges for housing providers. Meeting these challenges must begin with evidence-based practice, and the results of this study will make an important contribution to this.

SESSION 1610 (POSTER)

DEMENTIA - BSS POSTER SESSION

RESIDENT-ASSISTED MONTESSORI PROGRAMMING (RAMP): TRAINING NURSING HOME RESIDENTS TO SERVE AS GROUP ACTIVITY LEADERS

M.J. Skrajner, C. Camp, J.L. Haberman, *Research Division, Hearststone Alzheimer Care, Willoughby, Ohio*

In an ongoing NIMH-funded research study titled "Resident-Assisted Montessori Programming" (RAMP), nursing home residents with early-stage dementia are being trained to lead Montessori-based group activities for persons with more advanced dementia. This presentation will focus on results from the first phase of the study, in which five residents (mean age 71 and mean MMSE total score 22.75) from two facilities were trained to lead two activities: Memories Squared® and Reading Roundtable®. A description of these activities will be provided. Twenty-two resident participants (mean age 82 and mean MMSE total score 19.6) took part in activities conducted by resident leaders. Baseline observations of the participants' engagement and affect during standard, staff-led activity programming were taken prior to the implementation of RAMP programming using the Menorah Park Engagement Scale (MPES). Treatment MPES observations were then taken during activities led by residents. Significant changes from Baseline to Treatment

were found. For example, there was a statistically significant increase from Baseline to Treatment in the percentage of MPES observations for which Pleasure was observed (29% to 44%) and a statistically significant decrease in the percentage of MPES observations for which Other Engagement was observed (26% to 7%). Residents were able to lead activities up to 45 minutes with less than one minute of staff assistance. Preliminary results suggest that nursing home residents are capable filling important social roles. After attending this presentation, audience members will be able to describe the RAMP activities, training procedures used, and outcomes of the first phase of the study.

UTILISING THE EMOTIONAL STROOP TASK TO INVESTIGATE IMPLICIT AWARENESS OF MEMORY DIFFICULTIES IN PEOPLE WITH DEMENTIA AND THEIR CAREGIVERS

A. Martyr¹, S. Nelis¹, L. Clare¹, I. Markova², R. Morris³, I. Roth⁴, R. Woods¹,
1. Bangor University, Bangor, United Kingdom, 2. University of Hull, Hull, United Kingdom, 3. Institute of Psychiatry, London, United Kingdom, 4. The Open University, Milton Keynes, United Kingdom

The emotional Stroop paradigm is based on the observation that individuals respond more slowly to words that are salient to their condition than to neutral words, even when these are not explicitly processed for meaning. This study investigated whether PwD were slower to respond to dementia-related words, such as 'remember', 'forgetful', etc, than to frequency-matched neutral words, such as 'borrowing', 'physical', etc. It was hypothesised that implicit awareness of memory difficulties would lead to a slowing of response times to the emotionally salient dementia-related words. The sample consisted of 79 PwD who were diagnosed with Alzheimer's disease, vascular dementia or mixed AD and vascular dementia, and 85 normal controls, who were caregivers of the PwD. It was found that PwD were slower to respond to emotionally salient words compared to emotionally neutral words. Additionally it was found that carers also responded more slowly to emotionally salient words compared to emotionally neutral words. There was no difference in the size of the effect between PwD and their caregivers. This suggests that PwD demonstrate an implicit awareness of their memory impairments. Therefore, awareness of memory difficulties seems to be retained at an implicit level in early-stage dementia. The emotional Stroop task is a useful method for directly investigating the robustness of the implicit awareness system.

THE INFORMATION BEHAVIOR OF CARERS OF PEOPLE WITH DEMENTIA: WHAT DIFFERENCE DOES A YEAR MAKE?

P.A. Bath, J.A. Harland, *Information Studies, University of Sheffield, Sheffield, United Kingdom*

Understanding the information needs of carers of people with dementia at diagnosis is important as provision of high-quality information may help carers to cope better in the early stages. However, dementia is a long-term condition, which progressively worsens over time, so that the information behavior of the carer may change as they have to cope with new situations and take increasing responsibility for the everyday care of the person with dementia. The aim of this longitudinal study was to investigate the information behaviors of people with dementia. Here we present the results of follow-up interviews with 12 informal carers, just over one year after diagnosis. Qualitative analysis of the transcripts revealed that many carers recognised a deterioration in the person with dementia, which raised new questions about how they should provide the best care and cope with what they perceived to be 'problematic behavior'. Carers wanted the opportunity to talk with medical professionals to try to make sense of these changes, but reported that the only contact that they had were annual check-ups. The carers that used the Alzheimer's Society reported that it was useful for providing practical advice but they also wanted a central hub where medical and social services support and information could be provided as they did not have the

time to consult numerous different sources. Gaining an understanding of the changes that take place over time should help professionals recognize that information and support is required throughout the course of the disease, not just at diagnosis.

A BEHAVIORAL INTERVENTION TO REDUCE AGITATION IN INDIVIDUALS WITH DOWN'S SYNDROME AND DEMENTIA

M. Steers, L. Feliciano, *Department of Psychology, University of Colorado, Colorado Springs, Colorado Springs, Colorado*

The majority of individuals with Down's syndrome (DS) develop dementia of the Alzheimer's type (AD) and the morbidity prevalence increases with advancing age. In fact, as many as 54.9% of individuals with DS develop dementia (Cooper and Prasher, 1998). As a result of the dementing process, residents exhibit challenging behavior; the most common of which is agitation (i.e., physical and/or verbal aggression, restlessness). Agitation can both negatively affect quality of life and increase caregiver burden. While interventions have been developed to effectively reduce these behaviors in individuals with AD and in individuals with DS, a paucity of research has focused on individuals with comorbid DS and AD. The present study extended the current literature regarding the effects of behavioral interventions on reducing agitation to implement and evaluate individualized function-based interventions for individuals with comorbid DS and AD. The interventions were designed based on the results of the Motivation Assessment Scale (MAS: Duran & Crimmins, 1988), which was used to identify possible functions or motivators of behavior. A multiple baseline design across participants was utilized to evaluate the effect of the intervention on agitated behavior. In addition, staff-reported levels of agitation were measured by administering the Cohen-Mansfield Agitation Inventory (CMAI; Cohen-Mansfield, Marx, & Rosenthal, 1989). Case study data detailing the design and implementation of the behavioral interventions will be presented. Implications for care providers' management of problem behaviors will be discussed.

THE RELIABILITY OF SELF REPORTED FUNCTIONAL ABILITY IN MILD COGNITIVE IMPAIRMENT

J. Roberts, L. Clare, S. Nelis, A. Martyr, *Bangor University, Bangor, United Kingdom*

The most commonly used diagnostic criteria for mild cognitive impairment (MCI) require that functional ability is retained, although the limited research in this area suggests that varying degrees of functional difficulty can be observed in people diagnosed with MCI. One reason for this discrepancy may lie in a reliance on self-reported information about functional ability. The present study aimed to compare self- and informant ratings of functional ability in people diagnosed with MCI. Twenty people (mean age 74 years) diagnosed with MCI at a specialist memory clinic and an informant (mean age 68 years; 75% spouses; 80% co-resident with the person with MCI) responded to an 11-item modified functional activities questionnaire (FAQ; maximum possible score 33, with higher scores indicating greater functional difficulty), covering areas such as finances, shopping, hobbies and travel. Most people with MCI recognised some functional difficulty (mean score 3.1, s.d. 3.04, range 0 – 11) and most informants reported higher levels of functional difficulty (mean score 10, s.d. 8.41, range 0 – 30). The majority (85%) of the participants with MCI reported less functional difficulties than did informants (mean discrepancy score 6.9, s.d. 7.8). Correlation between self- and informant report showed a weak relationship ($r = .37$). This lack of agreement between the person with MCI and the informant when rating functional abilities raises the possibility that self-report may be unreliable. Clinicians should consider obtaining corroborative evidence regarding functional ability prior to making a diagnosis of MCI.

THE EFFECT OF SHARED MEMORY IN FORMING FRIENDSHIPS BETWEEN LONG-TERM CARE RESIDENTS WITH DEMENTIA

M.E. Jeresano, 1. Towson University, Towson, Maryland, 2. Copper Ridge Institute, Sykesville, Maryland, 3. The Johns Hopkins University School of Medicine, Baltimore, Maryland

Shared memory (i.e. a common theme discussed between two people through conversation) in residents with varying severity of dementia may play a role in the ability to sustain conversation and form friendships. Observations of 21 residents who live in a long-term dementia facility were recorded with audio and video equipment in a common area through out various times of the day. Conversation material and frequency of conversation between residents were also coded according to subject and theme. Dementia interferes with memory processes and affects the ability to recall personal events from life to share, without this ability, friendships are more difficult to initiate and sustain. When two people are engaged in friendly conversation, recall of past life memories are facilitated. Further research may explain the purpose of friendly relationships among cognitively impaired individuals with dementia and the impact on management of behaviors.

THE INFLUENCE OF LIFE REVIEW INTERVENTION ON COGNITIVE FUNCTION AND ACTIVITIES OF DAILY LIVING IN ELDERLY WOMEN REQUIRING LONG-TERM CARE

H. Uchida¹, Y. Kuwada¹, T. Nishigaki¹, H. Toji¹, S. Ino², K. Araki¹, K. Suei¹, 1. School of Human Science and Environment, University of Hyogo, Himeji, Hyogo, Japan, 2. Ino Hospital, Himeji, Hyogo, Japan

The aim of this study was to clarify whether the life review interventions affected the physical and mental functions of the elderly women requiring long-term care. We investigated the influence of the life review interventions which were performed for a month. The intervened participants were seven elderly women (age 85.7+/-8.3) in a geriatric health services facility, Himeji, Hyogo, Japan. We selected the control group consisting of seven women (88.0+/-2.6) in the same facility. We carried out a baseline survey at the end of January 2008, and the follow-up study was done at the end of February 2008. We evaluated their physical and mental functions using the questionnaires such as Mini Mental State Examination (MMSE), modified Barthel Index, Dementia Behavior Disturbance, Todai-shiki Observational Rating Scale, Minimum Data Set, Vitality Index, and Satisfaction. From the comparisons of the average scores of the questionnaires between pre- and post-intervention using generalized linear model, MMSE score significantly increased in the intervention group ($P<0.05$). In particular, the score of "Delayed Verbal Recall, in which the participants recalled three words we previously asked her to remember", significantly increased ($P<0.05$). These results suggest that life review interventions could improve cognitive function of the elderly women requiring long-term care.

PAIN SCREENING IN PERSONS WITH DEMENTIA

M.L. Jacobs¹, A. Snow^{1,2,3}, M.E. Kunik^{3,4,5}, C. Beck⁶, 1. University of Alabama, Department of Psychology and Center for Mental Health and Aging, Tuscaloosa, Alabama, 2. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, 3. Houston Center for Quality of Care & Utilization Studies, Michael E. DeBakey VA Medical Center, Houston, Texas, 4. VA South Central Mental Illness Research, Education, and Clinical Center, Houston, Texas, 5. Psychiatry & Behavioral Sciences Department, Baylor College of Medicine, Houston, Texas, 6. Geriatrics Department, University of Arkansas for Medical Sciences, Fayetteville, Arkansas

Persons with dementia are at high risk for under-diagnosis and under-treatment of pain, yet it is unclear how to best screen for pain in this vulnerable population. Nursing assistants could potentially be an important source of screening information because of the large amount of time they spend with residents. The main objective of this study was to compare three common pain screening approaches against a palliative care

physician pain rating: chart review, self-report, and nursing assistants behavioral observation. This study was conducted in four community nursing homes and used a cross-sectional design. The sample included 83 residents with moderate to severe dementia. Resident pain self-reports were collected with the Pain Thermometer and questions from the Structured Pain Interview. Chart reviews were conducted to gather information about current pain-related conditions, analgesic use, and any documented pain assessment and management details. Nursing assistant observations were collected with the Non-communicative Patients Pain Assessment Instrument (NOPPAIN) following performance of morning care activities. Palliative care physician consensus pain ratings served as the criterion. Neither chart review information nor self-reports from persons with dementia were significantly correlated with the physician pain rating criterion. Nursing assistant NOPPAIN ratings were significantly associated with the physician pain rating criterion. The NOPPAIN, when administered by nursing assistants, appears to be a valid method of pain screening in persons with moderate to severe dementia. In contrast, self-report and chart review performed poorly as pain screening methods.

PREMORBID PERSONALITY AND ITS RELATIONSHIP TO DEMENTIA BEHAVIORS

A. Reitmaier^{1,2}, C. Kovach¹, 1. University of Wisconsin- Milwaukee, Milwaukee, Wisconsin, 2. Winona State University, Winona, Minnesota

Four to five million Americans are affected currently by dementia and it is considered the leading cause of institutionalization among the elderly. Approximately 90% of clients with dementia demonstrate problematic behaviors, such as vocalizations, aggression, wandering, and delusions, in addition to cognitive and functional losses. These clients also may demonstrate more passive behaviors that often go unnoticed in the long-term care setting. There have been claims that clients with dementia lose themselves during the disease process, however theoretical and empirical evidence suggests that clients with dementia can maintain their sense of self or personhood throughout the dementia process. It is possible that while some changes in personality occur during the progression of dementia, the link between premorbid personality and behavior is retained to a degree that allows some prediction of dementia behaviors from knowledge of premorbid personality traits. The purpose of this study is to examine premorbid personality in clients with dementia and determine if those traits or facets can indeed predict specific dementia behaviors. Descriptive, correlational analysis and predictive regression analysis will be used to examine data in ninety residents from three nursing homes in southeastern Minnesota. This study utilized five separate instruments to measure cognition, functional ability, passive behaviors, aggressive behaviors, and personality traits and facets. With a better understanding of how premorbid personality plays a role on dementia behaviors, health care professionals may be able to implement interventions, improve outcomes, and improve these clients quality of life by understanding their needs.

BEYOND THE OBSERVABLE: EXAMINING SELF-REPORTED EXISTENTIAL WELL-BEING IN PEOPLE WITH DEMENTIA

W. Mak, Washington University in Saint Louis, St Louis, Missouri

The well-being of people with dementia is not well understood. Researchers often measure their well-being through observational methods or via proxies, but self-report is rarely used. Recently there is evidence that people with mild to moderate dementia are able to give reliable reports of their well-being, but empirical work in this area is limited. Most dementia-specific measures focus on mood or life satisfaction, and there are few that gauge more existential aspects of well-being (e.g., purpose in life). This study tested the use of a non-dementia-specific well-being measure in people with mild to moderate dementia. The relationship between goal pursuit, a predictor of well-being, and purpose

in life, an aspect of psychological well-being, was examined through questionnaire and experimental methods. The moderating effect of dementia severity was also investigated. Results showed that people with dementia were able to provide reliable self-report data on their well-being. A strong association between goal pursuit and purpose in life emerged, but dementia severity did not moderate this relationship. Experimental results were similar in that people who participated in a goal-directed activity reported a greater sense of purpose than those who participated in a goal-undirected activity. Implications for the study of well-being in dementia and its application in community settings are discussed. Understanding these relationships will illuminate the experience of psychological well-being in dementia and perhaps inform some methods of shaping activities to enhance psychological well-being.

NO LAUGHING MATTER?: HUMOR AMIDST THE CONCERNS OF ADULT CHILDREN OF PARENTS WITH ALZHEIMER'S DISEASE

L. Hodgson¹, S. Cutler², 1. *Sociology, Quinnipiac University, Hamden, Connecticut*, 2. *University of Vermont-Sociology, Burlington, Vermont*

Past research has shown that adult children of parents with Alzheimer's Disease (AD) exhibit heightened concerns about their own potential for developing AD. In 2000, Cutler and Hodgson conducted a baseline study of 258 middle-aged men and women on their personal concerns about developing AD. In 2005, 2nd wave follow-up data were collected from 80% of the original sample (N=206). Based on T1-T2 differences, a sub-sample of 59 respondents whose level of AD concern had increased over the 5 year interval was selected for intensive qualitative interviews; the interviews focused specifically on the context of their concern (why it had increased, with whom they had discussed it, what they had done to deal with it). All data were evaluated for underlying themes and patterns using NVivo software. The current study looks at one of the most robust themes to emerge from the data, the use of humor in the context of AD anxieties. For more than a third of the respondents, humor was mentioned as it relates to the trajectory of their increasing fears about AD. From their responses, humor plays several roles in overall concerns: as a coping mechanism, as a method of denial, as a communication tool, and as a way of approaching the seriousness of their fears. All are demonstrated by the data. For adult children of parents with AD, laughter about their own concerns about developing the disease may offer an unexpected but powerful benefit.

WHAT ARE THE UNMET NEEDS OF NURSING HOME RESIDENTS WITH DEMENTIA?

J. Cohen-Mansfield, M. Marx, M. Dakheel-Ali, K. Thein, *Research Institute on Aging, Rockville, Maryland*

Our approach for providing interventions for agitation (TREA – 'Treatment Routes for Exploring Agitation') is based upon a theoretical framework that provides a systematic methodology for individualizing non-pharmacological interventions to the unmet needs of agitated persons. This study was conducted to elucidate underlying unmet needs in a group of 61 agitated residents from 5 different nursing homes. Using TREA, the unmet needs of the agitated residents were identified through data collection from nursing assistants as well as through observation of the agitated person's behavior by trained research assistants, after which personalized interventions for decreasing agitation were delivered to the residents. Observations by research assistants were repeated. Analysis revealed that the most common unmet needs were: Loneliness/Need for social interaction, Boredom/Sensory deprivation, and Need for meaningful activity. Many other types of needs were reported at lower frequencies. In addition, we examined agreement between data obtained from nursing assistants and observations by research assistants, and from the pre- intervention and post- intervention observations by the research assistants. Finally, this study demonstrates the potential for combining a quantitative aggregate (nomothetic) methodology with an approach that stresses the need to individualize

the non-pharmacological treatment of agitation (ideographic methodology). This study was supported by grant #5R01AG010172-13

STAGING AN INDIVIDUAL'S EMOTIONAL RESPONSE TO THE PROCESS OF ALZHEIMER'S DISEASE

W.J. Puentes, *School of Nursing, University of Medicine & Dentistry of New Jersey, Stratford, New Jersey*

Earlier detection and diagnosis has led to the identification of an increasing number of persons with early Alzheimer's disease (AD). There is growing recognition that individuals with this diagnosis also experience significant clinical and sub-clinical emotional responses to their disease process. Using a phenomenological approach, the emotional experiences of individuals diagnosed with early AD were explored. Findings suggest that anxiety is highly associated with the period beginning with symptom recognition and ending about 1 year following diagnosis. After that time, other emotional states such as frustration and anger seem to predominate. Staging the emotional states associated with the progression of AD and the implications of this information for identifying non-pharmacological treatment approaches are discussed.

EXAMINING WORRIES AND GENERALIZED ANXIETY DISORDER IN PATIENTS WITH DEMENTIA

J.S. Calleo¹, A. Stupina², C. Kraus-Schuman^{2,1}, L. Snow³, N. Wilson¹, M. Kunik^{2,1}, N. Petersen^{2,1}, M. Stanley^{1,2}, 1. *Psychiatry, Baylor College of Medicine, Houston, Texas*, 2. *Michael E. DeBakey VAMC, Houston, Texas*, 3. *University of Alabama, Tuscaloosa, Alabama*

Anxiety is a common occurrence in persons with dementia. However, research on the strategies to define and assess anxiety in this population is limited. This study investigates the topics of worry in patients with dementia and anxiety who do and do not have GAD. Currently 37 patients and 37 have been recruited in a completed pilot and on-going clinical trial for psychosocial anxiety treatment. The patients are 49% male, primarily Caucasian 67% and ages range from 55 to 96 (M = 80, SD = 9.53). All included patients have a dementia diagnosis and screened positive for anxiety on the neuropsychiatric inventory. Each patient and collateral completes a structured interview on worry topics, the Mini International Neuropsychiatric Interview and the Clinical Dementia Rating scale (CDR). Seventeen patients (46%) meet criteria for GAD and 13 (35%) for depression. The most common worries are regarding family (78%), own health (62%) and loved ones' health (59%). The patients with GAD worried significantly more about minor matters ($\chi = 7.77$, $p < .01$) and community/world affairs ($\chi = 5.12$, $p < .02$) compared to the patients without GAD. Overall patients with mild dementia (CDR ≤ 1) endorsed more worry topics (mean of 5 topics per patient) compared to moderate dementia patients (CDR > 2 ; mean of 3.2 topics per patient, $t = -2.03$, $p < .05$). Our current results indicate that dementia patients with anxiety frequently endorse worries and those with GAD follow similar patterns of worry to what is reported in non-dementia patients.

PROFESSIONALS' KNOWLEDGE: PAIN PRACTICES IN AFRICAN-AMERICAN NURSING HOME RESIDENTS WITH DEMENTIA

S. Decker¹, I. Torres-Vigil², S. Cron¹, 1. *Nursing, University of Texas Health Science Center Houston School of Nursing, Houston, Texas*, 2. *University of Texas M D Anderson Cancer Center, Houston, Texas*

The purpose of this study was to describe the knowledge of nurses and physicians about pain assessment and management in African-American nursing home residents with dementia. Fifty-seven nurses from three nursing homes and three geriatricians from an academic center in metro-Houston completed the pain questionnaire. Three scenarios portrayed African-American residents with dementia as displaying common and subtle behavioral indicators of pain. Descriptive statistics were used to analyze demographic data and responses to the questions. A subgroup analysis using chi-square test was completed with Certified Nursing Assistants (CNAs) and Licensed Vocational Nurses (LVNs) on

selected questions. A majority of the participants were female ($n = 51$, 85%), between 40 to 59 years of age ($n = 28$, 46.7%), and African-American ($n = 43$, 72%). Most participants were CNAs ($n = 31$, 51.7%) or LVNs ($n = 22$, 36.6%). Thirty-one (51.6%) participants reported 10 years or less experience in nursing homes. Over half of the participants do not use clinical guidelines for pain assessment and management. Nurses and physicians more accurately identified common indicators of pain than subtle indicators of pain. Nurses administered Darvocet as ordered to manage pain. Heat/cold applications were most commonly used. The subgroup analysis indicated that CNAs were less likely to monitor pain than LVNs for two of the three scenarios ($p = 0.01$ and 0.04). These findings suggest the importance of education to include subtle indicators of pain, administration of geriatric appropriate medications, expansion of nonpharmacologic pain management practices, and implementation of clinical guidelines.

THE POTENTIAL UTILITY OF VIGNETTES AS AN INDIRECT MEASURE OF AWARENESS IN EARLY STAGE DEMENTIA

S. Nelis¹, A. Martyr¹, L. Clare¹, J. Roberts¹, I. Markova², R. Morris³, I. Roth⁴, R. Woods¹, 1. *Bangor University, Bangor, United Kingdom*, 2. *University of Hull, Hull, United Kingdom*, 3. *Institute of Psychiatry, London, United Kingdom*, 4. *The Open University, Milton Keynes, United Kingdom*

Awareness can be conceptualised as the accuracy with which a person appraises his/her functioning and situation. Disturbances of awareness in people with early-stage dementia have been extensively documented. Level of awareness has been inferred from a range of assessment methods including clinician ratings, patient/informant discrepancy ratings, and questionnaire/task performance discrepancy ratings. These methods primarily involve an evaluation of explicit expressions of awareness. Awareness may also be expressed in a more indirect way. Research has largely failed to address the issue of indirect or implicit manifestations of awareness. This study reports the development of an indirect assessment of awareness using vignettes. We developed three vignettes describing short scenarios of individuals showing behaviour that implied or was typical of these: established dementia, possible/early-stage dementia, and healthy old age. Ninety two people with early stage dementia were asked to describe how they perceived the situation/difficulties of the person in the scenario and what advice or potential solutions they would propose. Responses were coded in terms of appropriate problem identification and the appropriateness of responses to the possible solutions within the scenarios. We found that some respondents did use dementia and memory loss as possible explanations for the scenarios whilst others attributed the problems to old age or provided irrelevant accounts. Some respondents also related the items to themselves and their own personal experience of memory difficulties. People who are unable or reluctant to explicitly acknowledge their own difficulties may indirectly report awareness of memory difficulties with this emerging approach to studying awareness.

ELECTROMAGNETIC FIELD EXPOSURE AT WORK AND SUBSEQUENT RISK OF DEMENTIA

R. Andel¹, M. Crowe², M. Feychting³, N.L. Pedersen^{3,4}, L. Fratiglioni³, B. Johansson⁵, M. Gatz^{4,3}, 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *University of Alabama at Birmingham, Birmingham, Alabama*, 3. *The Karolinska Institute, Stockholm, Sweden*, 4. *University of Southern California, Los Angeles, California*, 5. *Göteborg University, Göteborg, Sweden*

We examined work-related exposure to low-frequency electromagnetic fields (EMF) in relation to dementia and Alzheimer's disease (AD), and occupational status as a potential modifier. We used all 9,954 individuals from the Study of Dementia in Swedish Twins (HARMONY) with complete occupational and diagnostic data. Dementia diagnoses were based on telephone screening and in-person work-up. Main occu-

pation was matched to an EMF occupational exposure matrix. Covariates included age, gender, education, vascular risk factors, and occupation-based measures of work complexity, physical demands, and undesirable working conditions. EMF exposure was dichotomized at 0.12 microtesla. We used generalized estimating equations (GEE), which can adjust for data dependency, with the entire sample and conditional logistic regression with complete twin pairs discordant for dementia status. In fully adjusted models, medium/high EMF exposure was associated with increased risk of dementia (odds ratio [OR]=1.36, 95% confidence interval [CI] 1.01-1.84) but the association was not statistically significant for AD alone (OR=1.29, 95% CI 0.89-1.85). The associations were modified by occupational status for both dementia and AD. The risk associated with EMF exposure appeared to be greater in former blue-collar workers (OR=1.54, 95% CI 0.98-2.45 for dementia; OR=1.78, 95% CI 0.96-3.31 for AD) but not white-collar workers (OR=1.02, 95% CI 0.61-1.70 for dementia; OR=0.88, 95% CI 0.48-1.63 for AD). Co-twin analyses, although underpowered (58 dementia-discordant pairs, 32 AD-discordant pairs), yielded similar findings. EMF exposure appears relevant to dementia risk primarily in former blue collar workers, possibly due to other adverse work exposures that may magnify the effects of EMF exposure.

AN INTEGRATIVE REVIEW: MEASURING MEALTIME DIFFICULTIES IN OLDER ADULTS WITH DEMENTIA

M.B. Aselage, 1. *College of Nursing, Medical University of South Carolina, Charleston, South Carolina*, 2. *2009-2011 John A. Hartford BAGNC Predoctoral Scholar, Charleston, South Carolina*

Dementia is one of the most burdensome conditions in late life and difficulties at mealtime can increase this burden. In the early 1990's, adequate instruments to measure mealtime difficulties in older adults with dementia were scarce. The objective of this integrative review was to determine the current state of instruments available to screen or assess for mealtime difficulties; specifically instruments measuring eating, feeding, and meal behaviors in the older adult with dementia. Database searches were conducted in EBSCOhost, PubMed, CINAHL, Science Direct, AgeLine, and HaPI. Twelve instruments were identified that met the inclusion criteria; only one instrument has been extensively tested for reliability and validity with psychometrics reported in the literature. The majority of instruments have only been used in research studies. Instruments to measure mealtime difficulties will inform the effect of interventions targeted to alleviate nutritional deficiencies. The Edinburgh Feeding Evaluation in Dementia Scale (EdFED) was the only instrument identified for clinical practice through this review. Resources for clinical use of the EdFED are currently being disseminated by the New York University Hartford Institute for Geriatric Nursing's Try This series, with a companion training video - How to Try This. In using the EdFED, interventions can be planned to monitor and promote the nutritional status of older adults with dementia.

SESSION 1615 (PAPER)

EMOTIONAL OUTCOMES, TRAUMA, AND MORTALITY

AGE GROUP DIFFERENCES IN FACETS OF POSITIVE AND NEGATIVE AFFECT

R. Ready¹, J.G. Vaidya², D. Watson², L. Clark², 1. *Psychology, University of Massachusetts, Amherst, Massachusetts*, 2. *University of Iowa, Iowa City, Iowa*

Age group differences in affect are relevant to issues of well-being and emotion regulation. To date, little work has focused on age differences in the facets of positive (PA) and negative affect (NA). The current, cross-sectional study determined age group differences in the structure of affect at the level of subscales. Sample: Older ($N = 212$; M age = 73.5 years) and younger adults ($N = 349$; M age = 19.1 years) rated

their general trait affect on the Positive and Negative Affect Scale (PANAS-X; Watson & Clark, 1994). The PANAS-X has three PA subscales (joviality, self-assurance, attentiveness) and four NA subscales (fear, sadness, guilt, hostility). Results: Older adults reported significantly lower scores on four NA facets and higher scores on one PA facet (attentiveness) than younger persons. Several correlations between PA and NA facets were significantly more negative in older than younger adults. Inter-correlations among all PA subscales were significantly stronger for older than younger participants. Discussion: Mean-level findings across PA and NA facets indicate greater emotional health in late life. Further, different aspects of PA were more tightly linked with one another in older than younger persons, suggesting greater coherence in positive emotions in older persons. PA and NA facets were more negatively associated in older than younger persons. This finding is intriguing because it is inconsistent with hypotheses that affect is more mixed across valence in older than younger persons (i.e., Carstensen et al., 2000). Methodological factors may account for some differences between studies; these issues, as well as alternative explanations for the findings, are discussed.

SALIVARY α -AMYLASE ACTIVITY MEASURES SNS ACTIVATION FOLLOWING HEART FAILURE SYMPTOM VERBAL REPORT

C.L. Delville, G. McDougall, G. Acton, H. Becker, A.P. Clark, *School of Nursing, The University of Texas at Austin, Austin, Texas*

Elevated norepinephrine in heart failure (HF) impairs calcium transients and accelerates cardiac remodeling, resulting in increased symptoms and death. Salivary α -amylase reflects serum norepinephrine levels resulting from physical and psychosocial stress. The purpose of this study was to examine salivary α -amylase as a direct measure of SNS activation in older adults reporting feelings related to HF symptoms. Salivary α -amylase levels were measured in older adults (N=60) with HF (NYHA Class II-IV) pre and post a five-minute description of their HF symptoms. The predominantly male (46), Caucasian (85%) sample had a mean age of 71.99 years (SD 9.40); mean education 14.14 years (SD 2.86), Mini-Mental State Exam mean of 29.10 (SD 1.64), and HF duration mean of 104.75 months. The Kansas City Cardiomyopathy Questionnaire overall summary score (mean= 56.65, range 1.04-95.83) evaluated symptom severity. 78.33% of the sample received a stable therapeutic dose of beta-blocking therapy. Interviews occurred 4-10 hours after awakening. Whole saliva was obtained via cotton Salavette at baseline and 20-minutes after speaking. Samples were stored at -20C until ELISA quantitative enzyme testing. Baseline salivary α -amylase mean = 54.69 pg/mL (SD 37.72), follow-up = 75.50 pg/mL (SD 47.29). Salivary α -amylase activity significantly increased over time ($t=4.31$, $p<.001$). Salivary α -amylase activity increased 63.62% reflecting SNS activation related to verbal reporting of HF symptoms even in the setting of chronic beta-blocking therapy. Future studies will utilize salivary α -amylase to evaluate the effectiveness of intervention designed to facilitate self-efficacy, quality of life, and self-care of people living with symptomatic HF.

AGE DIFFERENCES IN MOOD CONGRUENCE EFFECTS FOR WORD LISTS AND AUTOBIOGRAPHICAL MEMORY

B.G. Knight, J. Kellough, *U of Southern California, Los Angeles, California*

In previous research, this lab found that older adults showed mood congruence effects on more tasks than did younger adults during laboratory induced sad mood. In the current study, 73 USC students comprised the young adult group and 78 alumni were the older adult participants. 35 younger adults and 43 older adults were randomly assigned to sad mood induction using a movie clip followed by sad music. The remainder saw a neutral clip from the same movie, followed by neutral music. The induction produced similar changes in mood in both groups. Using a word list that roughly equated sad and neutral words on

length, frequency, and difficulty, no mood congruence effects were found. For autobiographical memories, mood congruence effects were found for older adults on memories from one week ago while younger adults showed opposing mood repair effects. Older adults reported less use of suppression as an emotion regulation strategy when in sad mood while younger adults showed more suppression. Implications for socio-emotional selectivity theory and for social cognitive theories of mood congruence will be discussed.

THE EFFECTS OF AN INTERVENTION TO IMPROVE THERAPEUTIC COMMUNICATION AMONG CERTIFIED NURSING AIDES ON NURSING HOME RESIDENTS' FACIAL AFFECT DURING MEALTIMES

L. Levy-Storrs, L. Lee, *Soc Wel, UCLA, Los Angeles, California*

Residents' facial affect during an activity of daily living may be one indicator of their quality of life in nursing homes. The purpose of this paper is to present results from an intervention to improve certified nursing assistants' (CNAs) therapeutic communication on nursing home residents' facial affect during mealtimes. All CNAs in the study received a total of four hours of therapeutic communication training during one month. The core aspect of the intervention was a facilitator-led viewing of a DVD containing examples of real CNAs engaging in therapeutic communication techniques. Before and after the intervention, 16 unique CNA-resident dyads were videotaped during mealtimes with nursing home residents. From the videos at both pre- and post-tests, coders rated the residents' facial affect once during the beginning, middle, and end of an interaction as one of the following: alert, pleasure, neutral, non-responsive, anxiety, sadness. These six affect expressions were reduced to positive (alert, pleasure) and negative (neutral, non-responsive, anxiety, sadness) types and regressed on the intervention. Descriptive results indicate that the predominant affect state was neutral for both pre- and post-tests. Using multi-level logistic regression analyses to adjust for nesting within dyads, the odds of positive affect at post-test was twice that at pre-test ($p<.001$). These results suggest that the intervention on CNAs' therapeutic communication during mealtimes had a positive effect on residents' affect. The clinical significance and implications of these findings for nursing home residents' quality of life will be discussed.

A CONCEPTUAL FRAMEWORK OF THE EMOTIONAL LABOUR OF CARE STAFF, WORKING WITH RESIDENTS WITH DEMENTIA

R. Luff, S. Arber, *Sociology, University of Surrey, Guildford, Surrey, United Kingdom*

The paper examines the emotional labour undertaken by care assistants who are working with older people living in care homes, including residents with dementia. Emotional labour refers to the management of emotions in the workplace. This research provides a conceptual framework with which to better understand the emotion work of care staff, and examines how these staff could be better supported, to improve their own emotional wellbeing and also the care they provide for residents. Semi structured interviews were conducted with 36 care assistants across 5 residential care homes in the South of England. The interviews were analysed using an interpretative approach to understand the perspective of the care staff. It was found that care staff face many situations requiring high levels of emotional labour, or 'emotional challenges' when caring for residents with dementia. The situational context in which this labour was undertaken was relevant to both staff wellbeing and the quality of their care. Firstly, staff tended to conceptualise these challenges as relating to a difficult situation involving residents, or a 'challenging' resident, influencing their response. Secondly, emotional challenges were either readily understood or found to be complex, with staff relying on their understanding to guide their response. However, particularly when caring for residents with dementia, the 'correct' response could be ambiguous, undermining staff's confidence. Finally, whether the outcome for the resident was positive or not was vital to the emo-

tional wellbeing of the care staff. Implications for policy and practice relating to staff support will be discussed.

SESSION 1620 (SYMPOSIUM)

ETHICAL ISSUES IN GERIATRIC MENTAL HEALTH CARE

Chair: *M.J. Karel, Psychology, VA Boston Healthcare System, Brockton, Massachusetts, Harvard Medical School, Boston, Massachusetts*

Discussant: *T. Cole, University of Texas-Houston Health Science Center Medical School, Houston, Texas*

Clinicians and researchers who work with older adults with mental health problems face a range of potential ethical dilemmas. At the core, a frequent tension exists between respect for the older adult's autonomy and a professional obligation to protect the safety of a potentially vulnerable individual. When working with older adults whose decision making capacity is compromised by dementia or serious mental illness, the tension between these competing ethical principles can be challenging to resolve. This symposium will illustrate ethical issues in geriatric mental health care through presentation of three ethically challenging dilemmas, followed by facilitated audience discussion. The first speaker will discuss the issue of patient and surrogate consent for research participation by elders who lack decision-making capacity, sharing research on the attitudes of patients and surrogates regarding the ethics of proxy consent. The second speaker will discuss research and ethical implications of using GPS technology to monitor the location of older adults with dementia, balancing concerns about privacy and confidentiality with those for safety. The third speaker will discuss ethical issues that may arise in working with suicidal older adults. While suicide is most often viewed as a preventable outcome of depression or other medical/social concerns, suicide is viewed by some, in some circumstances, as a rational response to suffering in late life. How are autonomy and protection of safety to be balanced in these difficult situations? A medical humanist discussant will provide commentary and encourage the audience to share reactions and reflections on the material presented.

THE USE OF GPS BY PEOPLE WITH DEMENTIA AND THEIR FAMILY CAREGIVERS: ETHICAL ISSUES

A. Pot, B. Willemse, *Netherlands Institute of Mental health and Addiction, Utrecht, Netherlands*

Many people with dementia get lost at some point in their illness, and a few percent get lost repeatedly. Getting lost may lead to dangerous situations for the person with dementia, may be a burden for the caregiver, and may eventually result in nursing home placement. GPS has been suggested as a way of allowing people to remain independent for longer. A satellite tracker is worn by the person with dementia. The person's movements are monitored on a map and can be seen via a secure website. The family caregiver can also be alerted by a signal if the person with dementia goes outside a specific area. In this presentation, research on using GPS technology by older adults with dementia and their family caregivers will be presented. Several ethical issues will be discussed: the decision whether or not to use GPS; restriction of the privacy of the person with dementia who will be tracked and traced; safety issues and issues of autonomy.

ADDRESSING THE ETHICAL AND POLICY CHALLENGES OF RESEARCH THAT INVOLVES OLDER ADULTS WHO CANNOT PROVIDE AN INFORMED CONSENT

J.H. Karlawish, *Medicine, University of Pennsylvania, Philadelphia, Pennsylvania*

Research that involves older adults who cannot themselves provide an informed consent because of illnesses such as dementia presents a challenge: under what conditions is it appropriate to enroll such a person into research? Proposals would sharply limit the amount of risk a person can be exposed to and also set limits on the role of a proxy deci-

sion maker. But a growing body of research suggests that these policies may not adequately align with the views of the people they are designed to protect. This talk will examine how older adults would want other people to make research decisions on their behalf. Research suggests that the concept of "leeway" and certain attitudes about biomedical research support willingness to participate. The talk will examine how these data impact on policy and how we conceptualize the principle of respect for autonomy among older adults.

PERSPECTIVES ON SUICIDE, RATIONAL SUICIDE AND HASTENED DEATH: ETHICAL ISSUES FOR MENTAL HEALTH PRACTITIONERS

A. Fiske, A. O'Riley, *Psychology, West Virginia University, Morgantown, West Virginia*

Mental health practitioners who work with older adults may be more likely than other practitioners to face ethical issues surrounding a client wishing to end life. Clinicians may need to respond to a client's expression of suicidal intent, a request for aid in dying, or a client's reported plan to hasten an imminent death. Decisions may rest on whether the client's expressed wishes to end life may be construed as rational. As public opinion and policy on these matters shift, the likelihood of a mental health practitioner facing an issue of this sort will only grow. This presentation will provide an opportunity to consider rational suicide and related issues from various perspectives. Often, the issue is framed as an ethical tradeoff between valuing the client's autonomy and valuing the client's safety. In this presentation, other perspectives will be considered.

SESSION 1625 (SYMPOSIUM)

LONGITUDINAL INTERRELATIONS BETWEEN SOCIAL SUPPORT, CONTROL BELIEFS, AND HEALTH

Chair: *F.J. Infurna, Penn State University, University Park, Pennsylvania*

Discussant: *T. Antonucci, University of Michigan, Ann Arbor, Michigan*

Lifespan psychologists have long been interested in structural relations among intraindividual changes within and between domains of functioning. As a prime example, there are rich conceptual frameworks linking age-related changes in facets of social support, sense of control, and health. The major objective of this symposium is to bring together a collection of empirical papers that examine such notions about how levels and age-related changes are interrelated across these domains. Using data from the Americans' Changing Lives Study, Infurna and Gerstorf show that profound associations between emotional support, mastery beliefs, and functional health not only exist in mean levels of functioning, but also that across-domain changes are moderately interrelated. Agrigoroaei and Lachman use nine-year longitudinal data from the national MIDUS study to show that a recipe of psychosocial and behavioral factors combined relates to minimized health declines with advancing age. Wagner and colleagues use data from the national SOEP study to empirically demonstrate that, relative to younger adults, older adults report more positive than negative reciprocity and also show more health benefit from such positive reciprocity. Sorkin and Rook report that interpersonal control strivings predict longitudinally the quality of social exchanges and such positive social exchanges were in turn relate to experiencing fewer functional limitations. The discussion by Toni Antonucci will integrate the four empirical papers, highlight how interrelationships between social support, sense of control, and health contribute to and influence lifespan development, and discuss various types of integrative research that promise further understanding of this across-domain interplay.

EXAMINING CROSS-DOMAIN LINKAGES BETWEEN EMOTIONAL SUPPORT, MASTERY, AND HEALTH

F.J. Infurna, D. Gerstorf, *Penn State University, State College, Pennsylvania*

Lifespan developmental psychology has long been interested in examining changes within and structural relations between domains of functioning. To explore cross-domain associations between facets of social support, control beliefs, and health, we applied a multivariate latent growth curve model to 4 waves of longitudinal data covering 15.5 years from the Americans' Changing Lives Study (mean age 54, range 25-96) to examine cross-domain linkages between emotional support, mastery, and health. Our results indicate profound associations between emotional support, mastery beliefs, and functional health not only exist in mean levels of functioning, but also that across-domain changes are moderately interrelated. Additionally, statistically nested model comparisons established that such cross-domain associations do not differ by groups of age, education, and gender. Our discussion highlights how integrative research examining cross-domain associations can inform conceptual models of lifespan development.

KEY PSYCHOSOCIAL AND BEHAVIORAL INGREDIENTS FOR HEALTHY AGING: SENSE OF CONTROL, SOCIAL ENGAGEMENT, AND PHYSICAL ACTIVITY

S. Agrigoroaei, M. Lachman, *Brandeis University, Waltham, Massachusetts*

There is widespread evidence for average declines in health with aging, yet there are large individual differences in the nature and patterns of change. Using a lifespan developmental approach, we consider the modifiable psychosocial and behavioral factors that could potentially account for such individual differences in changes in health. The presentation will include findings from the Midlife in the United States (MIDUS) Study, a large national longitudinal survey of adults between ages 25 and 85. With repeated measures analysis, we examined the cumulative effect of control beliefs, social engagement, and physical activity in relation to 9-year changes in health, while controlling for the effects of age, sex, education, and risk factors (large waist circumference, smoking, and alcohol problems). Results support a recipe for a combination of psychosocial and behavioral factors to minimize declines with aging, and suggest possibilities for promoting health.

AGE-DIFFERENTIAL EFFECTS OF RECIPROCITY ON HEALTH AND SOCIAL FUNCTIONING ACROSS ADULTHOOD

J. Wagner¹, G.G. Wagner², F. Lang¹, *1. Friedrich-Alexander University Erlangen-Nuremberg, Erlangen, Germany, 2. Max Planck Institute for Human Development, Berlin, Germany*

Findings in life span psychology point out differential developmental pathways of individuals of high and low resource groups. Thus, resource availability is a major factor of everyday functioning and successful aging. Our research aims at the detection of the interplay between the motive of reciprocity and indicators of health and social embeddedness. This paper explores age-differential patterns of positive and negative reciprocity and the predictive value of reciprocity regarding social integration and health status. The paper is based on a German panel study (SOEP) of 20075 individuals (age 20 to 96 years) that completed a scale on positive and negative reciprocity in 2005. Preliminary results indicated age-differential patterns and health effects of positive and negative reciprocity across adulthood. Older adults show more positive than negative reciprocity and greater benefit of such positive reciprocity as compared to younger adults. Results are discussed with respect to relationship regulation and functioning across adulthood.

THE IMPORTANCE OF INTERPERSONAL CONTROL STRIVINGS FOR CLOSE RELATIONSHIPS AND HEALTH IN LATER LIFE

D. Sorkin, K. Rook, *University of California, Irvine, Irvine, California*

People vary in the importance they ascribe to, and efforts they invest in, maintaining positive relationships with others. Research linking these interpersonal control strivings to the quality of older adults' social exchanges has yet to examine implications of such strivings for physical health. Data for this study came from the Later Life Study of Social Exchanges, a 2-year, five-wave, longitudinal survey of older adults. Participants were randomly drawn from a U.S. representative sample of non-institutionalized older adults 65 and older (N=916). Analyses that controlled for marital status and gender revealed that interpersonal control strivings were associated with more positive social exchanges over a 1-year period. In turn, companionship, a specific kind of positive social exchange, was associated with fewer functional limitations over a 1-year period. These findings suggest that older adults' control strivings in the interpersonal domain influence the quality of their social exchanges, which, in turn, influence physical functioning.

SESSION 1630 (PAPER)

MANAGEMENT AND TREATMENT FOR BETTER HEALTH

LET ME HAVE A SAY ABOUT MY CARE: CONSISTENCY OF PREFERENCES AMONG PERSONS WITH COGNITIVE IMPAIRMENT

C.J. Whitlatch, H. Menne, *Margaret Blenkner Research Institute, Benjamin Rose Institute, Cleveland, Ohio*

There is growing interest in research and practice to investigate and understand the care decision-making experiences and preferences of persons with cognitive impairment (PWCIs). Oftentimes, PWCIs feel they do not have enough information or involvement in the care decision-making process, and their family caregivers (i.e., care partners) are often unprepared and overwhelmed by the pressure to make informed decisions. Indeed, many practitioners, policy makers, and researchers regard cognitive impairment as a barrier to communicating care preferences. This presentation describes research findings based on interviews with PWCIs (n=371) and cognitively intact older persons (CIPs; n=220). Respondents were asked a variety of questions including static and fluid fact-based (e.g., date of birth and age), state-dependent (e.g., general preferences), and experience-based questions (e.g., weekly activities). Over a one-week period PWCIs and CIPs were found to answer more reliably to fact-based questions than to state-dependent and experience-based questions. Interestingly, there were no group differences for one state-dependent and one experience-based measure ($p > .20$). Results also suggest that as cognitive impairment worsens reliability decreases for fact-based questions, but remains stable for state-dependent and experience-based questions. The implication of these finding for policy makers, practitioners, and families is that PWCIs have the ability to participate actively in care planning and that their preferences remain constant over time. The findings support the utility and importance of developing interventions that improve communication between PWCIs and their caregivers throughout the progression of cognitive loss.

PREFERENCE ASSESSMENTS AS PART OF A TAILORED INTERVENTION TO MANAGE NUTRITION IN ELDERS WITH DIABETES

S. Anderson, A. Jay, M. Steers, L. Feliciano, *Psychology, University of Colorado, Colorado Springs, Colorado Springs, Colorado*

Chronic diseases are common amongst older adults and the prevalence increases with age. Type II diabetes is one of the most common chronic diseases in the U.S. affecting 1/5 elders, and thus represents an important target for intervention. Nonadherence with diet and medical

recommendations remains a challenge for all medical patients including older adults. Even with serious chronic conditions such as diabetes few elders fully adhere to treatment regimens, despite demonstrating sufficient knowledge of treatment procedures. The high prevalence of diabetes and associated medical complications in elders suggests simple education and diet recommendations may not be enough. Maintaining adequate nutrition can require a high degree of individual self-management strategies. Low income community dwelling elders need easy to manage, individually tailored interventions that consider the unique environmental factors relevant for their diet and health behaviors. Preference assessments (PA) may have utility in identifying healthy food options that appeal to the individual and can be used with a tailored intervention. Studies have shown that PA when used with tailored interventions has been effective in establishing healthy eating behaviors across a number of different populations including children with autism, adults with developmental disabilities, and in typically developing children with food refusal (i.e., picky eaters). However, the PA strategy has not been applied to managing dietary choices in older adults with diabetes. This study investigates whether the use of PA for healthy food choices (as part of a home-based consultation approach) results in better diabetes-related outcomes in low income elders with type II diabetes.

DIABETES MANAGEMENT IN LOW INCOME ELDERS: A RANDOMIZED CONTROLLED TRIAL OF SYSTEMATIC INDIVIDUALIZED INTERVENTION

M. Steers, L. Feliciano, A. Jay, S. Anderson, *Department of Psychology, University of Colorado, Colorado Springs, Colorado Springs, Colorado*

Type II diabetes is one of the most common chronic illnesses amongst older adults (OAs), affecting approximately 20% of seniors (National Diabetes Information Clearinghouse, 2008). Improperly managed diabetes detrimentally affects health (i.e., eye, circulatory, nerve, and kidney disorders) and thus represents an important target for intervention. Simple education and diet recommendations are often not enough. Treatment nonadherence is a serious concern; resistance to treatment is particularly prominent when lifestyle changes are recommended (Meichenbaum & Turk, 1987). Psychosocial interventions can improve the well-being of patients with chronic medical conditions (Fekete, Anotni, & Schneiderman, 2007), but these interventions are not always successful in part because adequate diabetes management requires a high degree of self-management strategies. Thus, in order to be successful, researchers need to approach this problem differently and consider the complexity of this disorder. The present study evaluated the effects of an innovative approach to diabetes management in community-dwelling older adults with Type II diabetes utilizing an individualized home-based consultation method (IHBC). Participants were randomized to either a psychotherapy group or IHBC. Each group met for five 90 minute weekly sessions to assist OAs in: a) proactive diabetes management, b) identifying potential barriers to effective self-care, or c) identify factors potentially relevant to home health behaviors (i.e., mobility concerns, barriers to accessing health meals/beverages). Outcome measures included the Summary of Diabetes Self-Care Activities (SDSCA) scale, the WHO-5 Well-Being Index, and the Outcome Rating Scale (ORS). Group comparisons were conducted and results will be discussed in terms of patient outcome indicators.

A MIXED METHOD ANALYSIS OF GENDER DISPARITIES IN HEALTH OUTCOMES OF OLDER ADULTS WITH DIABETES

E.J. Nicklett, J. Liang, R. Anspach, R. Halpern, *Sociology & Public Health, University of Michigan, Ann Arbor, Michigan*

OBJECTIVE: Using trajectory analysis, we aimed to (1) determine whether or not there are gender differentials health decline; and (2) examine the correlates of this relationship proposed previously in cross-sectional research, such as relationship trajectories, informal care, and

other forms of support. METHOD: We examined trajectories 14-year HRS (n=4,809 with diabetes) on health outcomes (ADLs/IADLs) with gender as well as: (a) marriage/relationship status; (b) provision and receipt of care; and (c) provision/receipt of support. We triangulated qualitative and life history calendar data from a community sample of older adults with diabetes (n=30) in the larger Detroit area to examine the causal pathways underlying gendered relationships between sex and transitional health outcomes. RESULTS: Controlling for race and age, biological sex was not significantly related to rates of decline among diabetics ($p < .05$), although the shape of trajectories differed. Triangulation with qualitative and life history calendar data provided new insight on the mechanisms. More specifically, the provision of spousal support, stressful life events, marital disruptions or disharmony, providing care to family and friends, and economic deprivation were specific concerns that were particularly prevalent among older women (relative to older men) interviewed. Protective factors included receipt of social support and informal caregiving, higher wealth and income, and supportive romantic relationships. Preliminarily, these factors appear to interact with other forms of social status, such as race/ethnicity (including immigration history) and social class. CONCLUSIONS: Trajectory analysis did not demonstrate significant differences in health outcomes between men and women; however, there are particular gendered differences in the lived experience of diabetics which relates to both regimen adherence and health outcomes. More attention—in research and policy—is needed to address these disparities as the population ages and chronic illnesses such as diabetes become increasingly prevalent.

COST-EFFECTIVENESS OF MEDICAL NUTRITION THERAPY AND MEALS FOR SENIORS WITH CARDIOVASCULAR DISEASE

J. Troyer¹, W.J. McAuley^{2,3}, M. McCutcheon², 1. *University of North Carolina at Charlotte, Charlotte, North Carolina*, 2. *George Mason University, Fairfax, Virginia*, 3. *Agency for Healthcare Research and Quality, Rockville, Maryland*

Many older people experience hyperlipidemia and hypertension, but there is little information regarding whether medical nutrition therapy (MNT) or therapeutic meals have an independent or joint beneficial impact on older people with these diagnoses. The objective of this study was to provide evidence regarding the cost-effectiveness of MNT and therapeutic meals for older adults (aged 60+) with hyperlipidemia and/or hypertension. We conducted a one-year clinical trial where 321 people were each assigned to one of four arms: (a) a literature only control group, (b) a meals only group that received seven diagnosis-appropriate therapeutic meals a week, (c) a MNT only group, and (d) a MNT plus meals group. Our outcome measure was quality adjusted life years (QALYs), which allows for the comparison of our cost-effectiveness results to a broad range of interventions. Costs included both intervention and medical costs. We used two analytical approaches: 1) estimation of separate models of costs and QALYs that facilitated the construction of incremental cost effectiveness ratios and 2) net benefit analysis which allowed us to present information regarding the probability that each intervention was cost-effective given different values for society's willingness to pay for a QALY. The point estimates for the incremental cost effectiveness ratios suggest that all interventions are cost effective, with the MNT only group being the most cost-effective. Using the net benefit approach and a willingness to pay of \$109,000 per QALY, the probability that the therapeutic meal delivery program is cost-effective is 95%, and, for MNT, the probability is 90%.

MEASUREMENT & METHODS

QUALITY OF LIFE IN INSTITUTIONAL SETTINGS: THE DEVELOPMENT OF A COMBINED RESIDENT AND CAREGIVER ASSESSMENT

F. Oswald¹, H. Wahl¹, O.K. Schilling¹, C. Heusel², A. Maurer², P. Antfang², *1. Dept. of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany, 2. Paul Wilhelm von Keppeler-Foundation, Sindelfingen, Germany*

The aim of this project is to develop a multidimensional quality of life assessment for people living in institutional settings, useful for residents with and without dementia. Along 12 dimensions of life quality (based on Lawton et al., e.g., functional capacity, meaningful activity, safety, relationships, dignity, privacy), individual semi-structured face-to-face interviews are conducted to assess the resident's perspective and evaluations. Next, in a moderated session caregivers collect individual life quality issues for each resident and evaluate life quality dimensions from their perspective. Finally both perspectives are juxtaposed. Data is based on assessments from 376 residents (79.8% women; 29.8% demented) in 21 nursing homes. Mean duration of the combined assessment is 3.9h. Quantitative and qualitative analyses of about 12.000 residents' statements and evaluations of the 12 dimensions show differences due to age, gender, living duration, and dementia diagnosis. Findings shall lead to a more complex understanding of life quality in institutional settings and a better fit between the residents' and the caregivers' perspectives.

COMPARING THE PSYCHOMETRIC AND PREDICTIVE PROPERTIES OF TWO MEASURES OF WISDOM

J. Webster², M. Taylor¹, G. Bates¹, *1. Swinburne University of Technology, Melbourne, Victoria, Australia, 2. Langara College, Vancouver, British Columbia, Canada*

Two recently developed scales of wisdom were compared on their abilities to have their factor structure replicated and to predict relevant personality (i.e., forgiveness) and life satisfaction (i.e., psychological well-being) variables. One hundred and seventy-six primarily (71%) Australian participants ranging in age from 18 to 68 years ($M = 36.60$, $SD = 12.07$) completed an on-line survey of the Self-Assessed Wisdom Scale (SAWS; Webster, 2003, 2007), the Three-Dimensional Wisdom Scale (3D-WS; Ardelt, 1997, 2003), the Heartland Forgiveness Scale, Ryff's (1989) measure of psychological well-being (PWB), and a measure of social desirability. Results indicated that the factor structure of the SAWS, but not the 3D-WS, replicated, and the 3D-WS, but not the SAWS, was contaminated by a social desirability response bias. Both scales predicted equally well PWB and Forgiveness in predicted directions. Implications for future use of both scales are discussed.

LONGITUDINAL TRAJECTORIES OF SUBJECTIVE HEALTH DIFFER BY FRAME OF COMPARISON

C.E. Loeckenhoff¹, A. Terracciano², L. Ferrucci², P. Costa², *1. Cornell University, Ithaca, New York, 2. National Institute on Aging, Baltimore, Maryland*

Research suggests that measures of subjective health are associated with important outcomes such as objective health and mortality. However, responses to self-ratings may be skewed by frames of comparison. To study age differences in such effects, we examined the influence of comparison frames on longitudinal trajectories of self-rated health in a large life-span sample drawn from the Baltimore Longitudinal Study of Aging and assessed up to 10 times over an interval of up to 18 years ($N = 2106$, age range at first assessment 17-93, $M = 55.4$, $SD = 17.6$, 54% female). To examine the relative role of social and temporal comparisons, single-item health ratings were collected under four comparison frames: Comparison to age peers, comparison to past, comparison

to future, and no frame/open-ended. In Hierarchical Linear Modeling analyses, age and age-squared were significant predictors of all four health ratings ($p < .01$). However, while open-ended ratings followed a curvilinear slope with accelerated decline in old age, social and temporal comparisons remained comparatively stable in middle and late adulthood. Gender and cohort effects were found for intercepts (e.g. women had higher expectations of future health, $p < .001$), but not for longitudinal trajectories ($p > .05$). We interpret results in the context of social and temporal comparison theories and discuss implications for assessing subjective health across the life-span.

CREATION OF USER-CENTERED REPORTS FOR PATIENTS AND MEDICAL PROFESSIONALS

J.O. Brooks¹, W.C. Logan², E. Cress³, V. Hirth⁴, R. Beeco¹, J. Gomer¹, L. Smolentzov¹, *1. Psychology, Clemson University, Clemson, South Carolina, 2. Greenville Hospital System, Greenville, South Carolina, 3. University of Georgia, Athens, Georgia, 4. Palmetto Health, Columbia, South Carolina*

Systematic approaches for presenting medical information to seniors have not been widely explored and published. Prior to incorporating a mobility and physical function measure into clinical practice, meaningful and understandable reporting formats were needed for physicians and therapists. It was important for seniors with varying educational and cognitive levels also understand the information. Testing was conducted in three phases with over 200 participants including seniors with a broad range of physical functioning, subject matter experts, and medical professionals. Focus groups and interviews evaluated prototype reports using several presentation styles, graph orientations, and levels of detail/abstraction. Cost-effectiveness and ease of incorporation into both paper and electronic medical records were also considered. The final product, while containing that same content for patients, physicians and therapists, represented three very different formats - each accommodating the specific needs of each user group. To maximize health literacy, all medical reports would benefit from user-centered design.

IS THE SENSORY ORGANIZATION TEST A RELIABLE MEASURE OF CENTRAL SENSORY FUNCTION IN ADULTS WITH FIBROMYALGIA?

D. Rose¹, K. Marsh¹, C. Dickin², *1. Kinesiology, California State University, Fullerton, Fullerton, California, 2. University of Idaho, Moscow, Idaho*

A common complaint among adults diagnosed with Fibromyalgia (FM) is postural instability and dizziness (Bennett et al., 2006). One test commonly used to evaluate sensory system impairments that are central in origin is the Sensory Organization Test (SOT). To date, however, the reliability of this test has not been investigated in a population with FM. The goal of this study was to use Generalizability Theory to determine the most effective testing protocol to obtain a reliable assessment of postural sway in various sensory conditions. Study participants included 41 females and two males, ranging in age from 40 to 78 years ($M = 58.72$, $SD = 9.89$). The six-condition SOT was administered twice on the same day by the same test administrator with a 30-minute rest interval separating the two tests. An Equilibrium Score (ES) was calculated for each of the three test trials in each condition as a measure of postural sway. The results indicated that performing the SOT twice on a single testing day was sufficient to achieve moderate-to-good (.61 to .89) reliability across the six testing conditions. Conducting a third assessment was suggested to increase the level of reliability obtained (.70 to .92). Collectively, the results indicate that a reliable evaluation of central sensory system function can be obtained in adults with FM after a minimum of two full testing sessions. Whether testing on multiple days as opposed to a single day yields higher reliability due to less fatigue remains to be determined.

MBMD TREATMENT PROGNOSTICS AND STRESS MODERATORS AMONG OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT

C.A. Yeager¹, L. Hyer², *1. Institute for Mental Health Policy, Research, and Treatment, Essex County Hospital Center, Cedar Grove, New Jersey, 2. Georgia Neurosurgical Institute, Macon, Georgia*

Objective: Memory impairment at later life in the form of Mild Cognitive Impairment (MCI) or mild dementia is problematic as, increasingly, these states cause multiple psychiatric and functional problems. In this poster we highlight one less studied aspect of these problems in older adults: personality patterns as embodied in lifestyle habits, stress moderators, and treatment prognostics. We similarly present psychiatric and coping profiles of such individuals in comparison to those who have age-typical cognitive function. **Method:** A sample of 70 individuals, referred for neuropsychological assessment because of subjective memory complaints, was identified. Patients were assessed with the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS), the Millon Behavioral Medicine Diagnostic (MBMD), as well as other measures. The majority were Caucasian, married females with at least a high school diploma. The MBMD provides information regarding psychiatric factors, stress moderators that affect coping, negative lifestyle habits, and treatment prognostics that influence treatment compliance and illness management. **Results:** 55% qualified for a designation of MCI/mild dementia. Of these, differences were noted between healthy and MCI/dementia groups in lifestyle habits (inactivity), one stress moderator (future pessimism), and one treatment prognostic (interventional fragility). In addition, the memory-impaired group had more depression, anxiety, and emotional lability. A secondary focus on personality patterns revealed differences between groups in inhibition, oppositional, and denigrated coping patterns. **Discussion:** We elaborate on the importance of treatment prognostics, lifestyle habits, and stress moderators in the context of MCI/mild dementia, especially when psychiatric conditions are implicated and illness management issues are of concern.

CLINICAL VALIDITY OF THE MINI-MENTAL STATE EXAM AND THE FULD OBJECT MEMORY EVALUATION WITH AFRICAN AMERICAN, LATINO AND CAUCASIAN OLDER ADULTS

T. Rideaux¹, S.A. Beaudreau², S. Fernandez³, R. O'Hara², *1. PGSP-Stanford PsyD Consortium, Palo Alto, California, 2. Stanford University School of Medicine, Veterans Administration Palo Alto Health Care System, and the Sierra-Pacific Mental Illness, Research, Education and Clinical Center (MIRECC), Palo Alto, California, 3. Center for Healthful Behavior Change, Department of Medicine, New York University School of Medicine, New York, California*

Rationale: Detecting dementia in older ethnic minority adults, especially those with limited education¹ can be significantly compromised using biased cognitive screens. The Mini-Mental State Examination (MMSE) is potentially biased by ethnicity and education.^{2,3,4} Some evidence, however, suggests that the Fuld Object-Memory Evaluation (FOME) may not be biased by education or ethnicity.^{5,6,7} **Objective:** To compare the validity of the FOME with the MMSE for detecting dementia in African American, Latino, and Caucasian older adults. **Participants:** Adults over 70 (613 Caucasians, 159 African Americans, 73 Latinos) enrolled in the Aging, Demographics, and Memory Study, a supplement to the Health Retirement Study. **Method and Results:** We conducted analyses for the three ethnic groups with signal detection software for iterative Receiver Operator Characteristics developed by investigators at VA Palo Alto Health Care System and Stanford University (ROC Version 4.22). We included age, education, gender and dementia screen scores. For both Caucasian and African American older adults, a combination of the MMSE and FOME provided the best sensitivity and specificity for detecting dementia. The optimal measure for Latinos was the MMSE only. None of the demographic variables significantly contributed to the validity in any ethnic group. **Conclu-**

sion: Clinicians can significantly improve the validity of a dementia screen by using a combination of the MMSE and FOME with both African American and Caucasian older adults. The FOME did not have significant incremental validity beyond the MMSE for detecting dementia in Latino older adults, thus the MMSE alone may be sufficient in this older ethnic group.

FELT RESTRICTIONS AMONG MULTI-ETHNIC COMMUNITY RESIDING ELDERS

H. Cheng, B. Gurland, M. Maurer, *Columbia University, New York, New York*

Background: We conjectured that gaining access to (accessing) choices and choosing among them is a unifying choices and choosing (c-c) process that, in a given context and with knowable influences, is necessary and sufficient for understanding health related impairments of quality of life and for rationally evaluating and assisting persons when this process is constrained or inefficient. We hypothesize that c-c model could be the underlying mechanism of QoL and link QoL with health imposed restricted activities called felt restrictions (FR). **Methods:** This is a secondary data analysis based on the Northern Manhattan Aging Project (NMAP) between 1989 and 1995. A random sample of 2030 Medicare beneficiaries were recruited who were 65 and older and lived in Manhattan, a multiethnic community. The face to face interview used the Comprehensive Assessment and Referral Evaluation (CARE). We operationalized a definition of restricted c-c based on the subjects' response to items explicitly stating that a health problem was preventing the attainment of some preferred goals and activities. More than 5 restrictions were defined as FR. **Results:** Eighteen items explicitly describing health imposed restrictions of the c-c process were found. The prevalence of FR was 29.6 % (631/2130). FR was independently associated with a variety of health conditions, life satisfaction, ADL and IADL. **Conclusion:** c-c model is a new concept that could be a final common pathway for multiple health conditions and a possible link to a hard science base and a potential outcome measure of therapeutic interventions or a potential target for improving QoL in the elderly population.

HOLLYHOCKS, BIRCHES, AND RAISED BEDS: CULTURAL CONTINUITY AND CHANGE IN ONE RETIREMENT COMMUNITY

S.A. Eisenhandler, *Sociology, University of Connecticut, Waterbury, Connecticut*

This analysis traces residential turnover in the small retirement community of Kahehtiyo. Qualitative research [2005-2009] documents the impact of residents' departures on the culture of the community. Now in its seventeenth year, Kahehtiyo has sustained its life and shaped its evolution in the gardens created by individual residents. Photographs and selected passages from interviews depict the well-being residents find in gardening and related activities. In the past two years, several residents have departed. Traditional or folk wisdom holds that 'a garden dies with its gardener.' Nonetheless, departed gardeners live on in the landscape and in social life—in a cluster of pink hollyhocks vigilantly protected from reckless mowers; in a corner of paper birches that irritate everyone but remain safe from the chainsaw year after year; in raised beds once home to an array of vegetables shared among residents in the heat of August. Such material elements of gardening are woven into stories told by residents among themselves and in conversations with new residents. Though as yet there have been no formal memorial plantings or garden benches; i.e., items commemorating a departed resident, the spirit of former residents is evident in the clear expectation that newcomers will take up gardening. Only one resident is a non-gardener. Likewise, changes are expected and have been observed: newcomers have uprooted shrubs and perennials and planted their favorites; bird feeders grace the maligned but upstanding birches; and, raised beds are filled with flowers instead of vegetables.

RECRUITMENT STRATEGIES, CHALLENGES AND YIELDS IN RESEARCH ON POST-HIP FRACTURE RECOVERY INTO COMMUNITY PARTICIPATION

C.C. Green, M. Harrod, H. Moilanen-Miller, J.A. Nasr, C. Lysack, M. Luborsky, *Wayne State University, Detroit, Michigan*

Recruitment and retention of older adults with disabilities and minorities for research poses significant challenges especially when “healthy” participants are sought. Further considerations are posed by the policies of local partner institutions and HIC/IRB regulations. This paper reports outcome yields for recruitment techniques and evaluates key strategies designed to improve recruitment in aging and disability related community-based research. Data is examined from a 4 year study comparing men with women (N=100) post-hip fracture (HF) in Detroit designed to specify the forms of desired community participation and trajectories of return to full participation after injury. A range of targeted recruitment strategies were conducted. Analysis examined stage-specific challenges and strategies and resulting relative recruitment yields by study group and background factors. Findings show: (1) yields in terms of effectiveness and costs of each source and strategies for recruitment (highest to lowest) patient pools; local media, regional media, face-to-face; (2) gender contrasts (face-to-face least effective for men); (3) ethnic factors show African Americans responded least to radio ads and most to conferences and flyers; and (4) physical condition factors (level of residual impairment, duration since HF) where volunteers with high residual impairment were gained only by ads and special pools vs. face to face. Specific recommendations for recruiting persons with disabilities are summarized. Final discussion considers implications for cost and representativeness of findings in designing studies of healthy elderly with disabilities. [Support: NIH # R01AG023572]

CONSISTENCY AND ACCURACY OF CANCER REPORTING IN THE PANEL STUDY OF INCOME DYNAMICS

A. Zajacova, J. Dowd, *University of Michigan, Ann Arbor, MI*

Self-reports of conditions and health status comprise a majority of population-level health data. Self-reports of serious conditions are viewed as particularly reliable due to their salience to the respondent. On the other hand, serious illnesses are known to be associated with social stigma, possibly leading to underreporting. We examine retrospective reports of cancer diagnoses in Panel Study of Income Dynamics, a nationally representative longitudinal survey. Cancer survivorship status and the timing of diagnosis were ascertained in four successive waves. Employing a range of analytic approaches including regression and latent growth models, we evaluate the consistency and timing accuracy of reports across waves and analyze correlates of most consistent and accurate reports. Of 978 adults who reported ever having cancer, over 27% provided inconsistent reports, defined as denying cancer occurrence after reporting ever having had cancer. Consistency was related to the type of cancer, ranging from 100% for colon cancer to 77% for cervical cancer. Women were more likely to provide inconsistent reports; other characteristics of individuals (age, race, self/proxy reporting, other primary cancer sites) did not affect reporting consistency. With regard to timing accuracy, we found evidence of heaping but no evidence of telescoping; consistent reports were significantly more accurate than inconsistent ones. The findings suggest that even life-threatening health conditions are misreported in interview surveys. This study highlights the caveats of using self-reported conditions, including underreports and timing inaccuracy. Repeated retrospective questions in longitudinal surveys such as the PSID can be useful for improving the reliability of health data.

MODELING INTRAINDIVIDUAL VARIABILITY: A COMPARISON OF DISCRETE TIME AND CONTINUOUS TIME METHODS

P.R. Deboeck, *University of Kansas, Lawrence, Kansas*

Many methods are available for modeling intraindividual change. The modeling of intraindividual variability, however, requires significant advancement in the statistical models that are being used. One prevalent approach is to incorporate an autoregressive component to describe intraindividual variability; that is, a component where some observation is caused by a previous observation. This discrete time approach differs from continuous time approaches that postulate that observations are manifestations of an ongoing, underlying process. Oud & Jansen (2000) have shown that a discrete time autoregressive model can be written as a continuous time model. By doing so, one should be able to estimate relationships that are independent of the sampling rate. This paper examines the modeling of affect data from the Notre Dame Longitudinal Study on Aging using both discrete and continuous time methods. The discrete time model includes the application of an autoregressive model to intraindividual data that has been altered to mimic differing sampling rates. As is to be expected, differing parameter estimates occur, corresponding to the changes in sampling rate. A continuous time method is then considered (Continuous Time State Equation, Oud & Jansen, 2000). These analyses serve as an example of the conflicts that may occur in the literature due to the combination of differing sampling rates and discrete time methods. The analyses also demonstrate the estimation of relationships using a continuous time method, which are less dependent on the rate at which individuals are sampled.

AN EXAMINATION OF THE SENSITIVITY OF THE ACTIVITIES-SPECIFIC BALANCE CONFIDENCE (ABC) SCALE

R. Ellis¹, D.S. Moore², M. Kosma², J. Fabre², R. Wood³, *1. Kinesiology and Health, Georgia State University, Atlanta, Georgia, 2. Louisiana State University, Baton Rouge, Louisiana, 3. New Mexico State University, Las Cruces, New Mexico*

Falls and fall-related psychological concerns significantly impact the quality of life of aging adults. Fall-related psychological surveys provide useful outcomes for fall prevention programs, thus the need to examine the psychometric properties of these instruments. Sensitivity to change is an important, yet understudied psychometric property (Jorstad et al., 2005). The purpose of the study was to test the sensitivity to change of the Activities-specific Balance Confidence (ABC) Scale (Powell & Myers, 1995) in fallers and non-fallers. Twenty-two older adults (M age = 74.2 years, SD = 11.3) participated in two falls risk screenings over a 12-month period. Participants completed the ABC that assesses confidence in the ability to maintain balance when performing activities of daily living. History of falls within the last 12 months was determined using the Comprehensive Falls Risk Screening Instrument (Fabre, 2009). Mann-Whitney U tests revealed no significant group differences in ABC scores at time 1 based on falling status at time 2, $U = 50.0$, $p = .89$, and no significant differences in ABC change scores between fallers and non-fallers at time 2, $U = 45.0$, $p = .52$. Although these results indicate that the ABC is not sensitive to change in a community-based setting, lack of statistical power and the inability to control for falling status at time 1 limit the confidence of these findings. Further testing of the sensitivity of the ABC and other fall-related psychological instruments is warranted because of the importance of using these instruments to determine the efficacy of falls prevention interventions.

FACTORIAL INVARIANCE OF THE BRIEF COPE ACROSS POVERTY LEVEL

A. Carr¹, G.I. Caskie¹, M.K. Evans², A.B. Zonderman², 1. *Lehigh University, Bethlehem, Pennsylvania*, 2. *National Institute on Aging, Baltimore, Maryland*

The Brief COPE (Carver, 1997), derived from the original COPE Inventory (Carver et al., 1989), is a widely used measure of coping skills in the aging literature. A review of the literature reveals that the Brief COPE is utilized with individuals from a broad socioeconomic range (e.g., Stein et al., 2008). As such, the present study investigated the factorial invariance (FI) of the Brief COPE for individuals above ($n=956$) and below ($n=883$) the poverty level, using the factor structure found in a previous exploratory factor analysis (Carr et al., 2008). Participants included 1839 community-dwelling African American ($n=1104$) and White ($n=735$) adults aged 30–64 years ($M=47.96$, $SD=9.135$) from the National Institute on Aging's Healthy Aging in Neighborhoods of Diversity across the Life Span study. The evaluation of factorial invariance involved testing a nested sequence of increasingly stringent models (Meredith, 1993). A comparison of the configural invariance model to the weak invariance model was non-significant, $\Delta\chi^2(9, N=1839)=11.318$, $p=.25$, indicating that factor loadings for the Brief COPE were equal across poverty level. However, the comparison of the weak and strong invariance models was significant, indicating inequality of observed means across poverty level. The relative fit indices for the weak factorial invariance model indicated an adequate fit to the data (e.g., RMSEA=.062). The identification of weak factorial invariance in this study allows valid comparison of factors scores in the Brief COPE to be made (Liang, 2002) when comparing individuals below and above the poverty level.

IS RETIREMENT HEALTH A LAUGHING MATTER? UNDERSTANDING THE MODERATING EFFECT OF HUMOR

G.P. Freeman, W. Ventis, *The College of William & Mary, Williamsburg, Virginia*

This research assessed the extent to which humor moderates the relationship between retirement stress, including hassles, and health. Two hundred sixty-five retirees over the age of 55 years completed the SF-36, Humor Styles Questionnaire, Perceived Stress in Retirement Scale, and the Daily Hassles Scale. The stress moderating effect of humor was examined via regression analyses. Results revealed two contexts that affect the "adaptiveness" of a humor style—gender and level of stress/hassles (high or low). For example, for males, the regression of Pain on Retirement Stress at varying levels of Self-defeating humor was significant at $F = 5.139$, $p = .002$, and the Stress \times Humor interaction was significant at $t = 2.049$, $p = .042$. Although labeled a maladaptive humor style, Self-defeating humor only appeared maladaptive when stress was low. However, when stress was high a higher Self-defeating score was related to more optimal outcomes along the Pain measure, and appeared to be adaptive for male retirees. For females, the regression of Role Limitations due to Emotional Problems on Hassles Intensity on varying levels of Self-defeating humor was significant at $F = 8.644$, $p < .001$ and the interaction Hassles \times Humor was significant at $t = -3.000$, $p = .003$. Unlike with males, during low hassles, high Self-defeating humor appeared to be somewhat adaptive, and related to less Role Limitations. However, during high hassles, high Self-defeating humor appeared maladaptive and related to more Role Limitations for female retirees. These relationships were found across other health outcomes as well.

EXAMINING THE LONGITUDINAL RELATIONSHIP BETWEEN SOCIAL CONTROL AND WELL-BEING

T.L. Bisconti¹, C.S. Bergeman², 1. *Psychology, University of Akron, Akron, Ohio*, 2. *University of Notre Dame, Notre Dame, Indiana*

The goal of the present study was to examine the relationship between perceived social control and well-being in a sample of 37 widows (M

age = 73) between 3 and 5 years post-loss. Measurements on perceived social control, depression, and life satisfaction were taken as part of a longer longitudinal study 3 years after women lost their husbands and predictions were made about outcomes at year 5. Participants were married an average of 46 years and 75% of the sample was in their first marriage. Regression analyses demonstrated that perceived social control measured at T1 (3 years post-loss) was significantly predictive of both depression and life satisfaction at T2 (4 years post-loss) after controlling for T1 outcomes. More specifically, the model for depression accounted for 36% of the variance and included a beta weight of $-.34$ ($p < .05$) between T1 control and T2 depression. Similarly, the model for life satisfaction accounted for 38% of the variance and included a beta weight of $.38$ ($p < .05$) between T1 control and T2 life satisfaction. Understanding the longitudinal relationship between various protective mechanisms and well-being outcomes brings us one step closer to assisting helping professionals understand the process between coping with the loss of a spouse.

FOOD PREFERENCES IN MIDDLE-AGED, YOUNG-OLD AND OLDEST-OLD ADULTS

K.E. Cherry², A. Newman¹, B. Garrison¹, C. Lefante³, 1. *Louisiana State University College of Agriculture, Baton Rouge, Louisiana*, 2. *Psychology, Louisiana State University, Baton Rouge, Louisiana*, 3. *Louisiana State University Health Science Center, New Orleans, Louisiana*

Lifestyle factors, including food preferences and dietary practices, have been shown to influence health outcomes in later life. In the present research, we examine self-reported food preferences and dietary habits in sample of adults who range in age from 45 to over 90 years of age. The objectives of the proposed study are to: (1) describe favorite foods; (2) explore age differences in food preferences. These data were collected as part of the Louisiana Healthy Aging Study (LHAS), a multidisciplinary study that examines the determinants of healthy aging. Participants were 160 community-dwelling adults (Cherry, Hawley, Jackson, Volaufova, Su, & Jazwinski, 2008). As a part of the standard protocol, the participants describe their favorite foods during a two-minute interval. These data have been grouped into their respective food categories based on the United States Department of Agriculture: My Pyramid (food pyramid). Descriptive statistics indicated that the food group with the most favorite foods was meats; 89.5% of the participants indicated at least one meat among their favorite foods. Age group differences were apparent in meats and combination foods; in both instances, more younger participants reported preferring meats and combination foods than older participants. Implications of these results for current views of successful aging and the dynamic relationship between food preferences and health outcomes will be discussed.

GROCERY SHOPPING HABITS OF COMMUNITY DWELLING OLDER ADULTS

A. Hanson, J. Lee, *North Dakota State University, Fargo, North Dakota*

The home environment provides the major portion of food and beverages available to individuals (Carlson, Kinsey & Nadav, 2002). While nutrition plays a role in the poor health of older adults, the food shopping environment has been identified as one of the negative factors that influence the nutritional status of older adults (Moore & Diez Roux, 2006). The purpose of this study was two-fold: 1) to identify general food shopping behaviors of older adults and 2) to identify factors that influence food choice in older adults. Snowball sampling was used to interview 26 older adults, 65 years old and older who grocery shopped and prepared their own meals. Interviews were transcribed and coded for thematic analysis. The four themes discovered in the analysis were older adults planned their meals based on prepared lists and specials in advertisements and also planned for impulse buys. Older adults' shopped for foods based on their habitual and unconsciously ongoing food preferences rather than nutritional considerations. Habitual patterns were

found as participants showed loyalty to one store, followed the same path around the store, and purchased similar items each time they grocery shopped. Older adults indicated they looked at nutrition labels; however nutrition was not as important as price when they chose a food item. Educators need to focus on creating older adults' need for nutrition education by promoting the importance of adequate nutrition knowledge for their health and the positive impacts of nutritionally conscious food shopping on their health.

SESSION 1640 (SYMPOSIUM)

NEW DIRECTIONS IN CAREGIVING RESEARCH: THE PERCEPTIONS OF CARE RECIPIENTS

Chair: *S.M. Moorman, Boston College, Boston, Massachusetts, University of Wisconsin, Madison, Wisconsin*

Discussant: *K.M. Bennett, University of Liverpool, Liverpool, United Kingdom*

While the bulk of the caregiving literature addresses the experiences of informal care providers, this symposium focuses on the experiences of persons who receive care. We examine the emotions, expectations, preferences, and choices of older persons as they progress from healthy persons anticipating future care needs to terminally ill persons preparing for death. Moorman addresses the relationship of objective and subjective problems to the level of concern that healthy older adults hold about burdening caregivers in future. Crist explores older Mexican Americans' preferences for informal over formal care services. Bodnar-Deren investigates the reasons seriously ill persons give for the presence and content of end-of-life medical care plans. Egbert studies the mental health of stroke survivors as they adapt to their new roles as care recipients. Schroepfer examines the social support that terminally ill persons expect to receive in their last months and following their deaths. Across our studies, themes include autonomy, concerns about burdening caregivers, and acceptance of caregivers' imperfections. Care recipients wish to preserve their independence to the extent possible. They experience guilt and depression over their care needs, and work to protect their caregivers from burden. They prefer informal care, but are aware that their caregivers may lack nursing skills and may offer unhelpful social support. Overall, our studies suggest that older adults are active participants in the caregiving relationship. We propose directions for future research as well as best practices for health care professionals working with older patients and their caregivers.

HEALTHY OLDER ADULTS' CONCERN ABOUT BURDENING FUTURE CAREGIVERS: A GENDERED APPROACH

S.M. Moorman, 1. Boston College, Boston, Massachusetts, 2. University of Wisconsin-Madison, Madison, Wisconsin

A majority of recipients of informal health care express concern that their caregivers are burdened. Although many care recipients experience depression, suicidal ideation, and other forms of psychological distress as a result of their concern, little research has examined the sources of perceived burden. Because care work experiences differ by sex across the life course, I study perceived burden as a gendered issue. In a sample of nearly 10,000 White adults in their mid-60s who are anticipating their future care needs, I find that women perceive more burden than do men. Subjective concerns, such as personal autonomy, are the major sources of perceived burden, presumably because care recipients wish to protect caregivers' independence. Although norms of reciprocity dictate equal exchange, objective concerns such as finances contribute little to perceived burden. Interventions should address subjective concerns, especially among women, in order to improve the psychological well-being of care recipients.

KEEPING IT IN THE FAMILY: WHEN MEXICAN AMERICAN ELDERS CHOOSE NOT TO USE HOME CARE SERVICES

J.D. Crist, College of Nursing, The University of Arizona, Tucson, Arizona

BACKGROUND: Mexican American elders are more functionally impaired and chronically ill, yet use home care services less than Anglo elders. **PURPOSE:** Describe the process by which Mexican American elders and their caregivers decide not to use home care services. **METHODOLOGY:** Grounded theory's constant comparison was used to analyze Mexican American elders' (N=11) and family caregivers' (N=12) interviews. **FINDINGS:** The emerging substantive grounded theory included three stages: Taking Care of our Ourselves, Acknowledging Increasing Needs, Tapping Family Resources. The processes describe how Mexican American families face increasing needs of elders at home in the context of their cultural norm of familism. **DISCUSSION:** Findings were similar to those by elders who chose to use home care services and can shape interdisciplinary interventions to support traditional Mexican American family values, including elders' aging in place. Increased understanding will contribute to the national agenda to reduce health care disparities.

UNDERSTANDING PATIENTS' PERSPECTIVES ON END-OF-LIFE HEALTH CARE PLANNING

S. Bodnar-Deren, Sociology and Institute for Health, Rutgers University, New Brunswick, New Jersey

Much of the research on End-of-Life (EOL) planning has focused on objective measures of patients' planning rather than patient self-appraisal/perception, and relatively little is known about how patients' perceptions operate in terms of informing EOL planning. The purpose of this study is to explore how patients' perceptions affect their EOL planning. Audio-taped focus groups (N=75) were conducted to explore self-perceptions among cancer, CHF, and diabetes patients. Content analysis revealed five major themes: self-perceived burden was a major factor in EOL planning, patients reported that being able to control/direct their care at the end of life was important, as was the desire to prevent family conflict. Similarly, issues regarding autonomy and dignity factored into individuals' EOL planning behaviors. These themes broaden what we know about EOL planning, serve to guide health professionals, and suggest that by eliciting patient perceptions about illness impact, practitioners may better facilitate increased levels of EOL planning.

EXPLORING THE RELATIONSHIP BETWEEN CARE RECIPIENT PWB AND PERCEPTIONS OF SELF AND STRAIN WITHIN THE CAREGIVING CONTEXT

N. Egbert¹, G.C. Smith², K.M. Nanna², M. Dellmann-Jenkins², 1. Communication Studies, Kent State University, Kent, Ohio, 2. Kent State University, Kent, Ohio

Although it is well-established that the psychological well-being (PWB) of family caregivers is related to perceived self and strain in the caregiving role, scant research has explored if the PWB of care recipients is similarly linked to their perceptions of roles and self within the caregiving context. We analyzed self-reported baseline data from 14 male stroke survivors with elevated depression or anxiety recruited for a randomized clinical trial of an intervention for spousal caregivers. Depression correlated positively with perceived dependency (.57), and inversely with perceived quality of care (-.52) and social support (-.49). Anxiety correlated inversely with perceived quality of care (-.55) and overprotection (-.37). Although self-reported mastery was weakly related to depression and anxiety, it correlated highly with both perceived dependency (-.43) and emotional support (.44). These exploratory findings suggest that the PWB of care receivers is strongly associated with how they view interacting with caregivers [Funded by R21NR010189-01A1].

TERMINALLY ILL ELDER'S ANTICIPATION OF SOCIAL SUPPORT IN DYING AND AFTER DEATH

T. Schroepfer, H. Noh, *School of Social Work, University of Wisconsin-Madison, Madison, Wisconsin*

Social support has been found to play a key role in the dying process of terminally ill elders; however, scant information is available regarding the type of support these elders receive and prefer. The purpose of this study was to ask elders who had less than six months to live about their support. In-depth, audiotaped face-to-face interviews were conducted with 100 terminally ill elders and data were content analyzed to identify and categorize the main themes. Although not asked specifically about anticipated support, preliminary findings revealed that 85 of the 100 elders identified such support as important. Four themes emerged: 1) reasons for anticipating support from others, 2) feelings of guilt about anticipating support, 3) anticipating both helpful and unhelpful support, and 4) support anticipated both in dying and after death. These research findings have implications for those seeking to provide appropriate support to an elder in his/her dying process.

SESSION 1645 (SYMPOSIUM)

NEW INSIGHTS IN LIFE REVIEW: FROM THEORY TO THERAPY

Chair: G.J. Westerhof, *Psychology and Communication of Health and Risk, University Twente, Enschede, Netherlands*

Discussant: P. Cappeliez, *University of Ottawa, Ottawa, Ontario, Canada*

Reminiscence and life review have a long tradition in gerontology, but the link between research and applications has been rather weak. This led us to conduct a systematic review of scholarly publications relating reminiscence and life review to mental health. We found three basic functions: social functions include the exchange of positive memories in social interactions; negative functions relate to the use of positive memories to reduce boredom and to the continuous revival of bitter memories; positive functions include the integration of both positive and negative memories into one's present life and identity. In this symposium, we draw implications from this research for interventions, focusing in particular on the use of life review in psychotherapy. First, we present a new classification of interventions based on reminiscence functions. Life review therapy is added as a new type of intervention besides simple reminiscence and structured life review. This classification also makes it possible to formulate more precisely why certain interventions will be effective in promoting particular aspects of mental health. Second, we assessed reminiscence functions in people with symptoms of depression and anxiety. Reminiscence is systematically related to mental health problems in this population, showing that it is important to address reminiscence functions in psychotherapy offered to this group. Third, an RCT of an intervention combining life review with creative therapy is presented. The program is found to be effective in promoting personal meaning and thereby in alleviating depression. The study provides evidence of the importance of integrating life review in psychotherapy.

THE EFFECTS OF LIFE REVIEW THERAPY ON PERSONAL MEANING AND DEPRESSION

G.J. Westerhof¹, E.T. Bohlmeijer¹, A. Pot^{2,3}, 1. *Psychology and Communication of Health and Risk, University Twente, Enschede, Netherlands*, 2. *Free University, Amsterdam, Netherlands*, 3. *Trimbos Institute, Utrecht, Netherlands*

An intervention based on life review and creative therapy was developed to increase personal meaning and decrease depression by the integration of positive and negative recollections of one's life. A multicenter RCT was conducted with an intervention group (N=73) and a control group (N=67). Measurements took place before and after the intervention and three months later using a sentence completion questionnaire for personal meaning and the CES-D for depression. The inter-

vention group increased significantly more in personal meaning than the control group and remained stable at follow-up. Baseline personal meaning and improvements in meaning during the intervention predicted decline in depressive symptoms later in time. Personal meaning is a positive asset in the lives of older people that can be supported by means of life review therapy. The focus of the intervention on the promotion of meaning in life contributes to the mental health of the older participants.

NEW DEVELOPMENTS IN RESEARCH ON REMINISCENCE AND LIFE REVIEW IN RELATION TO MENTAL HEALTH: A SYSTEMATIC REVIEW

E.T. Bohlmeijer, G.J. Westerhof, *Psychology and Communication of Health and Risk, University Twente, Enschede, Netherlands*

Life-review is used to treat depression in later life, but its evidence is contradictory. Therefore, recent research on reminiscence and life-review and their relation to mental health was systematically reviewed (period 1990 – 2008). Three basic functions of reminiscence and life review were found for mental health: social, positive, and negative functions. It is proposed that these functions are addressed in different types of interventions: simple reminiscence stimulates social functions to promote positive feelings, life review uses positive functions to enhance personal well-being, and life review therapy is directed at change in negative functions to alleviate symptoms of mental illness. The distinction between life-review and life-review therapy is new and offers a possible explanation for the inconsistent results of effect studies. It is concluded that it is relevant to distinguish between different reminiscence functions and the ways in which interventions use these functions to promote different aspects of mental health.

REMINISCENCE FUNCTIONS AND MENTAL HEALTH IN OLDER ADULTS WITH MODERATE DEPRESSION

J. Korte¹, E.T. Bohlmeijer¹, G.J. Westerhof¹, A. Pot^{2,3}, 1. *Psychology and Communication of Health and Risk, University of Twente, Enschede, Netherlands*, 2. *Free University, Amsterdam, Netherlands*, 3. *Trimbos, Utrecht, Netherlands*

Since moderate depression and anxiety are by far the most important risk factors of late-life clinical disorder, it is relevant to study the functions of reminiscence in this group at risk. We assessed positive reminiscence functions (identity, problem solving) and negative reminiscence functions (bitterness revival, boredom reduction) in 171 Dutch older people with depressive symptomatology. Furthermore, we measured depressive and anxiety symptoms, important life-events and serious illness. Depression was positively correlated with negative reminiscence functions, in particular with bitterness revival. Anxiety has a positive relation with negative functions, as well as a negative relation with problem solving. Moreover, problem solving mediates the relation of negative life events with anxiety. To reduce clinical symptomatology and prevent mental disorder, we advise mental health care professionals to use techniques which reduce bitterness revival in people with depressive symptoms, and to use problem solving techniques in people with anxiety symptoms.

SESSION TEMP (SYMPOSIUM)

THE EXPLORATION OF DEEP SPIRITUALITY: MEANING MAKING AT THE END OF LIFE

Chair: L.K. Manning, *Sociology/Gerontology, Miami University, Oxford, Ohio*

Discussant: R.C. Atchley, *Sociology/Gerontology, Miami University, Oxford, Ohio*

Spirituality is a commonly used term that permeates popular culture. It is a term used by many to describe religious world-view and understanding of life experience, while for others it reflects an indescribable state of being having little to do with religiosity. Spirituality has been

described as an inner, experiential domain that can include experiences of religion and religious social contexts but is not restricted to such experiences (Atchley, 2009). Spiritual experience can occur at many levels: physical, cognitive, emotional, and transpersonal; it can be both transcendent and immanent, transcending worldly concerns, as well as intense present moment perceptions that ground all beings. In this symposium, we bring together spirituality and thanatology, exploring the deep spiritual meanings of death practices at the end of life for elders in variety or spiritual and social contexts. We will discuss death from a variety of spiritual and religious perspectives, exploring the essence of spirituality and the implications it has on meaning making at end of life.

ASSESSING THE CONNECTION OF SOUL (COS) WITH A TRANSCENDENTAL WORLD FOR DEATH AND DYING STUDIES: REFLECTING THE WORLD'S MAJOR CULTURAL TRADITIONS

A.L. Ai, H. Kanno, *University of Pittsburgh School of Social Work, Pittsburgh, Pennsylvania*

In line with the global population aging, death and dying has become an increasingly important topic in research area. Contrary to the general expectation, the association between religious factors and death anxiety is mixed in meta-analyses. This inconsistency led to the question about religious instruments used and the suggestion for measuring belief in an afterlife. Accordingly, we developed a new scale, the Connection of Soul (COS) in a transcendental world. Beliefs in soul can be traced back long before the emergence of today's major religions. In the word's history, fantasy about an afterlife has been widely spread, manifested in myths and cultural views. Based on Smart's "Great Three" origins, our study generated and verified the three-dimensional COS, Secular, God-centered, and Cosmic-spiritual Views, reflecting the cultural value in ancient East, West, and South cultural legacies. Further analyses offered psychometric properties of the COS. Two faith-related views are protective against existential terror.

TIBETAN VIEWS AND PRACTICES AROUND DYING

M.D. Frank, *Social Work, Minnesota State University Mankato, Mankato, Minnesota*

Death is certain; the time of death is uncertain. Tibetan elders believe in rebirth and that actions and practices in this lifetime impact the next life. In the Tibetan Buddhist tradition, contemplation and meditation on death and impermanence helps one realize how precious and short this human life, and provides opportunities for the practitioner to become familiar with the stages of dying, allowing one to die in a peaceful and relaxed way. The Dalai Lama's advice on "living well and dying consciously" (2003) and practices that can be used each day, at the time of death, and by others during the forty days immediately following death will be discussed. Results from qualitative inquiry with Tibetan monks in Nepal and the U. S. will be presented along with results from conversations with Tibetan elders.

SERIOUS ILLNESS AND THE SEARCH FOR MEANING AMONG AFRICAN AMERICAN ELDERS WITH ADVANCED HEART FAILURE

F.P. Hopp¹, N. Thornton¹, L. Martin², *1. Wayne State University School of Social Work, Detroit, Michigan, 2. Wayne State University Department of Anthropology, Detroit, MI, Michigan*

Purpose: This study was designed to explore the lived experience of advanced heart failure among urban African American elders. Method: Focus groups and individual patient interviews were conducted among African Americans age 60 and over with advanced heart failure living in Detroit, Michigan, and the resulting qualitative data was analyzed for relevant themes. Results: The theme of life disruption encompassed the process of losing awareness, getting scared, attempts to make sense of heart failure, and limiting activities. Resuming life was a contrasting theme involving culturally relevant coping strategies aimed at re-gain-

ing and maintaining a sense of self amidst serious illness. Spiritual-focused coping included the quest for deeper spirituality and meaning, praise, gratitude, acceptance, and acknowledgment of spiritual dependence. Conclusion: African Americans with heart failure face many challenges, and frequently invoke spiritual coping to make sense of their condition and maintain a sense of self amidst the challenges of advanced illness.

SESSION 1655 (SYMPOSIUM)

TRUST, NEIGHBORHOODS, AND THE OLDER PERSON: TRANSLATING RESEARCH INTO PRACTICE

Chair: A. Glicksman, *Planning, Phila Corporation for Aging, Philadelphia, Pennsylvania*

Discussant: K. Clark, *Planning, Phila Corporation for Aging, Philadelphia, Pennsylvania*

Trust is a critical element in maintaining any social organization, from a small group to entire societies. Trust is also critical for individual well being. The lack of trust and feeling of isolation contributes to the decline of both physical and mental health. This panel looks at trust and the implications of trust in, or the lack of trust in, the health care system for the well being of older persons. Three papers (Norstrand, Hoffman, and Glicksman) investigate this issue through secondary analyses of a representative probability sample of older persons living in the City of Philadelphia and the four surrounding counties. Each paper looks at the issue of trust through a different prism – urban/suburban differences (Hoffman), trust in neighbors (Norstrand) and religious and ethnic differences (Glicksman) with a focus on how trust in the health care system relates to compliance with recommendations for regular cancer screenings. The fourth paper (Eichwald) reports on efforts to encourage older adults to be screened for cancer and ties the findings from the three analytic papers into the experience of promoting healthy behaviors. Finally, the respondent (Clark) will discuss implications of the findings and the experience of health promotion for building greater trust across all age groups in the city. Persons attending the session will be able to 1) identify three ways that trust can be built among older city dwellers and 2) describe at least two reasons that older persons sometime mistrust the health care system.

TRUST AND THE OLDER ADULT: TRANSLATING RESEARCH INTO PRACTICE

B. Eichwald, D. Nevison, *Planning, Phila Corporation for Aging, Philadelphia, Pennsylvania*

The Planning Department at Philadelphia Corporation for Aging is involved in supporting several health promotion programs including ones designed to encourage elders to be screened for cancer and programs designed for non-English speaking audiences as well as programs to assist older persons to remain in their homes and neighborhoods. Data from our research program are used by the Planning Department to help design and structure evaluations of some of these programs. Specific examples of the interface between research and planning will be examined. These include 1) evaluating neighborhood level programs to maintain elders in their homes 2) developing a breast cancer screening program and 3) assisting in identifying specific goals for other efforts to make the city more "senior friendly." The process by which the research data is integrated into the planning process will be described.

THE ROLE OF URBAN RESIDENCE IN TRUST OF THE HEALTH CARE SYSTEM

C. Hoffman¹, A. Glicksman¹, M.H. Kleban², *1. Philadelphia Corporation For Aging, Philadelphia, Pennsylvania, 2. Madlyn & Leonard Abramson Center for Jewish Life, Horsham, Pennsylvania*

Recognition of the impact of environment on behavior and feelings is growing. In this paper, regression analyses were used to explore relationships between medical mistrust and urban or suburban dwelling,

age, income and minority status. For Respondents age 60 and older, residing in a city (Philadelphia or Chester, PA) was predictive of distrust of the medical system. This was observed for 6 of the 9 healthcare trust items in the 2008 Public Health Management Corporation community survey. The medical mistrust questions encompassed several dimensions (i.e. benefits of the system; greed; racial equality of care; experimentation on patients). The mistrust items regarding medical errors did not show a distinction between urban and suburban. In examining possible implications of medical distrust, urban versus suburban residence did not bear upon the likelihood of undergoing various cancer screenings at their recommended frequencies.

RELIGIOUS AND RACIAL DIMENSIONS OF TRUST AMONG OLDER ADULTS

G.G. Glicksman¹, A. Glicksman³, M.H. Kleban², 1. *Reconstructionist Rabbinical College, Wyncote, Pennsylvania*, 2. *Polisher Research Institute, Horsham, Pennsylvania*, 3. *Phila Corporation for Aging, Philadelphia, Pennsylvania*

Two widely held assumptions were tested, one, that religious affiliation and two, that being white, are associated with higher trust in the health care system and positive health behaviors. We compared responses of white versus Black respondents to questions about trust in the health care system and about compliance for cancer screenings within the recommended time. We then restricted the sample to white respondents and compared Protestant, Catholic and Jewish responses to the same questions splitting all analyses by gender. Jewish women and Black women were more likely to be distrustful of the health care system than members of the other groups but were more likely to have completed cancer screenings within the recommended time. These findings indicate that the role of religious affiliation and of ethnic/racial membership as they relate to trust in the health care system and health behaviors is much more complex than often described.

HOW DOES THE SOCIAL ENVIRONMENT IMPACT TRUST IN THE HEALTHCARE SYSTEM AMONG OLDER ADULTS?

J. Norstrand^{1,2}, A. Glicksman², M.H. Kleban³, 1. *Boston College, Newton, Massachusetts*, 2. *Phila Corp for Aging, Philadelphia, Pennsylvania*, 3. *Abramson Center, Horsham, Pennsylvania*

Introduction: Social environment is significantly associated with health (McNeill et al., 2006). Goal: Study examined whether social environment (measured by perception of neighborhood, PON) is associated with trust in healthcare system and following medical advice. Method: Community health survey collected in 2008 by Public Health Management Corporation provided sample of 3,257 elderly (60 years and over) living in Southeastern Pennsylvania. Multiple regression analyses were carried out for positive and negative trust in healthcare system and following medical advice. Socio-demographic and health predictors were entered in first and second steps respectively, and PON in final step. Results: PON was significant predictor of trust in healthcare system. Models were statistically significant for positive trust: $F(7, 2174) = 19.02, p < .001$ and negative trust: $F(7, 1797) = 19.53, p < .001$. PON did not predict following medical advice. Conclusions: Social environment of older adults may play key role in how older adults relate to healthcare system.

SESSION 1660 (PAPER)

WORKING IN A NURSING HOME

A NATIONAL OVERVIEW OF THE TRAINING RECEIVED BY NURSING ASSISTANTS WORKING IN U.S. NURSING HOMES

M. Sengupta¹, L. Harris-Kojetin², F. Ejaz³, 1. *CDC/NCHS, Hyattsville, Maryland*, 2. *CDC/NCHS, Hyattsville, Maryland*, 3. *Benjamin Rose Institute, Cleveland, Ohio*

Adequate training is critical to meet long-term care (LTC) direct care workforce retention challenges. Yet, little is known about the adequacy of initial training and continuing education received by LTC direct care workers. A few geographically limited studies have indicated that training of direct care workers is often insufficient. Using the first-ever nationally representative sample of nursing assistants (NAs) from the 2004 National Nursing Assistant Survey (NNAS), this descriptive paper provides an overview of the initial training and continuing education received by NAs working in nursing homes, assesses NAs' perceptions of the adequacy of their training, and identifies unmet training needs. Chi-squares are used to examine associations between NAs' job satisfaction and NAs' perceptions about the adequacy of training. Results show that overall about 66 percent of NAs feel that their initial training prepared them well for their jobs. However, there is wide variation in the perceived adequacy of initial training in specific skills: less than half of NAs feel that their initial training provided them with excellent preparation to work with dementia patients, while over 70 percent thought that they had excellent preparation for handling residents' needs for assistance in activities of daily living (ADLs). Nearly 90 percent attended continuing education classes. Job satisfaction varied significantly by NAs' perceived adequacy of training: a higher percent of aides who rated their training as excellent were satisfied with their jobs. Findings could inform enhancements to NAs' initial training as one approach to help address retention challenges for this essential labor force.

PRACTICE VARIATION AMONG NURSING HOMES THAT PERCEIVE THEMSELVES AS MOSTLY AND COMPLETELY CULTURE CHANGE FACILITIES

S. Sterns, S.M. Allen, S.C. Miller, *Community Health, Brown University, Providence, Rhode Island*

The culture change (CC) movement aims to transform nursing homes (NHs), that often restrict resident/staff autonomy by empowering resident/frontline staff. However, little is known about the transition process to becoming a CC home, including whether this process differs between NHs perceiving themselves as "mostly" vs. "completely" CC facilities. Using data from a 2007 Commonwealth-funded study, we examined 291 NHs self-reporting as being "mostly" or "completely" CC facilities, and used complexity theory to help inform our thinking. Using descriptive statistics we examined prevalence of practices by extent of CC and years implementing (1-3 versus 3+). Practice categories included resident-centered care and staff empowerment. Empirically, differences across years of implementation were greater among "completely" NHs. Among "mostly" CC homes, only two of sixteen practices showed differences across time categories, but for "completely" NHs, ten of sixteen practices showed significant differences. For example, having self-managed work teams was unchanged for "mostly" NHs (26%-27%), but a greater proportion of NHs self-identified as "completely" and implementing CC for 3+ versus 1-3 years had such teams (49% versus 30% respectively). NHs with 3+ versus 1-3 years of implementation had higher turnover in "mostly" CC-NHs and lower turnover in "completely" CC-NHs. Findings suggest tangible distinctions between NHs self-identified as "mostly" and "completely" CC facilities. "Completely" NHs may have a philosophical mission to become a total CC facility, and thus continually implement new practices. Facilities without this mission, after adopting some practices, may stop CC improvement efforts, indicated by little variation based on when adoption occurred.

PREDICTORS OF SATISFACTION WITH SUPERVISION FOR NURSES IN LONG TERM CARE SETTINGS

L. Noelker, F. Ejaz, M. Rose, *Benjamin Rose Institute, Cleveland, Ohio*

There has been little research on the supervisory needs of nurses in long term care compared to acute care settings. This study addresses the literature gap by examining predictors of satisfaction with supervision in a sample of 136 RNs and LPNs working in 49 nursing homes, assisted living facilities, and home care agencies in northeast Ohio. The research is based on the stress and support model with four categories of predictor variables (background characteristics, personal stressors, job-related stressors, and social support in the workplace) to explain satisfaction with supervision. Regression analysis showed the background characteristics category was not significant and was dropped. The remaining categories each made a significant contribution with an adjusted R² of .26 ($p=.000$). While the category of personal stressors was significant, there were no individual variables in the category that emerged. The significant predictors were from the job-related stress and social support categories: satisfaction with paid health insurance, opportunities for promotion, and reports of more positive and less negative support in the workplace. Management efforts to improve nurses' satisfaction with supervision can be addressed through improved health insurance plans and career ladders for nurses and attention to the work environment's socio-emotional milieu.

THE UNCONSCIOUS AND UNRESTRAINED MONITORING SYSTEM AND ITS INFLUENCE ON THE CARE STAFF AND THE INSTITUTIONALIZED ELDERLY PERSONS

H. Uchida¹, Y. Fujiwara², K. Taniguchi³, S. Shinkai², 1. *School of Human Science and Environment, University of Hyogo, Himeji, Hyogo, Japan*, 2. *Kinden Kyoto Institute, Kizugawa, Kyoto, Japan*, 3. *Tokyo Metropolitan Institute of Gerontology, Itabashi, Tokyo, Japan*

The aim of this study was to clarify how the introduction of an unconscious and unrestrained 24-hour monitoring system in a nursing home affected the physical and mental functions of care staffs, and ADL in elderly persons requiring long-term care. This system was composed of an air pressure sensor system and an ultrasonic oscillosensor system. The intervened participants were seven care staffs (age 37.4 \pm 14.2) and seventeen elderly persons (age 85.1 \pm 9.2) in a nursing home, Osaka, Japan. We selected the control group consisting of seven care staff (39.0 \pm 15.8) and eighteen elderly persons (age 86.8 \pm 9.2) in the same facility. We carried out a baseline survey at the end of September 2008, and the follow-up study was done at the end of October 2008. We evaluated care staff's physical and mental functions using the questionnaires such as cumulative fatigue symptoms, job stress, Maslach Burnout Inventory etc. Step counts, and total and each energy expenditures of care staffs during a night shift work were assessed by using a pedometer calorimeter. From the comparisons of the average scores of measurements between pre- and post-intervention using generalized linear model, the scores of "energy expenditure during diaper changing", "the counts of diaper changing", "decreasing of work incentives", and "conflict with their chief" significantly decreased in the intervention group ($P<0.01$, $P<0.05$). These results suggest that the introduction of the 24-hour monitoring system in the nursing home could decrease care burden of the care staffs and improve ADL and QOL of the elderly persons requiring long-term care.

SESSION 1665 (PAPER)

BODY COMPOSITION

HOSPITALIZATION AND CHANGES IN BODY COMPOSITION IN A POPULATION-BASED COHORT OF OLDER PERSONS

D. Alley¹, A. Koster², L. Ferrucci³, D. Mackey⁵, F. Tykavsky⁴, P. Cawthon⁵, A.B. Newman⁶, T. Harris², 1. *University of Maryland, Baltimore, Maryland*, 2. *National Institute on Aging Laboratory of Epidemiology, Demography, and Biometry, Bethesda, Maryland*, 3. *National Institute on Aging Longitudinal Studies Section, Baltimore, Maryland*, 4. *University of Tennessee Health Science Center, Memphis, Tennessee*, 5. *Research Institute, California Pacific Medical Center, San Francisco, California*, 6. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Hospitalization-related declines in lean mass may be one pathway through which hospitalization increases disability risk. We conducted a repeated measures analysis using data from six years of the Health, Aging, and Body Composition Study (Health ABC) to examine how 1-year changes in body composition were related to hospitalization in the previous year. Total mass, lean mass, and fat mass were measured annually over 6 exams using DXA. Using GEE models, we compared 1-year changes in body composition for participants with and without a hospitalization in the previous year, controlling for demographic and behavioral characteristics and comorbid conditions. A total of 3366 hospitalizations occurred in 1554 participants between the Year 1 and Year 6 exams. Hospitalization in the previous year was associated with greater declines in total body mass in both men (-0.74kg) and women (-0.81kg), as well as greater loss of fat mass (-0.35kg in men, -0.59kg in women) and lean mass (-0.30kg in men, -0.24kg in women) ($p<.001$ for all comparisons). Associations increased with number of days hospitalized and were largest in men and women hospitalized for eight or more days in the last year. In men, hospital-associated loss of lean mass was confined to participants who lost weight over the entire study period. In women, hospitalization was associated with lean mass loss regardless of total weight change. Results suggest the importance of interventions to maintain lean mass among hospitalized older persons. This research was partially supported by the Intramural Research Program of the NIH, National Institute on Aging.

A COMPARISON OF BIOLOGICAL RISK BY BODY MASS INDEX IN THE UNITED STATES, UNITED KINGDOM, AND TAIWAN

S. Vasunilashorn, J. Kim, E. Crimmins, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Weight in various countries has generally been associated with adverse health indicators and outcomes. To examine cross-cultural associations of weight and indicators of risk for certain health conditions, we investigated the link between weight and biological markers of health, often the first sign of deteriorating health in a population, using data from three nationally representative population studies: the United States National Health and Nutrition Examination Survey (2003-2006; N=4400), the English Longitudinal Study of Ageing (2004-2005; N=9139), and the Social Environment and Biomarkers of Aging Study (SEBAS) in Taiwan (2000; N=1023). Indicators of risk were compared across body mass index (BMI, kg/m²) categories (underweight <18.5, normal 18.5-29.9, and obese ≥ 30) for adults age 52 and older. In all countries, obese individuals were at greater risk of having high-risk levels of blood pressure, cholesterol (total, high-density lipoprotein, and low-density lipoprotein), triglycerides, C-reactive protein, and glycated hemoglobin; however, the excess risk linked to obesity was greater in Americans and Britons. Some specific differences among the countries were: very few obese Britons had high-risk levels of fasting glucose and obese Taiwanese had the highest mean blood pressure levels. This study

found cross-country differences in the relationship between BMI and biological risk which may reflect differences in lifestyle and diet.

MEASURING THINNESS IN OLDER PERSONS: ASSOCIATION BETWEEN SIMPLE ANTHROPOMETRIC MEASURES AND MORTALITY

H.A. Wijnhoven¹, M.A. van Bokhorst - de van der Schueren², M.W. Heymans¹, H.C. de Vet³, H.M. Kruizenga^{1,2}, J.W. Twisk¹, M. Visser¹, *1. Department of Health Sciences and the EMGO Institute for Health and Care Research, VU University, Amsterdam, Netherlands, 2. Department of Nutrition and Dietetics, VU University Medical Center, Amsterdam, Netherlands, 3. Department of Epidemiology and Biostatistics and the EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands*

Context - Low body mass index (BMI) is a general measure of thinness and is widely used as an indicator of undernutrition in older persons although practical and validity problems hamper its use in this age group. Other simple anthropometric measures like low mid-upper arm circumference (MUAC) and calf circumference may better reflect muscle mass and thus stronger associated with mortality. **Objective** - To study dose-response associations of BMI, MUAC, calf, hip and waist circumference with mortality in community dwelling older men and women. **Design** - In 1677 non-institutionalized participants aged ≥ 65 years of the Longitudinal Aging Study Amsterdam anthropometric measurements were performed in 1992-93 and mortality was followed until June 1, 2007 for their vital status. **Results** - Based on visual inspection of dose-response associations, low MUAC was most strongly associated with 15-year mortality in both men and women, even after excluding 3-year mortality and those with a smoking history, obstructive lung disease, or cancer. When categorizing anthropometric measures, low MUAC (<10th percentile versus 40-60th percentile) was clearly associated with mortality in men (hazard ratio (HR) = 2.72 (95% CI, 2.03-3.66)) and somewhat weaker in women (HR=1.60 (95% CI, 1.17-2.21)). Other HR's were: 1.61 (95% CI, 1.19-2.19) (BMI, men); 1.45 (95% CI, 1.03-2.04) (BMI, women); 2.09 (95% CI 1.37-3.18) (calf circumference, men); and 1.38 (95% CI, 0.90-2.11) (calf circumference, women). **Conclusions** - Based on its prediction of mortality and given an easy assessment, low MUAC seems the most appropriate simple anthropometric measure for assessing thinness in older persons.

LOW MID-UPPER ARM CIRCUMFERENCE AND MORTALITY IN OLDER PERSONS: THE INFLUENCE OF FAT AND MUSCLE MASS

H.A. Wijnhoven¹, M.B. Snijder¹, M.A. van Bokhorst - de van der Schueren², M. Visser¹, *1. Department of Health Sciences and the EMGO Institute for Health and Care Research, VU University, Amsterdam, Netherlands, 2. Department of Nutrition and Dietetics, VU University Medical Center, Amsterdam, Netherlands*

Background - In older persons, low mid-upper arm circumference (MUAC) is associated with 15-y mortality. It is unknown whether this is explained by low muscle or fat mass. **Objective**: To examine whether the association between low MUAC among older persons can be explained by low appendicular muscle mass (aMM), appendicular fat mass (aFM), and/or trunk fat mass (tFM). **Design** - In 475 non-institutionalized participants aged ≥ 65 years of the Longitudinal Aging Study Amsterdam whole body dual-energy x-ray absorptiometry was performed to determine lean and fat mass at several regions. Participants were followed 12 years for their vital status. **Results** - MUAC was, independent of each other and of height, associated with aMM (standardized beta = 0.52 (men), 0.14 (women)), aFM (beta = 0.41 (men), 0.66 (women)), and weaker with tFM (beta = 0.21 (men), 0.20 (women)). Low MUAC (<10th percentile versus 40-60th percentile) was associated with mortality in men (hazard ratio (HR) = 2.92 (95% CI, 1.55-5.49)) and in women (HR = 3.41 (95% CI, 1.56-7.45)). In men, both low aMM (HR=2.37 (95% CI: 1.24-4.55)) and aFM (HR=1.95 (95%

CI, 1.05-3.64)) were independently associated with mortality. No statistically significant association was found for tFM (men and women) and aMM and aLM (women). Only arm FM was statistically significantly associated with mortality in women (HR = 2.67 (95% CI, 1.29-5.52)). **Conclusions** - The association between low MUAC in older persons can largely be explained by both low aMM and low aFM in men and only low arm FM in women.

SESSION 1670 (PAPER)

CARDIOVASCULAR HEALTH

PHYSICAL FUNCTION, METABOLIC HEALTH, AND SUBCLINICAL ATHEROSCLEROSIS IN HEALTHY OLDER ADULTS

M. Hamer¹, A. Steptoe¹, M. Kivimaki¹, A. Lahiri², *1. Epidemiology and Public Health, University College London, London, United Kingdom, 2. Cardiac Imaging & Research Centre, Wellington Hospital, London, United Kingdom*

Physical function is a predictor of longevity in ageing, although the mechanisms are poorly understood. We examined the association of physical function with metabolic health and markers of sub-clinical atherosclerosis in a sample of 530 older participants (average age 63yrs) without overt CVD from the Whitehall II cohort. Physical function was assessed from a timed walking test. Electron beam computed tomography and ultrasound was used to assess the presence and extent of coronary artery calcification (CAC) and carotid intima-media thickness (IMT), respectively. Clinically relevant levels of CAC (Agatston score>100) were detected in 24% of the sample. Faster gait speed (top third) was associated with lower risk of CAC (odds ratio=0.54, 95% CI, 0.32 to 0.92) and lower IMT (β =-0.04, 95% CI, -0.01 to -0.07 mm) in comparison with the slowest (bottom third), after adjusting for age, sex, social status and smoking. Faster gait speed was also associated with lower body mass index (β =-0.90, 95% CI, -1.71 to -0.10 kg/m²), C-reactive protein (β = -0.48, 95% CI, -0.93 to -0.03 mg/L), 2 h post load glucose concentration (β = -0.36, 95% CI, -0.72 to 0.00 mmol/L), and higher HDL cholesterol (β = 0.08, 95% CI, 0.00 to 0.17 mmol/L) after adjusting for age and sex. The associations between gait speed and sub-clinical atherosclerosis persisted after adjustment for metabolic risk factors. In summary, physical function, as assessed from a simple timed walk test, is associated with markers of metabolic health and sub-clinical atherosclerosis in healthy older adults.

THE U.S. AND JAPAN: DIFFERENCES IN CARDIOVASCULAR HEALTH BY SEX IN THE 65 AND OLDER POPULATION

S. Davarian, E. Crimmins, *Gerontology, University of Southern California, Los Angeles, California*

Cardiovascular disease is a leading cause of death in the U.S. with more men affected than women. Cardiovascular disease is not as important as a cause of death in Japan and differences by sex are smaller than in the U.S. While we have comparative information on mortality as a cause of death between the two countries, we know little about how the disease process differs. This study examines sex differences in the 65 and older population in prevalence and incidence of risk factors of cardiovascular disease utilizing data from the Nihon University Japanese Longitudinal Study of Aging (NUJLSOA) (n=6,201) and the U.S. Health and Retirement Study (HRS) (n=22,000). Unlike the U.S., the means between the sexes in Japan are very similar on measures of heart rate (m=70.4, f=72.7), systolic blood pressure (m=155.6, f=155.4), diastolic blood pressure (m=82.4, f=81.5), pulse pressure (m=73.2, f=74.0), and body mass index (BMI) (m=22.4, f=22.4). The percentages of males and females with high-risk systolic blood pressure (m=75%, f=72%) and high-risk diastolic blood pressure (m=25%, f=24%) are also similar in Japan. OLS-Regression showed that, holding age constant, none

of the differences are significant with the exception of pulse (women had 2.23 beats/min ($p<.001$) more than men). T-tests showed a larger difference in the prevalence of stroke ($m=14\%$, $f=10\%$, $p<.001$) and logistic regression showed that women are 37% ($p<.001$) less likely than men to have had a stroke. Aside from stroke, Japan provides an example of similarity in cardiovascular risk and disease not observed in other countries.

RELATIONSHIPS AMONG DIAGNOSED CORONARY HEART DISEASE SELF-REPORTED SLEEP DISTURBANCE AND COGNITIVE IMPAIRMENT

C. Cole^{1,2}, J. McSweeney¹, M.A. Cleves³, D. Bliwise⁴, *1. College of Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas, 2. Central Arkansas Veterans Administration, Little Rock, Arkansas, 3. Arkansas Children's Hospital Research Institute, Little Rock, Arkansas, 4. Emory University, Atlanta, Georgia*

This study analyzed a pre-existing dataset that contains retrospective self-reported prodromal and acute symptoms of coronary heart disease (CHD) (specifically acute myocardial infarction [MI]) in 1270 postmenopausal women from 15 sites nation-wide. Data were collected via telephone using the McSweeney Acute and Prodromal Myocardial Infarction Symptom Survey. We investigated the estimated prevalence of: 1) sleep disturbance, 2) cognitive impairment (CI), 3) sleep disturbances and CI, and 4) relationships among sleep disturbance, CHD, and CI. The final sample consisted of 42.6% African-American 42.1% Caucasian, 14.6% Hispanic, and 1.6% other. The average age was 66.54 ($+12.09$). Prodromally, 50.6% of this sample reported sleep disturbance and 31.3% reported changes in thinking or remembering (CI). Cross tabulation of sleep disturbance (no, mild, moderate, severe) and change in thinking or remembering (CI) (no, mild, moderate, severe) indicated that 256 (20.15%) women with diagnosed MI reported symptoms of sleep disturbance and CI before their MI. Only 17.2% of this sample reported chest pain as a prodromal symptom. Prodromal reports of sleep disturbance and CI may be related to sleep apnea but because specific questions were not asked pertaining to sleep apnea, we can only surmise what the sleep disturbance response indicates. Further investigation is needed.

ANGIOTENSIN RECEPTOR BLOCKER VERSUS ANGIOTENSIN-CONVERTING ENZYME INHIBITOR USE AND ALL-CAUSE MORTALITY IN HOSPITALIZED ELDERLY HEART FAILURE PATIENTS WITH CHRONIC KIDNEY DISEASE

A. Ahmed^{1,2}, R. Allman^{1,2}, I. Aban¹, P.W. Sanders^{1,2}, D.K. Arnett¹, T.E. Love³, G.L. Bakris⁴, M.W. Rich⁵, *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. Veterans Affairs Medical Center, Birmingham, Alabama, 3. Case Western Reserve University, Cleveland, Ohio, 4. University of Chicago, Chicago, Illinois, 5. Washington University, St. Louis, Missouri*

Background: Angiotensin-converting enzyme inhibitors (ACEIs) and angiotensin receptor blockers (ARBs) improve outcomes in heart failure (HF) and chronic kidney disease (CKD). However, the comparative value of these drugs in elderly HF patients with CKD is unknown. Methods: Charts of 7009 patients ≥ 65 years discharged alive in 1998-2001 from 106 US hospitals with a primary diagnosis of HF were abstracted. Overall, 4491 (64%) patients had CKD (eGFR < 60 ml/min/1.73m²), of which 2475 (55%) were receiving either ARBs ($n=453$; 18%) or ACEIs ($n=2022$; 82%). Propensity scores for ARB use were used to assemble a cohort of 378 and 1088 patients receiving ARBs and ACEIs, respectively. Subjects were well-balanced on 58 baseline characteristics. Cox-regression models were used to estimate association of ARB use with 4-year all-cause mortality. Results: The mean (\pm SD) age was 79 (± 8) years; 68% were women; 17% were non-whites. Mean eGFR (41 ml/min/1.73m²) and ejection fraction (40%) did not differ between groups. Mortality occurred at a rate of 2500 and 2641 deaths/10,000

person-years of follow-up among matched patients receiving ARBs and ACEIs, respectively (HR when ARB use compared with ACEI use=0.94; 95% CI=0.80-1.10; $P=0.412$). Among 2475 pre-match patients, unadjusted, multivariable-adjusted and propensity-adjusted HRs (95% CIs) for mortality associated with ARB use were 0.85 (0.74-0.97; $P=0.016$), 0.91 (0.80-1.05; $P=0.203$), and 0.93 (0.80-1.07; $P=0.278$), respectively. Conclusion: ACEIs and ARBs had similar effect on 4-year mortality in older adults with HF and CKD. The effect of these agents on renal function, hospitalization and quality of life requires further study.

SESSION 1675 (SYMPOSIUM)

EXPLORING FUNDAMENTALS OF STRENGTH, SPEED AND STAMINA IN THE BALTIMORE LONGITUDINAL STUDY OF AGING

Chair: E. Simonsick, *National Institute on Aging, Baltimore, Maryland*
Discussant: L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

Strength, speed and stamina define essential components of functional independence and life quality. In this symposium, investigators from the Longitudinal Studies Section of the National Institute on Aging use data from the Baltimore Longitudinal Study of Aging (BLSA), a longitudinal observational study extending over 50 years, to explore various fundamental elements - genetics, personality, biomechanics, homeostatic regulation, body composition and disease pathology - of these key life dimensions. Topics include, an examination of the role of glucose regulation in non-diabetic persons aged 60 years and older in conditioning mobility and endurance; evaluation of the genetic basis for variation in blood iron concentrations, a factor in iron deficiency and diminished exercise tolerance; an investigation of the independent and joint associations of knee osteoarthritis, a disease process, and thigh muscle quality factors with customary and maximum gait speed; an analysis of personality facets and their association with muscle strength decline and how these associations vary across the age-spectrum; and lastly using a state-of-the-art gait laboratory, an assessment of age-related differences in response to different mobility challenges especially changes in speed and joint mechanics. Findings provide further evidence that mobility and its components - strength, speed and stamina - represent complex systems controlled and conditioned by a multitude of fundamental agents.

MOBILITY IMPLICATIONS OF "NOT QUITE NORMAL" GLUCOSE TOLERANCE IN OLDER BLSA PARTICIPANTS

E. Simonsick^{1,2}, B. Windham³, E. Metter¹, L. Ferrucci¹, *1. National Institute on Aging, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland, 3. University of Mississippi, Jackson, Mississippi*

Although diabetes has been linked to functional limitations, the relationship of glucose tolerance to physical capacity in non-diabetics remains unclear. In 348 BLSA participants aged 60+ years with no contraindication to exertional activity, we compared mobility status of three groups - normal (fasting glucose < 100 mg/dL and 2-hour < 140 mg/dL), impaired (fasting glucose = 100-125mg/dL or 2-hour = 140-199mg/dL) and unaware (fasting glucose < 126 mg/dL and 2-hour ≥ 200 mg/dL) adjusted for age, sex, race, obesity, smoking, and walking behavior. Mobility did not differ between the "normal" and "impaired". However, the "unaware" versus "normal" needed more time to walk 400m (364 v. 281s; $p<.001$), had slower usual (1.01 v. 1.13m/s; $p=.032$) and rapid (1.50 v. 1.70m/s; $p=.011$) gait speed and lower walking ability score (range 0-9; 7.1 v. 8.3 points; $p=.006$). Findings indicate that older seemingly healthy individuals with pathologic 2-hour glucose levels have diminished mobility and suggest that glucose tolerance testing may help identify persons with impending mobility problems.

INDEPENDENT AND JOINT ASSOCIATIONS OF MUSCLE QUALITY, ADIPOSITY AND KNEE OSTEOARTHRITIS ON WALKING SPEED IN THE BLSA

C. Schreiber, A. Devonshire, A. Penmetsa, M. Nesbitt, E. Metter, E. Simonsick, L. Ferrucci, S.M. Ling, *NIH/NIA, Baltimore, Maryland*

Osteoarthritis of the knee (KOA) is considered a major cause of mobility limitation; however several predisposing factors for KOA, including excess adiposity and poor thigh muscle quality may contribute to restricted mobility. Data are from 638 BLSA participants (mean age 68, 50% women) classified as KOA present (32%) or absent who underwent knee extensor strength and performance testing and computed tomography of the thigh. Persons with KOA had similar usual ($p=.349$), but slower rapid gait speed than persons without KOA ($p=.005$) (adjusted for age, sex, race and co-morbidities). Thigh muscle density, knee extensor strength and cross-sectional muscle area were positively and fat area negatively associated with usual and rapid gait speed independent of KOA. The relationship between KOA and rapid gait speed was mediated by muscle density and strength. Thus, muscle quality factors that predispose to KOA may impact mobility as much as the presence of KOA.

AGE-RELATED DIFFERENCES IN GAIT PATTERN RESPONSE TO INCREASED SPEED AND FATIGUE - RESULTS FROM THE BLSA

S. Ko¹, J. Hausdorff², L. Ferrucci¹, *1. Clinical Research Branch, NIA, Baltimore, Maryland, 2. Tel Aviv Sourasky Medical Center and Harvard Medical School, Boston, Massachusetts*

Age-associated changes in the gait pattern are generally considered compensatory to loss of motor function and physiological reserve. This study investigated the effects of walking under different challenges on speed and muscle force generated during these activities and how this varies with age. We investigated usual, fast and fatigued walking in 152 BLSA participants (72 ± 9 years, 51% women) who could walk unassisted. Walking speed across all tasks decreased with increasing age with fast walking showing an accelerated decline ($p<.001$). Medial-lateral (ML) hip concentric mechanical work expenditure showed accelerating decline with increasing age for fast and fatigued walking compared to usual walking ($p=0.026$ and $p=0.019$, respectively). These findings indicate that older adults experience more pronounced decline in walking speed and ML hip control during challenging tasks. Hence, exercise programs aimed at improving ML hip concentric joint power may improve mobility and prevent mobility loss in older adults.

GENETIC BASIS FOR VARIATION IN PLASMA IRON CONCENTRATION AND ANEMIA-RELATED TRAITS

T. Tanaka^{1,2}, C.N. Roy³, W. Yao³, A. Matteini³, R. Semba³, J.D. Walston³, S. Bandinelli⁴, *1. National Institute on Aging, Baltimore, Maryland, 2. Medstar Research Institute, Baltimore, Maryland, 3. Johns Hopkins University, Baltimore, Maryland, 4. ASF Florence, Italy*

Because of the essential role of iron in human physiology and its high toxicity, the absorption and recycling of iron is tightly regulated. To investigate genetic contributors of iron homeostasis in persons not affected by overt genetic disorders of iron metabolism, a genome-wide association (GWA) study was conducted in the InCHIANTI (N=1206) and Baltimore Longitudinal Study of Aging (BLSA, N=722). Top SNPs were examined for replication in the Women's Health and Aging Study (WHAS, N=569). The SNP strongly associated with serum iron concentration was rs4820268 ($p=3.96 \times 10^{-9}$) located on exon 13 of the transmembrane protease serine 6 (TMPRSS6) gene, an enzyme that promotes iron absorption by inhibiting hepcidin transcription. Nonsense mutations in this gene have been previously described in iron-refractory iron deficiency anemia. Our results indicate that common polymorphisms in TMPRSS6 have a more general effect on the regulation of circulating iron concentration in the general population.

CHANGING ROLE OF PERSONALITY ON STRENGTH DECLINE ACROSS THE AGE SPECTRUM: FINDINGS FROM THE BLSA

M.I. Tolea, P. Costa, A. Terracciano, E.J. Metter, L. Ferrucci, *National Institute on Aging, Baltimore, Maryland*

How personality impacts muscle strength with aging is unknown. Using the NEO-PI-R, we investigated the association of personality domains and facets and muscle strength decline across the age spectrum ($n=1406$; age-range 20-94 years; average follow-up=6.7 years). We found lower self-discipline ($p=0.007$) associated with accelerated strength decline in old age. Whereas, in early life, high agreeableness (vs. low: $p=0.006$, vs. average: $p=0.042$), particularly the facets of altruism (vs. average: $p=0.039$) and compliance (vs. low: $p=0.027$; vs. average: $p=0.030$) was associated with accelerated decline, lower levels of these facets tended to be associated with strength decline in late life. Thus, the negative effects of low self-discipline and agreeableness on rate of strength decline were more evident in later life while in early life low self-discipline and low agreeableness seemed beneficial. Findings suggest personality factors supportive of strength in early life may place individuals at increased risk of strength decline in late life.

SESSION 1680 (POSTER)

INCONTINENCE

THE PREVALENCE AND BURDEN OF URINARY INCONTINENCE ON THE QUALITY OF LIFE OF THE ELDERLY WITH MEDIGAP INSURANCE

J. Pernarelli¹, K. Hawkins¹, R.J. Ozminkowski^{1,2}, M. Bai¹, S.J. Gaston¹, C. Hommer², I. Bloomfield³, C.S. Yeh⁴, *1. Ingenix, Ann Arbor, Michigan, 2. UnitedHealth Group Alliance, Minnetonka, Minnesota, 3. OptumHealth Care Solutions, Minnetonka, Minnesota, 4. AARP Services, Inc., Washington, District of Columbia*

Research Objectives: To estimate the prevalence and burden of urinary incontinence (UI) on the quality of life (QoL) of Medigap insureds. The findings from this study, the first known to be conducted on a Medigap population, were compared to similar studies conducted on Medicare managed care populations. Methods: Data were obtained from a mail survey known as the Health Update Survey (HUS). The HUS contains several questions on demographics, comorbid conditions, and the Veterans RAND (VR-12), which is a validated 12-item health status survey. The HUS was fielded on a random sample of 15,000 insureds from 10 states in 2008. Respondents were divided into those expected to have UI and others, based on their response to a question about leaking urine during the last six months. Univariate and multivariate models were used to estimate the impact of UI on various QoL measures while controlling for patient demographics and comorbid conditions. Principle Findings: Of the 5,530 survey respondents eligible for the study, 37.5% reported urine leakage. The strongest predictors of UI were female gender, advancing age, and obesity. All the QoL estimates were significantly lower for those with UI ($P<0.0001$). Further, UI had a stronger influence on QoL than did several chronic diseases (diabetes, cancer, and arthritis), particularly with regard to mental health. Conclusions: Consistent with studies on other Medicare populations, UI is common in the elderly and is strongly associated with lower QoL, affecting mental, physical and social dimensions of well-being.

PREVALENCE AND ASSOCIATED FACTORS OF URINARY INCONTINENCE IN LONG-TERM CARE HOSPITALS IN KOREA

J. Yoon¹, J. Lee², B.J. Bowers¹, *1. School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin, 2. Hoseo University, Seoul, Korea, South*

This was the first nation-wide study to explore the prevalence and associated factors of urinary incontinence (UI) among residents in long term care hospitals (LTCHs) in Korea. This study was a descriptive cross-

sectional data analysis of 46,336 residents over 65 years old in 583 LTCHs in July 2008. Data were collected from monthly LTCHs residents' assessment (Patient Assessment Instrument) reports to the Korean Health Insurance Review and Assessment Service, which tracks quality indicators and reimbursement. The residents consisted of 72.7% females, with a mean age of 79.3±7.3 years. The mean length of stay was 0.69±0.87 years. The prevalence of UI at LTCHs in Korea was 68.8%. Odds ratio (CI) were calculated for the associated factors using logistic regression; locomotion dependency 7.06 (6.60-7.55), cognitive impairment 4.90 (4.58-5.24), pressure ulcer 2.54 (2.20-2.93), delirium 2.11 (1.95-2.28), urinary tract infection 2.07 (1.60-2.68), tube feeding 1.97 (1.71-2.27), stroke 1.63 (1.55-1.71), length of stay 1.38 (1.34-1.43), depression 1.35 (1.28-1.41), gender 1.25 (1.20-1.32), and age 1.03 (1.026-1.033). The high prevalence of UI and its associated factors among residents in LTCHs in Korea is similar to nursing homes in the U.S. These findings suggest that UI is a serious issue affecting Korean residents in LTCHs, particularly those who are physically dependent or cognitively impaired. Future study may focus on understanding current approaches to care of UI for this population.

SESSION 1685 (POSTER)

NUTRITION - HS POSTER SESSION

IMPLEMENTING HEALTHIER MENUS IN CARE HOMES FOR OLDER PEOPLE

C. Bamford¹, B. Heaven¹, C. May¹, P. Moynihan², 1. *Institute of Health & Society, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Newcastle University - Institute of Ageing & Health, Newcastle upon Tyne, United Kingdom*

The UK Food Standards Agency (FSA) has developed guidelines for healthier menus in care homes. This project examines the feasibility of introducing the guidelines in care homes in the North East of England. The project uses ethnographic methods including observation, interviews and informal conversations with residents, staff and relatives to explore the views of different stakeholders. This presentation will focus on the findings from the first care home, drawing on field notes from observation and 20 interviews conducted prior to the implementation of the guidelines and 22 follow-up interviews conducted either one or five months after implementation. The identification of facilitators and barriers to the implementation of the menus was informed by Normalisation Process Theory. In this presentation, we focus on factors relating to the perceived coherence of the FSA menus, that is, the extent to which the FSA menus made sense to the different stakeholders. The factors that shaped the meaning of the FSA menus in Home 1 can be broadly categorised as relating to: - The 'culture' of Home 1 and the surrounding community - The perceived legitimacy and value of the FSA menus - Perceptions of the role of staff within the home. The findings suggest that for many staff and residents, the FSA menus lacked coherence and often conflicted with their views on what was important for older people living in care homes. Successful implementation will require the development and implementation of strategies to increase the coherence of the FSA guidelines.

FACTORS AFFECTING FRUIT AND VEGETABLE CONSUMPTION: SECONDARY ANALYSIS OF THE 2007 BEHAVIORAL RISK FACTORS SURVEILLANCE SURVEY

W. Hart, *Health Sciences, Rogers State University, Claremore, Oklahoma*

Increased fruit and vegetable consumption has been linked to lower rates of several important diseases; specifically, diabetes, cancer and heart disease. Many of the educational programs from USDA and others have been aimed at encouraging the increase of fruit and vegetable consumption in the population. Although there is considerable evidence that such an increase would indeed benefit many, efforts to this point

have not been as successful as we would like. This research project was designed to examine multiple factors affecting fruit and vegetable consumption; including some that have not been included in many analyses to the point. Secondary analysis of a multi-stage probability survey of the non-institutionalized, civilian population of the United States seemed to present an opportunity to include multiple factors while addressing this issue. The 2007 Behavioral Risk Factors Surveillance Survey was selected both for its recency and for its large sample size. We examined the joint effects of Age, the presence of Diabetes, Region of the Country, Season of the year, Body Mass Index group, Race/Ethnicity, Education Level and Income level. We constructed separate models for Females and Males. The results a significant effect of Age and Presence of Diabetes for both Females and Males. Regionality affected Females more than Males. Seasonality affected both genders as did Body Mass Index. There were only small differences between Race/Ethnic groups. Education and Income levels were more important for Females than for Males. Implications of these findings for future educational campaigns for different age groups. will be discussed.

EFFECTS OF A NURSE-LED NUTRITIONAL PROTOCOL FOR POSTOPERATIVE ELDERLY PATIENTS UNDERGOING GASTROINTESTINAL SURGERY

M. Wang^{1,2}, T. Yin³, Y. Tien¹, C. Chen¹, 1. *National Taiwan University, Taipei, Taiwan*, 2. *Taipei Veterans General Hospital, Taipei, Taiwan*, 3. *The Control Yuan of The Republic of China, Taipei, Taiwan*

The prevalence of malnutrition is high among the elderly who underwent gastrointestinal surgery. The aim of this study was to evaluate the effects of a nutritional protocol on nutritional status of elderly patients underwent an elective gastrointestinal surgery. A pre- and post controlled clinical trial design was employed to enroll subjects aged 65 years and older who scheduled for an elective gastrointestinal surgery at a 2000-bed medical center in Taiwan. Subjects enrolled during 8/07 to 4/08 were served as the controls (n=68) and subjects enrolled since 5/08 to 11/08 served as the experimental group (n=66). For the experimental group, a daily nutritional protocol including oral care, diet education and early mobilization was implemented. Educational pamphlet on overcoming malnutrition was also provided. Subjects in the control group received usual care. Mini-Nutritional Assessment (MNA), body weight, and hand grip strength were measured at three points: before surgery, at discharge and 3 months after surgery. Analyses were performed to examine the group differences using SPSS. Preliminary results shown that, at discharge, patients at experimental group had significant less body weight loss (1.8±2.2 vs. 3.2±3.0 kg, p < 0.05), better MNA scores (21.4±3.0 vs. 13.0±3.3 points, p < 0.05), and less decline in hand grip strength (0.9±3.0 vs. 2.6±3.0 kg, p < 0.05) compared to the controls. The findings support effects of this nurse-led nutritional protocol in preventing malnutrition for the elderly who underwent gastrointestinal surgery.

VITAMIN D DEFICIENCY AND ORAL SUPPLEMENTATION: A PILOT STUDY OF OUTCOMES

M. Pallaki¹, D.M. Kresevic^{1,2}, C.J. Burant^{2,1}, E.L. Dunlop¹, M.R. Benich¹, J.E. Denton¹, 1. *Louis Stokes Cleveland VA Medical Center, Cleveland, Ohio*, 2. *Case Western Reserve University Frances Payne Bolton School of Nursing, Cleveland, Ohio*

Recent research indicates 25-hydroxyvitamin D (25-OHD) deficiency is prevalent among older adults, especially African Americans (AA). This deficiency has been associated with increased rates of cancer, hypertension, and infection. However, the current healthcare system lacks guidelines for routine screening of 25-OHD deficiency, and the recommended dosage of 200-400 IU may be inadequate. This pilot study, a retrospective chart review, was conducted on community-dwelling veterans age 65 and older who were cared for in VA geriatric primary care clinics and had one or more recorded 25-OHD levels. A total of 234 charts were reviewed (124 Caucasian, 78 AA, 32 other/unknown race). At baseline, 206 (88.0%) patients had a serum

level below normal (32 ng/mL). An independent samples t-test revealed AA patients had a significantly lower mean level ($M=15.38$ ng/mL, $SD=8.743$) compared to Caucasians ($M=19.85$ ng/mL, $SD=19.85$) [$t=3.272$, $df=184.667$, $p=.001$]. Despite supplementation efforts, few patients overall increased to normal serum levels ($N=16$ of 202, 7.9%), and fewer AA veterans were as likely as Caucasians to increase their serum levels to normal (AA: $N=4$ of 78, 5.1%; Caucasian: $N=12$ of 124, 9.7%). From baseline to Time 3, differences remained in mean vitamin D levels between Caucasians ($M=24.0$ ng/mL) and AAs (16.5 ng/mL) [ANOVA $p=.02$]. In addition, low vitamin D levels were associated with clinical morbidities, such as falls ($N=139$, 59.7%) and hypertension ($N=203$, 87.1%). Future research is needed to explore vitamin D deficiency, the low response rate to supplementation, and associations with parathyroid levels, medications, and other health complications.

SESSION 1690 (POSTER)

PRESSURE ULCERS

ASSOCIATION BETWEEN SUPPORT SURFACE USE & PRESSURE ULCER INCIDENCE IN ELDERLY HIP FRACTURE PATIENTS

S.E. Rich¹, M. Shardell¹, W. Hawkes¹, D. Margolis², S. Amr¹, R.R. Miller¹, M. Baumgarten¹, 1. University of Maryland School of Medicine, Baltimore, Maryland, 2. University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania

National clinical practice guidelines recommend that patients at risk of pressure ulcers use pressure-redistributing support surfaces (PRSS), i.e., mattresses and overlays intended to prevent pressure ulcers, but it is not known whether types of PRSS vary in effectiveness. To evaluate the association between use of PRSS and pressure ulcer incidence, we performed a study of 648 patients age ≥ 65 years who underwent surgery for hip fracture. Full-body skin examinations were performed at baseline and every two days for 21 days; type of support surface (standard, static air, gel filled, alternating pressure, or low air loss mattresses; foam, static air, or alternating pressure overlays; or other PRSS) was recorded at each study visit. A new stage II-IV pressure ulcer was observed at 4.0% (89/2,213) of visits following use of PRSS, and 4.2% (193/4,627) of visits following no use of PRSS. The rate of incident stage II-IV pressure ulcers per person-day of follow-up was marginally lower for those with pressure-redistributing overlays in use, compared to those with no PRSS (relative rate 0.7, 95% CI 0.5-1.0); the pressure ulcer rate for patients with pressure-redistributing mattresses did not differ significantly from that of patients with no PRSS (relative rate 0.9, 95% CI 0.6-1.3). There was no significant association between pressure ulcer incidence rate and use of any of the eight types of PRSS, compared to standard mattress. Additional study is needed to determine if there is a difference in effectiveness between types of PRSS in preventing pressure ulcers, as this study provided no such indication.

TURNING AND DOCUMENTATION FIDELITY IN A RANDOMIZED CONTROLLED TRIAL FOR PRESSURE ULCER PREVENTION

M.P. Rapp¹, R.E. Villarreal¹, N. Bergstrom¹, S. Horn², R. Smout², 1. University of Texas Health Science Center at Houston, Houston, Texas, 2. International Severity Information Systems, Inc./ Institute for Clinical Outcomes Research, Salt Lake City, Utah

Background: Research on pressure ulcer prevention focuses on the reduction of prevalence and/or incidence of pressure ulcers as a result of one or more interventions. In one observational study of repositioning frequencies for pressure ulcer prevention in nursing facilities, written documentation of adherence to repositioning greatly exceeded actual practice. Purpose: To test the percent agreement between the Certified Nursing Assistant [CNA] Shift Documentation tool for repositioning and independent observations of position documented by nurses on a

Supervisor Repositioning Checklist tool. Methods: The TURN [Turning for Ulcer Reduction] Study is a randomized controlled trial comparing every 2 hour in-bed repositioning with 3 or 4 hour in-bed repositioning on pressure ulcer development. Participant repositioning is performed by CNAs who document the time and repositioning at the point of care. Nursing supervisors make independent observations of the participant's position approximately every hour. Percent agreement was based on the CNAs documentation and the nurses observation of the participant's position, either right, back, left, or chair. Acceptable percent agreement was set at 80% or higher. Results: For 94 nursing facility residents and 16,552 repositions documented by CNAs, the percent agreement between CNA documentation and nurse observation was 83.79%. Percent agreement for 2, 3, and 4 hour repositioning was 84.42%, 83.5%, and 82.49%, respectively. Discussion: Testing percent agreement between CNA documentation of the TURN Study intervention and independent nurse observation suggests accurate turning documentation by CNAs.

MULTI-FACETED INTERVENTION TO PREVENT SKIN TEARS IN A MAJOR LONG-TERM CARE FACILITY

M. Silverman^{1,2,3}, E. Alzugaray^{1,2}, L. Moffett², Z. Monali², P. Mora², A. Silverman⁴, 1. Geriatrics, University of Miami Miller School of Medicine, Miami, Florida, 2. Miami Jewish Home and Hospital, Miami, Florida, 3. Stein Gerontological Institute, Miami, Florida, 4. Nova Southeastern University, Miami, Florida

Skin tears in the elderly are a major challenge for nursing homes. These traumatic wounds can be associated with pain and potentially infection. Their occurrence in the elderly reflects underlying physiologic skin changes, with significant comorbidities and nutritional decline. Despite the difficulty of prevention, skin tears are erroneously considered a determinate of poor care or abuse by NH staff. The MJHH is a 492-bed teaching nursing home tasked with the care of very frail, old, and chronically ill elderly. **METHODS:** In 2007 a QI program was initiated to reduce the number of skin tears in residents. Major intervention components included bathing with moisturizing soaps; daily AM and PM moisturizing lotion; special peri-care cleansers after incontinent episodes; application of protective creams; application of skin sleeves for high-risk patients; intensive staff training for patient transfers; removal of wheelchair foot-rests before transferring; and high-protein nutritional supplements. Data were collected for a 9-month period before the program and prospectively collected for a 9-month period after the intervention. The average daily census for the 18-month period was 440. **RESULTS:** Before the multi-faceted intervention 300 skin tears were documented; after implementation, 166 skin tears were recorded, for a 35% decline ($p < .001$). **CONCLUSION:** Significant reduction in skin tears was accomplished through an intense, multi-faceted intervention, which can serve as a blueprint for similar institutions. Despite the success of the QI program, skin tears continue as a care challenge, indicating that newer technology must be sought in order to overcome the floor effect.

SESSION 1695 (SYMPOSIUM)

PREVENTION IN RELATION TO AGING

Chair: K. Avlund, University of Copenhagen, Copenhagen K, Denmark
Discussant: A.E. Stuck, Department of Geriatrics, University of Bern, Bern, Switzerland

There is increasing evidence of beneficial effects of prevention of functional decline in old age. This symposium will bring together research on preventive efforts towards older people. Hendriksen will describe the possibilities for integrated health care in relation to preventive efforts among old people with special focus on tools for coordination, integration and decisions in daily practice. Some of the studies will describe results from the Danish Intervention Study on Preventive Home visits in 34 Danish municipalities. This study showed that edu-

cation of preventive home visitors and general practitioners postponed functional decline in the older people living in the municipalities. Based on data from this project Ekman will delineate how different invitational procedures influence whether older people accept the preventive home visits and Yamada will outline whether continuity in the preventive home visits is related to beneficial outcomes in the older adults. Lastly Sahlen will introduce results from a qualitative study in Sweden on how older adults cope with their everyday life after the preventive home visits and how home visitors can affect the health of older adults. Together these presentations address some of the complex patterns involved in prevention in older adults.

PREVENTION AND HEALTHY AGEING

C. Hendriksen, *Institute of Public Health, University of Copenhagen, Copenhagen, Denmark*

Carsten Hendriksen, Associate Professor, Institute of Public Health, University of Copenhagen Plenty of evidence exists concerning effective prevention and healthy ageing. New technology, preventive medication, physical activities and integrated health care are good examples in a preventive perspective. Because of this older people have the chance of living longer without onset of disability. By law, preventive home visits must be offered to people aged 75 years or over in Denmark. Together with proactive efforts in General Practice, cross-sectional collaboration in relation to rehabilitation, comprehensive geriatric assessment and management, the preventive possibilities are at hand. But do older people have access to these possibilities to day?. How to translate evidence into practice? With focus on preventive medication the presentation describes the possibilities in integrated health care in relation to decision making, the influence of social and ethnic factors, alternatives to medication and tools for coordination, integration and decision in daily practice.

CONTINUITY IN PREVENTIVE HOME VISITS

Y. Yamada, M. Vass, K. Avlund, *University of Copenhagen, Copenhagen, Denmark*

Continuity is a key for developing trustful relationship between client and clinician, and may be related to better client outcomes. This study aims to examine whether continuity in a preventive home visits has any association with preventive benefits among older people. The study population included 947 nondisabled 75- and 80-year old persons who had had yearly preventive home visits for 3 years. Continuity of preventive home visits was defined as having the same visitor for all visits. Benefits of preventive home visits were measured by questionnaire to the old persons on, e.g. whether or not the visits had made their daily life easier to manage, whether or not they had important information from the visits. In total, 57% of the participants had continuity. These persons were more satisfied with and had more benefits from the visits than those without continuity. The result suggests importance of continuity in preventive home visits.

PREVENTIVE HOME VISITS – ARE INVITATIONAL PROCEDURES OF IMPORTANCE?

A. Ekman, K. Avlund, M. Vass, *University of Copenhagen, Copenhagen, Denmark*

In Denmark the preventive home visits is an elective offer to all citizens aged 75 or older. The aim of the study was to describe how different invitational procedures were associated with first preventive home visit acceptance rates. The study was designed as secondary analyses on data from the Danish Intervention Study on Preventive Home Visit in 34 municipalities. Three invitational procedures were identified through inspection of invitational letters and interview with leaders and home visitors in the municipalities. In both sexes the highest acceptance rate were associated with an invitational letter proposing date and time for the visit, less visits were accepted when offered by telephone, and fewest visits were accepted when the visit was offered with an invi-

tational letter without proposed date and time. It was concluded that invitational procedures were associated with first preventive home visit acceptance rates among citizens aged 75 or more.

PREVENTIVE HOME VISITS IMPROVE SWEDISH SENIORS COPING STRATEGIES AND HEALTH

K. Sahlén^{1,2}, L. Dahlgren¹, L. Lindholm^{1,2}, B. Hellner¹, 1. *Epidemiology and Public Health, Umeå University, Umeå, Sweden*, 2. *Centre for Population Studies: Ageing and Living Conditions Programme, Umeå University., Umeå, Sweden*

Preventive home visits (PHVs) promote health in old age. Research indicates that PHVs have a positive health effect on mortality, admissions to institutions, and falls. To understand how seniors perceive PHVs and how they cope with everyday life when PHVs have ended, five individual research interviews were conducted with seniors aged 79 – 88 years. When seniors had a low degree of control over their daily life they appeared to gain more from PHVs than other seniors. To help seniors to increase control seems essential if they are to lead an independent and healthy life. PHVs can contribute to positive health development by improving seniors' sense of control and processing the used coping strategies. It is important that home visitors understand how the different coping strategies used by seniors affect health. After attending this activity participants will understand why home visitors must promote seniors control in order to affect health.

SESSION 1700 (PAPER)

TECHNOLOGY

A TECHNOLOGY-BASED SELF-MANAGEMENT PROGRAM FOR OLDER ADULTS WITH CHRONIC DISEASE

E. Marziali, *Baycrest, Toronto, Ontario, Canada*

Objectives: The aim of this feasibility study was to observe self-care management responses of chronically ill older adults to a technology-based in home support group intervention program. The objectives included; a) helping chronically ill older adults to manage prescribed rehabilitation regimes more effectively, achieve improved health outcomes, and maintain a satisfactory quality of life. Methods: Eighteen older adults with chronic disease (diabetes, congestive heart failure, chronic obstructive pulmonary disease) (six per disease group) who had difficulty maintaining medically recommended rehabilitation regimes participated in an Internet-based video conferencing intervention program. The program consisted of ten weekly online sessions facilitated by a healthcare professional and was supported by a password protected web site [CFM©] with web pages, video-audio interactivity, and information access designed according to usability criteria sensitive to the physical and attention limitations of older adults. The intervention program addressed the health care needs of chronically older adults by delivering to their homes, via the Internet, disease-specific information with regard to disease diagnosis, course of illness and self-care strategies. In addition the aim of the intervention was to provide psychosocial support in a group, mutual help format. All participants were interviewed at the end of the intervention program; interviews were transcribed and analyzed using open coding methods. Results: The participants were positive about using technology to access health services, found the support group format helpful in terms of addressing the barriers to maintaining recommended rehabilitation behaviors, and were consistent in using the web site tools to monitor self-care management behaviors.

IMPROVING CHRONIC CARE MANAGEMENT: AN IPHONE APPLICATION FOR POST-STROKE RECOVERY

A.S. Sterns^{1,3}, G. Lax^{1,2}, H.L. Sterns^{2,1}, K. Allen⁴, S. Hazelett⁴, S. Fosnight⁴,
1. Creative Action LLC, Akron, Ohio, 2. The University of Akron,
Akron, Ohio, 3. Kent State University, Kent, Ohio, 4. Summa Health
System, Akron, Ohio

A feasibility study investigates use of an iPhone-based medication data gathering and reporting system for individuals in post stroke recovery. Research program goals include: improved health through better patient education, improved medication adherence, timely monitoring and reporting of patient behaviors, cognition, and attitudes, and automated sharing of information with primary care providers (PCPs). Previous research has demonstrated success training older adults in using similar systems, a PDA-based medication reminding system designed for older adults (Sterns, 2005). The current study focuses on three significant elements of a care management model first proposed by Wagner, then operationalized and tested by Allen et al. (2002, 2004): First, improving medication appropriateness and adherence to both medications and rehabilitation programming; Second, improvement in communication with the PCP and specialists involved in care of the patient; Third, improving education of patients and caregivers. The authors utilize a previously tested education and data collection booklet as a control treatment and the proposed iPhone-based system as the experimental treatment. Forty eligible patients undergoing acute treatment at a local hospital are randomized into either group. The authors will present results and next steps, and discuss larger implications for chronic care management. After attending this activity, participants will be able to discuss potential applications of such technology for better involving patients in their own care and improving the quality of information available to PCPs to support better patient care.

IMPLEMENTATION OF A MEDICAL MODULE IN A LONG TERM CARE ELECTRONIC MEDICAL RECORD (EMR)

S.D. Fields^{1,2}, J. Kineiko², J. Parisi², 1. Medicine, Gurwin Jewish Nursing & Rehabilitation Center, Commack, New York, 2. University Medical Center at SUNY Stony Brook, Stony Brook, New York

Background: Most electronic health records designed for use in a nursing home lack a physician component. Methods: After reviewing 24 EMR software products, Gurwin selected Optimus EMR, Inc., a long term care, web-based product. The vendor agreed to develop a "medical module" dedicated to physician documentation. Over a three year period, Gurwin implemented EMR and CPOE on all nursing units. The medical director, in conjunction with medical staff, created the contents for templated notes, including admission, discharge/transfer, required federal interim, and progress notes. The templated notes incorporated reminders for both ACOVE and PQRI measures. Optimus transformed these notes into an electronic format, which the medical staff beta-tested. Results: Although certain workflow processes were streamlined, time savings were not achieved across the board. Average physician time to write initial and interim notes and admission orders increased significantly, whereas, time for 28 day reorders decreased. Nursing time to pick up 28 day orders on 20 residents decreased dramatically from a mean of 9.6 hours to 16.9 minutes. An interface with the laboratory vendor allowed for real time, electronic results reporting of laboratory data directly in patients' records. As a result of the medical EMR, Gurwin is now a partner in the Suffolk County RHIO and a participant in multi-center grants evaluating use of electronically generated data to improve patient outcomes. Conclusions: Implementation of a medical module in a long term care EMR enabled generation of legible, comprehensive electronic medical notes. Future studies will examine the impact of the medical module on quality indicators.

ROLE OF ELECTRONIC INFORMATION SYSTEMS (EIS) IN PAIN MANAGEMENT IN U.S. NURSING HOMES: 2004 NNHS

A. Bercovitz, P. Jamison, M. Sengupta, J.E. Watts IV, National Center for Health Statistics, Hyattsville, Maryland

Electronic information systems (EISs) have been promoted as tools to improve the efficiency and quality of health care. However, there are few empirical, nationally representative studies of the association between EISs and quality of care. The purpose of this analysis is to assess the association between EISs for medication orders, medication administration, or resident medical records and two quality measures - reported pain and pain management. Analyses are based on linked facility and resident components of the 2004 National Nursing Home Survey, a nationally representative sample survey. Logistic regression was used to assess independent contributions of facility and resident characteristics. The two measures of pain management, standing and "as needed" orders, were each dichotomized to no order versus order alone or with other approaches. Preliminary analyses suggest that having an EIS for resident records was associated with reported pain. Also, residents of private non-profits, smaller facilities, women, and residents with diagnoses of some chronic conditions were more likely to have reported pain, while residents in facilities that were in metropolitan areas and had a lower proportion of residents on Medicare were less likely to have reported pain. Analyses of types of pain management orders found no association with the use of any of the three EISs. Residents of smaller facilities were more likely to have an "as needed" order either alone or in combination with other methods, and less likely to have a standing order alone or in combination. Analyses are planned on the association of EISs and medications.

SESSION 1705 (SYMPOSIUM)

VITAMIN D'S ROLE IN THE DISABILITY PATHWAY AMONG DIVERSE POPULATIONS OF OLDER ADULTS

Chair: D.K. Houston, Sticht Center on Aging, Wake Forest University School of Medicine, Winston Salem, North Carolina

Discussant: S. Kritchevsky, Sticht Center on Aging, Wake Forest University School of Medicine, Winston Salem, North Carolina

Increasing knowledge of the physiologic effects of vitamin D suggest that 25-hydroxyvitamin D (25(OH)D) insufficiency accelerates the disablement process through a wide range of chronic conditions that are directly related to the development of limitations in physical function, including knee and hip osteoarthritis, diabetes, hypertension, and cardiovascular disease, as well as through direct effects on muscular function. Vitamin D metabolites affect muscle metabolism through both genomic and non-genomic pathways and play an important role in the regulation of calcium transport and protein synthesis. National data indicate that approximately one-third of U.S. adults aged 70 years and older have insufficient 25(OH)D levels (serum 25(OH)D <50 nmol/L [<20 ng/mL]). Each paper in this symposium examines the role of serum 25(OH)D on aspects of physical function across the older age range (InCHIANTI, aged 65+; Health ABC, aged 70-79; CHS All Stars, aged 77-100; the Georgia Centenarian Study, aged 80-89 and 98+), as well as in men (MrOS, aged 65+), an understudied group. Physical function was measured by objective measures of performance and muscle strength as well as self-reported measures of disability. This symposium will address the consistency of the association between 25(OH)D and physical function in initially well-functioning older persons, persons of advanced old age, as well as in blacks and whites, men and women. Both cross-sectional and longitudinal associations will be discussed.

25-HYDROXYVITAMIN D AND PHYSICAL FUNCTION IN ADULTS OF ADVANCED AGE: THE CHS ALL STARS

D.K. Houston¹, K. Shea¹, J.A. Toozé¹, P.H. Chaves², J. Robbins³, A.B. Newman⁴, S. Kritchevsky¹, 1. *Sticht Center on Aging, Wake Forest University School of Medicine, Winston Salem, North Carolina*, 2. *Johns Hopkins University, Baltimore, Maryland*, 3. *University of California at Davis, Sacramento, California*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania*

We examined the association between 25-hydroxyvitamin D (25[OH]D) and physical function in the CHS All Stars cohort (n=988). Physical performance was assessed using the short physical performance battery (SPPB) and self-reported function using activities of daily living (ADLs). The mean age of the participants was 85.2 yrs; 64% were women, and 83% were white. The mean 25(OH)D level was 64.4 ± 25.2 nmol/L. Participants in the lowest quartile of 25(OH)D (<45 nmol/L) had significantly lower SPPB scores (5.34 ± 0.21 vs. 5.92 ± 0.23, p=0.008) compared to participants in the upper quartile (≥80 nmol/L) after adjusting for demographics, behavioral characteristics, BMI, and season. Participants in the lowest quartile of 25(OH)D were also more likely to report ADL disability compared to participants in the upper quartile (26.3% vs. 18.1%, p=0.05). In summary, low 25(OH)D levels were associated with worse physical performance and impaired ADLs among adults of advanced age.

SERUM 25-HYDROXYVITAMIN D LEVELS PREDICT WALKING SPEED IN OLDER COMMUNITY-DWELLING ADULTS

R. Semba¹, D.K. Houston², K. Sun¹, M. Shardell³, S. Bandinelli⁴, A. Cherubini⁵, J. Guralnik⁶, L. Ferrucci⁷, 1. *Ophthalmology, Johns Hopkins University, Baltimore, Maryland*, 2. *Wake Forest University, Winston-Salem, North Carolina*, 3. *University of Maryland, Baltimore, Maryland*, 4. *Azienda Sanitaria Firenze, Florence, Italy*, 5. *University of Perugia, Perugia, Italy*, 6. *National Institute on Aging, Bethesda, Maryland*, 7. *National Institute on Aging, Baltimore, Maryland*

Background: Vitamin D may play a role in musculoskeletal function, but the relationship between vitamin D and walking speed has not been well characterized. Objective: To examine the relationship between serum 25-hydroxyvitamin D (25[OH]D) at baseline and walking speed at baseline, 3- and 6-year follow-up. Methods: Walking speed over a 4 m course was assessed in 1,006 adults, aged ≥65 years, in the InCHI-ANTI study, a population-based study of aging and mobility disability in Tuscany, Italy. Results: Median (25th, 75th percentile) serum 25(OH)D concentrations were 39.9 (26.2, 63.9) nmol/L. Participants in the highest versus lowest quartile of serum 25(OH)D at baseline had higher walking speed at baseline, 3-, and 6-year follow-up, respectively (all P < 0.001) in a multivariate mixed effects regression model adjusting for age, sex, season, cognitive function, smoking, and chronic diseases. Conclusion: In older community-dwelling adults, serum 25(OH)D is an independent predictor of walking speed.

25-HYDROXYVITAMIN D AND LOWER EXTREMITY FUNCTION: THE HEALTH ABC STUDY

K. Shea¹, S. Kritchevsky¹, R.H. Neiberg¹, D.B. Hausman², M. Johnson², J.A. Cauley³, D. Bauer⁴, D.K. Houston¹, 1. *Wake Forest University School of Medicine, Winston-Salem, North Carolina*, 2. *University of Georgia, Athens, Georgia*, 3. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 4. *University of California San Francisco, San Francisco, California*

We examined the association between serum 25-hydroxyvitamin D (25[OH]D) and lower extremity function in well-functioning older adults in the Health ABC Study (n=2,704). Lower extremity function was assessed using the expanded short physical performance battery (HABC-SPPB), 400-m walk test, and isokinetic knee strength. Participant mean age was 74.7 years; 51% were women, 39% were black, and 33% had

insufficient 25(OH)D levels (<50 nmol/L). We determined a 25(OH)D threshold above which no further improvement in lower extremity function was observed of approximately 75 nmol/L using a nonparametric loess model. After adjusting for demographics, behavioral characteristics, BMI, and season, participants with 25(OH)D <50 nmol/L had significantly lower HABC SPPB scores and slower 400-m walk speeds than those with 25(OH)D ≥50 nmol/L (p for trend, <0.0001). There was no association between 25(OH)D and isokinetic knee strength. In summary, lower 25(OH)D levels were associated with poorer physical performance but not strength in older adults.

25-HYDROXYVITAMIN D AND HANDGRIP STRENGTH: THE GEORGIA CENTENARIAN STUDY

M.A. Johnson¹, D.B. Hausman¹, D.K. Houston², E. Cress¹, A. Davey³, L. Poon¹, 1. *University of Georgia, Athens, Georgia*, 2. *Wake Forest University, Winston-Salem, North Carolina*, 3. *Temple University, Philadelphia, Pennsylvania*

We examined the association of serum 25-hydroxyvitamin D (25[OH]D) and handgrip strength in participants of the Georgia Centenarian Study aged 80-89 (n = 80, 66% female, 18% black) and 98+ years (n = 236, 84% female, 20% black). The prevalence of vitamin D insufficiency (25(OH)D < 50 nmol/L) was 22.5% in the 80s and 36.4% in the 98+. Handgrip strength was significantly lower in vitamin D insufficient vs. sufficient individuals (11.4 vs. 14.8 kg, P < 0.01) when controlled for age, gender, race, nursing home residence (vs. community), season, and other potential confounders (serum albumin, hemoglobin, BMI, and MMSE). Similarly, vitamin D insufficiency was significantly associated with lower handgrip strength in subgroup analyses of 80s only, 98+ only, and women only, when adjusted for potential confounders. In summary, poor vitamin D status may be a modifiable risk factor for loss of strength into very late life.

VITAMIN D LEVELS AND PHYSICAL PERFORMANCE IN OLDER MEN: MROS STUDY

T.L. Dam¹, A. Adams², P. Cawthon³, J.A. Cauley⁴, N. Lane⁵, A. Hoffman⁶, H. Fink⁷, E. Barrett-Connor⁸, 1. *Medicine, Columbia University, New York, New York*, 2. *Oregon Health Sciences University, Portland, Oregon*, 3. *University California San Francisco, San Francisco, California*, 4. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 5. *University of California Davis, Sacramento, California*, 6. *Stanford University, Palo Alto, California*, 7. *University of Minnesota, Minneapolis, Minnesota*, 8. *University of California San Diego, San Diego, California*

Vitamin D supplementation may reduce falls by preserving musculoskeletal function. Studies in women found that lower 25-hydroxyvitamin D (25-OHD) levels were associated with lower physical performance. Data in men are lacking. We examined the association between baseline 25-OHD levels in 1606 community dwelling men aged >65 with repeated measures of grip strength, leg power, gait speed and chair stands 4.6 years apart. Three quarters of the men were vitamin D deficient/insufficient (25% with 25-OHD <20 ng/ml and 50% with 25-OHD=20-29 ng/ml). Vitamin D deficient men had 2kg weaker grip strength and 0.05 m/s slower walking speed than vitamin D sufficient men after adjusting for age, site, race, season, physical activity and skeletal muscle mass. Baseline vitamin D levels were not associated with baseline leg power or chair stands, or with change in physical performance.

WOMEN'S HEALTH - HS PAPER SESSION

SERUM ESTROGEN METABOLITES AND SYSTOLIC BLOOD PRESSURE IN A POPULATION-BASED SAMPLE OF POSTMENOPAUSAL WOMEN

C. Masi¹, L. Hawkey¹, X. Xu², T. Veenstra², J.T. Cacioppo¹, 1. *University of Chicago, Chicago, Illinois*, 2. *NCI Advanced Technology Program, Frederick, Maryland*

Hypertension is more prevalent among men at younger ages and among women after age 60. This pattern is consistent with age- and sex-related differences in serum estrogen concentrations. The purpose of this study was to examine the relationship between serum estrogens and systolic blood pressure (SBP) in a population-based sample (N = 47) of postmenopausal women living in Cook County, Illinois. Seated systolic and diastolic arterial blood pressure readings were obtained from the nondominant arm, which was supported at the heart level by a cushion. Demographic and health history information was obtained via questionnaires. Serum was analyzed for 17beta-estradiol and 14 estrogen metabolites using mass spectrometry. Of the 37 women for whom all data were available, mean age was 57 years (SD = 4 years) and mean SBP was 129 mm Hg (SD = 11.9 mm). Univariate analysis revealed an inverse relationship between SBP and both natural log (ln) 16alpha-hydroxyestrone (r = -0.360, p < 0.05) and ln 16-ketoestradiol (r = -0.360, p < 0.05). In multivariate analysis which adjusted for age, race, ethnicity, body mass index, and use of cardiovascular medications, ln 16alpha-hydroxyestrone (B = -5.3, SE = 2.1, p < 0.05) and ln 16-ketoestradiol (B = -4.7, SE = 1.9, p < 0.05) were both significant predictors of SBP. Ancillary analysis revealed that 16-ketoestradiol likely served as a marker for 16alpha-hydroxyestrone. 16alpha-hydroxyestrone-induced endothelial prostacyclin production may explain this metabolite's association with lower SBP. These results may have important implications for the screening and treatment of hypertension, especially among postmenopausal women.

VAGINAL ATROPHY SYMPTOMS: NATURAL HISTORY AND PREDICTORS IN OLDER WOMEN

A. Huang¹, E. Moore², E. Boyko^{3,4}, D. Scholes⁵, F. Lin¹, E. Vittinghoff¹, S. Fihn⁶, 1. *University of California San Francisco, San Francisco, California*, 2. *Royal Childrens Hospital, Parkville, Victoria, Australia*, 3. *University of Washington, Seattle, Washington*, 4. *VA Puget Sound Health Care System, Seattle, Washington*, 5. *Group Health Center for Health Studies, Seattle, Washington*, 6. *Department of Veterans Affairs, Washington, District of Columbia*

Background: Vaginal atrophy is a widely recognized consequence of menopause and aging, but little is known about the natural history and determinants of vaginal atrophy symptoms in older women. Methods: Prospective, 2-year, population-based cohort of 1,017 postmenopausal women aged 55 to 75 years. Vaginal dryness, itching, and painful sexual intercourse were assessed by questionnaire, and vaginal microbial swabs were performed at baseline, 1 year, and 2 years. Generalized estimating equations were used to identify factors associated with symptoms. Results: Half of women (N=471) reported problematic vaginal dryness, a third (N=316) reported itching, and 40% of sexually active women (N=166) reported painful intercourse at baseline. Of women not taking estrogen, half of those reporting symptoms at baseline were symptomatic after 24 months. Vaginal dryness was associated with younger age (OR=0.81, 95%CI=0.69-0.94 per 5 years), non-white race (OR=1.53, 95%CI=1.04-2.27), diabetes (OR=1.51, 95%CI=1.07-2.12), lower SF-36 physical functioning scores (OR=0.90, 95%CI=0.85-0.97 per 10-points), lower body mass index (OR=0.81, 95%CI=0.71-0.93, per 5 kg/m²), recent sexual activity (OR=1.14, 95%CI=1.08-1.21), and vaginal colonization with enterococci (OR=1.25, 95%CI=1.04-1.51). Vaginal itching was also associated with lower physical func-

tioning scores (OR=0.86, 95%CI=0.80-0.92 per 10 points). Risk factors for painful intercourse included younger age (OR=0.72, 95%CI=0.56-0.93 per 5 years), diabetes (OR=3.48, 95%CI=1.93-6.27), lower body mass index (OR=0.76, 95%CI=0.61-0.95 per 5 kg/m²), and higher vaginal pH (OR=1.10, 95%CI=1.00-1.21 per 0.5 units). Conclusions: Vaginal symptoms affect a large proportion of women after menopause, particularly diabetics and those with lower body mass index, but resolve for up to half without estrogen therapy.

HORMONE THERAPY AND CHANGE IN FUNCTION IN THE WOMEN'S HEALTH INITIATIVE

Y.L. Michael^{1,2}, R. Gold², J.E. Manson³, B.B. Cochrane⁴, N. Woods⁴, R. Brzyski⁵, G. McNeely⁶, R. Wallace⁷, 1. *Oregon Health & Science University, Portland, Oregon*, 2. *Center for Health Research, Kaiser Permanente Northwest, Portland, Oregon*, 3. *Harvard University, Boston, Massachusetts*, 4. *University of Washington, Seattle, Washington*, 5. *University of Texas Health Science Center at San Antonio, San Antonio, Texas*, 6. *Wayne State University, Detroit, Michigan*, 7. *University of Iowa, Iowa City, Iowa*

Background: Although estrogen therapy may be linked to biologic pathways that maintain higher physical function, the evidence is mostly derived from observational epidemiology and therefore suffers from numerous limitations and confounders. Data from the Women's Health Initiative (WHI) clinical trial were analyzed to clarify the role of hormones in changes in physical function in post-menopausal women. Methods: Detailed assessments of physical function were conducted in a sample of women aged 65 to 79 at time of enrollment at 40 clinical centers beginning in 1993. A total of 922 non-disabled women with previous hysterectomies were randomized to receive estrogen-only or placebo; 1458 non-disabled women with intact uteri were randomized to receive estrogen plus progestin or placebo. All women completed three performance-based measures of physical function at baseline. These measures were repeated after 1, 3, and 6 years. Changes in physical function were analyzed for treatment effect, and sub-group differences were evaluated. Results: Among all women in the trial, participants' grip strength declined by 12.0%, chair stands declined by 3.5%, and walk-pace slowed by 11.4% over six-years of follow-up (all p-values < 0.0001). Hormone therapy, as compared to a placebo, was not associated with an increased or decreased risk of decline in physical function in either the intention-to-treat analyses or in analyses restricted to participants who self-reported compliance in taking study pills. Conclusions: Hormone treatment provided no overall protection against functional decline in non-disabled postmenopausal women aged 65 years or older over 6 years of follow-up.

MENOPAUSE ACCELERATES IMMUNE SENESCENCE AND DIMINISHES IMMUNE RESPONSE TO VACCINATION

I. Messaoudi^{1,2}, F. Engelmann¹, A. Barron¹, H. Urbanski^{2,1}, M. Neuringer^{2,1}, 1. *Vaccine and Gene Therapy Institute, Oregon Health and Sciences University, Beaverton, Oregon*, 2. *Oregon National Primate Research Center, Beaverton, Oregon*

Menopause and the associated loss of estrogen and progesterone represent a dramatic physiological change. Although, several studies strongly suggest that female sex hormones influence the immune system, the impact of menopause on immune function remains poorly understood. To address this question, menopause was induced surgically in adult and aged female rhesus macaques by bilateral oophorectomy. Our studies show that ovariectomized adult female rhesus macaques have increased frequency of CD8CD28- T cells, a hallmark of T cell senescence. More importantly, ovariectomized female rhesus macaques generate a lower antibody and T cell responses following vaccination than age-matched cycling females. Estrogen replacement therapy (ERT) improved both T and B cell responses to vaccination in elderly oophorectomized female rhesus macaques. These data suggest that loss of estrogen that accompanies menopause exacerbates immune senescence and

that ERT should be considered as a strategy to improve immune response to vaccination in aged postmenopausal women.

SESSION 1715 (SYMPOSIUM)

BUILDING THE EVIDENCE BASE OF EXPERIENCE CORPS®

Chair: *N. Morrow-Howell, Washington University, St. Louis, Missouri*

Discussant: *L. Strong, Experience Corps National, Washington DC, District of Columbia*

Experience Corps® (EC) is a program that brings older adults into public elementary schools to improve academic achievement of students, through tutoring, small group academic help and assisting teachers. It has been in existence for over 13 years and currently operates in 23 cities, where a total of 2,000 adults over the age of 55 serve 20,000 elementary school students. Given early evidence of the positive impact of the program on both students and older volunteers, its national scope, and replicability potential, this program is being studied by various researchers, using a range of designs and analyses. Based on Fried's social model of health promotion, the effects of high-commitment volunteering and factors associated with these effects are being assessed using experimental and quasi-experimental designs. In addition to effects on older volunteers, effects on students and teachers and well as aspects of program design are being considered. In this session, researchers will overview two large research projects that focus on the Experience Corps program and update the audience on the current status of the evidence base. The session will begin with a paper that reviews the two research projects, highlighting designs, variables and study topics; and the samples of participating EC volunteers will be compared. Next, four different papers will be presented which represent the range of topics under investigation: the social marketing of the program, costs of operating the program, the effects of stipends, and health benefits of participation on the EC volunteers. The Chief Operating Officer of Experience Corps will discuss application of these findings.

OVERVIEW OF THE COMPLEMENTARITY OF THE BALTIMORE EXPERIENCE CORPS TRIAL AND THE NATIONAL SURVEY

M. Carlson¹, E. Tanner¹, T. Seeman³, N. Morrow-Howell², E.J. Tan¹, S. McGill⁴, L.P. Fried⁵, G. Rebok¹, *1. Johns Hopkins Medical Institutions, Baltimore, Maryland, 2. Washington University, St. Louis, Missouri, 3. University of California Los Angeles, Los Angeles, California, 4. Greater Homewood Community Corporation, Baltimore, Maryland, 5. Columbia Mailman School of Public Health, New York, New York*

We capitalize on different study designs in the Baltimore Experience Corps Trial (BECT) and a national survey of the program in 18 cities across the U.S. to examine sociodemographic and motivational diversity which may increase generalizability of program findings and potential for dissemination. In the BECT, 534 adults aged 60-89 years were randomized, with 86% female, 89% African-American, 45% with \leq high school education, and 42% reporting health as very good to excellent. In the national survey, 730 volunteers aged 50-84 included 86% females, 53% African-American, 30% with \leq high school education, and 85% reporting health as very good to excellent. For both studies, "word of mouth" recruitment was most successful. Primary motives for participation in both studies included a desire to help children (31%) with other motives varying substantially across studies and in ways that will inform understanding of program retention and effectiveness, particularly among at-risk segments of the population.

A SOCIAL MARKETING CONCEPTUAL FRAMEWORK FOR CIVIC ENGAGEMENT BASED PUBLIC HEALTH INTERVENTIONS

E.J. Tan¹, E. Tanner¹, T. Seeman², G. Rebok¹, K. Frick¹, M. Carlson¹, K.E. Whitfield³, L.P. Fried⁴, *1. Medicine, Johns Hopkins Center on Aging and Health, Baltimore, Maryland, 2. UCLA Schools of Medicine and Public Health, Los Angeles, California, 3. Duke University, Durham, North Carolina, 4. Mailman School of Public Health - Columbia University, New York, New York*

We present a social marketing conceptual framework for the Experience Corps (EC) program in Baltimore. In social marketing, the core product represents the desired benefit; the actual product represents the desired behavior. Increased physical activity is a core product in EC, while the actual product is a volunteer opportunity in public schools. We describe EC using the four P's of product, place, price and promotion and describe the 1st year of recruitment for the Baltimore Experience Corps Trial. One hundred fifty-five older adults were randomized. The average age was 69; 84% were women, and 86% were African American. Word of mouth was the most successful recruitment strategy while gospel radio was the second most successful. "The four P's" can be used to develop future community-service based public health that "market" generative opportunities. Interventions modeled after EC have the potential to promote physical activity through both mass media and grassroots organizing.

THE COST OF IMPLEMENTING EXPERIENCE CORPS WITH STIPENDS IN PUBLIC ELEMENTARY SCHOOLS

K.D. Frick¹, C. Shih¹, G. Rebok¹, S. McGill², L.P. Fried³, *1. Health Policy and Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Greater Homewood Community Corporation, Baltimore, Maryland, 3. Columbia University, New York, New York*

The Baltimore Experience Corps has been implemented in public elementary schools with monthly participant stipends. The Greater Homewood Community Corporation (the community partner that manages the volunteer program along with Johns Hopkins University for Baltimore City Public Schools) provided expenditure reports for fiscal year 2008 (7/1/07-6/30/2008). Annual expenditures totaled \$1.55 million. Combined Expenditures for participant stipends and related payroll taxes accounted for 56.1% of the total. VISTA program participants at the schools received 2.4% of expenditures, and salaries, payroll taxes, and fringe benefits for program staff accounted for 21.9% of expenditures. Training accounted for 2.0% of expenditures and outreach accounted for 1.4%. Thus, calculated non-stipend related costs of program operation are a greater percentage of total costs than what was previously projected (30%). Although costs that must be offset to achieve a positive net benefit are likely to increase proportionately, the program had sufficient benefits to continue to be cost-effective.

THE EFFECTS OF STIPENDS ON THE EXPERIENCE CORPS PROGRAM

A.M. McBride, E. Gonzales, N. Morrow-Howell, *George Warren Brown School of Social Work, Washington University in St. Louis, St. Louis, Missouri*

AIM: About half of Experience Corps (EC) participants across the country are provided stipends in exchange for higher levels of commitment, and there are no income requirements. We examine the effect of stipends on who serves, for how long, and with what benefits. METHOD: Data derive from phone surveys with 263 members who joined the program in the 2006-2007 academic year and participated in a follow-up survey at the end of the year (56% were stipended). Bivariate and multivariate analyses correcting for clustering were performed. FINDINGS: Stipended participants were more likely to be non-Caucasian and had less household income. Stipended members served for more hours and were more likely to complete the program, as would be

expected; but they also reported more benefits from participating, even after controlling for higher levels of involvement. IMPLICATIONS: These results suggest that stipends may promote program inclusion, efficiency, and effectiveness.

HEALTH-RELATED BENEFITS FROM HIGH-COMMITMENT VOLUNTEERING

S. Hong¹, N. Morrow-Howell², 1. *Social Work, National University of Singapore, Singapore, Singapore*, 2. *Washington University in St. Louis, St. Louis, Missouri*

Aim. We evaluated the effects of Experience Corps (EC) on volunteers' health. **Methods.** EC participants consisted of new volunteers to the program from 14 cities. They were pretested before beginning their volunteer work and posttested after two years of service. We compared changes over time between EC participants ($n=167$) and matched observations from the Health and Retirement Study. We used Mahalanobis matching combined with the boosted propensity scores to develop the comparison group. We corrected for clustering effects and calculated adjusted post-test means of health outcomes, controlling for all covariates and the propensity score. **Findings.** Compared to matched controls, the EC group showed lower depression and functional limitation, and effects were large. Both groups showed a decline in self-rated health, but EC group registered less decline. **Implication:** This study offers a stringent analytic approach to increase confidence in the growing evidence that supports the social model of health promotion.

SESSION 1720 (PAPER)

FALLS AND INJURY

FALL PREVENTION NEEDS AMONG HOME CARE AIDES: LET'S LISTEN TO THEIR VOICES

N. Muramatsu, V. Lukyanova, R.K. Sokas, J. Zanon, *University of Illinois at Chicago, Chicago, Illinois*

Home environments may present risks for falls not only among frail seniors but also their home care aides who provide housekeeping and routine personal care services. However, little is known about home care aides' risks for falls and their roles in fall prevention. The goal of this paper is to understand home care aides' experience with falls, and their current and potential roles for preventing their clients' falls. We conducted six focus groups with home care aides ($N=45$) as well as a focus group with home care supervisors in a large Midwest city. The home care aide participants were mainly age 50+ (64%) African-American women (95%). Approximately one third of the home care aides had slipped, tripped or fell in or around their clients' home in the previous 12 months. Injuries from falls, while infrequent, tend to cause long-term health and economic consequences for home care aides and their employers. Among the risk factors identified were: home environment (e.g., slippery floors), behavioral factors (e.g., rushing), the lack of equipment (e.g., shoes) or proper training (e.g., lifting), and home care tasks (e.g., bathroom cleaning). Home care aides are already playing critical roles in preventing falls among seniors by observing clients and their life space and taking necessary actions. We recommend (1) providing home care aides with additional information on clients and their home environment prior to the first home visit to allow precautions, (2) enhancing hands-on training, and (3) involving home care aides in fall prevention for frail home-bound seniors.

FACTORS INFLUENCING OUTCOMES OF AN EVIDENCE-BASED FALLS PREVENTION PROGRAM FOR TEXAS SENIORS

M.L. Smith, M.G. Ory, A. Wade, C. Mounce, R.A. Larsen, *School of Rural Public Health, Texas A&M Health Science Center, College Station, Texas*

Falls among older adults are associated with direct costs exceeding \$19 billion, compromised quality of life, increased dependency, and institutionalization. A Matter of Balance volunteer lay leader program (MOB/VLL) is an evidence-based falls prevention program designed to raise awareness of fall risk factors, introduce exercises for balance and strength, and empower informed choices about daily living. The purpose of this study is to investigate relationships between demographic and geographical factors associated with programmatic outcomes. Pre- and post-test data were collected from 1,272 Texas seniors enrolled in MOB/VLL. Structural equation modeling was used to examine relationships between variables of interest. Multiple imputation was performed to handle missing data. Direct and mediating relationships were examined using a model derived from evidence-based practice ($X^2/df=2.57$, CFI=0.960, TFI=0.905, RMSEA=0.037). Results indicate demographic and geographical variables are significant antecedent factors to health outcomes. The number of sessions attended by participants was directly related to decreased falls ($\beta=.014$, $P<.001$) and interference with daily activities ($\beta=.071$, $P<.002$), and increased number good physical ($\beta=.216$, $P<.001$) and mental days ($\beta=.151$, $P<.001$). Being male was correlated with increased falls ($\beta=.066$, $P<.05$). Residing in areas with higher rates of seniors was correlated with increased physical activity ($\beta=1.778$, $P<.05$). Residing in rural communities ($\beta=.134$, $P<.001$) and being a racial/ethnic minority were correlated with increased interference with daily activities ($\beta=.287$, $P<.001$). Increased understanding of factors associated with program success in different populations can assist practitioners to expand program offerings to diverse populations, assess programmatic costs, and examine long-term effectiveness of these programs.

UNDERSTANDING THE LONG TERM CONSEQUENCES OF INJURY: MODELING SURVIVAL DURING AND AFTER SENTINEL INJURY EPISODES

F. Porell¹, M.W. Carter², 1. *University of Massachusetts Boston, Boston, Massachusetts*, 2. *Center on Aging, West Virginia University, Morgantown, West Virginia*

Despite a precipitous drop in injury rates over the past 30 years, little progress has been made in reducing the injury rate among older adults, with 40% of injury-related hospital visits now made by adults aged 65 years and older. Compared with younger populations, older adults sustaining an injury experience increased risk of poorer outcomes, including death. Poorer outcomes are largely thought to reflect the complexities of managing traumatic injury among a subpopulation with higher rates of preexisting comorbidities and reduced physiological reserve. However, because research to date has focused primarily on event-specific outcomes rather than long-term consequences of an injury episode, less is known about the impact of injury on older adults surviving the initial injury episode. In response, this study employed survival analyses using multiple years of data from the Medicare Current Beneficiary Survey to estimate the marginal effect of sentinel injuries on the hazards of institutionalization and death, after adjusting for differences in sociodemographic characteristics, prevalent comorbidities and individual health behaviors. Findings suggest that hazard rate of death increases by roughly 50% over the long-run for those individuals experiencing a sentinel injury relative to otherwise similar persons without serious injury. Alternatively stated, survival time among individuals experiencing a sentinel injury event is reduced by about 25% in comparison with similar adults without serious injury. Results from this analysis suggest that despite the apparent successful medical resolution of serious injury among older adults in some instances, the long-

term consequences may continue long after injury-related healthcare use has ceased.

SESSION 1725 (SYMPOSIUM)

GETTING TO THE NITTY-GRITTY: REPLICATING HEALTHY AGING PROGRAMS ACROSS THE US

Chair: K. Braun, *Public Health, University of Hawaii, Honolulu, Hawaii*
Discussant: N. Whitelaw, *National Council on Aging, Washington, District of Columbia*

Chronic disease prevalence in the US continues to increase, especially among older adults, contributing to increasing health care costs. A number of health promotion programs have been developed and shown through randomized controlled trials to reduce chronic conditions and their risk factors. The US Administration on Aging launched an initiative to support the replication of evidence-based health promotion programs, and programs now are operational in 26 states. The purpose of this symposium is to present the experience of four states—Texas, Hawai'i, Maryland, and Maine—in choosing, adapting, implementing, monitoring, and evaluating A Matter of Balance, EnhanceFitness, and the Chronic Disease Self-Management Program. Each of the state speakers will describe the state's experience, present evaluation findings, and discuss its major successes and challenges. Findings will be useful to: service providers concerned about the intricacies of adapting evidence-based programs to fit their clients; researchers concerned with monitoring fidelity of delivery and client outcomes; and administrators and policy makers concerned with sustaining programs after grant funding is discontinued.

REPLICATING AND SUSTAINING ENHANCEFITNESS IN HAWAII

K. Braun, M. Tomioka, *Public Health, University of Hawaii, Honolulu, Hawaii*

Healthcare costs increase with age. EnhanceFitness (EF) is an exercise program specifically designed to increase the strength, flexibility, and balance of older adults. Controlled trials show that participants who attended at least one EF class per week realize physical benefits and reduced healthcare costs. As part of AoA's Healthy Aging initiative, Hawai'i replicated EF, most successfully on the island-county of Kaua'i. We present our experience replicating EF. Seniors attending at least weekly are showing significant improvement in measures of upper body strength, lower-body strength, balance and agility. Our estimated investment-to-return ratio is 1-to-2, i.e., for every dollar invested, \$2 should be saved in averted healthcare costs. Still, program managers are struggling to find ways to sustain the program, either through new grant funds or reimbursement. Discussion of our successes and challenges should assist other states that are replicating, or hope to replicate, evidence-based health promotion programs for elders.

LESSONS LEARNED: MARYLAND'S LIVING WELL PROJECT AND THE CHALLENGES OF IMPLEMENTING AND SUSTAINING EVIDENCE-BASED PROGRAMS

D.M. Cox, D. Wagner, E. Takagi, *Health Science, Towson University, Towson, Maryland*

Maryland's Living Well Project, which has been implemented in six regions, uses Stanford's Chronic Disease Self-Management program to foster healthy behavior among older adults and encourages participants to take charge of their own health. The Center for Productive Aging at Towson University, partnered with the Department on Aging to evaluate the project. We have surveyed over 750 program participants to collect baseline data and completed follow-up surveys for more than half of those who completed the course to assess the extent to which the program has influenced their personal behavior. In addition, we have interviewed program managers and peer leaders to conduct a process evaluation of the program. In this session inter-county differences in terms

of participation and organizational factors that related to participation will be discussed. We will also discuss the partnerships associated with implementing the project and offer recommendations for coordinated efforts that ensure program sustainability at the local level.

BUILDING STATE-WIDE CAPACITY FOR FALLS PREVENTION PROGRAMS: TEXAS FALLS PREVENTION COALITION

M.G. Ory¹, M.L. Smith¹, A. Wade¹, C. Mounce¹, R.A. Larsen¹, C. Quinn¹, R. Gibson³, R. Parrish², 1. *School of Rural Public Health, Texas A&M Health Science Center, College Station, Texas*, 2. *Capital Area Council of Governments, Austin, Texas*, 3. *Brazos Valley Area Agency on Aging, College Station, Texas*

Falls can have detrimental consequences for the health and functioning of older adults. This paper describes a state-wide effort to build capacity for disseminating A Matter of Balance (AMOB), an evidence-based program for reducing fall risks. AMOB is being implemented through the Texas Association of Area Agencies on Aging (AAA) with support from the Texas Department of Aging and Disability Services. Analyses are based on a central database of participant and organizational characteristics describing program reach and adoption. Implemented in 230 of the 254 Texas counties, there are now 76 master trainers and 286 lay leaders who have offered over 115 classes to 1690 participants. Centralized training is an effective way to quickly build capacity, enabling the implementation of a successful state-wide evidence-based program within two years. Working through the local AAAs is critical for achieving broad state-wide coverage and providing a forum for promoting program fidelity and sustainability.

REPLICATING AND SUSTAINING EVIDENCE-BASED PROGRAMS STATEWIDE IN A RURAL SETTING THE MAINE EXPERIENCE

T. Herrick^{1,2}, L. Gottfried^{1,2}, 1. *MaineHealth Partnership for Healthy Aging, Portland, Maine*, 2. *Maine Office of Elder Services, Augusta, Maine*

Living Well for Better Health (Stanford University's Chronic Disease Self-Management Program) and A Matter of Balance Volunteer Lay Leader programs were disseminated statewide to improve the health and reduce the fear of falling among older adults in Maine. This was accomplished through a partnership between the Maine Office of Elder Services, the Maine Center for Disease Control, MaineHealth's Partnership for Healthy Aging, and local partners around the state. Local partners include Area Agencies on Aging, Healthy Maine Partnerships, and healthcare organizations. Since 2006, over 1030 people have participated in these two programs. In this session, we will discuss how these programs were implemented in Maine, lessons learned, and present findings from the programs including Living Well for Better Health's Pre-survey and 6-month post survey data and results from a program sustainability survey for the A Matter of Balance/ Volunteer Lay Leader program. Finally we will discuss recommendations for sustaining Evidence-Based programs in a rural state like Maine.

SESSION 1730 (POSTER)

HEALTHCARE SYSTEMS

MEDICARE PRESCRIPTION DRUG BENEFIT: IMPACT ON OLDER PERSONS WITH A MENTAL ILLNESS

L. Bakk¹, R. Dunkle², A.T. Woodward¹, 1. *Michigan State University, East Lansing, Michigan*, 2. *University of Michigan, Ann Arbor, Michigan*

Prescription drugs are an essential part of medical treatment and play an increasingly important role in health care. However, restrictions and requirements imposed by Medicare prescription drug plans can create barriers to medication access for older persons with a mental illness and can impact medication compliance. This exploratory study examined

the effect of the Medicare prescription drug program on access to psychotropic medications among older adults with a mental disorder. Data were collected from 11 community agency staff members working with persons aged 55 and older with a mental illness who access their medications through the Medicare prescription drug program. Qualitative, semi-structured interviews were utilized to determine the perception of staff of the problems and challenges their older clients face as a result of the program. Data were analyzed using NVivo. The results indicate that medication compliance varies, and is affected by requirements and restrictions imposed by the plans. These findings suggest that access to psychotropic medications can be inhibited by the overall structure of the Medicare prescription drug program. The most common prescription medication access barriers encountered by older persons with a mental illness under Medicare drug plans are the coverage gap, formulary restrictions, and the low income subsidy application process. Additionally, older persons with a mental illness did not understand the program, which could lead to difficulties accessing necessary medications. Community agency involvement was found to be a critical factor in facilitating access to medications for older persons with a mental disorder.

CONFLICT, CULTURAL MARGINALIZATION, AND PERSONAL COSTS OF FILIAL CAREGIVING IN MEXICAN AMERICAN FAMILIES

C.E. Barber, *Leadership & Professional Studies, Washington State University, Spokane, Washington*

PURPOSE: To investigate family conflict and cultural marginalization as predictors of perceived personal costs associated with filial caregiving in Mexican American families. **RATIONALE:** Although family conflict has been included in several caregiving studies, it has never been studied in conjunction with cultural marginalization in Hispanic families. Similarly, the role of acculturation as a factor affecting caregiver well-being has been studied, but not in the context of family conflict, and never with marginalization as a measure of acculturation. **HYPOTHESES:** 1. Family conflict will be positively correlated with perceived personal costs of caregiving; 2. Cultural marginalization will be positively correlated with personal costs of caregiving, but such will not be the case for measure of cultural orientation. 3. Cultural marginalization will mediate the effect of family conflict on the perceived personal costs of caregiving. **DATA COLLECTION:** Interviews with 47 Mexican American filial caregivers residing in Colorado. Cultural orientation and cultural marginality were measured using Scales 1 and 2 of the revised Acculturation Rating Scale for Mexican Americans. **RESULTS:** Correlational analysis supported Hypotheses 1 and 2. Testing Hypothesis 3 was guided by Baron and Kenny's (1986) analytical strategy for establishing the role of a mediating variable using regression analysis: First, cultural marginalization was regressed on family conflict. The standardized regression coefficient indicated that family conflict was significantly related to cultural marginalization ($\beta = .513$, $p < .001$). Higher levels of family conflict were predictive of higher levels of cultural marginalization. Second, hierarchical regression used. In Step 1, the measure of personal caregiving costs was regressed on family conflict ($\beta = .387$, $p < .01$). This association was significant, with higher levels of family conflict predicting higher levels of perceived personal caregiving costs. In Step 2, cultural marginalization was added to the equation. Support for the mediation function of cultural marginalization was found in that the effect of family conflict, while still significant, decreased when the variable of cultural marginalization was added to the equation (β was .513 for Step 1 and .387 in Step 2). The R^2 for the full equation was .339, with a significant change in R^2 from Step 1 to Step 2. Cultural marginalization accounted for an additional 22% of the variance in personal costs of caregiving. **DISCUSSION:** Practice implications for mental health professionals working with Mexican American caregivers are presented, as are study limitations and suggestions for future research.

INEQUITABLE ACCESS TO HEALTH SERVICES FOR OLDER ADULTS WITH DIABETES: POTENTIAL SOLUTIONS ON A STATE LEVEL

A.C. Faul, R.F. Stone, P.A. Yankeelov, *Kent School of Social Work, University of Louisville, Louisville, Kentucky*

This paper presents results of an existing data study investigating potential barriers for diabetic older adults to access health care. The focus was to investigate the complexities of disproportionate health access, guided by Andersen's Behavioral Model of Health Utilization. The research questions were: 1) Are there any significant relationships between State external environment factors, and individual level demographic, social structure, enabling resources, health needs and health utilization variables for diabetic older adults? 2) Can these relationships explain health disparities over 12 years for diabetic older adults? The study was a longitudinal, trend study with a two-nested-level structure, testing a multilevel model. It used secondary data for 12 cohorts gathered from the BRFSS. Four additional sources of data were used for State information. A sample of 122,383 individuals representing all 50 States in the USA and DC were used to test the model. The results indicated diabetic adults most at risk of not utilizing health resources are those without a high school diploma, health plan or personal doctor, who are self-employed, Hispanic, separated from a spouse, with cost as a barrier to care, and living in rural areas. Adults living in States with higher percentages of minority populations and people in poverty, and those living in health shortage areas, are also more at risk. Inequitable health care access is a concern for older adults in the USA. With education, job creation, available and affordable health care services, and health care insurance plans for all citizens, health disparities can effectively be addressed.

DISPARITIES IN CORONARY ARTERY DISEASE CARE AMONG INSURED WITH AARP MEDICARE SUPPLEMENT COVERAGE UNDERWRITTEN BY UNITEDHEALTH GROUP

K.R. Hawkins¹, K. Hamilton Escoto¹, R.J. Ozminkowski^{1,2}, G.R. Bhattarai¹, J.K. Marshall¹, H.T. Harbin³, R.J. Migliori², *1. Ingenix Consulting, Ann Arbor, Michigan, 2. UnitedHealth Group Alliances, Minnetonka, Minnesota, 3. AARP Services, Inc., Washington, District of Columbia*

Research Objective: Discover if age-, gender-, race-, or income-related disparities in care for coronary artery disease (CAD) exist among the elderly with Medicare Supplement (i.e. Medigap) coverage. **Study Design:** Data were obtained from United Health Group's database of insureds who have Medigap coverage via AARP Medicare Supplement insurance. Patients were selected for the study if they had one or more medical claims with a diagnosis of CAD from July 1, 2006-June 30, 2007. Logistic regression analyses tested for age-, gender-, race-, or income-related differences in the likelihood of receiving an office visit, coronary angiography, or surgical intervention. The regression models controlled for socioeconomic, health status, type of supplement plan, and residential location. **Population Studied:** Of the 2.2 million Medigap insureds eligible for the study, 25.4% (570,711) had CAD. **Principle Findings:** Males were 60% ($p < 0.001$) more likely than females to have an office visit, but gender was not a significant predictor for the other services. Patients residing in high-minority neighborhoods were about 8% ($p < 0.001$) less likely to receive any services for CAD. Older individuals were significantly less likely ($p < 0.001$) to have invasive procedures (angiography and surgery). Patients residing in lower-income areas were about 9% ($p < 0.001$) more likely to receive any of the CAD services. **Conclusions:** Disparities in CAD-related care existed by age, income, and race, but the magnitude was relatively small (about 10%). Larger disparities were found by residential location and for those with mental health problems. UnitedHealth Group is designing interventions to address these disparities.

ACCESS TO CARE MANAGEMENT PROVIDERS FOR THOSE WITH MEDICARE SUPPLEMENT COVERAGE

R.J. Ozminowski^{1,2}, T.B. Klaus², K. Hamilton Escoto¹, R. Migliori², K.R. Hawkins¹, C. Yeh³, *1. Ingenix Consulting, Ann Arbor, Michigan, 2. UnitedHealth Group Alliances, Minnetonka, Minnesota, 3. AARP Services Inc., Washington, District of Columbia*

Research Objective: UnitedHealth Group (UHG) is working to provide higher-quality, better-care management to AARP member who have Medicare Supplement (i.e., Medigap) coverage underwritten by UHG. Although Medigap policy holders may utilize all Medicare-approved providers, care management will be facilitated by ready access to providers who already have an understanding of, and experience with, managed care methods. Such providers would be members of UHG's networks for other managed care products. This analysis examined access to UHG's network physicians and hospitals, and compared access for those residing in high-minority, low-minority, or standard zip-codes. **Study Design:** Three sources of data were used: the AARP Membership file, the UHG Provider Network file, and the 2000 US Census file. Network accessibility was measured as the percentage of insureds who resided in high-minority, low-minority, or standard zip codes where provider acceptability standards were met. Chi-square tests were used to compare access by minority status. **Population Studied:** 2.2 million AARP members with UHG's Medigap coverage. **Principle Findings:** Almost all ($\geq 99.0\%$) of the high-minority zip codes met acceptability standards in urban and suburban areas. There was a larger discrepancy in acceptability standards between high and low-minority zip codes in rural areas, but the population of Medigap insureds in high-minority, rural areas was small. Hospital access was the key issue. **Conclusion:** UHG AARP Medigap insureds have ready access to UHG network providers, regardless of whether they live in high-minority, standard, or low-minority zip codes. This will facilitate their and their physicians' abilities to better manage chronic conditions.

OLDER ADULTS IN SUBACUTE REHAB: AN EXAMINATION OF CO-EXISTING VISION AND DEPRESSIVE DISORDERS

A. Horowitz^{1,2}, J.P. Reinhardt^{1,2}, C.Y. Tarshish¹, K. Boerner^{1,2}, *1. Department of Research, Jewish Home Lifecare, New York, New York, 2. Mt. Sinai School of Medicine, New York, New York*

Older adults entering nursing homes for subacute care typically have multiple co-morbidities that influence the course and outcomes of their rehabilitation experience. Two common co-morbidities which are often under-diagnosed and under-treated are vision impairment and depression. This presentation examines the prevalence of vision impairment (both self-reported and measured acuity) and depression (PHQ-9), as well as their relationships with rehabilitation experiences among a sample of 55 older adults newly admitted to subacute care. Average age was 78.6, 71% were female, 74% non-Hispanic white, and 30% had mild levels of cognitive impairment (MMSE < 24). Average length of stay was 34 days, with an average of 15 hours of PT and 46 hours of OT received during their stay. Seven percent were transferred to a hospital and 16% fell during their subacute stay. Almost all (89%) returned to their community residences. Thirty-one percent met criteria for at least moderate levels of depressive symptomatology (PHQ-9=10+); 14% had acuities of 20/70 or worse, and 11% self-reported functional vision problems indicating low vision conditions. Poorer vision was significantly associated with higher levels of depressive symptomatology. Neither depression nor vision was related to length of stay, hours of PT or OT, or hospitalization. However, poorer vision was related to having a fall during subacute care, and depression was related to reporting greater pain, both of which have been found to negatively influence rehab outcomes. Implications for identifying and addressing depression and visual impairments in subacute populations are discussed.

THE PROGRAM OF ALL-INCLUSIVE CARE FOR THE ELDERLY [PACE]: LENGTH OF ENROLLMENT [LOE] AND REASONS FOR DISENROLLMENT

G. Wieland^{1,2}, R. Boland¹, B. Kinosian³, *1. Geriatrics Services, Palmetto Health Richland, Columbia, South Carolina, 2. University of South Carolinas School of Medicine, Columbia, South Carolina, 3. CHERP, Philadelphia, Pennsylvania*

As an alternative to nursing-home [NH] and other LTC, PACE provides community-based comprehensive care to dual eligibles certified at NH level-of-care. PACE's goals of providing high-quality service to enhance health and prevent institutionalization are aligned with payer and participant interests, with research suggesting PACE is successful. However, PACE assumes economic risk and could theoretically act to control risk not only through service quality but by selective admission and disenrollment practices observed in other managed care. We describe LOE and disenrollment reasons as performance benchmarks. Participant data (n=28,375), including continuous enrollment and disenrollment reasons, were recovered from DataPACE/DP 2.0 files for 33 programs under demonstration (pre-1997) and provider status. LOE was examined using SAS LIFETEST. To examine trends across successively remote LOE, we segment time into brief enrollments (≤ 3 & ≤ 6 mos.) and into time-to-disenrollment. Median LOE was 2 yrs, 11 mos.; 25th percentile = 14 mos.; 75th = 6 yrs. Mortality accounts for 42 & 45% at 3 & 6 mos., and increases (52, 70, 80 & 89%). A quarter occurred for unspecified reasons by 3 mos., and though decreasing continued at rates higher than specific non-mortality reasons. Moving and own-MD preference each account for 10% short-term. Quality/quality dissatisfaction (6%), financial reasons (4%), and non-compliance (6%) peak at 3 mos., and become rarer. In sum, disenrollment rates sensitive to participants' access or quality concerns are relatively small but largest early. Variability of LOE/reasons by site, site maturity, year, and other factors is discussed, as is CMS's monitoring role.

RESIDENTIAL AND HEALTHCARE TRANSITION PATTERNS AMONG ELDERLY MEDICARE BENEFICIARIES OVER TIME

M. Sato^{1,2}, A.I. Arbaje⁴, T. Shaffer^{2,3}, M. Schneider^{1,2}, I. Zuckerman^{1,2}, *1. University of Maryland School of Pharmacy, Pharmaceutical Health Services Research, Baltimore, Maryland, 2. University of Maryland, Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland, 3. University of Maryland, Doctoral Program in Gerontology, UMB/UMBC, Baltimore, Maryland, 4. Johns Hopkins University School of Medicine, Center on Aging and Health, Division of Geriatric Medicine and Gerontology, Baltimore, Maryland*

OBJECTIVE: Transitions between different residential living settings or healthcare settings represent vulnerable periods for older adults. An overall assessment of transition patterns including residential settings has yet to be described in the literature. The objectives of this study are to describe transition patterns across both residential and healthcare settings over time, to determine whether transition patterns are consistent across years, and to characterize complicated transitions. **METHODS:** This retrospective cohort study used the Medicare Current Beneficiary Survey (2000-2005). The sample was beneficiaries aged 65 and older (N=59,457). Annual transition patterns were expressed with a string created by combining four types of settings: C (community), F (facility), S (skilled nursing facility), and H (hospital). Weighted frequencies of transition patterns were compared across years. **RESULTS:** Both number and types of transitions remain consistent from year to year. About 7% of beneficiaries have three or more transitions in one year. The most frequent transition pattern was the transition to the hospital and back (CHC=11.5%, FHF=7.9%). Beneficiaries either residing in a facility or eventually transferred to a facility were the most likely to have complicated transitions. **DISCUSSION:** These results show stable and consistent patterns of residential and healthcare transitions in the Medicare population. Knowledge of transition patterns across both

residential and healthcare settings may provide a basis from which to understand healthcare utilization among older beneficiaries. The consistency of patterns may serve as a baseline from which to compare future patterns and design interventions targeted at specific transitions.

PERSONALISATION THROUGH INDIVIDUAL BUDGETS IN ENGLAND: DOES IT WORK FOR OLDER PEOPLE ELIGIBLE FOR PUBLICLY-FUNDED SOCIAL CARE?

K.C. Jones¹, A. Netten¹, J. Fernandez², M. Knapp², 1. *Personal Social Services Research Unit (PSSRU), University of Kent, Canterbury, United Kingdom*, 2. *London School of Economics, London, United Kingdom*

In England, individual budgets (IBs) have been seen as a way of personalising social care services by providing greater clarity about the resources available and more choice and control over how needs are met. The initiative was piloted among 13 local authorities and independently evaluated by the Individual Budgets Evaluation Network (IBSEN), using a range of research methods that included a randomised controlled trial of 959 service users. One of the key objectives of the evaluation was to identify whether the IB approach improved outcomes for people without increasing the overall cost of the care system. Overall, while very little difference was found between the costs of IBs and conventional services, holding an IB was associated with better social care outcomes, including higher perceived levels of control. IB holders appeared to welcome the support obtained and how it was delivered, compared to those receiving conventional social care services. While IBs seemed to have a positive impact on experiences among other user groups, the opposite was found for older people. IBs appeared to have a negative impact on psychological well-being of older people, at least in the ways these new arrangements were introduced and implemented during the pilot. The effect on older people did not appear to be associated with social care outcomes, and it was noticeable that this group did not experience the higher level of control with IBs reported by younger age groups. While this finding may be partly a cohort effect, it does indicate that 'one size does not fit all' which requires further research to understand the support needed by older people so they can enjoy the benefits of personalisation.

IMPLICATIONS OF POSSIBLE ELIMINATION OF FLORIDA OPTIONAL MEDICAID HOSPICE BENEFITS

G. Mitchell², J. Kwak¹, D.A. Chiriboga², 1. *Social Work, University of Wisconsin, Milwaukee, Wisconsin*, 2. *University of South Florida, Tampa, Florida*

While 47 states and the District of Columbia currently offer Medicaid's optional hospice benefit, there was a recent recommendation in Florida to eliminate the optional hospice benefit from the SFY 2009-10 Medicaid budget. This study examined Florida Medicaid hospice expenditures and implications for elimination of the benefit using claims data for the state fiscal year (SFY) 2006-2007. The total hospice claim amount for 16,475 beneficiaries was \$223 million (\$117 for dually-eligible and \$105 for Medicaid-only). Types and amount of claims differed significantly between the dually-eligible and Medicaid-only beneficiaries. The nursing home per-diem payment accounted for 97.4% of hospice claims among dually-eligible beneficiaries compared to 50% among the Medicaid-only. Contrary to the projected savings of \$343.3 million from eliminating the benefit estimated by the Agency for Health Care Administration (AHCA), our analysis suggests a total saving of \$58.4 million. Elimination of the benefit would not translate into automatic cost-savings, since a patient with a terminal illness must still receive care absent hospice services. Although the major source of potential saving projected by AHCA is the nursing home per-diem component (75.39%), this cost will be merely shifted to non-hospice Medicaid nursing services. Claims for continuous home care and general inpatient care are also likely to transfer to Medicaid state plan services for home health, inpatient care, outpatient care, emergency room visits, and physi-

cian services. Elimination of Medicaid hospice benefits is unlikely to produce substantial savings to offset potential increase in acute and long-term care cost and burden on beneficiaries and their families.

CULTURAL COMPETENCE: AN EXAMINATION OF THE FACTORS THAT PREDICT THE PERCEIVED COMPETENCE OF HEALTH CARE PROVIDERS

K.L. Phillips¹, D.A. Chiriboga², Y. Jang³, 1. *University of South Florida, Tampa, Florida*, 2. *University of South Florida, Tampa, Florida*, 3. *University of South Florida, Tampa, Florida*

Cultural competence has emerged as a potential method to eliminate disparities in both health and health care. Preliminary studies have revealed an association with cultural competence and an improvement in the quality of health care services, increased client satisfaction, decreased rates of non-compliance, increased effectiveness of services (Campinha-Bacote, 1991), and an overall optimization of health care for clients (Betancourt et al., 2003; Frist, Kennedy, Obama, & Bingaman, 2006; Giger et al., 2007; U.S. Department of Health and Human Services, 2005; U.S. Office of Minority Health, 2001). In addition, research suggests that when clients are matched with a provider of the same race/ethnicity this interaction significantly aids in the reduction of health disparities (Komaromy et al. 1996; Saha, Arbelaez, & Cooper, 2003). This study examines several variables, particularly whether or not a client was matched with a provider of the same race/ethnicity, and the impact of these factors on how culturally competent clients perceive their health care providers to be. The respondents were 2,075 racial/ethnically diverse adults ages 50 and older that responded to a national telephone survey. Results indicate that self-rated health has an impact on how culturally competent Non-Hispanic White, African American/Black, and Hispanic/Latino clients perceive their providers to be. The results also indicate that being matched with a provider of the same race/ethnicity was a significant factor only for Hispanic/Latino clients.

IMPACT OF POST-ACUTE FOLLOW-UP CARE ON RE-ADMISSION

H. Degenholtz, C.Y. Lin, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Adverse events after acute care hospitalization are common, especially among the vulnerable elderly population. Physician follow-up visits are recommended by many professional societies, especially for specific conditions, to improve post-discharge outcomes and prevent costly ED visits and re-admissions, as well as mortality. However, little is known about patterns of receipt and timing of physician follow-up visits after acute care hospitalization among the elderly. This knowledge gap includes (a) if patients receive follow-up visits, and if so, (b) when (e.g., within recommended timeframes based on current condition-specific follow-up guidelines) and (c) with whom (e.g., primary care or specialist physician) such follow-up occurs. We used data from the Medicare Current Beneficiary Survey to examine predictors, timing, and consequences of follow-up care after acute, non-elective hospitalizations among the elderly. The results show that 22% elderly who had a follow-up visit with a physician were readmitted, compared to 47% of those who did not have follow-up care. Further analysis will examine costs associated with lack of follow-up care. These results suggest that policies to improve access to follow-up care can have a dramatic impact on outcomes.

SESSION 1735 (SYMPOSIUM)

INDIVIDUALIZED SERVICES TO PEOPLE WITH DEMENTIA IN CULTURALLY TRANSFORMED NURSING HOMES: THE POSSIBILITIES AND CHALLENGES FOR QUALITY OF LIFE AND TRUE COMMUNITY

Chair: R.A. Kane, *Health Policy & Management, School of Public Health, University of Minnesota, Minneapolis, Minnesota*

Discussant: J. Rabig, *National Alliance of Small-House Nursing Homes, New York, New York*

Seniors with dementia present challenges to nursing home providers. Various strategies have been used to improve life and care for both persons with dementia and all others; one such approach is Dementia Special Care Units. Neighborhood or small-house models of nursing homes are a newer phenomenon emphasizing “normal” living environments, small-scale units, and individualized care plans. This Symposium explores the potential and the issues in transforming dementia care within the context of transforming nursing home care in general. Two papers are derived from research in at least 15 small-house nursing homes grouped in 3 residential neighborhoods in Ohio (Avalon-by-Otterbein). The houses are not specialized in dementia and their censuses reflect varying types and degrees of cognitive impairment with or without accompanying behavior problems. Rosalie Kane describes observed social engagement in the small-houses among various combinations of residents with or without dementia, staff and family, and discusses variations among frontline staff in their awareness of resident needs and preferences. Lois Cutler describes results of a post-occupancy evaluation study of the private rooms and bathrooms of each resident as well as the shared spaces in each small-house home it points to strengths and some limitations in the built environments and how they might be overcome. Elizabeth Drance describes an individualized assessment and care planning approach that facilitates successful transitions to nursing homes of individuals with dementia who also have been labelled as having severe behavioral or psychiatric problems. As discussant, Judith Rabig presents the process and content of a training approach for front-line staff that results in their development of deep responsive knowledge of the individuals with dementia in the community and ways to approach problematic behavior as puzzles to be solved.

COMPARING INTERACTIONS AND OUTCOMES FOR RESIDENTS WITH DEMENTIA IN SMALL-HOUSE AND TRADITIONAL NURSING HOMES

R.A. Kane, L. Cutler, *Health Policy & Management, School of Public Health, University of Minnesota, Minneapolis, Minnesota*

We sampled residents with cognitive impairment in 15 10-person small-house nursing homes in 3 separate neighborhoods in residential areas, and a comparison group of residents in units in 3 traditional nursing-home settings. We performed resident interviews, interviewed a front-line staff member about each resident, and interviewed a family member by phone. We observed social interaction at various times of the day and evening, including weekends, and interviewed professional staff more generally about dementia services in their settings. Some frontline workers were highly knowledgeable about the residents and devised creative care approaches, but the extent to which staff knew residents ranged widely. The paper compares these small-house nursing homes to more traditional settings. It also describes the composition of each small house or unit (gender mix, age mix, disability mix, proportion of persons with dementia) and examines how that composition affects observed interactions and other resident outcomes.

INDIVIDUALIZED CARE PLANNING FOR PEOPLE WITH SIGNIFICANT NEED-DRIVEN DEMENTIA COMPROMISED BEHAVIORS - PART OF A SUCCESSFUL TRANSITION INTO RESIDENTIAL CARE

E. Drance^{1,2}, R. Watson², R. Sirett², 1. *University of British Columbia, Vancouver, British Columbia, Canada*, 2. *Vancouver Coastal Health Authority, Vancouver, British Columbia, Canada*

Increasingly, residential care homes in Canada feel overwhelmed in caring for people with dementia who have marked need-driven dementia compromised behavior. Elders who have been labelled as aggressive or agitated while in acute care settings are increasingly being refused by nursing homes. The Helping Elders Adapt in Residential Transitions Program uses the Need-Driven Dementia-Compromised Behavior model (Algaese, Beck et al 1996) to develop an individualized plan of care which decodes dementia related behaviors with the goal of helping residential care homes to understand the individual's care needs, and to feel more confident in their ability to support the person. Assistance and mentoring are offered to the residential care homes who accept the care of these elders. Data from the evaluation of this program, as well as the tools implemented to operationalize individual care planning will be shared.

POST-OCCUPANCY EVALUATION OF PRIVATE AND SHARED ENVIRONMENTS FOR RESIDENTS WITH DEMENTIA IN SMALL-HOUSE NURSING HOMES

L. Cutler, *University of Minnesota, Stillwater, Minnesota*

We present results from a post-occupancy evaluation of the private rooms and bathrooms and the shared spaces of all residents with dementia in 15 10-person small house nursing homes in 3 separate small-house neighborhoods; methods include behavioral mapping, checklist assessments of private and shared spaces, place-centered time scans, and environmental tracers. Results are compared to POEs for similar residents in traditional nursing homes. The small scale of the environment is associated with increased functioning and social activity for residents with dementia, enables staff to be efficient in providing care, and promotes social engagement among residents, staff, and family. Issues and problems were identified in managing disruptive behavior in the small-houses and in managing interpersonal issues when some people in the house deteriorate cognitively at a faster rate than others, and some have psychiatric co-morbidity. Ways are noted that staff could take better advantage of the richness in the built environment.

SESSION 1740 (PAPER)

LONG TERM CARE: COSTS AND POLICIES

LESSONS FROM THE NATIONAL LONG-TERM CARE SURVEY

D. Redfoot, *AARP-Public Policy Institute, Washington, District of Columbia*

The National Long-Term Care Survey has provided the most comprehensive data on trends related to disability and caregiving in the older population. These data are of particular importance in providing a basis for anticipating future demand for long-term services and supports to an aging population. This presentation will include recently reweighted trend data covering the entire 20 year history of the survey from 1984 to 2004. While disability rates have declined substantially during that time period, they have not declined uniformly at all levels of disability or among all population groups. Disability rates have declined very rapidly among those who reported limitations only in instrumental activities of daily living (IADLs). Rates have declined among those with higher incomes and education levels much more rapidly than among those with lower levels of education and incomes. Age, race, gender, and marital status are also important predictors of disability – though declines have occurred across such categories. The presentation will end with a discussion of some of the policy implications of these trends,

especially in the context of the current discussions in Congress related to healthcare and long-term services and supports.

FISCAL IMPACT OF A STATEWIDE PROGRAM TO TRANSITION RESIDENTS FROM NURSING HOME TO COMMUNITY

G. Arling¹, V. Cooke², T. Lewis², *1. IU Center for Aging Research, Indiana University School of Medicine, Indianapolis, Indiana, 2. MN Department of Human Services, St Paul, Minnesota*

We demonstrate how a long-term care re-balancing initiative could successfully shift resources from nursing home (NH) to community without adding to Medicaid costs. We projected the fiscal impact of a proposed statewide program to promote community discharges for nursing home (NH) residents early in their stays (90-120 days after admission) who otherwise would be expected to remain in the NH and become long stay. Counseling and alternative services would be offered to targeted residents who preferred to return to the community and whose health and functional characteristics indicated potential for a successful transition. Using data from the Minimum Data Set (MDS) and state administrative systems we estimated probabilities each month of transitioning from NH to community, returning to the NH or dying in either setting. We then constructed multistate life tables for projecting Medicaid conversion rates, number of person-months spent in the NH or community, and total Medicaid payments for 735 targeted NH residents transitioned to the community each year. We tested two scenarios – Transition Case and Base Case without the intervention. Making conservative assumptions about reach and costs, we estimated that after five years the transition program would result in 172,000 fewer annual NH days and net Medicaid savings of \$10 Million per year after covering administrative and community care costs. Even a modest community discharge intervention (60 resident transitions per month) could have a sizable impact on NH utilization and payments, while enhancing consumer choice. This modeling approach can be extended to other re-balancing initiatives.

THE COST OF INCREASING THE PROPORTION OF POST-ACUTE CCARE PATIENTS IN NURSING HOMES

W. Spector¹, D.B. Mukamel², R. Limcangco³, *1. Agency for Healthcare Research & Quality, Rockville, Maryland, 2. University of California, Irvine, Irvine, California, 3. Social & Scientific Systems, Inc., Silver Spring, Maryland*

Post-acute care is becoming an increasingly important part of nursing home care. Spending for post-acute care has risen every year since 2000. For some nursing homes post-acute care has become an important niche. The decision to admit a larger proportion of post-acute care residents in nursing homes has important cost implications as the skilled and rehabilitative needs of post-acute patients are much greater than long-term care residents and the referral sources are very different. We study 949 NHs in California in 2005 and estimate the costs associated with increasing the percent of nursing home days that are funded by Medicare (%Medicare). Using Medicaid cost reports, the Minimum Data Set (MDS), Medicare enrollment files, Census data and the Area Resource File (ARF), we estimate a hybrid cost function, which in addition to outputs, wages, and ownership, includes %Medicare. We use instrumental variable (IV) techniques to account for the potential endogeneity of %Medicare and costs. On average nursing homes have 11% of nursing homes days paid by Medicare. The marginal cost of increasing the %Medicare one percentage point for an average cost nursing home is estimated as \$150,276 or about 2.6% of annual costs. Two-thirds of these additional costs go to rehabilitation, administration, RN expenses, and pharmacy. A comparison of ordinary least square (OLS) and two stage methods show a large endogeneity bias with OLS estimation. These findings suggest that as nursing homes admit a greater proportion of post-acute patients the distribution of costs is affected greatly.

REFORMING LONG TERM CARE: IS IT JUST FOR SMALL STATES, A REVIEW OF THE OHIO EXPERIENCE

R. Applebaum, S. Mehdizadeh, M. Deacon, J. Straker, *Miami University, Oxford, Ohio*

This paper reports results from a longitudinal study of long-term care utilization started in Ohio in 1993. The study tracks home care, assisted living and nursing home use trends over this time period. Public costs of long-term services through both the Medicaid and Medicare programs are included in the analysis. Demographic, service use and cost data from consumers in each setting are compared. Findings indicate that while Ohio has relied heavily on nursing homes as an approach to providing services to older adults with severe disability, these patterns are changing. In 1993, 92% of Ohio's long-term care Medicaid participants received services in nursing homes and 8% in the Medicaid home and community based care program. Results show that by 2007 that ratio had changed to 63% institutional to 37% in-home services. Although Ohio's ratio of institutional use is still higher than the majority of states, the system has indeed changed over time. This paper will provide an overview and analysis of the changes experienced by Ohio over the last 16 years.

MEDICAID FUNDING FOR ASSISTED LIVING CARE: A FIVE STATE STUDY

J. Fecondo, R. Newcomer, *UCSF, San Francisco, California*

Increasingly, assisted living facilities (ALFs) are seen as an alternative to nursing homes in the nation's long-term care system. Over the past ten years, the number of assisted living (AL) residents has more than doubled. This movement has been accompanied by states' growing willingness to shift Medicaid monies from nursing homes to ALFs. The most common mechanism for doing so is through Medicaid's Home and Community-Based Services (HCBS) waiver programs. At least 41 states have obtained federal HCBS waivers which cover AL services. In recent years, state AL laws have been amended to allow admission and retention of residents with greater care needs, thus increasing the population that can be served under this program. This study explores a number of issues relating to the Medicaid Assisted Living Waiver Program in five states. These states offer a cross-section by both geographic region and population size and are among those in which a significant percentage of AL residents are Medicaid eligible. This study includes a thorough review of relevant laws and policies and HCBS data, and interviews with a variety of stakeholders who were asked about vexing problems or ambiguities in the program and encouraged to offer opinions on how the program might better serve the needs of residents. This qualitative study provides a perspective on what is being done, the basis for the choices made, and the current problems and accomplishments.

SESSION 1745 (SYMPOSIUM)

PITFALLS, ROADBLOCKS AND THE OCCASIONAL GOLD NUGGET: ASSISTED LIVING RESEARCH WITH FEDERAL DATA SOURCES

Chair: *D. Potter, Ctr for Financing, Access and Cost Trends, AHRQ, Rockville, Maryland*

Discussant: *R. Newcomer, University of California, San Francisco, San Francisco, California*

Non-institutional residential care, such as assisted living (RC/AL), is an important community-based setting of care for persons in need of assistance with activities of daily living. Currently, differences in State requirements and a wide variety of services and amenities offered in RC/AL make it difficult for consumers (as well as researchers/ policy community) to obtain uniform information about RC/AL settings and populations. National surveys/censuses and federal administrative data can be used to make some national (and state) RC/AL inferences, but utilizing these data can be fraught with difficulties. The purpose of this symposium is to describe the major pitfalls/roadblocks in RC/AL esti-

mation using recent federal sources and to share with the research community findings that have emerged from efforts to characterize the national long-term care (LTC) population. The first paper focuses on the strengths and limitations of key federal data sources; special emphasis is given to sample design, survey operations and RC/AL estimation. The second paper updates estimates on the LTC population (published previously by Spector, et al. as a commissioned paper for the Institute of Medicine's report "Improving the Quality of Long-Term Care" (2001)) using more recent/alternative data sources and including estimates on RC/AL. Findings will be discussed in light of the current health policy reform debate. The last paper describes the new 2005 Medicaid Analytic Extract (MAX) data and discusses the challenges/potential solutions for using MAX to analyze home and community-based services including AL waiver use. The session concludes with discussant comments and floor discussion.

IS IT A HEALTH CARE FACILITY, A HOUSING UNIT OR A GROUP QUARTERS SETTING? IMPLICATIONS AND POSSIBLE DATA SOURCES

D. Potter, *Ctr for Financing, Access and Cost Trends, AHRQ, Rockville, Maryland*

Residential care/assisted living (RC/AL) is an important care option for people with health needs and functional impairments. With the capacity to serve over a million residents (Mollica et al, 2007), RC/AL is gradually approaching the size of the nursing home (NH) resident population (1.4 million; AHCA 2007). Currently there is no federally sponsored national survey for RC/AL analogous to the National Nursing Home Survey (plans are underway for one in 2010). Nor, are there federal RC/AL data collection requirements similar to those mandated for NH's and post-acute care. However, several national surveys/censuses and administrative data sources are available to tease out national/state RC/AL estimates, but utilizing these data can be fraught with difficulties. The purpose of this presentation is to describe these key federal data sources focusing on the strengths/limitations of the data. Special emphasis is given to sample design and survey definitional issues relevant to RC/AL estimation.

UPDATE: ESTIMATES ON THE LONG-TERM CARE POPULATION

D. Potter, *Ctr for Financing, Access and Cost Trends, AHRQ, Rockville, Maryland*

This presentation updates previous estimates on the U.S. long-term care (LTC) population initially published by Spector, Fleishman, Pezzin and Spillman as a commissioned paper for the Institute of Medicine's report "Improving the Quality of Long-Term Care" (2001). Using data from the American Community Survey (ACS) and federal administrative data sources this presentation, like the earlier report, will include estimates on the characteristics of the LTC population under the age of 65 (as well as over 65) residing in community and institutional settings. Unlike the predecessor report, estimates on the assisted living population will be included. Findings will be discussed in light of the current health policy reform debate.

USING THE MEDICAID ANALYTIC EXTRACT (MAX) TO IDENTIFY THE HCBS (ASSISTED LIVING) WAIVER POPULATION

K. McDonald¹, S. Karon², S. Lee³, J. Geppert⁴, L.A. Cubbins⁵, D. Potter⁶, *1. Center for Health Policy/Center for Primary Care and Outcomes Research, Stanford University, Stanford, California, 2. University of Wisconsin-Madison, Madison, Wisconsin, 3. University of California-San Francisco, San Francisco, California, 4. Battelle Memorial Institute, Arlington, Virginia, 5. Battelle Memorial Institute, Seattle, Washington, 6. Agency for Healthcare Research and Quality, Rockville, Maryland*

Assisted living (AL) services are a growing non-institutional long-term care alternative for many elderly. However, the lack of data available to reliably identify these services in the Medicaid claims has limited analyses to date. The new 2005 Medicaid Analytic Extract (MAX) includes data on dual eligible enrollment, Medicaid waiver enrollment, and expenditures for community-based long-term care (CLTC) services. This paper discusses the challenges and potential solutions for using these newly available data to analyze HCBS/AL services, including issues about data quality and uniformity, potential biases due to partial-year enrollment and enrollment in managed care plans, the availability of data from other payers (e.g., Medicare dual-eligible), and the accuracy of algorithms for identifying the population and sub-populations of interest. Estimates on the AL population are also compared to those reported by Mollica et al. (2005, 2007) in order to evaluate how well the MAX data benchmark to external sources.

SESSION 1750 (PAPER)

UNDERSTANDING AND PREVENTING ABUSE AND EXPLOITATION

JAPAN'S CERTIFIED SOCIAL WORKERS (CSW) AND ELDER ABUSE PREVENTION ACTIVITIES: THE MAJOR FINDINGS AND IMPLICATIONS OF A NATIONAL STUDY

T. Tatara¹, N. Tsukada², *1. Shukutoku University, Urayasu, Chiba, Japan, 2. Nihon University School of Business, Tokyo, Japan*

The Elder Abuse Prevention and Caregiver Support Law of Japan was enacted in November 1, 2005, and came into effect on April 1, 2006. One of the unique features of this law is that the law stresses the important role of Certified Social Workers (who are equivalent to ACSWs in the U.S.) in implementing the law's provisions. Amendments to Japan's Long-Term Care Insurance Law, which came into effect on the same day as the Elder Abuse Prevention Law, established nearly 4,000 Local Comprehensive Support Centers across the country and required local governments to assign certified social workers (along with public health nurses and nursing care managers) at all of these centers for the main purpose of handling elder abuse cases. In other words, 4,000 jobs of professional social workers were guaranteed by law for the first time in the history of Japanese social welfare. In the spring of 2008, the Japan Academy for the Prevention of Elder Abuse (JAPEA) and the Japanese Association of Certified Social Workers (JACSW) jointly conducted a national study of certified social workers working for the local comprehensive support centers. This presentation will discuss the major findings, along with their implications, of this study. The fact that a large proportion of the professional social workers were not very confident about the extent of their professional expertise in handling cases of elder abuse (65.1% for male social workers and 80.8% for female social workers) was a very big surprise to the researchers. The presentation will also describe some of the ways by which to strengthen the professional expertise of these professional social workers.

STAFF AND CLIENT MEASURES OF FINANCIAL EXPLOITATION OF OLDER ADULTS

K. Conrad¹, M. Iris², J. Ridings³, K. Langley¹, 1. *Health Policy and Administration, University of Illinois at Chicago, Chicago, IL, Illinois*, 2. *CJE SeniorLife, Chicago, Illinois*, 3. *Metropolitan Family Services, Chicago, Chicago, Illinois*

Until recently, elder abuse, especially financial exploitation, has received little systematic attention from researchers. Objectives. The purpose of this study was to develop staff observation and client self-report measures of financial exploitation of older adults. Methods. Items that were developed in through concept mapping and focus groups were administered to 227 substantiated clients and their corresponding elder abuse investigators (n=22) in a full-scale field test. This database, the largest on substantiated elder abuse clients to date, was used to estimate the psychometric properties of the two measures, i.e., staff observation and client self-report, using the Rasch item response theory model and traditional validation techniques. Results. The theoretical hierarchy that guided instrument development was tested empirically using Rasch person/item maps. Both staff observation and client self-report measures met stringent Rasch analysis fit and unidimensionality criteria; both had high person (internal consistency) and high item reliability; and met validity expectations. Significance. These measures were developed with modern psychometric techniques to aid in the sensitive and valid assessment of financial exploitation of older adults by both clinicians and researchers.

'IT'S ALL ABOUT COMPETENCY'; ADULT PROTECTION LEGISLATION AND THE BLACK BOX OF COMPETENCY ASSESSMENT

J. Harbison, S. Wildeman, S. Coughlan, A. Spady, E. Wexler, J. Karabanow, M. VanderPlaats, B. Gray, *Social Work, Dalhousie University, Halifax, Nova Scotia, Canada*

In Canada most adult protection legislation refers to the incompetency (or incapacity) of individuals as a prerequisite for unsolicited or unwanted interventions in an adult's life. In this paper we consider the implications of this focus on competency for the provision of assistance to older adults who are perceived as mistreated, neglected or self-neglecting. The authors, an interdisciplinary team including social workers, lawyers and sociologists, base their discussion on the findings of a recent study of three Canadian provincial jurisdictions. The methods used for the study were qualitative. Data collection included interviews and focus groups with diverse participants including health and social service professionals and members of seniors' organizations (N=55). In addition critical reviews of the relevant provincial legislation and policies were conducted. Findings indicate that despite the importance placed on competency in the adult protection services studied, the meaning of this legal status as interpreted by study participants, and the methods of assessment deployed, remain highly unsettled. The implications of these findings for the autonomy as well as the welfare of older people are discussed.

EXPLORING ELDER FINANCIAL ABUSE

P.B. Teaster¹, K.A. Roberto², J. Migliaccio³, 1. *Gerontology, University of Kentucky, Lexington, Kentucky*, 2. *Virginia Tech, Blacksburg, Virginia*, 3. *MetLife Mature Market Institute, Westport, Connecticut*

This presentation discusses key findings from a study of elder financial abuse. The study utilized Newsfeed articles from the National Center on Elder Abuse collected by the National Association of Adult Protective Services, as well as 12 electronic databases that indexed academic journals containing primary literature on elder abuse from 1998 through 2008 as well as trade publications from 2005 to 2008. Key findings suggest that the annual financial loss by victims of elder financial abuse is estimated to be at least \$2.6 billion dollars; elders' vulnerabilities and larger net worth make them a prime target for financial abuse; and the increased aging of the population, social changes, and technology

advances will lead to a dramatic increase in the opportunity for a growing level of elder financial abuse. Perpetrators of elder financial abuse are typically are people who have gained the trust of an elder. The presentation concludes with suggestions for intervention and prevention of this underrecognized, underreported, and under prosecuted phenomenon.

SESSION 1755 (SYMPOSIUM)

AGING WITH MULTIPLE SCLEROSIS: SUPPORTIVE HOUSING AND ASSISTED LIVING OPTIONS

Chair: J. Hyde, *Gerontology Institute, University of Massachusetts/Boston, Boston, Massachusetts*

Discussant: M. Campbell, *Department of Education, Washington DC, Alabama*

Of the nearly a half million people with Multiple Sclerosis in the United States, most are able to live independently and need relatively little support. However many others need help with both IADLs and ADLs. Because this need for services strikes people with MS at a much earlier age than the general population, there are currently over 100,000 people in the "baby boom" generation with MS who are facing the dilemma as a large wave of the population will be facing in the coming decades. In some ways this group serves as the "canary in the mine shaft" for the more general aging population. In other ways the needs of people with MS, with its variable array of symptoms, including mobility and cognitive impairments, incontinence, fatigue, heat sensitivity and depression, are somewhat unique. Also unique is that people with MS still may have school-age children, and may be facing many more years of disability than older people in need of support. Finally the high rate of divorce among those with MS further compounds the challenges they are facing. This symposium brings together results from three studies that address these issues. The studies take different approaches to identifying needs and preferences of people aging with Multiple Sclerosis, as well as options and funding sources available and lacking for this important population.

SUPPORTIVE HOUSING AND ASSISTED LIVING: QUALITATIVE STUDY OF PREFERENCES AND NEEDS AMONG A SAMPLE OF PEOPLE WITH MULTIPLE SCLEROSIS

A. Gottlieb, J. Hyde, *Gerontology Institute, University of Massachusetts/Boston, Boston, Massachusetts*

Similar to older adults in general, people with MS prefer to live at home even when confronting serious and increasing functional disability and physical challenges. Through qualitative interviews, substantially disabled people with MS described both resourceful approaches to retaining independence as well as substantial financial and bureaucratic barriers to obtaining needed resources to continue living at home. Participants typically had little information on supported residential options and seldom had explored options or made future plans. However, when asked to imagine an ideal supported residential community, participants identified features and services specific to MS as well as envisioning communities that included elements of universal design and "smart communities." Of greatest importance to participants were: private living units along with opportunities for socialization; proximity to social networks and familiar communities; availability of personal assistance; autonomy and choice; independence; and affordability.

AGING WITH MULTIPLE SCLEROSIS, HOUSEHOLD FINANCES, AND CONSIDERATION OF LONG TERM CARE SERVICE USE

M. Putnam¹, F. Tang², 1. *School of Social Work, Simmons College, Boston, Massachusetts*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*

Overview: This paper analyzes data from a 2004 randomized sample survey of persons aging with MS (N=576). Research questions

addressed the relationships between: 1) financial and savings characteristics and disease status, and 2) household finances and consideration of use of LTC services and supports. Bi-variate analysis indicated average respondent age was 50, 79% female, 67% married, 33% employed, 63% had an annual household income of <\$69,999, and 50% reported total asset levels of <\$139,999. Severity of MS was positively related to perceptions of greater financial discomfort and standard of living decline. Predictors of saving and preparedness to pay for LTC included MS severity, household income and receipt of LTC planning information. Perceived likelihood of needing LTC services significantly predicted perceived likelihood of using 6 LTC services; financial preparation to pay for LTC or saving for retirement or other goals was not predictive of perceived likelihood of use.

CHALLENGES IN ASSESSING AND MEETING UNMET NEEDS FOR HOUSING FOR PERSONS WITH MULTIPLE SCLEROSIS

R.A. Kane, L. Cutler, *Health Policy & Management, School of Public Health, University of Minnesota, Minneapolis, Minnesota*

Advocates for and leaders in services to people with multiple sclerosis (MS) are interested in estimating the need for specialized housing for MS. Such estimations are very complicated because of the multiple way housing needs can be met across the disease trajectory, the various patterns in how the disease progresses, and the varying social support structures. Estimates also need to take into account quality of available housing. Housing needs differ among individuals and over the life span for specific individuals. This paper reviews the different approaches to housing for people with MS, including independent housing, assisted living, and nursing homes, and lays out distinctions between housing that meets the needs of people with disabilities and housing specific to people with MS. Using the catchment area of the Minnesota MS Society as an example, the paper discusses strategies for assessing housing adequacy in a single geographic area.

SESSION 1760 (PAPER)

CAREGIVING, STRESS AND COPING

COPING STRATEGIES FOR GRIEF AMONG ALZHEIMER'S CAREGIVERS: THE INFLUENCE OF FAMILIAL ROLES

J. Frank¹, A. Watts², 1. *Center for Aging and Community, University of Indianapolis, Indianapolis, Indiana*, 2. *University of Kansas, Lawrence, Kansas*

The purpose of this study was to investigate differences in grief between current spouse and adult-child caregivers of individuals with dementia. The results presented are data from a 2006-2007 statewide study of Alzheimer's family caregivers in Indiana (N = 378; 159 spouses, 219 adult-children). The primary measures of interest were the Marwit-Meuser Caregiver Grief Inventory (MM-CGI) and a coping questionnaire designed by Frank (2006). The MM-CGI has three subscales: Personal Sacrifice Burden (PSB), Heartfelt Sadness and Longing (HSL), and Worry and Felt Isolation (WFI). Multiple group confirmatory factor analysis indicated that both spouse and adult-child caregivers experienced similar levels of perceived stress, sadness, and worry. Strong invariance of this factor structure was achieved across the spousal and adult-child of caregivers indicating the grief construct is consistent for the two groups. However, the experience of grief between the two groups differed. The relationship between PSB and HSL was highly correlated in the spousal caregiver group, but these correlations were significantly attenuated in adult-children. In addition, regression analysis showed that coping strategies are not only different among spouse and adult-child caregivers, but can actually predict the levels of PSB and HSL. For example, spending time with friends predicted decreased levels of PSB and HSL. Findings indicate grief is experienced differently for spouse vs. adult child caregivers and that the nature of the relationship to the

person with dementia (e.g. spouse vs. adult child) may influence the coping mechanisms used.

FAMILY CONFLICT AND STRESS AMONG ADULT CHILD CAREGIVERS

M. Kwak, B. Ingersoll-Dayton, J. Kim, *University of Michigan, Ann Arbor, Michigan*

Adult children are likely to experience stress as they attempt to negotiate their parents' care. This study examines how care recipient impairment and family conflict affect caregiver stress when simultaneously considering demographic and family structural factors. Of particular interest is the impact of, gender composition of sibling networks when examining the relationship between family conflict and stress. Data on adult child caregivers with siblings were identified in the caregiver survey portion of the 2004 National Long-Term Care Survey (N=751). These respondents, selected from a national probability sample, were caregivers for persons aged 65 or older. Structural equation modeling was used to test a conceptual model that included three key constructs: care recipient impairment, family conflict, and caregiver stress. Also included in the model were contextual factors, such as gender composition of caregiving siblings. The model fit indices were acceptable (RMSEA=.049, CFI=.98). Results indicated that family conflict partially mediated the relationship between care recipient impairment and caregiver stress. The inter-relationships among care recipient impairment, family conflict, and caregiver stress were positively associated with one another. In addition, families in which siblings were the same gender were less likely to experience family conflict than were those in which siblings were both male and female. These findings suggest that the gender composition of the family caregiving network is an important variable that needs to be considered when examining caregiver stress and family conflict among siblings who are providing care to their parents.

FINANCIAL STRESS, POSITIVE AND NEGATIVE SOCIAL EXCHANGES, AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS

H. Ahn, *SOCIAL WORK, UNIVERSITY OF WISCONSIN MADISON, Madison, Wisconsin*

Research demonstrates financial stress is associated with psychological well-being. Studies also evidence the role of social exchanges on the link between financial stress and well-being. There still remain many ambiguities, however, about the ways in which social exchanges are associated with life stress and depressive symptoms among older adults. What are the roles of social exchanges in the link between financial stress and depressive symptoms and are there any reliable differences in the relationships among the three factors between older men and women? I conduct a series of structural equation modeling analyses including multi-group analysis using Mplus version 5.2. Data are from the nationally representative Americans' Changing Lives study, for the subgroup of respondents (ages 60+) participating in the baseline (1986, n=1,669). Findings show that female older adults suffer more financial stress than male counterparts. Financial stress is significantly related to negative exchanges, and both financial stress and negative exchanges are predictive of elevated levels of depressive symptoms among male and female older adults. Positive exchanges, however, are not associated with financial stress in either group and they are marginally related to depressive symptoms only among male older adults. Overall financial stress has stronger effects on depressive symptoms among female older adults than male older adults. The mediating effects of social exchanges on the link between financial stress and depressive symptoms are more salient among male older adults. Findings demonstrate the importance of considering social exchanges in the understanding of the association between life stress and psychological well-being.

THE LONGITUDINAL STRESS-BUFFER ROLE OF INFORMAL AND FORMAL SUPPORT IN LATER LIFE

N. Chan¹, K. Anstey¹, T. Windsor¹, M. Luszcz², I. Centre for Mental Health Research, The Australian National University, Canberra, Australian Capital Territory, Australia, 2. Flinders University, Adelaide, South Australia, Australia

Introduction: We investigated whether type of instrumental support received – informal only, formal only or both informal and formal support – differentially buffered the harmful relationships between disability and depressive symptoms and life satisfaction over an eight-year period. The stress-buffer age-variation hypothesis (i.e., that the stress-buffer effects of social support strengthen in later life with increasing age) was also examined. **Methods:** We used multilevel modelling with three waves of data from a population-based sample of community-dwelling older adults (N=1961 at Wave 1). Time-invariant predictors were sociodemographic characteristics; social networks with children, relative and friends; and physical health variables. Time-varying predictors included marital status, cognitive status, functional limitations and type of support received. Dependent variables were depressive symptoms and life satisfaction. **Results:** Relative to no support, receipt of formal support in isolation moderated the negative association between increasing functional limitations and life satisfaction. Similarly, receipt of informal support only was associated with a weaker relationship between increasing functional limitations and depressive symptoms. Analyses also revealed that this second moderating effect strengthened with age. Finally, receipt of support was directly associated with greater depressive symptoms and lower life satisfaction, but only for individuals with few increases in functional limitations over time. **Conclusions:** Our findings highlight the complexity in the relationships between disability, received support and mental health. They indicate that instrumental support from both informal and formal sources has the potential to buffer the harmful effects of disability on mental health, and that these protective effects may strengthen in later life with increasing age.

THE EFFECTS OF SUPPORT RECEIVED ON SUPPORT OLDER ADULTS PROVIDE TO OTHERS

P.A. Thomas, *Sociology, Duke University, Durham, North Carolina*

Although studies have demonstrated the benefits of providing social support to others, few focus on what factors influence individuals to provide support. To the extent that older adults' support behaviors are the focus, research is typically in the form of cross-sectional studies of intergenerational relationships of reciprocity. The present study longitudinally examines support older adults provide to both family and friends, separating out the components of reciprocity as it is typically measured. Two waves of the North Carolina Established Populations for Epidemiologic Studies of the Elderly (EPESE) are used to examine these relationships with an analytic sample of 2,581 adults age 65 and older. Findings indicate that the number of types of support received from others significantly influences the number of types of support that older adults provide. Similarly, changes in support received significantly influence changes in the support older adults provide. However, the largest predictor of support provided is the support respondents gave at baseline. Poor health and older age significantly restrict the support older adults provide. African Americans, men, married individuals, and the more highly educated provide significantly more types of support to others.

SESSION 1765 (SYMPOSIUM)

CIVIC ENGAGEMENT OF THE YOUNG-OLD IN JAPAN AND KOREA: WILL THEY MAKE A DIFFERENCE IN RAPIDLY AGING SOCIETIES?

Chair: K. Katagiri, *Institute for Social Gerontology, Nipponkoa Welfare Foundation, Tokyo, Japan*

Discussant: G. Han, *Seoul National University, Seoul, Korea, South*

Like other developed countries at present, baby boomers in Japan and Korea are also reaching their retirement age. Moreover, both countries are facing rapid aging compared to other countries. Both societies used to be characterized by filial piety; however, drastic changes in family structure and norms have been observed in recent years. Purportedly, the younger generation is becoming increasingly individualistic and independent. At the same time, both countries are facing various inequalities in matters such as gender and residence, particularly in light of the recent recession. Such social inequalities could have detrimental effects on social participation. In this symposium, differences in social participation were examined: Who is more advantaged and who is more disadvantaged in relation to social participation? Katagiri et al. explored the differences between urban city and local city. They stated that disparities in residential areas were related to social participation. Han et al. analyzed the gender differences; men and women differ not only in terms of motivation of participation but also in the level of participation of various activities. Kim & Kang examined the effect of social participation in the young-old in Korea and indicated the moderating effect of marital status. Sugawara et al. focused on the generational differences; they pointed out different generations engaged in volunteer activities by different motivations. These studies revealed many disparities in social participation in the young-old and suggested the need for innovative policies in keeping with their motivations and characteristics. Creative ways to promote social participation will be discussed.

GENERATIONAL DIFFERENCES OF COMMUNITY ATTACHMENT AND COMMUNITY ACTIVITY PARTICIPATION: STUDY IN A SUBURBAN CITY OF TOKYO

I. Sugawara, H. Murayama, S. Yoshie, T. Wakui, R. Arami, *Institute of Gerontology, The University of Tokyo, Tokyo, Japan*

The aim of this study was to examine the generational differences of the attitude toward community and the patterns of community activity participation. The role of community in people's lives and relationships among neighbors have been changed in the last half of the last century. Especially the changes have been drastic in suburban communities of metropolitan areas. These changes might produce generational gaps of why and how people participate in community activities. A mail survey was conducted with 4123 residents aged 20 and older in a suburban city of Tokyo, Japan. The results showed that older people participated in community activities when their social networks were embedded in their community, whereas young-olds and younger generations engaged in community activities when their psychological connectedness with the community was high. These results suggested that different motivations might be working in the process of community participation of older and younger generations.

GENDERED SOCIAL PARTICIPATION OF KOREAN YOUNG ELDERLY

G. Han, *Seoul National University, Seoul, Korea, South*

The purpose of this study is to examine gender differences in the pattern of social participation and related factors of Korean young elderly residing in cities. Data were gathered from 1700 Korean men and women (men=850, women=850) aged 50-69 in Seoul and Kwangju, a city located in southern part of Korea. Elderly men and women differ not only in terms of motivation of participation but also in the level of participation of various activities. Women are more likely to participate in the social activities out of 'relational' motivation while men

emphasize more 'individualistic' motivation. Women actively participate in informal social network activities whereas men tend to participate in more formally organized social activities. The possible ways to encourage the participation of each gender on various activities and to promote healthy integration of gendered activities will be discussed.

DISPARITIES IN CIVIC ENGAGEMENT: WHO IS MORE SUCCESSFUL IN AGING IN PLACE?

K. Katagiri¹, I. Sugawara², *1. Institute for Social Gerontology, Nipponkoa Welfare Foundation, Tokyo, Japan, 2. the University of Tokyo, Tokyo, Japan*

Katagiri et al. examine the differences in social participation between urban and rural cities. We conducted a random sampling survey in the cities of Tokyo and Okayama in 2008. The rate of social participation in Okayama was higher than that in Tokyo. Logistic regression analyses were conducted to explore the related factors of social participation. Though residence area and health conditions were related to social participation, other demographic factors had no effect. Network factors, social participation history, and motivation for undertaking social activities were related to social participation. If people knew the persons involved in social activities, they were more involved. If they had experienced social activities in their youth, they were more participative. People with a keen motivation to participate in rural activities were more committed. However, some inequalities emerged when people were divided into groups. Potential disparities among the young-olds in social participation will be discussed.

SOCIAL PARTICIPATION, MARITAL STATUS AND MENTAL HEALTH OF KOREAN YOUNG ELDERLY

J. Kim^{1,2}, H. Kang², *1. Institute on Aging, Seoul, Korea, South, 2. Seoul National University, Seoul, Korea, South*

The purpose of this study is to examine the effect of social participation on mental health of Korean young elderly men and women. Previous studies suggested the positive relationship between social activities and mental health in later life but there is no systematic empirical studies focused on young-old. Therefore, this study aims to examine the effects of social participation on mental health of Korean young elderly. This study also focuses on the effects of marital status on social participation and explore its moderating effect. Data were gathered from 1700 Korean men and women aged 50-69. The results show the positive relationship between social participation and mental health. The level of social participation varied by marital status and the relationship between social participation and mental health differs by marital status. The important meaning of social participation determining mental health of young elderly and various impacts of marital status will be discussed.

SESSION 1770 (POSTER)

CREATIVE AGING

CHANGES IN VOLUNTEERING IN LATER LIFE BETWEEN 1992 AND 2006: THE IMPACT OF INDIVIDUAL AGE AND HISTORIC TIME

M. Broese Van Groenou, T. Van Tilburg, *VU University, Amsterdam, Netherlands*

Given population aging and the productive potential of older people, it is important to examine how individual aging as well as societal developments affect social engagement in later life. The present study examined changes in volunteering in later life among 60-85-year-olds between 1992 and 2006. Data are used from the Longitudinal Aging Study Amsterdam, an ongoing study on older people in the Netherlands. Data from six waves between 1992 and 2006 are used. Multilevel logistic regression analyses were conducted separately for men and women. Women were less often involved in volunteering than men in all age groups, but showed the same pattern of decline with age and an increase

over time. Interaction effects between age and time were not significant. Compared to 1992, older adults in 2006 were higher educated, worked more often and had larger networks, but reported more health problems, were less religiously involvement and were more often divorced. After adjustment for these individual differences, the net effects of age and time were still significant. It can be concluded that volunteering decreases with aging due to decreasing health. The finding that older adults are more socially engaged in 2006 than in 1992 is in part due to their higher educational level and larger personal networks, but it also reflects the more positive view on aging within society. Still, the larger health problems of the future older generations are a potential threat to their level of social engagement.

UNDERSTANDING PAST ACHIEVEMENTS AMONG CENTENARIANS: TRACKING THE PATTERNS OF SOCIAL AND PRODUCTIVE ACTIVITIES

N. Deshpande¹, P. Martin¹, M. MacDonald¹, J. Margrett¹, L. Poon², *1. Iowa State University, Ames, Iowa, 2. University of Georgia, Athens, Georgia*

Previous research supports participation in social and productive activities and its positive effects on well being in later life (Baker, Cahalin, Gerst & Burr, 2005). Centenarians often represent the population that has aged successfully. This study assessed the patterns of engaged lifestyle activities (e.g., volunteering, traveling, and public speaking) for centenarians of the Georgia Centenarian Study. A total of 137 centenarians and near centenarians (i.e., 98 years and older) participated in this study. Self reports of cognitively intact participants (i.e., MMSE > 16) were used for analysis. Descriptive statistics suggested high frequencies of engaged lifestyles such as public speaking, learning a foreign language throughout the life span. Forty percent of all centenarians reported having learned a foreign language, 43 percent of the participants reported continuing education. About half of our participants had volunteered at events, 37 % of them between ages 90 and 99 years. More than 60 percent of the centenarians reported travelling to a foreign country and 40 percent of the participants took trips within the country between the age of 90 and 99 years. Chi square tests suggested significant group differences in past achievements based on demographic characteristics. Significant ethnic differences ($\chi^2 = 8.71$, $p < .01$) were found with 45% Caucasian Americans reporting learning a foreign language as compared to 15% African Americans. Significant residential differences were found for those participants who reported continuing education ($\chi^2 = 6.95$, $p < .05$). No significant group differences were reported for volunteering and public speaking activities.

THE EXPRESSIVE BODY: EXPERIENCES OF CREATIVITY IN DEMENTIA

A. Phinney¹, H. Chaudhury², D. O'Connor¹, *1. School of Nursing, University of British Columbia, Vancouver, British Columbia, Canada, 2. Simon Fraser University, Vancouver, British Columbia, Canada*

While there is emerging evidence that involvement in creative activity provides important health benefits for older adults, less is understood about the importance of creative involvement for people with dementia. We report on findings from a qualitative study that has explored as an overall question how people with dementia understand and cope with the challenges of everyday activity, focusing in particular on what they find most meaningful. The importance of "doing something creative" has emerged as a central theme in this work. Using ethnographic methods, we have conducted repeated interviews and participant observation with fifteen people diagnosed with mild to moderate dementia who are living independently in the community, either alone or with family. Six of the participants have shared their experiences as visual artists and musicians. While the details of their situations are distinct, interpretive phenomenological analysis has revealed that for all of them, creative expression has opened up possibilities to engage with the world and to enjoy the smooth flow of the unencumbered body. To explore

these findings, we will present two narratives, highlighting the commonalities and distinctions in these different experiences of creative expression. We will discuss implications of these findings for understanding experiences of dementia and for identifying new ways of supporting people with this disease.

DO VISUAL ARTS PROGRAMS BENEFIT OLDER ADULTS LIVING WITH DEMENTIA? A SYSTEMATIC REVIEW

K. Brown, *College of Social Work, Florida State University, Tallahassee, Florida*

Research studies indicate that meaningful creative activities can benefit individuals, including those living with dementia (Hannemann, 2006; Kinney & Rentz, 2005; Marshall & Tibbs, 2006; Rusted, Sheppard, Waller, 2006). The objective of this systematic review is to examine the effects of visual arts activity programs with older adults living with dementia. The intervention involves visual arts activity programs that are intended to affect the cognitive, emotional, and/or social domains (Moore, Geboy, & Weisman, 2006, pp. 88-96). The expected outcome is increased communication and expression for older adults living with dementia. The systematic review located seven research studies utilizing visual arts with individuals living with dementia (Bober, McLellan, McBee, & Westreich, 2002; Brownell, 2008; Kinney, & Rentz, 2005; Rusted, Sheppard, & Waller, 2006; Seifert, 2000; Seifert & Baker, 1998; Stewart, 2004). One study is a randomized controlled trial, several of the studies are quasi-experimental, and one is a case study. Their analyses include quantitative and qualitative methods. One study involved an intervention led by social workers (Bober, et. al., 2002). The results of several of the studies show a few significant differences between outcomes with visual arts programs when compared with other activities. The findings of this systematic review indicate that further studies on using visual arts with individuals living with dementia may provide more information on whether visual arts activity programs constitute a useful intervention.

CREATIVITY AND AGING: THE EFFECT OF AGE ON COMPONENTS OF SELF-PERCEIVED CREATIVITY IN LATER LIFE

S. Kamath, M.M. Lee, G.M. Workman, *Midwestern University, Downers Grove, Illinois*

Creative activity in older adults has many positive effects. Creativity plays an important role in coping with challenges, improving emotional functioning, and facilitating independence. Creativity is comprised of a complex set of traits, skills, and capacities. Individual attitudes, such as self-perceptions of creativity, are particularly crucial to understand given their link with self-efficacy and their prospective impact on behavior. The purpose of this study was to examine self-perceptions of different components of creativity in later life. This study examined self-perceptions of creativity among three age groups of older adults: 50-59 (n=20), 60-69 (n=20), and 70-79 (n=22), as measured by the separate subscales of the Scale of Creative Attributes and Behaviors (SCAB). The SCAB measured five components of creativity: Creative Engagement, Creative Cognitive Style, Spontaneity, Tolerance, and Fantasy. Results indicated significant differences between age groups on the Creative Engagement ($F(2, 59) = 4.11, p < .05$), Spontaneity ($F(2, 59) = 3.24, p < .05$), and Tolerance ($F(2, 59) = 3.51, p < .05$) subscales. Individuals 60-69 scored significantly higher on the Creative Engagement subscale than those 70-79. On the Spontaneity subscale, participants 50-59 scored significantly higher than individuals who were 60-69. On the Tolerance subscale, participants 70-79 scored significantly higher than those 60-69. Findings suggest that older adults do not perceive declines across all domains of creativity in later life and that perceptions of creativity involving tolerance to new ways of thinking may be enhanced. These preliminary results have positive implications for assisting adults with adaptively managing the stressors of aging.

THE MEANING OF CREATIVE ACTIVITIES, GENERATIVITY, AND ATTITUDES ON LIVING A LONG LIFE

C. Adams-Price¹, L. Morse², A. Swindol¹, J. Nagle¹, I. White¹, L. Swan¹, *1. Psychology, Mississippi State University, Mississippi State, Mississippi, 2. Counselor Ed/ Ed Psychology Mississippi State University, Mississippi State, Mississippi*

The purpose of this study was to examine the relationship between creative activities and generativity in middle and late life, and between generativity and attitudes toward living a long life in males and females from 40-90. 80 participants filled out a questionnaire describing their creative hobbies, including how long they had engaged in those hobbies, and how often they engaged in them. They completed the Creative Meaning Scale, a 3 factor questionnaire of creative hobbies, assessing their spiritual meaning, the feelings of usefulness they generate, and the extent to which they provide feelings of mastery or recognition from others. Participants also completed the Khatena-Morse scale of overall creativity, the Loyola Generativity scale, and the Prolongevity scale. The latter is a recently developed scale designed to measure attitudes toward living to be very old. It has two factors: hope about living a long life, and dread of living a long life. Correlational analyses revealed few age differences, except that older participants were less hopeful about late life. Participants who spent more time creating and who had been creating longer scored higher on all three factors of Creative Meaning, but not on overall creativity. Regression analysis was used to examine the extent to which creative activities predicted generativity. It was found that recognition/mastery and overall creativity predicted generativity. Desire to live a long life was predicted by generativity, and negatively by age, but was not directly affected by overall creativity or creative meaning. Individuals high on overall creativity dreaded old age less.

WHISTLING IN THE DARK: HUMOR IN AN ACTIVE ADULT COMMUNITY THEATER PRODUCTION

R. Hrybyk, J.K. Eckert, A. Frankowski, L. Keimig, E. Roth, *UMBC, Baltimore, Maryland*

Negative perceptions of aging can create concerns about anticipated losses. This poster presents a content analysis of a theatrical spoof on life in a nursing home and examines how seniors in an active adult community use humor to deflect anxiety about advancing age. The use of humor to mitigate fears of the unknown is well documented in psychological literature. Freud (1928) suggested that humor is a defense mechanism and Rollo May (1953) proposed that humor may help one put a 'distance' between oneself and a perceived stressor. Written and directed by a twelve-year resident of an active adult community and member of the drama club, the show was a musical revue with flashbacks from the life stories of six fictitious residents, interspersed with scenes from the day-to-day life in a stereotypical nursing home. A mixed-age group of 78 residents made up the cast and production crew. The theme of the play was expressed in the first line of the script, "Aging is not for sissies." Using excerpts from the script, illustrated with photographs of the production, the focus of the poster is on humor as a coping strategy for adults 55 and older. This research is part of a larger NIA study, Stigma and the Cultural Context of Residential Settings for the Elderly, which explores how older adults react to stigmatizing traits in themselves and others, supported by the National Institute on Aging RO1 AG028469 (P.I. J. Kevin Eckert, Ph D.)

NEVADA'S TRUE GRIT PROGRAM: A HEALTHY AGING APPROACH FOR ELDERLY PRISON INMATES

K. Kopera-Frye^{1,2}, T. McMullen², M.T. Harrison³, B.D. Dodson², N. Tiano⁴, *1. School of Social Work/ Gerontology, University of Nevada-Reno, Sparks, Nevada, 2. UNR Gerontology Academic Program, Reno, Nevada, 3. Northern Nevada Correctional Center, Carson City, Nevada, 4. Nevada Center for Ethics & Health Policy, Reno, Nevada*

The average age of the American prison population is increasing. Almost 4% of Nevada's current prison population is 60+ years of age.

The number of inmates nationally in federal and state prisons aged 55+ years grew 33% from the years 2000-2005; an overall 9% increase. Due to factors such as longer adjudicated sentences, longevity, and more stringent parole policies, more inmates will be spending their remaining later years in prison. True Grit, a Senior Structured Living Program, costing Nevada \$0, began in 2004 at the Northern Nevada Correctional Center in order to promote a more positive aging experience for their inmates. True Grit is the only known structured living program of its kind nationally that humanely meets the unique physical, medical, psychological, and spiritual needs of men growing old in prison. Since its inception, 137 older adult men have been True Grit members. True Grit program activities include: physical exercise (e.g., beach volleyball), music (e.g., choral groups and musicians) and literature appreciation (e.g., poetry writing), diversion activities (e.g., puzzles, crocheting, beadwork), video and pet therapy, theater, mental health counseling (e.g., Alcoholics and Narcotics Anonymous), cognitive enrichment activities (e.g., bingo, bridge), spiritual counseling, movement therapy, and ADL duties for each of the individual men. Data will be presented on the efficacy and cost-effectiveness of this cutting edge model program to promote well-being and increased quality of life among older adult inmates.

SESSION 1775 (POSTER)

END OF LIFE

BARRIERS AND FACILITATORS OF IMPLEMENTING EVIDENCED-BASED PAIN PRACTICES AMONG HOSPICE NURSES

S. Sanders¹, J.A. Reyes², M. Lehan-Mackin², K. Herr², M. Titler², C. Forcucci², 1. School of Social Work, University of Iowa, Iowa City, Iowa, 2. University of Iowa, College of Nursing, Iowa City, Iowa

The purpose of this paper is to report findings from focus groups with hospice personnel that illuminate barriers and facilitators for the implementation of evidenced-based practices for cancer pain assessment and management in older adults in hospices. Data were provided from an NCI-funded project, Cancer Pain in Elders: Promoting Evidence-Based Practices in Hospices that is evaluating the effect of a multifaceted translating research into practice intervention. Sixteen Midwestern community-based hospices stratified by size serve as the clinical sites in this randomized control trial. Following the intervention period, focus groups were conducted at each intervention hospice with key personnel involved in the implementation of the intervention, as well as other hospice nurses and involved members of the interdisciplinary team. The focus groups were facilitated by a nurse who was uninvolved in the research project and experienced in conducting focus groups. The focus group data were analyzed independently by three researchers to determine the factors that served as barriers and facilitators to the implementation process. Consensus on main themes was achieved. The results identify that the barriers to the implementation of pain practices were associated with two main factors, organizational and structural issues within the hospice and understanding of the protocols outlined in the grant. The facilitators of the implementation process were associated with four main factors, including the tools and resources provided to the hospices as part of the grant, support from a nurse expert who worked with each hospice, educational resources, and willingness of hospice personnel and leadership to implement the evidence-based pain practices. Findings have importance for future research and clinical focus on promoting practice changes. Funded by R01CA115363

RETAINING PRE-ILLNESS COPING STRATEGIES AS A TOOL FOR POSITIVE ILLNESS EXPERIENCE: A CASE STUDY

H.K. Hunter, K.L. Payne, R.S. Allen, *Psychology, The University of Alabama, Tuscaloosa, Alabama*

Patients with terminal cancer engage in various forms of coping to deal with their illness experience (Heim, et al., 1993). Examining coping mechanisms that result in positive outcomes for patients need more attention. The current project is a case study of one 62-year-old Caucasian female cancer patient in Tampa, Florida, whose unique coping style helped her remain positive throughout her illness. Two semi-structured interviews were conducted, each approximately 60 minutes. This data is from a larger project on self-perception in older women with advanced cancer. Three interrelated coping strategies were identified which helped the patient remain positive throughout her illness. First, she engaged in turning negative circumstances into positive experiences. She said "...I wanted the Lord to let me help other people somehow, facing what I did." She often engaged in helping others reduce their anxiety while waiting for chemo treatment. Second, she viewed her cancer experience as a fight in which she could actively engage. She viewed herself as a fighter throughout her life and did not let the cancer change that aspect of her identity. Third, her spiritual relationship with God had always been an important aspect of her coping repertoire which remained stable during her illness. She says, "...If I have to go, He'll bring me home. And I hope he'll say to me, 'Good Fight.'" This case demonstrates that patients can find meaning in their coping strategies if they are able to maintain aspects of their identity and coping strategies that were previously important to them.

THE END OF MY LIFE FOR THE SENIOR CITIZEN AT MARGINAL HAMLET IN JAPAN

S. Sakurai¹, H. Kayano¹, Y. Hazama², 1. Mie University Faculty of Medicine, School of Nursing, Tsu City, Japan, 2. Gifu Medical College, Gifu City, Japan

The purpose: The object of this study, "SUGARI district" is an enclave in Owase City, (Location is Middle of Japan) and the marginal hamlet by the rate of aging 54.9% as an inconvenient traffic place. So, the access of the health welfare medical services is very difficult. This study aimed for the senior resident in this area to find out for better and necessary comprehensive health system. The method: The object was senior citizen 206 of 65 years or more of this district living, and the answer of 181 people was obtained. This survey contents are as follow; present health condition including ADL, family relationship, social support and the end of my life issues. The result: 80% or more is living alone or living of two people with the consort. As for children, 68% lived outside this area. 74 % of resident recognized health conditions "So-so". However, 68% have given some medical care. All residents are proud of natural environment, and wanted to live through life here. If they will be difficult to live by themselves, they wish that most was going to live in their own home or child's house. However, they realized that it could do nothing but enter nursing home actually. So, it was made not to think about my end of life issues as possible. Most of people satisfied the community bonds. But, the overall social support was low. Their keen demands are enhancement of the public transportation facility and the health service regularly

PROSPECTIVE END-OF-LIFE DECISION-MAKING IN YOUNGER AND OLDER ASIAN INDIAN HINDU ADULTS

D. Mohankumar, M.L. Hummert, *University of Kansas, Lenexa, Kansas*

The process of end-of-life decision-making involves the choice of treatment preference and decision-maker. This study examined Asian Indian Hindus' decisions to determine age and cultural effects within the context of socioemotional selectivity theory. Younger (N=100) and older (N=100) Asian Indian Hindus completed a questionnaire on end-of-life scenarios, Western and Indian acculturation and Hindu end-of-life values. Twenty participants were interviewed. Results of sequential

logistic regression indicated that the hypotheses on age effects were not supported. However, there was support of cultural effects, which was substantiated in the qualitative interview data as well as supplemental analyses with a sample of younger (N=64) and older (N=59) non-Hispanic Whites. The discussion focuses on the implications of these differences, for health related decision-making.

PALLIATIVE CARE PATTERNS OF OLDEST OLD AND RESIDENTS WITH NEUROPSYCHIATRIC CONDITIONS IN LONGTERM CARE

L. Hyer¹, C.A. Yeager², 1. *Georgia Neurosurgical Institute, Macon, Georgia*, 2. *Institute for Mental Health Policy, Research, and Treatment, Essex County Hospital Center, Cedar Grove, New Jersey*

Objective: According to the Center to Advance Palliative Care, the seriously ill constitute only 5-10% of patients, but account for over half of the nation's total healthcare costs. Palliative care (PC) programs have better and more cost-effective outcomes than conventional care and provide more/better services. To date, however, little research has been done to determine whether PC improves care in LTC settings. We address PC in these settings using the National Nursing Home Survey (NNHS). **Method:** 1,174 nursing home facilities participated in the 2004 NNHS, producing a sample of 1,317,300 residents. Data include health status, psychiatric and medical diagnoses, medications, and services received. We examined residents who were receiving PC (N=34,724). Data were parsed by age group: 65-84 yrs and 85 yrs and up, and by depression or dementia diagnoses. Outcomes involved standard PC given in hospitals. **Results:** 62.7% of residents did not have access to PC in their facilities. Of those with such programs available, 2.6% of respondents were in PC; 60.6% were ages 85+ years. Only 8% in PC made emergency room visits during their PC stay, most of these were for residents ages 85+ years. On average, 3 PC services were offered (range=1-7), most commonly symptom and pain relief and family assistance. Fewer services were offered to PC residents with dementia whereas those with depression received similar to the average. **Discussion:** We discuss how both the oldest old and residents with neuropsychiatric diagnoses receive different care in LTC than either younger groups or those with no such diagnoses.

END-OF-LIFE COMMUNICATION AMONG KOREAN AMERICAN AND NON-HISPANIC WHITE OLDER ADULTS

E. Ko¹, M. Bonilla², 1. *Social Work, San Diego State University, San Diego, California*, 2. *San Diego State University, San Diego, California*

End-of-life communication is an important process. However, discussing end of life treatment options varies by culture. This study aims to explore ethnic difference in end-of-life communication among Korean American and non-Hispanic White Older adults and identify the factors influencing it. This study used a cross sectional research design. Two hundred seventeen Korean American (n = 112) and non-Hispanic White older adults (n = 105) living in Metropolitan area were interviewed. Measures included end of life communication, knowledge, health beliefs including perceived susceptibility, severity, benefits and barriers, and other socio-demographic variables. Overall, approximately one half of the participants (51.6%) had ever engaged in end-of-life communication, but the prevalence of the end-of-life communication was significantly different between two ethnic groups. As compared to 64.8% of NHWs, 39.3% of KAs engaged in end-of-life communication. Multivariate analysis showed that end-of-life communication was significantly accounted for by knowledge, experience of illness, perceived severity of illness, and perceived barriers, but not by ethnicity. Knowledge, perceived severity and experience of illness had positive effects whereas perceived barriers had negative effects on end-of-life communication. Although ethnicity did not significantly predict end-of-life communication, ethnic differences in end-of-life communication were evident. In addition, knowledge gaps between these ethnic groups were

also observed. Given that obstacles (e.g., structural barriers to health care access) and cultural differences exist, development of culturally appropriate resources and interventions stand to promote advance care planning among Korean American older adults.

WILLINGNESS TO USE HOSPICE AMONG KOREAN AMERICAN OLDER ADULTS

J. Allen¹, Y. Jang², D.A. Chiriboga², J. Kwak³, J. Salmon⁴, W.E. Haley¹, 1. *University of South Florida School of Aging Studies, Tampa, Florida*, 2. *University of South Florida Department of Aging and Mental Health Disparities, Tampa, Florida*, 3. *University of Wisconsin-Milwaukee Department of Social Welfare, Milwaukee, Wisconsin*, 4. *Aging Research Group, Tampa, Florida*

Although hospice has been documented to provide quality care to dying patients and their families, few racial/ethnic minorities utilize hospice services. This is particularly evident among Asian Americans. The present study focuses on Korean Americans who are known to lack knowledge about end of life care planning and have negative attitudes toward end of life care (e.g., Murphy et al., 1996). Modifying Andersen's behavioral health model, predisposing variables, potential health needs, and enabling factors were considered as predictors of willingness to use hospice. A series of logistic analyses was conducted using data from 675 Korean American elders (Mean age =70.2, SD = 6.88) residing Florida. Results showed that those who were younger (OR=0.96, 95% CI: 0.93-0.98) and with an educational attainment greater than high school (OR=1.67, 95% CI: 1.13-2.48) were more willing to use hospice. As the number of chronic conditions (OR=1.23, 95% CI: 1.05-1.03) increased, so did the likelihood of endorsing willingness to hospice use. The subsequent models with enabling variables showed that those with health insurance coverage (OR=0.59, 95% CI: 0.37-0.94), greater levels of acculturation (OR=1.07, 95% CI: 1.03-1.10), and prior knowledge of hospice (OR=4.43, 95% CI: 2.85-6.90) had a greater likelihood of endorsing willingness to use hospice. Our findings demonstrate the important role of enabling factors in determining willingness to use hospice. Researchers and hospice care providers should consider outreach programs to those less acculturated and without knowledge of hospice. Further studies should evaluate if those who are willing to use hospice actually utilize hospice services.

COMMON SENSE MODEL AND THE LIKELIHOOD OF END-OF-LIFE PLANNING

S. Bodnar-Deren, *Sociology and Institute for Health, Rutgers University, New Brunswick, New Jersey*

The aim of this study is to examine whether patients' illness representations are associated with the probability of EOL planning. Data were used from a recent survey of 305 chronically-ill, non-institutionalized adults in NJ, age 55+. Logistic regression revealed that those patients who perceived their illness had greater impact on their life (rated on a scale from 0-10) were 1.2 times more likely to engage in formal EOL planning (OR = 1.184 per unit change in perceived impact, 95% CI = (1.046, 1.340)[p=.008]). The significance remained robust even when controlling for co-morbid conditions, functional-status, familial relationships, and sociodemographic variables. These findings broaden what we know about EOL planning and suggest that by eliciting patient perceptions about illness impact, practitioners may be able to increase the likelihood of EOL planning. By incorporating the Common-Sense-Model and patient perceptions of their illnesses, practitioners can better meet the end-of-life planning needs of their patients.

EFFECTIVENESS OF COMMUNITY OUTREACH IN INCREASING AFRICAN AMERICAN HOSPICE USE

D. Farmer¹, C.N. Yancu¹, D. Leahman², *1. Behavioral Sciences and Social Work, Winston-Salem State University, Winston-Salem, North Carolina, 2. Hospice and Palliative CareCenter, Winston-Salem, North Carolina*

Background. Since the 1979 establishment of the Hospice and Palliative CareCenter (HPCC) in the Piedmont region of N.C., numbers have grown. However, the diversity of patients served does not reflect the racial/ethnic makeup of the population. HPCC initiated a community outreach program aimed at increasing the number of clients, particularly African American clients, served. The purpose of this study is to examine the effectiveness of the outreach effort by analyzing changes in population served over time. **Methods.** HPCC census data from 1999 through 2008 were analyzed to ascertain overall growth by race/ethnicity for hospice homecare, hospice inpatient care, and comfort care. Pre/post survey data of participants attending outreach programs were collected and analyzed beginning in 2009 to elucidate changes found. **Results.** HPCC has grown from serving 346 inpatients/year and 516 hospice homecare patients in 1999 to 935 inpatient/year and 1,018 hospice homecare patients in 2008. The percent of African American patients served has remained relatively stable but higher (18%, 2005 and 2006) than state levels (15%, 2005 and 2006). With external grant funding in 2003, HPCC achieved 21% African American enrollment compared to 16% for the state. **Discussion.** These findings suggest that although the number of patients served has increased dramatically, the percent of African Americans served has remained relatively stable. African American enrollment increased appreciably with supplemental targeted funding. **Measurable objective.** The HPCC community outreach model is an effective tool for increasing enrollment in hospice. Increasing minority use of hospice services may require a targeted, culturally sensitive educational approach.

END-OF-LIFE CARE IN LONG TERM CARE SETTINGS IN HONG KONG: DEVELOPMENT AND EVALUATION

A.Y. Chow¹, J.H. Yuen², *1. Department of Social Work & Social Adm., The University of Hong Kong, Pokfulam Road, Hong Kong, China, 2. Tung Wah Group of Hospitals, Hong Kong, China*

Long term care setting has become a common site of death around the world. In Hong Kong, most of the long term care residents who are terminally ill, spend their last days in hospitals. With the aging population and growing respect for individual choices, it is anticipated that more residents will choose long term care settings as their place of end-of-life care and even place of death. The TWGHs Jockey Club Rehabilitation Complex, consists of long term care settings for older adults, started to develop the end of care in late 2006. A three-stage model is adopted. In the first stage, ten focus groups were carried out to examine the existing structure, resources, and room for development. In the second phase, the NEST assessment tool for screening the needs of the older adults was tested, and consequently a process for care was proposed. In the final stage, a multi-source and longitudinal evaluation was done with the users, family members, staff and visiting doctors. Four measures over a year were collected. Positive changes are found in quality of life. As observed by the visiting doctors, long term care residents were found to have significant changes in emotions ($t = -2.40$, $p < .05$) and overall health ($t = -4.19$, $p < .01$).

MEDICAL AND SOCIAL FACTORS AFFECTING HOME DEATH RATES BY PREFECTURE IN JAPAN

K. Abe, *National Center for Geriatrics and Gerontology, Aichi, Japan*

Objective: In Japan the place where people die has largely changed from home to hospitals. In 2006, overall 82.3% of deaths occurred in the hospitals, with only 12.2% occurring at home. However, many elderly people say that they wish to "die at home". Therefore, there is a great discrepancy between the preference and the reality. Previous studies

have reported that several factors were affecting home death rates in Japan. However, because of a lot of variables had been using in analysis, the problem of multicollinearity has not been solved. Therefore, the aim of this study is to examine the factors affected to the home death rate in Japan using a new method for the selection of variables. **Method:** The data analyzed in this study is from statistical documents published by the Ministry of Health, Labour and Welfare, the Ministry of Internal Affairs and Communications, and the Cabinet Office. All of this data can be obtained on the Internet. **Results:** In this study, the principal component analysis was adopted to select variables in initial analysis. Results of the multiple regression analysis examined significant effects of the numbers of days in hospital, the number of users of home services for the prevention of long-term care, and the number of users of home help services on the home death rate by prefecture in Japan. **Discussion:** The method employed in this study uses a clearer variable selection process than in previous studies. Therefore, this method seems to be an effective method for selecting indicators related to medical and social indicators which have many conceptual overlaps.

FAMILY THEMES IN RESPONSE TO THE DEATH OF AN ELDERLY FATHER

M. Moss, S. Moss, *Arcadia University, Glenside, Pennsylvania*

How do multiple family members respond to and make meaning of the death of an elderly father? What themes emerge from separate qualitative interviews with the local adult children and the widow 6 to 10 months after the death? What have we learned when they talk about their personal experiences and feelings and their perceptions of experiences and feelings of the other? An exploratory study includes 5 families that were located through newspaper obituaries. The deceased fathers ranged in age from 73 to 88; included Catholics, Protestants, and Jews; 1 African American family, 4 Caucasian; occupations ranged from shipping clerk to professor. Two interviews were audio taped and transcribed with each of 13 surviving family members: 5 widows, 8 adult children. Qualitative analyses yielded four interrelated themes: (1) A sense of separateness that each person experiences in his or her bereavement and the tendency to avoid disclosure and emotional sharing; (2) the reciprocal wish to protect the other from one's personal burden of loss; (3) adult children and their widowed mother tend to see the widow "in a new light", emphasizing independence and strength; and (4) mutual concerns about the widow's future decline and dependency. The implications of these findings are discussed as they relate to support provided to bereaved individuals and families.

'TIL DEATH DO US PART: SOCIODEMOGRAPHIC, HEALTH AND FUNCTION CORRELATES OF TIME SINCE SPOUSAL LOSS

B.R. Williams^{1,2}, P. Sawyer¹, R. Allman^{1,2}, *1. Medicine, UAB, Birmingham, Alabama, 2. Birmingham VAMC, Birmingham, Alabama*

Purpose: To explore characteristics associated with time since widowhood among African American (AA) and White (W) community-dwelling older adults of the UAB Study of Aging. **Methods:** Data were from an in-home assessment in 2004 (N=624) where 41.6% of participants were widowed (N=260). Time since spousal loss ranged from <1 year to 60-years (M=15.5). Time since spousal loss was categorized in quartiles: ≤5-years (N=64); 6-10 years (N= 67); 11-22 years (N=62); >22 years (N=67). CHI-Square, ANOVA, and LSD were used to examine sociodemographic and health/function variations. **Results:** Compared to other race/gender categories, AA females were more often widowed ($P = < .001$), with higher widowhood duration ($p = < .001$). Mean years since loss were: 20.6 for AA women; 13.39 for W women; for 11.0 for AA men; and 5.72 for W men. Compared to other race/gender categories, AA widows had lower incomes ($p = < .001$) and were more likely to live with others ($p < .001$); had lower physical performance scores ($p = .010$) and more limited life-space mobility ($p = .014$). Age, rural residence, transportation difficulty, social support, self-reported health, cog-

nitive status, comorbidity count, depression, and anxiety did not vary. Conclusion: Widowed older adults are a heterogeneous population, with significant variations in length of time widowed, race, gender, living arrangements, as well as measures of physical function and mobility. Among AA females, time widowed was longer and associated with a unique composite of sociodemographic and functional correlates. Qualitative research is needed to contextualize the impact of spousal loss among community-dwelling older minorities.

INFORMAL CAREGIVERS OF HOSPICE PATIENTS WITH CANCER: A PROSPECTIVE BEREAVEMENT STUDY

J. Cagle, *UNC Institute on Aging, Chapel Hill, North Carolina*

This prospective study explored social and psychological needs of caregivers of advanced cancer patients and their subsequent bereavement adjustment. Participants were recruited by staff referral from a large Gulf Coast-based hospice organization. The sample included informal caregivers who had provided assistance to a hospice patient with a primary cancer diagnosis. Those individuals who lived furthest from the dying care recipient, the long distance caregivers, were of particular interest. The study consisted of a repeated measures administration of self-report surveys, which collected respondent data within the first week of hospice enrollment and, again, 3 months into bereavement. A total of 106 caregivers participated in the pre-death survey (50% response rate) and 70 in the post-death survey. Findings indicate that caregivers who assumed a greater share of the care responsibilities reported higher levels of depressive symptoms during bereavement. Quality of dying was found to be positively correlated with length of stay in hospice ($r = .53, p < .01$) and negatively related to emotional grief ($r = -.55, p < .01$). A large majority of respondents were satisfied with hospice care. However, long distance caregivers were less satisfied with the availability of hospice ($p = .004$) and hospice care in general ($p = .042$). The generalizability of these data is limited by the use of non-probability sampling, nested groups, and small sample size. Implications for caregiver support, hospice care, and future research will be discussed.

COPING IN THE EARLY STAGES OF WIDOWHOOD: THE ROLE OF DEATH PHILOSOPHY, RELIGION, AND PHYSICAL HEALTH

D. Romo, *California State University, Fullerton, California*

The death of a spouse is a severe loss and can shatter a person's view of the world. However, restructuring its meaning via one's death philosophy can buffer the psychological impact of this loss. Research suggests that high levels of fatalism (the belief that events are largely beyond one's control) are associated with negative outcomes, whereas acceptance of death has been linked with resiliency. However, one important, unanswered question is how these opposing philosophies simultaneously influence one's ability to cope with the loss of a spouse. This study compared the influence of these contrasting perspectives on psychological adjustment 6 months following the death of a spouse. Religion and physical health, factors also known to influence bereavement trajectories, were included as potential moderators. Analyses were based on prospective, longitudinal data from the Changing Lives of Older Couples study ($N = 244$ widow(er)s). Regression analyses (controlling for various socio-demographic and baseline psychological adjustment variables) revealed that greater acceptance of death, religiosity and health satisfaction were significantly associated with fewer depressive symptoms and with less grief at the 6-month follow up, and that pre- and post-loss depression were positively correlated. Fatalism, however, was not significantly associated with psychological well-being at the 6-month follow-up. Health satisfaction and religiosity did not moderate any of the relationships between predictors and criterion variables. Although these results demonstrate conceptual divergence, they do not show fatalistic or accepting views of death as categorically opposed philosophies toward death and dying.

PARENTAL BEREAVEMENT IN TWO COHORTS OF THE ISRAELI OLD-OLD POPULATION

J. Cohen-Mansfield^{1,2}, D. Shmotkin¹, R. Malkinson¹, L. Bartur¹, H. Hazan¹, I. Herczeg Institute, Tel Aviv University, Tel-Aviv, Israel, 2. George Washington Univ, Washington, DC, District of Columbia

Little is known about the associations between parental bereavement and physical and mental health in old age. We investigated the types of parental bereavement and whether the death of a child led to decreased wellbeing and increased mortality in older parents. The data used are from two national studies on the health, mental, and social status of two cohorts of older persons living in Israel. Data analysis indicated that bereaved parents tended to be somewhat older, and were more likely to be female, unmarried, less educated, and born in the Middle East or North Africa than non-bereaved parents. In addition, bereaved parents were, as a whole, more depressed and more functionally limited than non-bereaved parents, even after controlling for age and gender. The observed crude association between bereavement and mortality was entirely accounted for after adjusting for age and gender. This analysis provides an initial examination of the types of bereavement in older Israeli parents and the concomitant mental health and functioning. Whereas parental bereavement due to war is most frequently discussed in the Israeli context, parental bereavement due to disease is the most prevalent in this age group, and is more common in persons from lower socio-economic status.

GRIEF AMONG DEMENTIA CAREGIVERS: A COMPARISON OF TWO MEASURES

E. Mulligan¹, C. Ott², 1. Psychology, Washington University in St. Louis, St. Louis, Missouri, 2. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin

Research suggests that grief can be a component of dementia caregiving, even before the care recipient dies. The purpose of the current study was to identify areas of overlap and disjunction in two self-report measures of grief, one adapted from the postdeath literature, and one designed specifically for use with dementia caregivers. The first measure, the Prolonged Grief Disorder Inventory (PG-12; Prigerson, Vanderwerker, & Maciejewski, 2008) has been applied extensively to post-death populations, but is only beginning to be applied to predeath grief. The second measure, the Marwit-Meuser Caregiver Grief Inventory-Short Form (MM-CGI-SF; 2005) was developed based on focus groups with dementia caregivers. These measures appear to differ both in item content and in their definitions of pathological grief, but these differences have not been tested empirically. A total of 110 spousal and adult child caregivers of people with dementia completed these measures. Each measure had acceptable levels of internal consistency in this sample ($\alpha s > .80$). In terms of areas of overlap, total score on the PG-12 was highly correlated with total and subscale scores on the MM-CGI-SF ($r = .51$ to $.68$). These findings provide evidence for the convergent validity of each measure. However, the number of caregivers identified as in need of intervention based on the PG-12 and the MM-CGI-SF criteria were 4% and 18%, respectively. This discrepancy suggests the need for future research regarding the best way to define pathological grief, and which grief symptoms and measures are most predictive of long-term dysfunction.

NEW FACTOR STRUCTURE FOR THE REASONS FOR LIVING INVENTORY AMONG OLDER AFRICAN AMERICAN ADULTS

A. June, D. Segal, *University of Colorado at Colorado Springs, Colorado Springs, Colorado*

Older adults aged 65 and older in general have high suicide completion rates but older African Americans have relatively lower rates than their European-American counterparts suggesting that their protective factors are unique. The Reasons for Living Inventory (RFL) is a 48 item self-report measure that assesses potential reasons for not com-

pleting suicide should the thought arise. The authors of the RFL have proposed the scale to contain six subscales: Survival and Coping Beliefs, Responsibility to Family, Moral Objections, Fear of Suicide, Fear of Social Disapproval, and Child-related Concerns (Linehan, Goodstein, Nielsen, & Chiles, 1983). The RFL has a solid theoretical base, is widely used in clinical research, and has ample evidence of reliability and validity among European-American adults (Osman et al., 1993; Range, 2005; Range & Knott, 1997). The purpose of the present study was to explore the factor structure of the RFL with older African American adults to determine its validity with this particular population. Community-dwelling older African American (N = 72; M age = 69.9 years; age range = 60 to 86 years; 57.5 % Female; M years of education = 13.3) anonymously completed the RFL. Principal components analysis with promax rotation revealed that the factor structure of the RFL with older African American adults is different than the theoretically derived factor structure proposed by the authors. Items similarly loaded onto six factors, though not as initially proposed. Correlations between these newly derived factors ranged from 0.3 to 0.7. Future research is needed to validate these preliminary findings.

THE IMPACT OF WIDOWHOOD ON PARENT-CHILD RELATIONSHIP AND ITS IMPLICATIONS FOR WELL-BEING AMONG KOREAN ELDERS

J. Ha¹, H. Yoon², Y. Lim², 1. *University of Chicago, Chicago, Illinois*, 2. *Hallym University, Chuncheon, Korea, South*

While ambivalence theory suggests that intergenerational ambivalence tends to increase during life transitions, previous research in the US has not supported this hypothesis in the case of older adults' transition to widowhood. Using data of Korean elders, this paper examines: (1) the effect of widowhood on older adults' positive and negative assessment of their relationship with children and (2) its implications for older adults' psychological well-being in East Asian culture. Analyses are based on data from the Survey on the Quality of Life of the Elderly, a stratified multi-stage probability sample of older adults living in the cities of Seoul and Chuncheon in Korea. The first wave of data collection occurred in 2003 followed by additional surveys in 2004, 2005, and 2007. The current study uses data from 2004 survey which contains the measures of older adults' positive and negative feelings toward children. Analytic sample consists of 360 widowed and 384 married individuals who are aged 60 and over. Compared to married older adults, widowed older adults showed higher levels of negative and lower levels of positive feelings toward their children. Lower positive and higher negative feelings toward children were associated with higher levels of depression and lower morale among widowed persons. Findings suggest that widowhood may bring strain in intergenerational relationships in Korea more so than in the US. Working with bereaved older adults and their children to reduce negative interactions and forge constructive relationships may enhance older adults' well-being in this cultural milieu.

SESSION 1780 (POSTER)

GENDER AND PERSONALITY

AT MY AGE? DO I REALLY NEED TO?

P. Flores, *University of Texas at Austin, San Antonio, Texas*

Background: Latino/Hispanic women have the highest rate of cervical cancer in the U.S. (16.2 per 1000) while having the lowest rate of Pap screening. Texas has one of the highest cervical cancer death rates in the US. The mortality rate for cervical cancer in Hispanic women is 13.2 per 100,000 as compared to 8.2 per 100,000 for white women and 8.4 per 100,000 for all races. Cervical cancer screening is the lowest among older Hispanic women. Older Mexican American women are the least likely (less than 60%) to be compliant with cervical cancer screening. Cultural beliefs and health literacy are believed to play a role in the

decision making process of these older woman who choose not to be screened. Aim: To develop a culturally informed theory of behavior to understand factors that influence and older Latino/Hispanic woman's decision to undergo recommended routine gynecological exam. Methods: A semi-structured interview was conducted with questions aimed at exploring the process that older Latino/Hispanic women undergo to decide whether to attend cervical cancer screening. Results: There are varied and complex reasons not to attend routine gynecological exam, including lack of information and/or knowledge as well as family history. Conclusion: Additional information is presented to further understand the decision making process of an older Mexican-American woman to undergo or forgo annual gynecological exam. Further research is needed to address misinformation and provide adequate education to older Mexican-American women

WOMEN NARRATE LATER-LIFE REMARRIAGE: NEGOTIATING THE CULTURAL TO CREATE THE PERSONAL

W. Watson¹, N. Bell², C. Stelle¹, 1. *Bowling Green State University, Bowling Green, Ohio*, 2. *Texas Tech University, Lubbock, Texas*

While research has provided information about remarriage for women in later life, much of our knowledge concerns factors that contribute to remarriage or the desire to remarry. This study adds to the literature by focusing on the process of remarriage for women in later life. The purpose of this qualitative study was to enhance our understanding of how older women view and experience remarriage. In this study, a narrative approach affords both a holistic vantage point on later-life relationships and at the same time a "view from the inside" – older women's own accounts of single life, relationship development, and remarriage. The narratives were obtained in semi-structured, in-depth interviews with eight recently remarried women between the ages of sixty-five and eighty. A two-stage analysis addresses, first, the narrative content—the phenomenology of remarriage for these older women. Topics include: (a) the desire (or not) to remarry, (b) the experience of dating, (c) the decision to remarry, (d) marriage as a different experience than it was previously, and (e) the negotiation of interdependence in this new relationship and its meaning for identity. The second stage focuses on process, analyzing how cultural-level narratives are drawn upon in the creation of the women's personal stories. Based upon these analyses, we discuss the ways that a narrative approach can inform our understanding of later-life relationships, and we comment on the potential of narratives such as these to rewrite a script for older women's relationships.

BODY IMAGE AND OLDER WOMEN: NOT INVISIBLE ANY MORE

J. Henry, *Health Science, Kinesiology, Recreation, & Dance, Univ. of Arkansas, Fayetteville, Arkansas*

Though there has been research asserting that older people are affected by changes in body appearance and function, few studies appear to have examined body image (BI) and aging. In an effort to direct future research efforts by clearly delineating the need for defined focus and expanded research regarding BI in older women, this poster reports results of a review of existing published research on BI and older women. Research questions included: What proportion of published studies in academic journals addressed BI in older women? What tools are available for collecting valid, reliable data? What are key variables of interest? What are key findings of current research into BI in older women? What future research is recommended? Results include: review of one key database, January 2007-present, revealed 343 citations for BI and women, yet only 12 referred specifically to older women; of the many instruments found to assess aspects of BI, only three were designed and tested for older adults; generally agreed-upon finding include that older women may reject current cultural ideals, but BI disturbance persists into old age even though greater tolerance for larger body size may exist as compared to younger women, dieting practices persist

into old age, and older men are less concerned with BI aesthetics than older women. It is hoped that this presentation will raise awareness of the current dearth of research regarding BI in older women, increase interest in the topic, and generate productive discourse regarding specific future research questions, projects, and collaborations.

THE ROLE OF SOCIAL SUPPORT IN BEHAVIORAL OUTCOMES AMONG OLDER WOMEN

I.S. Harvey¹, M.E. Muiot², K. Alexander³, 1. *Kinesiology and Community Health, University of Illinois Urbana Champaign, Champaign, Illinois*, 2. *University of Illinois Urbana Champaign Department of Statistics, Champaign, Illinois*, 3. *University of Maryland Baltimore County, Baltimore, Maryland*

Although research has documented that social support is a positive pathway to health-promoting behavioral practices, very few longitudinal studies assess the relationship between social support and health-promoting behaviors among older, diverse women. Three waves of data from the Americans' Changing Lives (ACL) survey assess whether changes in perceived social support influence behavioral outcomes among 671 African American and non-Hispanic white women aged 60 years and older. Body mass index (BMI), physical activity, alcohol consumption, and cigarette smoking were examined as dependent variables. Independent variables were demographic characteristics, and social support variables. Research indicates that age, ethnicity, and education were strong predictors for BMI; demographic characteristics and number of chronic conditions for physical activity; age, ethnicity, education, and income for alcohol consumption; and age and marital status for cigarette smoking. Positive social support from friends were the most successful in explaining physical activity while positive social support from friends, spouse and children were not significant for BMI, alcohol consumption, or cigarette smoking. The results imply is that social support from friends may be an important predictive factor in engaging older women in physical activity. By understanding how social support interactions affect the health of older women, public health interventions can be designed to optimize physical activity as women age.

AGE, SOCIAL SUPPORT, AND CHILDHOOD TRAUMA AS PREDICTORS OF SUBSTANCE USE IN RECENTLY INCARCERATED WOMEN

T.L. Young, A. Pearman, *Gerontology, Georgia State University, Atlanta, Georgia*

In 1990, adults aged 50 and older accounted for 4% of the incarcerated population. By 2001, the percentage of incarcerated adults aged 50+ had increased to 8% (Corrections Yearbook, 2001). While the majority of these prisoners are white males, research suggests that the older female population is also increasing (Kratcoski & Babb, 1990). The majority of the research examining older adult incarcerations has explored either male incarceration exclusively or has focused on macro forces, such as sentencing mandates and stricter consequences for petty crimes. Therefore, the goal of this research is to examine micro forces, such as social support, substance use, and childhood traumas and their roles in the lives of older incarcerated women. The sample of 189 recently incarcerated women aged 18-58 is derived from a larger research study entitled the Women's Life Experience Project. Participants were asked questions in regards to their perceptions of social support using the Interpersonal Support Evaluation List (Cohen, 1985), experiences of childhood sexual trauma using the Sexual Abuse Exposure Questionnaire (Ryan, Rodriguez, Rowen, & Foy 1992), experiences of childhood physical trauma using six survey questions, and experiences of substance use collected by correctional officials. Multiple regression analyses revealed that older age and less social support predicted more alcohol use, and older age alone predicted more drug use. These results illustrate a need for deeper exploration of these micro forces across the life course of incarcerated women and the need for age-specific programs with at-risk populations to address substance use.

THE INFLUENCE OF PERSONALITY ON CAREER CHOICES

R.J. Maiden¹, B. Hayslip², M.M. Maiden³, 1. *Psychology, Alfred University, Alfred, New York*, 2. *University of North Texas, Denton, Texas*, 3. *University of the Sciences in Philadelphia, Philadelphia, Pennsylvania*

This study explores the relationship between the NEO-PI and vocational choice as determined by Holland's typology on a sample of 486 older adults (M age = 72). Costa, McCrae, & Holland (1984) conducted a similar study on a sample of 361 adults, 21 to 89 years old using the Self-Directed Search scales. The data revealed that the personality trait of Openness to Experience was strongly associated with Investigative and Artistic interests, Extroversion with Social and Enterprising interests, and less Openness with Conventional interests. To explore further the influence of personality traits on career choices, we utilized the revised NEO-PI (Costa & McCrae, 1992), which added the personality traits of Agreeableness and Conscientiousness, and we assessed vocational interests by ranking the participants stated job according to the Holland Typology scales. We found, as anticipated, comparable results to Costa et al.'s study while controlling for gender on the personality traits of E and O. For example, we found that a high score on Openness was strongly related to career choice in the Investigative, Social, and Artistic fields while a high score on Extraversion was associated with Enterprising careers. In addition, we found that high Conscientiousness was associated with Artistic endeavors and high Agreeableness with Social interests. Moreover, scoring high on Neuroticism went with choosing Conventional and Realistic lines of work. Finally, Realistic jobs were associated with less Openness, Extroversion, Conscientiousness, and Agreeableness. Implications for post-retirement vocational choices and the strong influence that personality plays in career experiences are discussed.

PERSONALITY, HOUSING SATISFACTION, AND PSYCHOLOGICAL WELL-BEING AMONG OLDER ADULTS LIVING IN CCRC

A. Begovic-Juhant¹, H.L. Sterns², 1. *Health Sciences, Cleveland State University, Cleveland, Ohio*, 2. *The University of Akron, Akron, Ohio*

This research examined the relationship between personality, housing satisfaction, and psychological well-being of thirty-seven older adults, who moved into a newly constructed Continuous Care Retirement Community (CCRC). The participants were interviewed twice; during the first interview, the participants were asked to respond to questions on research instruments as if it was one week before the move. The second interview examined the same measures except for personality questionnaire. Two research questions were explored. The first asked which personality traits (neuroticism, extroversion, conscientiousness, agreeableness, and openness) were more prevalent among older adults. The second question asked which personality traits were significantly related to housing satisfaction and psychological well-being. Results for the first question indicated that participants scored the lowest on Neuroticism and highest on Agreeableness and Conscientiousness. To explore the second question, the relationship between personality, housing satisfaction, and psychological well-being was examined separately for the data collected during the retrospective and second interviews. For Neuroticism, the results revealed a significant positive relationship with depression and significant negative relationship with morale and life satisfaction. For Extroversion, Agreeableness, and Conscientiousness, the results revealed significant positive relationship with morale and life satisfaction and significant negative relationship with depression. Openness to Experience was not significantly related to any of the outcome variables, and not one personality factor was significantly related to housing satisfaction. These results suggest that the participants scored relatively low on Neuroticism and relatively high on Agreeableness and Conscientiousness. Personality did not significantly affect

housing satisfaction, but personality was significantly related to psychological well-being.

SOCIAL RELATION GOALS AND TELEONOMIC RELEVANCE

C. Bolkan¹, D. Coehlo², K. Hooker³, 1. *Washington State University, Vancouver, Vancouver, Washington*, 2. *Oregon State University, Corvallis, Oregon*, 3. *Oregon State University, Corvallis, Oregon*

The extent to which current goals relate to future goals is called teleonomic relevance. The closer goals are hierarchically linked will theoretically result in psychological well-being and increased motivation to achieve goals. The importance of social relationships becomes a particularly salient goal domain in later life. We explored the inter-relatedness between current social relation (SR) goals and future SR goals. We conducted face-to-face interviews with 85 (57 women, 28 men) community-dwelling older adults (mean age = 74) recruited from two small primary care clinics. We administered a measure of current (personal projects) and future (possible selves) goals, the Geriatric Depression Scale, Life Orientation Test, Health Perceptions Questionnaire, and a measure of teleonomic relevance. Close to half of the participants spontaneously identified at least one SR possible self ($n = 52$) as well as at least one SR personal project ($n = 36$). Although there was no significant relationship between actual generation of current SR personal projects and future SR possible selves, participants who identified SR projects still perceived more teleonomic relevance between their current and future goals [$t(73) = -2.3, p = .03$] compared to individuals who did not generate current SR projects. Although mental and physical health status were unrelated to teleonomic relevance scores, optimism significantly predicted teleonomic relevance ($F = 1, 76 = 5.0, p = .03$). These findings perhaps indicate that social engagement and optimism may facilitate motivation for all future goals, regardless of specific goal domain

PERSONALITY AND VOLUNTEER ACTIVITY AMONG JAPANESE COMMUNITY-DWELLING OLDER ADULTS

H. Iwasa, Y. Masui, Y. Gondo, C. Kawaai, H. Inagaki, T. Suzuki, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

[Introduction] Volunteer activity is beneficial for maintaining autonomy and quality of life in old age. Many studies have reported various factors associated with volunteer activity among older adults. However, few studies have examined the relationship between personality traits and volunteer activity among older adults. We therefore examined this relationship in a sample of Japanese community-dwelling older adults, using a cross-sectional study design. [Method and materials] The study sample included 1279 individuals (506 men and 773 women) aged 65 years and older. The NEO five-factor inventory was administered to assess the "big five" personality traits: neuroticism, extraversion, openness, agreeableness, and conscientiousness. Multivariate logistic regressions adjusted for gender, age, number of years of education, presence of chronic diseases, presence of psychiatric problems, history of hospitalization during a one-year period, living alone, functional capacity (measured using the Tokyo Metropolitan Institute of Gerontology Index of Competence), and mental health state (measured using the General Health Questionnaire), were performed for each personality trait to test the association between personality and participation in volunteer activity. [Results] The rate of participation in volunteer activity among the elderly was 14.6%. Use of logistic regressions showed that extraversion (1-standard-deviation increment; odds ratio [OR] = 1.34, 95% confidence interval (95%CI) = 1.11-1.62), agreeableness (OR = 1.25, 95%CI = 1.06-1.48) and conscientiousness (OR = 1.37, 95%CI = 1.15-1.64) were associated with participation in volunteer activity. [Conclusion] Our results indicate that high extraversion, high agreeableness, and high conscientiousness are predictive of participation in volunteer activity among community-dwelling older adults. Our findings may help to

encourage older adults to initiate volunteer activity that would contribute to maintaining autonomy and quality of life in old age.

SEX AND PERSONALITY PREDICTORS OF MEMORY SELF-EFFICACY IN YOUNGER & OLDER ADULTS

M. O'Barr, A. Pearman, *Georgia State University, Atlanta, Georgia*

Memory self-efficacy (MSE) is defined as beliefs about one's ability to remember. Previous studies have looked at MSE with a broad range of variables, such as sex, personality, and age, but few studies have combined these variables to explore differential predictors of MSE. Data was collected on 95 young adults (ages 19-28) and 283 older adults (ages 45-89). Participants with gross cognitive dysfunction were excluded from the study. The Capacity, Change, Anxiety, and Locus of Control subscales of the Metamemory in Adulthood questionnaire (Dixon, Hultsch, and Hertzog, 1998) were used as the measure of memory self-efficacy. The NEO-Five Factor Inventory (NEO-FFI; Costa & McCrae, 1992) was used to measure the five personality domains, including Neuroticism, Extraversion, Openness, Agreeableness, and Conscientiousness. As expected, we found age to be negatively correlated with MSE scores. There was not a main effect of sex on MSE scores. We found that four of the five personality domains were related to MSE. Specifically, significantly higher MSE scores, while low scores on Neuroticism were related to higher MSE scores. We also found two interactions, namely Age X Extraversion and Sex X Agreeableness. Older adults low in Extraversion had significantly lower MSE scores than older adults high in Extraversion, whereas extraversion was not important for young adults' MSE scores. Females high in Agreeableness had significantly higher MSE scores than those low in Agreeableness, whereas the Agreeableness effect for males was negligible. These results will be presented and further explained.

THE BIG FIVE PERSONALITY TRAITS AND RATINGS OF HEALTH AS PREDICTORS OF MORTALITY

N.A. Turiano¹, A. Spiro², D. Mroczek¹, 1. *Child Development & Family Studies, Purdue University, West Lafayette, Indiana*, 2. *Boston University School of Public Health, Boston, Massachusetts*

There is a burgeoning literature on the Big Five personality traits as predictors of mortality. Specifically, low levels of conscientiousness and high levels of neuroticism are deleterious to an individual's health. Findings for other traits are somewhat mixed. Moreover, understanding the influence of other factors (such as health) with this relationship is also growing. The current investigation utilizes data from the Boston VA Normative Aging Study. In 1990-91, 1,349 male participants (mean age = 64.9; range = 45-89) completed the Goldberg Unipolar markers of the Big Five personality traits and were followed until July 2006 (mean survival time = 11.01 years), during which 547 deaths occurred. We used proportional hazards modeling to examine mortality risk over the 18-year follow-up period. There were significant main effects for each trait except for neuroticism. High levels of conscientiousness, extraversion, agreeableness, and openness significantly decreased mortality risk. After adding controls (age, objective and self-rated health, and depression), the personality effects were attenuated. A 1 SD increase in age was associated with 85% increase in mortality risk (HR = 1.11; CI = 1.09-1.12). A 1 SD increase in subjective health (better health) was associated with 15.4% decrease in mortality risk (HR = 0.77; CI = .68-.90). A 1 SD increase in objective-rated health was associated with 13.4% increase in mortality risk (HR = 1.01; CI = 1.00-1.01). Both subjective reports of one's health and objective-rated health explain the personality-mortality association. The interplay between personality and health likely has cumulative effects over time that influences mortality risk.

EFFECT OF CHOICE SIZE AND PERSONALITY STYLES ON PERFORMANCE OF DECISION MAKING AND OPINION ON THE CHOICE SIZE ADEQUACY IN MEDICARE PART D

C. Bhattacharya^{1,2}, B.A. Rakela², P. Liu^{1,2}, W.T. Eriksen², A. Schmidt², S. Wood², 1. *Claremont Graduate University, Claremont, California*, 2. *Scripps College, Claremont, California*

The Medicare prescription drug plan requires older adults to consider many options. Thus choosing the best plan may be difficult especially for older adults (Tanius, Wood, Hanoch, & Rice, 2009). In this study we investigated the effect of choice size and age on performance of a decision making task, their opinion on the adequacy of choice size, and the influence on personality factors, such as maximizing and satisfying. We had 223 participants, 120 young adults and 103 old adults. We found that age and choice size have significant effects on decision making, for choice size ($B=0.40$, $t=4.45$, $p<.01$) for age ($B=0.428$, $t=3.41$, $p<.01$). Interestingly, only choice size but not age has a significant effect on participants' opinion on the choice size adequacy, ($B=.066$, $t=6.56$, $p<.01$) such that choice of 3 plans are judged as not enough and choice of 20 plans are judged as more than required. It was found that there is no significant effect of differences in maximizing styles on performance on decision making. There is a significant interaction effect of maximizing styles and choice size on participants' opinion on the choice size adequacy, ($B=.024$, $t=2.13$, $p=0.34$) such that individuals who tend to maximize find choice size of 20 as either adequate or less than adequate but individuals who satisfy find choice size of 20, too much and more than adequate. This implies that personality factors have a significant effect on opinion about number of choice but has no significant effect on performance of decision making.

RELATIONSHIPS BETWEEN BIG FIVE PERSONALITY TRAITS AND MARITAL SATISFACTION IN LONG-TERM MARRIAGES

E. Rosowsky², K. King², D. Segal¹, F. Coolidge¹, J. Simenson¹, 1. *Univ. of Colorado, Colorado Springs, Colorado*, 2. *Massachusetts School of Professional Psychology, Boston, Massachusetts*

Research has indicated that Big Five personality traits are related to marital happiness or discord (Bouchard et al., 1999; Donnellan et al., 2004; Watson et al., 2000) but few studies have examined late life marriages. Whisman et al. (2006) found that greater marital discord was associated with lower agreeableness and higher neuroticism for older couples, but marital discord was not assessed by a standardized measure. This study examined associations between Big Five personality traits and marital satisfaction among older adults in long-term marriages. Older couples ($N=32$; $M = 49.2$ years of marriage) completed the Revised NEO Personality Inventory and the Marital Satisfaction Scale. There was no significant mean difference in overall marital satisfaction between the husbands ($M = 8.1$, $SD = 15.0$) and wives ($M = 9.0$, $SD = 16.8$) ($p > .25$). There was a weak positive, non-significant correlation between their marital satisfaction scores, $r(30) = .14$, $p > .25$. From the perspective of the husbands, a linear multiple regression with marital satisfaction as the DV and their self-reported Big Five personality dimensions as the IVs revealed no significant relationships. The husbands' marital satisfaction was also compared to their wives' Big Five scores. Multiple regression revealed a significant relationship (adjusted R squared = .32, $p = .020$). Standardized beta coefficients revealed that Openness was a significant negative predictor. From the perspective of the wives, regression revealed no significant relationship between their marital satisfaction and their personality traits. The wives' marital satisfaction was also compared to their husbands' Big Five scores. Multiple regression revealed there was no significant relationship but standardized beta coefficients revealed that Agreeableness was a significant negative predictor. This study suggests that marital satisfaction in older men is related to lower levels of openness in their wives whereas marital satisfaction in older women is related to lower levels

of agreeableness in their husbands. The finding may reflect traditional gender role expectations and life stage.

CONSCIENTIOUSNESS AND NEUROTICISM AS PREDICTORS OF DISCREET PHYSICAL HEALTH OUTCOMES

G.W. Edmonds, J.J. Jackson, S.M. Spain, B.W. Roberts, *University of Illinois at Urbana Champaign, Champaign, Illinois*

Links between personality and both physical health outcomes and mortality have been demonstrated in many samples. These effects typically involve relating a broad measure of personality to a broad measure of physical health, or a broad measure of personality to one specific health outcome or process. Conscientiousness and neuroticism consistently emerge as the best predictors of physical health, where conscientiousness is positively related to health outcomes and neuroticism is usually negatively related to health outcomes. Prediction of specific health outcomes is an important step in better understanding the relationship between personality and broad outcomes such as overall physical health and mortality. These broad relationships may result from personality traits operating simultaneously through many different discreet health outcomes. The present study uses data from the Health and Retirement Study (HRS) to investigate the relationships between Big Five conscientiousness and neuroticism and self-reported diagnoses of specific physical health outcomes including hypertension, heart disease, diabetes, lung disease, arthritis, and stroke. Since the HRS data consists of married couples, we employ a multilevel model to account for dependency between dyad members. With the exception of diabetes, both conscientiousness and neuroticism operate as parallel predictors, although their relationships to specific health outcomes vary in magnitude. In the case of diabetes, conscientiousness is a significant predictor while neuroticism is not. Implications for future research linking personality and physical health are discussed.

GENDER DIFFERENCES IN THE ASSOCIATIONS BETWEEN ADL AND OTHER HEALTH INDICATORS IN 1992 AND 2002

P. Schön^{1,2}, I. Kåreholt¹, M. Thorslund¹, M.G. Parker¹, 1. *Aging Research Center, Karolinska Institutet & Stockholm university, Stockholm, Sweden*, 2. *Department of Social Work, Stockholm university, Stockholm, Sweden*

Different components of disability and health follow different trends over time. Also, several health indicators develop differently for men and women. Have the relationships between ADL and other health indicators changed over time? And are there gender differences in these changes? We examined gender differences in the associations between ADL and objective tests (physical performance and lung function) as well as self-reported measures (global health, mobility, pain, and psychological problems) in 1992 and 2002. Data were from the Swedish Panel Study of Living Conditions among the Oldest Old (SWEOLD), a nationally representative interview survey of persons aged 77+. Women had significantly higher prevalence rates for most problems both survey years. Prevalence rates increased significantly between 1992 and 2002 for all indicators except ADL and IADL. Virtually all measures, both objective tests and self-reports, were significantly correlated with ADL and IADL. The associations between activity limitation and different health problems were stronger for men than for women. The overall pattern over time was that the correlations become weaker for women and stronger for men in 2002 compared to 1992. Changes in the associations between activity limitations, physical capacity, and health problems imply that different indicators follow different trends. ADL and IADL appear to reflect different dimensions of health and different kinds of needs for men and women. Changes in the environment and in gender roles may contribute to change over time and these changes seem to affect men and women differently.

GENDER AND RELIGIOUS DIFFERENCES ASSOCIATED WITH VOLUNTEERING IN LATER LIFE

L.K. Manning, *Sociology/Gerontology, Miami University, Oxford, Ohio*

The purpose of this study is to use a nationally representative sample of older adults in the United States to investigate the effect gender and religiosity has on volunteer behavior in later life. This study looks specifically at the gender and religious differences associated with volunteering in later life. Accounting for gender and religious differences, more specifically, this study examines the assumption that older women are more likely to volunteer in later life as opposed to men, and that gender is a better predictor than being religious for the likelihood of occupying a volunteer role in later life. This study poses questions about the differences in gender and religiosity associated with volunteering in later life; the results indicate there is more work to be done as we conduct research that is clearer about how volunteerism and religiosity are measured in relation to gender, and the overall impact these differences have for older women and their respective communities.

PROFILE OF OLDER MEN WITHIN THE GREATER PITTSBURGH RANDOMIZED HOUSEHOLD HEALTH SURVEY

B. Sellars, C. Fryer, S. Thomas, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Due to the high mortality of Black men, it is pertinent that we increase knowledge about racial differences in the aging process. Our study provides an overview of the similarities and differences between older Black and White men in Allegheny County on demographics, medical mistrust, social support, discrimination, health, and psychological well-being. We use a weighted subsample of Black and White men aged 50 years and older ($M=64.90$, $SD=10.53$) from the Greater Pittsburgh Randomized Household Health Survey ($N=244$; 22% African American). Within demographics, White men reported higher levels of education ($p=.010$) and income ($p=.000$) and being married ($p=.004$). In the same vein, more Whites owned their own homes ($p=.000$). Within health, both races reported similar levels of physical activity, tobacco usage, depressive symptoms, and self-esteem. Whites reported more social support ($p=.040$) and receiving care from a doctor's office ($p=.000$). Within medical mistrust, both races were equally willing to participate in future medical research, and both felt that their doctor would explain a research study fully. However, Black men reported more experienced discrimination across all settings ($p=.000$), and had heard more about the Tuskegee Syphilis Study ($p=.000$). Also, both races reported similar levels of perceived quality of health care. While this study is a preliminary investigation, it provides needed background for understanding racial similarities and differences among older men, especially within medical mistrust. Many of the racial differences found confirm findings reported previously, however, the similarities between these two groups are worthy of note and have implications for future research.

CHEMICAL ADDICTIONS IN OLDER ADULTS: THE RELATIONSHIP OF GENDER TO TREATMENT, RELAPSE AND RECOVERY

P.A. Greenberg, C.R. Shawley, *Community Studies, St. Cloud State University, St. Cloud, Minnesota*

While older adults are one of the fastest growing populations in the chemical addictions community the literature and treatment programs overwhelming focus on adolescents and younger/mid-life adults. Additionally, there are even fewer sources that examine gender and aging as variables for treatment, recovery and potential relapse. The present study utilized a holistic approach to explore differences in the experiences and outcomes of older women and men who underwent treatment for chemical addictions in a program specifically for older adults. A total of 285 people participated in the study between April 2004 and June 2008. Of the 285 participants, women comprised 40% (114) and men 60% (171). Men were more likely to have experienced previous treatment

(72%) while women were more likely (83%) to have co-occurring disorders (depression and other mental health issues). Although co-occurrence was also a significant factor for men (68%). Participants were initially interviewed two weeks into the treatment program and then re-interviewed by telephone at 6 month intervals for up to two years following the completion of treatment. Follow-up response rates were higher for women but overall fairly low which can be expected for this population. More than half of those participants who completed follow-up interviews continued to abstain from alcohol and/or other chemicals and regularly attend support group meetings. Family and social supports tended to be more significant for women which is reflected in the overall older adult population. Project funded by a grant from the Minnesota State DHS

EVERYDAY PROBLEM-SOLVING STRATEGIES: EXAMINING AGE AND SEX DIFFERENCES IN VARYING DOMAINS

J.A. Flinn¹, J. Strough², *1. Psychology, Frostburg State University, Frostburg, Maryland, 2. West Virginia University, Morgantown, West Virginia*

The current study examined how age and sex of participants, and domain of the problem influenced the generation of problem-solving strategies. Participants, 136 younger adults ($M = 19.22$, $SD = 1.30$: 58 M, 78 F) and 81 older adults ($M = 73.17$, $SD = 7.76$: 38 M, 43 F) were given two hypothetical vignettes, one in the work domain, and one in the caregiving domain. Responses were coded for two instrumentally-oriented strategies (deliberation and self-action). A 2 (age) x 2 (sex) x 2 (form type) x 2 (domain) MANOVA indicated two significant three-way interactions for instrumentally-oriented strategies: domain by strategy by sex and domain by strategy by age. Results indicated that the reporting of deliberation strategies varied by domain, Wilks' $\Lambda = .835$, $F(1, 212) = 41.94$, $p < .001$, with participants more likely to report these strategies for the work domain. Sex differences emerged when participants responded for the caregiving domain vignette, with men more likely to report self-action strategies than women, $F(1, 212) = 6.52$, $p < .011$, $\eta^2 = .03$. Results also indicated that age was a significant variable, Wilks' $\Lambda = .979$, $F(1, 212) = 5.06$, $p < .025$. In the work domain, older adults were more likely to report deliberation strategies than younger adults, $F(1, 212) = 5.64$, $p < .018$, $\eta^2 = .026$. In the caregiving domain, older adults were more likely to report deliberation strategies, $F(1, 212) = 31.50$, $p < .001$, $\eta^2 = .129$, while younger adults reported more self-action strategies, $F(1, 212) = 17.20$, $p < .001$, $\eta^2 = .075$. These results suggest that domain, as well as age and sex, are important factors to be considered in examining problem-solving strategies.

SESSION 1785 (SYMPOSIUM)

HEALTH AND CARE FOR CHINESE ELDERS: RELIGION, INTERGENERATIONAL EXCHANGES AND SOCIOECONOMIC STATUS

Chair: I. Chi, *University of Southern California, Los Angeles, California*

In both the United States and China, the long predicted impact of global aging is already being felt. Although the objective health outcomes are similar, the self-perceived health tends to be different among the Americans and Chinese. In addition, the eldercare values differ between east and west. This symposium focuses on the health status and long term care services for older adults in China. Four papers examine the impact of different factors including religion and intergenerational support on the health and cognitive function among older Chinese adults. The last paper examines the conceptualization and professionalization of elder care services among residential institutions in China.

THE IMPACT OF SOCIOECONOMIC STATUS ON TRAJECTORIES OF COGNITIVE FUNCTION AMONG OLDER CHINESE ADULTS

Y. Li, I. Chi, *School of Social Work, University of Southern California, Alhambra, California*

Objectives: This study examines the effects of socioeconomic status (SES) on the trajectories of cognitive function among older adults in China. **Methods:** Data came from the longitudinal China Health and Nutrition Survey (CHNS). Using latent growth curve models, this study estimates the trajectories of cognitive function among 2,345 older adults aged 55 and above from 1997 to 2006. Cognitive function was measured using questions selected from Mini-Mental Status Exam (MMSE). **Results:** Higher education is associated with better cognitive functions at baseline as well as less steep declines over time, supporting the cumulative advantages hypothesis. Occupational class and income did not lead to diverged cognitive function at old age, but their effects persisted into old age. **Discussion:** This study demonstrates the effect of SES on cognitive function continued over time, and the effect varied by the components of SES examined.

INTERGENERATIONAL SUPPORT AND SELF-RATED HEALTH FOR CHINESE OLDER ADULTS IN ONE-CHILD FAMILY—THE DIFFERENCE BETWEEN URBAN AND RURAL AREAS

L. Xu, I. Chi, *USC, Monterey Park, California*

As a result of the one-child policy, increasing number of older adults has only one child in China, which puts pressure on the traditional family-based support system. Data (N=1101) were a sub sample of people aged 60 or over who participated in the nationwide 2000 Sample Survey on Aged Population in Urban/Rural China (SSAPUR). Intergenerational support was measured through structural, instrumental, financial and emotional support. Findings from the hierarchical regression showed that only emotional support ($t=3.93, p<.001$) in urban area and financial support ($t=4.36, p<.001$) in rural area influenced older adults' self-rated health after controlling for demographic variables. Intergenerational support explained 28.8% and 30.7% variances in self-rated health for urban and rural older adults respectively. The results suggested that health benefits from emotional and financial support should not be ignored when developing elder care policy in China to meet the needs of the one-child older adults in the coming years.

SPECIALIZATION OF AGING SERVICES IN CHINA'S LONG-TERM CARE

H.J. Zhan, *Sociology, Georgia State University, Atlanta, Georgia*

This paper exams the conceptualization and professionalization of elder care services among residential elder-care institutions in China. Based on a study conducted in 2008 in 23 elder care institutions with data drawn from over 1400 residents, this study reveals a high level of ambiguity in ownerships of elder care institutions. Furthermore there is a lack of specialization and professionalization in types of elder care services. The author argues that the social context and social system in China may have contributed to the current confusion in conceptualization and professionalization. Yet to meet the demands for the growing Chinese baby boomers in both urban and rural China, clear definitions and specifications in aging services will be a necessary step to promote both the growth of aging services as well as quality control of such services.

CONSEQUENCES OF CARING FOR GRANDCHILDREN ON GRANDPARENTS' HEALTH: THE CASE OF CHINA

F. Chen, G. Liu, *Sociology&Anthropology, North Carolina State University, Raleigh, North Carolina*

Using a longitudinal dataset (China Health and Nutrition Survey), we investigate the effect of grandparent caregiving on their health trajectories in China, a setting where it is normative for grandparents to

provide routine care for grandchildren and yet virtually nothing is known about the health consequences. This study overcomes limitations in the existing literature in the following ways: 1) we use a general sample of older adults, including both grandparents and non-grandparents, and those who provide help and those who do not; 2) we examine a range of caregiving involvement provided by grandparents; 3) we use multiple indicators of health; 4) we use longitudinal data analytical techniques to make stronger causal inferences. Finally, rich community level data provide us with the opportunity to contextualize the analysis, given that rapid socioeconomic changes and massive out-migration in the rural areas may change demands, normative expectations and resources related to childcare.

SESSION 1790 (SYMPOSIUM)

HEALTH BEHAVIORS AND HEALTH CONTROL IN MID- AND LATER LIFE: EVIDENCE FROM QUANTITATIVE AND QUALITATIVE STUDIES

Chair: *T. Pudrovska, Sociology, University of Texas, Austin, Texas*

Discussant: *D. Carr, Rutgers University, New Brunswick, New Jersey*

Chronic diseases become increasingly prevalent in mid- and later life. It is well documented that lifestyle affects the onset and progression of chronic conditions, yet factors associated with optimal health behaviors are less understood. The purpose of this symposium is to integrate two levels of the analysis of health behaviors and health regulation. On the one hand, we present quantitative analyses of the distribution of health beliefs and behaviors at the population level. On the other hand, findings from qualitative studies reveal how health behaviors are constructed and negotiated at the dyadic level of couples in long-term relationships. The quantitative papers in this symposium are based on two longitudinal large-scale surveys of aging. Pudrovska compares health control beliefs among cancer survivors and individuals without cancer to analyze how perceptions of controllability of health change after cancer. Storch examines how employment and occupational characteristics in late midlife predict changes in men's body mass index during the transition to old age. The qualitative studies are based on in-depth interviews with middle-aged and older couples. Paying particular attention to the consequences of aging for dyadic interactions, Reczek explores the ways in which same-sex and opposite-sex couples negotiate and regulate eating, drinking, and exercise habits. Umberson examines gendered processes of health regulation and control in marriage as a form of emotion work for wives and husbands. Taken together, these papers provide a multifaceted view of health behaviors as shaped by the interplay of socio-cultural influences at the macro-level and dynamic interactive processes at micro-level.

"HEALTH DEPENDS ON THINGS I DO": AGE AND COHORT DIFFERENCES IN THE EFFECT OF CANCER ON HEALTH CONTROL BELIEFS

T. Pudrovska, *Sociology, University of Texas, Austin, Texas*

Using two waves of the National Survey of Midlife Development in the United States, I compare longitudinal changes in health control beliefs among cancer survivors and individuals without cancer. Moreover, I examine age and cohort differences in the perceptions of controllability of health after cancer. The theoretical framework of this study integrates competing views of cancer as a stress process and as a positive catalyst. Findings from three-level random-coefficient models support both views. In 1940s, 1950s, and 1960s birth cohorts, the sense of mastery over one's health increases with age for cancer survivors while declining for persons without cancer. Conversely, in the 1920s and 1930s cohorts, having cancer is associated with a steep decline in health control beliefs over time. These findings suggest that health control beliefs are shaped by the interplay of developmental and socio-cultural influences. Seemingly idiosyncratic psychological reactions to cancer reflect macro-level processes represented by cohort differences.

GENDER, HEALTH HABIT REGULATION, AND EMOTION WORK IN LONG-TERM RELATIONSHIPS

D. Umberson, 1. *Sociology, University of Texas, Austin, Texas, 2. Population Research Center, Austin, Texas*

Survey research suggests that spouses attempt to regulate and control their partner's health habits. Moreover, women are more likely than men to impose regulation and control and men are more likely than women to be the recipients. We go beyond statistical patterns of gender, regulation efforts, and health habits to examine underlying processes through which these patterns emerge. Qualitative data from 62 in-depth interviews with men and women (31 couples) in long-term marital relationships suggest that health regulation is a form of emotion work that is more likely to be performed by women than men but that health problems of a partner often lead to change in this process, particularly for men who begin to devote more time and concern to monitoring their wife's health.

BREADWINNING AND WEIGHT: EXAMINING THE EFFECT OF EMPLOYMENT AND OCCUPATIONAL CHARACTERISTICS ON THE BODY MASS INDEX OF OLDER MEN

J. Storck, *University of Texas, Pflugerville, Texas*

Overweight and obesity have been studied extensively as important risk factors for multiple chronic conditions that develop with advancing age. However, researchers of aging have paid relatively little attention to the influence of later-life economic activity on older men's weight. Using two waves of the Wisconsin Longitudinal Study, I examine the effects of employment and occupational characteristics on men's body mass index (BMI) in late midlife and early old age. In this cohort of older White men who have adhered to clearly demarcated gender roles and placed a high emphasis on their breadwinning activity over the life course, employed men exhibited a greater increase in BMI with age than their peers who were out of the labor force. Yet, characteristics of men's occupation, such as occupational income and education, were associated negatively with men's BMI. I discuss these findings with respect to the social selection and causation mechanisms.

SESSION 1795 (PAPER)

HEALTH PROMOTION MESSAGES FOR OLDER ADULTS

THE BABY BOOM GENERATION OF AFRICAN AMERICAN AND AFRO-CARIBBEAN WOMEN: THE EXPLORATION OF COHORT EFFECT AND OBESITY

G.M. Simpson¹, J. Bramble³, L. Cornelius², 1. *Social Work, Morgan State University, Towson, Maryland, 2. University of Maryland, Baltimore, Maryland, 3. Times Community Services, Baltimore, Maryland*

Obesity, defined as an unhealthy excess of body fat, is a growing problem in the United States which is disproportionately increasing among African Americans and persons of African descent, such as Afro-Caribbean. Although obesity is a public health concern among all adults, the baby boom generation, persons aged 44-62 (born between 1946 and 1964), are often overlooked by health care providers, researchers and policy makers. Statistical projections found the highest rates of obesity can be found among baby boomers and are expected to increase over the next two decades, particularly among women aged 50 and over. Longer life expectancy in the baby boom generation coupled with highest rates of obesity, suggest that obesity will adversely affect multiple chronic conditions such as cancer, diabetes, heart disease, high blood pressure, osteoarthritis, and Alzheimer's disease. Given the above projections, it is important to understand how cohort effects influence eating habits, physical activity and perceptions of obesity among older, African American and Afro-Caribbean women. A qualitative focus group methodology was employed to address this area by conducting four focus

groups (n=26), ages 41 to 60 years of age, divided based on ethnicity and socioeconomic status. Primary themes derived from the data revealed how exposure from environmental and societal factors influence cooking traditions, eating preferences, physical activity and perceptions of body weight and obesity. Implications for practice suggest that birth cohort must be integrated into health prevention and intervention programs, in order to effectively address weight loss and healthy behaviors.

ENVIRONMENTAL IMPACT ON OBESITY IN COMMUNITY DWELLING OLDER ADULTS

A. Eisenstein^{1,4}, T. Prohaska¹, W. Satariano², M. Kealey², R. Hunter³, 1. *Center for Research on Health and Aging, University of Illinois at Chicago, Chicago, Illinois, 2. University of California, Berkeley, Berkeley, California, 3. University of North Carolina, Chapel Hill, North Carolina, 4. Rush University Medical Center, Chicago, Illinois*

Introduction: While we have considerable evidence as to the role of physical activity and nutrition on obesity, relatively less is known about the environmental correlates of obesity among older adults. This study examines the role of environmental risk factors in obesity among community residing older adults. Methods: Interviews were conducted with 884 adults aged 65 and older, residing in four areas in the U.S.: Alameda County, CA; Cook County, IL; Allegheny County, PA and Durham/Wake Counties, NC. Participants provided self-report data on demographics, general health, and attitudes/beliefs towards walking. Assessments of the neighborhood were based on the modified Neighborhood Environment Walking Survey (NEWS). Subscales of the NEWS survey include access to services, land use, street connectivity, places for walking, neighborhood surroundings, traffic safety, and safety from crime. Bivariate analyses examined the relation between BMI and environmental, demographic, and physical characteristics. Multinomial regression analyses were conducted to examine significant neighborhood characteristics while controlling for demographics. Results: BMI was associated with access to services, neighborhood surroundings, and safety from crime summary scores. After controlling for demographic characteristics, access to services remained significant. That is, older adults who reported less availability of services in their neighborhood were more likely to have a greater BMI. Discussion: The findings suggest that access to resources in the neighborhood, such as access to grocery stores and mass transit options should be considered in the context of educational health promotion interventions to maintain and promote healthy weight among older adults.

EXERCISE MOTIVATION AND FITNESS THROUGH DOG WALKING AMONG OLDER ADULTS

R. Johnson^{1,2}, C.A. McKenney², 1. *University of Missouri-Sinclair School of Nursing, Columbia, Missouri, 2. University of Missouri-College of Veterinary Medicine, Columbia, Missouri*

Background: The rising rate of obesity in older adults is linked with the national problem of limited physical activity (PA), resulting in chronic illness. Older adults who walk dogs have been found to maintain physical functioning over a 3 year period (Thorpe 2006). Research questions: To what extent do older adults in a shelter dog walking (DW) group, have better physical function, physical activity, mood, social support and weight loss than those in a human walking companion (HWC) group or a no-treatment control (C) group? What are the participants' perceptions of the walking program? Methods: A three-group, repeated measures design tested efficacy of a 12-week (5 days/week) DW program for adults over age 65. To control cross-group contamination, each of three retirement facilities were assigned to a group. The DW group selected a dog matching their walking capability & walked at the animal shelter. The HWC group identified a walking partner & walked at their residence. Results: 54 adults participated {DW n=12, HWC n=23 & C n=19}. Fourteen males & 40 females, ranged in age from 67-93 years (Mean=85). The 6-minute walk compared pre and post for the DW group showed a 28% increase (p=0.012), the HWC had a 4% increase (p=0.32)

and the C group a 6% increase ($p=0.18$). Conclusions: Participants in the DW group immediately expressed affinity for the shelter dogs. The DW group had significantly improved walking speed. Dog walking may be a beneficial way to improve or maintain functioning in older adults.

EFFICACY OF DIFFERENT EXERCISE PROGRAMS ON COGNITIVE FUNCTION IN PERSONS WITH ALZHEIMER'S DISEASE

S. Eichberg, *Institute for Sportgerontology, German Sport University Cologne, Cologne, Germany*

Dementia is one of the leading causes of death. Today about 13 % of Americans (7 % of Germans) aged 65 years and over have Alzheimer's disease (AD). AD is characterized by a severe loss of cognitive abilities such as processing speed and executive function. There is hopeful evidence that physical activity could be an effective approach to improve cognitive performance of older people. There exist only few intervention studies with AD patients. These studies are mostly based on endurance training. Only little is known about the benefits of strength training. The objective of the present study was to examine the effects of different training programs on different cognitive abilities. 34 persons (32% women) with AD underwent cognitive tests (processing speed, word fluency, executive function, reaction time). The sample had a mean age of 73 years and a MMSE score of 24. The sample was randomized into two intervention groups (endurance: $n=8$; strength: $n=11$) and one control group ($n=15$). The groups did not differ in age and MMSE score. After 3 months of training, the participants in both training groups showed notable (but statistic not significant) improvements in all tests of cognitive function compared to the control group. Processing speed and executive function was enhanced in the strength training group. Word fluency and reaction time was rather improved in the endurance training group. Although not significant, these results emphasize the assumption that endurance and strength training have benefits and provoke heterogeneous mechanisms which are responsible for improvements of cognitive functions.

TO BE ACTIVE OR NOT TO BE INACTIVE

N. Notthoff, L. Carstensen, *Department of Psychology, Stanford University, Stanford, California*

Introduction: Younger adults engage more in health promoting behaviors when information is framed in terms of gains rather than losses and when the framing matches their approach/avoidance motivation focus. This study examined, if gain framing of health messages is effective in promoting walking among older adults. Given older adults' increased attention to positive information as predicted by Socioemotional Selectivity Theory, we expected that gain framing would have an advantage over loss or neutral framing. Methods: Younger adults ($n=65$, mean age=21.43) and older adults ($n=57$, mean age=74.84) received information about walking that either explained physiological information about walking in neutral terms or was framed in terms of potential gains resulting from walking or potential losses resulting from not walking. Participants' walking was monitored for one week using pedometers. Results: Younger adults walked more than older adults (meanYA=56691.52, meanOA=31089.98, $p<0.001$). Younger adults walked the same amount of steps in the gain (mean=53658.15), loss (mean=58837.95), and neutral (mean=57302.68) framing conditions. However, older adults walked the most steps when they were given gain framed (mean=39080.19) rather than loss (mean=22048.94) or neutrally framed (mean=30860.18) information ($p<0.05$ for gain versus loss and for gain versus loss or neutral). In fact, in the gain frame condition, the difference in number of steps taken per week between younger and older adults was reduced to marginal significance ($p=0.08$). Conclusion: Framing information in terms of potential gains of pursuing physical activity promotes walking among older adults.

SESSION 1800 (SYMPOSIUM)

HUMAN COMPUTER INTERACTION ISSUES FOR OLDER ADULTS

Chair: W.A. Rogers, *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*

Discussant: E.D. Mynatt, *Georgia Institute of Technology - School of Interactive Computing, Atlanta, Georgia*

Advanced technologies are prevalent in our environments – at home, at work, and in most other facets of our lives including healthcare, transportation, and leisure activities. In many contexts technology interactions are no longer optional but instead necessary to achieve a goal or perform a task. Older adults face unique challenges interacting with advanced technologies for myriad reasons including age-related perceptual and cognitive changes as well as perhaps limited experiences with technologies in general. The focus of this symposium will be on human-computer interaction (HCI) issues for older adults. Charness et al. will discuss a modeling technique that enables predictions of performance and likelihood of errors for older technology users. Czaja et al. will focus on use challenges in the workplace for communication technologies. O'Brien et al. will describe analyses of interactions with everyday technologies and the mediating role of technology experience. Beer et al. will explore the potential of virtual agents to provide information and task support to older adults. The discussant will be Elizabeth Mynatt who is Director of the Gvu Center and Associate Professor of Interactive Computing. She will provide her perspective as a computer scientist regarding the pressing needs for HCI research targeted to older adults. This symposium will provide in-depth examples of the HCI issues that must be considered if older adults are to be successful interacting with advanced technologies and maintaining their quality of life and independence.

OLDER WORKERS AND COMMUNICATION TECHNOLOGY: IMPLICATIONS FOR TRAINING AND EMPLOYMENT

S. Czaja¹, C. Lee¹, V.L. Hanson², A.F. Newell², J.T. Richards³, L. Gibson², *1. University of Miami Miller School of Medicine, Miami, Florida, 2. University of Dundee, School of Computing, Dundee, United Kingdom, 3. IBM T. J. Watson Research Center, Hawthorne, New York*

Today's workplace requires the use of multiple communication technologies such as e-mail, video conferencing and instant messaging. The use of these technologies means that workers are constantly bombarded by the need to respond to requests from co-workers/supervisors. This may be problematic for older workers because of limited familiarity with these technologies and age-related cognitive changes which may make them more prone to disruptions. We explored these issues with 52 adults (aged 55+) who viewed a scenario where communication technologies were introduced into a workplace and discussed the potential impact of modern communication technologies on work behaviors. Most participants indicated that modern communication technologies may decrease ability to focus at work, quality of interactions with co-workers and negatively impact on worker collaborations. However, the majority expressed interest in learning these applications. These findings will be discussed in terms of strategies to increase the successful participation of older adults in today's workplace.

BENEFITS OF GOMS ANALYSIS FOR DESIGN FOR OLDER TECHNOLOGY USERS

N. Charness¹, T. Jastrzemski², *1. Psychology, Florida State University, Tallahassee, Florida, 2. Air Force Research Laboratory, Mesa, Arizona*

Aging adult cohorts lag behind their younger counterparts in adoption of technology products such as mobile phones, computers, and the Internet. Technology adoption depends on factors such as access, motivation, ability, design, and training. Adequacy of design is often evalu-

ated through usability testing of products. Such testing can be time consuming and expensive. Modeling offers an alternative that can often pinpoint design flaws. Card, Moran & Newell's (1983) Goals, Operators, Methods, Selection rules (GOMS) modeling offers a good first approximation modeling approach. We have recently extended GOMS modeling to take into account older adult information processing abilities and have used it to model performance on mobile phone tasks. We will present tips on how to ensure reliability in modeling, and discuss how GOMS can be extended to predict not just performance time, but also accuracy. We will also highlight some non-obvious insights that can be gleaned from GOMS analysis.

EXAMINING ENCOUNTERS WITH EVERYDAY TECHNOLOGIES AMONG YOUNGER AND OLDER ADULTS

M. O'Brien, *Psychology, University of Alabama, Huntsville, Huntsville, Alabama*

In order to successfully complete activities of daily living, older adults must adopt an evolving repertoire of new and improved technologies. The fact that these technologies are being adopted (e.g., DeFalco, 2009 March) suggests that these technologies are appropriately designed for them. Longer lag times to adoption than younger generations, however, suggest that effective use may be based on different strategies. This research study systematically examines encounters younger and older adults have with everyday technologies, such as cell phones and fitness machines, that are designed for use with no training and minimal instruction. The presentation will present results from our study of younger adults and older adults with high and low technology experience about their encounters with these everyday technologies over a ten day period. We will focus on factors contributing to first-time success and effective problem-solving in the face of errors.

RECOGNIZING SOCIAL CUES WHEN INTERACTING WITH VIRTUAL AGENTS: WHAT LEADS TO EMOTION MISATTRIBUTIONS?

J.M. Beer, A.D. Fisk, W.A. Rogers, *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*

Virtual agents are increasingly applied to healthcare and domestic domains to address problems such as medication management, diet and so on. These agents must socially interact and communicate with users through simulated face-to-face communication. Understanding how people interpret social cues presented by virtual agents is important for design of agents whether virtual or not. Indeed, there is little or no systematic research exploring emotion recognition when interacting with machine agents. This fundamental knowledge is crucial for proper human-machine interaction. We investigated older and younger adults' recognition of facial expressions produced by a virtual agent. We will present a recognition confusion matrix illustrating the locus of age-related differences and deviations from human facial expression recognition. We will focus on the errors made when identifying the virtual agent's emotions and also present design recommendations for virtual agents that interact and communicate with older adults.

SESSION 1805 (SYMPOSIUM)

LIFE IN THE PAST LANE: REFLECTIONS IN A REVIEW MIRROR

Chair: G.T. Reker, *Trent University, Peterborough, Ontario, Canada*
Discussant: B. Haight, *Medical University of South Carolina, Charleston, South Carolina*

We live life forward, but understand it backward. Much has been learned about the psychosocial benefits of autobiographical methods but less is known about the processes that operate when participants report having grown personally. Using self-reports of guided autobiography participants, Reker et al. find structural changes over time to the self-system, coupled with positive evaluations of others and life at pres-

ent. Svensson reports on the anticipated and actual evaluations of usefulness, value, importance, and impact of various components of guided autobiography, and notes shifts towards increased group cohesion, closer family ties, and greater spiritual connectedness. Cappeliez and Drouin investigate the self-reflections of older adults regarding reminiscence. They report that the identity function predominates, that reminiscence and emotions are intertwined, and that reminiscence is both an index of good memory and a pathway to avoiding dementia. Participants' reflections on a life can be captured by way of the life-line interview method. Pierce and Schroots report on the spatial distribution of life events across the life course, noting a sharp peak for life events between the ages of 10 and 30 (the bump) and a flattening of distances for life events in adults over 70. Schroots charts the life course over a 5 year period in terms of number, affect, and content noting that most bump-period memories are positive with emphasis on personal and interpersonal life domains.

SELF-ASPECT RECONSTRUCTION THROUGH GUIDED AUTOBIOGRAPHY: EXPLORING UNDERLYING PROCESSES

G.T. Reker¹, J. Birren², C. Svensson², *1. Psychology, Trent University, Peterborough, Ontario, Canada, 2. University of Southern California, Los Angeles, California*

This research explores possible reconstruction processes involving the self-system (actual, ideal, and social image selves) of participants taking part in guided autobiography (GAB). Ten young and eleven older adults met each week for 12 weeks. Data were collected at pretest, midtest, and posttest. Three indicators of structural change were measured and analyzed: self-aspect congruence, self-aspect integration, and self-aspect consistency. For all participants, results revealed a significant increase over time in self-aspect congruence (actual/ideal and actual/social image) and self-aspect integration (actual self only), while self-aspect consistency remained constant and high. Compared to younger adults, older adults showed significantly greater congruence in actual/ideal and actual/social image self aspects following the GAB experience. Moreover, greater self-aspect congruence was associated with positive evaluations of others and life at present. Our findings provide us with an understanding of the underlying mechanisms that operate when individuals, particularly older participants, report having grown personally through GAB.

ANTICIPATED AND ACTUAL EVALUATIONS OF THE COMPONENTS OF GUIDED AUTOBIOGRAPHY

C.M. Svensson¹, G.T. Reker², J. Birren¹, *1. University of Southern California, Los Angeles, California, 2. Psychology, Trent University, Peterborough, Ontario, Canada*

Participants in Guided Autobiography (GAB) classes come in with their own preconceived ideas about the class, e.g., how it will be structured and what they will be expected to do. Most come in with the simple goal: to write their life story. However, GAB builds on a process that emphasizes small group work, writing on increasingly sensitive themes, and personal sharing of one's writing. Twenty-one young and older participants met each week for 12 weeks during the 2007 Fall semester. The themes, elements, and processes of GAB were assessed pre- and posttest. Significant changes occurred in all areas. For instance, the greatest change was seen in the usefulness of reading their writing in the small group, as well as active participation in the group. Qualitative comments from the participants and reflections of GAB by the group facilitators are discussed to further clarify the power of the GAB process.

WHAT DO OLDER ADULTS THINK OF REMINISCENCE?

P. Cappeliez, H. Drouin, *Psychology, University of Ottawa, Ottawa, Ontario, Canada*

This research investigates the implicit theories of older adults regarding reminiscence. A semi-structured interview was conducted with eight

older adults (average age: 77.3 years). Contents were analyzed by three researchers who followed the method of grounded theory. Five main themes emerged. The identity function of reminiscence is the one that predominates. Reminiscence and emotions are intertwined: emotions characterize reminiscence and reminiscences are used to manage emotions and foster adaptation. Some reminiscences occur spontaneously while others are intentional, each type having its own triggering context. Interpersonal relations are at the core of reminiscence. Finally, reminiscences are considered as both an index of good memory functioning and a way to exercise memory in order to avoid dementia. These findings provide further insight on the contribution of reminiscences to psychological adaptation in later age.

THE SPATIAL DISTRIBUTION OF LIFE EVENTS USING THE LIFE-LINE INTERVIEW METHOD

T.W. Pierce¹, J. Schroots², 1. *Department of Psychology, Radford University, Radford, Virginia, 2. Free University Amsterdam, Amsterdam, Netherlands*

Ninety-eight adults (18 – 84 years) drew life-lines documenting the course of their lives using the Life-line Interview Method (LIM) (Schroots et al., 2003). Participants labeled significant life events on the life-line and provided their chronological age for each event. For each of 500 life events identified, we recorded both the chronological age for the event and the distance across the life-line at which the event was labeled. Consistent with previous research, the frequency distribution of chronological ages for life events shows a sharp peak between the ages of 10 and 30. However, the frequency distribution of distances across the graph for life events is considerably more flat, especially for adults over 70. This pattern indicates that, for older adults, events from the teens and 20s are not merely reported more frequently; they occupy a disproportionately larger portion of LIM life-lines depicting the perceived locations of events across the life course.

THE DYNAMICS OF AUTOBIOGRAPHICAL MEMORY

J. Schroots, *Vrije Universiteit / ERGO, Amsterdam, Netherlands*

The Amsterdam Longitudinal Study of Autobiographical Memory (ALSAM) covers a period of five years in which the Life-line Interview Method (LIM) was administered three times to a group of 98 young, middle-aged, and older men and women (18-84 yrs). The life-course dynamics of memories and expectations were analyzed from the perspective of number, affect and content of life-events. Salient results will be presented with the focus on the emergence of the AM 'bump' over the adult lifespan. Memories from the bump-period (10-30 yrs) are mostly positive memories, belonging to the categories 'Begin Relations' (e.g. in love), 'Commitment' (e.g. marriage), 'Birth Child' (e.g. children), 'Finishing School' (e.g. graduating), and 'Beginning Work' (e.g. first job). Computer simulation (Janus model) of general physiological performance and ALSAM data supports the hypothesis that the relatively more intensive, neural encoding and storage of information in the bump period underlies the emergence of the AM bump in older adults.

SESSION 1810 (PAPER)

LIVING AND DYING WELL

QUESTION ASKING BY FAMILY CAREGIVERS IN HOSPICE INTERDISCIPLINARY TEAM MEETINGS

E. Wittenberg-Lyles¹, D. Parker Oliver², G. Demiris³, K. Washington⁵, K. Regehr⁴, H. Wilder⁴, 1. *Communication Studies, University of North Texas, Denton, Texas, 2. University of Missouri, Columbia, Missouri, 3. University of Washington, Seattle, Washington, 4. Warren Alpert Medical School of Brown University, Providence, Rhode Island, 5. University of Louisville, Louisville, Kentucky*

This project is part of a larger National Cancer Institute funded intervention to improve communication between hospice staff and caregivers.

The project utilized portable videophones to facilitate caregiver participation in hospice team meetings. This data was collected from 36 video-recorded team meetings from 12 caregivers who participated in the intervention phase of the study. A qualitative content analysis was conducted to obtain the frequency, type, and content of questions asked by caregivers and staff. Hospice staff asked almost three questions to every one question asked by a family caregiver. Both caregivers and staff predominantly asked direct (Yes/No) questions. Clarification, coordination of care, technical quality, and prompt questions demonstrated the task function of the IDT meeting. Questions regarding medication/pain management, patient symptoms, and the patient's overall condition indicate that the emphasis of IDT meetings between staff and caregivers is the patient's physical care. Findings suggest that the videophone conference provided the opportunity for direct communication about plans of care.

FALLS IN HOSPICE: EXAMINING OCCURRENCE AND RISK FACTORS FOR FALLS IN A VULNERABLE POPULATION

M. Bhatnagar, H. Degenholtz, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Falls are recognized as a major cause of morbidity in elderly and frail populations. Falls have been shown to result in injury, loss of independence and reduced quality of life in the geriatric population. While intuitively, one would expect similar consequences from falls among hospice patients, there are currently no data available as to the prevalence of falls or risk factors associated with falls in the hospice population. We examined the prevalence of falls among patients receiving hospice care at home, nursing home or inpatient hospice unit and determined the risk factors associated with falls in the hospice population. We analyzed secondary data at the provider level accessed from a national quality improvement benchmarking database that includes organizational characteristics, case mix and the rate of falls. Independent variables include patient volume, type of setting (home, nursing home, inpatient), process of care (e.g. number of weekly visits per discipline), quality practices (e.g., as percentage of physicians who are board certified). Dissemination of these results would enhance understanding of the nature of falls among hospice patients and lead to assessment and management tools that would be specific to the hospice population. Evidence of variation in rate of falls among providers suggests that there are opportunities for to improve quality of care, however further research is needed on the consequences of falls and treatment guidelines for falls with injury in this population.

STRUGGLE OVER "THE LITTLE THINGS": SOCIAL WORKERS AND ETHICAL DILEMMAS IN HOSPICE

M. Dennis, *University of Michigan, Ann Arbor, Michigan*

The world of hospice patients has often been reduced to a room or a bed where "the little things" become important for expressing autonomy and control. Little attention is given to the ethical dilemmas faced by social workers as they help patients' efforts to maintain control. This qualitative study utilized semi-structured interviews (N=14) to explore the ethical dilemmas master's level social workers encounter in a hospice setting. Findings suggest: 1) social workers are internally conflicted over obeying hospice rules and meeting the hospice clients' needs to maintain control over "little things" such as being able to walk outside, to receive mail, and to spend money; and 2) social workers utilize internal problem solving processes and design solutions that often benefit the patient. This study offers insight into the impact and power social workers can have in hospice patients' efforts to maintain autonomy and control.

ENHANCING QUALITY OF LIFE FOR COMMUNITY-DWELLING FRAIL ELDERLY: PALLIATIVE CARE AT HOME

E. Chichin, O.R. Burack, T. Adamski, A.L. Kreiser, *Jewish Home Lifecare, New York, New York*

While hospice services for the dying have long been the accepted model of care, the use of non-hospice palliative care for chronically ill individuals in the community is relatively new. Given that the bulk of frail elderly with chronic illnesses reside in the community, the need for such initiatives is great. Described here are the development, implementation, and initial findings of a palliative care program within a home health care program. Included in the initiative were a palliative care education program for all levels of clinical staff, including nursing aides and escort-translators, a modification of extant telehealth technology to identify palliative care issues, and hiring a 1/2 time palliative care consultant. In its first year, 53 homecare clients were referred to palliative care. The majority of referrals (69.3%) were made by home care nurses, with 22.5% made by social workers. Four referrals came through non-video telehealth monitors, where clients indicated that they had symptoms that would benefit from a palliative intervention. Of the 53 clients referred to palliative care, 40 clients were referred for pain-related issues, generally of a chronic nature. Recommendations for management ranged from medication changes to referral to pain clinic to increased socialization. This model with its palliative approach to care can be adapted with relative ease and can potentially enhance the quality of life and quality of care of frail, community-dwelling elders.

SESSION 1815 (SYMPOSIUM)

METACOGNITION IN ADULTHOOD AND AGING: BELIEFS, MONITORING, AND SELF-REGULATORY CONTROL

Chair: C. Hertzog, *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*

Discussant: C. Hertzog, *School of Psychology, Georgia Institute of Technology, Atlanta, Georgia*

Metacognition involves the beliefs, knowledge, and awareness about one's own cognition, including monitoring current status of cognitive processes. Monitoring one's cognitive performance allows effective self-regulation of performance, because one can make informed strategic decisions about how to achieve performance goals. For example, if monitoring a retrieval attempt indicates that information cannot be accessed, one can engage in additional attempts to learn the desired information, perhaps by changing learning strategies. Recent research has shown that there are age differences in some aspects of metacognition, but not others. For example, older adults generally have lower memory self-efficacy and perceived control over memory, which predicts whether they will use effective strategies for learning and remembering. On the other hand, older adults have been shown to monitor learning and some aspects of retrieval as well as younger adults. The proposed symposium reviews new research on older adults' beliefs about memory, including correlates of personality and leisure activities with memory beliefs. Pearman and Trujillo report on predictors of older adults' memory complaints. Jopp describes relationships of memory self-efficacy and control with self-reported activities. The symposium also contains two papers reporting evidence that older adults use metacognitive monitoring to effectively control learning when the task context affords it. Hines shows that older adults' subsequent study time allocation is influenced by confidence in accuracy of their memory. Price shows that older adults' selection of new items to study is similar to younger adults' selections. These papers contradict the hypothesis of age deficits in metacognitively-guided control.

AGE DIFFERENCES IN PREDICTORS OF CHANGE IN SELF-ASSESSED MEMORY

A. Pearman, A. Trujillo, *Georgia State University, Atlanta, Georgia*

Understanding what causes changes in memory perceptions is an important step to understanding and treating older adult's memory complaints. This study was designed to examine the role of age, memory beliefs, and personality in changes in self-assessed memory over the course of a study. Using a sample of 51 younger ($M = 21.19$ years, $SD = 3.22$) and 59 older ($M = 76.83$ years, $SD = 8.28$) adults, participants were first asked to rate their overall memory ability, were then given a series of memory and cognitive tasks (1.5 hours), and were then asked again to rate their overall memory. For younger adults, changes in self-rated memory were related to overall perceived task performance and general memory self-efficacy; whereas for older adults, changes in self-rated memory were related to higher perceived performance and neuroticism. Actual performance on the memory tasks was not related to changes in perceived memory ability.

PREDICTING MEMORY PERFORMANCE IN A LIFESPAN SAMPLE: COMPARING THE ROLE OF SELF-REPORT ACTIVITIES, MEMORY BELIEFS, AND STRATEGY USE

D. Jopp, *Psychology, Fordham University, Bronx, New York*

Everyday activities have been investigated with respect to constructs of successful aging and prevention of age-related cognitive decline. In order to explore the specific paths involved, we related self-reported activities to memory beliefs, memory strategies and memory performance in a sample of 267 individuals aged 18 to 85 years. Memory beliefs were assessed with a memory action control measure, measuring self-efficacy, means-ends, and control beliefs (Jopp & Hertzog, 2009). Memory strategies were indicated by retrospective reports on strategies use during encoding. Memory performance was based on two paired associate memory tasks. Findings indicate that activities were predictive of memory strategy use, and memory performance. Activities were more strongly linked to the action control measure than to other belief measures. Specific activities (e.g., technology use) were independent predictors of memory performance, when controlling for age, beliefs, and strategies. In sum, activities, strategy use, and action control beliefs are valuable in predicting memory.

METACOGNITIVE INFLUENCES ON STUDY TIME ALLOCATION: AN ANALYSIS OF AGE DIFFERENCES

J. Hines, *Psychology, Georgia Tech, Atlanta, Georgia*

Metacognitive control involves the use of accurate monitoring to adjust cognitive processing to achieve performance goals (Nelson & Narens, 1990). Two experiments involving paired-associate learning examined age differences in the monitoring-control relationship, relating metacognitive measures collected during an initial learning trial to study time allocation during a second trial. Our hypothesis (Hines, Touron, & Hertzog, 2009) was that trial 1 metacognitive measures would account for variance in trial 2 study time independent of trial 1 objective performance measures. Gamma correlations and multilevel regressions supported this hypothesis; both objective measures (e.g., test RT and accuracy) and metacognitive measures (judgment of learning, test confidence, and perceived test RT) exerted independent influences on trial 2 study time allocation. However, contrary to Dunlosky and Connor (1997), no evidence was found of an age-related deficit in metacognitive control over allocated study time. Older adults use monitoring effectively to regulate self-paced study.

SELF-REGULATED LEARNING: DOES AGING AFFECT METACOGNITIVE CONTROL?

J. Price, *Department of Psychology, University of Alabama in Huntsville, Huntsville, Alabama*

Three experiments examined whether participants' self-paced study (item selection and study time allocation) behaviors conformed to the

region of proximal learning (RPL) model when studying normatively easy, medium, and difficult Spanish-English vocabulary pairs. Experiments 1 and 2 found that younger and older adults selected items for study in an easy-to-difficult order, indicating that the RPL model applies to older adults' self-regulated study, even when the value of recalling vocabulary pairs was manipulated by assigning points in Experiment 2. Individuals allocated more time to difficult items, but prioritized easier items when given less time or point values favoring difficult items. Older adults studied more items for longer time and still realized lower recall than younger adults. Experiment 3 randomized the previously static presentation order within grids and manipulated whether younger, middle age and older adults were informed about normative item difficulty. Preliminary results suggest that these manipulations eliminate RPL-consistent selection effects.

SESSION 1820 (SYMPOSIUM)

NOT TO BE OVER-LOOKED: THE IMPORTANCE OF PHYSICAL ENVIRONMENTS FOR PEOPLE WITH DEMENTIA IN LONG-TERM CARE

Chair: P.J. Doyle, *University of Maryland, Baltimore County, Baltimore, Maryland*

Discussant: M. Calkins, *IDEAS Institute, Kirtland, Ohio*

The physical environment is an important factor to consider when examining individuals' aging processes. Environmental gerontology has a strong body of work grounded in theory which has enabled its' continual growth as a sub-discipline. This symposium will discuss four components of environmental gerontology: theory, evaluation, psychosocial implications, and ethics. A crucial topic in this field is the design of long-term care environments for people with dementia. Theory, both informal and formal, informs how we choose to design our physical environments. These environments are designed to best "fit" the people living there (taking into account their abilities and possible limitations). Once established, it is important to assess the environment to determine how it is both helping and hindering the residents. This symposium will include an evaluative study of 26 Specialized Care Units which used the Professional Environmental Assessment Protocol to determine positive and negative aspects of these environments for people with dementia. To address the psychosocial implications of physical environments, another study preformed in a dementia care setting which looked at how environmental design (e.g., proximity of room to dining room tables) can impact the social interactions of people with dementia will be discussed. This symposium will conclude with the ethical concerns inherent in gerontological studies of environments in particular settings for people with dementia. The multi-faceted approach to this symposium will allow for a more complete look at the role of physical environments as we age.

THEORY DEVELOPMENTS IN ENVIRONMENTAL GERONTOLOGY: IMPLICATIONS FOR LONG-TERM CARE

H. Wahl, *University of Heidelberg, Heidelberg, Germany*

Environmental gerontology has argued from its inception that aging is shaped by physical environments and that the importance of physical contexts tends to be underestimated, because the scholarly (and practice) view predominantly focuses on the aging person. This paper aimed to serve with a conceptual discussion starts with meta-ideas of environmental gerontology, putting special emphasis on cognitive impairment and physical environment interactions. Classic theories such as the competence-press and person-environment fit model as well as more recent work (e.g., related to an enriched understanding of the concept of place) will be evaluated in terms of their current and future potential to better understand and optimize human development under extreme conditions, that is, in the situation of severe cognitive impairment and long-term care environments. The paper also addresses conceptual chal-

lenges coming with intercultural issues, contrasting the latest long-term care solutions in Europe with the North American sphere.

ENVIRONMENTAL ASSESSMENT OF SPECIAL CARE UNITS AND POLICY IMPLICATIONS IN VANCOUVER, CANADA

H. Chaudhury, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

This study presents highlights from environmental assessment of twenty-six special care units in a major health region in metro Vancouver, Canada. Environmental assessment was conducted using Professional Environmental Assessment Protocol (PEAP), photo-analysis and floor-plan analysis. Eight environmental dimensions (e.g., awareness and orientation, support of functional abilities, etc.) based on responsive physical environments in dementia care were used to evaluate each unit and to conduct a comparative assessment of all the study sites. Design recommendations were made based on identification of possible low-investment renovations. The study was conducted as part of the regional health authority's initiative in developing a dementia strategy. A discussion of the role of environmental assessment in the macro policy environment will be included in terms of institutional and systemic challenges in policy and practice.

SOCIAL IMPLICATIONS OF DEMENTIA CARE ENVIRONMENTAL DESIGN: A CASE STUDY OF BEDROOM LAYOUT AND DINING ROOM SEATING

P.J. Doyle¹, K. De Medeiros^{2,3}, P. Saunders⁴, A. Mosby², M.E. Jeresano⁵, 1. *Gerontology, University of Maryland, Baltimore County, Baltimore, Maryland*, 2. *The Copper Ridge Institute, Sykesville, Maryland*, 3. *Johns Hopkins University School of Medicine, Baltimore, Maryland*, 4. *Georgetown University, Washington, District of Columbia*, 5. *Towson University, Towson, Maryland*

Many dementia care settings are being developed within long-term care. These residences often have unique environmental design to best serve this population. This paper draws from an ethnographic study investigating the factors influencing friendships between people in a dementia care assisted living. Observations showed dining to be a time of heightened social interactions but one that remained relatively static over time. Dining room seating was so routine and ingrained that it often became a source of conflict. Interestingly, the seating was not a product of the sociability "fit" of elders but rather was closely associated with the residents' room proximity to their dining room table. By influencing who ended up sitting at each table, the environmental design of this setting established specific social networks between elders. This paper will review this setting's environmental design and discuss the implications of its influence on the social world of people with dementia.

ETHICS AND ENVIRONMENT IN LONG-TERM CARE

R. Rubinstein, L.J. Clark, *Gerontology, University of Maryland, Baltimore County, Baltimore, Maryland*

Surveillance of residents with dementia in long-term care is often oriented to negative behaviors. This paper discusses what is not observed and what is observed in other ways. It raises questions about the extent to which nursing home residents can or should in fact remove themselves from surveillance. What are their rights in this regard? Does optimal treatment involve both scrutiny and the ability to withdraw from scrutiny?

SESSION 1825 (SYMPOSIUM)

NOW THAT WE ARE 85: INSIGHTS INTO AGING FROM THE AHEAD SAMPLE

Chair: E. Crimmins, *University of Southern California, Los Angeles, California*

Discussant: J. Guralnik, *National Institute on Aging, Bethesda, Maryland*

This symposium will provide a multifaceted understanding of the individual and population changes that occur with aging into and through the oldest-old years for a large-scale nationally representative sample of Americans. The Survey of Asset and Health Dynamics Among the Oldest Old (AHEAD), initially a subset of the Health and Retirement Study (HRS), is a study of more than 8,000 individuals born prior to January 1, 1924 and their spouses. The sample was interviewed for the first time between October 1993 and April 1994 and at that time ranged in age from 70 to 104. At the most recent, the eighth, interview in 2008, the youngest members of this cohort were 85 and the average age of the survivors was about 88. This dataset is enriched by the addition of Medicare, Social Security, and National Death Index matches for sample members. This symposium will describe major transitions over approximately 14 years as they go from the 70+ population to the 85+ population. Areas of focus include links between diseases and functioning ability, links between hospitalization and subsequent stroke and hip fracture diseases, social- psychological well-being and resources, and familial and support relationships. The symposium will clarify the multiple paths reflecting stability and change, both positive and negative, taken through these years when the transitions associated with aging affect most individuals. The role of gender and race, ethnicity as well as socioeconomic status in influencing outcomes will also be discussed. Long-term survivors have notably more positive experiences at earlier ages.

TRAJECTORIES OF PSYCHOSOCIAL STATUS DURING OLD AGE: CORRELATES AND ASSOCIATIONS WITH LONGEVITY

J. Smith^{2,1}, L. Ryan^{2,1}, 1. *University of Michigan, Ann Arbor, Michigan*, 2. *Institute for Social Research, Ann Arbor, Michigan*

According to models of successful aging, the maintenance of subjective well-being contributes to healthy longevity. We examined this proposal using longitudinal data from the AHEAD cohort (approximately 8000 in 1993, age 70 – 104). In 2006, approximately 34% survived and 18% were aged 90 to 105 (fewer expected in the to-be-released 2008 wave). Participants were interviewed at 2-year intervals (potentially eight occasions). We applied dual trajectory finite mixture modeling (Nagin, 2005) to examine differential trajectories of status change in self-reported depressive (psychosomatic) symptoms and positive well-being prior to death and among the survivors. In addition, we examined the psychosocial profiles (personality, loneliness, life satisfaction, aging satisfaction) of the survivors obtained in 2006 and 2008. Initial analyses reveal multiple trajectory groups differentiated by status level and pattern variability over time. The long-term survivors of the 1993 septuagenarians, octogenarians, and nonagenarians experienced extra years of life quality in advanced old age.

POST-HOSPITALIZATION HIP FRACTURE AND STROKE RISK: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY

R. Wallace¹, S. Bentler², F. Wolinsky³, 1. *Epidemiology, University of Iowa College of Public Health, Iowa City, Iowa*, 2. *The University of Iowa, Dept. of Health Management and Policy, Iowa City, Iowa*, 3. *The University of Iowa, Dept. of Health Management and Policy, Iowa City, Iowa*

Hospitalization for elders may have both positive and adverse effects on health. We determined the occurrence of and risk factors for hip frac-

ture and stroke in the AHEAD cohort of HRS, 5,511 persons >69 years and not in Medicare managed care, from 1993-2005. Baseline risk factors included socio-demographic and geographic status, health behaviors, disease history, functional status and cognitive performance. In the post-hospital period, hip fracture incidence rates increased over two-fold, and were highest in the oldest old. Similarly, the post-hospital period saw a trebling of stroke risk. Many of the risk factors for hip fracture and stroke were similar to those described in general for these conditions. We conclude that the risk of hip fracture and stroke after hospitalizations for reasons other than these conditions is substantially increased. Enhanced discharge planning and home care interventions may substantially reduce this excess occurrence.

EFFECTS OF DISEASES ON FUNCTIONAL CHANGE AMONG THE AHEAD COHORT

D. Alley⁴, E. Crimmins¹, B.J. Soldo³, D. Weir², M. Ofstedal², 1. *University of Southern California, Los Angeles, California*, 2. *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *University of Maryland, College Park, Maryland*

The purpose of this paper was to develop growth curve models of functional decline and to estimate the effect of changing disease status on functional trajectories in the AHEAD cohort of the HRS. Functioning is measured using 8 Nagi-Breslow measures. Mixed-effects models (also called growth curve models and multilevel models) were used to examine the relationship between increasing age, presence and onset of chronic disease, and functional change. Models assumed a Poisson distribution because of the count nature of the dependent variable. Results suggest important group differences in the process of functional decline with age. Women and those with lower socioeconomic status have higher levels of functional difficulties at every age. All diseases examined were associated with higher levels of functional difficulty, although not all were associated with the rate of functional decline. The conditions associated with the greatest level of limitations were arthritis, stroke, and lung disease.

TRACING PARENTAL RESOURCE FLOWS TO/FROM INDIVIDUAL OFFSPRING: STABLE OR DYNAMIC?

B.J. Soldo¹, J. Henretta², 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *University of Florida, Gainesville, Florida*

Since 1993, AHEAD respondents have been actively followed biennially. At each wave, elderly parents provide detailed data on the socio-demographic traits of each child and their individual transfers to and from each child. This paper reconstructs the flow of in-kind and financial transfers between the parent and each child individually. Our goal is to estimate stability over time in donor-recipient dyads and examine how family context, mother's characteristics, and child's characteristics produce stability or change in the exchange patterns. We estimate two-level multi-level models, using the multiple waves of data to characterize the level of exchange stability (both in level and type of transfer) of each dyad. Most respondents aged 70+ are female and a majority are unmarried. In all observations across years 16.7 % of offspring provide some type of support to a parent and a much smaller proportion of parents give to a child.

SESSION 1830 (SYMPOSIUM)

SUPPORT FOR RURAL AGING: PAST, PRESENT AND FUTURE

Chair: A.L. Cohen, *Sociology and Gerontology, Miami University, Oxford, Ohio*

Discussant: G.D. Rowles, *University of Kentucky, Lexington, Kentucky*

The rural areas of the United States are rich with history, culture and traditions that nurture natural support networks. Such areas also present multiple challenges to aging in place including geographic and social isolation, a dearth of healthcare providers and facilities and a lack

of transportation options. As the number of rural elders increases, services, supports and social ties needed to age in place successfully will likewise increase presenting both opportunities and challenges for older adults, families, and service providers. This symposium will examine how older adults age in place in rural areas through connections with their communities as well as social, healthcare, and personal care supports. In order to best understand the future impact of aging on rural America it is essential to understand the historical context of rural aging alongside current trends. Therefore this symposium will provide a temporal lens on rural aging that includes a retrospective look at research on the configuration of supports received by rural older adults in the past, interpretation through the lens of what we know today, and a prospective view of what is to come. Topics presented provide an opportunity to look at the past, present, and future of aging in rural areas for specific populations of older women, informal caregivers, paraprofessional caregivers, and rural native Alaskans. Special consideration will be given to the evolving interrelationship of formal (paid) and informal (unpaid) caregiving and social support networks in rural areas.

SUCCESSFUL AGING THROUGH THE EYES OF ALASKA NATIVES: THE HEALTH AND WELLBEING OF ALASKA NATIVE ELDERLY IN BRISTOL BAY, AK

J. Lewis, *Psychology, University of Alaska Fairbanks, Fairbanks, Alaska*

There is very little research on Alaska Native elders and how they subjectively define a successful older age. The lack of a minority definition risks portraying them as aging less successful than their non-minority counterparts. This research explores the concept of successful aging from an Alaska Native perspective and what it means to age well in Alaska. The Explanatory Model (EM) was used to gain a sense of the cultural beliefs about aging from Alaska Native elders in Bristol Bay. Research findings indicate that a set of cultural beliefs exist about successful aging, health status is related to successful aging, passing down knowledge is critical to becoming an elder, and aging successfully is based on personal responsibility and cognitions. Most elders stated that reaching a certain age (e.g. 65) does not determine their status as an elder, but rather the wisdom and experiences they gain throughout life.

CARE WORK IN RURAL AMERICA: OUT-OF-POCKET AND OPPORTUNITY COSTS OF RURAL CAREGIVERS

D. Wagner, *Gerontology, Towson University, Towson, Maryland*

This paper focuses on the spending and opportunity costs incurred by rural caregivers who participated in a survey and cost diary study conducted in late 2007. The study included caregivers across the country including urban and rural areas. This paper examines the strategies for managing informal care, the spending associated with this care and the opportunity costs of the care by rural caregivers. Diarists in the study spent an average of \$1,200 per month on caregiving expenses for the care recipient; medical supplies and costs were the most commonly reported cost category. Rural caregivers face not only geographic challenges in the support available to them, but financial challenges as well. The research revealed that those with the lowest income had both the highest levels of time spent on care and the highest proportion of income spent on care. Key findings and the implications for policy and practice are highlighted in the paper.

SOMEONE TO LEND A HELPING HAND REVISITED: WOMEN GROWING OLD IN RURAL MINNESOTA

D. Shenk, *Anthropology, University of North Carolina Charlotte, Charlotte, North Carolina*

This paper will revisit the findings from the Older Rural Women's Project which studied the social support systems of older women living in rural Central Minnesota in 1986-1987 with a follow-up in 1990. We will reconsider the findings through a new lens of the current emphasis on "aging in place." The focus is on the systems of exchange and support through which the 30 participants met their increasing needs

based on societal rules and values that govern a lifetime of social exchange. The women were participants and active manipulators of social support systems through which they met their needs and the needs of others in their networks while striving to remain independent and self-reliant. We will assess shifting cultural values based on traditional rural values and their implications for meeting the needs of rural elders through informal and formal systems of support.

THE CHALLENGES FACED BY PERSONAL SUPPORT SPECIALISTS PROVIDING HOME CARE IN A RURAL STATE

S. Butler, A. Ashley, *University of Maine/School of Social Work, Orono, Maine*

The paraprofessional workforce has been described as the centerpiece of our long-term care system (Stone & Weiner, 2001). But even in these difficult economic times of high unemployment, recruitment and retention of direct care workers remains challenging. This paper reports on a statewide study in Maine regarding work experiences of Personal Support Specialists in home care (n=260). Survey respondents reported a mean wage of \$9.05/hour and erratic part-time hours (mean=17.9/week). Reflecting the particular challenges of home care in a very rural state, un-reimbursed mileage averaged 44.4 miles/week; in the most rural regions, un-reimbursed mileage was significantly greater ($t = -2.70, p < .01$) than elsewhere. Themes from the rich narrative data included by 133 respondents (51% of sample) reiterated these challenges. This paper will review the particular burdens faced by rural home care workers and potential solutions to the problem of turnover including mileage reimbursement, guaranteed hours and livable wages.

SESSION 1835 (SYMPOSIUM)

USING GLOBAL PERSPECTIVES ON HEALTH AND SOCIAL RELATIONS TO INFORM CREATIVE APPROACHES TO AGING

Chair: H. Akiyama, *University of Tokyo, Tokyo, Japan, Institute for Social Research, University of Michigan, Ann Arbor, Michigan*
Discussant: T. Antonucci, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

We utilize four studies from different countries to examine cultural differences (and similarities) between Health and Social Relations. These studies are drawn from two developing countries, Mexico and Lebanon, and two developed countries, Japan and the U.S. Studies comparing older people in Okinawa (Japan) and Oregon (U.S.) indicate that the total frequency of social interactions is quite similar in both countries (although face-to-face contact and proximity of kin is greater in Japan), with Social Relations associated with lower levels of MCI. In both Mexico and Lebanon family relations are highly valued, central, and most people's expected source of support in old age. In Mexico, positive aspects of relationships both interact and increase with age. More proximal networks are associated with better health. In Lebanon, older people report positive support from family is experienced as anticipating their needs while negative support is experienced as 'too much talk'. Social Relations are significantly associated with circulation problems. And finally, applying the concept of Social Relations and Health to the specific disease of diabetes, examination of ethnic/racial subgroups, African Americans and American Indians report higher levels of self-care while Asian Americans report the lowest levels. However, with increased social support, Asian Americans significantly increase their self care suggesting that positive support is a potential mechanism for improving health. In sum, these papers provide a global perspective on how social relations might uniquely and creatively influence health in old age.

EXPLORING THE PROS AND CONS OF FAMILY SUPPORT: THE CASE OF LEBANON

K. Ajrouch, 1. *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*, 2. *Eastern Michigan University, Ypsilanti, Michigan*

No one issue better captures the challenges associated with aging and well-being in Lebanon than family relations. Lacking universal government programs for the aged, family is the main source of support for elders. This paper examines the meanings attributed to close social relations, the distribution of positive and negative support with key family members, and the link those relations have to health. Data are drawn from a mixed-method pilot study with 25 elders aged 51-86. Meanings of positive support include the ability to anticipate needs; meanings of negative support include "too much talk." Descriptive results of survey data reveal that 68% (17) of elders report at least one chronic illness. In addition, while spousal support is not correlated with health, perceiving sibling and child relationship as demanding is correlated with blood circulation problems. Together, these data provide important preliminary insights into the pros and cons of family support in Lebanon.

SOCIAL NETWORKS, AGE, AND HEALTH IN MEXICO

T. Antonucci, H. Fuller-Iglesias, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Traditional Mexican culture emphasizes living in close contact with immediate and extended family, yet little is understood about how these cultural values influence the aging process. This study examines changes in the makeup of social support networks between midlife and old age and the ensuing effect on the aging process. Adults ages 45-99 (N=626) were selected from the Survey of Social Relations and Well-being in Mexico (Fuller-Iglesias & Antonucci, 2009). Correlations indicated that network size, frequency of contact with network, proximity with network, and proportion family in network were positively related to age. Regression analyses revealed significant interactions indicating that with increased age: frequency of contact and greater proportion family in network were related to greater life satisfaction; and increased proximity with network members was related to greater self-rated health. Findings will be discussed in light of cultural implications and creative applications of social relationships for promoting healthy aging in Mexico.

SOCIAL SUPPORT AS A POTENTIAL RESOURCE TO FACILITATE INCREASED DIABETES SELF-CARE AMONG OLDER ADULTS

N.J. Webster, G. Deimling, *Case Western Reserve University, Cleveland, Ohio*

Diabetes, an unfolding epidemic most common among older adults and 1.5 to 2.2 times more prevalent among racial/ethnic minorities can lead to other health complications when untreated. Social support is one resource that may increase diabetes self-care (checking blood sugar and feet for sores, and receiving annual eye exams) and subsequently prevent or delay complications. Using a U.S. national sample of adults aged 40-99 collected by the CDC in 2007 (N=28,138), this paper examines how frequency of diabetes self-care varies by race/ethnicity, and how self-care relates to level of social support. African-Americans and American Indians reported engaging in diabetes self-care most often, while Asian-Americans reported the lowest frequency. Among Asian-Americans, despite the lowest frequency, there was the strongest positive relationship ($r=.15$, $p<.001$) between social support and self-care compared to other racial/ethnic groups. Findings suggest social relations play a vital role in fostering self-care among racial/ethnic groups with the greatest need.

SOCIAL INTERACTION AS A POTENTIAL KEY TO OPTIMAL COGNITIVE AGING: OKINAWA-OREGON COMPARATIVE STUDY OF SUCCESSFUL AGING

H. Dodge^{1,2,3}, Y. Katsumata³, H. Todoriki³, D. Willcox⁴, M.J. Leahy⁵, Y. Michael¹, J. Kaye¹, 1. *Oregon Health & Science University, Portland, Oregon*, 2. *University of Michigan, Ann Arbor, Michigan*, 3. *Ryukyus University, Okinawa, Japan*, 4. *Okinawa International University, Okinawa, Japan*, 5. *Sky Lakes Medical Center, Klamath Falls, Oregon*

Past epidemiological studies have demonstrated that social relations have protective effects against the incidence of cognitive decline. The elderly in Okinawa, the most southern island prefecture of Japan, are known for long life expectancy and survive with better physical and cognitive health. One potential factor contributing to their health, as suggested by qualitative research, is observed high levels of social interaction. However, little quantitative and comparative research has been carried out. Therefore, we examined the levels of social interaction among Okinawan and Oregonian non-demented elderly aged 85 and older and whether the levels of social interaction are associated with cognitive well-being. Contact frequency with kin and non-kin members were similar between the two cohorts, although the Okinawan elderly had more face-to-face contacts with, and closer physical proximity to kin. Among the Okinawan elderly, mild cognitive impairment defined as CDR=0.5 (Clinical Dementia Rating) was associated with lower frequency of social interactions.

SESSION 1840 (SYMPOSIUM)

CHANGES AND ADAPTATIONS RELATED TO FUNCTION BEYOND AAGE 80: INSIGHTS FROM THE CHS ALL STARS STUDY

Chair: A.B. Newman, *Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*

Discussant: J.D. Walston, *Johns Hopkins University School of Medicine, Baltimore, Maryland*

The CHS All Stars is a cohort study of successful aging to very old age, based on a follow-up of the surviving CHS cohort, aged 80-100+ in 2005-06. The study is designed to characterize individual and joint pathways leading to positive health outcomes. Functional aging was defined as no difficulty with ADLs and modified mini mental state exam score >80. Function was also assessed with longitudinal performance measures: gait speed, grip strength and digit symbol score. Of 5333 CHS participants alive in 1992-93, 60% had died, 30% were reenrolled in CHS All Stars. Of these, 53% were functionally intact. Age-related biological factors were assessed over time as potential correlates of functional aging and survival, including markers of metabolic, immune and hormonal function. In this symposium, we review recent findings that illustrate expected as well as paradoxical associations. Higher levels of adiponectin, an adipocytokine related to insulin sensitivity should characterize functional aging, yet does not behave as expected in late life. Insulin-like growth factor, reflecting in part the decline in growth hormone with age, shows non-linear effects. This longitudinal approach might explain previous reports from cross-sectional studies. The inflammation pathway is perhaps most robust in relationship to poor function and survival and tracks with grip strength and gait speed. Dihydroepiandrosterone (DHEAS) falls dramatically across the full spectrum of age. We examined the utility in using decline to predict short term mortality. These approaches may prove to be useful to characterize optimal aging trajectories underlying retained function in very old age.

ARE ASSOCIATIONS OF ADIPONECTIN WITH HEALTH IN OLD AGE ADAPTIVE?

J.R. Kizer¹, A. Arnold², E.S. Strotmeyer³, M. Cushman^{4,5}, S. Kritchevsky⁶, P.H. Chaves⁷, C. Hirsch⁸, A.B. Newman^{3,9}, 1. *Weill Cornell Medical Center, Cornell University, New York*, 2. *Collaborative Health Studies Coordinating Center, University of Washington, Seattle, Washington*, 3. *University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 4. *Department of Pathology, University of Vermont College of Medicine, Burlington, Vermont*, 5. *Department of Medicine, University of Vermont College of Medicine, Burlington, Vermont*, 6. *Wake Forest University Health Sciences, Winston-Salem, North Carolina*, 7. *Johns Hopkins University, Baltimore, Maryland*, 8. *University of California, Davis, Sacramento, California*, 9. *University of Pittsburgh, School of Medicine, Division of Geriatric Medicine, Pittsburgh, Pennsylvania*

Adiponectin is inversely related to insulin resistance and inflammation, but is associated with a paradoxical increase in mortality in older individuals. Whether higher adiponectin in older adults represents a survivorship bias or signals adverse aging-related processes is unclear. We examined correlates of 9-year longitudinal change in adiponectin among initially healthy All-Stars participants, and tested the hypothesis that higher adiponectin portends functional deterioration. Adiponectin increased more in men than women. Although baseline glucose, CRP, and BMI were inversely related to baseline adiponectin, they were positively correlated with interval increase. Neither baseline nor change in adiponectin was significantly associated with overall functional decline. In women, adiponectin did show a significant U-shaped relationship with incident ADL decline, yet linearly predicted greater mobility impairment and, in both sexes, steepening decline in DSST. These findings highlight the complex relations of adiponectin in older adults, some of which could reflect an adaptive response to age-related deterioration.

GREATER DHEAS CHANGE IS ASSOCIATED WITH HIGHER INCIDENT MORTALITY IN VERY OLD ADULTS

J. Sanders¹, A. Arnold², A.R. Cappola³, P.H. Chaves⁴, J. Robbins⁵, M. Cushman⁶, R. Boudreau¹, A.B. Newman¹, 1. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *University of Washington, Seattle, Washington*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *Johns Hopkins University, Baltimore, Maryland*, 5. *University of California Davis, Sacramento, California*, 6. *University of Vermont, Burlington, Vermont*

We measured DHEAS in 1996-97 and 2005-06 in the Cardiovascular Health Study All Stars study [N=989, mean (SD) age 85.2 (3.6) years in 2005-06] and incident mortality through December 31, 2008. Using Cox proportional hazards regression adjusted for age, a significant drop in DHEAS level (more than -0.335 ug/ml in women and -0.582 ug/ml in men) was associated with increased risk of mortality in men and women (HR=1.78, 95% CI 1.16-2.73). Risk was attenuated in women after adjustment for baseline (1.60, 0.82-3.12) but not final (1.88, 1.23-2.89) level. Risk remained elevated in men after adjustment for baseline (3.76, 1.73-8.17) or final values (1.88, 1.23-2.89). In men, higher levels of DHEAS at baseline or follow-up were associated with ~35% mortality risk reduction for each 0.48ug/ml higher value. Results were similar after adjustment for cardiovascular disease. Declining DHEAS predicted short term mortality in very late life in this cohort.

DOES IL-6 TRACK WITH FUNCTIONAL DECLINE?

E.S. Strotmeyer¹, N.S. Jenny², B. French³, A. Arnold⁴, M. Cushman², P.H. Chaves⁵, S. Kritchevsky⁶, A.B. Newman^{1,7}, 1. *Epidemiology, University of Pittsburgh, Graduate School of Public Health, Pittsburgh, Pennsylvania*, 2. *University of Vermont, Burlington, Vermont*, 3. *University of Pennsylvania, Philadelphia, Pennsylvania*, 4. *University of Washington, Seattle, Washington*, 5. *Johns Hopkins University, Baltimore, Maryland*, 6. *Wake Forest University Health Sciences, Winston-Salem, North Carolina*, 7. *University of Pittsburgh, School of Medicine, Division of Geriatric Medicine, Pittsburgh, Pennsylvania*

Elevated inflammation markers are associated with death and disability in older adults, thus might track with longitudinal decline in physical function. In 1039 men and women aged 80-100+ in the CHS All Stars cohort, we examined concurrent changes in grip strength and gait speed in association with CRP and IL-6 changes over 9 years. Models were adjusted for age, sex, smoking, BMI, cardiovascular risk factors and baseline values of CRP or IL-6. Each doubling in CRP was associated with -0.30 (95%CI: -0.52, -0.08) decline in grip strength and for IL-6 doubling, -1.00 (95%CI: -1.39, -0.61). Results were similar for gait speed decline. For incident physical function impairment, ORs for IL-6 or CRP doubling were 1.26 (1.02, 1.56) and 1.15 (1.01, 1.29), respectively. IL-6 change was more strongly related to functional decline than CRP change suggesting that IL-6 could be useful in tracking functional decline in older adults.

TRAJECTORIES OF IGF-1 AND MORTALITY

A.R. Cappola¹, W. Guo¹, E. O'Meara², R. Kaplan³, M. Pollak⁴, A.B. Newman⁵, L.P. Fried⁶, 1. *University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania*, 2. *University of Washington, Seattle, Washington*, 3. *Albert Einstein College of Medicine, Bronx, New York*, 4. *McGill University, Montreal, Quebec, Canada*, 5. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 6. *Columbia University Mailman School of Public Health, New York, New York*

Disruption of IGF-I pathways increases lifespan in animal models, though this has not been confirmed in humans. We examined the relationship of IGF-I trajectory patterns with survival in 945 participants aged 65+ enrolled in the Cardiovascular Health Study who had IGF-I levels measured at 3-6 timepoints and vital status assessment over 16 years. Declining or increasing slope of IGF-1 level, increasing variability, and lower IGF-I levels were each associated with greater mortality (all p<0.001). In adjusted models including all three trajectory parameters (slope, variability and baseline IGF-I), a steep decline or increase and variability of 10% or greater independently predicted mortality, whereas only very low IGF-I levels remained predictive of mortality. In contrast to data from animal models, low IGF-I levels are associated with decreased survival in older humans. Irrespective of the actual level, older individuals with stability of IGF-I levels have lower mortality than those with whose levels fluctuate.

SESSION 1845 (POSTER)

CHRONIC DISEASE EPIDEMIOLOGY

DEPRESSIVE SYMPTOMS AND HEART RATE VARIABILITY IN COMMUNITY-DWELLING OLDER WOMEN

A.Z. Moore¹, P.H. Chaves², 1. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins Division of Geriatric Medicine and Gerontology, Baltimore, Maryland*

Associations between depression and cardiovascular disease outcomes have been observed in older adults. It has been hypothesized that autonomic dysregulation may be a mechanism through which depression is linked to cardiovascular disease. The relationship between depression and autonomic function has not been well characterized in older women. This project explores the relationship between prevalent depres-

sive symptoms as measured by the Geriatric Depression Scale (GDS) and heart rate variability (HRV) as classified by time and frequency domain indices as well as a nonlinear index, approximate entropy (ApEn), in cross sectional pilot data from a group of moderately to severely disabled older women. The data represent a subset of Women's Health and Aging Study I (Baltimore, MD) participants, $n = 296$. The prevalence of depressive symptoms ($GDS > 10$) in this sample was 24.7%. In crude logistic regression models and models adjusted for age, non-white race, CVD, diabetes, MMSE < 24 , smoking status, and use of beta blockers, heterogeneity in the odds ratio for lowest HRV tertile was observed across indices. There was agreement in the direction of association among several measures. The ApEn models exemplify this trend: the crude odds ratio for low ApEn comparing $GDS > 10$ to $GDS \leq 10$ was 1.82; (95% CI: 1.05, 3.13), the fully adjusted odds ratio was 1.61; (95% CI: 0.90, 2.90). These results support a hypothesized positive association between depression burden and autonomic dysregulation in older women. Further validation of this relationship and examination of the clinical relevance of HRV in the context of depression is warranted.

ASSOCIATION OF PARENTAL HISTORY OF HYPERTENSION, AGE AND BODY MASS INDEX (BMI) WITH INCIDENT HYPERTENSION IN CHINESE

E. Katz, J. Stevens, K.P. Truesdale, J. Cai, K. North, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Little is known about the influence of parental history of hypertension on incident hypertension among the Chinese. We hypothesized that individuals who reported a positive parental history of hypertension would be more susceptible to the effects of BMI, and that this association would vary with age. To address this research question, data from the Peoples' Republic of China Study were considered. Participants included 1,992 males and 2,194 females aged 24-71 years from Guangzhou, China. Baseline information was collected in 1983-84 and follow-up examinations were in 1987-88 and 1993-94. Anthropometrics were measured and parental history of hypertension was obtained from self-report questionnaires. Logistic regression models (SAS 9.1) suggest that a positive parental history of hypertension, age and larger body mass index, independently increased the risk of incident hypertension. There was no effect modification of parental history by age or BMI. For each of the main effects, the odds ratios (95% CI) for incident hypertension were 1.16 (1.11, 1.22), 1.09 (1.07, 1.10) and 1.42 (1.09, 1.86) for a one unit increase in BMI, a one year increase in age and positive parental history of hypertension, respectively, when controlling for sex, exercise, alcohol, smoking and region. In stratified models, the odds ratios for BMI and for age were almost identical between subjects with a positive and negative parental history of hypertension. These results suggest that a positive parental history of hypertension increased the risk of hypertension incidence but did not modify the association of age or BMI with incident hypertension in Chinese.

COMMON CAROTID ARTERY ADVENTITIAL & LUMEN DIAMETER CHANGES WITH PHYSICAL ACTIVITY IN OLDER ADULTS: LIFE RANDOMIZED PILOT STUDY

K.D. Lloyd^{1,2}, K. Sutton-Tyrrell¹, A.B. Newman^{1,2,3}, 1. *University of Pittsburgh, Graduate School of Public Health, Department of Epidemiology, Pittsburgh, Pennsylvania*, 2. *Institute on Aging, Center for Aging & Population Health, Pittsburgh, Pennsylvania*, 3. *School of Medicine, Pittsburgh, Pennsylvania*

The objective was to determine 6 month change in subclinical cardiovascular disease measures after physical activity or education only intervention in older adults in the Lifestyle Interventions and Independence for Elders (LIFE) randomized pilot study. We used 38 men and women with complete baseline and follow-up pulse wave velocity (PWV), common carotid artery intima media thickness (IMT), adventitial diameter (AD) and lumen diameter (LD). Participants were 70-85 years, able to walk, sedentary, free of severe health problems and ran-

domized to moderate Physical Activity (PA) or Successful Aging (SA) health education. T-tests, Wilcoxon tests, and General Linear Modeling were used to assess differences between groups and changes between baseline and follow-up measures. Participant average age was 77; they were predominately Caucasian (84%), female (74%), current non-smokers (100%), not diabetic (82%), and had a history of hypertension (55%). Average baseline PWV was 1199cm/s, IMT was 1.00mm, AD was 8.00mm and LD was 6.01mm; no differences between groups were observed. There were no differences between mean change of PWV (SA: -237cm/s, PA: -85cm/s) or IMT between groups. Mean AD (0.12mm) and LD (0.15mm) increased in the PA group and decreased in the SA group (AD: -0.13mm, LD: -0.11mm, both $p < 0.01$). Significant changes in AD and LD may reflect vascular remodeling processes that accompany physical activity. Although not statistically significant the change in PWV was clinically relevant. It is necessary to replicate these measures in a larger sample to better understand the effects of physical activity on vascular health in older adults.

ROPINIROLE PROLONGED RELEASE REDUCES NOCTURNAL SYMPTOMS IN PATIENTS WITH PARKINSON'S DISEASE

K. Sethi¹, R. Chaudhuri², L. Giorgi³, J. Statham⁴, N. Stover⁵, 1. *Movement Disorders Clinic, Augusta, Georgia*, 2. *National Parkinson Foundation Centre of Excellence, London, United Kingdom*, 3. *GlaxoSmithKline, Greenford, United Kingdom*, 4. *GlaxoSmithKline, Harlow, United Kingdom*, 5. *The University of Alabama at Birmingham, Birmingham, Alabama*

Objective: Assess the effect of ropinirole prolonged release on nocturnal symptoms in patients with advanced Parkinson's disease (PD) not optimally controlled with L-dopa. **Methods:** In a Phase III, 24-week, efficacy and safety study, patients were randomized to receive adjunctive once-daily ropinirole prolonged release (2-24 mg/day), or placebo (EASE-PD Adjunct [101468/169]). Nocturnal symptoms were assessed retrospectively for sleep dysfunction in all patients by change from baseline Parkinson's Disease Sleep Scale (PDSS) total score (range=0-150; ≤ 100 =sleep dysfunction). **Results:** Baseline PDSS score was ≤ 100 for 94/200 (47%) patients receiving ropinirole prolonged release vs 90/190 (47%) patients receiving placebo. Ropinirole prolonged release demonstrated a treatment benefit over placebo for patients with baseline PDSS score ≤ 100 ; mean (SD) increases from baseline PDSS score were: Week 12 observed case (OC), 14.2 (22.88) vs 2.8 (17.60); Week 24 OC, 11.3 (25.58) vs 4.0 (20.62); Week 24 last observation carried forward (LOCF), 10.3 (24.44) vs 2.5 (20.96) (ropinirole prolonged release $p \leq 0.0003$ vs baseline). Patients with baseline PDSS score > 100 showed similar changes whether treated with ropinirole prolonged release or placebo at Week 12 OC, -2.6 (16.95) vs -5.1 (16.73); Week 24 OC, -5.7 (21.46) vs -5.3 (13.03); Week 24 LOCF, -5.3 (20.31) vs -6.4 (13.62), respectively. **Conclusions:** Ropinirole prolonged release improves nocturnal symptoms in patients with advanced PD displaying significant sleep dysfunction as measured using the PDSS. **Study supported by:** GlaxoSmithKline R&D, SkyePharma.

ROPINIROLE PROLONGED RELEASE MAINTAINS A REDUCTION IN "OFF" TIME IN ADVANCED PARKINSON'S DISEASE

L. Giorgi¹, B. Hersh², B. Hunter³, 1. *GlaxoSmithKline, Greenford, United Kingdom*, 2. *Harvard Vanguard Medical Associates and Harvard Medical School, Boston, Massachusetts*, 3. *GlaxoSmithKline, Harlow, United Kingdom*

Objective: Retrospectively evaluate maintenance of a clinically meaningful reduction in "off" time with ropinirole prolonged release in patients with advanced Parkinson's disease (PD) not optimally controlled with L-dopa. **Methods:** The Phase III, 24-week EASE-PD Adjunct Study (101468/169) randomized patients to adjunctive ropinirole prolonged release (2-24mg/day) or placebo. Primary endpoint:

mean change from baseline daily awake “off” time at Week 24 last observation carried forward (LOCF). Retrospective analyses assessed the proportion of patients with $\geq 20\%$ reduction from baseline in “off” time maintained to study endpoint and present for ≥ 2 consecutive visits. **Results:** Baseline mean awake “off” time was 7.0h in both groups. At Week 24LOCF, ropinirole prolonged release significantly reduced “off” time from baseline vs placebo (adjusted mean treatment difference [AMTD]: -1.7h ; 95%CI: $-2.3, -1.1$; $p < 0.0001$). At Week 2 observed case, more patients achieved $\geq 20\%$ maintained reduction in “off” time with ropinirole prolonged release (35/197[18%]) than placebo (13/189[7%]) and significantly more patients achieved this maintained reduction with ropinirole prolonged release (104/201[52%]) than placebo (45/190[24%]) at Week 24LOCF (adjusted odds ratio: 3.52; 95%CI: 2.27, 5.47; $p < 0.001$). At Week 24LOCF, mean (SD) dose of ropinirole prolonged release was 18.8(6.3)mg/day. Adjusted mean L-dopa dose reductions were: ropinirole prolonged release, -242 and placebo, -137mg/day (AMTD: -105mg/day ; 95%CI: $-137.8, -73.0$; $p < 0.0001$). **Conclusions:** Ropinirole prolonged release can offer patients with advanced PD a $\geq 20\%$ maintained reduction in “off” time as early as 2 weeks after treatment initiation, with 52% of patients achieving this clinically relevant benefit within 24 weeks. **Study supported by:** Glaxo-SmithKline R&D and SkyePharma.

MORTALITY RISK OF CHRONIC OBSTRUCTIVE PULMONARY DISEASE IN OLDER PERSONS: A COMPARISON OF TWO STAGING STRATEGIES

C. Fragoso^{1,2}, J. Concato^{1,2}, G. McAvay¹, P. Van Ness¹, C. Rochester^{1,2}, H. Yaggi^{1,2}, T.M. Gill¹, 1. Yale University, New Haven, Connecticut, 2. VA Connecticut, West Haven, Connecticut

BACKGROUND: The Global Initiative for Obstructive Lung Disease (GOLD), the current standard, stages the severity of chronic obstructive pulmonary disease (COPD) based on the forced expiratory volume in 1-second (FEV1), expressed as percent predicted (%Pred). Among older persons, this approach has not been validated or compared with FEV1 staging based on standardized residual percentile (SR-tile). **OBJECTIVE:** To evaluate the association between GOLD staging, relative to SR-tile staging, and subsequent mortality among older persons with COPD. **METHODS:** We studied 2,480 persons, aged 65-80 years, from the Third National Health and Nutrition Examination Survey. COPD was defined by an FEV1/Forced Vital Capacity < 0.70 and staged according to GOLD and SR-tile cut-points. **RESULTS:** 831 (33.5%) had COPD and 868 (35.0%) had died over 12-years. Based on GOLD staging, mortality risk was elevated for FEV1 50-79%Pred and $< 50\%$ Pred, representing 388 (46.7%) participants with COPD: adjusted hazard ratios (HR) of 1.31 (1.08, 1.59) and 2.24 (1.65, 3.03), respectively. Based on SR-tile staging, mortality risk was elevated at an FEV1 $< 5\text{th}$ SR-tile, representing 179 (21.5%) participants with COPD: adjusted HR of 2.01 (1.60, 2.54). Among the 314 participants who had an FEV1 50-79%Pred, mortality risk was elevated only in the 105 (33.4%) who also had an FEV1 $< 5\text{th}$ SR-tile. **CONCLUSION:** GOLD staging, relative to SR-tile staging, substantially overestimates the number of older persons with COPD who are at increased risk of death. If confirmed in other populations of older persons, the SR-tile approach may improve the staging of COPD severity by more accurately classifying mortality risk.

LOW BLOOD PRESSURE AND PRESERVED SYSTOLIC FUNCTION ALTERS PROGNOSIS IN ELDERLY WITH HEART FAILURE

M. Murphy, Nursing, University of Utah, Salt Lake City, Utah

Aim: The purpose of the review of this literature is to evaluate the relationship of systolic blood pressure and preserved systolic function (PSF) on morbidity and mortality in elders with heart failure (HF). **Background:** Although existing research has advanced the body of knowledge for care and management of heart failure, treatment largely focuses on reducing blood pressure and fluid management to optimize deteriorated

systolic function. Understanding how differently elders respond to existing guideline treatments, when they have largely been excluded from clinical trials, remains relatively unexplored. **Method:** search of PubMed and CINAHL databases was conducted to review literature from 2006 to 2009. The question guiding the literature review was: Are we going too low managing blood pressure when treating elders with heart failure? **Findings:** Emerging research reveals low blood pressure is a risk factor for adverse outcomes in elders with HF. Elder participants with PSF experience similar mortality rates as counterparts with deteriorated systolic function. Participants with PSF are predominantly older females and are less likely to receive cardiology consultation for optimization of care. Pharmacologic interventions of β -blockers and angiotensin-converting enzyme inhibitors improve outcomes in elders with HF, most significantly with systolic blood pressures $< 110\text{mmHg}$, despite vasodilatory effects. **Conclusions:** A more comprehensive approach to the specific needs of HF elders with low blood pressure and PSF is associated with decreases in hospitalization and mortality. Guidelines specific to managing elders with HF and PSF requires further investigation. **KEYWORDS** heart failure, prognosis, preserved systolic function, blood pressure, elders

SESSION 1850 (POSTER)

FRAILTY AND OSTEOPOROSIS

PROGNOSTIC IMPACT OF PRE-OPERATIVE ALBUMIN ON IN-HOSPITAL MORTALITY AND COMPLICATIONS AFTER HIP FRACTURE

A. Jones¹, L. Beaupre¹, B. Pimlott², D.W. Johnston¹, 1. University of Alberta, Edmonton, Alberta, Canada, 2. Maricopa Health System, Phoenix, Arizona

Low serum albumin may have prognostic value for morbidity and mortality after hip fracture. The primary aim was to evaluate the independent association between low serum albumin ($< 35\text{ g/L}$) at hospital admission and short term (in-hospital) mortality/ post-operative complications of patients with hip fracture. **METHODS:** A review of a prospective population-based cohort of 583 hip fracture patients who had pre-operative serum albumin values measured at hospital admission. Patients who were 65 years or older and admitted with a primary diagnosis of hip fracture to a large urban health region (3 tertiary hospitals) were included. In-hospital mortality and post-operative complications were obtained from chart review. **RESULTS:** Mean age was 82 (SD 7) yrs and 71% were female. Mean serum albumin was 33.8 (SD 4.5) g/L; overall 55% ($n=318$) of patients had low albumin. In-hospital mortality was 46 (8%) and rate of non-fatal postoperative complication rate was 31 per 100. Only the presence of chronic obstructive pulmonary disease (COPD), and cancer were independently associated with low albumin levels. Mortality was 11% ($n=35$) among those with low albumin levels and 4% ($n=11$) for those with normal values (unadjusted odds ratio (OR) 2.86, 95%CI 1.42, 5.74). After multivariate adjustment, the association between low serum albumin and mortality remained statistically significant (adjusted OR 2.4, 95%CI 1.2, 5.1). Low albumin levels were also significantly associated with postoperative complications (adjusted OR 1.87 95%CI 1.27, 2.76). **CONCLUSIONS:** Routine measurement of serum albumin is warranted in this frail population because it seems to have “value-added” in terms of providing prognostic information.

OSTEOPOROSIS AND FRAILTY STATUS IN ELDERLY PEOPLE WITH CARDIOVASCULAR DISEASES. PRELIMINARY RESULTS FROM FRAILTY IN ELDERLY OUTPATIENTS WITH CARDIOVASCULAR DISEASE STUDY-FRAGICORS

A. Frisoli^{1,3}, E. Tinoco¹, N. Zanatta¹, M. Giannoccaro¹, S. Ingham^{2,1}, P.H. Chaves³, A.C. Carvalho¹, 1. *Cardiogeriatrics-UNIFESP, Sao Paulo, Sao Paulo, Brazil*, 2. *University of Pittsburgh Medical Center, Pittsburgh, Pennsylvania*, 3. *Center of Aging and Health of Johns Hopkins University, Baltimore, Maryland*

Aim: The goal of this study was to examine the impact of osteoporosis on frailty status in elderly outpatients with cardiovascular diseases. **Subjects and Methods:** cross sectional analysis of data from FRAGICORS an observational study of the epidemiology of frailty status and disability in 280 men and women who were 65 years old or more with cardiovascular disease from ambulatories of Federal University of São Paulo, Brazil, for 3 years. The analytic sample for this study included patients who underwent DEXA analysis in the last year. Frailty was considered prevalent if subjects had 3 or more of the following 5 criteria: weight loss, weakness, slowness, low energy expenditure, and exhaustion. Osteoporosis was defined as a bone mineral density t-score below minus 2.5 SD in lumbar and/or proximal femur). **Results:** Until November 2008, 74 elderly men and women were included. Frail older people were older (mean age: 79.5 years; $p=0.04$), black (86.4%; $p<0.05$), women (86.4%; $p=0.02$), widowers (63.6%; $p=0.05$) and take more daily medications (mean 6.6; $p=0.002$) when compared to non frail (pre frail and robust). Twenty two (29.7%) were frail, 43(58.1%) pre frail and only 9(12.2%) were robust. In frail older people the prevalence of osteoporosis was 45.6% ($p=0.007$), hypertension 95.5% ($p=0.29$), heart failure was 72.7% ($p=0.06$) and cognitive decline was 45.5% ($p=0.30$). The likelihood of being frail was substantially higher in the presence of osteoporosis ($OR=6.25$ $CI_{95\%}:1.89-20.66$; $p=0.003$) **Conclusion:** Our study suggests a strong association between osteoporosis and frailty status in a sample of outpatients elderly people with cardiovascular diseases.

SESSION 1855 (PAPER)

GERIATRIC CLINICAL ISSUES II

SUNDOWN SYNDROME: A SCIENTIFIC UPDATE

A. Yevchak¹, M. Steis¹, L.K. Evans², 1. *Nursing, The Pennsylvania State University, University Park, Pennsylvania*, 2. *University of Pennsylvania, Philadelphia, Pennsylvania*

PURPOSE: Sundown Syndrome is defined in the literature as increased confusion and agitation occurring near sunset in the early evening. Little scientific research has been reported 1987 when Evans conducted a seminal study. The purpose of this scientific update is to search for new research on or related to Sundown Syndrome. **METHODS:** The terms Sundown Syndrome and nocturnal agitation were used to conduct a systematic review of the literature for scientific evidence. The following databases were used: PubMed, CINAHL, and ProQuest. Inclusion criteria were: English language, peer reviewed, and the year 1987 forward. Literature was also retrieved from secondary references from included studies and relevant sources. **RESULTS:** A total of 21 research articles, including Evan's 1987 study, were identified by the literature search. The literature linked increased confusion and agitation in the early evening to the following: Sundown Syndrome/Disruptive Behavior (13), Circadian Rhythm (6), Delirium (1), and Melatonin (1). **IMPLICATIONS:** We will discuss the antecedents and consequences that have been debated in the research of Sundown Syndrome in older adults and methods for increasing the understanding of the Sundown Syndrome label. The potential relationship to delirium and a future research agenda for Sundown Syndrome research will also be discussed.

EXAMINING MEDICINE ACCUMULATION AND DISPOSAL: DRUG PROFILES, INFLUENCING FACTORS AND POLICY IMPLICATIONS FOR OLDER ADULTS

J. Crittenden¹, L.W. Kaye¹, S. Gressitt², 1. *Center on Aging, University of Maine, Bangor, Maine*, 2. *Maine Office of Adult Mental Health, Augusta, Maine*

The accumulation of pharmaceuticals in the home is a growing trend throughout the country that poses health and safety risks for older adults and their families. In response, the Safe Medicine Disposal for ME Program was established to provide older adults and their families with the country's first consumer-focused pharmaceutical mailback program. The program, in its first two phases, distributed envelopes ($n = 9,390$) to older adults, caregivers, and families in all 16 counties in Maine via a network of 100 distribution sites. Program envelopes provide a means for community members to return their unused and unwanted medications for safe and proper disposal while providing the unprecedented opportunity for critical health policy and medicine accumulation research. Returns from the program indicate that the response rate for this program is approximately 25%. Of the over 800 pounds of medicines returned to date, 10% of the drugs collected represent controlled substances. Significant factors leading to residential accumulation include: death in the family, medicine expiration prior to full use, or the patient instructed by a healthcare provider to discontinue use. Data were collected via program participant surveys ($n = 900$), envelope tracking protocols ($n = 3000$), and medicine returns inventories (over 4000 individual drug entries). Updated data analysis to be presented includes the type, average wholesale prices of unused medicine, classification, response rate data and contributing factors; demographic profiles; and salient motivational factors for program participation controlling for age. Supported by US EPA Grant #CH-83336001-0.

PATTERNS OF TOOTH LOSS IN OLDER ADULTS WITH DEMENTIA UNDER CURRENT MODELS OF CARE

X. Chen¹, S. Shuman², J.S. Hodges², L.C. Gatewood², 1. *Department of Dental Ecology, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*, 2. *University of Minnesota, Minneapolis, Minnesota*

Objective: While Older Adults with Dementia (OAD) experience more oral disease than non-demented elders, their tooth loss patterns remain unknown. This study's goal was to explore tooth loss patterns in OAD under current dental care models. **Methods:** 491 dentate elders, including 119 OAD, were retrospectively recruited. Subjects were treated and brought to stable oral health before enrollment. Dental treatment was equally provided for all subjects during follow-up. Baseline medical, functional, cognitive and dental assessments were abstracted from dental records to predict tooth loss. Propensity score matching was used to control for confounders. Cox, Poisson and negative-binomial regressions were developed to study tooth loss patterns for subjects with and without dementia. **Results:** Demented and non-demented subjects arrived with averages of 18 and 20 teeth, respectively. 27% of remaining teeth in the demented group were retained roots or decayed, higher than in the non-demented group ($P=0.0006$). Patterns of tooth loss did not significantly differ between the two groups. 11% of subjects in both groups lost teeth by 12 months' follow-up. By 48 months, 31% of non-demented subjects and 37% of demented subjects lost at least one tooth ($P=0.5$). In both groups, on average, 15% of people lost teeth per year. Mean numbers of teeth lost in 5 years were 1.21 for demented subjects and 1.01 for non-demented subjects ($P=0.89$). **Conclusion:** Dementia itself did not cause more tooth loss in OAD. While oral health was poor at arrival, demented subjects maintained their dentitions as well as non-demented subjects when dental treatment was provided.

PILOT STUDY OF COMPUTERIZED DECISION SUPPORT FOR DELIRIUM SUPERIMPOSED ON DEMENTIA IN OLDER ADULTS

D.M. Fick¹, M. Steis¹, L. Mion³, J.L. Walls⁴, S. Inouye², 1. *School of Nursing, The Pennsylvania State University, University Park, Pennsylvania*, 2. *Harvard Medical School, Boston, Massachusetts*, 3. *Vanderbilt University, Nashville, Tennessee*, 4. *Mount Nittany Medical Center, State College, Pennsylvania*

PURPOSE: Delirium occurs in over 40% of hospitalized older adults with dementia, substantially worsens outcomes in a population who are already burdened by functional decline, and costs over \$150 billion each year. The purpose of this pilot study was to test the feasibility, nurse adherence, and user satisfaction of the computerized decision support component of a multi-component intervention strategy called, Early Nurse Detection of Delirium Superimposed on Dementia (END DSD). The intervention is designed to improve both nurse assessment and detection of delirium and non-pharmacological management of DSD. **METHODS:** This pilot study enrolled and followed 15 consecutive admissions with dementia and their caregivers daily for the duration of their hospitalization and describes documentation and nurse adherence outcomes from 55 RNs and 7 LPNs at one Central PA acute care setting who used the delirium decision support screens integrated into the nursing portion of the electronic medical record (EMR). **RESULTS:** We found 100% adherence by nursing staff on the delirium assessment decision support screens and 75% adherence on the management screens. Fifty-five registered nurses (RNs) documented 196 times on the delirium screens across 96 hospital days. The pilot patients had a mean age of 83, and a mean admitting MMSE score of 14. Fourteen patients (14/15) showed an improvement in their MMSE scores at discharge. **IMPLICATIONS:** We will discuss the feasibility, the barriers and facilitators to use, the narrative data from the nurse documentation on mental status in the EMR, and the lessons learned for future research and practice.

SESSION 1860 (PAPER)

LONG TERM CARE - HS PAPER SESSION

LIFESTYLE, SOCIAL, AND MEDICAL PREDICTORS OF INSTITUTIONALIZATION: AUSTRALIAN LONGITUDINAL EVIDENCE

H. Kendig¹, C. Browning², Y. Wells³, S. Thomas², 1. *University of Sydney, Lidcombe, New South Wales, Australia*, 2. *School of Primary Health Care, Monash University, Notting Hill, Victoria, Australia*, 3. *Australian Institute for Primary Care, La Trobe University, Melbourne, Victoria, Australia*

Aims and Methods: This paper aims to identify lifestyle, social, and medical predictors of entry to residential aged care. The data are drawn from the Melbourne Longitudinal Studies on Healthy Ageing funded by the National Health and Medical Research Council, the Australian Research Council, and the Victorian Health Promotion Foundation. Baseline data were collected in a representative survey of 1000 people aged 65 years and over living in the community in 1994. Outcomes to 2006 were identified for 87% of respondents from biennial follow-ups with respondents or informants. Cox regression was used to identify how the likelihood of entry to residential care was predicted by a range of socioeconomic, health, and lifestyle factors at baseline. **Results:** Nearly half of the respondents, notwithstanding an average age of 74 years at baseline, remained in the community throughout later life and never entered residential care. Among the 50% who had died over the study period, only a third were known to have entered residential care. Baseline variables that significantly predicted entry to residential care – after controlling for all other factors – were relatively older age, IADL dependence, cognitive impairment, low or high BMI, and low social activity. For men only, number of medical conditions and healthy nutrition score also emerged as predictors. For women only, never having been mar-

ried, and low BMI, also were predictors. For men only, the risk of entry to residential aged care was determined mainly by disease burden whereas for women social vulnerability and functional capacities were more important.

ENRICHED CLINICAL LEARNING ENVIRONMENTS THROUGH PARTNERSHIPS (ECLEPS): A PATHWAY TO LONG TERM CARE

J.C. Cartwright¹, D. White³, J. Lottes³, R. Tadessa², J.M. Hagan², 1. *School of Nursing, Oregon Health & Science University, Ashland, Oregon*, 2. *Oregon Health & Science University, Portland, Oregon*, 3. *Portland State University, Portland, Oregon*

Long term care (LTC) nursing is complex and rewarding, requiring the very best in nursing skills, knowledge, and leadership. Yet few graduating nurses elect to pursue careers in LTC, in part, because of limited opportunities to learn in LTC settings. Faculty are often reluctant to use LTC because of concerns about available role models and the overall environment as a setting that promotes learning. LTC nurses desiring a role in student education report barriers of time and preparation for the role. ECLEPs is an academic-practice partnership designed to build capacity for LTC facilities to be excellent practice and learning sites. A course on chronic illness, mental health, and end-of-life care for mid-program students was chosen as the focus. Partnering with four LTC organizations (assisted living and nursing facilities), ECLEPs provided four days of training to 9 staff nurses that included information about the course, student learning activities, simulation laboratory learning, and the 2-day LEAP program (Mather Lifeways). Two student cohorts (n=21) have completed their clinical placements in one of these four facilities. Staff nurses and students reported positive experiences. Nurses felt supported by faculty, enjoyed working with students, and indicated a desire to continue as a clinical site. All students reported a positive educational experience, increased understanding of LTC, gerontologic nursing, and chronic illness, and respect for LTC nursing. Most would consider LTC nursing in their future, if not immediately after graduation. Several tools emerged from the project that can be used in replicating this approach to clinical education.

GEOGRAPHIC DIFFERENCES IN LONG-TERM HEALTH CARE SERVICES AMONG OLDER ADULTS

K.S. Clay, B. Kang, J. Lee, *School of Social Work, University of Georgia, Athens, Georgia*

Long-term health care for older adults has become an increasingly significant part of the health care system in the United States. However, there have been geographic variations in health service availability and service utilization. In addition, it is uncertain whether there are similar geographic variations in the rates of long-term health care utilization by older adults. This study used national data drawn from the Community Partnerships for Older Adults (CPOA) Program Survey of Older Adults. The study sample included community-dwelling older adults (n = 2,435, 64.3% women, 65.6% White) divided into five regions across the United States (Pacific, Northeast, Midwest, West, and South). Bivariate logistic regression and multivariate logistic regression were used for analysis. The majority (74.6%) of older adults reported that their community needed to do more to address their long-term health care needs despite the availability of many services in their community. Educational attainment and region were major factors influencing the knowledge of services (p < .05). Compared to other geographic regions, the South had significantly lower odds ratios for knowledge of health care services and using those services, as well as significantly lower odds ratios of having health care coverage (p < .05). Future study is needed to explore what causes these variations among regions across the United States. Additionally, advocating and advertising long-term health care services is important for community-dwelling older adults in the South.

REDUCING BELTS FROM NURSING HOMES: A PILOT STUDY

M. Gulpers^{1,2}, M. Bleijlevens¹, E. Van Rossum^{1,3}, J. Hamers¹, *1. Faculty of Health, Medicine and Life Sciences, School for Public Health and Primary Care: Caphri, Maastricht University, Maastricht, Netherlands, 2. Verpleeghuis Lückerreide (nursing home), MeanderGroep Zuid-Limburg, Kerkrade, Netherlands, 3. Research centre on Autonomy and Participation of chronically ill patients, Zuyd University, Heerlen, Netherlands*

Background: Several attempts have been made to reduce the use of physical restraints in nursing homes. Most studies used educational approaches and introduced a nurse specialist as a consultant. However, the success rate of these interventions has been inconsistent, and in some countries this intervention proved to be ineffective. Therefore we developed a new multi-component intervention ("EXBELT") that comprises the educational intervention for nursing home staff in combination with a policy change (belt use is prohibited by the nursing home management), availability of alternative interventions, and availability of a nurse specialist and nursing home director as consultants. **Methods:** "EXBELT" was introduced at 1 psychogeriatric ward (30 residents) in a Dutch nursing home. Resident characteristics (like cognitive status) and information regarding the use of physical restraints were collected at baseline, and after one, three and nine months follow-up. The use of physical restraints was measured using observations by blinded trained observers. **Results:** At baseline, belts were used in 12 residents. After 1 month follow-up, only 1 resident with a belt was left. This result was also found after 3 and 9 months follow-up. There was no significant increase in the number of falls, and the reduction of belts did not result in an increase the use of other physical restraints. **Conclusion:** The results of this pilot study are very promising. However, a limitation is that this study has been conducted on only 1 ward. Therefore "EXBELT" should be further developed and evaluated in a larger sample of psychogeriatric nursing home wards.

CONTINENCE AND SLEEP: NIGHTLIFE IN CARE HOMES FOR OLDER PEOPLE

I.A. Evers, S. Arber, *Faculty of Health and Medical Sciences, University of Surrey, Guildford, United Kingdom*

This research indicates that continence care is a key determinant of poor sleep in care homes for older people. The study is part of a four year New Dynamics of Ageing Collaborative Research Project (CRP), SomnIA (Sleep in Ageing), addressing practice and policy relevant issues arising from the nature, impact and management of the sleep-wake balance in later life. This is a complex cross-disciplinary research project, especially in light of the vulnerable group of older people living in care homes. In 10 care homes situated in England, quantitative and qualitative data were collated from 140 male and female residents aged 65 - 100. For a period of two weeks, diaries were maintained denoting sleep and activity of participants. To contextualise the environment in which they slept 240 hours of dawn, dusk and night observations and interviews with residents (n=40) and staff (n= 78) were conducted. Data establishes that continence care influences the daily routine in care homes and disturbed the participants' sleep. The physical, routine controls to check on an older person's continence are perceived as intrusive and influence their sleep pattern. The regular final check by night staff also brings an often premature end to a good night's sleep. There is a need to reconsider the implementation of best practice in continence care at night in order to improve care home residents' night time sleep. This research is supported by the New Dynamics of Ageing initiative, a multidisciplinary research programme funded by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009)

SESSION 1865 (SYMPOSIUM)

PREPARING A HEALTH CARE WORKFORCE FOR AN AGING AMERICA: CHALLENGES AND COLLABORATIVE SOLUTIONS

Chair: *M. Gugliucci, Association for Gerontology in Higher Education, Washington, District of Columbia, University of New England College of Osteopathic Medicine, Biddeford, Maine, Eldercare Workforce Alliance, New York, New York*

The Institute of Medicine, in its vital report "Re-tooling for an Aging America: Building the Health Care Workforce," called for immediate investments in preparing our health care system to care for older Americans and their families. Those who care for older adults must have essential data, knowledge, and tools to provide high-quality health care. A 3-prong approach was proposed: (1) Enhance the geriatric competence of the entire workforce; (2) Increase recruitment and retention of geriatric specialists and caregivers; and (3) Improve the way care is delivered. This panel discussion will illuminate the issues and challenges of meeting the health workforce needs of our changing demographics, and describe a collaborative effort to enhance the preparation of students and professionals in health care. Representatives of the national Eldercare Workforce Alliance, which is working to propose practical solutions to strengthen our eldercare workforce and improve the quality of care, will frame the challenges and issues. Representatives of the AGHE Geriatric Curriculum Development Task Force will describe its interdisciplinary and organizational approach for constructing Geriatrics/Gerontology competencies and curricula guidelines for Health Professions Programs at every educational level. The AGHE Task Force is motivated by the increased demand for health care providers competent to provide health-promoting/self-empowering care for older adults, the general lack of explicit geriatric content across disciplines, and the lack of geriatric/gerontology guidelines for health care provider education programs. This presentation will invite health professions educators to become part of the enterprise to improve the health and wellness of our older adult population.

SESSION 1870 (SYMPOSIUM)

THE PROBABILITY AND CONSEQUENCES OF SLOWING THE AGING PROCESS IN HUMANS

Chair: *L. Hayflick, University of California, San Francisco, San Francisco, California*

Ever since the first recipe appeared 3500 years ago for stopping or slowing human aging and the hundreds of thousands of additional instructions for doing so that followed, - none have succeeded. Impressed with the astounding scientific advances made during the last century, some scientists insist that we are on the verge of success. A few of this symposium's participants will not only address the means by which this might be achieved but also the likelihood of doing so in the twenty-first century. Others will focus on why the odds against tampering with the fundamental biology of age changes are so great and what the unintended biological, sociological, political and demographic consequences might be if human aging could ever be slowed or stopped.

"LIFE IS 6 TO 5 AGAINST" - DAMON RUNYON

L. Hayflick, University of California, San Francisco, San Francisco, California

Ever since the first recipe appeared 3500 years ago for stopping or slowing human aging and the hundreds of thousands of additional instructions for doing so that followed, - none have succeeded. Impressed with the astounding scientific advances made during the last century, some scientists insist that we are on the verge of success. A few of this symposium's participants will not only address the means by which

this might be achieved but also the likelihood of doing so in the twenty-first century. Others will focus on why the odds against tampering with the fundamental biology of age changes are so great and what the unintended biological, sociological, political and demographic consequences might be if human aging could ever be slowed or stopped.

WHAT WE KNOW FROM CENTENARIANS

T.T. Perls, *1. Boston University School of Medicine, Boston, Massachusetts, 2. Boston University Medical Center, Boston, Massachusetts*

Ever since the first recipe appeared 3500 years ago for stopping or slowing human aging and the hundreds of thousands of additional instructions for doing so that followed, - none have succeeded. SESSION 1875 (SYMPOSIUM)

UNIQUE SLEEP CHARACTERISTICS OF OLDER ADULTS

Chair: C.A. Enderlin, *UAMS College of Nursing, Little Rock, Arkansas*
Discussant: K. Richards, *Polisher Research Institute, Abramson Center on Jewish Life, North Wales, Pennsylvania*

More than two-thirds of older adults report impaired sleep which can lead to impaired functional and cognitive abilities. The need for health-care providers to characterize and respond to sleep impairment in our aging population is important to promote optimal quality of life. Two groups at high-risk for disturbed sleep include older adults with cancer and dementia. As a preliminary step in planning sleep interventions,

baseline sleep was analyzed in these two groups and will be presented in this symposium.

OBJECTIVE SLEEP, INSOMNIA SYMPTOMS AND DAYTIME SLEEPINESS IN OLDER WOMEN WITH BREAST CANCER

C.A. Enderlin¹, E.A. Coleman^{1,2}, K. Richards^{3,4}, C. Cole¹, R.L. Kennedy¹, J.A. Goodwin¹, L.F. Hutchins², *1. UAMS College of Nursing, Little Rock, Arkansas, 2. UAMS College of Medicine, Little Rock, Arkansas, 3. Polisher Research Institute, Abramson Center for Jewish Life, North Wales, Pennsylvania, 4. U. of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

This study described and compared the objective sleep, insomnia symptoms and daytime sleepiness of two groups of older women with and without breast cancer. Participants completed 72 hours of actigraphy, the Insomnia Severity Index and Epworth Sleepiness Scale. Nocturnal awakenings (9 vs 8; expected 2-6/night) and day sleep time (127 vs 120 minutes; expected 14-31 minutes/day) were similar and exceeded expected limits in both groups. Mean sleep onset latency was normal but longer (33 vs 15 minutes; expected < 35 minutes) in the breast cancer group ($p=0.01$). Mean insomnia scores (9 vs 6; normal under 8) reflected subthreshold insomnia in the breast cancer group, with score categories indicating worse insomnia symptoms (19% vs 9%). Mean daytime sleepiness scores score categories indicated excessive sleepiness in one fifth of both groups (22% vs 20%). These findings support baseline screening and intermittent monitoring of sleep in older women with breast cancer.

A DESCRIPTION OF SLEEP PATTERNS IN PERSONS WITH DEMENTIA IN THE NURSING HOME

M. Harris^{1,2,3}, K. Richards^{4,5,6}, *1. College of Nursing, University of Arkansas for Medical Sciences, Searcy, Arkansas, 2. BAGNC Scholar 2007-2009, Little Rock, Arkansas, 3. NGNA Mary Wolanin Graduate Scholarship, Little Rock, Arkansas, 4. Polisher Research Institute, North Wales, Pennsylvania, 5. Professor, University of Pennsylvania, Philadelphia, Pennsylvania, 6. Director, Pennsylvania Hartford Center for Geriatric Nursing, Philadelphia, Pennsylvania*

Studies document that sleep patterns worsen after nursing home placement for persons with dementia. This paper reports 48 hours of descriptive baseline actigraphy data obtained from persons with dementia ($n=47$) in four nursing facilities. The study was part of a larger study of the effects of massage on sleep. Data on minutes of nighttime sleep, sleep latency, sleep efficiency, wake after sleep onset, daytime sleep and day/night sleep ratio were analyzed and stratified by Mini Mental Status Examination (MMSE) scores into three subgroups: mild dementia ($MMSE>15$, $n=11$); moderate dementia ($MMSE 5-15$, $n=23$); and severe dementia ($MMSE<5$, $n=13$). Overall, participants slept 56% of the night and napped 17% of the daytime. Poor sleep hygiene practices and environmental factors could have contributed to poor sleep. Recommendations for nursing practice include recognition of poor sleep patterns and the use of non-pharmacological interventions to promote sleep in persons with dementia in the nursing home.

SESSION 1880 (SYMPOSIUM)

AGING WITH HIV: CHALLENGES TO PHYSICAL AND MENTAL WELLNESS

Chair: M. Brennan, *Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York*
Discussant: L.D. Moneyham, *University of Alabama at Birmingham, Birmingham, Alabama*

In the US the number of HIV cases among those 50 and older increased by 77% from 2001 through 2005 (CDC, 2006). This age group will comprise over half of the population living with HIV within the next decade. While new HIV infections occur in this age group, most are survivors due to the effectiveness of anti-HIV medications. There

is no cure for HIV, but it is now a chronic manageable illness. Recent data indicate there are high levels of age-associated comorbidities occurring and their onset is at much younger ages. This may be related to the effects of the virus on metabolic processes that have not been defined. Furthermore, HIV treatments do not alleviate the psychosocial challenges faced by those aging with HIV (i.e., stigma, depression). This session will focus on physical and mental health comorbidities of this population. The powerful effects of stigma on the quality-of-life will be detailed. Lastly, interventions will be presented that can improve the physical and mental health of older adults with HIV. The first presentation will examine the prevalence of physical comorbidities and the clinical characteristics of this population. The second paper will discuss the relation of physical health and depression. The third presentation will address the burden of HIV-stigma, and its effects on life quality. The last paper will present an economically viable intervention that can alleviate the high prevalence of mood disorders among these older adults. The discussion will address practice recommendations to insure optimal aging for those growing older with HIV.

CO-MORBIDITY PREVALENCE AND CLINICAL CHARACTERISTICS OF AGING WITH HIV

D. Vance, M. Mugavero, J. Willig, J. Raper, M. Saag, *School of Nursing, University of Alabama at Birmingham, Birmingham, Alabama*

Of the 1.1 million adults infected with HIV in the United States, those adults 50 years of age or older made up 15% of all new HIV diagnoses, 24% of those living with HIV, 29% of those diagnosed with AIDS, and 35% of those who died of AIDS. With the increasing number of older adults with HIV, healthcare professionals will need to know what to expect as this population ages. This cross-sectional study examined the medical records of 1,478 HIV patients from a university clinic from May 2006 to August 2007. Clinical characteristics and patterns of comorbidities were examined across each decade of life. Data reflected that older adults with HIV had lower HIV viral loads but had more comorbidities, in many cases several fold higher. Such comorbidities included hypertension, hypercholesterolemia, hypogonadism, and coronary artery disease, and diabetes just to name a few. Implications for practice and research are provided.

HEALTH COMORBIDITIES AND DEPRESSION IN OLDER ADULTS WITH HIV

R.J. Havlik, S.E. Karpiak, *AIDS Community Research Initiative of America, New York, New York*

Are the high rates of depression found in older adults living with HIV associated with specific diseases or conditions? The study Research on Older Adults with HIV (ROAH: Karpiak et al., 2006) collected self-report health data on almost 1000 NYC HIV positive men and women 50 years and older. An inventory of health problems was compiled as well as CES-D scores (Center for Epidemiologic Studies Depression Scale). Higher CES-D scores indicate increased depressive symptoms. The correlation between CES-D scores and number of comorbidities was significant ($p < 0.001$). Correlations with specific comorbidities varied. Significant correlations with sensory loss as well as dermatological problems suggest these are important disease conditions that may be contributing to the depressive symptoms. Significant correlations exist with heart and respiratory conditions, fractures, and impotence. These associations require further research to understand how high rates of depression are related to comorbidities found in the growing aging HIV population.

THE IMPACT OF STIGMA ON OLDER PEOPLE LIVING WITH HIV/AIDS

C.A. Emler, *University of Washington, Tacoma, Tacoma, WA*

HIV stigma is pervasive and impacts the psychosocial wellbeing of older persons living with HIV/AIDS. Using purposive sampling techniques, 25 HIV+ adults, 50 years and older were interviewed in the

Pacific Northwest concerning HIV stigma and depression. The 25 participants ranged in age from 50 to 72 years ($M = 56.1$, $SD = 5.75$). Seventeen (68%) were male and 40% were people of color. Stigma scores for the sample ranged from 54 to 141 (possible scores of 40-160) with a mean of 94.32 ($SD = 23.12$). Higher scores on the CES-D depression scale were positively correlated with all stigma subscales and overall score. Statistically significant correlations were found between depression and personalized stigma ($r = 0.668$, $p < .001$) negative self-image ($r = 0.709$, $p < .001$), public attitudes ($r = 0.573$, $p < .01$), and overall stigma ($r = 0.627$, $p < 0.001$). The development and testing of stigma interventions should be a priority.

USING THE MACARTHUR MODEL OF TELEPHONE SUPPORT FOR DEPRESSION WITH OLDER HIV-POSITIVE ADULTS

M. Brennan, M. Vega, S.E. Karpiak, *Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York*

Older adults account for 27% of those living with HIV in the US and are the fastest growing segment of the HIV population. In a large New York City study (Research on Older Adults with HIV; Karpiak et al., 2006), significant depressive symptomatology was 5 times higher in older adults with HIV compared to the general population. We implemented and adapted an intervention based on the MacArthur Model, consisting of a weekly telephone call to "touch base," inquire about current status, and retest biweekly for depression using the PH-Q 9 assessment. Twenty-one older adults with HIV were enrolled. The MacArthur Model was modified to address cultural competency and group-specific issues (phone access, stigma, substance use, numerous medical appointments). Over a 20 week period, levels of depressive symptoms decreased significantly, on average from 18 to 10 points. Implications of these findings and future work with this growing population will be discussed.

SESSION 1885 (POSTER)

CREATING COMMUNITIES FOR AN AGING SOCIETY

LOSING GROUND: RESPONDING TO MANUFACTURED HOME PARK CLOSURES IN OREGON

A. Tremoulet, *Institute on Aging, Portland State University, Portland, Oregon*

Shelter security is essential for the social and physical well-being of older adults. Losing one's home unexpectedly is a catastrophic experience for most people, but especially older adults. Not only do they lose a place to live at a stage in life when resiliency is most challenged, but they also lose connections to friends, memories, community and all that is familiar. The closure of manufactured home parks is a form a gentrification that disproportionately affects older adults. In the US, approximately 41% percent of all manufactured homes occupied as a primary residence are owned or rented by a householder age 50 and older (US Census 2000). Many states permit the creation of "senior manufactured home parks" limited to households with members age 55 and older. This poster will describe a case study of the state policy response to the escalation of manufactured home park closures in Oregon from 2001 through 2007. During this time period, 4% of all Oregon parks closed. These closures were concentrated in urbanized and urbanizing areas of the state. The loss of these parks disproportionately affected low income and elderly households. The poster will summarize the policy outcomes of the 2007 Oregon legislative session and their implications for older adults, Oregon communities, and the continued viability of this housing form favored by older people, particularly those with low incomes.

WEEKLY OUT-OF-HOME ACTIVITY OF OLDER ADULTS AND THE AVAILABILITY OF A CAR

T. Yang, S. DeVane, *Consumer Sciences and Retailing, Purdue University, West Lafayette, Indiana*

Out-of-home activity of older adults is associated with improved survival and better functional status. Using data from the 2006 Health and Retirement Study (HRS) and the 2007 Consumption and Activity Mail Survey (CAMS), this research examined the association between availability of a car, driving status, and control variables on weekly out-of-home activity. The dependent variable was the sum of five activities (shopping or running errands; attending concerts, movies, or lectures; or visiting museums; working for pay; participating in sports or other exercise; and personal visits to friends, neighbors, or relatives). If individuals responded with the hours that they spent in an activity, participation in that activity was counted as 1. The average for all participants was 2.47 out of five activities. Results of OLS regression showed that those who had a car available and those who were able to drive were involved in more activities. However, the availability of a car was more important than driving status. Having more education and having a partner or spouse meant participating in more out-of-home activities. Those who were older, in poorer health, and who experienced more limitations in regard to Activities of Daily Living participated in fewer out-of-home activities. Black respondents had fewer out-of-home activities than White respondents. The results have important implications for public policy related to the availability of transportation of older adults.

ASSESSING STAKEHOLDER OPINIONS ON MEDICAL REVIEW OF IMPAIRED DRIVERS AND FITNESS TO DRIVE

N.M. Silverstein, K. Barton, K. Chan, K. Lloyd, M. Belony, D.A. Gromack, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Driving is the main mode of travel for Americans age 65 and older. Although older drivers are generally found to be safe drivers, aging often brings about functional limitations and an increase in medications that can impede driving fitness. More specifically, aging is accompanied by an increase in the prevalence of such conditions as arthritis, dementia, sleep apnea, and macular degeneration, which may impair critical driving skills and compromise safety. States vary greatly in their approach to licensing and renewal practices related to at-risk drivers. States also vary in their utilization of a Medical Advisory Board and medical review practices. In March 2009, 24 in-person interviews were conducted with Massachusetts stakeholders, including representatives from the state legislature, government agencies, advocacy organizations, licensing authority, medical community, driving assessment centers and mobility planners. Issues covered included: immunity for reporting, mandatory vs. voluntary reporting practices, confidentiality for reporters, licensing and renewal practices, function and composition of the Medical Advisory Board, counter personnel training, driving cessation support, and information on alternative transit. One area that found strong consensus was to join the ranks of other states that already provide immunity for physician reporting of medical conditions that may impact critical driving skills. Less agreement was found regarding criteria for considering accelerated renewal or what role, if any, licensing authorities should have related to driving cessation support and information on alternative transit. The goal of the study is to produce a white paper for continuing the dialogue to strengthen Massachusetts' response to identifying medically-at-risk drivers.

THE RELATIONSHIP BETWEEN SOCIAL SUPPORT AND AGING-IN-PLACE PLANNING

Y. Lee, F. Tang, *University of Pittsburgh, Pittsburgh, Pennsylvania*

While a majority of older adults prefer to live as long as possible in their familiar surroundings, the factors that promote aging in place are not sufficiently examined. This study investigated the relationship between social support and the planning for aging in place. This study

used data from the Community Partnerships for Older Adults Program Survey and the sample was composed of respondents who were living independently either in a rented place or in their own place and who were healthy at the survey time ($N = 2,461$). Social support was used as emotional support and instrumental/informational support. Emotional support was measured by marital status, the number of living child, and social network, which consisted of attendance of religious events and entertainment activities, and getting together with family, friends, or neighbors. Informational support was measured by the extensive knowledge of home- and community-based long-term care services (HCBS) availability (i.e., senior center, adult day program, housekeeping service, senior lunch program, telephone helpline, home repair assistance, visiting nurse service, personal assistance, and door-to-door transportation). Having more social network in the community and knowledge of HCBS were related to an older age which the respondents anticipated to remain living on their own with regular help. Findings have implications for developing more emotional and informational social support resources in the community. Older adults need more opportunities of participating social activities in the community and become aware of the availability and accessibility of HCBS.

TEN YEARS DOWN THE ROAD: PREDICTORS OF DRIVING CESSATION

M. Lunsman¹, E. Bart¹, G. Cissell², J. Edwards¹, *1. University of South Florida, Tampa, Florida, 2. University of Alabama at Birmingham, Birmingham, Alabama*

Introduction: Recent prospective studies have found that cognition, particularly speed of processing and everyday functional performance, predicts driving cessation among community-dwelling older adults (e.g., Ackerman, Edwards, Ross, Ball, & Lunsman, 2008; Edwards et al., 2008). However, these studies have been limited to 5 years of follow-up. The current study used data from the Maryland Older Drivers Project to examine predictors of driving cessation in older adults over a 10-year period. **Methods:** Participants ($N = 1248$) completed baseline and 5-year assessments of performance-based functional abilities. Driving status was ascertained at baseline and annually thereafter. Cox proportional hazard models were used to examine the risk of driving cessation as a function of demographic, physical, and cognitive predictors. **Results:** Older age ($HR = 1.12$, $p < 0.001$), driving fewer days per week ($HR = 0.83$, $p = 0.05$), and slower speed of processing as measured by subtest 2 of the Useful Field of View Test ($HR = 1.76$, $p < 0.01$) were significant predictors of driving cessation. **Conclusion:** These results corroborate previous research and underscore the importance of cognitive speed of processing in the maintenance of driving.

LOCAL GOVERNMENT INNOVATION CREATING AGING-FRIENDLY COMMUNITIES: SURVEY RESULTS

A.J. Lehnig, *School of Social Welfare, University of California, Berkeley, Berkeley, California*

Gerontologists have been describing the potential benefits of aging in place in terms of an older adult's ability to remain independent and enjoy a high quality of life for several decades, as well as the potential impact of adapting the environment on the health and well-being of aging individuals. It remains unclear, however, whether local governments are responding to an expected growth in their older population by adopting and implementing policies, programs, and changes in infrastructure that will improve the health and well-being of their aging residents. The data for this research are based on quantitative results from a mixed method study exploring local government involvement in aging-friendly communities. Online surveys were conducted in the spring of 2009 with city planners, county aging services directors, county transportation planners, and employees of public transit providers in the San Francisco Bay Area. Respondents were asked to identify aging-friendly policies and programs provided by their city or county government in the areas of community design, housing, transportation, health care and

supportive services, and opportunities for community involvement. Respondents also were asked about the factors that contributed to the decision to put these policies and programs in place. This research contributes important information to the burgeoning aging-friendly community literature. Understanding both what local governments are doing and why they are doing it will assist policymakers at all levels of government as they develop strategies to improve the health and well-being of the expanding senior population.

ELDERLY-FRIENDLY ZONING AND LAND-USE PLANNING: AN EVALUATION OF EXISTING POLICY USING RE-AIM

G.L. Byars, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

This poster presents a review of the literature evaluating elderly-friendly zoning and land-use planning policy; focusing upon health, social, economic outcomes. The United States is experiencing a boom in the population of older-adults; 90% of whom live in traditional homes within the community and 80% express a strong desire to remain there. There is a growing call to transform our planning policy to produce elderly-friendly communities, and many communities have added elderly-friendly planning policies. However, there is a lack of research supporting existing policies. While there is overwhelming data to suggest a link between the environment and health and functioning among older-adults, research on community and neighborhood factors is severely limited. This poster represents an evaluation of elderly-friendly land use and zoning policy using the RE-AIM framework (Reach, Effectiveness, Adoption, Implementation, and Maintenance). This policy evaluation presents a review of key features of elderly-friendly land-use and zoning policy, the need for such policy, and potential outcomes for individuals and communities. Outcomes on the individual level include health, independence, and social participation. Outcomes on the community level include economic and social impacts to business and government. This evaluation suggests that elderly-friendly planning policy may relate to improved health, functioning, and social connection for older adults and increased growth and income to communities.

RESIDENTIAL RELOCATION IN LATE LIFE: A COMPARISON OF PROACTIVE AND REACTIVE MOVES

N. Pope, *The University of Georgia, Athens, Georgia*

Proactive coping involves anticipating future events or stressors and preparing in advance for them (Aspinwall & Taylor, 1997). Even for stressful events or life changes that cannot be avoided and are still uncertain, such as aging and potential long-term care needs, proactive efforts can promote health and well-being. Studies suggest that older adults who plan ahead are more likely to receive the type of care they prefer and be less of a burden on family members and friends (Brechling & Schneider, 1993; Pinquart & Sorenson, 2002b; USDHHS, 2008b). Housing considerations are also an important consideration in preparing for later life. An older person's decision to move can be made proactively, such as moving to a smaller house or apartment, or reactively, moving because of deteriorating health or the death of a spouse. The purpose of this study is to explore differences between proactive and reactive residential relocation in a sample of older adults. Data was used from Waves 2 and 3 of the Second Longitudinal Study of Aging (LSOA II), a nationally representative sample of persons 70 years of age and older from 1994 to 2000. Based on the theory of proactive coping, reasons for relocating at Wave 2 ($n = 736$) and Wave 3 ($n = 713$) were categorized as either proactive and reactive. Results indicate that the proactive group of movers were younger, more educated, and had higher income. The results provide support for proactive coping theory and its application to residential relocation in late life.

NO ROOM AT THE INN: HOUSING POLICY IMPLICATIONS OF THE SOCIAL CONSTRUCTION OF ELDER HOMELESSNESS IN THE U.S

K. Mills-Dick, *Boston University, Boston, Massachusetts*

According to recent estimates, there are over 75,000 homeless elders in the U.S. today (Cunningham & Henry, 2007; Gibeau, 2001). Such numbers represent the failure of both the aging and homeless service systems to meet the needs of the most vulnerable older adults in our communities. In the housing and aging literatures, little attention has been paid to the homeless elderly (Martin, 1990; Tully & Jacobson, 1994), and research on homeless elders remains limited (Crane, 1994). While a significant network of policies and programs exists to meet the economic and health needs of older adults, the plight of homeless older adults has largely been ignored. Similarly, policy responses to homelessness generally do not highlight or emphasize older adults as a target population. This presentation will explore the historical development and implementation of policies and programs addressing homelessness, with particular attention to the inclusion of and impact on the subgroup of older adults. With an emphasis on theories of homelessness and the social construction of social problems, this presentation will discuss changing conceptions and shifting constructions of elder homelessness. Particular attention will be paid to the ways in which various constructions of homeless older adults have both impacted and been influenced by a range of policies throughout U.S. history. This presentation will highlight the role of social problem construction and definition in the policy process (Pal, 2006) and discuss implications for including the perspectives of marginalized populations in problem resolution and policy responses.

SESSION 1890 (SYMPOSIUM)

DIMENSIONS OF RETIREMENT INSECURITY IN AN ECONOMIC DOWNTURN: CAUSES AND OPTIONS

Chair: C.E. Bishop, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Discussant: J. Schulz, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

This recession has battered several of the supports that sustain security in retirement, including portfolios, market value of owner-occupied housing, post-retirement health benefits, and access to jobs. The panel will begin with presentation of a multidimensional standard for economic security and risk that proposes thresholds for five aspects of retirement security, demonstrating that risk is both widespread and unevenly distributed. When translated to the state level, the measure can be used to track impact of state policies. The housing bubble induced some home owners to extract equity from housing assets for other purposes, and our second panelist presents evidence about the impact this has on economic security in retirement. Work choices over the life course affect the value of the assets available to fund retirement. Our third speaker will consider the role of work life trajectories in determining the distribution of economic wellbeing and risk in retirement. The final panelist will update us on the impact of this particular recession on retirement security, and the implications for public policy.

THE HOUSING BUBBLE AND RETIREMENT SECURITY

M. Soto¹, A.H. Munnell², 1. *The Urban Institute, Washington, District of Columbia*, 2. *Center for Retirement Research at Boston College, Chestnut Hill, Massachusetts*

House prices rose 60 percent between 2000 and 2007 before the bubble burst. The question is whether the housing bubble made people better or worse prepared for retirement. Using the Survey of Consumer Finances this paper investigates the probability of households extracting home equity through an increase in housing-related debt, the probability that they use their housing-related borrowing for consumption, and finally the factors that determine the level of consumption spend-

ing out of their increased debt. The results show that while homeowners appear to take the present discounted value of future rents into account, many of them extracted equity and used it for consumption. A substantial proportion – perhaps 30 percent – of older households will be less secure in retirement because of the housing bubble.

LIVING LONGER ON LESS: THE NEW ECONOMIC (IN)SECURITY OF SENIORS

T. Meschede, L. Sullivan, T. Shapiro, *Heller School, Brandeis University, Waltham, Massachusetts*

We created the Senior Financial Stability Index to measure long-term economic security of senior households throughout their retirement years. The fundamental components that frame economic stability for older Americans are housing costs, healthcare expenses, household budgets, home equity, and household assets. We find that 78 percent of all senior households are financially vulnerable and 84 percent of single senior households face financial insecurity. More than half of all senior households lack financial resources to meet lifetime projected expenses, and household budgets don't allow for additional savings for larger and unforeseen expenses for one-third of senior households. Further, paying out-of-pocket health expenses is burdensome for 25 percent of senior households, and high housing costs put 45 percent of their budgets at risk. These compelling statistics reflect the realities of many seniors and demonstrate the roots of economic security and fragility – a fundamental mismatch between income and costs of essential and other expenses.

WOMEN'S FINANCIAL SECURITY: COMPLEX LIVES IN DIFFICULT TIMES

M. Hardy, M. Hidajat, *Sociology, Penn State, University Park, Pennsylvania*

Women's financial security in old age has generally been linked to two social institutions—marriage and the labor market. As more highly educated cohorts of women move into older age, both of these pathways carry considerable risk of dissolution. Our analyses of the National Longitudinal Surveys of Women, launched in the late-1960s and continued through 2003, reveal the complex patterns of women's lives and how different patterns of attachment set women on different pathways of financial (in)security. Maintaining a balance between work and family responsibilities challenged 20th century women. As long term relationships, either with spouses or with employers, become less common, an important policy question for this century involves the trade-off between 'flexibility' and 'insecurity.'

SHORING UP RETIREMENT SECURITY

G.A. Mackenzie, *Public Policy Institute, AARP, Washington, District of Columbia*

U.S. workers have seen their investments dwindle, jobs disappear, and retirement plans thrown off track as a result of the worst economic crisis most Americans have ever experienced. This presentation will take stock of the impact of the recession on retirement security. It will assess the state of defined benefit (DB) pensions and acknowledge lessons learned about the vulnerabilities of the defined contribution (DC) system exposed by the market downturn. It will then discuss options for improving the security of the retirement system, including improving DC plans, ensuring the security of DB plans, and enhancing and securing Social Security. It will also examine options for "second tier" or "universal 401(k)" plans.

SESSION 1895 (SYMPOSIUM)

FRONTLINE WORKERS IN ASSISTED LIVING: MAXIMIZING SATISFACTION AND RETENTION

Chair: M. Ball, *Georgia State University, Atlanta, Georgia*

Discussant: F. Whittington, *George Mason University, Fairfax, Virginia*

Despite the recent growth of the assisted living (AL) industry, little research has addressed the growing shortage of direct care workers (DCWs) in this setting. DCWs often are called the centerpiece of the formal long-term care system, and this symposium will present key findings from a mixed methods study of how to maximize satisfaction and retention of these workers in AL (5R01 AG021183). The study sample included 400 DCWs and 44 administrators from 45 AL facilities in Georgia. The symposium will provide an overview of study methods, placing Georgia workers and facilities within the national AL context, and include both qualitative and quantitative investigations of topics central to the maintenance of a quality frontline workforce. In the first presentation, the authors use grounded theory methods to examine co-worker relationships, the factors that influence their maintenance and development, and the influence that these relationships have on DCW satisfaction and retention. Next, multilevel modeling techniques are utilized to explore the effects of individual, facility, and community characteristics on job satisfaction, intent to turnover, and actual turnover. The third presentation is a qualitative examination of reward systems found in these diverse settings and the multilevel factors that influence the tangible and intangible meanings they have for DCWs. In the final presentation, authors highlight the study's principal findings and present a model that encapsulates the key elements and outcomes of the process of maximizing the satisfaction and retention of DCWs in AL. A leading AL scholar will serve as discussant for this symposium.

CO-WORKER RELATIONSHIPS IN ASSISTED LIVING: THE INFLUENCE OF SOCIAL NETWORK TIES

C. Hollingsworth¹, M. Perkins², W.M. Sweatman¹, *1. Georgia State University, Atlanta, Georgia, 2. Emory University, Atlanta, Georgia*

In this study, we use grounded theory methods to examine co-worker relationships and the influence that these relationships have on satisfaction and retention of DCWs. We focus on staff-staff relationships as well as the relationships that DCWs have with their direct supervisors and facility administrators. We find that social networks (relationships with family, friends, and former co-workers and employers) are a key factor leading DCWs into employment in these homes. However, we find that these network ties are not necessarily close ties and that this pattern of job referral does not always lead to a cohesive social environment. DCW and administrator turnover, as well as strategies participants use to survive economically, are important intervening factors that influence facility work culture. Findings have implications for interventions to promote organizational commitment and reduce staff turnover, which can improve resident care and reduce threats to DCWs,' as well as facility operators' economic security.

A MODEL FOR MAXIMIZING SATISFACTION AND RETENTION OF DIRECT CARE WORKERS IN ASSISTED LIVING

M. Ball¹, M. Perkins², C. Hollingsworth¹, C.L. Kemp¹, *1. Georgia State University, Atlanta, Georgia, 2. Emory University, Atlanta, Georgia*

Based on findings from a statewide study we present a model depicting the key elements and outcomes of the process of maximizing satisfaction and retention of direct care workers (DCWs) in assisted living. This model integrates our qualitative and quantitative findings and makes connections between the range of factors influencing satisfaction and retention. Multiple factors at the societal, industry, community, facility, and individual levels influence DCWs' motives for becoming paid caregivers and the rewards they receive from their jobs. Both motives and rewards have moral, material, and professional meanings that affect

DCWs' job satisfaction and retention. Multiple study findings establish the importance for DCWs of their relationships with residents and of receiving affirmation for the work they do. DCW job outcomes in turn have bearing on broader outcomes for residents' quality of care, for DCWs' position in society and in the labor market, and for the economic development of communities.

REWARDING WORKERS IN ASSISTED LIVING

C.L. Kemp, M. Ball, C. Hollingsworth, *The Gerontology Institute, Georgia State University, Atlanta, Georgia*

In this paper we examine reward systems in assisted living, consider the meanings they hold for direct care workers (DCWs) and identify factors that influence both. Analysis indicates that mean hourly wages are low (\$8.30), advancement opportunities are few, and access to and enrollment in benefits programs are not universal. Some facilities recognize DCWs through programs such as employee of the month, bonuses or appreciation events. Reward structures are influenced by facility size, location, resident census, fees, and ownership type, and by DCWs' work experience and performance. Most DCWs perceive their wages as unfair and would prefer greater extrinsic rewards. Many find "little stuff" such as verbal praise, affirming which is meaningful. Thus, although DCWs' personal characteristics and preferences influence the meaning of rewards such that no single reward type works for all DCWs forever, all want and need affirmation for their contribution to resident care and facility operation.

FACTORS ASSOCIATED WITH TURNOVER IN ASSISTED LIVING: A MULTILEVEL ANALYSIS

M. Perkins¹, R. Adelman³, C. Furlow⁴, W.M. Sweatman², J. Baird², 1. Behavioral Sciences and Health Education, Rollins School of Public Health, Emory University, Atlanta, Georgia, 2. Georgia State University, Atlanta, Georgia, 3. University of Buffalo, SUNY, Buffalo, New York, 4. Centers for Disease Control and Prevention, Atlanta, Georgia

Over the past thirty years, many conceptual models of the turnover process in long-term care have been proposed. However, few studies investigating these relationships have accounted for the hierarchical nature of the data, failing to acknowledge the inter-dependence that exists among staff within the same facility and leading to biased estimates. We use multilevel modeling techniques to explore the effects of individual, facility, and community characteristics on three outcome variables: 1) overall job satisfaction; 2) intent to turnover; and 3) actual turnover. Findings show that facility and community level factors explain little variation in actual turnover, the final outcome measure, which suggests that decision-making regarding turnover is a highly individualized process. In contrast, net of individual-level factors, macro-level factors explain substantial variation in overall job satisfaction and intent to turnover. The final model of turnover we present provides an analytic framework that can guide future investigations into these relationships.

SESSION 1900 (PAPER)

IMPROVING DEMENTIA CARE

PERFORMING DEMENTIA: INTERDISCIPLINARY APPROACHES TO CREATIVE CLINICAL CARE

J. McGovern, *Silver School of Social Work, New York University, Brooklyn, New York*

Interdisciplinary approaches to dementia research belie received wisdom. The majority of dementia literature focuses on either the person with dementia or the caregiver, and tends to confine the experience to decline, despair and deficits. However, recent studies from fields such as nursing, anthropology, occupational therapy, and cultural studies that acknowledge the condition's affect on relationships as well as individuals, demonstrate that an enduring, albeit transformed and evolving,

sense of relatedness can lead to positive outcomes. These include slowing progress of the disease, and increasing the wellbeing of all members of dementia-affected relationships. The infusion of new variables, such as spiritual growth, wisdom, and satisfaction, and new units of analysis, including couples and families, provide entry to creative care. New theoretical orientations contribute as well. Through the lenses of life course and performance theory, creative clinical care options become apparent. Linking the life course suggestion that human development continues into late-life, with the performance theory concept that meaning-making can occur in embodied exchange, has encouraged development of interventions geared toward dementia-affected families – for example, Alzheimer's cafes, couples counseling, and assisted vacations. Emergent international research shows that the verbal and non-verbal practice of "we-ness" allows for positive developmental outcomes heretofore undiscovered. This presentation takes an interdisciplinary perspective to explore the lived experience of dementia through the lens of life course and performance theory. Findings suggest implications for dementia care, particularly for couples and families.

CATAPULTING SHIFTS IN IMAGES, UNDERSTANDINGS AND ACTIONS THROUGH RESEARCH-BASED DRAMA

S.L. Dupuis¹, J. Gillies¹, G. Mitchell², C. Jonas Simpson², C. Whyte¹, J. Carson¹, 1. Murray Alzheimer Research and Education Program, University of Waterloo, Waterloo, Ontario, Canada, 2. York University, Toronto, Ontario, Canada

Postmodernist critiques of traditional ways of reporting qualitative research have led to alternative ways of writing and representing research, what Richardson (2000) calls creative analytic practices. Research-based-dramas, as one example of creative analytic practice, have been recognized as an effective medium for translating research about illness into communities of practice including healthcare professionals, policy makers, persons living with illness, families, and the general public. Nonetheless, our understanding of the impact of research-based drama is quite limited and in the very early stages of development. This paper examines how personal images, understandings, and actions change for family members of persons with dementia after the introduction of a research-based drama called I'm Still Here. The drama is based on research conducted with persons living with dementia and with daughters, expressing their experiences of living with loss. Guided by a hermeneutic phenomenological approach, a set of seven focus groups were conducted with diverse family members (n=48) in four different cities in Ontario, Canada. Focus groups were conducted immediately prior to viewing I'm Still Here and directly following a performance. Findings suggest that three major phenomenological shifts occurred for the family members including diminishing humanness to discerning humanness, detached caring to reflective engaging, and terrifying projections to hopeful possibilities. Our research suggests that research-based drama can have a profound impact on family members caring for those with dementia by engaging, awakening, and expanding understandings of dementia that transform both images and actions. Funded by the Social Sciences and Humanities Research Council in Canada.

FAMILY CAREGIVER VS. NON-CAREGIVER PERCEPTIONS OF DEMENTIA SCREENING

M.D. Justiss^{1,2}, M. Boustani^{1,2,3}, 1. Indiana University, Indianapolis, Indiana, 2. Indiana University Center for Aging Research, Indianapolis, Indiana, 3. Regenstrief Institute, Inc., Indianapolis, Indiana

Objectives: The purpose of this study is to explore differences in the perceptions of dementia screening between family caregivers of patients with Alzheimer's disease (AD) and older adult non-caregivers. Design: A cross-sectional study. Setting: Primary care clinics in Indianapolis, IN. Participants: A convenience sample of 81 family caregivers and 125 older adult (65+) non-caregivers. Measurement: Acceptance of dementia screening and its perceived harms and benefits as determined

by the PRISM-PC questionnaire. Results: Non-caregivers had significantly higher acceptance scores. Both caregivers and the non-caregivers agreed that screening is beneficial. Caregivers had significantly lower perceived stigma and impact on independence and significantly higher perceived suffering. The top three identified harms from screening by both caregivers and non-caregivers were emotional suffering by the family, loss of driving privileges and becoming depressed. Conclusion: By identifying unique perspectives of caregivers with first hand experience with AD, we are in a better position to understand the risks and benefits of screening in order to improve the process for early identification. It would appear there is a complex interaction of perceived harms and benefits making it difficult to determine whether the benefits of dementia screening outweigh the potential harms. Targeting these barriers will aid in the development of individualized counseling programs embedded within primary care. These programs may reduce the burden and stress experienced by caregivers as the disease progresses and their role increases, thus facilitating early diagnosis of dementia and setting the stage for early intervention with both patients and caregivers where necessary.

DEFINING PERSON-CENTRED CARE: THE VIEWS OF PEOPLE WITH DEMENTIA, FAMILY CARERS AND PROFESSIONALS

C. Bamford¹, M. Poole¹, J. Hughes^{2,4}, C. Kirkley¹, H. Arksey³, L. Corner⁴, J. Bond^{1,4}, 1. *Institute of Health & Society, Newcastle University, Newcastle upon Tyne, United Kingdom*, 2. *Northumbria Healthcare NHS Foundation Trust, North Tyneside, United Kingdom*, 3. *University of York, York, United Kingdom*, 4. *Newcastle University - Institute of Ageing & Health, Newcastle upon Tyne, United Kingdom*

Delivering person-centred care continues to be a key aspiration for services, including those providing respite care. However, there is little consensus over the meaning of person-centred care in academic literature and little explicit guidance in UK policy documents. As part of a broader study, we conducted focus groups and face-to-face interviews to explore the components of person-centred care from the perspectives of six people with dementia, 16 family carers and 21 professionals. Additional data were drawn from 58 telephone interviews with a range of professionals. Nine components of person-centred care were identified: - Respecting individuality and values - Enhancing psychological well-being - Promoting autonomy - Promoting a sense of shared responsibility - Fostering social context & relationships - Enhancing communication - Meeting physical & personal needs - Developing a therapeutic alliance - Valuing expertise Subsequent observation within six contrasting respite care services provided examples of how each component was promoted or undermined in day-to-day practice. These data will be used to illustrate the components at both a conceptual and practical level. The relative importance of components varied between groups of stakeholders, with people with dementia placing most emphasis on social context and relationships; family carers focusing on psychological well-being; and professionals emphasising individuality and values. The data also indicate wide variations in the extent to which the components are achieved in practice. The potential use of the components of person-centred care for service evaluation will be explored.

SESSION 1905 (SYMPOSIUM)

PRESCRIPTION DRUG AND ALCOHOL USE AMONG OLDER ADULTS: MULTIDISCIPLINARY APPROACHES AND PERSPECTIVES

Chair: T. Shaffer, *University of Maryland, The Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland, University of Maryland, School of Pharmacy, Department of Pharmaceutical Health Services Research, Baltimore, Maryland, University of Maryland, Doctoral Program in Gerontology, UMB/UMBC, Baltimore, Maryland*

Discussant: L. Schonfeld, *University of South Florida, College of Behavioral and Community Sciences, Tampa, Florida*

This Symposium looks at the topic of prescription drug and alcohol use in among older adults from four vantage points from four investigators. The presentations are organized by context and method. The first will look at the broad cultural determinants that help set up the dynamics that are influential in medication use among women through a qualitative lens. That is followed by use of the family as a specific context and uses structural equation modeling to examine the relative roles that stressful events, perceived stress, and social support play in alcohol-related problems. The idea of context is then shifted and looks at the influence of social support, depression, and physical disability in the potential medication misuse for a population receiving opioids at a Veterans Administration Medical Center using regression analysis. The final presentation uses the narrowest of contexts and chronicles the development of a new measure that can be used to establish variation in medication regimens for residents of long-term care settings. These four presentations highlight the variety of research that result from a multidisciplinary approach to a similar topic using qualitative, psychological, biopsychosocial, and pharmacologic frameworks.

STRESSFUL EVENTS, PERCEIVED STRESS AND ALCOHOL AMONG OLDER ADULTS: DOES FAMILY HISTORY MAKE A DIFFERENCE?

P.G. Sacco¹, K.K. Bucholz², N. Morrow-Howell¹, 1. *Social Work, Washington University, St. Louis, Missouri*, 2. *Washington University School of Medicine, St. Louis, Missouri*

Research on the role of stress on alcohol consumption and alcohol-related problems has been mixed, with some studies identifying associations and other studies finding no relationship. Based on developmental psychopathology, stress related risks are nested in the earlier risks like family history of alcoholism (FH+); this study analyzed the role of FH+ in stress and alcohol relationship. We hypothesized that FH+ subsamples would display stronger stress/alcohol relationships. In a national probability sample (60+; current drinkers), multiple group structural equation models compared the relationship of stressful events, perceived stress and social support in FH+ versus FH- samples. Three groups consisted of children of alcoholics (n=704), other family (n=1366) and those with no history (n=2241). SEM models tested relationships between stress constructs and average consumption, at-risk drinking and alcohol problems. Contrary to hypothesis, perceived stress was associated with alcohol related problems (B=.17; z=2.95; p<.001) in the subgroup with no family history.

RISK FACTORS ASSOCIATED WITH OPIOID MEDICATION MISUSE IN COMMUNITY-DWELLING OLDER ADULTS WITH CHRONIC PAIN

J. Park, *School of Social Work, University of Maryland, Baltimore, Maryland*

The study explored patterns of opioid medication use among community-dwelling older adults with chronic pain and examined biological, psychological, and social risk factors associated with opioid medication misuse in this population. A sample of 163 older men and women currently receiving opioid medication(s) due to chronic pain was sur-

veyed regarding demographic information, frequency and duration of consuming opioid medications, and proposed risk factors. In the cross-sectional research design, the survey was administered in outpatient clinics affiliated with the Baltimore Veterans Affairs Medical Center and the University of Maryland Medical System. Descriptive and OLS regression analyses were conducted. The findings revealed a relatively high prevalence of long-term users of opioid medication in the sample and the potential for these users to become addicted to the medications. The study findings indicated that physical disability, depression, and lack of social support were significantly associated with opioid medication misuse.

THE INFLUENCE OF CULTURE ON PRESCRIPTION DRUG USE AMONG OLDER WOMEN

S.L. Canham, *Doctoral Program in Gerontology, UMB/UMBC, Baltimore, Maryland*

This paper concerns medication use by community-dwelling older women. To the extent that differences among individuals are in part a result of cultural factors or how individuals interact within their culture, it is expected that there are differences in the experience of prescription drug use and the development of dependency. For instance, unique life experiences may lead older women to experience and interpret medications differently. Also, the cultural backdrop against which older women interact with their physicians, receive prescriptions, and understand their health and illness is important. A more thorough description of why older women are especially prone to prescription drug misuse will be presented as well as an argument for how culture influences dependency in older women. The guiding question of this paper is, "What is it about an older woman's culture that predisposes her to an increased risk of prescription drug use?"

MEASURING THE UNMEASURED – ESTABLISHING THE VOLATILITY OF DRUG REGIMENS FOR RESIDENTS IN LONG-TERM CARE SETTINGS

T. Shaffer, 1. *University of Maryland, Doctoral Program in Gerontology, UMB/UMBC, Baltimore, Maryland*, 2. *University of Maryland, The Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland*, 3. *University of Maryland, School of Pharmacy, Department of Pharmaceutical Health Services Research, Baltimore, Maryland*

Use of prescription medications is endemic in long-term care settings where over 98% of residents receive at least 1 drug, and commonly reported numbers of medications used is 7-9 per month. Use of medications in this setting is dynamic over time and only a small proportion of this population consistently receives the same monthly regimen. Despite this therapeutic reality, there are no available measures that can be used to establish the degree of change in therapeutic regimens over time. The ability to measure volatility can quantify another dimension of overall drug burden and identify residents who are at a higher risk of experiencing an adverse drug reaction. This presentation chronicles the creation of a new measure of medication regimen volatility using commonly available drug information (e.g., drug names, counts, therapeutic classification). Comparisons of measure performance will be shown and analytic considerations required when quantifying and evaluating volatility will be discussed.

SESSION 1910 (SYMPOSIUM)

SHOULD I STAY OR SHOULD I GO? HURRICANE KATRINA'S IMPACT ON NURSING HOME RESIDENTS' OUTCOMES

Chair: K. Hyer, *School of Aging Studies, University of South Florida, Tampa, Florida*

Discussant: T. Bowman, *Department of Health and Human Services, Atlanta, Georgia*

Hurricane Katrina devastated the Gulf Coast in August 2005 causing untold human suffering among elders and billions of dollars worth of damage. This symposium reports on the morbidity and mortality affects of the Hurricane on frail nursing home residents and evaluates the impact on resident outcomes of the nursing homes' decision to evacuate or shelter in place in the face of hurricane warnings. Using data from four impacted states (Louisiana, Mississippi, Alabama, and Florida) we identified 59 nursing homes that evacuated residents during Katrina. We describe and compare resident outcomes for evacuating nursing homes compared to residents who sheltered in place at 150 homes in the same counties. Furthermore, a comparison of morbidity and mortality for the affected facilities are made using control data for residents residing at the same nursing homes during a similar period of 2004 (a non-hurricane year). This symposium will first describe the goals of the research, then provide the methodology utilized to create the data sets and then present 1 month, 3 month, and 6 month data on the morbidity, mortality and functional decline of residents. Finally, the political and economic challenges providers face to sheltering residents in place will be detailed. Our discussant will summarize the policy considerations concerning nursing homes and the decision to evacuate versus shelter residents in place.

OBJECTIVES OF SAFEHAVEN STUDY

V. Mor, K. Hyer, Z. Feng, D. Dosa, L.M. Brown, *Community Health, Brown University, Providence, Rhode Island*

Strategic Approach to Facilitating Evacuation by Health Assessment of Vulnerable Elderly in Nursing Homes (SAFE HAVEN) Study is an RO1 study. Using Medicare claims, quarterly NH resident assessment data, longitudinal facility files and geo-coded data on each hurricane hitting Florida and the Gulf coast states between 2004 and 2007, we estimate the impact of hurricanes on NH residents' morbidity and mortality. Using the distance between the nursing home and the predicted path of Hurricane Katrina as an instrument, we will estimate the effect of the decision to evacuate or shelter in place on residents' outcomes at 1,3 and 6 month periods.

IDENTIFYING NURSING HOMES AND RESIDENTS IMPACTED BY HURRICANES

Z. Feng¹, K.S. Thomas², D. Dosa¹, K. Hyer², L.M. Brown², V. Mor¹, 1. *Center for Gerontology & Health Care Research, Brown University, Providence, Rhode Island*, 2. *University of South Florida, Tampa, Florida*

This presentation describes the hurricane forecasting model we use to identify the geographic location of nursing homes at risk for evacuation 48 hours prior to the hurricane landing in the event of Hurricane Katrina in August 2005. Based on the forecasted path of Katrina 48 hours before its landfall, we identified 209 nursing homes located in 42 "at-risk" counties from 4 states (LA, MS, AL, and FL), of which 59 homes evacuated and the remaining 150 sheltered in place. A total of 14,623 elderly residents in these 209 facilities met our inclusion criteria in the pre-storm baseline sample. Merging MDS, inpatient claims and Medicare enrollment data, we tracked these residents up to 180 days post Katrina to define their morbidity, hospitalization and mortality outcomes. We compare characteristics of facilities (from OSCAR) that evacuated versus those that sheltered in place as well as post-storm resident outcomes by evacuation status.

MORTALITY AND HOSPITALIZATION OF NURSING HOME RESIDENTS EVACUATED VERSUS SHELTERED IN PLACE DURING KATRINA

K. Hyer¹, L.M. Brown¹, D. Dosa², Z. Feng², K.S. Thomas¹, V. Mor², 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *Brown University, Providence, Rhode Island*

Long-stay nursing home (NH) residents are especially vulnerable to natural disasters, as they have extensive care needs and therefore, higher disaster-associated risks. This paper describes the affects of Hurricane Katrina on 14,623 long-stay nursing home (NH) residents in 209 facilities that were in the path of Katrina. We compare the mortality and hospitalization rates of these residents related to whether the residents were evacuated from the NH or sheltered in place. Additionally, we evaluate the differences in mortality and hospitalizations at 30, 90, and 180 days relative to control data from the same NHs during 2004. Residents are tracked by linking Minimum data set (MDS) records matched to Medicare claims. The trauma and risk of evacuation versus sheltering residents will be discussed.

IMPACT OF EVACUATION ON ADL DECLINE, FALLS, DELIRIUM

D. Dosa², L.M. Brown¹, Z. Feng², K. Hyer¹, K.S. Thomas¹, V. Mor², 1. *School of Aging Studies, University of South Florida, Tampa, Florida*, 2. *Brown University, Providence, Rhode Island*

This paper describes the affects of hurricane disasters on the morbidity of nursing home (NH) residents. We compare the morbidity (e.g. falls, functional decline, and behavioral symptoms such as delirium) of NH residents related to hurricane exposure at 30, 90, and 180 days relative to control data from the same NHs during 2004. Additionally, we evaluate the differences in morbidity related to evacuation status (e.g. before, after, or sheltered in place). Morbidity will be ascertained using data from the Minimum Data Set (MDS) and Medicare claims. A decline in Activities of Daily Living will be measured comparing the most recent MDS prior to the storm with those obtained subsequent to the hurricane. Data related to falls will be obtained from the MDS and from Medicare claims where falls were coded as a primary diagnosis. Finally, delirium will be determined using two previously published MDS scales proposed by Marcantonio and Dosa.

CHALLENGES PROVIDERS FACE TO SHELTER RESIDENTS IN PLACE: THE POLITICAL AND ECONOMIC CHALLENGES PROVIDERS FACE TO SHELTERING RESIDENTS IN PLACE

L. Polivka-West, K. Hyer, L.M. Brown, *FL Health Care Assoc, Tallahassee, Florida*

Emergencies can be a relatively localized event, such as aircraft crashes and tornadoes, or may encompass large geographic regions, such as hurricanes and wildfires. The speed at which events occur can vary greatly – Hurricane Katrina was tracked as a monster storm for at least 2 to 3 days prior to landfall, while Hurricane Wilma intensified explosively. While planning for every scenario is impossible, laws and regulations require comprehensive planning to ensure the protection of long term care facility residents, their proper nutrition and hydration, adequate staffing before, during, and after the event, essential communications with families and officials. Panelists will discuss the challenges of maintaining generator power with power outages, providing ongoing dialysis and vent care, planning for possible fuel and supply shortages, staffing concerns and dealing with the lack of consistent federal coverage policies.

SESSION 1915 (PAPER)

UNDERSTANDING AND TREATING MENTAL DISORDERS

ASSESSMENT OF PTSD IN OLDER PEACEKEEPERS: THE POSTTRAUMATIC STRESS DISORDER CHECKLIST: MILITARY VERSION (PCL_M)

E. Yoon, *School of Social Work, Jackson State University, Jackson, Mississippi*

As wars and conflicts continue, there is increasing concern for peacekeepers in conflict zones, many who are at high-risk for PTSD. Given rising deployments of military forces on peacekeeping missions to various conflict zones, it is important to better understand the risk factors for PTSD of these veterans. The goal of this study about trauma and its effect in older adults, especially peacekeepers and veterans is to contribute to a knowledge gap. The Posttraumatic Stress Disorder Checklist: Military Version (PCL_M) is a 17-item, self-report measure of PTSD symptomatology in military veterans, provides on total score and four subscale scores for older peacekeepers' PTSD (re-experiencing, avoiding, numbing, and hyperarousal symptoms). 456 male older peacekeepers with deployed experiences were selected from a larger survey data by Veterans' Affairs Canada. The PCLM scores ranged from 17 to 83 (Mean+ SD = 23.73+ 10.25). With different cutoff score of 31 (44 & 50), 17% (7% & 3%) of total respondents may be considered for diagnosis with PTSD. Overall scale reliability was excellent with alpha of .93 and subscale alphas ranged from .81 to .90. Confirmatory factor analysis confirmed the best fit of 4 first-order model. Validity was confirmed through significant association of the PCL_M scores with well-established measures of depression, substance abuse, and general health indices. This study implied that the deployed combat experiences among older peacekeepers may be associated with the development of PTSD, which may be linked to age-related affective disorders and substance abuse disorders. The PCL_M is recommended as a reliable and valid tool for the clinical and empirical assessment tool screening the PTSD symptomatology specifically related to military experiences for older veterans. The PCL-M can be also recommended as an effective and efficient component of a comprehensive veteran based compensation and pension evaluation.

MENTAL DISORDERS AND ANTIPSYCHOTIC USE AMONG NON-ELDERLY NURSING HOME RESIDENTS

S. Simon, D. Lipson, C. Stone, *Mathematica Policy Research, Cambridge, Massachusetts*

Over the past two decades, several federal laws have been enacted to ensure that people with serious mental illness, especially those under age 65, are not institutionalized improperly and can receive appropriate treatment in the community. To determine whether these laws are working as intended, it is important to monitor the number of working-age nursing home residents with mental illness. This study used Medicaid claims [Medicaid Analytic Extract (MAX)] data to calculate the percentage of nursing home residents under age 65 with a documented mental disorder or a claim for antipsychotic medication. In 2002, 134,420 Medicaid beneficiaries aged 22 – 64 were residents in a nursing home for at least six months in our forty-seven state sample. On average, nearly 16 percent had a primary or secondary mental disorder diagnosis; this proportion varied considerably by state, from 5.4 to 29.3 percent. Further, 46 percent of our sample had at least one claim for antipsychotic medication, ranging from 12.7 to 70.1 percent. The high percentage of younger nursing home residents receiving antipsychotics relative to the proportion with a diagnosis of mental illness raises questions about possible medication misuse. These findings underscore a need for further research to understand the determinants of state variation such as: 1) the effectiveness of state PASRR programs in identifying people who should be receiving care in the community, 2) the extent to which nurs-

ing facilities are substituting for institutions for mental disease for Medicaid beneficiaries under age 65, and 3) availability of community based mental health services.

PERSONAL SUPPORT NETWORKS AMONG AGING MOTHERS AND THEIR MENTALLY ILL ADULT DAUGHTERS

J.E. Balestrery, L. Chadiha, R. Dunkle, B. Ingersoll-Dayton, *University of Michigan School of Social Work, Ann Arbor, Michigan*

Since the 1950s, research on families with mental illness has addressed social support and support networks with little attention to aging mothers. This study examines received and reciprocated social support between aging mothers and severe mentally ill adult daughters using qualitative interview data from a purposive sample of 22 aging mothers, 52-90 years old. This study utilizes a multi-dimensional framework to investigate aging mothers' relationships with personal support network (PSN) members in areas of support structure (network composition), support types (emotional/instrumental), and support patterns (received/reciprocated). The presence of adult daughters in aging mothers' support structure was predominant; aging mothers received and reciprocated across all categories of emotional/instrumental support more often than not; overall, aging mothers reciprocated emotional/instrumental support to all PSN members more than received from all PSN members. These findings suggest professionals should consider adult daughters and both patterns of received/reciprocated network support in working with aging mothers.

UNFORGIVENESS, RUMINATION AND DEPRESSION AMONG OLDER ADULTS

B. Ingersoll-Dayton¹, C. Torges², N. Krause³, *1. School of Social Work, University of Michigan, Ann Arbor, Michigan, 2. North Dakota State University, Fargo, North Dakota, 3. University of Michigan, Ann Arbor, Michigan*

Understanding the factors that contribute to depression in later life can help mental health practitioners develop interventions to prevent or remediate this problem. One possible source of geriatric depression is older adults' inability to forgive themselves for transgressions they have committed that have been hurtful to others. Unforgiveness may result in enduring ruminations that lead to and exacerbate depression. This paper tests a model that includes older adults' experience of unforgiveness as a precursor of depressive symptoms. Data were gathered from a national probability sample, the Religion, Aging and Health Survey, based on interviews with adults aged 66 and over (n=996). Structural equation modeling was used to test a conceptual model including five constructs: unforgiveness from God, unforgiveness from others, unforgiveness from self, rumination and depressive symptoms. The goodness of fit indices (NFI=.99; GFI=.99) indicated that our conceptual model had a good fit with the data. Further results showed that: 1) rumination mediated the relationship between self-unforgiveness and depressive symptoms; and 2) self-unforgiveness and rumination mediated the relationship between unforgiveness by God and depressive symptoms as well as between unforgiveness by others and depressive symptoms. Findings from this study identify some important pathways to geriatric depression. Implications for practice include the importance of asking about unforgiveness when working with depressed older adults. It may be particularly significant for mental health practitioners to explore unforgiveness from multiple sources (i.e., God, others, and self) and to assess the extent to which these sources of unforgiveness trigger obsessive ruminations.

QUALITATIVE FINDINGS FROM A RANDOMIZED CLINICAL TRIAL OF PSYCHOTHERAPY FOR ELDERLY WITH DEPRESSION

E.K. Dakin, *School of Social Work, Colorado State University, Fort Collins, Colorado*

One advantage of qualitative research is its ability to elicit valuable data beyond the original, intended area of inquiry. This qualitative study examined the treatment experiences of participants in a 12-week course of psychotherapy as part of an NIMH-funded randomized clinical trial (RCT) comparing Problem Solving Therapy (PST) to Supportive Therapy (ST) for depressed older adults with mild cognitive impairment. In addition to the intended purpose of evaluating the research participants' therapy experiences, this study also revealed meaningful information about ways that their experiences as research subjects in an RCT had impacted their depression. Semi-structured individual qualitative interviews were conducted with 22 older adults with depression and mild cognitive impairment who had participated in the RCT. Individual qualitative interviews elicited participant perspectives about various aspects of their treatment experiences (e.g., expectations regarding treatment, what was most and least helpful about treatment). Interviews were digitally recorded and transcribed, and a transcript analysis was conducted using the qualitative analysis software NVIVO. A useful finding was participants' indication that the research component of the study impacted their treatment experience in both positive and negative ways. For example, some participants found that quarterly neuropsychological assessments associated with the study contributed to a marked increase in depressive symptoms. Findings from this study urge the consideration of possible unintended clinical implications when planning geriatric mental health interventions research. The implications of research participation as a treatment effect in addition to the psychotherapy itself must be considered when translating new psychotherapies from research to community settings.

SESSION 1920 (SYMPOSIUM)

CONTEMPORARY APPROACHES TO BIOGERONTOLOGY: NEW INSIGHTS FROM ESPO RESEARCHERS

Chair: T.A. Vasilopoulos, *Center for Developmental and Health Genetics, Pennsylvania State University, University Park, Pennsylvania*

The aim of this symposium is to display the work of young and emerging researchers in the field of biogerontology. Biogerontology is a multifaceted field and is informed by many areas of biological research. This symposium will highlight research from the fields of genetics, physiology, endocrinology, biostatistics etc. and will discuss how these fields contribute to our understanding of the biological mechanisms of aging. Within these fields, the presenters will also discuss the use of humans, rodents and other models in studying the biology of aging. This symposium intends to not only address how these approaches can be utilized to study the biology of aging but will also argue the importance of these biological mechanisms in the understanding and improvement of healthspan in our global aging population.

COMMON GENETIC FACTOR UNDERLIES PHYSICAL AND COGNITIVE FUNCTION

T.A. Vasilopoulos¹, G. Vogler¹, G.E. McClearn^{1,2}, B. Johansson^{3,1}, S. Berg^{2,1}, *1. Center for Developmental and Health Genetics, Pennsylvania State University, University Park, Pennsylvania, 2. Jonkoping University, Jonkoping, Sweden, 3. University of Gothenburg, Gothenburg, Sweden*

The "common-cause" hypothesis postulates that a common factor underlies age-related variance of both cognitive and non-cognitive phenotypes. However, few studies have surveyed how genetic and environmental factors contribute to this "common-cause." A common-path-

way model was fit to data from the OCTO-Twin study (twins 80+ years) to assess how genetic and environmental factors influence the variation of several biomarkers of aging (blood pressure, grip strength, pulmonary function) and cognition (verbal, spatial, and memory ability) via a single latent factor. This latent factor explained a large portion of the variance for verbal (0.86 loading), spatial (0.85) and memory (0.86) abilities and for pulmonary function (0.56) and grip strength (0.67). Genetic factors accounted for 70% of variance in this latent factor, while environmental factors explained the remaining 30%. The results support the plausibility of a single factor, primarily influenced by genetic factors, underlying the variance of both non-cognitive and cognitive phenotypes.

HORMONAL CONTROL OF AGING AND DISEASE

M.E. Matzko, R.J. McCarter, *Penn State University, University Park, Pennsylvania*

Hormonal control of metabolism is relevant to both processes that extend lifespan (i.e. caloric restriction) and ones that maintain healthspan (i.e. prevention of cardiovascular disease, diabetes). Here we wish to examine contributions of metabolic hormones relevant to the anti-aging processes of caloric restriction and to processes responsible for the accelerated aging in obese men and women. We hypothesize that analysis of the metabolic profiles of these models will be informative regarding the underlying systems regulating health and disease. Mice transgenic for low-IGF-1 and heterogeneous stock mice were randomized to caloric restriction diets or its mimetics: ten-day 40% and 60% restrictions, or long term 40% and low-methionine diets. Human tissue from obese gastric-bypass patients was also analyzed. Our results indicate that ghrelin, IGF-1, insulin and glucose are differentially affected in these various models, and that ghrelin in particular may be important in coordinating the whole-body responses to states of altered metabolism.

SESSION 1925 (SYMPOSIUM)

AGE-RELATED CHANGES IN DECISION MAKING

Chair: J. Mikels, *Human Development, Cornell University, Ithaca, New York*

Social trends over the past few decades have provided remarkable increases in the choices afforded individuals when making decisions. These changes are especially pertinent to older individuals as they are increasingly faced with complex healthcare and financial decisions. Although research and theory have traditionally focused on the cognitive components of the decision process, recent research and theory have underscored the important contributions of emotional factors to decisions. The consideration of cognitive and emotional components in the decision process is highly relevant across the adult life span given divergent age-related changes in these component processes. In particular, age-related declines in deliberative processes and age-related gains in emotional processes have critical implications regarding decision making and how older adults approach complex decisions. For instance, evidence suggests that when older individuals make decisions, they consider and seek less information and prefer smaller choice sets. The underlying psychological and neural mechanisms for these changes remain opaque, as do the consequences. In this symposium, we will explore age-related changes in decision making, the underlying psychological and neural mechanisms, how such changes may impact the quality of decisions, and potential ways to improve the decisions of older adults.

MECHANISMS UNDERLYING AGE DIFFERENCES IN FINANCIAL DECISION MAKING: EVIDENCE FROM FUNCTIONAL NEUROIMAGING AND BEHAVIORAL TASK MANIPULATIONS

G.R. Samanez-Larkin, *Psychology, Stanford University, Stanford, California*

As human life expectancy continues to rise, the financial decisions of aging investors may have an increasing impact on the global economy. Two studies will be presented exploring the cognitive mechanisms underlying age differences in investment decisions. By combining a dynamic investment task with neuropsychological measures and functional neuroimaging, the first study indicates that an age-related increase in financial mistakes when choosing risky assets is partially mediated by a neuropsychological measure of cognitive flexibility, but fully mediated by a measure of variance in caudate function – a subcortical region implicated in guiding reward-based decisions. These findings identify a novel neural mechanism by which aging may bound rational choice in the realm of finance. In the second study, a series of task manipulations that modulate the influence of prefrontal and striatal neural systems successfully improve the financial decisions and confidence of older adults (equivalent to younger adults at baseline).

WHEN LESS IS ENOUGH: AGING, INFORMATION SEARCH, AND DECISION QUALITY IN CONSUMER CHOICE

R. Mata, L. Nunes, *University of Lisbon, Lisbon, Portugal*

A meta-analysis of age differences in pre-decisional information search ($N = 1363$) suggests aging is associated with a small but significant decrease in information search (Hedge's $g = .31$) and that heterogeneity in current findings is related to task characteristics, such as the amount of information available: The number of cues, but not other task or sample characteristics (i.e., age, gender), was strongly related to age differences in amount of information searched across studies ($r = .58$, $p = .02$). In addition, we estimated the consequences of limited information search for decision quality in real-world environments. Specifically, we simulated the use of different decision strategies in 140 consumer products (e.g., dishwashers, credit cards) under different search conditions (0-100% information available). The results suggest that the aging decision maker may afford to neglect information because this leads to small losses in accuracy. Thus, less may be enough for the aging consumer.

CHOICE ACROSS THE ADULT LIFE SPAN

J. Mikels, *Human Development, Cornell University, Ithaca, New York*

When we make decisions, from everyday selections of material goods to critical healthcare decisions, we are typically confronted with a wide array of options. Although research findings support numerous benefits of moderate levels of choice, evidence also suggests that increased choice may lead to decreased satisfaction. Critically, older and younger individuals may approach increased choice differently given age-related declines in deliberative processes coupled with age-related motivational shifts toward emotional regulation. The current project explored age-related changes in choice preference and valuation. In a series of studies, the number of options that older and younger adults prefer, the value that they place on increased choice, and cognitive and emotional correlates were examined. It was found that older adults prefer fewer options and place lower value on increased choice relative to their younger counterparts. The cognitive and emotional correlates will also be discussed to better understand these age-related changes.

SESSION 1930 (SYMPOSIUM)

CHRONIC DISEASE, HEALTH BEHAVIORS AND HEALTH OUTCOMES FROM THE SEATTLE LONGITUDINAL STUDY

Chair: J. Blaskewicz Boron, Psychology, Youngstown State University, Youngstown, Ohio

Discussant: A. O'Hanlon, University of New Orleans, New Orleans, Louisiana

The Seattle Longitudinal Study (SLS), begun by K. Warner Schaie in 1956, has become one of the most influential studies of adult intellectual development over the last 50 years. Utilizing a longitudinal sequential design (Schaie, 2005), the SLS samples participants from a health maintenance organization in the Pacific Northwest every 7 years (1956, 1963, 1970, 1977, 1984, 1991, 1998, and 2005). Most publications using SLS data have focused on intellectual change across adulthood; however, the study is multidisciplinary in measurement scope. The present symposium highlights the types of research questions revolving around chronic disease, health status, and health behaviors that can be addressed within the SLS. The first two papers incorporate chronic disease within the investigation of variability in cognition. Specifically Caskie and colleagues examine rate of change in executive functioning from midlife to old age, while including the impact of hypertension on rate of change. Revell and Schaie consider the relationships among Type 2 Diabetes, APOE-e4, dementia status, and level of cognitive ability. The third paper, by Zanjani and colleagues, explores the relationship between alcohol consumption and cognitive change. Finally, health is considered as an outcome variable by Ryan and colleagues who investigate the impact of personality and late life work experiences on objective and subjective health status. The discussion by O'Hanlon will highlight the advantages of examining multiple facets of health in a longitudinal sample to evaluate both specific and broad impacts on differential aspects of development (i.e., cognition, lifestyle, etc.).

HEALTH STATUS AS A PREDICTOR OF MIDLIFE AND LATER LIFE EXECUTIVE FUNCTIONING

G.I. Caskie¹, S.L. Willis², A. Carr¹, 1. *Education and Human Services, Lehigh University, Bethlehem, Pennsylvania*, 2. *University of Washington, Seattle, Washington*

Executive functioning has been shown to be related to increased risk of cognitive decline and possible dementia in old age. However, research has been limited on change in executive functioning in midlife and its relation to cognitive risk in old age or how an individual's health status, particularly the development of cardiovascular disease (e.g., Hoth et al., 2008), may influence the amount of change in executive functioning during midlife and later life. The association of midlife executive functioning and midlife hypertension to executive functioning in old age was examined with a subsample of Seattle Longitudinal Study participants assessed both in midlife and later life. Latent growth models indicated significant average change in executive functioning in both midlife and later life. Executive functioning at age 46 was positively related to rate of change in later life. Midlife hypertension in midlife shows a trend toward greater executive functioning declines in later life.

DEMENTIA STATUS RELATED TO PRESENCE OF TYPE 2 DIABETES, APOE-E4, AND NEUROCOGNITIVE FACTORS

A. Revell¹, K. Schaie², 1. *University of Massachusetts Dartmouth, Department of Psychology, North Dartmouth, Massachusetts*, 2. *University of Washington, Department of Psychiatry and Behavioral Sciences, Seattle, Washington*

Type 2 diabetes as a risk factor for cognitive impairment has been documented (e.g., Arvanitakis, Wilson, & Bennett, 2006), though the relationship to dementia and which cognitive domains are affected is less clear. In a sample of 450 community-dwelling older adults (mean age=72.21, SD age=7.92, range 59-93) from the Seattle Longitudinal Study (SLS), we investigated whether non-demented healthy older adults

(n=336) and questionable or impaired adults (n=114) showed significant mean level differences in memory recall, perceptual speed, and verbal reasoning factors, and further whether dementia status was associated with the presence of type 2 diabetes and apolipoprotein-epsilon 4 (APOE-e4). Full-information structural equation models in Mplus indicated that questionable or impaired individuals, who were more likely to have type 2 diabetes and APOE-e4, had significantly lower mean levels on perceptual speed and verbal reasoning factors. The model met criteria for acceptable fit (CFI=.93; RMSEA=.08) with significant indicators ($p < .05$).

TALK TITLE: THE IMPACT OF PERSONALITY FACETS AND LATE LIFE WORK EXPERIENCES ON HEALTH IN OLDER ADULTS

L. Ryan^{2,1}, J. Blaskewicz Boron³, K. Schaie⁴, S. Willis⁴, 1. *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*, 2. *Institute for Social Research, Ann Arbor, Michigan*, 3. *Youngstown State University, Youngstown, Ohio*, 4. *University of Washington, Seattle, Washington*

Multilevel modeling was used to examine a combination of individual and environmental predictors of health status change in older adults. A sub-sample of individuals aged 60+ (N=272; Age: M(T1)=67.6; Education: M=15 years) from the Seattle Longitudinal Study was selected. All participants were working in 1991 and had 14-year (3-wave) longitudinal data (1991-2005). Fifty-two percent of women and 49% of men worked across all 3 waves. Decline in both objective health status (OHS) and subjective health status (SHS) occurred over 14 years. After controlling for age, education, gender, and SHS, higher level OHS was associated with continued employment; SHS significantly moderated the effects of age and work status on OHS. Higher levels of SHS were associated with continued employment, high facet-level conscientiousness (self-discipline), low facet-level neuroticism (self-consciousness), and a significant interaction between OHS and work status. The impact of personality on SHS, and potential long-term impacts on OHS will be discussed.

ALCOHOL CONSUMPTION AND COGNITIVE CHANGE IN MID TO LATE LIFE

F. Zanjani¹, S.L. Willis², K. Schaie², 1. *Gerontology, University of Kentucky, Lexington, Kentucky*, 2. *University of Washington, Seattle, Washington*

Alcohol consumption and cognitive change were examined in a subsample (N=404) of the Seattle Longitudinal Study (1993-1998). Mean age of the sample in 1993 was 64.39 years (SD=8.21; Range=51-91). Three age groups were created: Middle-aged(52%): 45-64 years; Young-old(36%): 65-74 years; Old-old(12%): 75+ years. Sixty-nine percent (n=276) presented with a Mental Health/Substance Abuse diagnosis. Cognitive change was examined for memory ability (5% declined, 8% improved), executive ability (4% declined, 4% improved), and psychomotor speed (9% declined, 9% improved). Individuals who declined significantly on executive ability or memory showed the greatest reduction in alcohol consumption. These individuals initially had the highest level of alcohol consumption. Results suggest that cognitive status may affect change in alcohol consumption, indicating a decrease in drinking among individuals that experience decline in memory and executive functioning. Although medical advances contribute to greater longevity, this does not equate to quality of life, particularly when cognitive decline is evident.

CHRONIC HEALTH

RELIGIOSITY AND DEPRESSION AMONG AFRICAN AMERICAN AND WHITE CANCER SURVIVORS

L. Caplan², P. Sawyer¹, C.L. Holt³, R. Allman^{4,1}, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Morehouse School of Medicine, Atlanta, Georgia*, 3. *University of Maryland, College Park, Maryland*, 4. *Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

This analysis examines the association of depression and religiosity among African American and White Cancer survivors who participated in the UAB Study of Aging, a study of 1000 community-dwelling adults aged 65 and older (50% African American, 50% male, and 54% rural). 177 persons had a non-skin cancer diagnosis history. Participants answered questions from the Duke Religiosity Scale and the Geriatric Depression Scale (GDS). Three components of religiosity included: Organizational (based on church attendance), non-organizational (based on private behaviors such as prayer), and intrinsic (based on level of agreement on three attitudinal statements: experiencing presence of the Divine, religious beliefs lying behind one's approach to life, and carrying religion into all other dealings in life) were examined. Mean age of cancer survivors was 75.9 (SD=5.9); 48% African American, 42% female, 47% rural. Mean GDS score was 2.4 with 14% having scores suggestive of depression. 65% reported attending church once a week or more (organizational); 81% reported prayer, meditation or Bible study more than once a week (non-organizational); and 76% reported "definitely true of me" for all attitudes (intrinsic). In a multiple linear regression model controlling for age, race, gender, and rural residence, lower church attendance and lower levels of intrinsic religiosity were independently associated with higher GDS scores ($p<.001$ and $p=.036$, respectively). There were no significant interactions between race and the measures of religiosity, suggesting that for both African Americans and Whites, higher levels of religiosity were associated with reduced depression.

TREATMENT DECISION MAKING AND INFORMATION PROCESSING IN OLDER CANCER PATIENTS

J.M. Jacobs-Lawson¹, M. Schumacher², S. Arnold², C. Ortiz¹, E. Waddell¹, 1. *Gerontology, University of Kentucky, Lexington, Kentucky*, 2. *University of Kentucky, Lexington, Kentucky*

Although a significant amount of research exists in terms of outcomes and satisfaction with lung cancer treatment decisions, very little has focused on how patients' process treatment related information when making decisions. The present study sought to fill this gap. Older lung cancer patients (N=45, aged 50-82) completed a decision task where they recommended a treatment for a hypothetical individual with lung cancer. They were presented with the characteristics (side effects, complications, survival rates, number of treatments, how administered, and patient's stamina) of six different treatment options (surgery, surgery and chemotherapy, surgery and chemoradiotherapy, radiation, radiation and chemotherapy, and palliative care) in table form. In order to track information processing, participants could only view one piece of information at a time. Repeated measures ANOVAs compared the amount of information considered about (a) each treatment and (b) each characteristic. Results revealed patients were most likely to consider survival rates and side effects and were least concerned with how the treatment was administered and the patient's ability to withstand the treatment. With respect to treatments, participants were least likely to explore palliative care, and were more likely to consider information about surgery than radiation. Based on the description provided about the hypothetical lung cancer patient and his ability to withstand treatment, the most appropriate treatment would have been surgery followed by chemotherapy; however, only 24.4% of the patients recommended this treatment. Findings have implications for how physicians commu-

nicate with patients and interventions aimed at helping patients make treatment decisions.

REACTING AND ADAPTING: CANCER SURVIVORSHIP IN VETERANS ACROSS THE LIFESPAN

E. Archambault¹, J. Schuster¹, M.J. Karel¹, K. Trevino¹, B. Salib¹, J. Doughan², J. Moye¹, 1. *VA Boston Healthcare System, Boston, Massachusetts*, 2. *VA San Francisco Healthcare System, San Francisco, California*

There is a nearly 50% lifetime risk of developing cancer, yet due to advances in detection and treatment, the overall death rate associated with cancer has declined. Therefore, cancer survivorship is an increasingly prevalent issue among the aging population. Cancer and its treatment are associated with long-term mental and physical side effects. There are now ten million cancer survivors in the U.S., including half a million veterans. 84% of cancer survivors in VHA are older than age 60. In a review of 4,991,231 veterans treated in fiscal year 2007, 11% were cancer survivors. The most common cancer types are prostate, skin (non melanoma), colorectal, bladder, and lung, although relative prevalence varies by age. This study interviewed 40 veterans who were cancer survivors, and found that more than half experienced the cancer diagnosis as a traumatic stressor and reported symptoms of cancer-related PTSD, which was associated with younger age and more intensive treatments. Many reported struggling with loss of pleasure, although 80-90% also reported perceptions of personal growth. Most expressed an interest in a post-cancer treatment "transition plan." While 50-67% stated they would go to their PCP first for treatment related symptoms such as fatigue and sexual dysfunction, 25% admitted reluctance to see doctors due to fear it would bring bad news. These findings suggest that a trauma focused model of cancer diagnosis and treatment may accurately capture many veterans' experiences. This new conceptualization is ripe for future research and may inform clinical care for cancer survivors.

USE OF A REGISTRY OF OLDER ADULT LATE-STAGE CANCER PATIENTS AND THEIR CAREGIVERS: BARRIERS TO DATA COLLECTION

C. Mitchell, E. Lea, R. Raychaudhuri, T. McCallum, *Case Western Reserve University, Cleveland, OH*

While older adult cancer patients are now living longer than ever due to sophisticated treatment methods, little research exists on the psychosocial experiences of these patients and their caregivers. The collection of this type of information, through the creation of patient and caregiver registries, allows for both the storage of a broad range of psychosocial data and the creation of longitudinal data sets. The current study seeks to explore the difficulty of re-contacting members of such a registry for additional data collection. Attempts were made to re-contact 128 dyads within a larger registry comprised of older adult, end-stage cancer patients and their caregivers approximately one year after original registry participation. Of this group, 58% of dyads were reached, 25% returned consent forms, and 16% completed study participation. Additionally, at the time of re-contacting, 13% of the original 128 patients were reported to have died, and 19% of patient and caregiver phone numbers had been disconnected. Although the concept of a registry is excellent in theory, this study demonstrates the difficulties inherent in re-contacting a population that is prone to high rates of attrition. Additionally, the current study was completed via mail. Future studies attempting to re-contact patients and caregivers from registry databases might consider collecting additional data in person while patients are completing treatment at hospitals. This would serve to complete the consent and questionnaire process in a timely manner as well as providing an opportunity for participants to clarify any questions they might have about study procedures.

RACIAL DIFFERENCES IN HEALTH MAINTENANCE APPROACHES OF OLDER ADULT SURVIVORS OF CANCER

S. Brown, G.T. Deimling, M. Laroco, K. Bowman, *Sociology, Case Western Reserve University, Cleveland, Ohio*

This study examines racial differences in self- and medical health maintenance activities among cancer survivors. It specifically explores the role that education, health, and health beliefs play as mediators. This research examines data from an NCI (#R01-CA-78975) funded study. Data were collected from a randomly selected tumor registry of older adult, long-term survivors of cancer. Analysis of variance and OLS regressions were employed for data analyses. Findings reveal that African American and white cancer survivors differ in types of activities (i.e. exercise, rest, medical involvement) they use for health maintenance. However, even greater differences are seen across levels of education, within racial groups. Regression model comparisons show that education is a relatively strong predictor of self- and medical health maintenance indicators for blacks ($\beta = .29$ and $.34$, respectively) and whites ($\beta = .14$ and $.23$, respectively). Yet, race helps to explain a disparity in medical health maintenance. African American cancer survivors are less involved in medical decision-making when compared to their white counterparts ($\beta = -.19$). In contrast, race does not significantly explain involvement in self health maintenance activities. Medical skepticism, a health belief measure, significantly predicts self health maintenance, but does not differ by race. Differences were found in predictors of health factors by race. Findings of distinctions across levels of education, a proxy for socioeconomic status, may be a more powerful predictor than race in understanding health maintenance use among cancer survivors. This has implications for clinicians and practitioners treating minority and less educated older adults.

MENTAL HEALTH OF MIDLIFE ADULTS WITH CANCER: THE ROLE OF LEISURE, RELIGION, AND COMMUNITY

J.J. Jones, M.C. Janke, *Recreation, Sport, and Tourism, University of Illinois, Champaign, Illinois*

Research has documented the multiple challenges among those diagnosed with cancer, including issues related to their mental health. However, little is known about how involvement in community activities can influence the well-being of these adults during midlife. Using data from the second National Survey of Midlife Development in the United States (MIDUS II; $N = 657$), this study investigates the impact of leisure involvement, religiosity, and sense of community (SOC) on cancer survivors positive and negative affect. A measurement of respondents' participation in formal leisure activities (e.g., attending sports and social groups) and cognitive leisure activities (e.g., reading, attending lectures) was created. Religiosity was assessed using a 9-item scale ($\alpha = .93$), and sense of community was measured using a 12-item scale ($\alpha = .84$). Regression analyses were conducted to examine these relationships and indicate that as age, SOC, cognitive leisure activities, and religiosity increased, positive affect also increased while education was negatively associated with positive affect. Increasing age, being male, better health status and greater perceptions of SOC were significantly associated with less negative affect in this sample. These findings suggest that certain forms of community support and involvement may promote the mental health of adults with cancer.

PREDICTORS OF THE USE OF COMPLEMENTARY AND ALTERNATIVE THERAPIES BY OLDER ADULT CANCER SURVIVORS

M. Laroco, G. Deimling, S. Brown, K. Bowman, *Case Western Reserve University, Cleveland, Ohio*

The characteristics of those who utilize complementary and alternative medicines (CAMs) as an approach to disease management are ambiguous (Willison et al. 2005). Nevertheless, the interest in the use of these practices for cancer patients is steadily growing and has been associated with well-being and quality of life. This research examines

the factors that predict the use of CAMs among older adult cancer survivors. Data from an NCI funded (#R01-CA-78975) study using a random tumor registry sample of 321 older-adult, long-term survivors of breast, colorectal and prostate cancer are used. OLS regression was used to examine a multivariate model of the usage of CAM practices. Fifty-one percent of respondents reported using one or more forms of CAMs during treatment. The most prominent were meditation, visualization, special diets or vitamins, and use of herbs or teas. The strongest correlates of the use of CAM practices were current symptoms attributed to cancer ($\beta = .21$), medical skepticism ($\beta = .17$), and optimism ($\beta = .13$). These factors along with the demographic and other health measures explained 17% of the variance. The use of CAM practices is not linked to psycho-social well-being. Individual dispositional factors played a major role in the total number of CAM practices utilized. However, the best predictors were current cancer-related factors. Other health problems were unimportant, suggesting that CAM practices were derived solely from cancer issues. These data can be helpful to practitioners as they identify which among their clients are most likely to employ CAM practices.

GENDER DIFFERENCES IN POSTTRAUMATIC STRESS AND GROWTH IN ELDERLY CANCER PATIENTS AND CAREGIVERS

E. Lea, C. Mitchell, R. Raychaudhuri, T. McCallum, *Psychology, Case Western Reserve University, Cleveland, Ohio*

Following trauma, women are more likely than men to exhibit symptoms of posttraumatic stress (PTS), including avoidance, hyperarousal, and intrusive thoughts. Furthermore, cancer survivorship is associated with increased symptoms of PTS, particularly hyperarousal. The present exploratory study examined the effects of advanced-stage cancer on the PTS and posttraumatic growth (PTG) of older adult cancer patients and their spouse or partner caregivers. Both patients and spouse or partner caregivers completed measures on the impact of traumatic events and PTG ($N = 42$). In cancer patients, women experienced significantly more symptoms of intrusion ($t(15) = 2.1$, $p = .05$), avoidance ($t(17) = 2.3$, $p < .05$), and hyperarousal ($t(17) = 2.4$, $p < .05$) than men. The magnitudes of these differences were large ($\eta^2 = .2$, $.3$, and $.2$ respectively). There were no differences in these symptoms across gender for caregivers. Also, there was a trend for women (both patients and caregivers) to report more PTG in regard to the cancer experience than men ($t(32) = 1.8$, $p = .08$). The magnitude of this difference was moderate ($\eta^2 = .09$). These findings are consistent with prior research on gender differences in PTS and the PTG model proposed by Tedeschi and Calhoun (2004) which suggests that PTG is a result of changes in cognitive schemas after processing intrusive ruminations using self-disclosure and social support. Therefore, increased PTG may be a result of coping with increased PTS. Future research should investigate differences in coping by gender with a larger sample of older adults.

NEW EVIDENCE ON THE RACIAL DISPARITY IN ELDERLY CARDIOVASCULAR HEALTH AND THE ROLE OF PHARMACEUTICALS

B. MacInnis, D. Weir, *University of Michigan, Ann Arbor, Michigan*

Background. Since racial disparity in healthcare may contribute to racial health disparity, we postulate that the health benefits of newer cardiovascular pharmaceuticals in the late-1990s are shared by all elders, with blacks possibly obtaining greater benefits than whites. Pharmaceuticals present unique advantages as a modality of quality healthcare because they are uniform in the content, quantity, quality, and delivery. We sought to determine whether racial disparity in elderly cardiovascular health narrowed since the late 1990s, and whether this change was partly attributable to innovations in cardiovascular pharmaceuticals. Methods. We used data from the Health and Retirement Study (1994-2004) focusing on men aged 65-85 with outcomes of health status, vision, mobility, and disability. We used difference-in-difference method where

we compared the outcome of black elders with and without cardiovascular disease before and after the late 1990s, in contrast to the white counterparts. We assumed that those with cardiovascular disease were exposed to the potential benefits of cardiovascular pharmaceuticals, while those without were not. Results: We found that racial cardiovascular health gap narrowed substantially in the early 2000s in contrast to the late 1990s, evidently in a multitude of health outcomes—poor health, mobility, vision, and disability, after accounting for individual demographics. We found while co-morbidities, access to care, and economic resources were important contemporaneous correlates of health, these factors did not explain the narrowed gap, but the receipt of cardiovascular pharmaceuticals did. Conclusion: Racial cardiovascular health disparity among older adult men declined, and cardiovascular pharmaceuticals appeared to be a contributing factor.

I KNOW THAT IT'S SOMETHING THAT IS HARD TO SEE: PERCEPTIONS OF HEART DISEASE AND RISK FACTORS IN THE RURAL SAN LUIS VALLEY OF COLORADO

C. McMillin¹, S. Davis¹, K. Gallegos¹, C. Ledonne², D. Vieira¹, L.L. Bryant¹,
1. Colorado School of Public Health - University of Colorado Denver, Aurora, Colorado, 2. San Luis Valley Area Health Education Center, Alamosa, Colorado

Cardiovascular disease is the leading cause of adult mortality and morbidity in the United States, with disparate burdens in underserved populations. Hispanic women tend to exhibit the heart health status of Caucasian women 10 years older. The 6-member Prevention Research Centers Cardiovascular Health Intervention Research and Translation Network (PRC CHIRTN) conducted formative research to increase understanding of knowledge and perceptions of disease, risk, and prevention in their underserved partner communities. In the University of Colorado's partner community—the rural, low income, biethnic (47% Hispanic, primarily descendants of early settlers) San Luis Valley (SLV) in south central Colorado—we conducted four focus groups and one photovoice group among adult women (27 women, 60% Hispanic). Participants defined heart disease as a heart attack, stroke or a blockage and displayed a fear especially of stroke. "It would be very easy for me to develop [heart disease] because I don't change my lifestyle." Commonly mentioned risk factors included overweight/obesity, insufficient exercise, poor diet, stress, and diabetes. "I would picture the overweight beefy faced white man that is what I picture. Either a stroke or heart attack on the way. Because of their weight, probably high cholesterol, under exercised, over stressed." Participants had knowledge of prevention practices; however, they primarily attributed their poor lifestyle choices to a lack of motivation. "A huge clue is you have to be motivated to do it." Programmatic suggestions in these rural communities included the use of small local groups sharing practical advice.

THE CHANGING FACE OF HEART FAILURE: A NEEDS-DRIVEN PALLIATIVE CARE MODEL FOR ADVANCED HEART FAILURE

J.E. Hupcey¹, L. Kitko², J. Fogg¹, K. Fenstermacher¹, 1. School of Nursing, The Pennsylvania State University, Hershey, Pennsylvania, 2. The Pennsylvania State University, University Park, Pennsylvania

Background: As medical, surgical, and interventional strategies for cardiac diseases improve, the numbers of people living with heart failure is increasing. While the typical heart failure trajectory includes a risk of sudden cardiac death that is six to nine times the rate of the general population, most heart failure patients experience a slow, chronic deterioration that is interrupted by acute episodes of exacerbation and hospitalization. While health professionals agree that there is a need for palliative care for heart failure patients and families, inconsistencies remain in the timing and scope of these services. Because of the unpredictable nature of heart failure, it has been difficult to establish prognostic indicators that would trigger a palliative care referral. Consequently, palliative care needs often go unanswered. Objective: The

purpose of this presentation is to describe the experience of living with heart failure to better understand the palliative care needs of older patients and their spouses. Methods: A grounded theory study of 20 older couples living with advanced heart failure was conducted. Couples were individually interviewed over the course of 12-15 months to explore changing needs as they traverse the heart failure trajectory. Findings: Interviews revealed an urgency for interventions for physical, emotional, and psychosocial needs in tandem with life-saving cardiac care. Conclusions: All of these needs could be addressed through a palliative care model that is needs-driven in response to the heart failure trajectory. A new model for palliative care that addresses needs from the time of diagnosis until death is presented.

OLDER BLACK AND WHITE WOMEN'S CARDIAC RISK PERCEPTIONS

L.L. Lefler, College of Nursing, U of Arkansas for Medical Sciences, Little Rock, Arkansas

Background: Risk factors for coronary heart disease (CHD) are at epidemic proportions among older women, yet women seldom perceive risk for heart disease. Reasons for lack of understanding regarding risk are unclear and not well established. Purposes were to: 1) Explore older women's perceived CHD risk to identify factors that influence beliefs, 2) Compare factors per race. Methods: A descriptive, naturalistic qualitative study using a semi-structured interview guide elicited in-depth, narrative data which was recorded and transcribed verbatim. Participants completed a demographic and medical questionnaire. Narrative data was analyzed using content analysis with constant comparison. Results: Twenty-four (n=9 Black; n=15 White), older (>60 years) women with CHD risk factors were recruited from a senior-health clinic. Participants had a mean of 4.42 risk factors, 80% with at least a high school education, and 33% impoverished. Mean perceived personal CHD risk was 1.95 (+ 1.57) on 0-7 scale. Preliminary qualitative analyses reveal five major factors that influenced risk perceptions: 1) Lack of awareness of women's CHD; 2) Limited understanding of CHD etiology; 3) Competing priorities, which emphasized gender-based caretaker roles; 4) Lack of healthcare provider influence for change; and 5) denial, transference and minimization of CHD. Racial differences in beliefs were found. Conclusions: Black and White older women perceived their risk for heart disease to be low. They had limited CHD awareness and knowledge with misunderstandings of the link between risk factors and heart disease. To be effective, tailored interventions for older women are needed that consider beliefs about CHD risk.

LEISURE-BASED PREDICTORS OF ARTHRITIS SELF-EFFICACY AMONG MIDDLE AGED AND OLDER ADULTS

M.C. Janke, J.S. Son, L.L. Payne, University of Illinois at Urbana-Champaign, Champaign, Illinois

Research suggests that individuals with higher self-efficacy tend to report higher activity levels, and that involvement in physically active leisure programs enhances arthritis self-efficacy. Yet, the relationship between social cognitive aspects of leisure (e.g., self-regulation, outcome expectations, self-efficacy) among adults with arthritis is unclear. This study examined the relationship between leisure activity and self-efficacy among 102 adults with arthritis (mean age 73.6 years). Leisure was measured in two ways: a modified version of the Selective Optimization with Compensation (SOC) scale to assess adaptation and self-regulation of leisure activities and a 12-item measure of Leisure Outcome Expectations assessing perceived benefits of leisure involvement. Self-efficacy was measured using the Arthritis Self-Efficacy Scale. Regression analyses indicated that leisure outcome expectations and arthritis severity significantly predicted perceptions of arthritis self-efficacy. Our findings suggest that aspects of leisure may influence the self-efficacy of adults with arthritis, particularly through their potential benefits.

WHAT'S GOD GOT TO DO WITH IT? RELIGIOSITY AND RELIGIOUS COPING IN BLACK AND WHITE WOMEN WITH ARTHRITIS

C.A. Mingo, J.M. McIlvane, T. Baker, *School of Aging Studies, University of South Florida, Tampa, Florida*

Religion often, but not always, has a salutary influence on health outcomes, particularly for Blacks. Compared to Whites, Blacks are more likely to utilize religion as a coping mechanism when faced with health problems. Using both illness-specific and general indicators of religious coping and religiosity, this study examines race differences between Black and White women with arthritis, and examines whether religiosity and religious coping are related to factors commonly associated with arthritis (i.e., pain, functional impairment, depression). Participants included 77 Black and 98 White women with arthritis (aged 45-90) who completed structured interviews assessing religiosity, religious coping, pain, functional impairment, and depression. Descriptive analyses examined race differences in study variables. Regression analyses examined associations of religious coping and religiosity with pain, functional impairment and depression in Whites and Blacks. Results indicated that Blacks were more likely to use religious coping and practices and had a greater sense of religious identity (e.g., how religious would you say you are) than Whites. Yet, in examining the relevance of religion in the context of arthritis, the non-significant results may be most telling. None of the religion indicators were associated with pain, functional impairment, or depression for Whites, or surprisingly for Blacks. Findings suggest that while religion may be beneficial to health outcomes in general, it may not transcend to outcomes specifically associated with arthritis. Considering that arthritis is often considered a normal part of aging, it may not be a condition where one feels it necessary to bother God, even for Blacks.

AGE AND RACIAL DIFFERENCES IN RADIATION THERAPY FOR BREAST CANCER AND ITS IMPACT ON SURVIVAL

M. Schneider, I. Zuckerman, D. Mullins, D. McNally, *University of Maryland School of Pharmacy, Department of Health Services Research, Baltimore, Maryland*

Objective Research suggests that radiation therapy reduces breast cancer recurrence. Studies have shown that age and race impact receipt of radiotherapy. The objective of this study was to explore age and racial differences in the receipt of radiotherapy among women with a first breast cancer diagnosis and determine the impact of receipt of this treatment on survival. Methods The most recent SEER-Medicare data (1999-2005) were used for this analysis. The study cohort included women age 65 and over with a first breast cancer diagnosis. Descriptive statistics were generated and multivariate logistic regression analyses performed to explore differences in receipt of radiation among groups (younger vs older women; whites, blacks, Hispanics) and to determine the impact of its receipt on survival. Results Of 145,710 women in the study cohort, 86% were white, 7% were black, and 2% were Hispanic. Analyses showed that receipt of radiation therapy decreased with increasing age; younger women were almost twice as likely as older women (age 75 and over) to receive treatment, controlling for cancer stage (OR=1.77; 95% CI=1.73-1.80). Whites were somewhat more likely to receive radiation therapy than blacks or Hispanics (OR= 1.09; 95% CI=1.04-1.15). Women in all groups who received radiation treatment were more likely to survive longer (HR=1.06; 95% CI=1.05-1.07). Discussion Results of this study substantiated previous studies showing that advanced age and race were risk factors for omission of radiation therapy. Findings suggest that improvement in treatment of vulnerable populations across the continuum of care for breast cancer is still needed.

DIABETES AND PHYSICAL FUNCTION IN THE HANDLS STUDY

M. Rice^{1,2}, S.R. Waldstein^{3,4}, M.K. Evans², A.B. Zonderman², *1. University of Maryland Baltimore, Gerontology Program, Baltimore, Maryland, 2. National Institute on Aging, Intramural Research Program, Baltimore, Maryland, 3. University of Maryland Baltimore County, Department of Psychology, Baltimore, Maryland, 4. Baltimore VA Medical Center, Geriatric Research Education and Clinical Center, Baltimore, Maryland*

Diabetes has been shown to predict decreased lower extremity function in adults. However, little is known about the association between diabetes and upper extremity function. We examined the potential interactive relations of diabetes and age, poverty, and race to upper and lower extremity outcomes in 1405 community-dwelling adults [mean age = 48(9.41), 43% male] derived from the baseline assessment of the Healthy Aging in Neighborhoods of Diversity across the Life Span (HANDLS) study. Exclusions were HIV/AIDS, neurological diseases, cardiovascular and cerebrovascular diseases, hand surgery, and arthritis. Participants performed lower extremity tests of side by side, semi-tandem, tandem, single leg stand, and number of repeated chairs tests, and upper extremity tests of right and left hand grip strength. Diabetes was defined by a fasting blood glucose sample (≥ 126) and self-reported history of diabetes diagnosis. Multiple regression analyses examined interactive relations of diabetes and age, poverty, and race to each physical function endpoint. Results revealed significant interactive relations of diabetes and race to right and left hand grip strength only (p 's $< .05$) such that African Americans with diabetes displayed greater grip strength. These findings contradict prior literature that has reported lesser grip strength among those with diabetes. However, African Americans have previously been shown to have greater average grip strength than Whites. Results may be further clarified by examination of possible higher order interactions of race and diabetes with other sociodemographic factors.

INCREASED SURVIVAL AMONG PEOPLE WITH MULTIPLE HEALTH PROBLEMS – A CHALLENGE FOR CARE PROVISION

B. Meinow, J. Heap, M.G. Parker, M. Thorslund, *Aging Research Center, Stockholm, Sweden*

Health trends among the oldest old are necessary to describe living conditions of the oldest old as well as to estimate future needs for eldercare. Most studies have focused on specific conditions one at a time and different indicators seem to follow different trends over time. Since health problems often exist simultaneously and are interrelated in late life, this study identified serious problems in three domains (diseases/symptoms, mobility, cognition/communication). Using two representative samples of the Swedish population aged 77+ (SWEOLD) we ask: How did the prevalence of persons having serious problems in no, one, and two/three domains (complex health problems) change between 1992 and 2002? How did the relation of complex health problems and mortality change during the same period? Results show that the prevalence of serious health problems in one domain as well as complex health problems increased significantly, from 19% to 26%. Controlled for age, gender, health and educational cohort differences, mortality decreased by 20% between 1992 and 2002. Men with complex problems accounted for most of this decrease. Thus the gender difference in mortality risk was almost eliminated among the most vulnerable adults. If this trend persists there are broad ramifications concerning resource needs and the need for collaboration between different providers of health care and social services. This is a particular challenge in Sweden with its policy that elderly people should remain in their own homes as long as possible.

APOE GENOTYPE AND LONGITUDINAL SERUM LIPIDS AND LIPOPROTEINS: AGE AND GENDER DIFFERENCES

C.A. Reynolds¹, A.M. Bennet², B. Johansson³, B. Malmberg⁴, M. Gatz^{5,2}, J.A. Prince², N.L. Pedersen^{2,5}, 1. *Department of Psychology, University of California at Riverside, Riverside, California*, 2. *Department of Medical Epidemiology and Biostatistics, Karolinska Institutet, Stockholm, Sweden*, 3. *Department of Psychology, Göteborg University, Göteborg, Sweden*, 4. *Institute of Gerontology, Jönköping University, Jönköping, Sweden*, 5. *Department of Psychology, University of Southern California, Los Angeles, California*

The APOE gene, encoding apolipoprotein E, plays a significant role in cholesterol metabolism and has been associated with a variety of health outcomes including cardiovascular disease and dementia. A recent meta-analysis suggested that the APOE genotype is associated with serum lipid levels with e2 carriers showing lower levels of total serum cholesterol and LDL-C levels and e4 carriers higher levels of these lipids compared to the intermediate values for those with the APOE e3e3 genotype. We extend prior research by considering APOE genotype and longitudinal serum lipids and lipoproteins in Swedish adults from the SATSA, OCTO-Twin and Gender twin studies. Applying a two-part spline growth model, results for men suggested that APOE genotype predicted level as well as longitudinal change for total serum cholesterol, apoA1, apoB, and triglycerides. For women, APOE genotype predicted level of total serum cholesterol and apoB but not longitudinal change. No association was observed for HDL in either males or females. Overall, relationships between APOE genotype and serum lipids and lipoproteins suggested that APOE e2 carriers demonstrate the lowest levels of total serum cholesterol and apoB and the highest apoA1 levels in contrast to APOE e4 carriers. For men, decline in total cholesterol occurred for APOE e2 carriers before 65 years whereas e4 carriers showed decline after age 65; moreover, the relative elevations in apoA1 levels for APOE e2 carriers dissipated after age 65. Triglycerides were elevated prior to 65 years in male APOE e2 and e4 carriers compared to those with APOE e3e3.

RETIREMENT AND CARDIAC HEALTH: A LONGITUDINAL, DYADIC ANALYSIS

A.L. Curl, *School of Social Work, University of Missouri, Columbia, Missouri*

As the Baby Boom generation reaches retirement age, the impact of this transition for cardiac health has emerged as a critical area of gerontological research. Prior research has examined the health effects of retirement, finding it to predict worse physical health (Curl, 2007; Dave, Rashad, & Spasojevic, 2006). This study investigated the impact of self-defined retirement on trajectories of heart problems of older married couples over a 12-year period (1992-2004). The sample (N=3,148) consisted of White and Black couples where both spouses participated in the Health and Retirement Study. At least one spouse was age 51 to 61 in 1992, and both were at least 40 years old. Neither spouse was completely retired at baseline and at least one spouse was working full-time or part-time (and not self-employed). Neither spouse reported a history of heart problems at baseline and both spouses had to meet all sample criteria. In multilevel analyses, the average risk of heart problem increased over time. For wives, both retirement and not being in the labor force predicted an increased risk of heart problems, compared to those who were working. For both husbands and wives, the retirement of one's spouse lowered their own risk of heart problems. There was significant individual variability in the impact of retirement on heart problems for husbands, but not wives. These findings have implications for policy and practice aimed at reducing post-retirement cardiac health decline as well as for continuing research efforts.

CAREGIVER RELATIONSHIPS IN ADVANCED CANCER: IMPLICATIONS FOR RACE AND DISTRESS

L.E. Francis, G. Kypriotakis, J.H. Rose, *Comprehensive Cancer Center, Case Western Reserve University, Cleveland, Ohio*

Objective: Advanced cancer afflicts the elderly more than any other group, and the burdens of caregiving fall heavily on African Americans and women. The psychological costs of caregiving are frequently high, with rates of depression and anxiety exceeding those of the general population. Drawing from the patient care literature, this study proposes that quality of relationship with key others involved in the patient's cancer care may serve as a buffer for caregiver distress. Relationships assessed included those between the caregiver and 1) family, 2) physician, and 3) patient. "Relationship" is conceptualized as including communication, conflict, and support. Method: Cross-sectional data were collected as part of an ongoing study of cancer support and communication. Data were collected via telephone interviews with 420 family caregivers of advanced cancer patients receiving care at two urban tertiary care cancer clinics in the Midwest. Depression and anxiety were measured with the 14-item Profile of Mood States. Results: Highly rated relationship quality for all three caregiver relationships, family ($p<.01$), patient ($p<.01$), and physician ($p<.001$) were associated with lower anxiety, but only two, family ($p<.01$) and physician ($p<.01$) were associated with lower depression. Race interacted with family and physician relationships, showing that a good physician relationship was more strongly associated with both lower depression and anxiety for whites, but a good family relationship was more strongly associated with lower depression and anxiety for African Americans. Conclusions: Relationship quality is an important buffer for caregiver distress, but not all relationships are equal for all groups of caregivers.

COMMUNICATION

NARRATIVES OF SELF IN A HISPANIC BILINGUAL DIAGNOSED WITH DEMENTIA OF THE ALZHEIMER'S-TYPE (DAT)

P.C. Lopez, *Applied Linguistics, Pennsylvania State University, University Park, Pennsylvania*

Literature on language and Dementia of the Alzheimer's-type (DAT) has traditionally focused on the neurological, cognitive, and functional declines and accompanying deficits. Emergent theories of self in dementia have shattered the notion that the person with DAT has no sense of self. Literature from a sociolinguistic perspective has shown that speakers diagnosed with DAT can display sense of self via the use of personal pronouns and personal references. This case study concerns the use of reported speech (RS – i.e., when a narrator quotes himself as speaker and as spoken about) in regard to the sense of self, and how RS is affected in one particular speaker. Methods: Narratives of a Hispanic bilingual diagnosed with DAT (BDAT) were collected and coded for RS, linguistic devices (e.g., adjectives, adverbs, choice of pronouns), and shifts in speaker roles (i.e., shift from narrator, character, interlocutor roles via change in verb tenses and pronouns). Results: Preliminary results of the case study indicate that (1) the BDAT decreases instances of RS, linguistic devices, and speaker roles when using his non-dominant language (English), and (2) the BDAT shows differential frequency of instances and levels of complexity of RS in both languages. Thus, DAT has a proportionally greater effect on RS in the non-dominant language (English) vs. the dominant language (Spanish). Discussion: The study suggests that although there are declines in linguistic devices, the BDAT continues exhibiting self-representations in both languages leading to a continued promotion of sense of self.

USING PERSON PERCEPTION SKILLS TO DISCERN EXEMPLARY AND ADEQUATE HOME CARE WORKERS

K. Grosch¹, L.J. Medvene¹, D. Walker², *1. Psychology, Wichita State University, Wichita, Kansas, 2. GRISWOLD SPECIAL CARE, Erdenheim, Pennsylvania*

This study tested the usefulness of a measure of interpersonal cognitive complexity for differentiating between home care workers who were exceptional versus adequate in providing care in person-centered ways to adults who were over 65 years of age, and disabled individuals living at home. Workers (N = 554) from five offices of an international home care organization were evaluated by the coordinators who referred them regarding their ability to provide care in individualized and personalized ways. The evaluation instrument consisted of 10 items related to person-centered behaviors identified and defined in previous research (Grosch, Medvene & Wolcott, 2008): e.g. "treats the client like a person". Across the five offices, the 60 workers scoring highest on the 10-item instrument were identified as exceptional- Group A - whereas those scoring lowest were considered adequate - Group B. Groups A and B were compared in terms of their ability to describe others in relatively complex ways, as measured by Crockett's Role Category Questionnaire (RCQ, Crockett, 1965). As hypothesized, workers in Group A had higher levels of interpersonal complexity than workers in Group B: M for Group A = 22.44 versus M for Group B = 17.98, $t(115) = 2.92$, $p < .01$. This study included a subsample (N = 30) of non-native English speaking workers. For this subsample, the hypothesis did not hold; however, RCQ scores were in the expected direction. The findings suggest that an individual difference - interpersonal cognitive complexity - may be useful in screening formal caregivers of the elderly.

USING A THINK-ALOUD TECHNIQUE TO EXAMINE THE FRAMING EFFECT AMONG YOUNGER AND OLDER ADULTS' MEDICAL DECISIONS

E. Woodhead, B. Edelstein, *Psychology, West Virginia University, Morgantown, West Virginia*

Older and younger adults are susceptible to a decisional bias when faced with medical decisions. The framing of the information (e.g., likelihood of dying versus surviving), upon which the decision is to be made, can influence a treatment decision. Although this framing bias has been demonstrated in multiple studies, no published studies have attempted to determine the decisional process older and younger adults engage in when presented with different information frames. The current study used a think-aloud procedure to examine decisional process differences in younger and older adults who did and did not demonstrate a framing effect. All participants were presented with a survival (chances of surviving) and mortality (chances of dying) framed scenario. Data were analyzed quantitatively to determine the presence of a framing effect and qualitatively to determine decisional process differences. Among younger adult participants, 45 percent demonstrated a framing effect, compared to 27.5 percent of older adults. Qualitative analyses revealed that older adults who did not demonstrate the framing effect tended to rely more heavily on personal experience, while those demonstrating the framing effect relied more heavily on the presented data. Among both younger and older adults, those demonstrating a framing effect tended to rely more heavily on the presented data. Those demonstrating the framing effect were significantly more likely to reference the data than those not demonstrating the framing effect ($p < .01$). After attending this session, attendees will be familiar with the effects information framing on medical decision making among older and younger adults.

FOCUSED COMMUNICATION TRAINING FOR CAREGIVERS OF PERSONS WITH AD: LESSONS LEARNED FROM CLINICAL TRIAL RESEARCH

P. Saunders¹, S. Walter², D.N. Ripich³, *1. GUMC, Washington, District of Columbia, 2. University of California, San Diego, La Jolla, California, 3. University of New England, Portland, Maine*

Communication problems have been cited to be the most difficult issue for caregivers of persons with dementia (AD). The FOCUSED Training (Ripich, 1994), an educational intervention for caregivers, was developed to help caregivers deal with one-to-one communication breakdowns. This is a 7-step caregiver-training program can increase successful communication and decrease communication barriers in conversations between the caregiver and the person with AD. FOCUSED was implemented as an add-on to a larger clinical drug trial run by the Alzheimer's Disease Cooperative Study. The VN study was aimed at testing the efficacy of divalproex sodium to reduce behaviors symptoms associated with dementia. The training program was expected to help reduce variance and promote study adherence in the larger clinical trial. The pilot results suggest trends ($n=8$) in the Caregiver Hassles Scale, The Modified Positive and Negative Affect Scale, and a survey of knowledge about AD. Results of this paper also describe best practices and lessons learned from incorporating communication training into a larger clinical trial.

"OLD PEOPLE AREN'T GREEN!" AN ANALYSIS OF DISNEY'S OLDER CHARACTERS, THEIR INTERACTIONS, AND THEIR INFLUENCE ON AUDIENCES

J.L. Atkinson, M.S. Plew, *Georgia State University, Atlanta, Georgia*

Research on media portrayals of older adults (e.g., children's literature, sitcoms, and magazines) has found older adults to be under-represented and/or negatively portrayed. Bell (1995) and Robinson, Calister, Magoffin, & Moore (2007) studied Disney portrayals, and this study extends this research by examining older characters, their interactions, and audience feedback. Twenty films were randomly selected from the "Disney canon," and the first project identified demographics for all speaking characters (N=460). Older adults (characters over 50 years of age) made up 23% of the sample. Of these older characters, 65.7% were male, 61% were white, and 42.9% were minor characters. In 10 movies, interactions were coded for elements such as cooperation, conflict, quality, context, patronizing speech, painful self-disclosures, interruptions, yelling, sarcasm, laughter, and power. Analyses reveal complicated relationships between type of contact (peer vs. intergenerational) and several interaction elements. Finally, focus groups were conducted: 1 group with teenagers, 2 groups with college students aged 18-28, and 1 group with adults aged 60 and older. Significant themes from these discussions include: Disney films are memorable and watched repeatedly; older characters were memorable only if they were main characters; portrayals influence other people but not me (Third Person Effect); older characters are diverse, as are real older adults; and age cues translate from interpersonal contexts to mediated contexts. Combining theoretically grounded content analysis with audience response increases our understanding of what these portrayals are and how they are perceived. The findings are discussed in terms of Intergenerational Contact Theory and Social Learning Theory.

TEXT COHESION AND READABILITY OF WRITTEN INFORMATION RELATED TO SENIOR HEALTH

C. Liu, *Indiana University at Indianapolis, Indianapolis, Indiana*

Text cohesion is the degree to which text content ties together. A cohesive text assists a reader to comprehend written information. However, text cohesion has never been measured in existing readability formulas, such as the Flesh Reading Ease index. To increase readability, particularly in current written health information for seniors, text cohesion might be an important factor in addition to existing readability formulas. This reported project was to examine 1) text cohesion of com-

mon written senior health information and 2) the correlation between text cohesion and the Flesh Reading Ease index. 200 short health texts were obtained from websites ($n=157$), brochures ($n=35$), and magazines ($n=5$). These texts were related to senior health in four domains: 1) medication knowledge, e.g. how to take or how to store medications; 2) disease knowledge, e.g., explanation of a disease and related symptoms; 3) treatment procedure, e.g., how a test is performed or how a disease is treated; and 4) health policy, e.g., Medicare. Coh-Metrix was used to analyze text cohesion among these texts. Factor analysis showed that referential cohesion and latent semantic index accounted for the most variance in text cohesion. There was no correlation between text cohesion and the Flesh Reading Ease index, $r = -.13$, $p = .055$. The result indicates that length of words and sentences (as measured by the Flesh Reading Ease index) is not related to text cohesion. Therefore, to increase readability of written health information for seniors, both factors must be considered.

COUPLES COMMUNICATION IN DEMENTIA: DEVELOPMENT OF AN IN-HOME INTERVENTION TO IMPROVE DYADIC COMMUNICATION IN CAREGIVERS AND THEIR DEMENTIA-DIAGNOSED PARTNERS

C.L. Williams, *Christine E. Lynn College of Nursing, Florida Atlantic University, Boca Raton, Florida*

As communication abilities decline, persons with dementia and their spouse caregivers are particularly vulnerable to communication breakdown. Misunderstandings, conflict and distress often characterize these relationships. The purpose of this pilot study was to examine the feasibility and acceptability of a communication intervention for dementia diagnosed couples. Spouses make up the largest group of dementia caregivers and have unique needs that should be addressed separately from other family caregivers. Interventions to facilitate positive relationships between dementia caregivers and their spouses diagnosed with dementia is an area of investigation in need of further development. A 10 week communication intervention was developed to improve dyadic communication. Couples received a program manual and were visited weekly for 10 weeks by a trained graduate student supervised by the investigator. Sessions included an 20 to 30 minutes of caregiver education and support, 10-15 minutes of supportive communication with care recipients and 10 minutes of dyadic communication in which the intervener supported caregivers to implement knowledge gained in the program. Couples were pre and posttested by an independent rater on marital satisfaction, caregiver burden and depression, care recipient depression, caregiver and care recipient verbal and nonverbal communication and caregiver knowledge about dementia. Qualitative methods were used to examine feasibility and acceptability of the intervention. Ultimately, this program of research will lead to the development of novel interventions to improve the quality of dyadic relationships in this vulnerable population.

A TOUCH OF HOME: ARTIFACTS OF PAST LIVES IN ASSISTED LIVING

R. Hrybyk, R. Rubinstein, *UMBC, Baltimore, Maryland*

The meaning of home and the impact of the environment on the aging self have been the focus of many studies. Chaudhury (2008) points out that "memories of home are a powerful means for sustaining our sense of self." Rubinstein (1989) suggests that "for older people, lives and environmental features are subjectively intertwined." The move from a home that often embodies life-long memories to a public-private room can disrupt one's sense of identity. A move to assisted living necessitates a downsizing of personal possessions as there is space for only a small number of mementos. These items often hold memories of loved ones or important events. Personal objects brought from home can preserve a sense of continuity with one's past. These treasures may create an important link for AL staff to communicate with elders in their care. This poster presents a content analysis of items in residents' rooms and

explores how these express the "self" to caregivers in assisted living. Methodology of the study combined content analysis of artifacts with ethnographic interviews of ten residents, the admissions coordinator, and a caregiver in a Mid-Atlantic assisted living facility. Using photographs of items as diverse as comfortable chairs to pictures of family members, this poster describes how artifacts of the past imbue a room in AL with a sense of home. This project is supported by the National Institute on Aging study, Stigma and the Cultural Context of Residential Settings for the Elderly, RO1 AG028469 (P.I. J. Kevin Eckert, Ph.D.)

INFORMATIONAL MEDIA PREFERENCES AMONG BABY BOOMERS AND OLDER ADULTS: FINDINGS FROM THE KENTUCKY ELDER READINESS INITIATIVE

F.B. Vorsky, G.D. Rowles, *University of Kentucky, Lexington, Kentucky*

This research sought to identify and compare media use preferences of Baby Boomers and older adults when seeking information on needed services. A survey developed as part of the Kentucky Elder Readiness Initiative included questions on the use of different media sources (newspaper, radio, television and internet) for learning about services, activities and local community events. The survey was mailed to 9,600 randomly selected households (640 in each of Kentucky's 15 Area Development Districts) in 2007. Statewide, 3,256 responses were received (33.9% response rate). Analyses differentiated among older adults (born before 1946) and Baby Boomers (born between 1946 and 1964). Results indicate high levels of reliance on newspapers (Baby Boomers 95.6%/older adults 94.8%) and television (Baby Boomers 94.7%/older adults 92.8%). Modest differences were apparent in the use of radio for information (Baby Boomers 92.7%/older adults 87.7%). Profound differences were found in the use of internet as a source of local information (Baby Boomers 80.7%/older adults 47.2%). The top quintile with respect to internet use was a cluster of three development districts including or adjacent to major metropolitan areas (Cincinnati, Louisville and Lexington). Education significantly affected use of the internet with only 52.4% of those with a high school diploma or less compared to 80.5% for those with some college or advanced degrees relying on this medium. The findings confirm the need for generation-related targeting of media choices by both advertisers and community services in their efforts to reach to reach older individuals.

SESSION 1945 (SYMPOSIUM)

GETTING TO KNOW THE NEIGHBORS: FRIENDSHIPS AMONG PEOPLE WITH DEMENTIA IN SPECIALIZED CARE UNITS

Chair: K. De Medeiros, *The Copper Ridge Institute, Sykesville, Maryland, The Johns Hopkins University School of Medicine, Baltimore, Maryland*

Discussant: S.R. Sabat, *Georgetown University, Washington, DC, District of Columbia*

People with dementia living in long-term care facilities are faced with many personal challenges, including forming new friendships, feeling "at home," and finding social activities that are personally interesting and cognitively stimulating. In addition, the ability to develop and maintain social relationships has been linked with positive psychological and health outcomes in this population. Although there is a body of work on relationships that people with dementia have with non-cognitively impaired people such as staff and family, there are few published studies that have explored sociability and friendships among residents themselves. This symposium presents a variety of findings from a current study on the social environments of a 20-bed residential unit of people with moderate to advanced dementia. Specifically, papers will address how friendship is operationalized, methods used to identify friendly and non-friendly interactions, and an ethnographic description of friends and non-friends in the study; a microanalysis of talk between friends and non-friends, including features of conversations among peo-

ple with moderate to advanced dementia; measures of cognitive, communicative and physical function and their role in predicting positive social outcomes; and the role of staff perceptions of residents and relationships in shaping the social milieu of the cognitively impaired. Having a better understanding of friendships that develop and are sustained in dementia care units, including how to foster better social interaction, has the potential to benefit residents in a variety of ways including increased quality of life and ability to maintain levels of function for longer periods of time.

RELATIONSHIP BETWEEN RESIDENTS' COGNITIVE AND COMMUNICATIVE ABILITIES AND STAFF PERCEPTIONS OF FRIENDSHIPS IN A DEMENTIA CARE ASSISTED LIVING SETTING

P.J. Doyle¹, K. De Medeiros^{2,3}, P. Saunders⁴, A. Mosby², M.E. Jeresano⁵, 1. *Gerontology, University of Maryland, Baltimore County, Baltimore, Maryland*, 2. *The Copper Ridge Institute, Sykesville, Maryland*, 3. *Johns Hopkins School of Medicine, Baltimore, Maryland*, 4. *Georgetown University, Washington, District of Columbia*, 5. *Towson University, Towson, Maryland*

The factors which contribute to the formation of friendships between people with dementia are still unknown. One possible factor is similarity of cognitive and communicative ability among residents. This was explored by utilizing qualitative and quantitative data of a study investigating these friendships. To describe resident relationships, staff rated how much resident A liked resident B on a scale of -3 to +3 for all 20 residents (Range(Means): 0.05-1.09). Staff also identified residents they thought were friends and explained why. Measures of cognitive (MMSE – Range: 0-18 & SIRS – Range: 4-22) and communicative ability (FLCI – Range: 7-82) were also used. We hypothesized that high likeability ratings would correspond to high cognitive and communicative abilities; low likeability with low abilities. While trends supported our hypothesis, relationships arose which suggested that ability alone does not predict friendship and that observed interactions may provide a better means of understanding friendships.

STAFF INTERACTIONS WITH RESIDENTS: COMMUNICATION STRATEGIES IN GROUP VERSUS INDIVIDUAL ENCOUNTERS

A. Mosby¹, K. De Medeiros^{1,2}, P. Saunders¹, P.J. Doyle¹, M.E. Jeresano¹, K. Van Haitsma¹, 1. *The Copper Ridge Institute, Sykesville, Maryland*, 2. *The Johns Hopkins University School of Medicine, Baltimore, Maryland*

Past research has shown that staff interactions with residents with dementia are a key component of socialization. Although there have been studies examining staff's role in the social world of long-term care environments, there have been few in depth explorations of the nature of these encounters. The purpose of this study was to examine how and when staff interacted with 20 residents in the context of general socialization (e.g., activities, meal times). Ethnographic observations were conducted for six months. Results revealed that activities' staff tended to focus their conversations on the residents' past, asking questions and providing opportunities for sharing memories while caregiving staff were more focused on immediate tasks at hand (e.g., finishing a meal). Interestingly, neither staff groups were likely to facilitate conversations between residents. This oversight may contribute to residents' dependence on staff for conversations. Further research is needed.

TOWARD DEFINING FRIENDSHIP IN COGNITIVELY IMPAIRED ADULTS: RETHINKING A FAMILIAR PARADIGM

K. De Medeiros^{1,2}, P. Saunders³, P.J. Doyle⁴, A. Mosby¹, K. Van Haitsma⁵, M.E. Jeresano⁶, 1. *The Copper Ridge Institute, Sykesville, Maryland*, 2. *The Johns Hopkins University School of Medicine, Baltimore, Maryland*, 3. *Georgetown University, Washington, D.C., District of Columbia*, 4. *The University of Maryland, Baltimore County, Baltimore, Maryland*, 5. *The Polisher Research Institute, Philadelphia, Pennsylvania*, 6. *Towson University, Towson, Maryland*

Although the term "friendship" may immediately invoke ideas about personal attributes or specific individuals in people without cognitive impairment, it can be more difficult to define in individuals with dementia. The question of what comprises friendships among people with dementia was the focus of our six-month observational study. Using a basic definition of "friendship" as including voluntary interaction, affective involvement, and a sense of commitment and reciprocity, we observed interactions among 20 residents and interviewed staff and residents about who were friends and why. Staff described "reminiscence" or participating in activities as a key component of resident friendships. However, from our ethnographic observations, we found that joint construction of the present (e.g., determining the year, the location, one's identity) between two or more people was a more common conversational theme among "friends." This insight adds an important and previously unreported dimension to the literature on social interaction.

TRANSITIONAL OBJECTS AS MEDIATORS OF COMMUNICATION IN MULTI-PARTY INTERACTIONS WITH DEMENTIA RESIDENTS IN LONG-TERM CARE

P. Saunders¹, K. De Medeiros^{2,3}, K. Van Haitsma⁴, A. Mosby², P.J. Doyle², M.E. Jeresano², 1. *GUMC, Washington, District of Columbia*, 2. *The Copper Ridge Research Institute, Sykesville, Maryland*, 3. *Johns Hopkins University, Baltimore, Maryland*, 4. *Polisher Research Institute, North Wales, Pennsylvania*

Much of the research on communication and dementia focuses on grammatical features (i.e., sentence length, complexity, forms of address) and topic (i.e., objects in the immediate context or distant past). Often this research excludes the role of the person with dementia as conversational partner in the communication process and avoids the complexity of multi-party conversation. This paper is based on data collected for the Friendship Study, which is an ethnographic study (n = 20 residents) of a long-term care facility for persons with moderate to severe dementia. Using an interactional sociolinguistic framework, which includes social factors such as power, space, and gender, this analysis examines linguistics elements to illustrate how the use of a toy animal promotes conversational interaction between staff and residents as well as between two residents. Findings show that residents and staff use indexicality, agency, coherence, and humor to facilitate and control/infantilize depending on the speaker/addressee.

SESSION 1950 (PAPER)

HOW SOCIAL NETWORKS INFLUENCE AGING

SUBJECTIVE SOCIAL STATUS AND HEALTH OF OLDER ADULTS IN MEXICO: DOES PLACE OF RESIDENCE MATTER?

H. Beard, R. Wong, *University of Texas Medical Branch, Galveston, Texas*

Objective: Subjective social status (SSS) is often used to explain social gradients in health. However, little research has focused on this factor in developing countries, particularly in Mexico. We explore regional differences (urban vs. rural) in the association between SSS and two health outcomes (global health and depressive symptoms) in a national sample from the 2003 wave of the Mexican Health and Aging Study (MHAS). Methods: The study included 5,543 Mexicans aged 52

and older from the MHAS. Half of respondents resided in urban Mexico. SSS was measured with the MacArthur Scale of Subjective Social Status. Health outcomes included a measure of global self-rated health and depressive symptoms using a modified version of the CES-D. Logistic regression models were used to explore the role of SSS in these health outcomes. Results: Thirty-six percent of older adults reported depressive symptoms and 68% reported poor/fair self-rated health. In rural areas, 42% reported depressive symptoms and 73% reported poor/fair self-rated health as compared to 30% and 62% in urban Mexico, respectively ($p < .001$). SSS was a consistent independent predictor of both depressive symptoms ($p < .001$) and poor/fair self-rated health ($p = .018$) in urban areas, whereas SSS was not significantly associated with these health outcomes in rural areas of Mexico. Implications: Findings suggest that health disparities in developing countries are not universally associated with SSS which is used in developed countries to demonstrate social gradients in health. Other factors such as social capital may be strongly associated with health disparities in rural regions of developing countries.

DEPRESSION AND SOCIAL NETWORKS IN COMMUNITY DWELLING ELDERS

F.E. Wilby, A. Barusch, *College of Social Work, University of Utah, Salt Lake City, Utah*

Social withdrawal and inadequate social support have been identified as correlates of depression in older adults, although the relationship between depression and social withdrawal is not universally accepted. The purpose of this study was to examine the social networks of both depressed and non depressed community dwelling elders to determine whether the depressed elders had fewer social contacts or less dense social networks than the non depressed participants. This study was conducted to describe social networks from the perspectives of older adults living in the community. The sample consisted of 91 randomly selected respondents. 25 respondents reported significant levels of depressive symptomatology as measured by the CES-D. All 91 completed in-depth interviews which included questions about the family members and other social contacts they had during the past week. All 91 of the sample reported having had social contacts with family and friends during the past week. Further analysis showed that depressed and non depressed individuals had very similar breadth of social contacts with spouses, grandchildren and family in general, although the depressed group mentioned sons and daughters less frequently. Additionally, the depressed group did report less involvement in volunteer work or civic engagement than did the non depressed group. The results suggest that the depressed group was not socially isolated or withdrawn but that the types of contacts they had differed from the non depressed group.

SOCIAL ISOLATION AMONG RECIPIENTS OF HOME-DELIVERED MEALS IN A MAJOR URBAN AREA

E. Wethington, *Human Development, Cornell University, Ithaca, New York*

Although home-delivered meals programs have existed for many years, relatively little is known about the social characteristics and networks of recipients, or the relationship of social support and network characteristics to physical functionality and well-being in this vulnerable population. The Cornell Institute for Translational Research on Aging (an Edward R. Roybal Center) and community partners conducted a random telephone survey with 1505 New York City recipients of home-delivered meals in 2004-2005. The study assessed social characteristics, health, formal service use, and evaluation of meals services. The sample was ethnically diverse (29% Black, 11% Hispanic, 1% Asian); 68% were age 80 or older and 12% were age 90+. Most recipients were at risk of social isolation, with 73% living alone and 67% widowed. The extent and frequency of interactions with children, other family members, neighbors and friends widely varied. Although one-third of the recipients reported frequent interaction and social activity, one-quarter

of the recipients reported a weak or nonexistent social interaction network, indicating social isolation. Among those classified as having multiple risk factors for social isolation, 27% reported being childless, 43% reported seeing children rarely or never, 51% had no relatives in the city, 48% reported no helpful neighbors, and 16% had no one to talk to if needed. Two percent spoke to no one but the meals delivery person on a daily basis. Larger social networks were strongly related to better mental health. The implications of these findings for the implementation of meals programs will be discussed.

SYMBOLIC BOUNDARY WORK AND FRIENDSHIPS AMONG RESIDENTS OF A PROGRESSIVE CARE RETIREMENT COMMUNITY

J. Harrison-Rexrode, *Virginia Tech, Blacksburg, Virginia*

In this study I explore the boundary work processes used by older adults, living in a progressive care retirement community, to decide who might be desirable and undesirable friends among other residents. Accounts of moral, cultural, and socioeconomic boundaries as mechanisms for including and excluding others as potential friends were collected using a combination of quantitative surveys and qualitative interviews from residents (age 65+) of a rural comprehensive retirement community in the United States. First, a survey designed to explore symbolic boundaries as well as structural and social aspects of friendships was distributed to approximately 350 residents of a comprehensive retirement community. Second, in-depth interviews of a sub-sample of 20 residents were collected in order to examine older adults' narratives regarding the role of symbolic boundaries in developing and maintaining friendships within the retirement community. Findings from this study enrich our understanding of how symbolic boundary use varies by group and context, as well as make theoretical contributions to the literature on symbolic boundaries by exploring the ways in which aging may alter the use of boundaries.

THE IMPACT OF SOCIAL NORMS ON RELATIONSHIPS OF OLDER MIGRANTS: RECIPROCITY AND EMOTIONAL CLOSENESS

V. Burholt, C. Dobbs, *Centre for Innovative Ageing, Swansea University, Swansea, United Kingdom*

There exists a wealth of research on care-giving to older people. However, there is relatively little data on the impact of reciprocity or non-reciprocity on the emotional well-being of older care-recipients. Research in the United Kingdom has found that, over time, increased support from adult children to parents decreased the emotional closeness of the parent to the child (Burholt & Wenger 1998). The authors speculate that this result is because uni-directional or non-reciprocated help is contrary to the mainstream British norms of independence. In other countries, where the expectation is to receive help from adult children in later life (Burholt et al. 2003), one may hypothesise that this relationship would be reversed, that is uni-directional help from adult children to parents would increase emotional closeness. With these structural determinants in mind, this paper seeks to explore the relationships between reciprocal help and emotional closeness in two different societies. The sample ($N = 603$, age = 55+) comprised Indian Gujaratis and Punjabis, and Bangladeshi Sylhetis living in the United Kingdom (i.e. migrant groups) or in the country of origin (i.e. non-migrant groups), where the number of participants was equally distributed across gender, ethnic group and country of residence. This research tests whether South Asian migrant carers have adopted the norms and values surrounding caring in the host society, or whether they maintain the values from the country of origin.

SESSION 1955 (SYMPOSIUM)

LOWER YOUR RISK OF COGNITIVE IMPAIRMENT? OPINIONS AND PRACTICES OF PRIMARY CARE PRACTITIONERS

Chair: R. Hunter, UNC Center for Aging and Health, Chapel Hill, North Carolina

Discussant: A. Caprio, UNC Division of Geriatric Medicine, Chapel Hill, North Carolina

Patients look to primary care practitioners for assessment and advice about maintaining health and preventing or delaying disease or disability. While patients view maintenance of cognitive function and prevention or delay of dementia as very important goals, relatively little is known about primary care practitioners' opinions and practices related to patients' cognitive health. This symposium will share research findings from focus groups and individual interviews conducted in three states by the Centers for Disease Control and Prevention's Healthy Aging Research Network to identify the current opinions and practices of primary care physicians, nurse practitioners and physician assistants. It will describe relevant recommendations and messages given to patients and identify perceived barriers to discussing brain health. Other findings to be presented are based on questions from the Porter-Novelli's 2008 DocStyles survey, with 1,000 primary care physician respondents, pertaining to their risk reduction communication with patients. In addition, the session will explore strategies used by primary care practitioners to keep current with evidence on cognitive health and the consequent implications for continuing education and other avenues for sharing evidence on cognitive health and/or prevention of dementia with medical practitioners. Implications for research, practice and training will be discussed.

PHYSICIAN OPINIONS AND PRACTICES FOR REDUCING RISKS OF COGNITIVE IMPAIRMENT: FOCUS GROUP RESULTS

A. Hochhalter^{1,2}, R. Hunter⁶, L.L. Bryant⁴, J. Sharkey³, D.B. Friedman⁵, R. Liu⁵, 1. Scott and White Healthcare, Temple, Texas, 2. Texas A&M Health Science Center, Temple, Texas, 3. Texas A&M HSC School of Rural Public Health, College Station, Texas, 4. University of Colorado Denver, Denver, Colorado, 5. University of South Carolina, Columbia, South Carolina, 6. University of North Carolina, Chapel Hill, North Carolina

Primary care physicians play a pivotal role in educating patients about management of health risks; however, little is known about physicians' opinions and practices regarding reduction of risk for cognitive impairment. A series of focus groups and individual interviews were conducted with 28 primary care physicians in three states by the Centers for Disease Control and Prevention's Healthy Aging Research Network. Results indicate that physicians do not view the evidence for prevention or delay of cognitive impairment or dementia as sufficiently compelling to integrate into patient counseling. However, they do offer recommendations that are supportive of brain health in the context of discussing other conditions. Reduction of risk for cognitive impairment is typically discussed directly only if prompted by a patient or family member. Other significant barriers to broader discussion of cognitive health are lack of time and the perception that other health issues are of relatively greater importance.

"YOU GIVE THEM ENOUGH TIME TO TALK A LITTLE BIT": MID-LEVEL PRACTITIONER FOCUS GROUP RESULTS

L.L. Bryant¹, A. Hochhalter², R. Hunter³, J. Sharkey⁴, D.B. Friedman⁵, R. Liu⁵, A.E. Mathews⁶, 1. Colorado School of Public Health, University of Colorado Denver, Aurora, Colorado, 2. Scott & White/Texas A&M Health Science Center, College Station, Texas, 3. Center for Aging and Health, University of North Carolina School of Medicine, Chapel Hill, North Carolina, 4. School of Rural Public Health, Texas A&M Health Science Center, College Station, Texas, 5. Arnold School of Public Health, University of South Carolina, Columbia, South Carolina, 6. University of South Carolina, Columbia, South Carolina

Mid-level practitioners – nurse-practitioners and physician's assistants – educate patients about healthy behaviors and management of health risks, but we know little about how they perceive and promote reduction of risk for cognitive impairment. Focus groups and individual interviews with 21 mid-level practitioners in three states by the Prevention Research Centers Healthy Aging Research Network found that, as with physicians, these providers do not regularly discuss brain health with older patients unless faced with obvious debility or family concerns. They do, however, encourage their patients to talk about "how they are doing," and if warranted, they follow up with mental status testing and recommendations for medications and physical and mental activity. They further express concern about the extent to which stigma and fear of dependence create barriers to addressing dementia and its common partner depression in both demented patients and their caregivers. These practitioners welcome continuing medical education in these areas.

PHYSICIAN BELIEFS AND PRACTICES FOR REDUCING RISKS OF COGNITIVE IMPAIRMENT: A LARGE NATIONAL SURVEY

K. Day¹, B. Wu², D.B. Friedman³, L. McGuire¹, S.B. Laditka⁴, J.N. Laditka⁴, R. Hunter⁵, L. Anderson¹, 1. Centers for Disease Control and Prevention Healthy Aging Program, Atlanta, Georgia, 2. University of North Carolina at Greensboro, Greensboro, North Carolina, 3. University of South Carolina, Columbia, South Carolina, 4. University of North Carolina at Charlotte, Charlotte, North Carolina, 5. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

Evidence increasingly suggests that healthy behaviors and management of vascular risks may help maintain cognitive health. Physicians educate patients about healthy behaviors and manage health risks. Yet little is known about physicians' beliefs and practices regarding risks for cognitive impairment. Five questions on physicians' risk reduction communication with patients were developed by the Centers for Disease Control and Prevention's Healthy Aging Program and Healthy Aging Research Network, and included in Porter-Novelli's 2008 DocStyles survey, with 1,000 primary care physician (PCP) respondents. 75% of PCPs said they discussed concerns about cognitive impairment with patients without dementia. Most PCPs (83%) said scientific evidence on reducing risk of cognitive impairment was moderate or weak. The majority reported advising patients to reduce their risk of cognitive impairment, with 92% recommending physical activity and 85% recommending intellectual stimulation. In this study, further analyses will be conducted on physicians' perceptions about the evidence and their recommendations.

PRIMARY CARE PROVIDERS' SOURCES AND PREFERENCES FOR COGNITIVE HEALTH INFORMATION

J. Warren-Findlow¹, A.E. Mathews², J.N. Laditka¹, 1. Public Health Sciences, The University of North Carolina at Charlotte, Charlotte, North Carolina, 2. University of South Carolina, Columbia, South Carolina

Many older adults are eager to maintain cognitive health (CH). Increasing evidence suggests that healthy behaviors, especially physical activity, promote CH. Primary care providers can offer patients information about behavior and CH. Further, tying hypertension and diabetes

treatment and smoking cessation to CH risk may improve adherence. We conducted 10 focus groups and 3 in-depth interviews with primary care providers (n=49) at 3 sites, asking about CH information. Regardless of delivery method (conferences, journals, Internet), preferred information sources had continuing medical education (CME) units. The most common information sources were pharmaceutical representatives and the popular media (local newspapers, news shows, celebrities on TV). Many providers used online subscription services for the latest research. Providers judged that research about the association between behavior and CH is “inconclusive,” with more research needed. Findings suggest a need for diverse communication strategies tied to CME to disseminate evidence-based CH information to primary care providers.

SESSION 1960 (SYMPOSIUM)

MECHANISMS UNDERLYING RESILIENCE: EXAMINATION OF RESOURCES AND PSYCHOLOGICAL STRENGTHS

Chair: D. Jopp, *Psychology, Fordham University, Bronx, New York*
Discussant: P. Fry, *Trinity Western University, Langley, British Columbia, Canada*

That individuals are often able to handle severe difficulty quite successfully is a fascinating issue that has been a topic of psychological research for decades. Despite the vast amount of research, there are still many open questions. This symposium focuses on the factors that may be underlying mechanisms of resilience. Sampling from an array of challenges including adaptation to a chronic health impairment, getting older, or self-stereotyping, the present papers focus on three types of mechanisms: resources, strategies, and beliefs. Christoph Rott and Daniela Jopp investigate the role of two sets of resources, contrasting the social and the physical environment, as sources of well-being in older adults. Alexa Mislowack examines effects of self-stereotyping on physical and psychological well-being. She uses Whitbourne's identity processing to explore the mechanisms through which stereotyping may operate. Drawing on Brandstaedter's dual process model, Kathrin Boerner investigates different types of coping responses to disability in midlife. Her qualitative and quantitative data provide an in-depth look at the multifaceted process of adaptation. Daniela Jopp and Christoph Rott investigate the factors related to self-efficacy in old age and centenarians. Jennifer Margrett and colleagues examine cognitive resilience and vitality among centenarians, by exploring which factors relate to cognitive competence and what characterizes the group of highly resilient individuals. Prem Fry will serve as a discussant. In sum, the papers show that resources and psychological strengths such as strategies and beliefs are mechanisms underlying resilience, and that these mechanisms help to gain a better understanding of the phenomenon of resilience.

PERSONS OR PLACES - ARE SOCIAL INTERACTION AND GOING TO FAVORITE PLACES SIMILAR SOURCES FOR WELL-BEING IN VERY OLD AGE?

C. Rott¹, D. Jopp², 1. *Institute of Gerontology, Heidelberg University, Heidelberg, Germany*, 2. *Fordham University, Department of Psychology, Bronx, New York*

It is well established that social interaction especially with persons that represent close relationships is an important source of well-being in old age. Much less evidence is available whether going to favorite places exerts a similar effect. In the current study affect, social interaction, visiting favorite places and physical symptoms of 26 subjects aged 75 to 103 years were assessed on an average of 25 days by daily telephone interviews. Within-person hierarchical linear models revealed that social interaction and going to favorite places enhanced positive affect when analyzed in separate models but each made also a comparable independent contribution when examined concurrently. No effect on negative affect was obtained. The effects of persons and places on positive affect persisted when controlling for physical symptoms that

might interfere with activities. Thus, going to favorite places seems to represent an additional and independent source for well-being in very old age.

POSITIVE AGING IN AN AGEIST SOCIETY: EXAMINING THE IMPACT OF IDENTITY PROCESSING AND SELF- STEREOTYPING ON WELL-BEING

A.M. Mislowack, *Counseling Psychology, Fordham University, New York, New York*

Previous empirical evidence suggests that age self-stereotyping (i.e., internalized ageism) poses serious threats to older adult's physical and psychological well-being. The present study explored the psychological mechanisms through which such self-stereotyping operate (i.e., identity processing styles; Whitbourne, 1986) and examined its impact on “positive aging” outcomes (psychological well-being, health-related quality-of-life, medical adherence). Internalized ageism was measured with Lawton's ATOA scale. Results revealed significant positive correlations between attitude towards aging and PWB ($r=.32$) and HRQOL ($r=.54$). Exploratory path analytic findings using 250 primarily White, community-dwelling adults (age 65-98) revealed both Whitbourne's balance and accommodation produced significant indirect and direct effects on both PWB and HRQOL scores as mediated by ATOA scores. Assimilation, according to Whitbourne akin to denial, was essentially non-informative in predicting positive aging. In conclusion, findings support Whitbourne and Sneed's (2002) hypothesis on the utility of considering internalization of ageist stereotypes within a self-system framework to predict positive adaptation.

COPING WITH DISABILITY – LIFE PHILOSOPHY VERSUS HANDLING CONCRETE CHALLENGES

K. Boerner, *Jewish Home Lifecare/Mount Sinai School of Medicine, New York, New York*

When goal pursuit is challenged, adaptive coping responses can involve the persistent effort to change one's situation to reach the goal (assimilation) and, when this no longer seems viable, to adjust one's goals to what is feasible (accommodation; Brandtstädter, 1999). This study used three types of data to examine the role assimilative and accommodative coping among 216 middle-aged adults with vision loss – general coping tendencies measured with scale data, as well as goal-specific coping assessed with item-based and narrative-based data. Whereas mean levels of both coping modes were similar for general coping, assimilative coping was clearly more prevalent in the goal-specific context. Moreover, the two coping modes showed a strong positive correlation for general coping, but either a negative or no link for goal-specific coping. Finally, general coping was more important in predicting depression, while goal-specific coping was more important for goal-interference. Implications for theory and future research are discussed.

SELF-EFFICACY IN YOUNG-OLD, OLD-OLD, AND CENTENARIANS: MEAN LEVELS AND PREDICTORS

D. Jopp¹, C. Rott², 1. *Psychology, Fordham University, Bronx, New York*, 2. *Heidelberg University, Heidelberg, Germany*

Psychological strengths such as self-efficacy have been investigated intensively regarding beneficial effects in young and middle-aged individuals, but much less in old age. Therefore, the present study addressed differences between young-old (n = 230) and old-old (n = 160) individuals as well as centenarians (n = 57) with respect to mean levels and the factors predicting self-efficacy. Self-efficacy was highest in the young-old, and somewhat lower in centenarians. The old-old had the lowest self-efficacy. Self-efficacy was positively related to education, phone contacts, vision, and health, and negatively related to loneliness. Age differential links existed for phone contacts and health, being related to self-efficacy in the younger groups, but not in centenarians. Loneliness was a significant predictor in all groups. Findings indicate that self-efficacy may be at risk in the fourth age, but that individuals are able

to adapt and distance themselves from factors that become continuously worse such as health.

COGNITIVE RESILIENCE AND VITALITY AMONG CENTENARIANS

J. Margrett¹, P. Martin¹, M. MacDonald¹, L. Poon², 1. *Iowa State University, Ames, Iowa*, 2. *University of Georgia, Athens, Georgia*

Despite advancing age and the presence of known risk factors, many individuals in very late life maintain high levels of cognitive functioning. The question arises as to which factors differentiate individuals who demonstrate cognitive resilience and vitality in advanced age. The current study examined cognitive resilience among 285 centenarians from the Georgia Centenarian Study. Using Mini-Mental Status Examination (MMSE) scores to gauge cognitive status, 55% of centenarians scored above 16 on the measure whereas 45% scored below this cut-off. Higher MMSE status related to greater ability to perform activities of daily living and everyday cognitive problem solving ($p < .0001$). Hierarchical regression analysis was employed to examine the influence of several categories of predictors on cognitive status including demographic and physical status, personality and coping, and social resources. Within the cognitively resilient group, the absence of negative affect and an orientation toward growth were significant predictors of cognitive status.

SESSION 1965 (SYMPOSIUM)

NEW PERSPECTIVES ON SOCIAL RELATIONS IN ADULTS: CONSIDERING HETEROGENEITY

Chair: K. Fiori, *Adelphi University, Garden City, New York*

The importance of social connectivity in adulthood is well-established; concurrently, researchers on differential aging have emphasized for decades the great heterogeneity among older adults. Despite this, many studies on social relationships have neglected the inherent variability of adult development. From multiple perspectives, this symposium seeks to explain that heterogeneity and underscores its importance by linking it to various adaptive outcomes. First, Merz and Huxhold examined the diverging effects of instrumental support provided either by kin or by non-kin on well-being and explored the role of relationship quality as a potential moderator of the association. Second, Fiori and Jager addressed heterogeneity in relationships using a pattern-centered approach that incorporated numerous aspects of support and social exchange. In their longitudinal analysis, latent class membership predicted various health outcomes of American middle-aged and older adults. The next two papers considered differences in self-regulatory processes to explain heterogeneity. Windsor and Anstey found that the strength of the association of positive and negative social exchanges with well-being diminished with increasing age. Huxhold and Wurm showed that individuals' attitudes towards their own aging affects the extent of aging-related decline in social integration. Finally, Rauer, Karney, and Zissimopoulos considered the influence of contextual factors on heterogeneity with respect to the marital relationship. Overall, these studies highlight the complexity of social relations in adulthood, and suggest that considering their inherent heterogeneity is important when trying to understand their influence on quality of life and the full potential of development into late life.

SOCIAL SUPPORT NETWORKS AND HEALTH ACROSS THE LIFESPAN: A LONGITUDINAL, PATTERN-CENTERED APPROACH

K. Fiori¹, J. Jager², 1. *Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York*, 2. *University of Michigan, Ann Arbor, Michigan*

Social support is a multidimensional construct that consists of the type of support (i.e., instrumental or emotional), the direction of support (i.e., given or received), the sources or targets of support (e.g., kin

vs. non-kin), and whether support is actual or potential. We used latent class analysis to uncover network types based on these dimensions and to examine the association between network types and health among 6,824 adults (M age = 54 at T1) in the two most recent waves (1992-3 and 2003-5) of the Wisconsin Longitudinal Study. We found six classes, or types, of social support networks. Class membership at T1 significantly predicted emotional, cognitive, and physical health at T2 (e.g., the "restricted" network had higher depressive symptoms at T2 than the "high potential support" network). Our findings will be discussed in light of the utility of a pattern-centered approach for uncovering heterogeneity in the social networks of adults.

REMARRIAGE IN OLDER ADULTHOOD: SIMILAR IN SUPPORT, YET NOT IN BENEFITS?

A. Rauer¹, B. Karney², J. Zissimopoulos³, 1. *Human Development and Family Studies, Auburn University, Auburn, Alabama*, 2. *UCLA, Los Angeles, California*, 3. *RAND, Santa Monica, California*

Although the benefits of marriage for older adults' health are well-documented, they appear to be enjoyed to a lesser extent by those in remarriages. One perspective on why this disparity exists is that remarriages are of lower quality than first marriages and thus provide fewer health benefits. To examine this, we compared continuously married and remarried individuals using the Health and Retirement Study (N = 2,069; M age = 65), controlling for variables likely to select individuals into remarriages (e.g., education). Despite a two-decade difference in marriage length, regressions revealed no differences in remarried and continuously marrieds' evaluations of their spouses' positive and negative support. Remarrieds, however, did report experiencing more chronic stressors. Our results suggest that to understand why remarriages in older adulthood may provide fewer health benefits, we need to look beyond the quality of these relationships to the circumstances in which they are likely to exist.

SOCIAL EXCHANGES AND MASTERY BELIEFS AS PREDICTORS OF AFFECTIVE WELL-BEING: EVIDENCE FROM THE PATH THROUGH LIFE PROJECT

T. Windsor, K. Anstey, *The Australian National University, Canberra, Australian Capital Territory, Australia*

Despite aging-related losses, studies have consistently shown relatively high levels of emotional well-being among older adults. We aimed to contribute to knowledge around the factors that predict well-being over the life course by examining age differences in associations of positive and negative social exchanges with positive and negative affect in a sample of 7472 young, midlife and older adults assessed on two measurement occasions, four years apart. Moderating effects of age on associations of mastery beliefs with affect were also examined. Results indicated a decrease in negative affect with advancing age. Older adults reported the most frequent positive and least frequent negative social exchanges; however associations of social exchanges with affect tended to be stronger among younger and midlife adults. Mastery was consistently related to higher well-being, with stronger associations evident for younger adults. Results are discussed in the context of life course perspectives on goal orientations and self-regulatory processes.

WELLBEING DEPENDS ON SOCIAL NETWORKS CHARACTERISTICS: COMPARING DIFFERENT TYPES AND PROVIDERS OF SUPPORT

E. Merz¹, O. Huxhold², 1. *Social Demography, Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands*, 2. *German Centre of Gerontology, Berlin, Germany*

This paper examined associations between characteristics of social relations and wellbeing in older adults. Particularly, emotional and instrumental support from kin and non-kin were studied in their diverging effects on wellbeing. Relationship quality was considered as moderator in the associations between support and wellbeing. Data from the

German Aging Survey were analyzed to predict wellbeing by kin and non-kin support and relationship quality. Emotional support from kin and instrumental support from non-kin were found to be positively associated with wellbeing. Emotional support from non-kin did not associate with wellbeing whereas instrumental support from kin decreased wellbeing. Relationship quality generally was positively related to wellbeing. Interestingly, the negative effect of instrumental kin support was buffered by relationship quality. In case of high relationship quality instrumental kin support benefitted wellbeing. Relations of high quality may ease the challenges of aging such as decreasing capacities and benefit wellbeing in older adults.

DYNAMIC INTERACTIONS OF INDIVIDUAL VIEWS ON AGING AND CHANGES IN SOCIAL NETWORKS

O. Huxhold, S. Wurm, *German Centre of Gerontology, Berlin, Germany*

Socio-emotional selectivity theory predicts that older adults abandon peripheral social contacts in order to maintain close relationships and to preserve high levels of social support. This developmental pattern has been thought of as an adaptive reaction of aging individuals to a limited time perspective or age-related losses in resources. Recent longitudinal studies have found, however, that older adults show significant interindividual differences regarding the development of social relationships. To shed some light on these differences, we link the development of structural social network characteristics to individual views on aging (IVA). It has been shown that, although IVAs are in part formed by actual experiences, individual's attitudes towards their own aging influence the way people age. Dynamic models using 12-year longitudinal data from about 1000 participants of the German Ageing Survey revealed that the more positive the IVA is, the less is the aging-related decline in social integration.

SESSION 1970 (SYMPOSIUM)

REACH OUT: THE BENEFIT OF ACTION GUIDES FOR TRANSLATING EVIDENCE-BASED INTERVENTIONS FOR CAREGIVERS

Chair: *L. McGuire, CDC, Atlanta, Georgia*

Discussant: *K. Maslow, Alzheimer's Association, Washington, District of Columbia*

There are approximately 10 million Americans are unpaid family caregivers who provide annually 8.5 billion hours of care to people with Alzheimer's disease or other dementia. Caring for a person with Alzheimer's disease or other dementia is often very difficult and challenging for a variety of reasons and can result in high levels of emotional stress and depression. For many caregivers, the care that they provide can have negative consequences for their health, employment, and financial security. The purpose of this session is to illustrate how an evidence-based caregiving intervention, REACH OUT (formerly known as the Alabama REACH Demonstration project), can be translated into an Action Guide or "how-to-manual" for the planning, implementation, and evaluation of the program in an agency or organization consistent with the RE-AIM framework. This session will achieve several goals: 1. demonstrate the need for and benefit of using evidence-based caregiving interventions; 2. describe the value of and methodology used to develop the Action Guide; and 3. present the components of the REACH OUT intervention with the supporting evidence. Finally, we will discuss the lessons learned from previous implementations and the benefit of the Action Guide. Through this session, attendees will learn how this intervention's implementation can be facilitated with the methodical approach presented within the Action Guide for use within their community or agency.

THE NEED FOR TRANSLATING EVIDENCE-BASED INTERVENTIONS: WHAT DO THE DATA TELL US ABOUT THE HEALTH AND WELL-BEING OF CAREGIVERS?

L. McGuire, M. Brown, CDC, Atlanta, Georgia

Caregivers provide an invaluable service to the people who receive their care. Approximately 10 million Americans are unpaid family caregivers provide annually 8.5 billion hours of care to people with Alzheimer's disease or other dementia. This type of caregiving may allow an individual with Alzheimer's disease to remain at home or in the community longer. For many caregivers, the care that they provide can have negative consequences to their physical and mental health, employment, and financial security. The purpose of this presentation is to provide an illustration of characteristics of caregivers, specifically those who care for persons with Alzheimer's disease, demonstrating the importance and need for implementing evidence-based interventions to improve the health and well-being of caregivers. This presentation will summarize recent findings from the Centers for Disease Control and Prevention, Alzheimer's Association, and other organizations with respect to caregivers' physical health, mental health, modifiable healthy lifestyle behaviors, and the use of preventative behaviors.

TRANSLATING THE REACH CAREGIVER INTERVENTION FOR USE BY AREA AGENCY ON AGING PERSONNEL: THE REACH OUT TRIAL

L.D. Burgio, School of Social Work, University of Michigan, Ann Arbor, Michigan

The Purpose Of This Project Was To Translate The Evidence-Based REACH II Intervention For Dementia Caregivers For Use In Four Area Agencies On Aging (AAAs). We Used a Quasi-Experimental Pre-Post Design. A Partnership Was Formed Between The Alabama Department Of Senior Services And The University Of Alabama. Through The Use Of Community-Based Participatory Research Methods The Partnership Trimmed The Full REACH Intervention Used In The Clinical Trial, For Feasible Use In The AAAs. A Condensed REACH Intervention Package (REACH OUT) Was Delivered To AD Caregivers During Four Home Visits And Three Therapeutic Phone Calls Over A 4-Month Period. A Condensed Assessment Package Examined Pre-Post Effects On Care-Recipient Risk And Behavior Problems, And Caregiver Burden, Health, And Depression. All Aspects Of The Program Except For Training And Periodic Consultation Were Controlled By AAA Staff. Significant Positive Pre-Post Effects Were Found On Caregiver Burden, Depression, Perceived Help, And Frequency Of Behavior Problems. A Caregiver Survey And AAA Interventionist Focus Group Reported High Acceptability Of The Program. After Attending This Symposium, Participants Will Be Able To Identify One Strategy For Translating Interventions Developed In Clinical Trial For Feasible Use In The Community.

DEVELOPING AN ACTION GUIDE TO TRANSLATE A CAREGIVING INTERVENTION

S.B. Toal, CDC, Atlanta, Georgia

The purpose of this session is to describe the development of a tool, referred to as an "Action Guide," designed to assist organizations in implementing caregiver programs. This session will first describe the value of an Action Guide and present examples of how this tool has been used in various public health programs. Then, the methodology used to develop the Action Guide will be delineated. Emphasis will be placed on how to dissect an intervention into planning, implementation, and evaluation phases. The REACH OUT caregiver intervention, formerly known as Alabama REACH, will be used as a case example. REACH OUT is designed to improve the lives of dementia caregivers by reducing their stress and burden. Through a series of home visits and phone calls, caregivers increase their knowledge of dementia and the caregiving role and learn various skills targeted at themselves (improving their health, teaching stress management) and the care recipient (teaching them how to manage problem behaviors). REACH OUT has been suc-

cessfully implemented in Alabama as a state-wide program and in several other settings, and holds promise for additional widespread implementation. Through this session, attendees will learn the importance of Action Guides in the translational process, gain an understanding of the methodical approach used in developing such Guides, and be able to apply this approach within their community or agency.

REACH OUT IMPLEMENTATION: LESSON LEARNED IN THE FIELD

B. Schmid, *1. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, 2. The University of Alabama, Tuscaloosa, Alabama*

REACH OUT is a model program of a successful translational project in the area of Alzheimer's caregiving. Many lessons have been learned in implementing the REACH OUT intervention in community settings. A successful program involves coordination among administrators and clinical staff from multiple organizations. Program planners and coordinators must contend with real world challenges such as budget constraints, limited human resources, and competing missions. The program was well-received by Alzheimer's family caregivers. In addition, it was praised by the staff implementing the intervention. Attendees will learn aspects of a successful implementation and the associated challenges from the perspective of both the Project Manager at The University of Alabama and the State Project Director. These will include lessons learned with respect to coordinating efforts among all partnering organizations, program development, training, consultation, and data analysis.

SESSION 1975 (POSTER)

SOCIAL NETWORKS

ASSOCIATION BETWEEN MARITAL STATUS AND LEVEL OF SOCIAL SUPPORT FOR AFRICAN AMERICAN WOMEN

K. Brown, *College of Social Work, Florida State University, Tallahassee, Florida*

Several scholars have detailed the importance of social support over the life course (Everard, 2000; Fung, Carstensen, & Lang, 2001; Lang & Baltes, 1997; Shaw, Krause, Liang, & Bennett, 2007). In an earlier study, Barrett (1999) found significant differences in levels of social support related to marital status. This current study sought to replicate and build upon Barrett's earlier study, with a focus on African American women. Tucker (2003) found that never married African American women reported less social support than married women. Social support is important because low levels of social support have been found to be correlated with depression (Lakey & Cronin, 2008). In this secondary data analysis study, the Americans' Changing Lives (ACL) longitudinal data set is used (House, 1986, 1989, 1994, & 2006). The research question asks whether there is an association between marital status and levels of social support for African American women, across their life spans. The hypothesis states that there is an association between marital status and levels of social support. Analysis of variance (ANOVA) was used in testing the hypothesis. Demographic factors controlled for include age, education, income, and health status. The sample of 3617 respondents was 53% female (n=1914), 11% Black (n=397), 69% married (n=2509), 20% previously married (n=738), and 10% never married (n=370). Significant between group differences related to marital status were found for social support, while controlling for race, gender, age, income, education, and self-reported health status. The findings have been weighted in order to generalize results to the population.

ON THE PROWL? EXPLORING 'COUGAR CULTURE' IN THE U.S

B. Harris-Wallace, L. Clark, *University of Maryland, Baltimore County, Baltimore, Maryland*

In the 1950 screen classic "Sunset Boulevard," an aged actress, Norma Desmond, attempts to revitalize her career by developing a relationship with a young, male screenwriter. "The Graduate," another Hollywood favorite, portrays the May-September romance as one of predator-prey, with an aging seductress enticing a young, naive schoolboy. In recent years, the popularity of the "older woman – younger man" relationship has risen due, in part, to its increased presence within Hollywood circles: Demi Moore, Madonna, and Ivana Trump are just a few of the celebrities leading this trend. The term 'cougar' has infiltrated popular media and culture, typically used to describe women who actively pursue younger men. Originally used in Canada as a slang term, some women view it as derogatory or demeaning, while others embrace it as portraying an image of desirability, independence, and empowerment. This paper examines the emergence of the 'cougar culture' in U.S. society. First, we present demographic and historical backgrounds, and common definitions existent in literature and popular culture. Next, we provide brief but exemplary representations of the 'cougar' in cinema, television, literature, and internet media. Third, we analyze these representations in the context of feminist and sociological theory, and discuss two relevant perspectives: the emergence of 'cougar' as social status, and the sub-cultural re-appropriation. We present positive and negative aspects of these, and conclude by suggesting future research that uses these frameworks to further understand how acceptance or rejection of cougar status influences relationships for women throughout their life course.

LIVING CONDITIONS AMONG PEOPLE WITH MULTIPLE HEALTH PROBLEMS

J. Heap, B. Meinow, M.G. Parker, M. Thorslund, *NVS, Karolinska Institutet & Stockholm Univ, Aging Research Center, Stockholm, Sweden*

This study focuses on very old people with multiple severe health problems. In Sweden, mortality rates for this group have declined and prevalence rates have increased significantly between 1992 and 2002. Thus, people live longer with multiple health problems than before. For those with multiple health problems, life can be said to be more difficult than for those without multiple health problems. When studying the concept Sense of Coherence, elderly people with multiple health problems to a lesser extent felt that life was manageable, comprehensible and meaningful. Besides having severe health problems – what are their living conditions really like? Our results from SWEOLD, a nationally representative survey of persons aged 77+, show that most elderly people with multiple health problems live alone. Looking at economic conditions, those with multiple health problems more often than those without multiple health problems had a lack of cash margin, but they did not report trouble managing their private economy. Regarding social network, almost all had someone to talk to about personal worries. Those with severe health problems had friends/acquaintances and relatives over to visit as frequently as those without severe health problems, but they were less likely to go out to visit others. Results also suggest that elderly people with multiple health problems felt lonely more often than those without multiple health problems. In summary, very old people with multiple health problems have somewhat fewer economic and social resources, but there were few signs of economic destitution or social isolation.

CORE DISCUSSION NETWORK TYPOLOGY AND EMOTIONAL WELL-BEING AMONG OLDER ADULT

J. Kim, *University of Chicago, Chicago, Illinois*

Being embedded in social network with a particular array of others provides qualitatively different information that is not captured by adding up individual source of close relationship (e.g. number of family, friends).

This study (1) develops the typology of core discussion network to reveal particular array of others and (2) examines the association between social network types and emotional well-being. The data are drawn from National Social Life, Health and Aging Project (NSHAP), a national representative, population-based study of community-residing older adults of age 57-85 (N=3,005). Latent class analysis is used to construct a typology of ego-centric discussant networks revealing six network types: children, friends, kin-friend, partner-divers, partner-children, and partner-centered network. Twenty-seven percent of U.S. older adult population belongs to the partner-children network. Respondent's self-rated physical health, loneliness and depressive symptom scores were regressed on network types, controlling for basic sociodemographic background. Compared to the children network, respondents embedded in the kin-friends network scored significantly higher self-rated physical health, and significantly lower loneliness and depressive symptom. Respondents in the partner-children and the partner-centered network received significantly lower score in loneliness. The results show that respondents in the partner-centered network are even better off than those in the friends network who have almost twice the members and that the magnitude of loneliness is the same as the partner-children network who have almost triple. This supports the idea that a simple count of network members may misidentify the effect of social network on mental health, and calls for examination of network members as a whole.

SOCIAL EXCHANGES AND SUICIDAL IDEATION AMONG OLDER VETERANS WITH BEHAVIORAL HEALTH ISSUES

S. Mavandadi¹, D.W. Oslin^{2,1}, *1. Mental Illness Research, Education, and Clinical Center, Philadelphia VA Medical Center, Philadelphia, Pennsylvania, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

Objective: Veterans are at increased risk for suicide-related outcomes, and factors such as older age and medical and psychiatric comorbidity may increase veterans' susceptibility to suicide ideation, attempts, and completion. The quality of social ties also is a significant predictor of suicide morbidity and mortality. Despite evidence that relationships are compromised among veterans experiencing mental health/substance abuse (MH/SA) conditions, few studies have explored the association between social interactions and suicidal ideation in this group. Thus, the current study examined the relationship between positive and negative social interactions and suicidal ideation among older veterans experiencing significant MH/SA symptomatology. **Method:** The sample included 134 veterans aged 65+ referred by primary care for a clinical MH/SA assessment following a positive screen. Data on sociodemographics, MH/SA conditions (e.g., depression, PTSD, and substance abuse), the frequency of positive/negative social interactions, and suicidal ideation were extracted from clinical interviews and evaluated. **Results:** The sample was primarily male, Caucasian, married, and financially comfortable, with 24.6% and 32.8% meeting criteria for a MH/SA condition and suicidal ideation, respectively. Multiple logistic regression analysis revealed that, adjusting for sociodemographic and MH/SA conditions, more frequent negative interactions were related to a greater likelihood of suicidal ideation (OR=2.03, p=.003). Positive interactions were unrelated to suicidal ideation. **Conclusion:** Findings highlight the value of exploring the content and quality of social interactions among older veterans with behavioral issues who report suicidal ideation. Doing so may inform the design and implementation of care management models that target social functioning and/or incorporate preexisting social resources.

STRUCTURAL, FUNCTIONAL AND EVALUATIVE COMPONENTS OF SOCIAL RELATIONSHIPS IN A SAMPLE OF SPANISH ELDERLY: AN APPLICATION OF THE CONVOY MODEL (KAHN & ANTONUCCI, 1980)

M.M. Sanchez, J. Buz, *Universidad de Salamanca, Salamanca, Spain*

The convoy model (Kahn & Antonucci, 1980) has been widely used in gerontological research to describe social relationships from a life course perspective. The model was proposed such as an universal framework that could be applied to people from different age groups and cultural settings. The aims of this study are (1) to describe the social network of the Spanish elderly using the convoy model, (2) to validate the distinction between different circles of proximity in social relationships, according to their structural, functional and evaluative components, and (3) to analyze whether they are differentially related to loneliness. A questionnaire was applied to a sample of 646 community-dwelling older adults (60+). Social network data were collected using the hierarchical mapping procedure (Antonucci, 1986). Significant differences were found in the composition, frequency of contact and duration of social relationships. Exchange of instrumental and emotional support was higher in the intimate circle than in the other two circles. Finally, the participants were more satisfied with their intimate relationships than with the relationships with the other network members. The components of social relationships in the three circles were also differentially related to loneliness. A higher proportion of variance was explained by the first and second circles, but the properties of the third circle were also important in the prediction of loneliness. Our results support the application of Antonucci's convoy model (1980) to a sample of Spanish elderly, and show that all levels of intimacy in the social network are important to protect against loneliness.

CONFIDANTS, PROVIDING SUPPORT, AND PSYCHOLOGICAL WELL-BEING: FINDINGS FROM THE NORMATIVE AGING STUDY

N. Toyokawa¹, S. Kang¹, S. Choun¹, A. Taylor¹, A. Spiro², C.M. Aldwin¹, *1. Human Development & Family Studies, Oregon State University, Corvallis, Oregon, 2. VA Boston, Boston, Massachusetts*

Social support plays an important role for physical and psychological well-being, particularly for older adults (House & Antonucci, 1983; O'Bryant & Morgan, 1990). However, providing social support may also be important for well-being, especially for older adults (O'Bryant & Morgan, 1990). We hypothesized that both the number of confidants and the number of people to whom support was provided would be positively associated with their psychological well-being. We tested this hypothesis using a sample of 1,535 men from the Normative Aging Study (NAS), longitudinal study of healthy aging. The men completed a social survey in 1985. Their age ranged from 39 to 88 (M = 60.6, SD = 3.81). Most participants (87.8%) had at least one close friend and 88.6% of them had one or more confidants. Approximately 70% of the participants had been confided in by others in the past 3 months. Using the depression subscale of the SCL-90-R (Derogatis, 1975), the number of confidants was negatively correlated with depressive symptoms ($r = -.12, p < .001$). Contrary to the hypothesis, the number of people who confided in the participants was positively but modestly related to depression ($r = .10, p < .001$). The more people confided in the participants, the more likely they were to report depressive symptoms. This supports a social contagion model of stress – the larger the network, the more exposure to stressors, and the greater the psychological distress (McAdoo, 1982).

INTERPERSONAL PROCESSES BETWEEN OLDER ADULT FRIENDS: AN ACTOR-PARTNER MODEL

J. McFall, E. Keener, J. Strough, L. Schlosnagle, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

The present study examined interpersonal processes that occurred when older adults collaborated with a same-sex friend on problem-solv-

ing tasks. According to socio-emotional selectivity theory (Carstensen, 1992), older adults are concerned with sociability when working with a partner because of concerns for maintaining social relationships. Collaboration involves unique contributions of each individual, which also influence the partner's contributions (Strough, McFall, Flinn, 2006). Thus, an actor-partner interdependence model was examined in order to understand "actor" and "partner" effects on interpersonal processes. Specifically, negative relationship quality (arguing, lack of concern for partner) and social elements of the interaction (disagreement, lack of enjoyment) were examined in the present study (Hall, 1992; Keener & Strough, 2007; Strough, Berg, & Meegan, 2000). 76 older adults (ranging in age from 60-89, $M=71.33$, $SD=7.96$) collaborated in a problem-solving task (see Strough et al., 2007). Each dyad member completed a measure of his or her relationship quality with the friend prior to completing the task. After collaboration, each member of the dyad completed separate measures of the interaction's social elements. Structural equation modeling through AMOS 16 indicated that both actor and partner effects were found to explain the negative interpersonal processes during interaction. Results are discussed within a social problem-solving framework.

GENDER DIFFERENCES OF THE RELATIONS BETWEEN WELL-BEING AND PHYSICAL AND PSYCHO-SOCIAL FUNCTIONS

M. Takayama¹, J. Ando¹, Y. Arai¹, M. Takayama¹, H. Akiyama², Y. Gondo³, *1. Keio University, Yokohama, Japan, 2. The University of Tokyo, Tokyo, Japan, 3. Osaka University, Osaka, Japan*

During the last few decades, the gerontological literature documented the positive aspects of aging, especially among the young old. However, recent studies of the oldest old suggest that the process of optimization in very old age is more difficult than in earlier age, and there are some gender differences in the process. The aims of this study are to examine gender differences of the relations between well-being and physical, psychological and social functions among the oldest old. We sampled 1,600 Japanese elder people aged 85+ living in Tokyo. Six hundred and sixty people completed the test battery of physical functions (ADLs, IADLs and subjective health), psychological functions (MMSE and self-efficacy), social relations (social network, support and companionship), and subjective well-being (WHO-5 and PGC). Gender differences were found in social network and support. Men had higher ratings in the social network and support from family than women, and lower ratings in the social network of friends. For men, well-being was related to the social network and support from family and subjective health. For women, well-being was significantly associated with providing social support, companionship, self-efficacy and subjective health. The results suggest that there are gender differences in the process of optimization in very old age. The elder men may shift the placement of importance from physical and mental functions to family relationships in order to maintain well-being. On the other hand, the elder women may shift the placement of importance to the relationships with friends and siblings, and emotional satisfaction.

IS FRIENDSHIP INCREASING IN IMPORTANCE IN LATE ADULTHOOD? A COHORT COMPARISON

N. Stevens, T. Van Tilburg, *VU University, Amsterdam, Netherlands*

By providing emotional support, companionship and reassurance of worth, friends makes a unique contribution to well-being in later life that supplements contributions by family. Some argue that friendship has increased in importance during the last two decades. This study examines whether there has been an increase in reporting same-sex and cross-sex friendships in personal networks among members of earlier and more recent cohorts of older adult men and women during 17 years. Method: Data are from 1764 male and 1857 female respondents, born between 1908 and 1937, and followed between 1992 and 2009 in the Longitudinal Aging Study Amsterdam. At each observation assess-

ments were made on whether male or female friends were personal networks members. Logistic multilevel regression is used to compare developments in the presence of same-sex and cross-sex friends in personal networks of more recent cohorts and earlier cohorts. Results: There is a decline in the availability of same-sex and cross-sex friendships that accompanies aging among both recent and earlier cohorts of older adults. However the decline is less dramatic among more recent cohorts, particularly for female friends of women. Conclusion: There is evidence that the presence of same-sex and cross-sex friends in personal networks has increased slightly among more recent cohorts of older men and women; the increase is striking for women's female friends. Implications of the increase in education, employment of women and urbanization for these results will be discussed.

MORE THAN A GAME: WII IN RESIDENTIAL CARE SETTINGS

A.D. Peebles^{1,2}, A. Frankowski², M.C. Nemec², J.K. Eckert², *1. Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland, 2. Center for Aging Studies, UMBC, Baltimore, Maryland*

The Nintendo Wii gaming system has gained popularity with a wide audience, including older adults living in institutional settings. This poster explores the use of Wii gaming in a multi-residential senior housing site comprised of independent apartments, assisted living units, and a nursing home. Data for our analysis was drawn from over 54 reflexive interviews and 130 fieldnotes compiled during 18 months of conducting ethnography at the field site. Our findings suggest that the way in which the game is organized and monitored by staff influences the way residents approach the game, and that participation in Wii gaming leads to positive psychological outcomes, such as a sense of personal accomplishment and greater camaraderie among residents. We examine the ways in which residents with differing physical and cognitive functional levels are able to play together. We also explore both the relevant issue of resident safety and the game as a social event where residents take on, at the same time, the roles of both spectators and players. Comparisons within and between settings are made. Support for this poster comes from a multi-year, multi-site qualitative NIA-funded study, Stigma and the Cultural Context of Residential Settings for the Elderly (R01 AG028469 P.I., J. Kevin Eckert).

CONSIDERING THE SOCIAL IMPACT OF MARITAL STATUS CHANGE FOR MEN

L.K. Soulsby, K.M. Bennett, *University of Liverpool, Liverpool, Merseyside, United Kingdom*

Earlier research on the social impact of marital status and marital status change has tended to focus on the differences between the married and unmarried, or single, with little research attention paid to individual marital status groups, and the social changes experienced by men over time. Using qualitative interviewing, this research aimed to examine how transitions into, and out of, marriage affect social relationships and social interaction. Cohabiting, married, separated/divorced and widowed men were interviewed, and transcripts were analysed using grounded theory. The findings strongly suggest that marital status does affect men's access to social resources, including social networks, positive social interaction and social support. There were interesting differences in social network between marital status groups, specifically in the loss and gain of relationships over time. Cohabiting and married men reported a growth of the social network, whilst separated, divorced and widowed men were more likely to experience the loss of social contacts. There were also differences between marital status groups in social confidence, social interaction, and received social support, with generally higher levels reported in the cohabiting and married groups. Availability of these social resources had appeared to have an important effect on the participants' sense of wellbeing. Marital status transitions appear to have important social implications for men, and the impact of marital status change may vary by age. Support services should work with

the aim of minimising the negative social outcomes of transitions out of marriage, including separation, divorce and widowhood.

THE IMPACT OF SOCIAL SUPPORT ON FUNCTIONALITY OF OLDER ADULTS WITH AND WITHOUT FIBROMYALGIA

L. Zettel-Watson, A. Bateham, S. Diosdado, R. Shimizu, J. Oliveros, B. Cherry, D. Rutledge, J. Jones, *California State University, Fullerton, Fullerton, California*

Fibromyalgia (FM) is a chronic disease/condition characterized by widespread pain, fatigue, stiffness, and concentration problems that affects roughly 10 million Americans. Persons with FM commonly report physical, cognitive, and psychological difficulties, but studies have suggested that social relationships may play a role in reducing the impact of the disease. Data from 70 individuals diagnosed with FM and 76 healthy controls (ages 50-87; $M = 64$) were used to assess the extent to which perceived social support impacts physical, psychological, and cognitive functioning. Controlling for age, linear regression results revealed significant interactions (FM status \times MOS social support score) for physical function (12-item composite measure) and depression (Beck Depression Inventory). Specifically, although non-FM participants reported higher levels of physical function and lower levels of depression (regardless of perceived social support), greater perceived levels of social support served as a significant buffer for FM participants in both of these domains ($p < .05$). In terms of performance on a cognitive measure of practical problem solving (The Everyday Problems Test), non-FM participants outperformed FM participants, but neither the interaction term nor the main effect of social support was significant. Thus, results suggest that perceived social support may reduce the effects of depression and improve physical function, especially for FM sufferers, but does not appear to impact problem solving abilities. Possible explanations for the findings are presented and potential intervention implications are discussed.

CONVOYS IN VERY LATE LIFE

G. Randall¹, P. Martin², M. MacDonald², J. Margrett², L. Poon³, *1. Family & Consumer Sciences, Bradley University, Peoria, Illinois, 2. Iowa State University, Ames, Iowa, 3. University of Georgia, Athens, Georgia*

This study investigated the influence of social relations in very late life by empirically examining Antonucci and colleagues' (2009) support/efficacy convoy model for older adults who resided in three different residential environments (80s in private homes, $n = 75$; centenarians in private homes, $n = 126$; centenarians in assisted living facilities, $n = 55$; and centenarians in nursing homes, $n = 105$). Based on the conceptual model, we specified and evaluated a path analytic model for each group. Self-efficacy was hypothesized to mediate the relationship between measures of social relations and both physical and mental health outcomes. All models tested controlled the endogenous variables for sex, mental status, perceived economic sufficiency, and activities of daily living. Model tests were conducted with Mplus Version 5.1 using full-information maximum likelihood (FIML) to handle missing data; overall model fit was assessed by employing the Satorra-Bentler chi-square test statistic (robust to non-normality of measures), CFI, SRMR, and RMSEA. Results indicated relationships between the conceptual model's variables unique to each of the four groups; four different models fit the data depending upon age group and residential environment. Implications of these findings for older adults in very late life are discussed.

SOCIAL NETWORKS AND WELL BEING IN SOCIO-GEOGRAPHICAL CONTEXT: A COMPARISON OF OLDER PEOPLE IN MEDITERRANEAN AND NON-MEDITERRANEAN EUROPEAN COUNTRIES

H. Litwin, *Hebrew University, Jerusalem, Israel*

Objectives: This study examined whether the social networks of older persons in Mediterranean and non-Mediterranean countries were appreciably different, and whether they functioned in similar ways in relation to well-being outcomes. **Methods:** The sample included family household respondents aged 60 and older from the first wave of the Survey of Health, Ageing and Retirement in Europe, in five Mediterranean ($n=3,583$) and seven non-Mediterranean ($n=5,471$) countries. Region was regressed on variables from four network domains: structure and interaction, exchange, engagement and relationship quality, controlling for background and health characteristics. In addition, two well-being outcomes—depressive symptoms and perceived income inadequacy—were regressed on the study variables, including regional social network interaction terms. **Results:** The results revealed differences across the two socio-geographical settings in each of the realms of social network, above and beyond the differences that exist in background characteristics and health status. The findings also showed that the social network variables had different effects on the well-being outcomes in the respective settings. **Discussion:** The findings underscore that the social network phenomenon is culturally bound. The social networks of older people should be seen within their unique socio-cultural milieu, and in relation to the values and social norms that prevail in different socio-geographical settings.

PERCEIVED SOCIAL PROFICIENCY RELATED TO OLDER ADULTS' INTEREST IN RELATIONSHIPS WITH INDIVIDUALS WITH PD

A. Hemmesch^{1,2}, L. Tickle-Degnen^{2,3}, L.A. Zebrowitz¹, *1. Psychology, Brandeis University, Waltham, Massachusetts, 2. Tufts University, Medford, Massachusetts, 3. Boston University, Boston, Massachusetts*

Social problems are common reports among individuals with Parkinson's disease (PD). While PD symptoms may affect social relationships, first impressions about sociability could also contribute to social difficulties experienced by individuals with PD. This study investigated the hypothesis that social proficiency, which refers to the proportion of positive to negative social behaviors expected from a target, would be associated with perceivers' interest in future relationships after controlling for perceiver gender, which may also affect perceiver sociability. Fifty-eight older adult perceivers viewed brief, content-filtered video clips of 12 targets with PD (6 female) and predicted how supportive and straining each target would be, as well as indicated their interest in getting to know the target better. Hierarchical multiple regression showed that social proficiency contributed to future relationship interest above and beyond the effects of perceiver gender (R -squared change = .26, $F(1, 54) = 20.27$, $p < .01$). Older adult perceivers were significantly more interested in getting to know individuals whom they believed would be more supportive than straining. These findings are consistent with socioemotional selectivity theory in that these perceivers seemed to use a rational guideline for making decisions about relationships by showing more interest in pursuing relationships — perhaps even new ones — that were likely to be associated with positive affect. Furthermore, these results suggest that older adults may be interested in relationships with individuals with PD if they believe the target would be a positive addition to their social network.

CAREGIVING, MARITAL QUALITY, AND PHYSICAL HEALTH: EVIDENCE FROM MIDUS 2004-05

S. Kang^{1,2}, N.F. Marks^{1,2}, *1. HDFS, UW-Madison, Madison, Wisconsin, 2. Institute on Aging UW-Madison, Madison, Wisconsin*

Guided by a life course perspective, this study aimed to add to a population perspective on caregiving, marital quality, and physical health

risks of family caregiving by (1) examining how providing caregiving for a child, spouse, or parent due to their illness or disability (in contrast to not providing caregiving for any kin or nonkin) is linked to multiple dimensions of physical health (self-rated health, health symptoms, functional limitations) and (2) evaluating how two dimensions of marital quality (spousal disagreement, spousal strain) might moderate caregiving risks to health. Data from 1138 married respondents aged 32-84 participating in the second wave of the National Survey of Midlife in the U.S. (MIDUS 2004-05) were used to estimate multivariate models. Models also adjusted for numerous sociodemographic factors. Results revealed that providing caregiving for a child was associated with poorer self-rated health, more functional limitations, and more health symptoms. Models evaluating moderation of caregiving risks to health by levels of spousal disagreement and spousal strain revealed that spousal caregivers who reported more disagreement or more marital strain reported poorer self-reported health; more disagreement was also linked to more functional limitations among spouse caregivers. Caregivers for parents who reported more marital disagreement or more marital strain indicated poorer self-assessed health, more functional limitations, and more symptoms than caregivers for parents with better marital quality. Overall, results suggest caring for a child is linked to significant health risks, and marital quality is an important moderator of health risk for married caregivers for spouses and parents.

INTERGENERATIONAL SUPPORT BETWEEN OLDER ADULTS AND ADULT CHILDREN IN JAPAN: LONGITUDINAL TREND BETWEEN 1999 AND 2006

E. Takagi¹, Y. Saito², 1. *Health Science, Towson University, Towson, Virginia*, 2. *Nihon University, Tokyo, Japan*

This study investigated the extent to which older adults provide and receive support from adult children and how it relates to their attitudes towards and utilization of formal care services. Study aims were addressed based on the analysis of a nationally representative sample of older adults (n=6,201) from the first four waves of data of the Nihon University Longitudinal Study of Aging (NUJLSOA), with a particular focus on the longitudinal participants in all four waves (n=2,337). Logistic regressions over time revealed the longitudinal trend where older adults and adult children continue to exchange support; however the flow of support tends to become primarily upward as they age: from adult children to older parents. Both receiving and providing support for adult children tended to be determined by the level of resources presented by older adults, such as their spousal availability, household income, and health condition. Among different types of support examined, the most common were adult children's assisting their parents for shopping, providing companionship, and offering financial help. On the other hand, older adults were mostly assisting their children with their finances, house chores, and food preparations. Older adults' personal attitudes against formal care services did not significantly impact the extent to which they rely on informal resources of adult children. The results are discussed in the current social welfare context of Japan, where the enactment of national long-term care policy in 1999 created new avenues of formal care service interventions for its growing number of older population.

WITHIN-FAMILY GENERATIONAL DIFFERENCES IN ATTITUDES TOWARD AGING: A PRELIMINARY INVESTIGATION

A.E. Soka, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

The numbers of families with multiple generations living together is increasing. To improve quality of life in aging people by helping to reduce intergeneration conflict, especially in such close quarters, it is important to understand within-family intergenerational differences in attitudes toward aging. These differences may affect (a) personal definitions of the term "old," (b) attitudes toward the process of aging, (c)

individual definitions of "successful aging," and (d) attitude toward one's own aging. In an effort to explore this heretofore uncharted territory, a case study approach was taken, examining four generations of women in one family ranging in age from 24 to 98. Individual in-person and telephone interviews were conducted with the participants, and each was asked the same set of questions. Responses indicated that within families, similarities exist across generations in attitudes toward aging such as the notion that aging is less about "chronological age" and more about engagement, personal adaptation, and acceptance of self. Attitudes can be "learned" by watching previous generations and how they age. Generational differences relate to what respondents believe they can (or plan to) do in their later years, and generational influences are bi-directional in nature. In conclusion by looking at within-family differences in attitudes toward aging, research will help elucidate the significance of personal familial experience and its effect on attitudes toward aging. The importance of aging role models for younger adults and the bi-directional nature of generational influence on attitudes toward aging have implications for gerontology policy, practice, and research.

MARITAL STATUS, MARITAL QUALITY, AND BIOLOGICAL HEALTH RISKS: EVIDENCE FROM THE NATIONAL SURVEY OF MIDLIFE IN THE U.S. (MIDUS)

J. Song¹, N. Marks^{2,3}, 1. *Waisman Center, University of Wisconsin, Madison, Wisconsin*, 2. *Human Development and Family Studies, Madison, Wisconsin*, 3. *Institute on Aging, Madison, Wisconsin*

This study aimed to examine the associations between marital status combined with marital quality and cumulative health-related biomarker risks of adults (i.e., allostatic load) by using survey and biomarker data from National Survey of Midlife in the U.S. (MIDUS) 1995-2005. OLS regression models were estimated using data from 344 respondents (176 women, 168 men) aged 34-84 in 2005 who participated in the MIDUS I (1995: M1) and MIDUS II (2004-2005: M2) and biomarker data collection and were either (1) continuously single (i.e., separated/divorced) M1-M2 (N=81), (2) continuously married to a first spouse with high marital strain at both M1 and M2 (N=113), or (3) continuously married to a first spouse with low marital strain at both M1 and M2 (N=150), and controlling also for age, gender, education, household income, having a child, employment status, financial strain, medications, and T1 self-assessed health. Results indicated: (1) Adults continuously married over 9-10 years to a first spouse indicated lower biological health risks (i.e., lower allostatic load) compared to continuously single adults regardless of levels of marital strain over time; (2) this pattern was stronger among younger continuously married adults compared to older continuously married adults. (3) Among continuously married adults, women with high marital strain demonstrated greater biological health risks than men with high marital strain, in contrast to their continuously single peers. Overall, findings suggest that it is not marital status alone but also marital quality that impacts the biological health risks of adults, contingent on their age and gender.

MIDLIFE SOCIAL SARCOPENIA TRANSLATES TO LOSS OF SOCIAL MUSCLE FOR SUCCESSFUL AGING

J.A. Arendt, *Case Western Reserve University, Cleveland, Ohio*

Midlife offers a perspective of individual adaptation or rejection of situational factors to maintain or improve one's life trajectory. This theoretical analysis offers insight into the magnitude that off-time pursuits and lost opportunities by midlife in an age-graded society affect the ability to age successfully. Transitions and turning points are deemed personal choices with modest attention given to social conditions and constraints. While some people can overcome personal obstacles and pitfalls to fulfill goals and dreams, the extent that environmental determinants influence when individuals close the door on a chapter of their life and settle into an obtainable life course is not understood completely. Social sarcopenia is a term I created to define a loss or inability to obtain personal goals and social expectations due to survival in a society driven

by age norms. Therefore, by examining the intersectionality of goal tenacity, goal strategy, planning for the future, making sense of the past, perceived social support, value to world, and life satisfaction an understanding of the factors that underlie the pressure and consequences of life course transitions and turning points will be defined. While turning points and transitions occur throughout the life course trajectory, focusing on midlife offers a perspective on the social networks accumulated along with the how individuals make decisions about their future life/work trajectories toward successful aging. Social sarcopenia can identify the loss of social muscle needed to weather structural lag in an age-normed society and age successfully into older adulthood.

SESSION 1980 (SYMPOSIUM)

TAILORED CAREGIVER ASSESSMENT AND REFERRAL: AN EFFECTIVE TOOL FOR TRIAGING SUPPORT SERVICES AND REDUCING CAREGIVER DEPRESSION AND BURDEN

Chair: R. Montgomery, *School of Social Welfare, University of Wisconsin - Milwaukee, Milwaukee, Wisconsin*

Discussant: K. Maslow, *Alzheimer's Association, Washington, District of Columbia*

Although efforts to provide support services for caregivers have increased, the scarcity of resources creates a challenge for policy makers, state program administrators, and practitioners to be efficient and strategic in their allocation of resources. Without valid and reliable mechanisms to accurately assess caregivers' needs and effectively target services to those needs, service providers are not able to use their resources wisely and efficiently; nor are caregivers well served. The Tailored Caregiver Assessment and Referral (TCARE) process is a caregiver assessment and referral protocol that gives care managers (care coaches, family specialists) an efficient strategy and tools to accurately assess caregivers' needs and create individualized care plans that will maximize benefits and enable organizations to allocate resources in an efficient manner. This symposium provides a detailed description of the development and testing of the TCARE model. The first paper provides a review of critical literature on care management, identifies core elements of care management practice, and outlines challenges for serving caregivers as a client population. The second paper describes the TCARE protocol and the interactive process used to develop it. The third paper describes findings from a process evaluation that demonstrated success with teaching the protocol to practitioners and maintaining fidelity with the process. The fourth paper reports findings from two randomized trials that document a significant impact on caregiver stress and depression. The final paper provides additional findings from two studies that identify the mechanism by which the TCARE process leads to positive outcomes.

THE ELEPHANT IN THE ROOM: RECOGNIZING THE FAMILY CAREGIVER

G. Kadushin, J. Rowe, *Social Work, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

This paper lays a foundation for creating and implementing care management protocols that could effectively support family caregivers. Despite wide recognition of the central role of family caregivers in the long term care system, few programs or policies fully acknowledge family caregivers as legitimate clients who could benefit from care management services. Recent advocacy for the inclusion of caregiver assessment as part of elder care programs have stopped short of advocating for care management services essential for supporting caregivers and older adults. Drawing upon the research concerned with care management and geriatric care management, this paper 1) identifies core elements that are implemented to access and coordinate formal and informal supports for people with complex chronic problems, 2) explores organizational and policy barriers to the adoption of a family-centered care man-

agement framework, and 3) provides recommendations regarding requisite skills and knowledge for effectively serving family caregivers.

DEVELOPMENT OF TCARE AND RANDOMIZED TRIAL: TRANSLATING RESEARCH TO PRACTICE

R. Montgomery¹, K. Kosloski³, M. Brintnall-Peterson², J. Jacobs¹, *1. School of Social Welfare, University of Wisconsin - Milwaukee, Milwaukee, Wisconsin, 2. UW-Extension, Madison, Wisconsin, 3. University of Nebraska, Omaha, Omaha, Nebraska*

The TCARE demonstration project is a 30-month randomized study designed to assess the hypotheses that implementation of TCARE will lower caregivers' depression and burden, increase caregiver uplifts, reduce identity discrepancy, and lower the probability of caregivers leaving the role. This paper describes the development of the TCARE protocol and of the measures included in the caregiver assessment tool and used to assess outcomes. The six step protocol, guides care managers through an assessment, consultation and care planning process. It reflects findings from a series of studies that included: (1) focus groups conducted with care managers and caregivers; (2) the creation of a caregiver registry to serve as a study population to develop, refine and norm measures; (3) the design and pilot testing of the assessment tool; (4) development of decision algorithms to guide care management decisions; and (5) pilot tests conducted in collaboration with service delivery organizations in four states.

FEASIBILITY AND FIDELITY OF IMPLEMENTATION OF TCARE BY CARE MANAGERS

J. Rowe, M. Wallendal, E. Enriquez, *School of Social Welfare, University of Wisconsin - Milwaukee, Milwaukee, Wisconsin*

A formal monitoring process was used to test for accurate and consistent implementation of TCARE by 40 care managers. The monitoring process entailed a review of all forms that were completed as part of the protocol for each caregiver at initial assessment and 6-month follow-up. Care managers were evaluated on two dimensions: (1) mechanics of implementation (i.e. the care managers' ability to accurately follow the process and complete forms) and (2) successful creation of an appropriate and viable care plan. A composite score was created for each care manager on each dimension. Descriptive statistics provided support for accurate and consistent implementation by care managers. At baseline, the overall average scores were 78.5% on mechanics and 88.7% for creation of appropriate care plans. These findings support the conclusion that care managers can be trained to successfully implement the TCARE protocol in a consistent manner.

PRELIMINARY FINDINGS FROM THE TCARE NATIONAL DEMONSTRATION

J. Kwak¹, K. O'Connell Valuch¹, L. MacBride¹, J. Lang¹, K. Kosloski², R. Montgomery¹, *1. Social Work, University of Wisconsin, Milwaukee, Wisconsin, 2. University of Nebraska, Omaha, Nebraska*

Findings are reported for initial analyses of data from two longitudinal, multi-site cluster randomized control trials of TCARE. Outcome variables examined include three measures of caregiver burden (stress, relationship, objective), identity discrepancy, and depression. Data were available for 174 caregivers randomly assigned to TCARE (n=90) or control groups (n=80) who completed up to three interviews at 3-month intervals. Descriptive statistics and individual growth modeling using SAS Proc Mixed procedures were conducted. Caregivers are female (79%), married (68%), white (72%), caring for someone with memory problem (90%), and living with the care-receiver (80%). Analyses revealed a significant group by time interaction on stress burden [F (2,144) = 8.70, p < .001] and depression [F (2,145) = 5.11, p < .01]. At T2 and T3, mean scores for both stress burden and depression were significantly lower for the TCARE group than for the control group.

MECHANISMS THAT PRODUCE POSITIVE OUTCOMES IN CAREGIVER INTERVENTIONS: THE ROLE OF IDENTITY DISCREPANCY

M.Y. Savundranayagam¹, R. Montgomery¹, K. Kosloski², 1. Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 2. University of Nebraska, Omaha, Nebraska

Few interventions for family caregivers directly test the mechanisms that contribute to positive outcomes. Caregiver identity theory posits that individuals experience burden when self-appraisals of behaviors are discrepant with expectations for their relationship identity. This study examined the extent to which change in identity discrepancy served as a mechanism by which burden and depression were reduced for participants in the Tailored Caregiver Assessment and Referral (TCARE) process versus a control group. Analyses using multiple hierarchical regression revealed that change in discrepancy had a significant effect on depression and on stress, relationship, and objective burden. Moreover, TCARE participants reported significantly less stress burden over time compared to the control group. Finally, chi-square tests revealed that a greater proportion of TCARE participants reported decreases in discrepancy compared to the control group. The findings support the utility of caregiver identity theory as a framework to test caregiver interventions.

SESSION 1985 (SYMPOSIUM)

TECHNOLOGY TOOLS TO SUPPORT OLDER ADULTS' SOCIAL INTERACTIONS AND INDEPENDENCE

Chair: G. Demiris, University of Washington, Seattle, Washington
Discussant: D. Parker Oliver, University of Missouri-Columbia, Columbia, Missouri

As technology advances and new positive models of aging emerge, there are new paradigms of technology enhanced platforms that support aging in place and independence of older adults. Specific systems include web-based applications to facilitate communication and home based monitoring technologies that capture both physiological variables and behavioral patterns. Research initiatives in this area have to address recruitment and retention issues, privacy and training issues as well as new ways to engage older adults in virtual environments. This symposium presents a series of ongoing initiatives, both research studies that include online trials and training initiatives pertaining to the use of computers and the Internet, as well as approaches to enhance and support aging in place with telehealth solutions that bridge geographic distance and sensor-based tools that capture behavioral patterns of older adults in an independent retirement community. Additionally, technology introduces new ways to address social isolation and enable older adults to communicate with distant family members and peers using tools that facilitate virtual communities. In this context, the concept of obtrusiveness of technology is discussed and a theoretical framework highlighting underlying dimensions is presented. Furthermore, the symposium addresses privacy and other ethical implications associated with the use of innovative technologies that promote social interactions and independence.

BEHAVIORAL SENSING TECHNOLOGIES FOR AGING IN PLACE

G. Demiris, University of Washington, Seattle, Washington

"Smart homes" are residential settings wired with sensor technologies that enable the detection of emergencies and identification of behavioral patterns and have the potential to support aging in place. Two distinct approaches to smart home design, namely Distributed Direct Sensing (DDS) and Infrastructure Mediated Sensing (IMS), have distinguishing features and implications resulting from their implementation. These two approaches have not been directly compared pertaining to their technical performance or their acceptance by older adults. It is also unclear what the perceived privacy and obtrusiveness concerns are

when it comes to the implementation of these two different approaches in homes. The study presented here aimed to evaluate acceptance of these two sensing approaches by older adults and assess the perceived privacy and obtrusiveness concerns and ultimately define social implications of "smart homes."

TRAINING OLDER ADULTS IN ASSISTED LIVING IN THE USE OF INFORMATION AND COMMUNICATION TECHNOLOGIES (ICTS): RESULTS FROM A RANDOMIZED CONTROLLED TRIAL

S.R. Cotten, Sociology, UAB, Birmingham, Alabama

Depression, physical health decline, loneliness, and social isolation are key issues of concern for older adults. With increasing numbers of older adults going into long term care facilities and declines in quality of life as individuals age, we need innovative ways to decrease these negative impacts and to enhance quality of life. The use of information and communication technologies (ICTs) represents one such way to potentially enhance quality of life among older adults. Early results are presented from a randomized controlled trial designed to train older adults in assisted living facilities to use ICTs, specifically computers and the Internet. Issues encountered in setting up portable computing labs, recruiting assisted living facilities and residents, and ensuring equivalence across groups are discussed. The types of data being collected, as well as early results, are also presented. Implications for designing other interventions using ICTs will also be discussed.

CHALLENGES AND STRATEGIES FOR RECRUITMENT AND RETENTION IN ONLINE TRIALS WITH OLDER ADULTS

E. Nahm¹, B. Bausell¹, B. Resnick¹, B. Covington¹, J. Magaziner¹, P. Brennan², 1. University of Maryland School of Nursing, Baltimore, MD, 2. University of Wisconsin-Madison, Madison, Wisconsin

Rapidly advancing information communication technology has revolutionized current healthcare, and more health-related studies are being conducted online. Although older adults are one of the fastest growing online user groups and have a significant interest in health, few online studies have focused on these individuals. Over the years, the authors have conducted several online studies focusing on older adults, including web surveys and behavior intervention trials. Through our research we have identified unique challenges and effective strategies for engaging older adults in online studies. In this presentation, we will discuss our findings in: (1) online recruitment focusing on sample representativeness, trust building, and recruitment methods; and (2) retention of participants focusing on usability, technical support, and follow-up plans. Our findings demonstrate older adults' high level of interest and willingness to participate in online health studies. To maximize benefits of online health interventions for older adults, more online studies must be conducted.

COMPUTER-ASSISTED SOCIAL ENGAGEMENT

N.E. Cutler, Motion Picture & Television Fund, Woodland Hills, California

Because elders nowadays want to live in their own homes as long as possible, the Motion Picture & Television Fund's Center on Aging is developing computer technology as central to this goal. And because Aging-in-Place need not be Aging-in-Isolation, our technology focuses on Computer-Assisted Social Engagement ("CASE") to enable the health, safety, and independence of community-resident older women and men. CASE uses web-based desktops with large touch screens, displaying software that provides mental and physical exercise, community networking, health information, and entertainment. Later, CASE will become a general home-based platform for wireless motion monitoring and telehealth. And because Aging-in-Place is itself multidimensional, we are embedding CASE in an expanding portfolio of services and activities including home renovation, transportation, volunteerism, and social services.

PERCEPTIONS OF PRIVACY IN LATER LIFE

L. Lorenzen Huber, *Indiana University, Bloomington, Indiana*

Ethical Technologies in the Homes of Seniors, NSF-funded research at Indiana University, is developing a framework describing the privacy needs of older adults using home-based ubiquitous technologies. Similar to findings in related research, participants exhibited less-than-expected concern about privacy. During focus group research, a participant commented, "I am very compliant about these kinds of things. I am not compliant with the thoughts of my mind, but I am compliant about following directions." Theories about late old age suggest that coping and adaptation is enhanced by passive mastery and selection and prioritization of important relationships. Our research suggests that late life coping and adaptation mechanisms promote unnecessary and potentially hazardous complacency and compliancy, particularly in regard to health and daily activity data. This session will discuss research methodology and technology design implications addressing late life complacency about privacy in home-based ubiquitous technologies.

SESSION 1990 (PAPER)

VIOLENCE, ABUSE, AND MISTREATMENT OF OLDER ADULTS

ASSOCIATION OF ELDER ABUSE AND MORTALITY IN A COMMUNITY-DWELLING POPULATION: THE ROLE OF COGNITIVE AND PHYSICAL FUNCTION

X. Dong¹, M. Simon², L. Hebert¹, D. Evans¹, *1. Rush University, Chicago, Illinois, 2. Northwestern Medical Center, Chicago, Illinois*

Background: Elder abuse is a public health and human rights issue. The association of elder abuse with mortality remains uncertain, especially among the frail population. We examined the associations of elder abuse with mortality and the associations of elder abuse with mortality across levels of cognitive and physical function. **Methods:** Prospective population-based cohort conducted from 1993-2005 of community-dwelling residents enrolled in the Chicago Health and Aging Project. A subset of these participants had elder abuse reported to protective services agency, which investigated and substantiated the cases. All-cause mortality ascertained during follow-up and the National Death Index. Cox proportional hazard models were used to assess the independent associations of elder abuse, both reported to and substantiated by the APS, with risk of mortality using time-varying covariate analyses. **Results:** Of 8,709 CHAP participants, 113 participants had been reported for elder abuse from 1993 to 2005. All CHAP participants were followed for a median of 6.1 years, during which 3,462 deaths occurred. After adjusting for confounders, reported elder abuse (HR, 1.62, 95%CI, 1.25-2.10) and substantiated elder abuse (HR, 2.38, 95%CI, 1.72-3.28) were associated with increased risk of mortality. Analyses including the interaction of elder abuse with physical performance tests indicate that the association of reported and substantiated elder abuse with risk of mortality was greater for those with higher levels of physical function. **Conclusion:** Both reported and substantiated elder abuse cases were associated with increased mortality risk. Mortality risk associated with elder abuse may be higher among those with higher levels of physical function.

MISTREATMENT AND PSYCHOLOGICAL WELL-BEING AMONG THE ELDERLY: EXPLORING THE ROLE OF PSYCHOSOCIAL RESOURCES

Y. Luo¹, L. Waite², *1. Sociology & Anthropology, Clemson University, Clemson, South Carolina, 2. University of Chicago, Chicago, Illinois*

This study examines the relationships among psychosocial resources, elder mistreatment, and psychological well-being using a representative sample of older adults aged 57 to 85 in the United States from the National Social Life, Health and Aging Project. It addresses three research questions: (1) Are older adults with fewer psychosocial

resources more likely to experience mistreatment? (2) Does experience of mistreatment have a negative effect on psychological well-being? (3) Do psychosocial resources buffer the negative impact of mistreatment on psychological well-being? Four types of mistreatment are examined (controlling behavior, verbal, financial and physical mistreatment). Psychological well-being is measured with global happiness and psychological distress scale. Psychosocial resources include self-esteem, marital/partner status, number of close friends and relatives, social support, feeling of loneliness and social activities participation. The results show that experience of mistreatment is associated with lower levels of positive support, higher levels of negative support, feeling of loneliness, and it has an inverse-U shape relationship with the number of close relatives and friends. The factors that are most salient for each type of mistreatment vary somewhat. Experience of mistreatment is associated with lower levels of global happiness and higher levels of psychological distress, and this association is explained in part by fewer psychosocial resources among the elderly who report mistreatment. There is also limited evidence for the buffering hypothesis—the associations between mistreatment and positive social support, feeling of loneliness, and social activities participation are particularly strong for the elderly who say they have been mistreated.

ELDER MISTREATMENT: PERCEPTIONS AND DEFINITIONS AMONG KOREAN AND CHINESE IMMIGRANTS

Y. Lee, *San Francisco State University, San Francisco, California*

Elder mistreatment (EM) has emerged as a serious public health problem affecting millions of elderly individuals. One of the greatest challenges in extant research is the lack of precise definitions to facilitate the reliable assessment of EM. Although sociocultural contexts significantly influence definitions about mistreatment, a paucity of data is available on Asian immigrant elderly. A qualitative study of 20 mistreated Chinese and Korean older adults and 5 focus groups with the general public and experts (N=40) examined definitions, perceptions, and meanings of EM in the San Francisco Bay area. The results of content analyses found that, in contrast to a common assumption that older Asian immigrants would have few issues around EM due to cultural emphases on filial piety and family harmony, EM has become a growing concern in both Korean and Chinese immigrant communities. In addition, the concept of EM is complex and intricately intertwined with the cultural values and beliefs about family obligation and responsibilities, such as caregiving and kin ties. The findings of this study showed that these beliefs influence how Chinese and Koreans perceive EM; and whom and at what point they might seek for help. The findings also demonstrate that elders' expectations of adult children have changed since migrating to the U.S. The findings suggest that there is a critical need in the area of EM, particularly with racial and ethnic minority populations. It is crucial to identify and develop culturally appropriate identification and intervention protocol in health care and social services for these populations.

ELDER ABUSE KNOWLEDGE AND TRAINING NEEDS AMONG GEORGIA'S CORONERS

S. Strasser¹, P.S. King², B. Payne³, *1. Georgia State University—Institute of Public Health, Atlanta, Georgia, 2. DHR-Division of Aging Services, Atlanta, Georgia, 3. Georgia State University—Department of Criminal Justice, Atlanta, Georgia*

Background: A Georgia coroner—an elected or appointed official charged with the responsibility of investigating deaths that occur while unattended by a physician—is in a unique position to identify suspicious signs of abuse and neglect directed toward elders before a body is sent to a funeral home or crematorium. Unless there are blatant signs of foul play, a medical examiner may not become involved in a case. Scarce elder abuse research has focused on coroners' knowledge of elder abuse issues. **Methodology:** A 25-item electronic survey instrument was

administered to coroners registered in Georgia Coroners' Association Directory to elicit information on: a) the perceived knowledge that Georgia coroners have about elder abuse, and b) their perceptions about what information they need regarding the topic. Results: 63 out of 198 surveys were completed (31.8% response rate). Respondents were overwhelmingly male (84%) and Caucasian (90%). The mean age of respondents was 53 years. More than half of respondents indicated that they know 'almost nothing' or 'a little' about: distinguishing signs of physical abuse from signs of aging (57%) and about mandatory reporting laws and related elder abuse statutes (65%). When asked how often cases involving older adults were referred to the medical examiner for autopsy, 44% indicated 'rarely if ever'. Conclusions: Study results indicate that gaps exist between what coroners know and need to know regarding elder abuse. The study findings reveal specific opportunities for enhancing training efforts aimed at coroners who play a critical role in identifying and addressing elder abuse.

NEIGHBORHOOD TRAUMA: COMMUNITY RESPONSE TO MID AND LATER LIFE INTIMATE PARTNER HOMICIDE SUICIDE IPHS

S. Salari, *Dept. Family & Consumer Studies, University of Utah, Salt Lake City, Utah*

Intimate partner homicide suicide (IPHS) constitutes a violent end of life outcome. This research focuses on the community response to this event among mid and later life couples. Media reports often have commentary from witnesses, neighbors and police. These accounts inform the public about the couple characteristics, past behaviors and neighborhood impact. Quantitative and qualitative content analysis is used to examine 402 murder suicide events (830 deaths) among middle aged and elderly dyads from a national archive of news articles, transcripts, and police reports from 1999-2005. Dyads are compared by age of oldest member 1) elderly (age 60+, n=225) or 2) middle aged (age 45-59 n=177). Perpetrators were typically men (elderly 96% and middle aged 91%) and firearms were most often used (88% and 91%). Illness was more often cited for elderly (55%) than middle aged dyads (9%), but 30% of sick elderly couples had only a perpetrator who was ill. Suicide pacts and mercy killings (CDC) were rare (4% elderly and 1% middle aged). Themes emerged as neighbors often perceived elderly couples were "quiet" and "kept to themselves." The middle aged were more likely to have child victims and police or SWAT team involvement. Community reactions seem to correspond to primary perpetrator motives that were typically suicidal for elderly and homicidal for middle aged. Communities and neighborhoods were shocked, saddened and terrified by the violence, but accounts more often "romanticized" the motives of elderly perpetrators. Implications and risk of IPHS for neighborhoods and communities are discussed.

SESSION 1995 (POSTER)

ADULT PROTECTION/ ELDER ABUSE

DISASTER PREPAREDNESS FOR VULNERABLE ELDER: AN INTERDISCIPLINARY STUDENT TEAM COMPETITION

K. Godwin¹, B. Reilley¹, S.K. Ostwald², C. Dyer¹, *1. University of Texas Health Science Center at Houston School of Medicine, Houston, Texas, 2. University of Texas Health Science Center at Houston School of Nursing, Houston, Texas*

It has been reported that worldwide a disaster occurs, on average, every 24 hours. Vulnerable elders, especially community dwelling elders, are at increased risk during and after disasters. Consequently, there is a need for disaster preparedness for community dwelling elders. The Houston Geriatric Education Center (HGEC) sought to educate health-care professional students about disaster preparedness for vulnerable elders by partnering with community agencies and sponsoring an Interdisciplinary Team Competition. The Competition consisted of two teams

encompassing thirty one students from three Universities, representing eleven disciplines including dental hygiene, dentistry, health informatics, medicine, nursing, occupational and physical therapy, pharmacy, public health and social work. In preparation for the Competition, students learned about disaster preparedness for the elderly via a web-based curriculum developed by a team of interdisciplinary faculty. Students also interviewed apartment managers and residents of senior housing complexes in the Houston area that were affected by Hurricane(s) Katrina, Rita and/or Ike. After three months of independent study and team work, both teams arrived at the Competition prepared to present their assessment of the problems encountered by the senior housing complexes and recommendations for the future. Each team presented before a live audience as well as interdisciplinary faculty judges representing the students' respective disciplines and an expert panel comprised of City of Houston officials who work closely with the vulnerable elder population and citywide disaster preparedness. Teams were judged on their assessment and recommendations. The team with the most comprehensive, feasible, and interdisciplinary approach was declared the winner.

CARING FOR VULNERABLE ELDER REPORTED TO ADULT PROTECTIVE SERVICES FOR SELF-NEGLECT: A MULTI-DIMENSIONAL APPROACH

S.L. Pickens^{1,3,4}, J. Burnett^{1,3,4}, K. Aung^{2,3}, B. Reilley^{1,3,4}, C. Dyer^{1,3,4}, *1. Internal Medicine, Division of Geriatrics and Palliative Medicine, University of Texas Health Science Center at Houston, Houston, Texas, 2. The University of Texas Health Science Center at San Antonio, San Antonio, Texas, 3. Texas Elder Abuse and Mistreatment Institute, Houston, Texas, 4. Harris County Hospital District, Houston, Texas*

Background: Vulnerable elders reported to Adult Protective Services (APS) for self-neglect, often suffer from multiple co-morbid conditions with associated cognitive, functional and affective impairments. No studies exist assessing the effectiveness of a comprehensive geriatric assessment and intervention (CGAI) with usual APS care for self-neglecters. We assessed the utility of a CGAI with APS care for this population. Methods: We conducted a retrospective chart review using clinical data collected by the Texas Elder Abuse and Mistreatment Institute (TEAM). Self-neglecters were assessed using standardized CGAI tools at baseline and 6-months. Assessments were completed in patient's homes or in the Harris County Hospital District's geriatric outpatient clinic. Dependent sample's t-tests were computed to assess changes in baseline and 6-month CGAI scores. Results: One-hundred and sixteen self-neglecters aged 50 years or older (M = 76.9+/-9.6, min = 50, max = 100) with baseline and 6-month follow-up data are included. Statistically significant improvements in baseline and 6-month scores were detected for depression (Mean = 0.750, 95% CI = 0.162 to 1.32), functional ability (Mean = -2.2, 95% CI = -3.56 to -0.886), psychiatric health (Mean = 2.3, 95% CI = 1.09 to 3.53), executive function (Mean = -0.172, 95% CI = -0.332 to -0.013) and self-rated health and mortality (Mean = -0.284, 95% CI = -0.544 to -0.025). Conclusion: These preliminary data support utilizing a multi-dimensional assessment approach to care for vulnerable elders reported to APS for self-neglect. Further studies are necessary to parse out the effects of this approach versus usual care performed by APS.

PREVENTING ELDER INVESTMENT FRAUD AND FINANCIAL EXPLOITATION: RESULTS OF DEVELOPING A CONTINUING EDUCATION PROGRAM ON EIFFE

R. Roush, A. Naik, G. Taffet, N. Wilson, M.E. Kunik, L. McCullough, *Baylor College of Medicine, Houston, Texas*

Cognitive impairment is very common in those over 70 years of age and markedly increases the chances of making errors on financial matters. Furthermore, cognitive impairments increase their vulnerability to undue influence, usually via wrongful use of power of attorney.

Unscrupulous financial advisors and family members exploit cognitively impaired elders at a prevalence rate estimated at 3.5%. As the population continues to age and, perhaps, the economy continues to flounder, the problem of Elder Investment Fraud and Financial Exploitation (EIFFE) will grow larger. With a grant from the non-profit Investor Protection Trust, the authors undertook the challenge of developing and implementing an educational program to alert health care providers to address EIFFE. A series of ten statewide 2-hour CME programs was attended by 260 primary care/human service providers composed of 40% physicians, 15% nurses, 20% social workers, 10% rehabilitation professionals (PTs and OTs), 10% LTC administrators, plus 5% others. A key part of the program included a Clinician Pocket Guide that provides "red flags" in a patient's history that suggest vulnerability to EIFFE. Nearly all participants reported that the pocket guide would be very useful in their practice, giving the program and materials high utility ratings. A sample of practitioner attendees will be selected for follow-up to determine the impact of the educational program in their practices. Knowledge and prevention of EIFFE is critical, as older victims of investment fraud and other forms of financial exploitation generally lack the means or time to recover financially from the losses they incur.

SESSION 2000 (SYMPOSIUM)

BO DIDDLEY TRACK: AGING AND THE BLUES- MORE THAN JUST THE MUSIC

Chair: *D. Sheets, Health Sciences, CSU Northridge, Pine Mountain Club, California*

The Bo Diddley Track will showcase two performers with the intent to get beyond the music and provide an intimate look at the life and struggles of older minority blues musicians. This session provides insight into the "real world" of minority aging, in a way that does not minimize the ravages of the decades of prejudice which they were subject to, yet provides gerontology professionals an appreciation of the great spirit, unrivaled vitality and energy, and the enormous creativity and dedication of the featured musician. Sandra Hall, a powerful blues vocalist with more than 50 years' experience singing the blues is known as the "Empress of the Blues". Hall began singing at the age of 4 at her grandmother's fish fry in Atlanta. In the 1960's her all-girl group, The Exotics, performed blues tunes as an opening act for legendary musicians like Jackie Wilson, B.B. King, the Temptations and Otis Redding. Her knockout shoutin' style has been compared to Koko Taylor, Big Mama Thornton, or Etta James. Tommy Brown is a legendary blues singer whose classic blues recordings, include his 1956 Billboard #1 hit "Weepin' & Cryin'". After 60+ years in show business, Tommy Brown is still recording and performing. Both musicians will perform at Blind Willies, voted 1997 "blues club of the year". It is Atlanta's home to great live blues music in an intimate setting and only a couple miles from the conference hotel. Remember, we're on a mission from God...

SESSION 2005 (POSTER)

END OF LIFE - HS POSTER SESSION

THE EXPERIENCE OF FAMILY CAREGIVERS OF ASSISTED LIVING RESIDENTS ENROLLED IN HOSPICE

M.A. Volpin, T.A. Harvath, School of Nursing, Oregon Health & Science University, Portland, Oregon

The fastest growing residential care setting for frail older adults is the assisted living facility (ALF), which has seen a 14.5% increase in capacity between 2000 and 2001. More and more of these adults are making ALFs their last home: nationally, one-third of residential care/assisted living residents remain in their residence until death, with annual turnover rate due to death between 16% and 28%. Family caregivers are often crucial to residents being able to die in their ALF home,

but there is limited information available regarding the nature of the family involvement, or empirical data from the family caregiver perspective. Utilizing family caregiver interviews and observation of the family caregiver and the ALF resident, this study explores the experience of family caregivers of assisted living facility residents enrolled in hospice. Among the issues examined were the expectations that family members have of themselves and the hospice and ALF providers; the nature and scope of family caregiver care activities; the factors that facilitate family caregivers providing care; their challenges to providing care; and the positive and negative impact of providing such help. The knowledge gleaned from this study can inform the development of policy and programs to support good end-of-life care in ALFs.

PREFERENCES OF OLDER ADULTS IN THE COMMUNITY AND IN NURSING HOMES FOR LIFE-SUSTAINING TREATMENTS

L.W. Suen, Department of Nursing, The Chang Jung University, Gueiren, Tainan., Taiwan

This study compares the preferences of community-dwelling older adults and nursing home residents for four life-sustaining treatments (antibiotics, CPR, surgery, and artificial nutrition) under eight hypothetical health scenarios for 32 conditions. The cross-sectional study included 95 community-dwelling Taiwanese older adults and 100 Taiwanese nursing home residents. The older adults in the community were 60 to 90 ($M = 70.8$, $SD = 8.8$), 45% were male and 54% female, and 37% rated their health as bad and very bad. The nursing home residents were 60 to 101 ($M = 80.16$, $SD = 8.37$), 33% were male and 67% female, and 41% rated their health as bad and very bad. For the community-dwelling older adults, the five most desirable life-sustaining treatments included antibiotics or artificial nutrition and were rated from 2.95 to 3.53 with 1 being definitely unwanted and 5 definitely wanted; for the nursing home residents, the five most desirable life-sustaining treatments all included artificial nutrition and were rated from 4.03 to 4.10. The 5 least desirable life-sustaining treatments involved surgery or CPR for both groups, and were rated from 1.72 to 1.89. In 12 out of the 32 conditions (37.5%) nursing home residents rated significantly higher desirability for antibiotics and artificial feedings than community-dwelling older adults. Self-reported health was significantly correlated with desire for surgery in 6 of the 8 health scenarios in nursing home residents and correlated with all four treatments in emphysema for the community-dwelling older adults. Age was not significantly correlated with desirability of life-sustaining treatments in both groups.

INFORMAL CAREGIVING AT THE END-OF-LIFE: INTERFACING WITH HEALTHCARE PROVIDERS DURING CLINIC VISITS

J. Penrod, J.E. Hupcey, P.C. Spigelmyer, P.Z. Shipley, J. Thurheimer, B. Baney, Penn State School of Nursing, University Park, Pennsylvania

This study illustrated key characteristics of clinic-based care settings that influence the caregiving experience in three distinct death trajectories. Ethnographic methods, including extended observations and brief interviews with key informants were used. Data were collected in three clinics serving patients with Lung Cancer, Heart Failure, and Amyotrophic Lateral Sclerosis through an extended immersion of non-participant observers. Four key elements of the culture of care were identified as influencing the caregiving experience: Role of the Health Care Provider, Conceptualization of the Patient System, Focus of Visit, and Flow of Care. Within-clinic patterns reveal close correspondence to prevalent models of death trajectories. Across-clinics analysis reveals significant variations that must be addressed when planning interventions to enhance supportive care for informal family caregivers providing end-of-life care. The culture of care inherent to a care delivery setting is quite powerful in shaping the experiences of family caregivers and warrants thoughtful consideration.

MEDICATION USE AMONG NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA

M.D. Rothman^{1,2}, J. Tjia³, D.K. Kiely^{2,4}, S.L. Mitchell^{2,4}, 1. *University of New England College of Osteopathic Medicine, Department of Geriatrics, Biddeford, Maine*, 2. *Hebrew Senior Life Institute for Aging Research, Boston, Massachusetts*, 3. *University of Massachusetts Medical School, Division of Geriatric Medicine, Worcester, Massachusetts*, 4. *Beth Israel Deaconess Medical Center, Division of Gerontology, Boston, Massachusetts*

Background: Many commonly prescribed chronic medications provide questionable benefit to nursing home (NH) residents with advanced dementia. A recent consensus panel categorized selected medications as 'never appropriate' with this condition.¹ **Objectives:** 1. To describe chronic daily medication use in NH residents with advanced dementia; 2. To identify and describe factors associated with the use of medications characterized as 'never appropriate' in this population. **Methods:** In a prospectively followed cohort of 323 NH residents with advanced dementia, daily medication use and other data were collected at baseline, and quarterly for up to 18 months. Multivariate logistic regression was used to identify factors associated with use of 'never appropriate' medications during the follow-up period. **Results:** Over 18 months, residents took a mean of 6.0 daily medications. The proportion of residents taking medications of questionable benefit included: anticholinesterase inhibitors or memantine, 22%; proton-pump inhibitors, 28%; osteoporosis medications, 32%; and lipid-lowering agents, 12%. Thirty-eight percent of residents were prescribed medications deemed 'never appropriate'. Factors independently associated with taking 'never appropriate' medication included: male, shorter NH stay, better functional status, diabetes, and the lack of do-not-hospitalize order. **Conclusions:** Prescribing patterns among NH residents with advanced dementia, should be guided by the goals of care to help avoid the burden and cost of inappropriate medication use.¹ Holmes et al. *J Am Geriatr Soc*. 2008; 56:1306-1311. Never Appropriate includes lipid-lowering drugs, NMDA receptor antagonist, cytotoxic chemotherapy, antiplatelet agents, hormone antagonists, leukotriene receptor antagonists, sex hormones, acetylcholinesterase inhibitors and antiestrogens

SESSION 2010 (PAPER)

EPIDEMIOLOGY- INTERNATIONAL

LOWER EXTREMITY FUNCTION, TOTAL MORTALITY, AND MEDICAL AND CARE EXPENDITURES IN JAPANESE ELDERLY

H. Yoshida, Y. Fujiwara, T. Fukaya, H. Amano, N. Watanabe, L. Sangyoon, M. Nishi, S. Shinkai, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

This study examined the impact of lower extremity function on total mortality and medical and long-term care expenditures in Japanese older adults. The subjects were those aged ≥ 70 years ($n=512$) who participated in the baseline health-check (2002) in Kusatsu, Gunma, Japan. Out of them, 401 individuals (78.3%) underwent the tests of usual walking speed and length of time standing on one leg with eyes open, and were followed up until the end of October 2005 (3.3 year-period). We classified the subjects into the lowest, middle and highest score groups of lower extremity function (higher the score, higher the function) according to a composite score derived from the two tests. Then we compared the period to death and accumulated medical and long-term care expenditures among the groups over the course. Cox proportional hazard models were used to examine the independent association between baseline lower extremity function and total mortality, controlling for age, gender, important medical conditions, self-rated health and generic mobility level. During the follow-up period, 25 subjects (6.2%) died. Compared with the highest score group, the lowest group showed significantly higher risk for total mortality (adjusted hazard ratio, 6.54;

95% CI, 1.95-21.99), and exhibited significantly higher medical and long-term care expenditures per capita per month. Lower extremity function is not only a risk for total mortality but also for higher medical and long-term care expenditure in Japanese older adults.

PREDICTORS OF QUALITY OF LIFE AMONG URBAN COMMUNITY ELDERLY IN KOREA

H. Kim, A. Kim, *Inje University, Pusan, Korea, South*

Because, in Korea, there has been increased numbers of elders with a poverty and social isolation, health professionals have recently focused on quality of life among community elders. According to prior studies, their socio-environmental characteristics and psychological status affects quality of life as well as physical health status. This study conducted to identify the predictive relationship between predictors such as psychological, socio-environmental, and physical health status and quality of life among urban community elders in Korea. This is a descriptive study using cross-sectional design. The subjects for this study were 153 elders by quota sampling from 16 areas of one metropolis in Korea. The subjects ranged in age from 60 years to 97 years and the mean age was 72.83 (SD=5.56). 64.7% were women, and 35.3% were men. 40.5% were living with spouses. Data collection was performed by 3 of trained interviewers individually in elderly association members under Korea National Red Cross from January to March, 2009. Quality of life by Andrew, perceived loneliness by revised UCLA Loneliness scale for psychological status were measured. IADL, Family relationship, Home environment for socio-environmental status, and Physical symptom for physical health status were used standardized form by Ministry for Health, Welfare and Family Affairs in Korea. Hierarchical multiple regression model was used to examine the relationship between quality of life and its' predictors. Demographics such as age and gender, psychological factors such as perceived loneliness, and socio-environmental status such as IADL, family relationship, home environment, and physical health status such as physical symptom significantly explained 55.6% of the total variance of quality of life ($F=14.7$, $P=.000$). Perceived loneliness ($\beta=-.297$, $P=.001$) was the most significant predictor of quality of life ($\beta=-.438$, $P=.000$). Family relationship ($\beta=.251$, $P=.004$) was the second most significant correlated variable of quality of life. Gender ($\beta=.182$, $P=.011$), physical symptom ($\beta=-.168$, $P=.032$), home environment ($\beta=.160$, $P=.032$) had effects on quality of life. Through this finding, it can be concluded that severe perceived loneliness, worse family relationship, female elderly than male elderly, more physical symptom, and less comfortable home environment will affect quality of life of urban community elders in Korea negatively.

THE IMPACT OF SEVEN CHRONIC CONDITIONS ON SELF-RATED HEALTH AMONG DUTCH 57- TO 97- YEAR-OLDS

H. van der Ploeg¹, A.W. Braam^{2,1}, D.J. Deeg¹, 1. *VU University Medical Center, Amsterdam, Netherlands*, 2. *Altrecht Mental Health Care, Utrecht, Netherlands*

Objective: Self rated health (SRH) is a strong predictor of health care use, morbidity, and mortality. This study aims to further clarify this relationship by examining the impact of seven chronic conditions as well as comorbidity on SRH. **Methods:** Cross-sectional data were used from 1907 men and women (age 57-97), who participated in the Longitudinal Aging Study Amsterdam (LASA). The presence of the following chronic diseases or disease events was assessed: chronic nonspecific lung disease, cardiac disease, peripheral atherosclerosis, stroke, diabetes mellitus, arthritis and malignancies. For assessing comorbidity, up to two additional chronic diseases were included, if mentioned by the respondent. SRH was measured by the question: How is your health in general? Response categories were 'very good', 'good', 'fair', 'sometimes good and sometimes poor', and 'poor'. Poor SRH was defined as a response in one of the last two categories. Prediction models were made using logistic regression. **Results:** Chronic nonspecific lung disease (OR=6.42, $p<.05$), diabetes mellitus (OR=7.28, $p<.05$) and arthri-

tis (OR=8.23, $p<.001$) increased the odds for reporting poor SRH. For each of the seven conditions, comorbidity affected SRH in a similar way. For example, persons with cardiac disease and one additional chronic disease had a greater chance (OR=15.5, $p<.001$), and persons with more than one comorbidity had an even greater chance of reporting poor SRH (OR=50.4, $p<.001$), compared to persons without chronic disease. Implications: Having one chronic disease does not necessarily affect SRH. For every condition likewise, comorbidity has a far more adverse effect on self-rated health.

THE USE OF ASSISTIVE DEVICES AND CHANGES IN SELF-RATED HEALTH IN 55-64-YEAR-OLDS IN THE NETHERLANDS

D.J. Deeg, C. Boons, K. van de Kamp, *LASA, VU University Medical Centre, Amsterdam, Netherlands*

Background. Disability has been shown to be an important determinant of self-rated health (SRH), thus strategies to reduce disability may be related to SRH as well. Since the use of assistive devices (AD) is intended to reduce disability, it may be expected that AD use is associated with a positive change in SRH. However, AD use represents aging, and may thus be associated with a negative change in SRH, particularly in young-old individuals. This study aims to examine how (initiating and continuing) AD use affects change in SRH among 55-64-year-olds. **Methods.** Data are used from two national cohorts aged 55-64 years (baselines 1992 and 2002) included in the Longitudinal Aging Study Amsterdam with 3-year follow-up ($n=1968$). The effect of AD use on change in SRH was examined taking into account demographics and level of disability. **Results.** At baseline, AD-users had poorer SRH than non-AD-users. Over time, continued AD use was associated with an improvement in SRH. Although disability increased over time, SRH did not show significant change in those initiating AD use. Although the 2002 cohort showed a higher disability prevalence (17% vs 9%) and higher AD use (11% vs 6%) than the 1992 cohort, cohort membership did not affect the association of AD use with SRH. **Conclusions.** The initial negative effect of AD use on SRH subsides over time in continued users of AD. In those initiating AD use, SRH remained stable despite increasing disability, which positive finding may be attributed to the use of AD.

COLLECTIVE EFFICACY AND DEPRESSIVE SYMPTOMS IN MID-LIFE AND BEYOND

M. Stafford, A. McMunn, R. De Vogli, *Epidemiology and Public Health, UCL, London, United Kingdom*

This prospective study examined the relationships between perceived neighborhood-based collective efficacy and subsequent depressive symptoms in over 6000 participants of the English Longitudinal Study of Aging 50+. High versus low collective efficacy at baseline (operationalised using two items capturing informal social control and two capturing social cohesion) was associated with reporting fewer CES-D depressive symptoms at follow-up independent of demographic and socioeconomic factors and baseline depressive symptoms. Structural equation modeling was then used to examine explanatory pathways behind these associations. This revealed that personal sense of control was a mediating factor. Further, although friendship quality was associated with collective efficacy it was only weakly associated with depressive symptoms, conditional on all other covariates. The study provides a contextual perspective on social relations and health among older people, indicating that better mental health, greater sense of control and better quality friendships are found in environments seen to be characterized by higher collective efficacy.

SESSION 2015 (PAPER)

FALLS RISK II

TO CHANGE OR NOT TO CHANGE: FALL HISTORY AS A PREDICTOR OF RESIDENTIAL ADJUSTMENTS

N. Leland Wiatrowski, *Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island*

The objective of this study was to examine the longitudinal relationship between fall history and the decisions to make residential adjustments among a nationally representative community-based older adult sample. Data from the Health and Retirement Survey (HRS), wave 4 through wave 7 (1998-2004) were used resulting in 25,036 person-wave observations. Fall history was classified based on the number of falls and the occurrence of an injury due to the fall. The sample was 55.4% female (mean age 74.9). Seventy-three percent reported no history of falls, 8.5% reported one fall with no injury, 8.9% reported more than one fall with no injury, and 9.6% reported at least one fall resulting in an injury. The residential adjustment outcome analysis incorporated a two part decision process: the decision to make any adjustment or not, and secondly what type of adjustment was made. The variable distinguishing the type of residential adjustment made was defined hierarchically and included four categories: 1) increasing assistance with ADLs or IADLs, 2) increasing familial support, 3) moving or making structural modifications to the current environment, or 4) increasing the use of adaptive equipment. Multinomial logit regression analysis suggests as fall history increases in severity, the odds of making any residential adjustment increases. Individuals reporting at least one fall resulting in an injury at baseline, compared to non-fallers, had higher odds of increasing assistance with ADLs or IADLs (OR=1.35) and higher odds of increasing the use of adaptive equipment (OR=1.54), relative to otherwise similar individuals increasing proximity of family support.

DEVELOPMENT OF A FALL RISK QUALITY INDICATOR FOR NURSING HOME RESIDENTS WITH DEMENTIA

C. Mueller¹, G. Arling², M. Boustani², A. Perkins², *1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. Regenstreif Institute, Indianapolis, Indiana*

Nursing home quality indicators (QIs) are being used to structure financial incentives for nursing home quality and to inform the public about care quality. Yet, many publically reported QIs do not adequately adjust for dementia as a QI risk factor nor do they offer guidance for improving the quality of dementia care. We examined risk of new falls, a publicly-reported NH QI in Minnesota, according to level of resident cognitive impairment, residence on an Alzheimer's or conventional unit, and covariates. The analysis was conducted using Minimum Data Set Assessments (MDS) from 21,587 residents in 380 Minnesota nursing homes in the 4th quarter 2008. The rate of new falls was significantly higher for residents with mild to moderate cognitive impairment compared to the cognitively intact or severely impaired even when controlling for other risk factors. Behavioral symptoms put residents at greater risk for falling, and psychotropic medications further increased the risk. Restorative care (range of motion) reduced incidence of falls. Finally, the rate of new falls was higher on Alzheimer special care units (SCUs) than on conventional units, probably resulting from placement of higher risk residents on SCUs. Public reporting of the falls QI should take into account level of CI and unit placement in order to make fair and accurate assessments of care quality in facilities focusing on dementia residents. Also, quality improvement programs should target dementia residents with clinical and functional conditions that increase the risk of falls, and should promote care processes that decrease the risk of falls while avoiding those that increase fall risk.

MY LIFE IS WORTH SOME RISK: A QUALITATIVE METASUMMARY OF ELDERS' VIEWS OF FALLS AND FALLING

S.S. Lyons, School of Nursing, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

Falls are the major cause of injury-related death and disability for persons age 65 years or older. Current fall prevention interventions are designed around the concept of risk. However, elders' uptake and adherence to professional recommendations for modifying fall risk is modest. Thus, older adults "at risk" for falls may be contesting the salience of this concept as a primary framework for elder-centric fall prevention strategies. Problematically, most risk factor profiles were developed without advice from older adults, while few interventions have taken into account the myriad meanings of falls from the perspectives of people who have experienced one. This presentation reports a metasummary of qualitative studies conducted with older adults with a history of falling. Research published from 1990-2008 in English language journals and in which findings focused on elders' perceptions of falling was included. Studies conducted only with family caregivers or health professionals were excluded. The bibliographic sample included 25 research reports from such disciplines as aging studies, geriatrics, nursing, occupational and physical therapy, psychology, and public health. The majority of studies were conducted with samples of older white females in English-speaking nations (UK, USA, Australia, Canada). A few studies were conducted with more gender equitable samples (UK, Taiwan, China). This presentation highlights extracted findings from published reports as well as frequency patterns and estimated effect sizes. Themes include personal competence, inevitability, common sense, "other people", caution, independence, integrity, courage, and connection. Recommendations for incorporating elders' views of falling into fall prevention programs are suggested.

DEVELOPMENT OF A FALL RISK SELF-ASSESSMENT FOR SENIORS

B. Kramer^{1,2,3}, R. Vivrette¹, J. Martin^{1,2}, L.Z. Rubenstein^{1,2,3}, 1. VA Greater Los Angeles Healthcare System, Los Angeles, California, 2. David Geffen School of Medicine at UCLA, Los Angeles, California, 3. Fall Prevention Center of Excellence, Los Angeles, California

Aim/Purpose: Falls are a major public health problem for older adults, but fall risk may go unrecognized. Our objective was to design a self-administered fall risk self-assessment brochure targeted to the general knowledge and readiness to change of community-dwelling seniors to encourage risk reduction behaviors. **Methodology:** A qualitative approach was used: 1) Focus groups with seniors to identify knowledge, perceptions and attitudes about fall risks and risk reduction (Phase I) and to assure user-friendliness of the evidence-based self-assessment tool (Phase II). **Findings/Results:** Phase I: Three focus groups were conducted. Participants (n=19) recognized that muscle weakness was a key indicator of fall risk. Although a positive tone was perceived as a key motivator for fall prevention, a high level of threat (e.g., nursing home placement) was also discussed and considered motivational. Phase II: Four focus groups were conducted. Participants (n=19) preferred that self-assessment items be linked to evidence-based facts to clarify the question's intent, as well as provide targeted education. They rejected printed statements about negative consequences as failing to inspire motivation to change and requested more information about risk reduction activities. Participants found the brochure most useful to stimulate discussions about falls with healthcare providers and with their community. **Conclusion/Recommendation:** The risk-assessment/reduction brochure may provide a low cost way to improve fall risk assessment, encourage seniors to discuss fall risks with healthcare providers, and stimulate preventative activities. Further research is needed to validate the self-assessment instrument.

HOW DO MEDICATIONS INCREASE FALL RISK?

G. Pepper, B. Wong, J. Bassett, College of Nursing, University of Utah, Salt Lake City, Utah

Contradictory results in studies of the association between medications and falling predominate when drugs grouped for analysis represent diverse pharmacologic mechanisms. Three candidate mechanisms of drug-related falling are muscarinic blockade ("anticholinergic"), sedation, and orthostatic hypotension. The purpose of this pilot study was to ascertain relative contributions of pharmacologic mechanisms to imbalance, fear of falling, and fall events. Using longitudinal, descriptive, correlational design, a sample of 47 adults >70 years (mean 78.3years; 75% female) taking medications associated with falling were assessed on predictor variables of demographics, functional status, depression (GDS-SF), cognitive function (MMSE), postural hypotension, sedation (MRS, DSST) and anticholinergic burden score. Dependent variables were postural sway, dynamic balance, and fear of falling (MFES). Fall events were ascertained by diaries and telephone interview. On univariate analysis fall events were associated with sedation ($p=.05$) and history of falling ($p<.001$). Fear of falling was associated with sedation ($r=.45$; $p<.001$) and postural hypotension ($r=.35$; $p<.05$). Balance was associated with sedation ($r=.047$; $p<.001$), while postural hypotension was associated with sway ($r=.30$; $p<.05$). Neither cumulative anticholinergic burden nor highest potency were associated with fall events. In multivariate analysis imbalance was predicted by postural hypotension and use of anticholinergic drug(s) ($R^2=22\%$, $p<.05$). The only predictor of incidence of fall events was DSST sedation ($R^2=14\%$, $p=.039$), while age, MRS and postural hypotension predicted fear of falling ($R^2=50.2\%$; $p<.001$). Results suggest health care providers should assess for postural hypotension and minimize the anticholinergic and sedative burden of medication regimens. Funded by NIH R15NR05136.

SESSION 2020 (POSTER)

FAMILY CAREGIVING - HS POSTER SESSION

ASSESSING A SPECIAL CARE UNIT FROM THE PERSPECTIVE OF FAMILY MEMBERS

M. Brosseau-Richard^{1,2}, N. Dubuc^{2,1}, M. Tousignant^{2,1}, 1. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. Research Centre on Aging of the Centre de Santé et de Services sociaux-Sherbrooke Geriatric University Institute (CSSS-IUGS), Sherbrooke, Quebec, Canada

INTRODUCTION: Prosthetic units suggest that families are essential care partners. However, no evaluative study has, so far, taken an interest in their level of satisfaction concerning the care provided to their loved ones as well as what is expected from the families themselves. **OVERALL OBJECTIVE:** To assess, according to the family's perspective, a prosthetic unit (PU) for the elderly with cognitive impairment and behavioural and psychological symptoms associated with dementia (BPSD). **SPECIFIC OBJECTIVES:** 1) Describing this unit's components. 2) Determining how these components have an influence on the family's engagement and satisfaction. **METHODOLOGY:** An intrinsic case study is currently under way. The institutional documents given to the families and the staff will be reviewed (objective 1). The EPO questionnaire (Physical and Organizational Environment), developed and validated in Quebec, will document the environmental component. Moreover, a group interview is scheduled with eight staff members and a second one with the person responsible for the unit. Individual interviews with caregivers will be held (objective 2). They will be selected according to their loved ones' functional autonomy profile. Interviews will be recorded and transcribed for analysis. Triangulation of the data will provide a thorough description of the unit. **OUTCOME:** A presentation will be held on the unit's components, the care approach and themes emerging from the families' point of view concerning their satisfaction and perception of their allocated role. **CONCLUSION:** This

research should bring forward suggestions to improve the quality of life of these seniors and their families.

FAMILY QUALITY OF LIFE IN DEMENTIA: QUALITATIVE APPROACH TO FAMILY-IDENTIFIED CARE PRIORITIES

D.S. Geldmacher, J. Ducharme, *University of Virginia, Charlottesville, Virginia*

Assessing quality of life (QOL) in dementia is difficult. Individuals with dementia often possess limited insight, leading them to self-rate QOL differently from those who care for them. Many outpatients with dementia receive care in a family unit, but measures of whole-family QOL have not been widely implemented in the dementia population. The concept of family quality of life (FQOL) has been validated among families caring for children with developmental disabilities. FQOL measures have the potential to improve determinations of effectiveness in dementia care. Fifty-four questionnaires requesting information on priorities for care were collected from families of patients obtaining interdisciplinary care at an academic dementia clinic. Patients, family members, or both, completed the forms. The patients' mean age was 73.6 years; 61% were women. Two evaluators conducted qualitative analyses of the responses, assigning comments to five domains validated for FQOL in developmental disability families. Ten additional cases were previously used to define criteria for domain assignments. Both evaluators rated a validation sample (11 cases) to enhance inter-rater reliability. Five domains were identified: 1) Family Interactions, 2) Direct Care/Activities of Daily Living Support, 3) Emotional/Behavioral Well-being, 4) Physical/Cognitive Well-being, and 5) Disability-related Support/Medical Care. Not surprisingly for scheduled medical encounters, nearly all families expressed medical care inquiries and requests. Families identified concerns about physical and cognitive well-being nearly as often. Issues regarding family interactions and emotional well-being were rarely raised. An FQOL model designed for developmental disabilities provided useful information for qualitative characterization of priorities among families involved in dementia caregiving.

ADAPTATION AND EVALUATION OF PROBLEM SOLVING THERAPY FOR THE PREVENTION OF DEPRESSION IN FAMILY CAREGIVERS OF PERSONS WITH MILD COGNITIVE IMPAIRMENT (MCI)

L. Garand, *Health & Community Systems, The University of Pittsburgh School of Nursing, Pittsburgh, Pennsylvania*

Background: Persons with MCI are at high risk to progress to dementia. At the stage of MCI, their family members begin to adopt caregiver roles as they cope with this condition. Because these family members are in the earliest stages of caregiving, the timing is ideal for implementing selective prevention strategies in order to protect their mental health in the face of their family member's illness and their growing caregiving responsibilities. **Methods:** Phase I involved adapting and manualizing problem solving therapy (PST) for depression prevention in this population of new caregivers, and developing content for a suitable comparison condition (nutritional education). Phase 2 involved implementing a randomized controlled trial to evaluate the effectiveness of the PST intervention on family caregiver mental health outcomes one, three, six, and 12 months' post-intervention. **Results:** In Phase I, a nine-session PST-adapted intervention was tailored to the unique needs of individuals caring for a person with MCI. A similar approach was taken for developing a suitable comparison condition. In Phase II, 61 subjects have been enrolled and randomized to date (target N = 165). Primary outcomes are depressive symptom levels and the development of diagnosable mood disorders. We will present baseline demographic, psychiatric, and caregiver burden data to date. **Conclusions:** PST can be adapted and utilized with this population of new caregivers. Caregivers are willing to enroll in our study and early data suggest that it is not too early to intervene with this population of caregivers.

SESSION 2025 (PAPER)

FRAILTY

PHYSIOLOGICAL REDUNDANCY IN OLDER ADULTS IN RELATION TO THE SLOPE OF A CLINICALLY DERIVED FRAILITY INDEX WITH AGE

K. Rockwood^{1,2}, M. Rockwood¹, A. Mitnitski¹, *1. Dalhousie University, Halifax, Nova Scotia, Canada, 2. Capital District Health Authority, Halifax, Nova Scotia, Canada*

Background: The clinical operationalization of a Frailty Index based on the items recorded in a Comprehensive Geriatric Assessment (FI-CGA) potentially offers the ability to precisely grade frailty from routinely collected clinical data. One test of the precision of the FI-CGA is whether accumulation of deficits results in loss of redundancy. This would be reflected by attenuation in the slope of a Frailty Index with age, as is seen in representative population-based studies using the Frailty Index. **Methods:** In a secondary analysis of data from the clinical sample from the second wave of the Canadian Study of Health and Aging, we were able to calculate an FI-CGA for 2305 people aged, 70 years older at baseline. **Results:** At the 25th percentile of deficit accumulation, the slope of the FI-CGA in relation to age was 0.044 (0.038-0.049). At the 75% value, the slope was 0.021 (0.016-0.027). By the 90th percentile, the slope had become statistically indistinguishable from 0. An age-invariant limit to deficit accumulation was demonstrated at an FI-CGA value of about 0.7. **Conclusion:** As predicted by the reliability theory of aging, the rate of deficit accumulation slows with increasing frailty. A Frailty Index derived from data routinely collected as part of a Comprehensive Geriatric Assessment can estimate loss of redundancy in older adults.

RESISTANCE TRAINING WITH OR WITHOUT NUTRITIONAL SUPPLEMENTATION OF SOY-PEPTIDE FOR THE FRAIL ELDERLY

S. Shinkai, H. Kim, N. Watanabe, S. Lee, Y. Fujiwara, H. Yoshida, K. Saito, T. Suzuki, *Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

It remains still controversial whether nutritional supplementation has any additive effect for improving frailty in older adults over resistance training alone. We conducted a randomized controlled trial to examine whether the supplementation of soy-peptide enhance the effects of resistance training for the community-dwelling frail elderly. The subjects comprised 33 older adults who had reported one or more fall experiences in the previous year (designated as "fallers"), and 50 older adults who had been identified to have two or more geriatric syndromes among fall experience, urinary incontinence, disability in one or more items of five instrumental activities of daily living, and lower frequency of going outdoors (designated as "multiple-geriatric syndrome"). Within each subgroup, they were randomly allocated into exercise group and exercise plus nutritional supplementation group. Both groups participated in supervised resistance training class, two times per week, one hour each for 12 weeks. During this period the nutritional supplementation group was given soy-peptide beverages which were equivalent to 32 g soy protein intake per week. After the 12-week intervention, the exercise plus nutritional supplementation group within the fallers showed significantly greater improvement in knee-extension power and usual walking speed, and greater reduction of white blood cell counts. However, no significant additive effect of supplementation was found in the multiple-geriatric syndrome subgroup. Supplementation of soy-peptide may enhance the effect of resistance training in a certain subset of the frail elderly.

A COMPARATIVE GLYCOPROTEOMICS APPROACH TO FRAILITY USING LECTIN AFFINITY CHROMATOGRAPHY: A PILOT STUDY

S. Espinoza^{1,2}, A. Pierce^{1,2}, K. Shamsi¹, D. Halade¹, A. Richardson^{1,2}, *1. The University of Texas Health Science Center at San Antonio, San Antonio, Texas, 2. South Texas Veterans Health Care System, San Antonio, Texas*

Background: The geriatric syndrome of frailty is associated with physiologic dysregulation in many physiologic systems; however, its etiology is poorly understood. Proteomics biotechnology allows the study of hundreds of plasma proteins. To date, physiologic alterations associated with frailty have almost exclusively demonstrated modifications in glycoproteins. The purpose of this study is to determine if pre-frailty is associated with changes in the expressed plasma glycoproteome, which might provide direction for future research identifying creative interventions for healthy aging. **Methods:** Subjects were age and sex-matched pre-frail (n=4) and non-frail (n=4) community-dwelling older adults (mean age 81 ±5.6 years, 50% female). Pre-frailty was defined as two of 5 criteria: weak grip, slow walk, weight loss, exhaustion, and low physical activity. Approximately 200 glycoproteins were isolated using Concanavalin A, wheat germ agglutinin, and Jacalin lectins affinity columns, were separated with 2-dimensional polyacrylamide gel electrophoresis, and stained with Sypro ruby for quantification. Relative spot intensities were estimated using PDQuest; those showing ≥2-fold difference by group were identified using mass spectrometry. **Results:** Five glycoproteins or their isoelectric isoforms were upregulated in pre-frail compared to non-frail individuals (transferrin, N-terminal haptoglobin, haptoglobin, and kininogen-1 variant). Five were down-regulated (hemopexin precursor, kininogen-1 variant, fibrinogen isoform, apolipoprotein E, and lucentin rich alpha-2-glycoprotein 1). **Conclusion:** Differential expression of several glycoproteins related to inflammation and the hematologic system was found at the pre-frailty stage, before frailty becomes clinically apparent. These findings may suggest the feasibility of this methodology for discovery of potential biomarkers for frailty and earlier identification of at-risk older adults.

A FRAILITY INDEX FOR OLDER CARDIOVASCULAR PATIENTS CONSISTING OF PHYSICAL, COGNITIVE, EMOTIONAL AND SOCIAL DOMAINS

E. Freiheit, D.B. Hogan, M. Eliasziw, M.F. Meekes, W. Ghali, C. Maxwell, *Community Health Sciences, University of Calgary, Calgary, Alberta, Canada*

Introduction: Frailty in later life is attracting growing clinical and research interest. However, its operationalization often excludes domains that are arguably part of the construct. We combined measures from physical, cognitive, emotional, and social domains to develop a brief frailty index. **Methods:** We used data from a prospective study of 374 patients over 60 years old (73% males) who had undergone cardiac catheterization. Twelve potential criteria were modeled on functional disability at twelve months post revascularization procedure using Poisson regression with a log link and Pearson scale. We constructed an index from the best-fitting model variables and quantified its predictive accuracy using area under the ROC curve (AUC). Using the frailty index, we estimated the twelve-month risks of increased disability, decreased health-related quality of life (HRQOL), and further revascularization procedure/death. **Results:** The 5 best-fitting criteria in the model were poor balance (risk ratio (RR)=2.36), body mass index above 30 or below 21, (RR=1.77), executive dysfunction (RR=2.34), depressive symptoms (RR=1.83), and living alone (RR=2.19). The model with 5 criteria as separate variables and the 5-criteria frailty index yielded identical AUC, 0.76 (95%CI 0.66,0.84). Patients with 3+ criteria (compared to none) were at greater risk for increased activities of daily living disability, (RR=10.39, 95%CI 4.33,24.91) and decreased HRQOL (RR=4.16, 95%CI 2.26,7.66), but showed no increased risk for further revascularization procedure/death (RR=2.11, 95%CI 0.71,6.21). **Conclusion:** A

brief frailty index which includes cognitive, emotional, and social criteria is able to predict typical frailty outcomes although not therapeutic outcomes. Continued exploration of criteria from cognitive, and emotional, and social domains is warranted.

SESSION 2030 (PAPER)

MEDICATION USE ISSUES

PSYCHOTROPIC DRUG USAGE IN OLDER ADULTS LIVING AT HOME: RESULTS FROM THE HEALTH AND RETIREMENT STUDY (HRS)

H. Kim, D. Algate, *The University of Michigan, Ann Arbor, Michigan*

Although use of psychotropic drugs is common in older adults, prevalence of use of these agents has been investigated rarely for home-dwelling U.S. elderly. In this study we estimated the prevalence of psychotropic drug use among older adults (aged 50 and over) at home and examined demographic and clinical variances using a nationally representative sample (N = 4,624) from the first wave of the HRS 2005 Prescription Drug Study. The prevalence of older adults who were taking at least one psychotropic drug was 25.5%. The most frequently prescribed psychotropic drug was antidepressants (13%) followed by anti-convulsants (6.4%) and anxiolytics (5%). Cholinesterase inhibitors and sedatives were taken by 2.8% of older adults. Antipsychotics and antiparkinsonism drug were taken by 1.8% and 1.4% of people, respectively. Psychotropic drug use was most prevalent among people aged 50-64 (28.9%), followed by those over 85 (28.5%), 75-84 (26.2%), and 65-74 years old (21.7%). White people were more likely to use psychotropic drugs than other racial groups. People who were working for pay were less likely to use psychotropic drugs than those who were not employed. Perceived health was negatively related to use of psychotropic drugs; presence of memory disease, emotional disease, sleep disturbances, and troubles in pain were associated with the psychotropic drug use as well, controlling for other demographic factors. Our study results provide insights to healthcare providers and policymakers, which may be useful for screening and targeting older adults who are likely to receive psychotropic drug treatments.

RELATIONSHIP BETWEEN MEDICATION BELIEFS AND PSYCHOTHERAPEUTIC DRUG ADHERENCE AMONG OLDER ADULTS

Y. Chang^{1,2}, T.D. O'Connor^{1,2}, L. Wray², *1. State University of New York at Buffalo, Buffalo, New York, 2. VA Western New York Healthcare System, Buffalo, New York*

Background: Older adults are frequently prescribed psychotherapeutic drugs including opioids (pain relievers), central nervous system (CNS) depressants (tranquilizers and sedatives), and stimulants. These drugs can alter brain activity and are highly addictive. Research suggests that older adults are at high risk for the misuse of psychotherapeutic drugs. However, little is known about how older adults' medication beliefs impact their use of psychotherapeutic medications. **Purpose:** This ongoing study aims to examine the relationship between beliefs about medications and use of psychotherapeutic medications for older adults. **Method:** This study is a cross-sectional design. Participants are recruited from the Veterans Affairs Medical Center at Buffalo. Older adults are excluded if they are not able to communicate, have significant memory impairment (Mini Mental Status Examination score of less than 24), or do not have collateral informants to provide information. Measures include Mini Mental State Exam, the Beliefs about Medications Questionnaire, the self-report Medication Adherence Scale, and a demographic questionnaire. Descriptive statistics and Pearson's correlation will be utilized for analysis. **Results:** We expect that a total of 60 older adults will participate in this study. Preliminary findings indicate 25% of participants did not take their psychotherapeutic medications as prescribed. We hypothesize a moderate correlation between

medication beliefs and psychotherapeutic medication use. Conclusion: The findings will extend our understanding of the prevalence of psychotherapeutic misuse and the impact of medication beliefs on medication taking in older adults. Also, our findings will indicate a need to develop individualized monitoring programs for this ever-growing older population.

POTENTIAL UNDERUSE OF ANTIDEPRESSANTS IN OLDER VETERAN NURSING HOME PATIENTS

J.T. Hanlon^{1,2}, N. Castle¹, R.A. Stone^{1,2}, S. Handler^{1,2}, T. Semla⁴, M. Pugh³, D. Berlowitz⁵, M. Dysken⁶, 1. *UPITT, Pittsburgh, Pennsylvania*, 2. *Pittsburgh VA, Pittsburgh, Pennsylvania*, 3. *South Texas Veterans Health Care System, San Antonio, Texas*, 4. *VA PBM, Hines, Illinois*, 5. *Edith Nourse Rogers VA Memorial Hospital., Bedford, Massachusetts*, 6. *Minneapolis VA, Minneapolis, Minnesota*

The objective of this longitudinal study is to examine the prevalence and factors associated with antidepressant use by older long-stay Veterans Affairs Nursing Home Care Unit (NHCU) patients with a diagnosis of depression. This study included 3692 veterans aged 65 years or older admitted between January 1, 2004 and June 30, 2005 for 90 days or more to one of 133 VA NHCUs. Overall, 877 (23.7%) had a diagnosis of depression (determined by ICD-9 codes from hospitalization or physician visit in previous year, or severe depressive symptoms on NHCU admission). Of the 877 patients with depression, only 57.6% (n=505) received an antidepressant. Selective serotonin reuptake inhibitors were the most commonly used antidepressant class (72.1%) whereas tricyclic antidepressants or monoamine oxidase inhibitors were used infrequently (5.5%). Depressed patients with worse functional status (Adj. OR 1.03, 95%CI 1.01-1.05), or a history of hip fracture (Adj. OR 2.12, 95%CI 1.06-4.21) were more likely not to be treated with an antidepressant. Depressed patients with cancer (Adj. OR 0.65, 95%CI 0.45-0.96), more prescription orders (Adj. OR 0.98; 95% CI 0.98-0.99), antipsychotic use but not schizophrenia (Adj. OR 0.50; 95% CI 0.35-0.71), or acetylcholinesterase use (Adj. OR 0.61; 95% CI 0.41-0.91) were less likely not to have their depression treated by an antidepressant (i.e., more likely to be treated). Antidepressants are potentially underused in older veteran nursing home patients with depression, especially in those with relatively poor health status.

THE PREVALENCE OF PSYCHOTROPIC MEDICATION USE AMONG NURSING HOME RESIDENTS AND RELATIONSHIPS WITH FUNCTIONAL AND PSYCHOSOCIAL VARIABLES

E. Galik, B. Resnick, *University of Maryland, Baltimore, Maryland*

Psychotropic medications, such as antipsychotics, antidepressants, anxiolytics, and sedative/hypnotics, are commonly prescribed for older adults living in nursing homes and have been associated with negative functional outcomes such as falls, gait impairment, sedation, and cognitive decline. The purpose of this study was to describe the prevalence of psychotropic medication use among nursing home residents, and to test the relationship of psychotropic medication use on functional and psychosocial outcomes. This descriptive study is a secondary data analysis of baseline measures from the Restorative Care Study that included 419 residents from 12 nursing homes. Medication data was obtained from chart abstraction. The average age of the participants was 83.74 (SD=8.47), and the majority were female (80%), white (65%), and unmarried (90%). Results: There were 288 participants (69%) who were prescribed at least one psychotropic medication, with 81 participants (19%) taking antipsychotics, 248 (59%) taking antidepressants, 50 (12%) taking anxiolytics, and 37 (9%) taking sedative/hypnotics. After controlling for gender, age, and cognition, functional outcomes (specifically physical function and balance) were significantly lower in those residents taking psychotropic medications ($F=3.15$, $p=.01$) than those not taking psychotropic medications. Likewise, psychosocial outcomes (specifically self-efficacy and outcome expectations for function, and

quality of life) were significantly lower in those residents taking psychotropic medications ($F=1.92$, $p=.05$). The findings from this study provide additional support for the prevalence of psychotropic medication use among nursing home residents and suggest that residents taking psychotropic medications may be less likely to engage in functional activities, and experience decreased quality of life.

POTENTIALLY INAPPROPRIATE MEDICATION USE IN COMMUNITY-DWELLING DEMENTIA PATIENTS AND THEIR INFORMAL CAREGIVERS

J.M. Thorpe, K.A. Kennealy, *School of Pharmacy, University of Wisconsin - Madison, Madison, Wisconsin*

METHODS: Data were drawn from the Resources for Enhancing Alzheimer's Caregiver's Health (PI; R. Schulz), a sample of 1,222 caregivers from across the United States. This cross-sectional study analyzed the subset of dementia patients (n=1,173) and caregivers (n=569) aged 65 or older. PIM was defined using the 2003 Beers drugs-to-avoid criteria. The relationship between patterns of one dyad member's medication use on the other dyad member's risk of PIM was of particular interest. Separate multivariate logistic regression models were conducted for patients and caregivers. **RESULTS:** In dementia patients, 33% were taking at least 1 PIM, and 39% of caregivers were on a PIM. Nearly 57% of caregiver/patient dyads had at least one dyad member on a PIM. In the multivariate model of PIM use in dementia patients, the following characteristics were associated with an increased risk: female patient, younger caregiver age, less cognitive impairment, and caregiver polypharmacy (taking 5+ medications). In caregivers, the following characteristics were associated with an increased risk of caregiver PIM use: female caregiver, female patient, fewer years as a caregiver, number of caregiver comorbidities, patient PIM use, and patient polypharmacy. **CONCLUSION:** PIM use may be higher in dementia patients (33%) and their informal caregivers (39%) compared to the general older adult population (~20%). Further, patterns of medication use in one member of the caregiver/patient dyad may influence the other member's risk of PIM. These results suggest that interventions to increase appropriate medication use in dementia patients and/or caregivers should target both members of the dyad.

SESSION 2035 (SYMPOSIUM)

NEIGHBORHOOD CONDITIONS AND OLDER ADULTS: UNDERSTANDING HOW ENVIRONMENTS AFFECT LATE-LIFE FUNCTION

Chair: R.J. Thorpe, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Discussant: D.K. Miller, *IU Center for Aging Research and Regenstrief Institute, Inc., Indianapolis, Indiana*

While studies have examined the relationship between neighborhood factors and health, little is known about the structural factors and mechanisms that link one's environment to late-life function. This symposium highlights epidemiological research focusing on how neighborhood conditions affect late-life function. Using data consisting of 6,000 older black and white adults, Mendes de Leon and colleagues examine the association of neighborhood cohesion and disorder with changes in disability over 9 years. Lemelin and colleagues examine how individual- and area-based socioeconomic characteristics and their interactions are related to physical functioning in later life in a sample of 5,362 adults. Using 10-year panel data of 3,956 black and white older adults, Kelley-Moore examines whether the pattern of variation in disability estimates affect "average" differences across race and SES within and between communities. The race and socioeconomic patterns in the variation of estimated disability trajectories vary by the type of community. James and colleagues use cross sectional data consisting of 1,140 adults, ages 50-70 to determine whether neighborhood psychosocial hazards (NPH)—visible characteristics of neighborhoods that heighten vigilance

or threat—are associated with lower social engagement. Findings indicate a step-wise reduction in social engagement across quartiles of NPH after adjustment for demographics, health characteristics, and SES. Adjusting for neighborhood SES strengthened the association between NPH and social engagement. Implications of these findings to late-life function will be discussed in the symposium.

NEIGHBORHOOD COHESION AND DISORDER IN RELATION TO CHANGE IN DISABILITY

C.F. Mendes de Leon¹, K.A. Cagney², K. Rajan¹, L.L. Barnes¹, P.A. Scherr³, D.A. Evans¹, 1. *Rush University Medical Center, Chicago, Illinois*, 2. *University of Chicago Department of Health Studies, Chicago, Illinois*, 3. *National Center for Chronic Disease Prevention and Health Promotion, Atlanta, Georgia*

Despite emerging evidence regarding the association between neighborhood conditions and health, the exact role of neighborhood factors in health changes in older age remains poorly understood. In this presentation, we will study the prospective association of neighborhood cohesion and disorder with change in disability. Data come from a population-based, longitudinal study of about 6,000 older blacks and whites, with a high density of participants from a small urban area in Chicago. Using individual-level information, we will perform a spatial analysis to derive geographically-defined estimates of neighborhood-level social cohesion and disorder. These estimates will be combined with geocoded individual data, and merged with up to 9 yearly waves of self-reported disability measures. Using longitudinal models, we will test the hypothesis that neighborhood social cohesion is associated with smaller increases, and neighborhood disorder with greater increases in disability.

DO NEIGHBORHOOD PSYCHOSOCIAL HAZARDS CONSTRAIN OLDER ADULTS' SOCIAL ENGAGEMENT?

B.D. James¹, T. Glass¹, B.S. Schwartz², 1. *Epidemiology, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Recommendations for older adults to stay socially engaged to promote healthy aging may ignore the social and environmental contexts that place certain populations at higher risk for social disengagement. We used baseline data from the Baltimore Memory Study (1,140 adults, ages 50-70, from 65 neighborhoods) to test the hypothesis that neighborhood psychosocial hazards (NPH)—visible characteristics of neighborhoods that give rise to a heightened state of vigilance or threat—were associated with lower social engagement (measured as a latent variable through factor analysis) using multilevel modeling. We found a step-wise reduction in social engagement across quartiles of our NPH scale after adjustment for demographics, health characteristics, and SES. This association was strengthened after adjusting for neighborhood socioeconomic deprivation. Violent crime rate alone was not the driving force behind the relationship. Finally, lessons on over-adjustment for ‘compositional’ variables such as race and SES emerged from this analysis and will be discussed.

DECONSTRUCTING DISPARITIES: PATTERNS OF WITHIN-COMMUNITY VARIATION IN DISABILITY TRAJECTORIES AMONG BLACK AND WHITE OLDER ADULTS

J. Kelley-Moore, *Sociology, Case Western Reserve University, Cleveland, Ohio*

The extent and pattern of variation in disability estimates affect whether “average” differences across races or levels of SES are significant within and between communities, yet this has not been systematically examined. Estimating multilevel models of 10-year panel data for Black and White older adults (N = 3,956), I demonstrate that the race and socioeconomic patterns in the variation around estimated disability trajectories vary by type of community. Variance in disability trajectories is smallest for non-incorporated rural areas and largest for sub-

urban areas. The significantly greater level of disability for Black older adults in urban areas is influenced by a cluster of highly-dependent elders. Disability trajectories over ten years in suburban areas are steepest for the middle SES category relative to low and high SES groups, controlling for baseline disability. Relying on the average estimated trajectory to determine between-community differences in disability obscures the social dynamics at work within communities.

LIFE COURSE INDIVIDUAL AND NEIGHBORHOOD SOCIOECONOMIC POSITIONS AND PHYSICAL FUNCTIONING AT AGE 53: A MULTILEVEL PROSPECTIVE ANALYSIS

E.T. Lemelin^{4,1}, R. Hardy¹, Y. Ben-Shlomo², H. Southall³, P. Aucott³, D. Kuh¹, J. Guralnik⁴, 1. *MRC Unit for Lifelong Health and Ageing, University College and Royal Free Medical School, London, United Kingdom*, 2. *Department of Social Medicine, University of Bristol, Bristol, United Kingdom*, 3. *Great Britain Historical GIS Project, Department of Geography, Portsmouth, United Kingdom*, 4. *Laboratory of Epidemiology, Demography, and Biometry, National Institute on Ageing, Bethesda, Maryland*

Cross-sectional studies have shown that older people in poorer neighbourhoods have worse physical capability than those in better neighbourhoods, with daily functioning affected by both individual and area level deprivation. Few studies have considered area effects acting across the life course. This study will examine how individual socioeconomic position [ISEP] and area-based socioeconomic characteristics [ASEP] are independently related to physical functioning at age 53. Using data from the MRC National Survey of Health and Development, we shall use cross-classified hierarchical models that allow for individual and area level variation at local government district across 1950, 1972, 1989, & 1999. ISEP is based on father's occupation in 1950 and the participant's own occupation for the following years. ASEP is the participant's residential address at each time point geocoded and linked to census data. Data was collected prospectively birth-age 53, when physical performance tests assessing strength, balance, and chair rising were administered.

SESSION 2040 (PAPER)

CURRENT STATUS OF MINORITY OLDER ADULTS

ETHNIC DISPARITIES IN LONGEVITY AND OLD-AGE PROFILES IN MULTICULTURAL HAWAII

K. Braun, C. Browne, N. Mokuau, *University of Hawai'i, Honolulu, Hawaii*

In the U.S., the residents of Hawai'i live the longest. In past estimates (1950-1990), ethnic disparities in life expectancy have been seen in the state, with the shortest estimates for Native Hawaiians. This paper presents life expectancy estimates from 2000; compares them to past estimates; and examines reasons for ethnic differences. Life tables for 2000 were calculated from death record and population data for the state's five major ethnic groups—Hawaiians (24%), Caucasians (24%), Japanese (18%), Filipinos (16%), Chinese (7%)—using methods comparable to past estimates. In 2000, life expectancy was again lowest for Native Hawaiians, highest for Chinese and Japanese residents, and intermediate for Filipino and Caucasians residents. Looking over time, life expectancy had increased significantly for all groups, but the relative and absolute disparities indices have changed very little, with about 10 years between the longest-living (Chinese and Japanese) and shortest-living (Native Hawaiians) groups. Disparities are explained, in part, by differences in each group's history in Hawai'i, socio-economic status, and lifestyle behaviors. These have resulted in very different life courses and very different profiles of the older adults in each ethnic group. Native Hawaiian kupuna (elders) have a higher prevalence of chronic disease and disability, as well as shorter lives than elders in other groups. These data are being used by Ha Kupuna—National Resource Center for Native

Hawaiian Elders at the University of Hawai'i to propose programs to address disparities over the life course so that more Native Hawaiian kupuna (elders) can enjoy a healthy old age.

LONELINESS AND MINORITY ELDERS LIVING IN THE UK: AN EXPLORATORY SURVEY

C. Victor¹, W. Martin¹, V. Burholt², 1. *University of Reading, Reading, United Kingdom*, 2. *University of Swansea, Swansea, United Kingdom*

INTRODUCTION: Research in the UK consistently reports that 8-10% of people aged 65+ report significant levels of loneliness. However, studies of loneliness have frequently excluded the 'ageing' migrant communities as these represent less than 5% of the population and thus national surveys rarely include sufficient numbers of older people from minority communities to establish overall levels of loneliness. **METHOD and RESULTS:** Data from a sample of 300 people aged 65+ from key minority communities suggest that this omission is a cause for concern. Overall 27% of the sample reported that they were often lonely and 11% that they were always lonely. This masks some striking variations between groups with 4% of Indian elders reporting that they are often/always lonely compared with 50% of the Pakistani group; 40% of the Bangladeshi group; 13% of Caribbean elders; 50% of African elders; and 40% of Chinese elders. Compared with 10 years ago the percentage rating themselves as more lonely ranged from 10% (Indian elders and the general population) to 80% (African elders). Thinking of the situation a decade in the future 4% (Indian elders) to 62% (African elders) thought that they were likely to be more lonely. **DISCUSSION/CONCLUSION:** These data provide a novel insight into the experience of loneliness amongst older people drawn from a range of minority ethnic groups and suggest that there is a need for considerably more research in this area specifically, and more broadly examining social relationships and social networks of our ageing minority communities.

HIGH DEPRESSIVE SYMPTOMATOLOGY AMONG OLDER COMMUNITY-DWELLING MEXICAN AMERICANS: THE IMPACT OF IMMIGRATION

K. Gerst, K. Markides, *University of Texas Medical Branch, Galveston, Texas*

Objectives: This analysis explores nativity differences in depression among very old (75+) community-dwelling Mexican Americans. **Design:** Cross sectional analysis using the fifth wave (2004-1005) of the Hispanic Established Populations for Epidemiologic Studies of the Elderly (Hispanic-EPESE). **Participants:** The sample consisted of 1,618 non-institutionalized Mexican American men and women aged 75 and over. Depressive symptoms were measured by the Center for Epidemiological Studies Depression Scale (CES-D). Logistic regression was used to predict high depressive symptoms (CES-D score 16 or higher) and multinomial logistic regression was used to predict low, moderate and high depressive symptoms. **Results:** Results showed that Mexican American elders that were born in Mexico had higher odds of more depressive symptoms compared to otherwise similar Hispanics born in the United States. Age of arrival and other covariates did not modify that risk. **Conclusion:** The findings suggest that older immigrants are at higher risk of depression compared to persons born in the US, which has significant implications for research, policy and clinical practice.

EXPLORING THE NEEDS OF ARAB AMERICAN OLDER ADULTS

E.L. Essex¹, N.M. Adam¹, W. Moukahal¹, S. Tabahi², 1. *Governors State University, University Park, Illinois*, 2. *University of Chicago, Chicago, Illinois*

The term Arab American is used to designate an immigrant or descendant from any of 22 Arabic speaking countries. Recent estimates of the number of Arab Americans range from 1.2 million to almost 4 million. However there has been little research about Arab American older adults,

and the limited research that exists was conducted primarily in the Dearborn, Michigan vicinity. Illinois ranks as the state with the sixth largest Arab American population. Many of the older Arab Americans in Illinois are first generation immigrants. We describe a qualitative study on the needs of older Arab American immigrants in the southwest suburbs of Chicago, the area of Illinois with the highest density of Arab Americans. In order to explore the needs of these older adults, we conducted four focus groups with 6 to 10 participants each. These included two groups, one male and one female, of Arab American elders (age 60 or older) and two groups, one male and one female, of adult children and children-in-law of Arab American elders. A salient theme expressed by all participants was adjusting to the social isolation of a highly individualistic society as opposed to the communitarian society in their country of origin. Participants expressed a desire for more opportunities for older adults to socialize with others from their own culture. Other concerns included access to transportation and health care services. We discuss the implications of our exploratory study for service planning and delivery as well as for future research.

SESSION 2045 (SYMPOSIUM)

EVALUATION OF THE MEDICARE LOW VISION REHABILITATION DEMONSTRATION

Chair: *W. Leutz, Heller School, Brandeis University, Waltham, Massachusetts*

Discussant: *S. Green, Center for the Visually Impaired, Atlanta, Georgia*

More than 3.6 million Americans over age 40 have vision impairments, which may result from conditions such as macular degeneration, diabetic retinopathy, and glaucoma. Although Medicare covers medical treatment for these conditions, its coverage is limited for assessments, services, and devices to help beneficiaries function better with low vision, e.g., magnifiers and lights. The purpose of the Medicare Low Vision Rehabilitation (LVR) Demonstration, which began in 2006 and ends in 2011, is to see if there are advantages to Medicare and Medicare beneficiaries by expanding coverage for LVR to include services provided by certified LV therapists, LV rehabilitation teachers, and orientation and mobility specialists, in addition to occupational therapists, and by having these LVR professionals provide services in appropriate setting, such as in the home. This symposium, based on research findings to date from the Demonstration evaluators, has three presentations followed by a discussant from one of the provider agencies. (1) Provider Case Studies of five large, non-profit organizations for the blind have participated the Demonstration, and four independent providers who have not. (2) Beneficiary Case Studies of nine beneficiaries, five of whom participated in the Demonstration. (3) Cost and Utilization of LVR Services, based on preliminary analyses of the Demonstration's Medicare claims data.

UTILIZATION PATTERNS FOR LOW VISION REHABILITATION: IMPACT OF THE DEMONSTRATION

C.E. Bishop, G. Ritter, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Utilization of Medicare low-vision rehabilitation (LVR) services, under the Demonstration or under standard Medicare, is very rare, and it is difficult to identify beneficiaries with low vision using diagnostic codes. Despite these challenges, we used claims to develop estimates of whether the Demonstration (1) expanded access to Medicare-paid LVR services in Demonstration states and areas; (2) shifted the personnel providing Medicare LVR services or the location of service (office vs. home); or (3) for beneficiaries using Demonstration services, changed the utilization of other Medicare services compared to the year prior to LVR service use. These findings provide a backdrop for design of future innovations in LVR services.

PROVIDER CASE STUDIES

W. Leutz, *Heller School, Brandeis University, Waltham, Massachusetts*

The implementation evaluation of the Medicare Low Vision Rehabilitation (LVR) Demonstration included in-depth case studies of five large organizations for the blind that participated in the Demonstration and interviews with four independent providers who did not. Compared to the independents, the large organizations had advantages that allowed them to participate in the Demonstration, including organizational missions to expand services to Medicare beneficiaries, having the newly covered LVR specialists on staff, and resources to subsidize start-up costs and operational losses. Some of the large organizations had to make significant changes to financial and clinical systems to become Medicare providers. Others delivered only part of the newly covered services due to regulatory or professional barriers, or to financial incentives to deliver LVR services through occupational therapists. All respondents recommended increasing reimbursement rates for LVR specialists and adding coverage of LVR devices.

BENEFICIARY CASE STUDIES

W. Leutz, D. Gurewich, M.D. Gaiser, C.E. Bishop, *The Heller School for Social Policy & Management, Brandeis University, Waltham, Massachusetts*

The study collected information from nine beneficiaries who received Demonstration low vision rehabilitation (LVR) services. LVR helps patients function within their vision limitations. Some respondents successfully addressed their primary goal (e.g., reading) with LVR. However, LVR offered others only partial assistance (e.g., ability to read newspaper headlines, but not articles), or very little relief. Service effectiveness was affected by three barriers to using LVR: limited knowledge of LVR among medical providers, which was reflected in low referral rates; the need for beneficiaries to travel to service locations, which was addressed by family members; and the cost of devices, which was addressed by the providers' charitable funds. Three areas are presented for discussion regarding access and LVR services: education of medical providers about LVR, coverage of LVR exams and LVR professionals, and coverage for LVR devices. (Note that none of these three areas was within the scope of the Demonstration design).

SESSION 2050 (SYMPOSIUM)

MATURE WORKER POLICY INITIATIVES IN MASSACHUSETTS: THE VISION, THE REALITY

Chair: *E.A. Bruce, Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

The proposed symposium will present lessons learned from Massachusetts policy initiatives designed to promote the employment of mature adults. These initiatives were developed in response to a growing body of labor market, demographic, and gerontological research suggesting the aging workforce and retirement of the Boomer cohort will have a negative impact on the Commonwealth's economic growth and productivity. By the year 2020, 25% of the Massachusetts workforce will be over age 60. The oldest of the Bay State's 1.8 million Boomers are now on the brink of retirement, raising concerns about potential labor shortages, skills gaps, and leadership vacuums in key industries such as health care, education, and government. The Massachusetts 50+ Task Force and subsequent Partnership on the Civic Engagement and Employment of Older Adults were designed to raise awareness of the macro-economic benefits of retaining older workers, and to promote a statewide policy agenda supporting older workers. The objective of the session is to describe the challenges of moving from research to policy development. Symposium presenters will discuss the vision behind these policy initiatives, highlight the successes and lessons learned, and address the practical realities of managing these projects. The program will include the following components: Massachusetts Demographic Pro-

file and Vision, Obtaining Political Buy-in and Navigating Stakeholder Agendas, Project Management and Lessons Learned, and The Policy Agenda.

MASSACHUSETTS DEMOGRAPHIC PROFILE & VISION

D. Banda, *AARP Massachusetts State Office, Boston, Massachusetts*

Approximately 25% of the Massachusetts population is over age 55, with the median age of individuals in the workforce at 42.0 years. As the pool of younger workers is shrinking in Massachusetts and nationwide, the pool of 50+ workers is growing. Given current economic conditions, the relative absence of defined benefit pensions and retiree health coverage, many older workers are planning to remain in the labor force beyond the traditional retirement age. The Massachusetts older worker policy initiatives described in this presentation were developed in response to these demographic and economic trends. The vision for these projects stems from an assumption that the economic and social well-being of Massachusetts may depend on how well we manage to retain and retrain – instead of retire – the increasing number of mature workers in Massachusetts.

OBTAINING POLITICAL BUY-IN AND NAVIGATING STAKEHOLDER AGENDAS

R. Palombo, *Executive Office of Elder Affairs, Boston, Massachusetts*

The Massachusetts Secretary of Elder Affairs joined with UMass Boston's Dean of the McCormack Graduate School of Policy Studies to develop a concerted effort to support and expand the workforce participation of older adults to improve the competitiveness of the Massachusetts economy. That initiative was expanded to include volunteerism when the state was selected to participate in the National Governors Association's Policy Academy on Civic Engagement of Older Adults. The initiative has required coordination across a number of government units including Executive Office of Labor and Workforce Development, Executive Office of Elder Affairs, Massachusetts Rehabilitation Commission, and the State Human Resource Division, as well as non-governmental entities such as universities and non-profit agencies. Staffing, financing, and locus of control were negotiated in an environment of declining revenue and a tight employment market. The strategies to deal with these challenges will be discussed as well as specific progress with the initiative.

PROJECT MANAGEMENT AND LESSONS LEARNED

A. Tull, *Research & Development, Massachusetts Rehabilitation Commission, Boston, Massachusetts*

This presentation will address the challenges of managing a policy initiative, with emphasis on the successes of the Massachusetts projects. Challenges to implementation included resource limitations, managing multiple stakeholder agendas, crafting the public relations message, getting the appropriate people to the table, and promoting this agenda in an environment of economic crisis. Successes included the ability to bring together diverse stakeholder groups, particularly government agencies that were not accustomed to working together, to address mature worker issues in a collaborative effort, and raising public awareness of an issue that is common in the literature, but not as visible in the policy arena. This presentation will address the importance of building a project management plan that is achievable and sustainable. Project management resources will be shared.

THE POLICY AGENDA

E.A. Bruce, *Gerontology Institute, University of Massachusetts Boston, Boston, Massachusetts*

The Massachusetts 50+ Task Force broke into 9 work groups; 2 focused on increasing volunteerism, 3 focused on employment of mature workers, 2 groups addressing the barriers of transportation and the digital divide, a policy work group and a public awareness group. The Policy Work Group gathered policy options that could increase employ-

ment/volunteerism among people 50+ from the literature and coalition members. A review of pending state legislation was completed. From this list, the group examined only state initiatives as the group's influence over federal legislation was deemed minor. The policy options fell into several categories; incentives, mandates, sanctions, and education. Criteria for assessing the options included cost, # of people affected, advocates and detractors for the policy, administrative complexity, and possibility of passage. The policy options that have been considered will be discussed as well as the process and criteria by which the options were chosen.

SESSION 2055 (PAPER)

NURSING HOME REGULATIONS

EXPLORING SPATIAL DETERMINANTS OF NURSING HOME DEFICIENCY CITATION ISSUANCE

M.W. Carter¹, J.A. Halverson², 1. *Center on Aging, West Virginia University, Morgantown, West Virginia*, 2. *West Virginia University, Morgantown, West Virginia*

All nursing homes receiving Medicare or Medicaid dollars must undergo an annual inspection to ensure quality of resident care. Previous research has revealed both intra- and inter-state variation in deficiency citation issuance, which may suggest systemic determinants of deficiency receipt. However, empirical investigations are lacking. In response, this study used data from the Online Survey Certification and Records System to examine the extent to which patterns of deficiency citation issuance are spatially correlated over surveyor regions. Survey regions were identified using a number of strategies, including telephone and email correspondence, leading to the identification of survey boundaries in 25 states. Multivariate Spatial Lag Models were used to examine the extent to which region of location explained spatial variation in deficiency citation issuance across nursing homes. Model results were compared with estimates obtained from random effects models. Results from the spatial lag models suggested that neighboring facilities' receipt of deficiency citations are an important determinant of deficiency citation issuance. For example, the Moran's I (0.098, $p < .000$) was significant, confirming the presence of spatial dependence, while the spatial lag parameter (0.306, $p < .000$) indicated that the values clustered geographically. Random effects models failed to account for spatial variation, as the level-1 variance components remained nearly identical to the unconditional models. Findings provide new insight into the underlying causes of variations in outcomes across facilities that cannot be explained by differences in facility operating characteristics, resident population characteristics, or area market attributes.

PERSISTENT DEFICIENCY CITATIONS OF PRESSURE ULCERS IN NURSING HOMES

N.J. Zhang, S. Paek, T. Wan, *Department of Health Management and Informatics, University of Central Florida, Orlando, Florida*

Background: Despite being classified as only a localized soft-tissue wound, pressure ulcers have many serious clinical complications and a negative social impact for patients. Identifying risk factors related to persistent deficiencies of treating pressure ulcers in nursing homes and providing evidence-based knowledge in preventing resident deficiencies from resurfacing are key steps to reducing occurrences of pressure ulcers. However, few studies have examined the development of persistent deficiencies of pressure ulcers in nursing homes. Objectives: The principal aim of this study is to examine organizational, management, aggregate residential and market factors associated with persistent deficiency citations for treating pressure ulcers in nursing homes. Research design: We conducted a pooled cross-sectional analysis of 11 years data from 1997 to 2007 of all certified U.S. nursing homes. Both Online Survey Certification and Reporting Data and Area Resource File were used. A binary logistic regression model was utilized to test the proposed

hypotheses. Results: In addition to clinical factors, organizational, management and market risk factors are associated with the development of persistent deficiencies of treatment of pressure ulcers. Comprehensive care planning, resident assessment, total nurse staffing and market demand are all positively associated with fewer persistent deficiencies of treatment of pressure ulcers. Conclusions: Our study shows that a multidisciplinary approach integrating clinical, organizational, management and market strategies provides better interventions for persistent deficiencies of pressure ulcers. The effectiveness of multidisciplinary intervention on other deficiency citations should be examined in future studies.

SESSION 2060 (PAPER)

OLDER AMERICANS ACT (OAA): CLIENTS AND SERVICES

UNMET NEEDS FOR THE OLDER AMERICANS ACT NUTRITION PROGRAM IN GEORGIA

J. Lee¹, A. Brown², M. Johnson¹, R. Bengt¹, S. Sinnett¹, 1. *Foods and Nutrition, University of Georgia, Athens, Georgia*, 2. *Georgia Department of Human Resources Division of Aging Services, Atlanta, Georgia*

The Older Americans Act Nutrition Program (OAANP) is the longest and largest program under the Older Americans Act (OAA) meant to improve independence and overall well-being of low-income minority, rural older adults. With population aging and the current economic crisis, this program is challenged to meet the unprecedented increased needs for its services. We examined the capacity of the Georgia OAANP and characteristics of the waitlisted people using data from the Georgia OAANP client database systems and the ongoing Georgia Performance Outcomes Measures Project. Based on the client database systems, we identified a total of 4731 older Georgians who requested OAANP services during July through mid November, 2008. Only 40% of them received the program, and the remaining 60% were on the waiting list. Around 33% of those identified completed the self-administered mail surveys ($n=1594$, mean age: 74.5 ± 9.7 , 68.5% female, 26.4% black). Waitlisted people who participated in the survey were more likely to be younger, black, less educated, under poverty level, and requesting home delivered (vs. congregate) meals than those enrolled in the meals programs. They also reported higher levels of poorer self-reported health status, food insecurity and nutritional risk. The Georgia OAANP does not completely meet the needs of older Georgians, especially those targeted by the OAA. Given the critical role of optimal nutrition in healthy aging, more attention should be given to expand and enhance the delivery of the Georgia OAANP to meet the need and demand of nutritionally vulnerable older Georgians.

ETHNIC-RACIAL DIVERSITY AND SOCIAL SUPPORT OF SENIOR CENTER PARTICIPANTS: RESULTS FROM THE HEALTH INDICATORS PROJECT OF NEW YORK CITY

N. Giunta^{1,2}, C. Morano^{1,2}, N. Parikh², D. Friedman², M. Caron², D. Das², M. Ruiz², M.C. Fahs^{2,3}, 1. *Hunter College School of Social Work, New York, New York*, 2. *Brookdale Center for Healthy Aging & Longevity, Hunter College, City University of New York, New York, New York*, 3. *Hunter College Program in Urban Public Health, New York, New York*

As baby boomers reach retirement age, it is essential that evidence-based programs and services are accessible in communities to promote healthy aging and prevent or delay the onset of chronic conditions. In the first year of a three-year study to assess the effectiveness of New York City's aging services network, a survey of senior center participants was conducted with a random, representative sample of 1870 older adults from 56 senior centers citywide. This paper presents an examination of neighborhood perceptions, social support, and health status among senior center participants. Preliminary results using bivariate

analyses support existing evidence of the positive relationship between social support and self-reported health ($F = 3.63$, $p < .01$). However, social support among older adults who attend senior centers with more ethnically and racially diverse populations was found to be significantly lower than participants in more homogeneous centers ($t = -3.46$, $p < .01$). Multivariate analyses will be presented to better understand these findings and to help design effective policies and programs that support healthy aging among ethnically and racially diverse populations. This first of its kind representative sample of senior center participants provides a rigorous methodological approach to designing and implementing evidence-based interventions in community-based settings serving older adults.

COMMUNITY-BASED PREVENTIVE GERONTOLOGY AND PUBLIC HEALTH: POTENTIAL ECONOMIC BENEFITS OF EVIDENCE-BASED STRATEGIES TO REDUCE RACIAL/ETHNIC DISPARITIES IN HEALTH RISKS AMONG SENIORS ATTENDING SENIOR CENTERS

M.C. Fahs^{1,2}, N. Parikh³, D. Das³, D. Friedman³, M. Caron³, M. Ruiz³, N. Giunta¹, C. Morano¹, 1. Brookdale Center for Healthy Aging and Longevity, Hunter College, New York, New York, 2. Graduate Center, City University of New York, New York, New York, 3. Brookdale Center for Healthy Aging and Longevity of Hunter College, New York, New York

Innovative community-based models are urgently needed to target effective prevention among urban older adults. Recently, the Urban Institute projected significant savings within 5 years from investments in strategic low-cost, community-based prevention efforts. Yet a paucity of studies differentiates correlates of health risks by race/ethnicity and neighborhood among community-dwelling older adults. We use a public health ecological approach to estimate potential economic benefits of risk reduction in 3 important areas affecting health: nutrition, physical activity, and tobacco use among NYC seniors attending senior centers, a potentially vital structural component of urban aging policy. We conducted a survey of 1,870 randomly selected adults aged 60 years attending a representative sample of 56 senior centers in NYC in 2008. In-person interviews were conducted in six languages using standardized individual and neighborhood-level health risk instruments. Random effects models estimate the impact of individual and neighborhood-level characteristics on health risk behaviors. Economic projections associated reduced health risk behaviors are derived. The sample is composed of 44% White non-Hispanics, 21% Latino/Hispanics, 21% African Americans, 14% Asian/Pacific Islanders. Strikingly, senior center participants are representative of the US population of community-based older adults, based on nonsignificant differences in physical and mental health scores. Yet large statistically significant ($p < .01$) differences in health risks by race/ethnicity and neighborhood were identified, with large potential for economic benefit associated with risk reduction. Neighborhood-based senior centers have the potential to contribute to healthy urban aging. New policy initiatives are discussed within the economic framework of community-based public health prevention.

TITLE V OF THE OLDER AMERICANS ACT, THE SENIOR COMMUNITY SERVICE EMPLOYMENT PROGRAM: PARTICIPANT DEMOGRAPHICS AND SERVICE TO RACIALLY/ETHNICALLY DIVERSE POPULATIONS

M.M. Washko¹, R.W. Schack², B.A. Goff², B. Pudlin², 1. Employment and Training Administration, US Department of Labor, Washington D.C., District of Columbia, 2. Charter Oak Group, LLC, Glastonbury, Connecticut

The number of older adults in our nation's workforce has been steadily increasing since the late 1980s. The Senior Community Service Employment Program (SCSEP) —authorized by Congress in Title V of the Older Americans Act of 1965 and administered by the USDOL—is a work-training program for low-income job seekers, age 55+, and is

part of a larger public policy effort to help older Americans maintain maximum independence. Emphasis is placed on assisting individuals with the greatest social and economic need, particularly low-income minority individuals and those living in rural areas. An analysis of participation levels of minority individuals and an examination of their duration on subsidized employment and eventual employment outcomes (job placement) was conducted. Overall, findings indicate that SCSEP serves a substantially higher proportion of minority groups overall than their incidence in the population, and specifically serves slightly higher proportions of Blacks, American Indians and Pacific Islanders. Major findings include that Pacific Islanders have the longest duration in this subsidized employment program and in terms of employment outcomes, Hispanics are employed at a higher rate than non-Hispanics. This presentation will discuss these findings and others, along with national level programmatic implications which include: (a) a need for more training & technical assistance on how to recruit, train and retain racially/ethnically diverse seniors and (b) more targeted outreach by grantees to the minority populations that are being underserved.

SESSION 2065 (POSTER)

RESEARCH METHODS: APPROACHES AND PARTNERSHIPS

CONTENT ANALYSIS APPLIED TO PUBLIC USE AGING SURVEY INSTRUMENTS TO ASSESS ACTIVITY MEASURES

M. Inoue³, M. Putnam¹, J.C. Greenfield², N. Morrow-Howell², 1. School of Social Work, Simmons College, Boston, Massachusetts, 2. Washington University in St. Louis, St. Louis, Missouri, 3. Boston College, Boston, Massachusetts

This poster presents the application of a Content Analysis method and describes how it was applied to a collection of 8 survey instruments from public use data sets to thematically categorize measurement domains and variables related to older adults and activity. Public use data sets include: American Community Survey, National Health Interview Survey, Behavioral Risk Factor Surveillance System, Panel Study on Income Dynamics, Midlife in the United States, Baltimore Longitudinal Study of Aging, Longitudinal Study of Aging, Health and Retirement Study. Methodological description of the Content Analysis includes the process of public use data set selection, data collection across public use data sets, determination of decision rules for data inclusion/exclusion, data analysis, and assessment and articulation of findings. Means of establishing reliability and ensuring scientific rigor are discussed. Findings comment on the use of Content Analysis as a preliminary step in comparing the usefulness of public use data sets to answer specific empirical research questions about activity patterns and their associated factors and health outcomes.

METHODOLOGICAL CHALLENGES OF CONDUCTING RESEARCH WITH A COMMUNITY-ENGAGED ARTS PROGRAM

E. Moody, A. Phinney, School of Nursing, The University of British Columbia, Vancouver, British Columbia, Canada

Arts programs have been shown to support healthy aging and may be particularly important for older adults living in the community who are at risk for social isolation. Research on arts programs is becoming increasingly important to provide evidence on how to best promote healthy aging for older adults, however, there are often challenges to conducting research with arts programs, especially those conducted in collaboration with community groups. In this paper, I will describe the methodology and findings of an ethnographic study with a Community-Engaged Arts program. I will also point to some of the methodological challenges of conducting the research and the possibility that these challenges are indicators of the success of the program. The research, com-

pleted as part of a masters thesis, included several hours of participant observation and interviews with participants and staff involved with the Arts, Health and Seniors Program, a Community-Engaged Arts project offered in Vancouver, Canada. In addition to providing arts programming, the Arts, Health and Seniors Program was aimed to support independence and community inclusion for the older adult participants. The findings indicate that there was a strong sense of community within the group and that the members found new ways to engage with others in their neighborhood through the group work. I will discuss the significance of the methodological challenges of conducting research in such a setting and explore the possibility that they may indicate strengths of the program.

A STATEWIDE SATISFACTION SURVEY FOR RESIDENTIAL CARE FACILITIES: INSTRUMENT REFINEMENT

J. Straker^{1,2}, J.S. Brown^{2,1}, 1. *Scripps Gerontology Center, Oxford, Ohio*, 2. *Dept. of Sociology and Gerontology, Oxford, Ohio*

The Ohio Residential Care Facility (RCF) Resident Satisfaction Survey was developed by the Scripps Gerontology Center at Miami University and the Margaret Blenkner Research Institute at Benjamin Rose in 2006. At that time, a limited pretest with data from 102 residents in 9 nursing homes was conducted. Because of the limited number of written survey responses received in the pretest it was recommended that additional psychometric work be conducted after statewide data collection. The RCF satisfaction survey interviews were conducted in fall 2007. This presentation details the psychometric analyses conducted on the statewide data. Over 9000 interviews were conducted with residents in 529 Ohio residential care facilities. The data from those interviews provides the basis for this psychometric work. For the items in these analyses, the number of respondents ranged from about 6,000 to over 9,000. Results were used in developing the list of items to be included in each domain for domain score calculation reported on Ohio's long-term care consumer guide website at www.ltcoho.org. Based on statewide data and behavioral coding during interview observation we recommend changes to domains, elimination of items, and further refinements of item wording. We expect that these changes and the presentation of our improved survey instrument will result in a better interview process and more reliable results when the RCF satisfaction survey is administered again in 2009.

PAPER OR INTERNET?: EXAMINING DIFFERENCES IN RESPONSES TO WEB-BASED AND MAILED PROGRAM EVALUATION SURVEYS

J.C. Greenfield¹, N. Morrow-Howell¹, J. Branham², 1. *Washington University in St. Louis, St. Louis, Missouri*, 2. *The OASIS Institute, St. Louis, Missouri*

A program evaluation survey was conducted with participants of a national education/service organization serving adults age 50 and older. The study's purpose was to understand differences in results from Web-based versus paper surveys. A sample of 300 respondents was chosen from among organization participants with email addresses, with 150 drawn from each of two program locations; these respondents received an email invitation to complete a Web-based survey. Another sample of 300 participants was chosen from program participants at the two locations regardless of their email status; these respondents received a paper survey mailed to their home address. Both groups received two reminders in the month following the initial invitation to participate. When comparing the Web-based and paper survey groups, statistically significant differences emerged. Among those who had not been active with the organization recently, those who responded by Internet tended to choose travelling or volunteering elsewhere as the top reasons, while mailed survey respondents endorsed reasons related to health problems or transportation challenges. Internet respondents reported greater ease in completing the survey and less time required to complete the survey, and

Internet surveys generated fewer missing data. Paper surveys, however, had higher response rates. Despite the potential benefits of using Web-based survey instruments, these results suggest that respondents to paper and Web-based surveys may be meaningfully different. Although Web-based surveys have potential to be efficient and effective for program evaluations, they may not have broad enough reach for those wishing to gather data from diverse samples of older adults.

SENIORS COUNT!: A COMMUNITY BASED PARTICIPATORY RESEARCH APPROACH TO COMPILING AND DISSEMINATING DATA ON AGING

T.B. Jankowski¹, J. Booza², C. Leach¹, 1. *Institute of Gerontology, Wayne State University, Detroit, Michigan*, 2. *Wayne State University School of Medicine, Detroit, Michigan*

A dearth of accessible data on the growing aging population in Southeast Michigan prompted the development of the Seniors Count! project, a collaboration between the Institute of Gerontology at Wayne State University in Detroit and Adult Well Being Services, a local non-profit community agency that promotes the health and independence of older adults through advocacy and service. The Seniors Count! project is funded by the Kresge Foundation, the Community Foundation of Southeast Michigan, and the American House Foundation to plan, design, and implement an ongoing systematic collection, analysis and interpretation of demographic and social data on older adults in the region. Inspired by the successful Kids Count initiative, Seniors Count! seeks to assess the well being of older adults by identifying, gathering, and analyzing core indicators of basic individual and social characteristics related to health, health care, income, education, transportation, housing, the workforce, social services, public safety, civic engagement, and volunteer opportunities. We employ strategies from community based participatory research (CBPR) to encourage and facilitate participation from stakeholders, such as service providers, non-profit organizations, Area Agencies on Aging, government officials, policymakers, and advocates, in our Community Advisory Board (CAB). The CAB helps to identify data sources, but more importantly, provides advice and guidance to our researchers about the utility of various data and the ways in which they can be reported. Our poster discusses how we employed CBPR methods to form a community partnership to meet the data needs of the aging network as it plans for population aging.

EPISODES OF CARE: AN IMPORTANT FRAMEWORK FOR INVESTIGATING NURSING HOME OUTCOMES

K. Thomas, Z.D. Gassoumis, K. Wilber, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Nursing home usage patterns and discharge outcomes continue to be important research and policy topics. This poster describes the rationale for using aggregated episodes of care instead of unaggregated stay data; provides a detailed description of how to create episodes of care from MDS records; and compares usage patterns and discharge outcomes using episode versus stay data. The need to create episodes is driven by two issues inherent in nursing home outcomes research: sampling biases and transitions between care settings, specifically between hospitals and nursing homes. Because of the population mix and resident transitions, traditional length of stay calculations tend to overestimate acute discharges and underestimate the number of long-stay residents. Methodological differences in how these issues are handled produce significantly different results, which have implications for research and policy. For this analysis, an episode is defined as an aggregated nursing home stay without an intervening discharge period of more than thirty days. An episode ends when the resident remains outside the nursing home for more than thirty days or when he/she dies. In this study, the stay data show 47% of residents being discharged within thirty days, compared to 39% when using episode data. Looking at discharge outcomes, stay data show 17% of residents discharging to acute within fourteen days, compared to 10% using episode data. Inconsis-

tent sampling techniques and episode definitions make it difficult for researchers to compare results across studies. Furthermore, accurate measurement of nursing home use is important for designing and pricing public and private long-term-care insurance.

CLIENT AND CAREGIVER PERCEPTIONS OF ADULT DAY SERVICES: A PROGRAM EVALUATION

D.M. O'Donnell, *Hurley Elder Care Law, Atlanta, Georgia*

The MJCCA Weinstein Center for Adult Day Services provides social activities and medical services to older adults, including individuals with memory loss. Center administrators requested a program evaluation to explore attraction and retention of clients, beneficial effects of Center activities, and the current case management program. Regular members of the Center's Traditional Group and family caregivers of Memory Loss program attendees participated in open-ended interviews in focus groups. Content analysis revealed that clients consider Center activities, staff, and social environment superior to the few other day care alternatives. The activities benefit clients primarily physically and emotionally. Potential areas of improvement include enhanced communication with caregivers and more engaging, mentally-stimulating activities personally significant to participants. These findings reveal that person-centered care is appropriate in the adult day service setting and can guide the Center in program modifications.

SESSION 2070 (PAPER)

TRANSITIONS BETWEEN CARE SETTINGS

HEALTH CARE TRANSITION IN SMALL ADULT CARE HOMES

K. Bailey, *Social Work, Arizona State University, Phoenix, Arizona*

This paper presents the results of a qualitative exploratory study of small adult care home owners and their experience with health care transitions. Health care transitions are an issue of national concern. The elderly are particularly vulnerable to frequent health care transitions and represent the largest population at risk for rehospitalization, emergency room use, and medication errors resulting from poor care transitions. Small adult care homes are an integral part of the care continuum, yet investigation into health care transition in this setting is scant. Research to date has been focused on medical settings to the exclusion of this provider group suggesting they may be marginalized within this health care continuum. Eight semi-structured interviews were conducted with small care home owners (bed capacity 10 and under) licensed in Maricopa County, AZ over a three month period. Grounded theory methodology was utilized to analyze care home owners experiences. Findings indicate no standardized process for coordination of care with this provider group. Instead, owners develop unique strategies, including development of their own forms, direct in-person contact, family bonding, and relationship building with medical providers to mediate the exchange of health care information. Factors impacting owner's utilization of these strategies include length of time in the business, age of owner, and having a medical background. Findings of this study indicate a need for improved processes of communication and increased understanding of regulatory requirements between small care homes and medical providers.

THE IMPACT OF GROUP ADULT FOSTER CARE SERVICES ON NURSING FACILITY ADMISSION

W. Lin, L. Bruner-Canhoto, G. Aweh, M. Samnaliev, D. O'Connor, D.B. Centerbar, P. Swoboda, R. McManus, *Center for Health Policy and Research, University of Massachusetts Medical School, Shrewsbury, Massachusetts*

Growing awareness of the need to rebalance the national's long-term care system toward home and community-based services and continuing interests in cost containment have prompted states to pursue nurs-

ing facility (NF) alternatives. One alternative, Group Adult Foster Care (GAFC), provides personal care, nursing oversight, and case management in a community-based housing environment. This study examined whether GAFC use was associated with delayed long-term NF admission. Massachusetts Medicaid claims and Minimum Data Set - Home Care (MDS-HC) assessments for GAFC applicants from FY04 to 06 were merged for analysis. We identified a group of 1,276 GAFC users and a comparison group who applied for but did not use GAFC (n=178). To address the potential selection-bias surrounding the non-random assignment of GAFC users, we used the propensity score method to estimate the probability of GAFC use. We included this estimated probability as a control variable in the subsequent survival analysis modeling time to NF admission. The unadjusted percentage of non-GAFC users staying in the community rapidly decreased in the first 9 months after MDS-HC assessment, compared to a moderate decrease in GAFC users. Results from the survival analysis show that the NF admission rate in GAFC users at any point in time was less than one-third of the rate for non-GAFC users (hazard ratio=0.32 and 95% CI (0.20, 0.51)). Our findings show that GAFC can divert users from long-term NF admission. As states actively pursue NF alternatives, the GAFC model of combining housing and medical services is a plausible option.

MAKING CARE COORDINATION ESSENTIAL TO NATIONAL HEALTH CARE REFORM

P.J. Volland, J. Melly, *SWLI, New York Academy of Medicine, New York, New York*

Numerous studies have documented that the relatively small percent of Medicare beneficiaries with multiple chronic conditions account for the vast majority of Medicare spending; eventually many of these individuals are institutionalized. Once this occurs the costs associated with their care rises from \$20,000 to \$77,000 per year. Care coordination is a vital tool in reducing long-term health care costs and improving quality of life for adults with multiple chronic conditions by taking a client-centered, assessment-based interdisciplinary approach to integrating health and human services care. In 2008 the National Coalition on Care Coordination (N3C) was convened under the leadership of the New York Academy of Medicine (NYAM) to advocate for the inclusion of adopting care coordination policies as the foundation of care. NYAM is also currently partnering with the New York State Department of Health to develop a blueprint for adoption of comprehensive care coordination guidelines, and a plan that improves the quality of long-term care for older adults by implementing a statewide care coordination program that is person-centered while adhering to a single format. This process has included community-based participatory research to develop consensus around care coordination principles and qualifications. Focus groups have been conducted with caregivers, care coordinators and agency staff. This presentation will focus on the development of N3C and the Blueprint for Care Coordination for NYS, and the efforts to ensure that care coordination policies are included in upcoming health care reform and health care policies in NYS.

UTILIZING THE CTM3 TO EVALUATE A CHANGE IN HOSPITAL DISCHARGE PLANNING PRACTICE

M.A. Hemann², D.E. Holland¹, *1. Nursing Research, Mayo Clinic, Rochester, Minnesota, 2. Mayo Clinic, Rochester, Minnesota*

While the National Quality Forum (NQF) endorsed the 3 item Care Transitions Measure (CTM3) as a standardized measure of patients' perceptions of care coordination, little evidence was found in the literature regarding its use in practice. The CTM3 was mailed one week after discharge to 416 adult medical-surgical patients hospitalized in a large Midwestern academic medical center prior to a discharge planning the practice change and to 387 patients from the same two units after the change. This practice change targeted higher risk patients for a standardized discharge planning intervention. Following NQF specifications, the CTM3 was mailed to all discharged patients (both targeted high risk patients

directly effected by the discharge planning intervention and lower risk patients not directly effected by the practice change). The response rates were 52.8% before (220/416) and 39.5% (153/387) after the practice change. There were no significant differences in demographic characteristics between the before and after groups, although a greater proportion of the respondents after the practice change were hospitalized for surgical reasons than the group prior to the change. A large ceiling effect (highest possible score) occurred in the scores from both groups (48.6% in the group prior to the practice change, 37.3% afterwards). Scores of targeted higher risk patients improved (before = 65.1(±30.3), after = 75.0 (±25.8)). The CTM3 appears to have utility in assessing patients' perceptions of care coordination in targeted higher risk patients. The utility of CTM3 responses from a general sample of hospitalized patients remains unclear.

SESSION 2075 (SYMPOSIUM)

WWW.LTCFOCUS.ORG: A NEW LONG-TERM CARE DATA RESOURCE FOR RESEARCHERS, POLICY MAKERS AND THE PUBLIC

Chair: *O. Intrator, Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island, VA HSR&D, Providence, Rhode Island*

Discussant: *J.G. Haaga, National Institute on Aging, Bethesda, Maryland*

More than 1.4 million Americans live in nursing homes today. By 2020, an estimated 12 million will need long-term care, whether in a nursing home, assisted living facility, chronic care hospital or at home. Brown University researchers have created a database aimed at providing information to improve the nation's long-term care system – and the lives of the elderly who rely on that system. The “www.LTCFoCUS.org” website hosts data regarding the health and functional status of nursing home residents, characteristics of facilities, state policies relevant to long term care services and financing, and new survey data regarding delivery of care in nursing home settings. The data will allow researchers to trace a clear relationship between state policies and local market forces and the quality of long-term care. Researchers can use this website to examine care processes and resident outcomes within the context of their local markets and regulatory practices. Policymakers can use the information to shape state and local guidelines, policies, and regulations that promote high-quality, cost-effective, equitable care to older Americans. Together, it is anticipated that these audiences will have the data, tools and results to better understand the long term care system, and to achieve improvements in how care is organized, financed and delivered. This symposium will introduce the website, demonstrate its features by navigating through it, describe the underlying data sources, and demonstrate its utility by presenting a glimpse of regional variation in long-term care, raising the question: Is geography destiny in long-term care?

WWW.LTCFOCUS.ORG: DATA SOURCES AND DATA QUALITY

O. Intrator^{1,2}, V. Mor¹, M.A. Unruh¹, V. Nathilvar¹, Z. Feng¹, *1. Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island, 2. VA HSR&D REAP, Providence, Rhode Island*

The Minimum Data Set (MDS) resident assessments underlie many of the measures published on the LTCfocUS website. The MDS includes over 300 data items and is completed upon admission, discharge, significant change, and at least quarterly. The assessments enable a health care provider to assess key domains of physical and cognitive function, social support, and service use. Summary outcome scales measure cognitive and physical function, mood, pain, etc. This data, now used in research for almost 2 decades, is used for reimbursement by Medicare and 37 states. MDS-based quality measures for long stay and post-acute patients are published quarterly by CMS. This paper examines the completeness of the MDS assessment schedule and the corroboration of

MDS items and measures with diagnoses in Medicare claims. These results quantify the quality of the measures published on the LTCfocUS website and their geographic variation and changes over time.

WWW.LTCFOCUS.ORG: NURSING HOME PROVIDERS

Z. Feng, M. Fennell, O. Intrator, V. Mor, *Center for Gerontology & Health Care Research, Brown University, Providence, Rhode Island*

The framework used in the LTCfocUS.org to characterize nursing home residents is based on all residents identified in the nursing home on a particular day each year. Using these residents' Minimum Data Set (MDS) assessments, information is aggregated from those residents to the facility level. This enables users of LTCfocUS.org to profile all certified US nursing homes at an annual snapshot or track individual providers in a longitudinal manner. This presentation concentrates on the shifts over time in racial composition of nursing home residents; racial segregation and disparities in nursing home access and quality of care; trends in the case mix of nursing home residents; and changes in both the levels and skill mix of nursing home staffing (from Online Survey Certification and Reporting data). Geographic variability in selected provider characteristics will also be presented using geo-referenced data.

LTCFOCUS.ORG: NAVIGATING THE SITE

D. Tyler, V. Mor, Z. Feng, O. Intrator, *Center for Gerontology, Brown University, Providence, Rhode Island*

The LTCfocUS.org website provides users with research abstracts and publications and allows users to create their own tables and maps. This data-rich and graphically sophisticated website allows users to customize maps and tables to gather information by state, county, or individual facility, including information on facility characteristics, geo-coded facility locations, resident characteristics, local market characteristics, facility staffing, admissions, quality, and state long-term care policies. The goal of the website is to allow researchers to trace clear relationships between state policies and local market forces and the quality of long-term care. Policymakers will also be able to use the information to craft state and local guidelines that promote high-quality, cost-effective, equitable care to older Americans. This presentation will introduce the data available on the website and demonstrate its functionality and use, including the creation of custom maps and tables.

SESSION 2080 (SYMPOSIUM)

THE EVOLUTION OF SLOW AGING AND NEGLIGIBLE SENESCENCE

Chair: *C. Finch, University of Southern California, Los Angeles, California*

Relative to most other mammals, humans have very slow rates of aging. This symposium will summarize evidence and theory for the popular concept of negligible senescence.

AVOIDING AGING: NEW PERSPECTIVES ON OLD THEORIES

D. Promislow, J. Moorad, *Genetics, University of Georgia, Athens, Georgia*

Classic models for the evolution of senescence suggest that aging is an inevitable consequence of the way that selection acts, or fails to act, on old individuals. However, these models are based on numerous simplifying assumptions. We have taken a new look at these old models, relaxing many of these simplifying assumptions. New results suggest that under a variety of circumstances, the rates of decline in the force of selection may be much slower than previously thought.

THE EVOLUTIONARY ECOLOGY OF SLOW AGING AND NEGLIGIBLE SENESENCE

S. Austad, *University of Texas Health Science Center, San Antonio, Texas*

Only a handful of animal species have been reliably reported to live more than a century in nature — the current long-life record holder being the ocean quahog which can live more than 400 years. I will review what is known about the longevity of a number of these exceptionally long-lived species and discuss how the particular ecological niche they occupy and anatomical/physiological traits they possess may have led to the evolution of slow aging. Using the principles revealed by this analysis, I will also make predictions about other animals in which negligible senescence has not yet been described but should be with sufficient investigation.

DEMOGRAPHY OF AGING FOR PLANTS IN NATURAL ENVIRONMENTS

D. Roach, *Biology, University of Virginia, Charlottesville, Virginia*

Most of our information about variation in the rates of aging is based on humans and short-lived animal studies in the laboratory. When we look more broadly across species, there is evidence that some organisms may be able to escape senescence. For example, many plant species, with their modular body plans, indeterminate growth and long life spans, may challenge the theoretical expectation of the inevitability of senescence. This talk will discuss our current knowledge of senescence patterns across the plant kingdom and will use recent analysis from field experiments with *Plantago lanceolata* to demonstrate negligible senescence. Results will also be presented to show that age-by environment interactions are critical to our understanding of senescence across species in their natural environments.

EXPANDING EVOLUTIONARY THEORY OF AGEING

A. Baudisch, *Max Planck Institute for Demographic Research, Rostock, Germany*

Senescence is only one possible path of life for a species. Alternatively, adulthood could follow a simple path of maintenance or even of continued growth and enhancement. It is time to expand the evolutionary theory of ageing to embrace age-patterns of mortality, fertility and growth that include not only senescence but also sustenance and improvement. Classical theory argues that senescence is inevitable, because the force of selection declines with age. Challenging this view, it is argued that a declining force of selection does not preclude the evolution of non-senescent life history strategies.

SESSION 2085 (SYMPOSIUM)

ASSOCIATIONS BETWEEN DAILY AND CHRONIC STRESSORS, FAMILY RELATIONSHIPS, AND WELL-BEING

Chair: K.E. Cichy, *Human Development and Family Studies, Kent State University, Kent, Ohio*

Discussant: M. Franks, *Purdue University, West Lafayette, Indiana*

This symposium features research examining associations between family relationships, stressful experiences, and health. Families face chronic issues, such as the stressors associated with family caregiving or managing a chronic health condition, as well as the daily hassles of family life, such as an argument with a spouse or concern over a family member's problem. Both chronic stressors and daily hassles may compromise health by taxing individuals' physical, emotional, and cognitive resources. This symposium will highlight the ways family relationships contribute to how individuals respond to both chronic and daily stressful experiences. First, Berg, Wiebe, and Butner examine emotional transmission between spouses in couples experiencing stressful events surrounding prostate cancer. Martire, Stephens, Brach, Keefe, and Schulz examine same-day and next-day associations between spousal influence and patients' daily functioning among older knee osteoarthritis patients and their spouses. In contrast, Cichy, Stawski, Mroczek, Spiro, and

Almeida examine older spouses' emotional reactivity to their own as well as their spouses' daily stressful experiences. Finally, Stawski, Cichy, Sliwinski, and Mogle examine how perceived social support from family and friends buffers older adults' emotional and cognitive reactions to daily stressors. Together, these studies use daily diary approaches to examine how family relationships influence emotional, physical, and cognitive reactivity to diverse stressful experiences. Melissa Franks will share her expertise on aging families and chronic disease to draw parallels across the studies and offer recommendations for future research on family relationships, health, and well-being.

HUSBANDS AS NATURALLY OCCURRING STRESSORS: DAILY STRESSORS AND WELL-BEING IN OLDER COUPLES

K.E. Cichy¹, R.S. Stawski², D. Mroczek³, A. Spiro⁴, D. Almeida², 1. *Human Development and Family Studies, Kent State University, Kent, Ohio*, 2. *The Pennsylvania State University, University Park, Pennsylvania*, 3. *Purdue University, West Lafayette, Indiana*, 4. *Boston University, Boston, Massachusetts*

Prior research emphasizes the benefits of marriage in later life, particularly for husbands. Still, older couples are not immune to negative interactions. Gender differences in marital roles may contribute to older wives reacting to not only their own stressors, but also to their husbands' stressors. A total of 96 dyads (Mean age_{Husbands} = 75, SD = 6; Mean age_{Wives} = 71, SD = 8) completed measures assessing daily stressors and negative affect (NA) on eight consecutive days. Results revealed that both partners experienced significantly higher NA on days when they experienced arguments, overloads at home, and health-related stressors ($p < .05$). Only husbands exhibited increases in NA associated with experiencing avoided arguments and overloads at work ($p < .05$), whereas only wives exhibited increases in NA associated with network stressors ($p < .05$). Furthermore, husband's experience of daily stressors had an additional and unique effect on wives NA, but only for husband's arguments ($p < .01$).

SPOUSAL INFLUENCE ON DAILY FUNCTIONING IN KNEE OSTEOARTHRITIS

L.M. Martire¹, M. Stephens², J. Brach¹, F.J. Keefe³, R. Schulz¹, 1. *Psychiatry, University of Pittsburgh, Pittsburgh, Pennsylvania*, 2. *Kent State University, Kent, Ohio*, 3. *Duke University, Durham, North Carolina*

Knee osteoarthritis (OA) is a chronic, painful condition and a primary cause of disability in older adulthood. Among married patients, the spouse is likely to be the primary social influence on daily functioning. This dyadic study focused on older knee OA patients (average age = 70 years, range = 53 to 89; 61% female) and their spouses. Both partners used an electronic diary to provide daily data for 21 days regarding mood, patient pain, spousal responses to patient pain (i.e., empathic, insensitive, and solicitous responses), and spousal control of physical activity (i.e., autonomy support, persuasion, and pressure). Both participants also wore an accelerometer in order to measure daytime physical activity over the same 21-day period. Presented findings will focus on same-day and next-day associations between spousal influence and patients' daily functioning, and whether the effects of negative spousal communications have a greater impact on male patients than on female patients.

EMOTIONAL TRANSMISSION IN MARITAL COUPLES DEALING WITH STRESSORS SURROUNDING PROSTATE CANCER

C.A. Berg¹, D.J. Wiebe², J. Butner¹, 1. *Psychology, University of Utah, Salt Lake City, Utah*, 2. *University of Texas Southwestern Medical Center, Dallas, Texas*

The study examined how a person's mood is influenced by their spouse's mood, as spouses experience stressful events surrounding

prostate cancer. Emotional transmission may occur more frequently when couples are collaboratively engaged around stressful events. Fifty-nine husbands and wives completed diaries for 14 days reporting stressful events, collaborative coping, and positive and negative mood. Hierarchical Linear Modeling revealed that emotional transmission did not occur for positive emotion ($p > .5$ for husbands and wives), but did occur for negative emotion ($b = .11$, $p < .05$ for husbands, $b = .22$, $p < .01$ for wives). Negative emotional transmission was moderated by the amount of collaborative coping perceived across the 14 days. Transmission of negative emotion only occurred when spouses reported higher collaborative coping across the period. The results suggest that one potential downside to collaborative coping is the short-term cost to daily mood, despite the more general positive effects of dyadic coping.

PERCEIVED SOCIAL SUPPORT AND REACTIVITY TO DAILY STRESSORS AMONG OLDER ADULTS

R.S. Stawski¹, K.E. Cichy², J. Mogle³, M. Sliwinski³, *1. Pennsylvania State University, University Park, Pennsylvania, 2. Kent State University, Kent, Ohio, 3. Syracuse University, Syracuse, New York*

Research has shown that social support is an important factor contributing to health and well-being across the lifespan. Little research, however, has examined whether perceived social support (PSS) buffers older adults reactions to their naturally occurring daily stressors. The current study examined whether PSS from family and friends buffered emotional and cognitive reactions to daily stressors in a sample of old adults. Eighty-four older adults (Mage = 83; 27% Male) completed six sessions over a period of two weeks. At each session participants completed measures assessing their experience of daily stressors, negative affect, and cognitive interference. They also completed measures of PSS from both family and friends. Results revealed a significant three-way interaction between daily stressor occurrence, age, and PSS from family such that PSS blunted stressor-related increases in cognitive interference, but only amongst the oldest adults ($p = .01$). PSS from friends was not significantly predictive of reactivity to daily stressors.

SESSION 2090 (SYMPOSIUM)

CHALLENGES TO AL QUALITY: INSIDER VIEWS

Chair: *L. Morgan, UMBC, Baltimore, Maryland*

Discussant: *J. Hyde, UMBC, Baltimore, Maryland*

There is considerable interest in creating, sustaining and evaluating quality in long-term care, including the newer assisted living (AL) sector. This symposium addresses structural, temporal, interactional, fiscal and regulatory challenges to high quality of life in AL. Papers present results from a mixed method, NIA-funded study (Stakeholders' Models of Quality in Assisted Living) that used semi-structured interviews with 77 residents, 52 staff, and 57 family members to identify bases upon which they judge quality. Questions identified elements of daily life that mattered to themselves/their relatives/residents for a good/bad day, or that they would change if they were in charge. The audio-recorded interviews identified a wide range of quality criteria, both within and across respondent groups and settings in the study. As a newer and less-clearly defined alternative in long-term care, the sector faces daily challenges to enact its distinctive philosophy while meeting diverse and changing needs/preferences of its residents, as well as operational, regulatory and fiscal goals. After an initial orienting paper (1) that outlines our dynamic view of quality, remaining papers focus on findings including; 2) specific challenges encountered by adults residing in a collective environment; 3) the multiple, and sometimes contradictory, expectations of staff roles within AL settings; 4) balancing service, regulatory and fiscal goals; and 5) the challenge to researchers of translating research findings to consumer and provider audiences. Quality implies meeting diverse expectations from multiple interested stakeholders that require daily negotiations and problem-solving to maximize quality.

RULES, REGULATIONS, AND QUALITY IN AL

L.J. Clark, J.K. Eckert, E. Roth, *Center for Aging Studies, UMBC, Baltimore, Maryland*

Assisted living settings operate under certain rules and regulations imposed by the state, administrative and corporate structures, and setting-specific boards and directorships. Often, quality is assessed by static measures of how well ALs follow these; yet, our research indicates that such rules and regulations do not capture the dynamic elements of quality, and can impede the delivery of quality care and services. This paper discusses how oversight from external bodies competes with ongoing efforts of residents, staff, family, and administrators to achieve quality in AL. Our findings describe the impact of rules and regulations about the physical plant, staff training, medication, food preparation and variety, on the experience of everyday quality within ALs. These findings are relevant to AL providers and policymakers, as they provide insight into how the current procedural and regulatory milieu impacts the experience of quality by those who live, work, and visit in AL.

THE DYNAMICS OF ASSISTED LIVING QUALITY: A MULTIFACETED AND MOVING TARGET

L. Morgan, J. Eckert, *UMBC, Baltimore, Maryland*

Quality evaluation often employs surveys or consumer satisfaction studies. This paper outlines two critiques of traditional approaches to quality assessment. Employing data from interviews with residents, staff and family members from 7 AL settings, results show that quality is complex, contested, and dynamic through time. Critique 1 addresses how participants' frames of reference shape priorities for what matters most to quality. Variations among residents, between residents, kin and staff; and across the settings suggest that quality criteria are not uniform or widely shared. Critique 2 addresses how changes over time in both residents and in AL settings shift the quality equation. Suitability of a setting is shaped not just by a given resident's preferences and needs but also by changes in ownership, leadership or services of the AL. Both of these critiques question traditional measurement of quality; complexity and change are at the heart of the AL quality challenge.

AT THE THRESHOLD OF INSTITUTIONAL LIFE: THE CONUNDRUM OF RESIDENT INDEPENDENCE AND RELIANCE

A. Frankowski, L.J. Clark, *UMBC, Baltimore, Maryland*

Assisted Living (AL) sits at a pivotal point between a loosely configured collective living environment and a structured institutional setting. Often called a "soft" institution, the AL presents pragmatic challenges for residents who expect and rely on needed services while also enacting independent choices. This paper examines how perceptions of quality within the soft institution of AL are affected by (1) the ways in which residents' conceptions of independence and choice are moderated by the AL and (2) how residents are able to balance their individual expectations of collective living with the institutional rules in place at the formalized setting. The authors present findings on the intricacies of negotiating space (public and private, shared and individual), social interaction (activities and daily routines), and medical needs (medication management and functional assistance) with the realities of living collectively.

TOWARD A CULTURE OF CARING

L. Keimig, E. Roth, *University of Maryland Baltimore County, Baltimore, Maryland*

Perceptions of quality in assisted living depend largely on interactions with direct care staff. This paper explores the deeper aspects of providing quality care in these settings, based on a narrative analysis of in-depth interviews with 186 staff, administrators, residents, and families. Findings focus on the relational aspects of care: personal warmth and attention, staff orientations and attitudes, sensitivity in handling bodily needs, and spirituality, especially at the end of life. Our findings

illustrate how direct care workers, despite experiences with inadequate staffing, low pay, and complex rules and regulations, make personal and meaningful connections, bring comfort to those in their care, and serve as exemplars of quality in assisted living.

TRANSLATING QUALITY TO PRACTICE

J.K. Eckert¹, S. Zimmerman², 1. *University of Maryland Baltimore County, Baltimore, Maryland*, 2. *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

To improve health and well-being, research must be translated into practical applications. NIH has made translational research a top priority for bench science application to clinical practice, and the need for translational research is no less important for behavioral and social sciences research. This project on the perceptions of quality in AL has made practical application of results a top priority and accomplishes this task by: 1) expressly engaging residents, family members, caregivers, supervisors, and administrators on the topic of quality in AL; 2) analyzing data to derive their "take away" messages in jargon free language; 3) separating the methodological discussion so important to social science researchers from the practical message relevant to consumers and providers; and 4) focusing on actionable suggestions for providers and consumers. Examples to be discussed include applying concepts of quality when marketing and selecting a residence, and acting when quality goes awry.

SESSION 2095 (PAPER)

EDUCATING GERONTOLOGISTS

GERONTOLOGIZING ACADEMIA

T.A. Abramson, *Behavioral Science, New York Institute of Technology, Old Westbury, New York*

The shortage of trained professionals and academic programs to train students to work with an older adult population has been well documented. The growth of the older cohort and the lack of professionals to work with older adults across disciplines is of great concern and requires creative solutions to meet this growing need. Senator Boxer's Bills currently in front of the House and Senate as well as work groups are important steps for the future. What must be considered are the current emerging professionals and the training, or lack therefore, being received in academic settings. To address this question a survey was conducted of all faculty in a medium sized suburban University that includes a school of Osteopathic Medicine. Survey data revealed that the majority of courses offered are not specific to aging, but a slightly higher percentage of the courses did include some, although minimal, aging content. About half of the faculty indicated that textbooks contain some aging content, whereas visuals do not. Many faculty indicated finding ways to bring aging content into their courses, particularly those from the medical school. Only 50% of the faculty felt there was a need for additional aging content in their courses. These findings indicate that there is a great need to begin the process of gerontologizing academic settings with creative solutions if there is any hope of increase the aging workforce. Faculty also rated what would be most helpful in bringing aging into their courses. These ideas are key to finding creative ways to address the pending workforce shortage.

CREATIVE APPROACHES TO AGING CURRICULAR INFUSION: BUILDING STUDENT GERONTOLOGICAL COMPETENCIES

R.P. Bonifas, T. Kennedy, *School of Social Work, Arizona State University, Phoenix, Arizona*

Curricular infusion efforts to gerontologize social work education have been identified as effective strategies for preparing social workers for practice with older adults, regardless of their primary specialization area (Hooyman, 2006; Hooyman, 2009). Gerontological social work

competencies serve as a valuable mechanism for assessing learning outcomes of such interventions (Damron-Rodriguez, Volland, Wright, & Hooyman, 2009) and provide an important basis for evaluating the impact of gerontological curricular infusion efforts on student learning (Hooyman, 2006). This paper examines one MSW program's involvement in the Gero Innovations Grant Masters Advanced Curriculum Project and reports preliminary results regarding the affect of gerontological curricular infusion on MSW students' self-assessed mastery of gerontological competencies within a newly implemented health/behavioral health concentration. Infusion strategies included standardized teaching modules, a standardized client interview, and a standardized case study infused in non-aging practicum settings. Following exposure to the gero-enriched curriculum, students made gains in several gerontological competencies, with the greatest gains among students with no prior exposure to older adults. This finding suggests the need for additional strategies to improve competency gains for students with previous formal or informal contact with older adults. Although students viewed gerontological content as an important component of an MSW education and 80 percent anticipated employment in multigenerational practice settings, they were less likely to recognize the linkage of gerontology to their own careers. This finding replicates results of previous research (Fredriksen-Goldsen & Bonifas, 2005; Fredriksen-Goldsen, Bonifas, & Hooyman, 2006) and highlights the importance of interventions that enable students to make this connection.

INTERDISCIPLINARY FACULTY SCHOLARS PROGRAM: LESSONS LEARNED

C. Ford¹, A. Curtis¹, P. Sawyer¹, P. Bosworth¹, C.S. Ritchie^{1,2}, 1. *Gerontology, Geriatrics & Palliative Care, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

The UAB Geriatric Education Center Faculty Scholars Program (FSP) is an interdisciplinary training program designed to improve the quality of health care for older adults. Geriatric training is provided to Faculty Scholars (FS) in priority areas identified by the Institute of Medicine (advanced illness, care coordination, frailty, symptom and medication management, ethnogeriatrics, and health literacy). Ten FS representing medicine, dentistry, social work, psychology, nursing, physical and occupational therapy completed 36 hours of geriatric training. Health literacy and cultural competency were integrated into all the above mentioned content areas (4 quarterly in-person sessions and 8 web-based modules). The average improvement for web-based curriculum ranged from 4% to 30% (average improvement = 16%). All faculty completed action plans and 3 FS introduced geriatric content into classes presented to 227 graduate and undergraduate students. Other FS have plans to integrate content into their 2009-10 classes. All scholars planned and participated in two workshops at the Alabama Gerontological Society Annual Meeting. Six of the FS students have poster presentations at this meeting. Two focus groups were conducted during the year to evaluate the process and content of presentations. All faculty strongly supported the interdisciplinary interaction requesting additional face-to-face meetings, the formation of an alumni group and the opportunity for continued participation and working with the new group of FS. These suggestions have been incorporated into the Year 2 Program. After attending this activity, participants will be able to discuss the opportunities and challenges regarding faculty recruitment, curriculum modification, program implementation and evaluation.

THE ELDER PROJECT: EDUCATIONAL MODEL AND 3-YEAR OUTCOMES OF A COMMUNITY-BASED, FEDERALLY FUNDED INITIATIVE

J. Lange, P. Greiner, D. Mager, *Fairfield University, Fairfield, Connecticut*

Purpose: The purpose of the ELDER (Expanded Learning and Dedication to Elders in the Region) Project was to address the needs of under-

served older adults by providing continuing education to individuals who provide nursing care to older adults in community health centers, home health agencies, and long-term care facilities. Four agencies located in a Health Professional Shortage and Medically Underserved Area participated. Model: Project staff conducted separate focus groups with administrators and staff at each agency to determine educational needs and preferences. Curricula from the Hartford Institute and Geriatric Education Centers were adapted to design unique curricula for each agency and level of personnel (licensed nurse or unlicensed caregiver). Simulation exercises during year three facilitated teamwork and interprofessional communication. Outcomes: Sixty-seven nurses and nursing aids as well as seven administrators, physical or occupational therapists, social workers and a physician participated. Evaluations conducted by an independent consultant were highly favorable. Simulations demonstrated participants' ability to integrate best practices into typical clinical scenarios, and revealed improved communication among care providers. Implications: Tailored, on-site education incorporating simulation is an effective model for translating gerontological knowledge into practice and improving the care of older adults in multiple settings.

DEMOGRAPHIC AND EPIDEMIOLOGICAL IMPLICATIONS OF POPULATION AGING AND THE IMPACT ON TEACHING HOSPITAL ADMISSIONS AND UNDERGRADUATE EDUCATIONAL EXPERIENCES

J. Da Silva, L. Soares, P. Carvalho, G. Silva, *UFRJ / EEAN, Petropolis - RJ, Rio de Janeiro, Brazil*

Study developed with three undergraduate nursing students and their advisor based upon a proposal derived from clinical practice at Anna Nery School of Nursing / Federal University of Rio de Janeiro. The research team used quantitative data from three Brazilian databases, two national (IBGE and DATASUS) and one local (HUCFF) to study the phenomenon observed during school activities: an increasing number of older adults across floors and specialty clinics in the Teaching Hospital. The study objectives were to describe the socio-demographic-clinical profile of patients, its impact and potential challenges for nursing professional practice and teaching-learning experiences of an undergraduate curriculum that emerges from practice. The method included: first, the development of a spreadsheet to include socio-demographic data, length of stay, and the International Disease Classification Codes; second, data collection on the databases; and third, the organization and analysis of a newly generated database. Preliminary descriptive statistics indicate that when compared to the population, the number of older adults admitted to hospital was higher than younger adults. More specifically, in Rio de Janeiro State admissions of older adults represented 46% of all admissions. Results and knowledge produced were shared with nursing and medicine undergraduate program directors and resulted in a first multidisciplinary optional course offered jointly by the schools of Nursing and Medicine - optimizing the use of resources for a more refined care for critically ill or highly complex older patients, such as those in a Teaching Hospital.

WORKFORCE NEEDS FOR GERONTOLOGICAL EDUCATION AMONG NEVADA BUSINESSES

K. Kopera-Frye^{1,2}, B.D. Dodson², T. McMullen², C. Weaver², 1. *School of Social Work/ Gerontology, University of Nevada-Reno, Sparks, Nevada*, 2. *UNR Gerontology Academic Program, Reno, Nevada*

Between the years of 2000-2007, Nevada's senior population aged 65+ years increased by 30%; faster than the national average growth of 8%. With the aging of the nation's baby boomers, Nevada's senior population is projected to grow at a rate of 264% between the years 2000-2030. In light of this projected increase in senior population, the Gerontology Academic Program at the University of Nevada, Reno created a statewide survey of Nevada businesses. The survey of businesses had two purposes: 1) to understand the need for gerontological training among employees and employers; and 2) assess the familiarity and aware-

ness level of the University of Nevada, Reno's online 24 credit gerontological training certificate. Preliminary data from 170 surveys (111 aging-specific entities; 59 non-aging specific surveys) revealed that 54% of the aging specific entities, and 1% of the non-aging businesses reported our gerontology certificate to be at least a little useful; 20% were already familiar with our certificate. Further, the more aging-related issues experienced ($M = 3.2$) in the workplace (e.g., retirement planning) was significantly correlated with greater interest in gerontological training ($r = .30, p < .001$). The results have implications for employer-employee relationships and gerontological education training needs in the context of the workplace. Discussion will revolve around how the findings inform us about the barriers and challenges occurring in the intersection between business and aging.

SESSION 2100 (PAPER)

HEALTH DISPARITIES AND AGING

FOOD AVOIDANCE AND MODIFICATION INFLUENCE DIETARY QUALITY AMONG MULTI-ETHNIC OLDER RURAL ADULTS

S.A. Quandt¹, M.R. Savoca², X. Leng¹, H. Chen¹, R.A. Bell¹, A.M. Anderson¹, G.H. Gilbert³, T.A. Arcury¹, 1. *Wake Forest University School of Medicine, Winston-Salem, North Carolina*, 2. *University of North Carolina at Greensboro, Greensboro, North Carolina*, 3. *University of Alabama at Birmingham, Birmingham, Alabama*

Self-management of oral health deficits by older adults may lead to declines in overall diet quality. As chewing or swallowing certain foods become difficult, individuals may avoid these foods or modify their preparation. This population-based survey of oral health and diet among adults 60+ years included a random sample of 635 stratified by gender and ethnicity (African American, American Indian, white) recruited from rural North Carolina. Respondents completed in-home interviews documenting usual dietary intake and food avoidance and modification due to oral health problems. Health Eating Index-2005 scores (HEI-2005) were calculated using dietary data. 43% had <8 years of education and 32% had incomes below the poverty level. 72% of participants avoided and 74% modified at least one food because of the condition of their mouth or teeth. Apples, nuts, candy, and carrots were the most frequently avoided foods. When asked about modifying apples, carrots, meats, beans, or greens, apples were most frequently mentioned (68%) and nuts least often (24%). After adjusting for age, gender, ethnicity, poverty, and education, as more foods were avoided, the total HEI-2005 score decreased ($p < 0.0001$). HEI scores increased (improved) as more foods were modified ($p = 0.0033$). Regardless of the number of foods avoided, those who modified 4-5 foods had total HEI-2005 scores that were 6% higher than those who modified 0-3 foods. Overall diet quality among this population could be improved if nutrition education promoted active self-management through food modification among those limiting their food choices due to oral health deficits. (NIH Grant R01-DE17092)

IS ELIMINATING HEALTH INEQUALITIES BETWEEN SOCIOECONOMIC AND RACE/ETHNIC GROUPS REALISTIC? HOW LANGUAGE AND POLITICAL CORRECTNESS DISTORT OFFICIAL GOALS

J.S. Siegel, *J. Stuart Siegel Demographic Services, North Bethesda, MD, Maryland*

Eliminating health "disparities" between socioeconomic and racial/ethnic groups is a principal goal of various federal health programs. This paper offers a critical view of the concept of health "disparities," questions the possibility of eliminating them, and suggests a more realistic goal. Of the total gap between the measures of differences between groups, denoted inequality, the part of it considered unjust or unfair I denote inequity; a part of inequity is unavoidable. It is the avoid-

able part of inequity on which we should focus, i.e., those inequities relating to differences in access to health care and quality of care provided. Even in countries with universal health care and in segments of a population with equal access to care, class differences remain, whether we consider Medicare participants in the United States, civil servants in Great Britain, or the populations of Canada and the Scandinavian countries. Moreover, considerable differential variation within “cognizable” groups exists; i.e., unobserved heterogeneity is characteristic of the health status of every group. Intergroup, and possibly intragroup, differences are a result in large part of variations in the power status of persons in the work (and nonwork) hierarchy. It may be very difficult to narrow these differences as we try to raise the health level of the general population (cf., U.S. household income). The greatest hope for reducing the equitable part of inequality is to divert massive resources to modify the lifestyle and behavior of the “lower” socioeconomic classes. This effort has a fair likelihood of proving ineffective and of diminishing resources for research and development into new technologies for diagnosis and treatment of major chronic illnesses—a path so important to the “upper” classes. Achieving an elimination of group inequalities in health requires simultaneously achieving a society-wide elimination of educational, housing, income, and wealth inequalities, and even political power, and this is visionary.

HEALTH DISPARITIES AMONG AGING POPULATIONS IN LATIN AMERICA, THE CARIBBEAN AND ASIA

M. McEniry, *Center for Demography & Ecology, University of Wisconsin, Madison, WI*

While we know about many features of aging in developing countries (e.g. speed of aging), we know less about the determinants of health and how to fully explain health disparities in these settings. Early life circumstances may provide one clue in understanding the pattern of health disparities. Yet, there have been relatively few cross national studies which examine health disparities and early life conditions among older adult populations in the developing world. In this paper, I compare and contrast health disparities in older adults across a large and diverse set of countries and examine the degree to which poor early life circumstances help explain the observed pattern of health disparities. I include data from major studies on aging in Latin America and the Caribbean (MHAS-Mexico, SABE-capital or major cities, PREHCO-Puerto Rico, CRELES-Costa Rica), Asia (CLHLS-China, IFLS-Indonesia, MHSS-Bangladesh) and data from the US (HRS, WLS), the UK (ELSA), the Netherlands (SHARE) and Taiwan (SEBAS) to benchmark results. Health disparities within and across countries are compared using country-specific and pooled multivariate models to estimate the effects of SES (education, household income) on adult health (self-reported health, heart disease, diabetes, obesity, functionality) controlling for early childhood conditions (childhood health, SES, markers of nutritional status, mother's education), and adult risk factors (smoking). There is some, although weak, evidence that individuals who have been unduly influenced by early life conditions exhibit sharper health disparities. It will be important to design effective health policies to prepare for health needs of older adults in these settings.

THE EFFECTS OF RACE, SOCIOECONOMIC STATUS, AND HEALTH CARE USE ON SELF-RATED HEALTH AMONG OLDER ADULTS

J. Sautter, *Sociology, Duke University, Durham, North Carolina*

In this paper I explore the effect of race on self-rated health among older adults. I examine several mediating pathways, including socioeconomic status, social support, and healthcare behavior. I analyze data from the fourth wave of the Americans' Changing Lives Survey, collected in 2001/2. I find significant Black-White differences in self-rated health, education, family income, use of preventive care, and delaying or foregoing prescription medicine due to lack of insurance or money. Results from nested logistic regressions show that Black respondents

have higher odds of poor self-rated health than White respondents, and that this difference is mediated by socioeconomic status, particularly income. I find striking effects of healthcare behavior on self-rated health. Respondents who trust doctors have decreased odds of poor self-rated health, and respondents who delay or forego prescription medicine due to lack of insurance or money have much higher odds of poor self-rated health. The effect of delaying or foregoing prescription medicine on poor self-rated health is even stronger among White respondents, and non-significant among Black respondents. These results highlight new pathways to poor health and health disparities in older age. Although healthcare is supposed to be universal, there are significant racial differences in use of healthcare driven by socioeconomic status and inability to pay.

IMPROVING BLOOD PRESSURE IN HYPERTENSIVE LATINO OLDER ADULTS: QUALITATIVE PHASE OF A MIXED-METHODS STUDY

S. Fernandez¹, M. Rosal², F. De la Calle¹, E.T. Carbone³, A. Borg², G. Ogedegbe¹, 1. *Medicine, New York University School of Medicine, New York, New York*, 2. *University of Massachusetts Medical School, Worcester, Massachusetts*, 3. *University of Massachusetts Amherst, Amherst, Massachusetts*

Efficacious behavioral interventions for controlling blood pressure (BP) are underutilized with hypertensive Latino older adults, a group with low BP control rates and a related higher risk of mortality. Methods: Phase 1 of this two-phase study of Spanish-speaking Latino older adults includes focus groups and cognitive interviews to gain insights on knowledge, attitudes and behavioral skills for hypertension self-management among older Latinos; use of these data to tailor intervention strategies and materials; pre-test clarity of strategies and materials. Phase 2 includes a small RCT of feasibility and impact of a group-based behavioral intervention for hypertension (HTN) in senior centers. A trained facilitator conducted three Spanish-language 1.5-hour groups, assessing HTN-related knowledge and attitudes; behavioral skills related to therapeutic lifestyle changes. Twenty-nine Latino seniors participated (mean age = 71.91 years [SD = 6.74]; 90% female; 59% 11th grade education or below; 62% widowed or divorced; 38% Dominican, 28% Puerto Rican, 17% Ecuadorian). Phase 2 begins the summer of 2009. Results: Emergent themes reflected a range of knowledge of lifestyle changes to improve BP, biomedical and non-biomedical beliefs regarding the etiology of HTN, belief in the inevitability of disease, language as a barrier to adopting lifestyle change, and participant learning style preferences. Conclusions: RCT intervention will include (1) use of plain language and pictures; (2) in-class demonstration of self-management skills (e.g. reading food labels, relaxation techniques, use of pill boxes) (3) in addition to education on behavioral skills for improving blood pressure, emphasis on education regarding etiology of HTN, stress and health, healthy aging.

SESSION 2105 (SYMPOSIUM)

INNOVATIVE RESEARCH IN LATE-LIFE DEPRESSION: FROM CLINICAL EPIDEMIOLOGY TO TREATMENT DEVELOPMENT

Chair: J. Evans, *Geriatrics Research Branch, National Institute of Mental Health, Rockville, Maryland*

Discussant: C.F. Hybels, *Duke University, Durham, North Carolina*

Major Depressive disorder is one of the most common mental health problems among older adults and often may be difficult to detect in this population. Furthermore, issues with co-morbidity and frailty often contribute to incomplete response to treatment. Research in this area has demonstrated the need for better detection and treatment alternatives that may be useful in this population. This symposium will highlight current work in behavioral science and clinical epidemiology research in late-life depression. Presentation topics will include: (1)

Cognitive changes after antidepressant treatment among older adults; (2) Culturally informed treatment for late-life depression in a sample of African American women; (3) A population study of the risk of suicide across the lifespan; and (4) Epidemiological research examining ethnic differences in the prevalence of major depressive disorder among older adults. An integrative discussion will provide synthesis of this work in relation to other aspects of late life mental health research and other opportunities for innovative work in this area.

FEASIBILITY OF THE OH HAPPY DAY DEPRESSION INTERVENTION (OHDDI)

E.C. Ward, *University of Wisconsin-Madison, Madison, Wisconsin*

The primary aim of this study was to examine the feasibility and acceptability of the OHDDI intervention. In an effort to improve depression care for older African American women, interventions need to be culturally congruent with the needs, preferences, and cultural learning styles of this largely underserved and under-researched population. The OHDDI was developed to address this deficit. The OHDDI is a 90-minute weekly cognitive behavioral group counseling intervention for 12 weeks. A one-group pretest-posttest design was used. The sample consisted of 13 African American women aged 60 and over with depression symptoms. Outcome evaluations were conducted at baseline, weeks 6, 12 and 24 using standardized instruments. Qualitative interviews were conducted with participants between weeks 12-14 to explore acceptability of the intervention and the experience of late-life depression. Results indicate the intervention was effective in reducing symptoms of depression. Study results and directions for future research will be presented.

EPIDEMIOLOGY OF LATE-LIFE DEPRESSION AND ETHNICITY RESEARCH STUDY (ELLERS)

H. Gonzalez¹, K.E. Whitfield², W. Tarraf¹, *1. Gerontology, Wayne State University, Detroit, Michigan, 2. Duke University, Center for Biobehavioral and Social Aspects of Health Disparities, Durham, North Carolina*

Currently, depression is a leading cause of disability in the United States and will continue to ascend in importance as the population continues to grow older over the coming decades. For older adults, national prevalence estimates of "true" depressive disorders meeting established diagnostic criteria date three decades back to pioneer psychiatric epidemiologic work in the nineteen-eighties. Demographically, much has changed over the past twenty-years in the public health of the United States and internationally. Middle-aged "baby boomers" are now entering retirement age and Latinos, largely ignored until the turn of the millennium, are now the largest ethnic minority in the country. We will provide updated national estimates of "true" depressive disorders in older adults of major ethnic/racial groups in the United States. These products will offer insights for opportunities for late-life depression prevention in an aging and increasingly diverse United States population.

HERITABILITY OF FATAL SUICIDAL BEHAVIOR ACROSS THE LIFESPAN IN THE SWEDISH TWIN REGISTRY

A. Fiske, *Psychology, West Virginia University, Morgantown, West Virginia*

Older adults are at an elevated risk of dying by suicide compared to other age groups. Depression, which is a risk factor for suicidal behavior at all ages, is more closely linked with suicide among older adults than among younger individuals. Studies of nonfatal suicidal behavior, as well as selected samples of twins who died by suicide, suggest that genetic factors may contribute to risk. Nonetheless, no population-based study has yet evaluated the extent to which genetic factors may contribute to risk for fatal suicidal behavior. The present study investigated the heritability of fatal suicidal behavior in the population-based Swedish Twin Registry. Among twins born in Sweden between 1886 and 1958, there were 561 suicides through 2003. Structural equation twin models

were used to estimate heritability and investigate the extent to which genetic risk differs across the lifespan.

CHANGE IN COGNITIVE FUNCTIONING FOLLOWING ACUTE ANTIDEPRESSANT TREATMENT IN LATE-LIFE DEPRESSION

M. Culang¹, J. Sneed^{2,3}, J. Keilp^{2,3}, S.P. Roose^{2,3}, *1. City University of New York, New York, New York, 2. Columbia University, New York, New York, 3. New York State Psychiatric Institute, New York, New York*

The association of late-life depression and cognitive impairment has been well documented. However, there have been few placebo-controlled trials examining the impact of SSRIs on cognitive functioning. Pre-post neuropsychological data collected as part of an 8-week, double-blind, placebo-controlled trial of citalopram in depressed patients aged 75 years and older were used to examine change in cognitive functioning as a function of responder status and treatment condition. Responders in the citalopram group significantly improved in visuospatial functioning over the course of treatment when compared to non-responders. Furthermore, citalopram non-responders showed a significant decline in verbal learning when compared to placebo non-responders. The present results suggest that, in late-life depressed patients aged 75 and over, citalopram may interfere with the normal practice effect in verbal learning. In addition, our findings imply that non-responders should not be maintained on medication that may have a negative effect on some aspects of cognitive functioning.

SESSION 2110 (SYMPOSIUM)

INTEGRATING SPIRITUAL INTERVENTIONS INTO OLDER PERSONS' CARE: IS IT ETHICAL AND FEASIBLE?

Chair: *S. Monod, Service of Geriatrics, Lausanne University Medical Center, Lausanne, Switzerland*

Discussant: *C.J. Bula, Service of Geriatrics, Lausanne University Medical Center, Lausanne, Switzerland*

Multiple studies have documented a significant association between spirituality and health. Although spirituality is usually considered as a positive resource for coping with illness, spirituality might also influence negatively health outcomes. Spiritual distress has been associated with increased mortality, more severe depression, and desire of hastened death, suggesting a potentially harmful effect on patients' prognosis and quality of life. These observations support the growing interest toward implementing spiritual interventions, but it remains unclear whether such interventions are feasible and effective. This symposium will discuss ethical and feasibility concerns that emerge when considering to implement spiritual interventions into standard care provided to elderly persons. The first presenter will address ethical issues raised by the integration of spiritual care into standard care. Particularly, the conditions under which such integration can be fruitful will be discussed. The second presenter will discuss the issue of spirituality intervention in older people living with HIV. This paper will address the spiritual resilience of those living with HIV and discuss options for spiritual interventions to improve life quality and foster effective aging. The third presenter will discuss a model of spiritual intervention in elderly patients undergoing rehabilitation. This model of spiritual intervention is fully integrated into rehabilitation care, and based on a structured approach aimed at assessing patient's unmet spiritual needs. The symposium will be concluded with a discussion arising from the presentations.

NARRATIVE PERSPECTIVES ON SPIRITUAL INTERVENTIONS IN THE CARE OF ELDERLY PATIENTS

G. Jobin, *Theology, Laval University, Québec, Quebec, Canada*

Geriatrics and gerontology are domains of care where it seems possible and fruitful to integrate spiritual care into standard care provided to elderly persons. In fact, this preoccupation is relayed by doctors, nurses, social workers, among many, and pastoral care providers. But

such an integration is done with the risk of blurring the boundary between clinical care and spiritual care. Under the guise of holistic care, it is sometimes difficult to distinguish the prerogatives of spiritual care providers from those of other care providers on «spiritual matters». Based on an «applied narrative perspective», this paper will present the challenges brought by this integration of «spiritual» care into clinical care and the conditions under which such an integration can be fruitful.

DESIGNING SPIRITUAL INTERVENTIONS FOR OLDER ADULTS WITH HIV: OVERCOMING STIGMA AND ACTIVATING SPIRITUAL RESOURCES

D. Vance¹, M. Brennan², *1. School of Nursing, University of Alabama at Birmingham, Birmingham, Alabama, 2. AIDS Community Research Initiative of America (ACRIA), New York, Alabama*

Spirituality has both positive and negative connotations for older adults living with HIV, who will constitute one-half of HIV cases in the USA within the next decade. Many faith-based organizations have responded compassionately to those with HIV, and have provided spiritual, emotional, and material comfort for these individuals. However, many older people with HIV have also experienced rejection from their spiritual communities due to HIV stigma and stigma related to risk for HIV infection (i.e., intravenous drug use, homosexuality, incarceration). Research has found that levels of spirituality in this population are comparable to other groups, and spirituality has emerged as an important covariate of better outcomes in this population, namely, less depression and better medical treatment adherence. This paper will address the spiritual resilience of those living with HIV and discuss options for spiritual interventions to improve life quality and foster effective aging for this emerging group of older adults.

SPIRITUAL CARE INTEGRATED INTO REHABILITATION CARE FOR ELDERLY PERSONS: A STRUCTURED APPROACH

S. Monod, E. Rochat, C.J. Bula, *Lausanne University Medical Center, Lausanne, Switzerland*

In elderly patients undergoing rehabilitation, spiritual distress has been associated with higher depression rate and tends to be associated with worse rehabilitation outcomes. This paper will present a spiritual intervention concept, fully integrated into elderly rehabilitation care, aimed at addressing spiritual distress and improving patient's spiritual state. This intervention is based on a structured assessment that identifies patients' unmet spiritual needs. Results of this assessment, including the degree to which spiritual needs remains unmet, are transmitted by the chaplain to health professionals. To preserve confidentiality, transmission of the spiritual assessment is performed without disclosing patient's intimate details. The chaplain suggests follow-up discussions, as well as possible interventions to address identified unmet spiritual needs. These propositions include interventions carried out by the chaplain directly with the patient and/or indirectly through health professionals counseling. Expected benefits for patients of this spiritual intervention concept will be discussed and illustrated with preliminary results.

SESSION 2115 (PAPER)

OPINIONS, ATTITUDES, AND STEREOTYPES: IMPACT ON PERSONAL AND COLLECTIVE HISTORY

DISPROVING OLD AGE STEREOTYPES: SOCIAL CAPITAL AND COMMUNITY PARTICIPATION AFTER HIP FRACTURE

M. Harrod, H. Moilanen-Miller, M. Luborsky, *Wayne State University, Detroit, Michigan*

End-of-life and frailty stereotypes still dominate popular thinking of older adults by neglecting how individuals along with their social net-

works rearrange their environments to accommodate ever-changing abilities. This paper explores the reality of those stereotypes by examining the social worlds of older adults after a life-altering injury. Social capital provides a unique framework to explore community participation from both individual and social network perspectives. Putnam defines social capital as, "...features of social organization such as networks, norms, and trust, that facilitate coordination and cooperation for mutual benefit," (1995, p. 67). Community participation affords access to social capital that individuals utilize to define who they are and who they are not. Using qualitative methods, this study interviewed 100 older adult participants who had sustained a hip fracture within the last 8 years. Major domains are lifetime community involvement, reengagement after injury, and alteration of community activities. Lifetime community involvement was examined over the individual's lifespan to better understand how community participation is a continuum that must be modified given life events. Analysis of the domain, reengagement after injury, showed that older adults find ways to negotiate and reengage in their communities activities by utilizing their existing social environments. Through alteration of community activities, older adults illustrate their independence and inventiveness in the ways in which they alter their activities and environments in order to maintain a full and active community life. These domains, in conjunction, reveal variable aspects to community participation that negate the foundations of aging stereotypes. [NIH Grant 5R01AG023572-03]

NEWSPAPER PORTRAYALS OF SSCANDALS IN AMERICAN NURSING HOMES: ISSUES OF INTRA-GENERATIONAL INEQUALITY, 1998-2008

J. Rozanova¹, E.A. Miller², T. Wetle^{3,1}, *1. Brown University - Center for Gerontology and Health Care Research, Warren Alpert Medical School, Providence, Rhode Island, 2. Brown University - Departments of Public Policy, Political Science, and Community Health, Providence, Rhode Island, 3. Brown University - Department of Community Health, Warren Alpert Medical School, Providence, Rhode Island*

Newspaper portrayals of nursing homes influence how long-term care institutions are viewed and understood by the society. This research examined how scandals in nursing homes were portrayed in the American press during 1998-2008. The data sources included more than 10,000 articles focusing on nursing homes, retrieved from 82 newspapers published in the capital and the largest city of each state. A representative subsample of 300 articles (30 per year) was analyzed thematically using the constant comparison method. Nursing homes were discussed in five contexts, including: family, end-of-life, elder abuse and neglect, financial misconduct, and health care policy and regulation. Emerging findings indicate four themes that capture issues pertaining to nursing home scandals. The background theme, apocalyptic demography, presents the raising costs of institutional eldercare due in part to growth of vulnerable populations as a budget buster. The premature death theme developed from the early 2000s when nursing homes were identified as locales of avoidable deaths due to misconduct of staff and authorities. The intra-generational inequality theme in the aftermath of hurricane Katrina raised the issue of disposable lives. Stories suggested that seniors whose compromised health is compounded by racial, gender, and class disadvantage were often left behind when other people were escaping. The fourth theme, social responsibility for eldercare, underscored the society's moral duty to frail elders, but positive images tended to be focused on more privileged white older adults. This analysis illustrates how sensational portrayals of nursing homes may shape changes in public policy pertaining to long-term care institutions.

CAROLINAS CONVERSATIONS COLLECTIONS: A GERONTOLOGY RESOURCE

B.H. Davis¹, C. Pope², 1. Boyd Davis, *UNC-Charlotte, Charlotte, North Carolina*, 2. *Medical University of South Carolina, Charleston, South Carolina*

Expected to be open to researchers in late 2010, the Carolina Conversations Collection offers a password-protected web portal of conversational interviews with persons over 65 years of age from diverse racial, ethnic, and linguistic groups from North and South Carolina. Participants discuss a variety of 11 chronic conditions, including Alzheimer's, cancer, diabetes and hypertension as well as their experiences maintaining their health and using health services across their lifetimes. Audio and video recordings and transcripts are synchronized by an online digital management package that supports downloadable analyses at the level of sound, word, and syntax. Roughly 75 unimpaired persons are interviewed twice: once by graduate/medical students acting as providers and once by gender, race and age-concordant community partners. A similar number of cognitively impaired elders are arrayed longitudinally, speaking either with researchers or student volunteers. This presentation details how the archive was developed and the precautions taken for security, the password process for access, and the organization of the unique website for potential investigators. Examples of conversations will demonstrate search and retrieval strategies and the integrated programs that can be used for speech analysis and analysis as a corpus of language data. Demonstrations will include the training approach for students and community interviewers geared to more effective communication with older people. Funded by the National Library of Medicine, the Collection stands as a model for the mediated organization of spoken data for secondary analysis for the study of communication and aging.

WAR IN LIFE STORIES: LOSS, SURVIVAL, AND ALZHEIMER'S DISEASE

T. Hamaguchi, *English Language and Literature, University of the Sacred Heart, Tokyo, Japan*

This study will investigate the role of war and war-related events in life stories of a 97-year-old Japanese elderly woman before and after she suffered from Alzheimer's disease. Through analyzing tape-recorded life stories told at different points in time with different health statuses, I will demonstrate how the loss and survival surrounding the war are recounted, and how Alzheimer's disease affects the ways in which she treats the same experience. Although the two stories are qualitatively and quantitatively different, the war appears as a clear representation of distress in both stories. This is evidenced not only by the fact that she talks about the war in both stories but also by the fact that paralinguistic cues such as hesitations and long pauses are used the most in those segments. Moreover, in the second story (after the onset of AD), the war terminates the story development and nothing about her life after the war is told. I claim that the war serves as a sign of loss: family and house in the past; and memory and independence in the present life. However, a clear difference is that survival is highlighted in the first story while loss is highlighted in the second. In other words, the war is used as a life event through which she justifies her current self: happy survivor or pitiful sufferer. This study suggests that the same life experience can be recounted in significantly different ways depending on the health and cognitive status of the speaker.

A LIFE-COURSE ANALYSIS OF HEALTH AND FUNCTIONING ACROSS FOUR US WAR ERAS

M. Brooks, *US Army-Baylor, Fort Sam Houston, Texas*

There are 23.4 million living US veterans in the United States, consisting of 39.4% sixty-five or older. Relatively little is known about the long-term effects of war cohort membership on physical health outcomes across a life-course. This research uses a nationally representative survey of veterans to analyze four era cohorts of US veterans examining

measures of health and well-being, disability, prevalence and treatment of significant health issues. The research question was: Drawing on life-course theory, among US veterans, does physical health differ among war era cohorts and between combat and non-combat era veterans? Multivariate models controlled for age, gender, race/ethnicity, occupational status, marital status, environmental exposures, and mental health. Analysis was weighted for national representation. Adjusted odds of self-reported good health for Korean War veterans (OR 1.27); Vietnam War Veterans (1.07); and Gulf War Veterans (0.84) compared to veterans of WWII. Intra-cohort differences were noted. Combat veterans of Korea (OR 1.28); Vietnam (OR 1.09); and WWII (OR 1.16) all had higher odds of self-reported good health compared to non-combat veterans; Gulf War veterans were notably less likely (OR 0.83) (all $p < .0001$). Korea combat era veterans had significantly higher odds of being treated for rheumatism and lung issues; Gulf War Era veterans were more likely to have high blood pressure, lung, heart, stroke, and rheumatism issues compared to the older WWII cohort. As veterans age they will need substantial physical health services, often from the VA. Policymakers and practitioners alike need to plan for and address these needs.

SESSION 2120 (SYMPOSIUM)

PSYCHOSOCIAL INTERVENTIONS FOR OLDER ADULTS WITH VISION LOSS

Chair: S. Sorensen, *Psychiatry, University of Rochester School of Medicine and Dentistry, Rochester, New York*

Discussant: M.K. Diehl, *Colorado State University, Fort Collins, Colorado*

The risk of severe eye problems has been found to increase significantly with age, particularly among adults over age 65 (National Eye Institute, 2004). Older adults with vision impairment are at increased risk for falls and hospitalizations, they find it more difficult to take their medications properly, and they are more likely to be socially isolated, placing them at greater risk for physical health problems. Low vision reduces individuals' ability to engage in valued and enjoyable activities, thus increasing their vulnerability to depression and anxiety. Vision rehabilitation effectively increases patients' functioning using adaptive training and instructional programs. In this context, optometrist or ophthalmologist, as well as rehabilitation therapists assess the current abilities and goals of a patient. Clinic- or home-based rehabilitative training conducted by occupational therapist or certified low-vision therapist often improve older adults independent living skills. However, a focus on functional goals is often not sufficient to increase emotional adjustment, placing the vision-impaired older adult at risk for mental health problems. A variety of promising interventions have been or are currently being tested. We begin discussing the relationship of functional vision loss to leading causes of blindness and the role of the eye doctor in rehabilitation (Sterns). We continue with interventions that use Problem-Solving Treatment (Casten, Dreer, Horowitz) and group-based self-management training (Brody). Finally, we will discuss the elements that appear most effective and the extent to which these intervention approaches could be incorporated into regular low vision rehabilitation.

WHEN VISION FAILS: MEETING THE CHALLENGE

G.K. Sterns, 1. *Rochester General Hospital, Rochester, New York*, 2. *University of Rochester School of Medicine, Rochester, New York*

Vision loss can lead to loss of function and performance of activities of daily living in older adults. In many cases this can lead to depression and withdrawal. Many elderly think that vision loss is a normal part of aging and do not seek help to restore their vision and function. The nature of functional vision loss associated with leading causes of blindness will be presented. Solutions to improve function will be addressed, as well as the role of visual aids in rehabilitation. The responsibility of the ophthalmologist and eye care provider as a member of the rehabilitation team will be reviewed. In particular, their role is not only to

address the problem but also serve as a source of referral for care or to provide the care directly.

PSYCHOSOCIAL IMPACT OF AGE-RELATED MACULAR DEGENERATION AND EFFECTIVE INTERVENTIONS TO IMPROVE ADJUSTMENT

B.L. Brody, *Shiley Eye Center, University of California at San Diego, La Jolla, California*

The psychosocial impact of age-related macular degeneration (AMD) with permanent vision loss will be summarized, based on our research that showed high levels of emotional distress and disability (Williams et. al., 1998; Brody et.al., 2001). Findings will be highlighted from our randomized controlled trials of a 6 week, 12 hour AMD Self-Management Program. At 6-month follow-up, the positive outcomes found at 6 weeks were confirmed and extended: less emotional distress using POMS ($p=.008$); better function on NEI-VFQ ($P=.05$); increased self-efficacy ($P=.006$) (Brody et. al. 2005). Also, there was reduction in depressive symptoms in the depressed in the self-management compared to the controls ($p=.032$) after 6 months (Brody et. al. 2006). The incidence of clinical depression in the self-management group compared to the controls was 7.2% vs. 17.4%; $p = 0.04$, thus indicating that 50% of the new episodes of depression were prevented in the self-management group (Brody et. al., 2005).

PROBLEM SOLVING TREATMENT (PST) FOR OLDER ADULTS WITH SUBTHRESHOLD DEPRESSION IN VISION REHABILITATION

A. Horowitz^{1,2}, J.P. Reinhardt^{1,2}, *1. Department of Research, Jewish Home Lifecare, New York, New York, 2. Mt. Sinai School of Medicine, New York, New York*

We present an intervention development study to evaluate the use of PST with visually disabled elders to treat subthreshold depression within a rehab context. Subthreshold depression is more prevalent than major depression among chronically impaired elders, and has similar negative consequences for life quality and rehabilitation outcomes. However, PST has been primarily used to treat major depression, or to prevent depression among visually impaired elders. This pilot RTC is recruiting 60 older participants with subthreshold depression, applying for vision rehab services with random assignment to treatment (usual care + 6 sessions PST) or comparison (usual care + attention control) groups. Primary outcomes include depression diagnoses and symptom severity. It is also hypothesized that providing PST prior to or concurrent with vision rehab will contribute to better compliance with rehab treatments and better functional outcomes. We present the rationale, design, and implementation experiences, as well as preliminary study results.

PREVENTING DEPRESSION IN AMS

R. Casten, *Psychiatry, Thomas Jefferson University, Philadelphia, Pennsylvania*

This study tested the efficacy of Problem Solving Treatment (PST) to prevent depression in patients with bilateral AMD. Two hundred six subjects were randomized to PST or a control condition. Subjects were assessed at baseline, 2, and 6 months. The main outcome was depression diagnosis, and vision function was the secondary outcome. The incidence of depression was significantly lower in PST (11.6%) vs. control (23.2%) subjects at 2 months. PST subjects were also less likely to relinquish a valued activity (23% vs. 37%) compared to controls. These effects were not upheld at 6 months. The data also show that subthreshold depressive symptoms were a risk factor for a future depressive episode. This study demonstrates that PST can successfully prevent depression in patients with AMD in the short term. However, the effects are not maintained over time, suggesting that booster sessions may be needed for optimal depression prevention.

PRELIMINARY FINDINGS FROM A LARGE-SCALE RCT ON PROBLEM-SOLVING THERAPY (PST) FOR PERSONS IN LOW VISION REHABILITATION

L.E. Dreer, C. Owsley, G. McGwin, *Ophthalmology, University of Alabama at Birmingham, Birmingham, Alabama*

Objectives: This abstract has two objectives: 1) to characterize the quality of life related issues and rehabilitation needs of persons referred for low vision rehabilitation, and 2) to present preliminary data on the impact of a brief problem-solving therapy (PST) intervention on quality of life and rehabilitation outcomes among a large sample of persons entering low vision rehabilitation using a randomized clinical trial (RCT) design. **Methods:** As part of this ongoing RCT, approximately two-hundred and fifty patients entering low vision rehabilitation have been randomly assigned to either a usual care plus PST condition or usual care plus attention control condition as part of this ongoing RCT. PST was delivered for five sessions in addition to two one hour booster sessions at 6 and 11 months post-intervention. The content area of baseline and outcome measures include various aspects of quality of life (i.e., depression, anxiety, distress, rehabilitation). Measures for all subjects are administered at baseline, 3-month follow-up (post intervention), 7 month-follow-up (post 6 month booster session) and at 1-year follow-up (post 11 month booster session). **Results:** Prevalence and incidence rates of issues related to quality of life and rehabilitation will be presented along with an evaluation of changes in quality of life measures using a mixed effects statistical model. **Conclusions:** Findings will highlight the needs and issues of patients presenting for low vision rehabilitation services. If effective, PST delivered by occupational therapists (OTs) may help to enhance quality of life and rehabilitation outcomes among persons with vision loss. This type of brief intervention may prove to be a useful approach for integrating into multidisciplinary rehabilitation practices.

INCORPORATING PSYCHOSOCIAL INTERVENTIONS INTO LOW VISION REHABILITATION: POSSIBILITIES AND CHALLENGES

K. White², I. Wander², S. Sorensen¹, *1. Psychiatry, University of Rochester School of Medicine and Dentistry, Rochester, New York, 2. Association for the Blind and Visually Impaired-Goodwill, Rochester, New York*

An emerging body of evidence supports the effectiveness of psychosocial interventions for reducing distress and preventing depression among older adults with vision loss. In turn, depression and distress prevent older adults from pursuing needed vision rehabilitation. It remains unclear, however, how to incorporate cost-effective psychosocial interventions into standard low-vision rehabilitation practice in order to enhance both psychosocial and vision functioning outcomes. There are numerous barriers to providing such comprehensive eye care, e.g., matching desired outcomes with approaches that are reimbursed by insurance; cost-effectiveness; training rehabilitation specialists to be sensitive to mental health concerns. We will provide an overview of the psychosocial intervention activities (groups, counseling) conducted at the Association for the Blind and Visually Impaired (ABVI) – Goodwill Industries of Greater Rochester, Inc. Then we will contemplate how interventions involving Problem-Solving Treatment or Self-management can be better integrated in a cost-effective manner into existing low vision programs.

SOCIOECONOMIC DISPARITIES IN HEALTH, FUNCTION, AND COGNITION AMONG MINORITIES

Chair: R.J. Thorpe, *Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Discussant: K.E. Whitfield, *Duke University, Durham, North Carolina*

A key objective of the public health agenda is to reduce, if not eliminate, health disparities. However over the past two decades little progress has been achieved as African Americans continue to exhibit poorer health, physical and cognitive functioning relative to whites. Many investigators believe race differences are a manifestation of SES differences, yet our understanding of SES disparities is limited because race and SES are confounded in the United States with African Americans having markedly fewer socioeconomic resources than whites. A key contribution to investigators' understanding of SES disparities is examination of SES differences and health, physical and cognitive functioning within racial groups, eliminating the confounding influence on race. This symposium highlights research focusing on SES differences and how multiple SES indicators affect several health outcomes. Thorpe and colleagues examine associations between SES indicators (income, education, financial strain) with disability and chronic conditions by age using a sample of African Americans in North Carolina. Using the same data, Szanton and colleagues examine the associations between childhood, adulthood and life course financial strain with several health outcomes. Sims and colleagues determine the impact of SES indicators (education, income, and perceived income inadequacy) on cognitive functioning in a sample of older African Americans in Maryland. Kelley-Moore and colleagues present data examining the SES gradient of functional impairment among African Americans and Whites using a national sample. These studies provide information that will bolster our knowledge of how SES contributes to development of interventions that will lead to reductions in health disparities.

SOCIOECONOMIC STATUS INDICATORS AND COGNITIVE FUNCTIONING IN OLDER AFRICAN AMERICANS

R.C. Sims¹, A. Gamaldo², J.C. Allaire², K.E. Whitfield¹, 1. *Center for Aging and Human Development, Duke University, Durham, North Carolina*, 2. *North Carolina State University, Raleigh, North Carolina*

Previous research indicates that socioeconomic indicators impact cognitive functioning and account for some of the racial differences in cognition in older adults. However, the relationship among these factors within ethnic groups is not well studied. The aim of the current analysis was to examine the relationships between cognitive functioning and socioeconomic status indicators (education, income, and how well income covers financial needs) among older AAs. Participants were 602 older AAs from the Baltimore Study of Black Aging that completed a battery of cognitive tests and provided information on socioeconomic background. Subgroups were created for levels of education (2), income (2), and how well income covers financial needs (4). Utilizing MANCOVA, the results showed that verbal memory, working memory, verbal ability, inductive reasoning, and global cognition performance is poorer among participants with lesser education, income, and coverage of financial needs. Implications of these findings will be discussed.

LIFE-COURSE FINANCIAL STRAIN AND HEALTH IN AFRICAN-AMERICAN ADULTS

S.L. Szanton¹, R.J. Thorpe², K.E. Whitfield³, 1. *School of Nursing, Johns Hopkins University, Baltimore, Maryland*, 2. *Johns Hopkins School of Public Health, Baltimore, Maryland*, 3. *Duke University, Durham, North Carolina*

Few studies have examined the cumulative effect of financial strain across the life-course. Using the population-based cross-sectional cohort of the Carolina African American Twin Study of Aging, we examined the associations between childhood, adulthood, and life-course, or cumu-

lative, financial strain with disability, lung function, chronic conditions, cognition, and depression. After adjusting for demographic and health-related characteristics (e.g., actual income, age, height, gender, smoking status), participants who reported financial strain at both time periods had a range of worse health outcomes when compared to their counterparts who did not; they were significantly more likely to be physically disabled (OR: 3.25 95% CI 1.67,6.26), have worse lung function ($p<0.05$), more depressive symptoms ($p<0.05$), and poorer cognitive functioning ($p<0.05$). Financial strain in adulthood was more consistently associated with poor health than childhood financial strain, a finding that suggests resolving adulthood financial strain could prevent disability, depression, and cognitive dysfunction.

BLACK-WHITE DIFFERENTIALS IN THE SOCIOECONOMIC GRADIENT OF FUNCTIONAL IMPAIRMENT

J. Lin, J. Kelley-Moore, *Sociology, Case Western Reserve University, Cleveland, Ohio*

High levels of socioeconomic status have been causally linked to elevated functional status, but whether this socioeconomic gradient is invariant across race groups remains a question. Given both differential access to resources and the inherent meaning of those resources between races, the socioeconomic gain to functional health may not be equivalent. This study uses four waves of panel data from the Americans' Changing Lives study to estimate age-graded growth curves of functional impairment among Black and White adults ages 45 to 85 years old. Our findings confirm a race differential in the inverse gradient between education and functional impairment that cannot be accounted for by selective survival or comorbidity. Specifically, holding income and wealth constant, the social gradient for education is steeper (more beneficial) for functional outcomes among White adults compared to Black adults. Alternatively, there were no Black-White differences in socioeconomic health gradient when measured by income or wealth.

SOCIOECONOMIC DIFFERENCES IN HEALTH AND DISABILITY BY AGE IN AFRICAN AMERICANS

R.J. Thorpe, *Johns Hopkins School of Public Health, Baltimore, Maryland*

One of the most well-established associations in the health literature is the relationship between socioeconomic status (SES) and health, but our understanding of the effect of age on the association between SES and health remains limited particularly among minorities. We investigated how SES differences in health and disability vary by age using a sample of 710 minorities from the Carolina African American Twin Study of Aging. SES measures included education, income, financial strain, and home ownership. After adjusting for gender, smoking status, obesity, and insurance status in our logistic regression models, we found that African Americans with low SES had a higher odds of having a disease or disability than those with high SES. This relationship increased with age. Efforts to improve health of African Americans should identify health-enhancing resources that would reduce SES disparities which require policy initiatives addressing components of SES that influence health.

SOURCES OF WELL-BEING FOR HEALTHY AGING

AGE IDENTITY IN CONTEXT: THE INTERSECTION OF LINKED LIVES, PERSONAL CONTROL, AND PERCEIVED TEMPORALITY

M.H. Schafer, T.P. Shippee, *Center on Aging and the Life Course, Purdue University, West Lafayette, Indiana*

The passage of time is fundamentally experienced through people's interaction with their social worlds. Life course scholars acknowledge the multiple aspects of temporality, but have given little attention to age identity in a dynamic context. We hypothesized that turbulence within people's intimate social networks would hasten the pace of subjective aging, leading to older age identities over the course of a decade. Personal control was expected to mediate this relationship. These hypotheses were tested with the Midlife Development in the United States study, a nationally-representative longitudinal survey. Regression results show that turbulence within people's social world does indeed accelerate subjective aging and that personal control is a partial mediator of this temporal flux. The findings demonstrate an interconnection between prevailing areas in social psychology (personal control and linked lives) and perceived temporality. Broadening our conception of time-based experience offers exciting directions for future theory and research in life course sociology.

THE IMPACT OF LOSS OF LOVED ONES ON LIFE SATISFACTION AMONG RESIDENTS IN A RETIREMENT COMMUNITY: THE ROLES OF SOCIAL SUPPORT

F. Sun¹, V. Waldron¹, R. Gitelson², C. Ho³, 1. *Arizona State University, Phoenix, Arizona*, 2. *Chico state university, Chico, California*, 3. *National Kaohsiung Hospitality College, Kaohsiung, Taiwan*

Purpose: Declined well-being is often observed among older adults experiencing recent loss of family members or close friends. Social support, an influential factor for well-being, can be adversely affected both quantitatively and qualitatively due to such loss. This study explores the roles of social support in mediating the relationship between loss of family members or close friends and the life satisfaction in older residents living in a retirement community. Methods: Data were collected through a mail survey on a sample of 734 older residents in a retirement community in the Southwest. Participants had an average age of 67 (SD = 9.6), and 62.4% of them were females. Social support is indicated by average network size, emotional support, and satisfaction with social support. SPSS Marcos developed by Preacher and Hayes (2008) for estimating the indirect effects in multiple mediator models was adopted. Control variables include demographics, self-rated health, engagement in volunteering work and social activity participation. Results: Participants who experienced loss in life reported statistically significant lower life satisfaction scores than those who reported no loss ($p < .01$). Multiple mediator analyses found that the direct effects of life loss on perceived life satisfaction is partially mediated by emotional support ($B = -.36$, $p < .05$) and satisfaction with social support ($B = -.49$, $p < .05$), but not average network size ($B = -.04$, $p > .05$). Implications: Interventions needs to target older adults who experienced loss in life and thereby dwindling social support, through provision of supportive services that improve emotional support and satisfaction with social support.

RELIGION AS A COPING MECHANISM FOR HEALTH PROBLEMS AND DEPRESSION AMONG AGING PUERTO RICANS ON THE MAINLAND

M.B. Rodriguez-Galan¹, L. Falcon², 1. *Social Sciences, Transylvania University, Lexington, Kentucky*, 2. *Northeastern University, Boston, Massachusetts*

The connections between religiosity or spirituality and health have been documented in hundreds of empirical studies. However, very few

studies have analyzed religious experience and coping from the elder's own standpoint; and even less have addressed this question in Hispanic populations. The purpose of this study is twofold; using semi-structured ethnographic interviews in a sub-sample of 40 aging Puerto Ricans from the Boston Puerto Rican Health Study, this paper examines: 1/ the scope and phenomenology of religious experiences of older Puerto Rican-born elders on the mainland; 2/ reported functional aspects of different forms of religious coping for health and depression. Puerto Ricans in this study were conspicuous in their religious coping. There is great diversity of religious/spiritual orientations, including religious syncretism. Both internal and external aspects of religion, such as faith, the power of praying, reading of religious texts, observances, participation in religious communities and contact with religious "families" and others derive forms of social support that support well being, keep away "bad thoughts," help address particular health problems and may also help the individual realize of psychological distress, such as through the manifestation of "celajes" or premonitions.

MODELING PATHWAYS TO POSTOPERATIVE OUTCOMES IN ADULT AND OLDER CARDIAC PATIENTS: A BIOMARKER AND POSITIVE AND NEGATIVE FAITH

A.L. Ai, I. Nam, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Introduction: Heart disease (HD) is the number one killer of older Americans, while studies have shown the protection of faith in HD populations. Evidence linking depression with poor prognosis of HD, including that of open-heart surgery, has been well-established. Hostility as negative emotion/personality traits has been associated with poor prognosis and mortality in HD. This interdisciplinary, prospective study estimated major psycho-physiological pathways from preoperative distress and religiousness, to postoperative depression and hostility. Methods: Using standardized instruments, trained research assistants conducted sequential interviews before and after surgery in middle-aged and older cardiac patient. Standardized medical and surgical indices were selected from a national database (the Society of Thoracic Surgeon's Database). Plasma samples were drawn in the morning before operation to obtain the data on interleukin-6 (IL-6), a stress-related biomarker. Results: Pre-operative spiritual struggle mediated the indirect effect of both anxiety and anger coping on IL-6 immediately before operation, which was in turn associated with poor postoperative outcomes (depression and hostility). Anger and avoidant coping also mediated the influence of anxiety on postoperative maladjustment. Further, positive religious coping (R-cope) and hope played important mediating roles on parallel pathways, to counterbalance or to moderate the undesirable influences of maladaptive coping on postoperative depression. Conclusion: Maladaptive coping contributes to poor postoperative outcomes. The link between spiritual struggle and IL-6 mediated the indirect effects of negative non-religious and religious coping on postoperative hostility and depression. Should positive pathways not be presented, the deteriorating effects of preoperative distress and maladaptive coping could have been more damaging.

ON THE ROAD TO HEALTHY AGING: PILGRIMAGE AS HEALTH STRATEGY IN JAPAN

J.A. Danelly, *UWM, Milwaukee, Wisconsin*

While religious activities such as prayer and church attendance have been widely discussed among gerontologists, religious pilgrimage has been given far less attention. In contemporary Japan, older adults are the most likely age group to embark on a religious pilgrimage. This paper examines the motivations for making a pilgrimage in late life as well as the subjective accounts of its effects on health and well-being. The data for this paper is based on two years of ethnographic research comprising interviews with religious pilgrims and observations during participation in two different pilgrimages. The preliminary findings of this research suggest that pilgrimage combines physical, emotional, social and spiritual health benefits for older adults in ways that other

resources do not provide. Older pilgrims are more likely to travel as a group, often combining religious practice with leisure activities such as visits to hot springs. Many pilgrimages explicitly involve practices aimed at healing of physical as well as mental decline, with whole circuits now devoted to the prevention of late life dementia. The pilgrimage model has also been successfully utilized by community welfare groups as a way to increase older adult social activity and integration, giving evidence that this model has implications for transferring the benefits of pilgrimage to non-Japanese cultures.

SESSION 2135 (SYMPOSIUM)

THE NATIONAL HEALTH AND AGING TRENDS STUDY: A NEW RESOURCE FOR THE STUDY OF DISABILITY TRENDS AND DYNAMICS IN OLDER PEOPLE

Chair: J. Kasper, *Health Policy & Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

This symposium introduces a new national survey aimed at assembling a rich database that will allow researchers to study changes over time in independence and disability among older people, and key causes and consequences of these changes. Dissemination and broad use of the data by the research community is a major goal and through presentations such as this we plan to inform researchers about the study's aims, design, data content, and availability. This presentation also provides the research team with the opportunity to hear from the research community as the study is being developed. Individual presentations will cover the following topics: 1. Overview of the National Health and Aging Trends Study: Design, Data and Dissemination 2. Conceptualizing and Measuring Disability: Plans for the National Health and Aging Trends Study 3. Assessing Disease Histories and Chronic Disabling Conditions in the National Health and Aging Trends Study 4. Tracking the Consequences of Disability in the National Health and Aging Trends Study 5. Designing Data Linkage Systems for the National Health and Aging Trends Study

OVERVIEW OF THE NATIONAL HEALTH AND AGING TRENDS STUDY: DESIGN, DATA, AND DISSEMINATION

J. Kasper¹, V. Freedman², G. Kalton³, 1. *Health Policy & Management, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*, 2. *University of Medicine and Dentistry of New Jersey, New Brunswick, New Jersey*, 3. *Westat, Rockville, Maryland*

A new national study aimed at assembling a rich database that will allow researchers to study changes over time in independence and disability among older people, and key causes and consequences of these changes, is underway. The study is funded by NIA and will be led by researchers at the Johns Hopkins Bloomberg School of Public Health working in collaboration with investigators at the University of Medicine & Dentistry of New Jersey, Brown University, Columbia University, the Medical College of Wisconsin, the Urban Institute, the University of Iowa, Syracuse University, and the survey research firm, Westat. The study consortium is designing comprehensive state-of-the-art methods for measuring disability in older people and will obtain information on key economic and social consequences of disability. This presentation will review the study aims, design, timeline and dissemination plans.

CONCEPTUALIZING AND MEASURING DISABILITY IN THE NATIONAL HEALTH AND AGING TRENDS STUDY

E. Agree, V. Freedman, L.P. Fried, B. Spillman, *Population, Family, and Reproductive Health, Johns Hopkins University, Baltimore, Maryland*

Disability measures in NHATS will support analyses in several areas: 1) understanding the relative contributions of shifts in physiologic, socioeconomic, environmental, behavioral, and medical factors to trends in disability; 2) investigations into which combinations of these factors

lead to different disability pathways at the individual level and how and why pathways differ for less advantaged groups; and 3) comprehensive modeling of outcomes of the disablement process. Information will be collected to disentangle the components of disability: an individual's underlying capacity to carry out basic tasks; the ability to carry out basic tasks independently, and the extent of engagement in tasks and valued activities. Measures will include the physical, social, and technological environment, and accommodations that individuals make in response to disability (e.g. use of assistive technology, environmental modifications, assistance from others, behavior change).

TRACKING THE CONSEQUENCES OF DISABILITY IN THE NATIONAL HEALTH AND AGING TRENDS STUDY

L.E. Pezzin, *Medical College of Wisconsin, Milwaukee, Wisconsin*

Disability and chronic disease have profound consequences for older individuals, their families and society. Providing data to better understand these consequences and track how they develop as functional decline progresses is one of the central aims of the NHATS. This presentation describes plans for measures of outcomes of functional decline in several domains: living and long term care arrangements, financial consequences of disability-related costs for individuals, families, public programs, economic wellbeing, and quality of life. Unique contributions will be the ability to track functional decline and its consequences from very early stages, to examine how individuals and families choose to respond and what influences responses, and to observe the implications of different responses for outcomes. These outcomes and their measurement will be examined in the broader conceptual framework of the disablement process central to the NHATS.

DESIGNING DATA LINKAGE SYSTEMS FOR THE NATIONAL HEALTH AND AGING TRENDS STUDY

V. Mor, *Community Health, Brown University, Providence, Rhode Island*

This new survey is one of the first national data sets being designed with explicit personal and geographical data linkage in mind from the outset, since these contextual factors are increasingly recognized as highly influential in shaping elders' response to the disablement process. Linkages are planned to: 1) Medicare enrollment records and all Part A (institutional), Part B (physician) and Part D (drug) claims, and 2) information about providers based on the Medicare Provider of Service files and other sources (e.g. information available about provider quality of care from external sources). Geo-coding a respondent's address provides for measures of distance from health care providers as well as characteristics of census blocks, zip codes and/or counties. Both restricted files that allow users access to linked data using established data security protocols for data use agreements and public use files which give users access to summary data are planned.

ASSESSING DISEASE HISTORIES AND CHRONIC DISABLING CONDITIONS IN THE NATIONAL HEALTH AND AGING TRENDS STUDY

R. Wallace, *Epidemiology, University of Iowa College of Public Health, Iowa City, Iowa*

Chronic diseases and conditions underlie much disability in older people and, as a result, are an important area for evaluation in NHATS. Information on chronic disease prevalence (and incidence) will be obtained from self-report as well as diagnostic information from linked claims data. We also plan to draw on CMS's Chronic Condition Warehouse indicators for major chronic conditions. Data on treatment related to chronic conditions will be collected including temporal patterns of clinical events, extent and intensity of medical care (including hospitalization), symptom profiles, prescription drug use, and self-management of chronic conditions. An equally important focus for data collection is clinical syndromes. These will be explored for temporality, extent of self-management and functional impact. Questions will be

included on emerging concepts such as geriatric frailty, and events such as falls, as precursors to disability.

SESSION 2140 (SYMPOSIUM)

THEORETICALLY DERIVED MODELS FOR COMMUNITY-BASED INTERVENTIONS DESIGNED TO IMPROVE NUTRITION-RELATED OUTCOMES IN OLDER ADULTS

Chair: J.L. Locher, *Medicine/Health Care Organization and Policy, University of Alabama at Birmingham, Birmingham, Alabama*
Discussant: J. Sharkey, *Texas A & M, College Station, Texas*

Reliance upon theory is critical in planning and developing effective community-based interventions, including those designed to improve nutrition-related outcomes in older adults. This symposium presents four projects that relied upon different theoretical perspectives. The first paper reports on a faith-based initiative designed to recruit volunteers to deliver meals to homebound older adults who were socially isolated in an underserved inner-city neighborhood. The project relied upon social capital and social network theory and was supported by the Lucille Beeson Foundation. The second paper reports on a telephone intervention designed to increase consumption of calcium and vitamin D in community-dwelling older adults who are at high-risk for experiencing osteoporotic fracture. The project uses social cognitive theory and is supported by the Agency for Healthcare Research and Quality. The third paper reports on a self-management intervention designed to improve nutritional intake in older adults receiving Medicare home health services and who are at especially high risk for experiencing under-nutrition. This project uses an ecological perspective and is supported by the National Institute on Aging. The fourth paper reports on a train-the-trainer intervention for lay leaders to teach family members of persons with dementia to alter mealtimes. This project used a self-efficacy framework and was supported by the South Carolina Nutrition Research Consortium. As major funding agencies are encouraging translational initiatives that link scientific research with public and private organizations in efforts to improve the health and well-being of community members, this symposium is relevant for anyone planning a theoretically informed community-based project.

A FAITH-BASED INITIATIVE TO RECRUIT VOLUNTEERS FOR A HOME-DELIVERED MEALS PROGRAM SERVING HOMEBOUND OLDER ADULTS: A THEORETICALLY DERIVED MODEL

D. Buys^{1,2}, M. Marler³, C. Robinson⁶, J.L. Locher^{2,4,5}, 1. *University of Alabama at Birmingham, Department of Sociology, Birmingham, Alabama*, 2. *Center for Aging, University of Alabama at Birmingham, Birmingham, Alabama*, 3. *1917 Clinic, University of Alabama at Birmingham, Birmingham, Alabama*, 4. *Division of Gerontology, Geriatrics and Palliative Care, University of Alabama at Birmingham, Birmingham, Alabama*, 5. *Department of Health Care Organization and Policy, University of Alabama at Birmingham, Birmingham, Alabama*, 6. *Center for Domestic Preparedness, Anniston, Alabama*

Government subsidized home-delivered nutrition programs, frequently called Meals on Wheels (MOW), seek to ensure that homebound older adults have nutritious meals regularly delivered by employees and volunteers. Long waiting lists exist in some places due to volunteer shortages. In one urban neighborhood, a community-based project rooted in social capital (SC) and social network (SN) theory was designed to increase volunteers for MOW. A Support Team model was used, solidifying pre-existing "bonding" SC among religious congregations in the neighborhood and SNs within those congregations, and building "bridging" SC to a local MOW program. Six congregations of different denominations staffed one volunteer route serving > 2000 meals to sixteen new clients in its year of inception, and the route is still in its existence. Further, the model has since been replicated. This program's successful

implementation, continuation, and replication demonstrate that theory is critical in developing effective community-based interventions.

USING THEORY BASED, TAILORED, WRITTEN MAILED MATERIALS TO INCREASE CALCIUM AND VITAMIN D INTAKE IN OLDER COMMUNITY-DWELLING ADULTS WITH HIGH FRACTURE RISK

B. Kitchin, J. Curtis, C. Kohler, *University of Alabama at Birmingham, Birmingham, Alabama*

Aging is a major risk factor for osteoporosis and subsequent fragility fractures. Fragility fractures in the elderly incur high personal and medical costs. However, many older people lack osteoporosis and fracture risk knowledge, awareness, skills, and self-efficacy necessary to engage in bone protective behaviors such as adequate calcium and vitamin D intake. In this study, the researchers will examine the efficacy of tailored printed materials in a magazine format in increasing calcium and vitamin D intakes in community dwelling older adults at high risk for fragility fractures. Participants will be randomized to a usual care group and an intervention group that will receive the tailored print materials by mail. The education materials will be tailored according to participant responses to a baseline survey based on the osteoporosis health belief model and self-efficacy theory. Outcome variables measured will include calcium and vitamin D intake after the 6 month intervention period.

USE OF AN ECOLOGICAL PERSPECTIVE IN AN INTERVENTION TO IMPROVE NUTRITIONAL WELL-BEING OF OLDER ADULTS RECEIVING HOME HEALTH SERVICES

J.L. Locher¹, C. Ritchie¹, K. Vickers², C.W. Bales³, 1. *Medicine/Health Care Organization and Policy, University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Mayo Clinic, Rochester, Minnesota*, 3. *Duke University, Durham, North Carolina*

The overall purpose of the study described in this paper is to evaluate the efficacy of a multi-level self-management intervention to improve nutritional intake in a group of homebound older adults who are at high risk for under-nutrition. The study is guided by the theoretical approaches of the Ecological Model and Social Cognitive Theory and uses a prospective randomized controlled design to estimate whether individually tailored counseling focusing on social, environmental, and behavioral aspects of eating results in increased caloric intake and improved nutrition-related health outcomes. This presentation focuses on the use of the Ecological Perspective to promote healthy eating behavior. Consistent with the Ecological Perspective, we describe the preliminary work that was conducted in order to identify the multiple levels of influence that effect eating behavior (including: intrapersonal/individual factors, interpersonal factors, institutional/organizational factors, community factors, and public policy factors) and how these were used to design the intervention.

SELF-EFFICACY FOR CHANGE IN A MEALTIME TRAIN-THE-TRAINER PROGRAM

E. Amella¹, S.B. Laditka², 1. *College of Nursing, Medical University of South Carolina, Charleston, South Carolina*, 2. *University of North Carolina at Charlotte, Charlotte, North Carolina*

Families of persons with dementia have a lifetime of experience sharing meals; tapping that knowledge to create a mealtime plan that allows for change related to dementia, particularly the need for assistance, managing disruptive behaviors and inadequate intake, was the underlying purpose of this project. As part of developing a comprehensive mealtime intervention, a train-the-trainer program for staff and caregivers of persons attending support groups and adult daycare was based on change theory – the Self-Efficacy component of Social Cognitive Theory. Caregiver's and trainer's self-efficacy for making mealtime changes was altered using the principles of learning from others (vicariously),

and sharing how newly acquired skills resulted in positive changes. Social persuasion was strong in these settings as trainers and caregivers tried hard to succeed and supported and received support for emotionally and physically challenging mealtimes. In this pilot study, mastery facilitated self-efficacy and adoption of new caregiving behaviors at mealtimes.

SESSION 2145 (SYMPOSIUM)

AN INTERPROFESSIONAL COURSE ON IMPROVING CARE TRANSITIONS: IMPLEMENTATION & LESSONS LEARNED

Chair: *E.S. McConnell, School of Nursing, Duke University, Durham, North Carolina, Durham VA GRECC, Durham, North Carolina*

Discussant: *D.S. O'Leary, The Joint Commission, Chicago, Illinois*

Managing transitions in care effectively requires interprofessional collaboration. Currently, health professions students lack opportunities to develop interprofessional competencies called for by the emerging evidence-base for improving care transitions. National attention directed toward improving the quality of care transition processes make care transitions an ideal focus for interprofessional coursework delivered using authentic, project-based cooperative learning techniques. Our semester-long course for advanced, pre-licensure students from medicine, nursing, pharmacy, physical therapy, and a physician's assistant program successfully met the IOM mandate for improving interprofessional learning regarding important geriatric care issues. Core elements of the course included an interprofessional faculty team, project-based learning, and use of active learning strategies. The objective of this session is to discuss course design, implementation and evaluation strategies for interprofessional learning that is focused on improving geriatric care. The session offers: (1) an overview of course development and implementation; (2) our approach to building students' quality improvement expertise to facilitate their ability to engage in project-based learning; (3) our experiences helping faculty develop needed skills and confidence in active learning techniques to support students' abilities to propose realistic solutions to problems elderly patients face in transition, and (4) a detailed description of teaching about problems in transitions using an active-learning approach. Our evaluation demonstrates significant improvements among both faculty and students on their self-efficacy for the majority of the core content. Individual sessions showcase practical solutions to managing challenges of interprofessional teaching around transitions in care. The discussion focuses on implications of training model for improving geriatric care.

IMPROVING QUALITY IN TRANSITIONS OF CARE FOR OLDER ADULTS: OVERVIEW OF AN INTERPROFESSIONAL COURSE FOR ADVANCED LEARNERS

T.R. Konrad¹, M. Heflin², E.O. Egerton², S.O. Pinheiro², D.K. Thornlow², E.S. McConnell², 1. *NC Institute on Aging, Univ No Carolina @ Chapel Hill, Chapel Hill, North Carolina*, 2. *Duke University, Durham, North Carolina*

A semester-long course for advanced pre-licensure health professions students aimed to enhance knowledge of care delivery across transitions and strengthen geriatric teamwork and quality improvement skills. Faculty teams facilitated seven interactive sessions on teamwork, transitions, communication and quality improvement (QI) for 12 students from 5 disciplines. Between sessions, students conducted patient and stakeholder interviews, performed chart reviews, observed team meetings, and worked as teams on QI projects. Learning was assessed using a mixed-method approach—pre-post self-efficacy, assignment completion, project evaluation, and student survey and focus group feedback. Students' reported high satisfaction, especially with active interprofessional (IP) learning. Self-efficacy increased significantly on 3 topics (quality improvement, transitions in care, and cultural compe-

tence) and marginally on IP care. Student teams presented QI proposals to faculty and health system leaders. This course enhanced relevant knowledge and skills in QI methodologies, cultural sensitivity, care transitions, and IP care.

BUILDING QUALITY IMPROVEMENT EXPERTISE THROUGH PROJECT-BASED LEARNING

D.K. Thornlow¹, H. White¹, M. Heflin¹, T.R. Konrad², E.S. McConnell¹, 1. *Duke University, Durham, North Carolina*, 2. *University of North Carolina, Chapel Hill, North Carolina*

Through interactive lectures and project-based assignments, we challenged interprofessional students to improve transitions in care for older adults. Students applied quality improvement (QI) methods to a current clinical issue: readmissions for elderly patients with heart failure (HF). To gain experience with care processes and variations in delivery, students conducted chart reviews, interviewed patients and stakeholders, and observed healthcare team meetings. Students selected a specific transition problem in patients with HF, used data to assess the outcomes of care, dissected the problem and identified contributing factors. Students reviewed literature and designed an evidence-based intervention with input from stakeholders. Students applied improvement principles to develop data collection plans and design and test changes. Upon project completion, teams presented findings to key stakeholders, who posed questions and provided recommendations regarding feasibility of implementation and strategies for overcoming resistance to change. On pre-post survey, student self-efficacy improved with respect to quality improvement methods ($p < .001$).

A LEARNER-CENTERED APPROACH TO INTERPROFESSIONAL INSTRUCTION: COURSE REFLECTIONS AND PRACTICAL APPLICATIONS

E.O. Egerton¹, G. Buhr¹, S. Pinheiro¹, K. Shipp¹, E.S. McConnell¹, J. Schuh², 1. *Duke University, Durham, North Carolina*, 2. *Campbell University, Buies Creek, North Carolina*

Evidence from educational research supports use of authentic, active learning strategies, however, many faculty only have experience using more traditional, passive teaching approaches. In order to ensure faculty and student success in a course involving authentic, project-based learning, we implemented a systematic strategy for developing faculty skills in active learning techniques. Approaches included: (1) interactive faculty development sessions, (2) use of interprofessional teaching teams, (3) consultation with instructional design experts during lesson plan development (4) post-session faculty reflection, and (5) faculty facilitated project-based, small group work. Systematic evaluation showed increases in faculty self-efficacy in actively teaching interprofessional core competencies. This session examines the synergistic collaboration of an interprofessional teaching team and instructional design experts to deliver an authentic, project-based curriculum. We will share our experiences helping faculty develop needed skills and confidence in active learning techniques to support students' abilities to propose realistic solutions to problems elderly patients face in transition.

PROBLEMS IN TRANSITIONS OF CARE: A COURSE SESSION EXEMPLAR

V. Scott, M. Heflin, C.C. Hendrix, S.O. Pinheiro, S.N. Hastings, *Community and Family Medicine, Duke University, Durham, North Carolina*

As part of an interprofessional course for advanced learners at Duke University, we designed a learner-centered session focusing on problems in transitions of care. We employed an interactive teaching approach to engage learners and promote active learning. Session objectives included: 1) identify patients at risk of complicated transitions, 2) describe common problems occurring during transitions and, 3) discuss the benefits of medication reconciliation. Teaching strategies included showing a video clip of a real patient transition followed by a group discussion of elements contributing to a good transition. We also included

brief mini-lectures emphasizing common problems in care transitions and risk factors for complicated transitions. Finally, learners participated in a small group exercise simulating medication reconciliation from the patient perspective. In follow-up, learners conducted interviews and chart reviews of older patients recently involved in care transitions. We describe the medication exercise in detail and discuss outcomes for this teaching module.

SESSION 2150 (PAPER)

ATTITUDES ABOUT AGING AND GERIATRIC ASSESSMENT

“WE HAVE TO CREATE FAMILY”: A CASE STUDY OF LESBIAN ELDERS ILLUSTRATING SUPPORT ISSUES AND NEEDS FOR AGING

M.L. Gabrielson, *College of Nursing, Illinois State University, Normal, Illinois*

There are striking differences between homosexual and heterosexual elders in terms of support needs for aging. Lesbian and gay elders are more likely to age single, live alone, and have no children to call upon in times of need as compared to their heterosexual counterparts. For lesbian and gay elders this potentially means a disparity in natural supports. There is a growing consensus regarding the importance of social ties on older adult well-being. Limited social support has been associated with a variety of health disparities. Lesbian elders are among the most invisible of all Americans and experience a triple minority status (age, gender, sexual orientation) that renders them marginalized. The purpose of this study is to increase visibility, awareness and understanding of elder lesbians. To date, there has been an inadequate amount of research devoted to the aging and health experiences of lesbian elders and the factors that impact those experiences. Continued lack of knowledge may potentially undermine optimal care delivery for this vulnerable population. An instrumental collective case study of four lesbian elders (aged 55 and older) illustrating support issues and needs for aging is discussed. Findings suggest that lack of biological family support, childlessness, and experiences of support within informal lesbian social networks significantly impact care expectations and decisions. Implications for health professionals in working with elder lesbians include exploring existing support systems as well as exploring and assisting with the formation of culturally acceptable support systems and services.

SILENT AGEISM: HOW HEALTH CARE WORKERS PERPETUATE NEGATIVE ATTITUDES AND STEREOTYPES

J. Klein, L. Liu, *University of Alberta, Edmonton, Alberta, Canada*

Introduction: Ageism refers to the stereotyping of and discrimination against individuals or groups because of their age. Ageism often goes undetected or unchallenged within health care. Objective: This study examines the perceptions of gerontological occupational therapists and their experiences with ageism within their work settings. The audience will understand the concepts of ageism and learn to recognize its occurrence within the health care system and learn strategies to prevent ageism. Methods: This interpretive inquiry study used in-depth semi-structured interviews with 16 occupational therapists working with older adults in various work settings to examine their experiences with ageism in these settings. Analysis of transcripts and written responses were subjected to constant comparative analysis. Results: This study revealed that there remains covert discrimination towards older adults, the health professionals with whom they work, and the organizational structures related to this population. Health professionals appeared to be agents of ageism - reflecting societal expectations and reinforcing stereotypical tendencies that were already present in society. The social impact of ageism will be discussed including discrepancies in service allocation. Findings from this study along with techniques provided on

how to confront this challenge can be used to inform clinical practice as well as encourage personal and professional reflections. Examples and case studies will be presented. Conclusions: Acknowledgement of the presence of ageism within our work setting is the first step towards providing optimal care for older adults with complex and ongoing medical needs and ensuring that ageist beliefs and attitudes are addressed.

DEVELOPMENT OF A CAREPARTNER COMPREHENSIVE GERIATRIC ASSESSMENT

J.P. Goldstein¹, R. Hubbard², P. Moorhouse^{1,2}, M. Andrew^{1,2}, S. Searle¹, K. Rockwood^{1,2}, *1. Dalhousie University, Halifax, Nova Scotia, Canada, 2. Capital District Health Authority, Halifax, Nova Scotia, Canada*

Introduction: A reliable instrument to assess health status is needed to improve acute care for vulnerable older adults. A Frailty Index derived from Comprehensive Geriatric Assessment (FI-CGA) discriminates between levels of fitness and frailty and predicts relevant outcomes. Information, particularly regarding prior levels of function, may be difficult to obtain from older people. Carepartners or relatives may be in a unique position to provide this important information. Our objective was to develop a CGA form for completion by carepartners. Methods: The carepartner survey (R-CGA) was based upon a single page CGA. The organization and content of the questionnaire were reviewed and revised by members of the multidisciplinary team. A convenience sample (n= 100) of older patients (age ≥ 70 years) presenting to Emergency Medical Services (EMS) and the Geriatric Medicine Ambulatory Care Clinic will be enrolled. The primary outcomes include time-to-complete, percent completeness and its agreement with other frailty indexes (FI-CGA). Results: The carepartner survey was developed over a six month period. It collects social, medical and functional information about the subject. In a pilot study (n=24), the protocol seemed feasible and R-CGA completion rates were high (90.1%). The mean age was 80.6 ± 5.2 years and 62% (15) of subjects were female. The time to complete was 11.6 ± 4.1 minutes (n=12). Conclusions: We have aggregated best evidence from geriatric and emergency medicine to develop a standardized tool to assess health status. The R-CGA may be a feasible, valid and efficient means of capturing important information about vulnerable older patients.

IS A COMMUNITY-BASED SELF-REPORT TOOL A VALID AND RESPONSIVE MEASURE IN FACILITY-DWELLING SETTINGS?

S. Olarsch¹, A. Jette¹, N. Kerse², P. Ni¹, N. Latham¹, S. Haley¹, *1. Health & Disability Research Institute, Boston University, Boston, Massachusetts, 2. University of Auckland, Auckland, New Zealand*

Objective: Evaluate the psychometric properties of the Late-Life Function and Disability Instrument (LLFDI) in an elderly, facility-dwelling population. Design: Retrospective cohort. Participants: 469 cognitively intact subjects from the “Promoting Independence in Residential Care” randomized controlled trial. Interventions: Not applicable. Main Outcome Measures: Reliability, concurrent validity, effect size (ES), standardized response mean (SRM), standard error of measure (SEM), and minimal detectable change (MDC90) of the LLFDI Function, Disability-Limitation and Disability-Frequency summary scales in association and comparison with a performance-based measure, the Elderly Mobility Scale (EMS) and components of a health index measure, the EuroQol (EQ-5D). Results: The 3 LLFDI summary scales demonstrated good internal consistency ($\alpha = .74 - .95$). Concurrent validity was supported for the Function and Disability summary scales, with the EMS and EQ-5D ($r = .73$ to $.43$, $p < .0001$). Distribution-based statistics revealed comparable or larger effect sizes for the LLFDI scales compared to the EMS and EQ-5D. Percentage of subjects exceeding a minimal change threshold was comparable or larger for the LLFDI Function scale than the comparison function measures and larger for the Disability-Limitation scale than the comparison disability measures. Conclusions: Reliability and validity of the LLFDI summary scales were

supported in this cognitively intact facility-dwelling population. The Function and Disability-Limitation scales demonstrated a larger degree of responsiveness than the EMS and EQ-5D measures. Performance of the Disability-Frequency scale was questionable in this population. Key Words: Psychometric properties, Function, Disability

EXPANDING NURSES ASSESSMENT OF OLDER ADULTS: SUCCESS OF THE HOW TO TRY THIS SERIES

K.A. Kany¹, S.A. Greenberg², N.A. Stotts³, D. Mason⁴, M. Mezey², 1. *American Journal of Nursing, Ashburn, Virginia*, 2. *NYU, College of Nursing, Hartford Institute for Geriatric Nursing, New York, New York*, 3. *University of California, San Francisco, School of Nursing, San Francisco, California*, 4. *American Journal of Nursing, New York, New York*

Care for older adults requires population specific assessment skills. Assessment is the hallmark of care to older adults. The Hartford Institute for Geriatric Nursing Try This™ assessment series has been highly successful in identifying valid and reliable assessment instruments and best practice approaches for the practicing nurse, faculty and nursing students. In 2007, the American Journal of Nursing (AJN) and the Hartford Institute developed "How to Try This," a video and print series to demonstrate how to apply 30 of the Try This™ instruments in the clinical practice setting. The 30 How to Try This videos were created using real patients and nurses in a typical hospital setting. All videos were free on the AJN web site. We report here on the use of the How to Try This™ series. Specifically using aggregated data collected from registered users of the AJN Web site (www.NursingCenter.com/AJNolderadults), we report on the access of the video series by 7,000+ RNs and other health care professionals. Specifically, we report data as to registered users relative popularity of assessment instruments, typical time spent on each assessment video, and user characteristics. We also report on closed and open ended responses to a mailed survey of 1000 randomly selected subscribers to AJN (response rate 30%) and responses of baccalaureate nursing faculty participating in the Geriatric Nursing Education Consortium (GNEC) project. Applicability of the findings to nursing education and practice will be discussed. Funding for this project provided by the John A. Hartford Foundation.

SESSION 2155 (PAPER)

DISPARITIES

MULTIPLE HOSPITALIZATIONS OF OLDER DIABETES PATIENTS: DO DISPARITIES EXIST?

H. Kim¹, G.D. Melkus¹, K. Boockvar², 1. *New York University, New York, New York*, 2. *Mount Sinai School of Medicine, New York, New York*

The purpose of this population-based study was to examine the extent and costs of multiple hospitalizations in older diabetes patients and their relationships with sociodemographic and clinical characteristics of patients. We analyzed California's state inpatient data, which included 199,990 older diabetes patients who were discharged from acute care hospitals in 2006. About 32.6% of patients were hospitalized more than once during the year, accounting for about 57.1% of total hospitalizations. The average length of stay was slightly longer for patients with multiple stays (6.1 days) than for patients with single stays (5.2 days). The average total cost was almost three times larger for patients with multiple stays (\$52,033.4) than those with single stays (\$18,094.9). Multiple hospitalizations were more likely to occur in ethnic/racial minority groups, people with Medicaid as primary payer, and people with lower median income. The most common principal diagnosis for the first hospital stay of patients with multiple stays was congestive heart failure (9.3%) followed by pneumonia (5.9%). Congestive heart failure is also the most common principal diagnosis category for subsequent hospital stays (10.4%) followed by septicemia (6.3%). On average, patients with multiple stays had four chronic conditions. The study find-

ings suggest that multiple hospitalizations in older diabetes patients are common, expensive, and more likely to be experienced by low-income ethnic minority populations. Innovative chronic care delivery models to reduce multiple hospitalizations in this population should be developed and evaluated.

REGIONAL DISPARITIES IN INCIDENT COGNITIVE DECLINE: THE REGARDS STUDY

V.G. Wadley¹, F.W. Unverzagt², L.C. McGuire³, C.S. Moy⁴, B. Kissela⁵, L.A. McClure¹, M. Crowe¹, V.J. Howard¹, 1. *University of Alabama at Birmingham, Birmingham, Alabama*, 2. *Indiana University School of Medicine, Indianapolis, Indiana*, 3. *Healthy Aging Program, Centers for Disease Control and Prevention, Atlanta, Georgia*, 4. *National Institute of Neurological Disorders and Stroke, NIH, Bethesda, Maryland*, 5. *University of Cincinnati, Cincinnati, Ohio*

Because there are shared risk factors for stroke and cognitive impairment, we aimed to determine in a national cohort whether incident cognitive impairment is greater in the Stroke Belt region (8 southern states with elevated stroke mortality) than in the remaining United States. Stroke risk factors were assessed in the REasons for Geographic And Racial Differences in Stroke (REGARDS) study via in-home and telephone methods. Global cognitive status was assessed annually by telephone with the Six-item Screener (SIS). We included REGARDS participants who were cognitively intact at enrollment (SIS > 4 of 6), reported no prior stroke or TIA, and had 2+ cognitive assessments. The resulting sample consisted of 18,781 participants: mean age 65 (± 9 years), 57% women, 37% African American, 55% residing in the Stroke Belt and 45% in the remaining 40 contiguous states. Logistic regression examined the association of region of residence with incident cognitive impairment (SIS score ≤ 4) among participants with a first SIS score > 4. Odds ratios were adjusted for age, race, gender, education, and time between first and last assessments (mean interval 2.0 ± 0.8 years). Overall, 1,600 participants (8.5%) declined to an SIS score ≤ 4. Residents of the Stroke Belt region had greater adjusted odds of incident cognitive impairment than non-Belt residents (OR = 1.20; 95% CI 1.08 - 1.34). All demographic factors and time independently predicted impairment. Factors influencing geographic disparities in stroke mortality may also influence disparities in cognitive decline, suggesting shared environmental risk factors.

PSYCHOTROPIC MEDICATION KNOWLEDGE: DIFFERENCES BY RACE/ETHNICITY AND AGE

M.M. Nelson, *Institute for Health, Health Care Policy, and Aging Research, Rutgers University, New Brunswick, New Jersey*

Reasons for racial/ethnic differences in psychotropic use among older adults are unclear. We examined differences in psychotropic knowledge among older adults with the Collaborative Psychiatric Epidemiology Surveys, nationally representative surveys of mental illness and treatment that oversampled racial/ethnic minority populations. Respondents were asked about past-year psychotropic use in two ways: acquiescence to broad categories of psychotropics (antidepressants, sedatives, tranquilizers), and identification by name. Logistic regression in SUDAAN measured relationships among concordance between medication reports and race (Non-Latino White, African-American/Afro-Caribbean, Latino, and Asian), mental illness, physical illness, sociodemographics, cognitive status, number of psychotropics, and past-year mental health services (MHS). Among adults ≥65 naming particular antidepressants (N=134), African Americans/Afro-Caribbeans and Latinos were less likely than Whites to acquiesce to the antidepressants category (Odds Ratio[OR]=0.03, 95% Confidence Interval[CI]=[0.00, 0.76]; OR=0.11, CI =[0.02, 0.72]), respectively). Specialist MHS were associated with high concordance. Among adults <65 naming antidepressants (N=1069), African Americans/Afro-Caribbeans were less likely than Whites to acquiesce to the antidepressant category (OR=0.55, CI=[0.30, 0.99]). Among younger respondents, concordance increased with mental ill-

ness and primary care MHS. Everyone naming particular tranquilizers (317 younger, 70 older adults) had complete concordance. Among younger adults naming particular sedatives (N=230), concordance was higher among Latinos than Whites and among those with more education. Only 49 older adults named sedatives, precluding further analysis. Results indicate that racial/ethnic disparities exist in identification of medication purpose, and these disparities differ by age and medication class. This study identifies populations who may benefit from increased medication education, as understanding medication purpose impacts adherence.

PATTERNS OF DISPARITIES IN DIABETES DIAGNOSIS AND GLYCEMIC CONTROL IN OLDER ADULTS

P. Lee^{1,2}, C. Cigolle^{1,2}, W.H. Herman¹, Y. Lee¹, C. Blaum^{1,2}, 1. *Internal Medicine, University of Michigan, Ann Arbor, Michigan*, 2. *VA Ann Arbor Geriatric Research, Education and Clinical Center, Ann Arbor, Michigan*

Younger age, minority ethnicity, and lower socioeconomic status (SES) are risk factors for sub-optimal glycemic control in older adults with diagnosed diabetes. However, the pattern of disparities in older adults with undiagnosed diabetes is not completely known. We hypothesized that younger age, minority ethnicity, and lower SES are also associated with the lack of a diabetes diagnosis in older adults. We performed secondary data analysis of wave 2006 of the Health and Retirement Study, a national health interview survey of older adults. The analysis was limited to respondents 53 years and older who submitted blood samples for HbA1c measurement (n=6,064). We used HbA1c $\geq 7\%$ to define sub-optimal glycemic control in those respondents reporting a diabetes diagnosis. Likewise, we used HbA1c $\geq 7\%$ to define undiagnosed diabetes in those respondents reporting no diabetes diagnosis. Socio-demographic covariates included age, gender, race, and SES. We performed bivariate analyses of association of socio-demographic covariates with self-reported diabetes and measured HbA1c levels. 1,273 respondents reported having diabetes; 29% had HbA1c $\geq 7\%$. 4,791 respondents reported not having diabetes; 1% had HbA1c $\geq 7\%$. Younger age, male gender, African-American ethnicity, and lower SES were associated with elevated HbA1c in respondents with diabetes diagnoses ($P < 0.05$). In contrast, only lower SES was associated with elevated HbA1c in respondents without a diabetes diagnosis ($P < 0.05$). Contrary to our hypothesis, a different socio-demographic disparity pattern underlies older adults lacking a diabetes diagnosis as opposed to those with diabetes and poor glycemic control. Lower SES is a common risk factor and potential target for intervention.

SESSION 2160 (PAPER)

MENTAL HEALTH - HS PAPER SESSION

UNDERSTANDING OLDER ADULTS WITH SCHIZOPHRENIA: BUILDING AND ERODING TRUST

H. Leutwyler^{1,2}, M.I. Wallhagen^{1,2}, 1. *UCSF School of Nursing, San Francisco, California*, 2. *UCSF/John A. Hartford Center of Geriatric Nursing Excellence, San Francisco, California*

Introduction: Adults who struggle with schizophrenia are living longer. At the same time, data suggest that older adults living with schizophrenia face health care disparities that contribute to poor physical health. The purpose of this poster is to present findings from a qualitative study that explored the understanding of physical health among older adults with schizophrenia. In gathering the individual perspective, one of the study goals was to understand factors that might influence experienced health care disparities. **Methods:** A grounded theory study was conducted among 28 older adults with schizophrenia living in a variety of settings using semi-structured interviews and participant observation. **Results:** The concept of trust evolved from the data as a dynamic process that was built with dimensions of respect, caring, advocacy, and

consistency and eroded through dimensions of disrespect, not being heard, lack of time and provider inaction, and stigmatization. This process of building and eroding trust was influenced by the symptoms of schizophrenia. **Conclusions:** The fluctuating and chronic nature of schizophrenia, the societal response to the disease, and the fragmented health care system all impact trust. When trust is given and received between providers, the health care system, and the older adult with schizophrenia, physical health outcomes may improve and health care disparities may decline. These findings provide insights for the design of future research interventions and clinical practice to promote optimal physical health outcomes for this growing population.

12-MONTH DIAGNOSED PREVALENCE OF BEHAVIORAL HEALTH DISORDERS IN MEDICARE AND MEDICAID MEMBERS

W. Lin, R.E. Clark, J. Zhang, G. Leung, *Center for Health Policy and Research, University of Massachusetts Medical School, Shrewsbury, Massachusetts*

The anticipated increase in the number of elders with behavioral health disorders (BHDs) poses serious challenges to the health care system. Nevertheless, prevalence of BHDs in elders has not been well studied. We used merged Massachusetts Medicare and Medicaid claims (CY2005) to examine 12-month diagnosed prevalence of BHDs and chronic physical conditions by insurance coverage (Dual Eligibles, Medicare Only, and Medicaid Only) and age (55 to 64, 65 and over). BHD-groups included Severe Mental Illness, Other Mental Illness, and Substance Use Disorders. Chronic physical conditions included 15 major conditions prevalent among elders. Almost 170,000 (20.8%) Massachusetts Medicare and Medicaid members aged 55 and over had one or more BHDs. The most common BHDs by group were major depression (SMI), other depression (OMI), and alcohol abuse or dependence (SUD). Dual Eligibles had the highest diagnosed prevalence of BHDs and physical comorbidities. Among Dual Eligibles aged 55 to 64, the BHD prevalence (51.7%) was 4 times higher than Medicare Only; for aged 65 and over, it was 2.5 times higher (38.8% vs. 16.1%). A much higher proportion of people with BHDs had 5 or more chronic physical conditions than those without BHDs. Among Dual Eligibles, the proportions were 20.8% vs. 13.0% in aged 55 to 64 and 49.2% vs. 23.3% in aged 65 and over. The level of complexity in treatment and care coordination is higher among elders with BHDs than for those without BHDs. Interventions that effectively integrate care for physical and behavioral health disorders are increasingly important as people age.

PHARMACOLOGIC AND NONPHARMACOLOGIC INTERVENTIONS USED IN GEROPSYCHIATRIC UNITS: A PILOT STUDY

P. Lindsey, *Illinois State University, Normal, Illinois*

A paucity of research has examined how psychiatric nurses manage behavior with elderly patients hospitalized in geropsychiatric settings. The purpose of this pilot study was to examine the pharmacologic and nonpharmacologic interventions that nurses use in the management of behavioral symptoms exhibited by older adults, hospitalized on two acute care geropsychiatric units. A retrospective chart review of 108 patient records (Site A: 52 charts; Site B: 56 charts) sampled from a 3 month period identified the documented use of pharmacologic (scheduled and p.r.n) and nonpharmacologic interventions to manage behavior. Data was analyzed using descriptive statistics. Rates of p.r.n. psychotropic medications were 67.3% ($x=7.3\%$ per patient) at Site A and 75% ($x=8.3\%$ per patient) at Site B. Documentation regarding p.r.n medications differed between the two sites, including the reason for administering p.r.n medications, response to p.r.n. medications, and alternative interventions that were attempted. A lack of documentation of nonpharmacologic interventions used per patient was prevalent at both sites (Site A: 69%; Site B: 62.5%). Differences and similarities in types of diagnoses as well as the types of and patterns of administration of medications will

be discussed. Further research is needed to better understand how nurses manage behavior in geropsychiatric settings. This research will benefit the care of older adults in acute geropsychiatric settings but can also be used as a basis for clinicians treating older adults with psychiatric disturbances living in independent or supervised settings.

PSYCHIATRIC COMORBIDITY AND REHOSPITALIZATION, MORTALITY, AND FUNCTION IN STROKE PATIENTS

A. Dossa^{1,2}, D. Berlowitz^{1,2}, S. Loveland^{1,2}, H. Hoenig³, *1. Center for Health Quality, Outcomes, and Economic Research, Bedford VA, Bedford, Massachusetts, 2. Boston University, Boston, Massachusetts, 3. Durham VA, Durham, North Carolina*

We used the 2001 VA Integrated Stroke Outcomes Database to examine associations between psychiatric comorbidities and important clinical and functional outcomes in 2545 stroke patients who received inpatient rehabilitation. We defined psychiatric comorbidity as having any mental health or substance abuse diagnosis. Outcome variables included 3 and 6-month mortality post-discharge, 3 and 6-month rehospitalization post-discharge, and functional change post inpatient rehabilitation. Our logistic and linear models examined associations between the presence of outcomes and: psychiatric comorbidity; any mental health diagnoses or substance abuse; and depression, psychosis, anxiety, as independent variables. Covariates included the Charlson index, demographics, discharge setting, length of stay, rehabilitation setting, and admission functional status. Having any psychiatric comorbidity predicted 6-month rehospitalization (OR: 1.25, $p = .04$). Having any mental health diagnosis was significantly associated with 6-month rehospitalization (OR: 1.09, $p = .04$) but substance abuse was not significant. Depression was significantly associated with 6-month rehospitalization (OR: 1.47, $p = .005$). Anxiety was significantly associated with 3 and 6-month mortality (OR: 2.12, $p = .02$; OR: 2.37, $p = .001$). Since rehospitalizations can impact function, quality of life, and cost of care, we need to continue working on successful interventions to address psychiatric comorbidity in this population. We did not see associations between psychiatric diagnoses and functional change possibly because rehabilitation programs may not accept patients with severe behavioral issues. Further research is needed on the impact of psychiatric comorbidity on: a) longer term follow-up of function post-rehabilitation and b) older veterans with different diagnoses and high disability risk.

SESSION 2165 (SYMPOSIUM)

NOVEL PHENOTYPE DEVELOPMENT IN A CHANGING GENETIC STUDY LANDSCAPE

Chair: J.D. Walston, *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*

Discussant: A.B. Newman, *University of Pittsburgh, Pittsburgh, Pennsylvania*

A revolution in high through-put genotyping over the past decade has brought genome wide screening technologies, dense SNP genotyping, and resequencing candidate genes to the forefront in the search for meaningful genetic variation. Large numbers of genotypes are now widely available in population studies of older adults, but many aging cohort studies lack precise phenotype measurements that can help capture biologically meaningful genetic variation. As part of an ongoing effort to detect meaningful genetic variants that influence late life biology, endophenotypes and longitudinal trajectories related to cognitive and physical decline, frailty and longevity are actively being developed. The objective of this symposium is to first provide an overview of the theory and methodology used to advance the ongoing cross-sectional and longitudinal phenotype development efforts in aging cohort studies and in the Johns Hopkins Older Americans Independence Center genetics core. These methods will be described in detail and specific phenotype development projects from prospective aging cohort

studies will be presented, including the use of longitudinal muscle strength measures to develop muscle endophenotypes and the use of principal components analysis to develop cognitive and longevity phenotypes. The discussion will center on future directions in aging, physiological, and chronic disease phenotype development efforts, and on specific examples of successful research consortiums that have enabled the development and application of novel, age-related phenotypes across cohort studies. In addition, the increasing usefulness of these phenotypes in the detection of meaningful genetic signals in aging cohorts will be discussed.

ENDOPHENOTYPES ACROSS PHYSIOLOGIC DOMAINS HAVE HIGH HERITABILITY IN THE LONG LIFE FAMILY STUDY

A. Matteini¹, D. Fallin¹, C.M. Kammerer², N. Schupf³, R. Mayeux³, A.B. Newman², E. Hadley⁴, J.D. Walston¹, *1. Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. Columbia University, New York, New York, 4. National Institute on Aging, Bethesda, Maryland*

The Long Life Family Study was developed to identify phenotypic and genotypic variation that correlates with long and healthy life. Thirty-two physiologic measurements from five trait domains (Cardiovascular, Cognition, Physical Function, Pulmonary, Metabolic) were used in a Principle Components Analysis (PCA) to develop component-derived endophenotypes of long and health life. Heritabilities of these endophenotypes were estimated. Overall, endophenotypes defined by variables across multiple domains showed higher heritability than those defined by a single domain. The first PC, consisting of measures of pulmonary and physical function, represented 14.5% of the total variance with an estimated heritability of 32%. The second PC consisted of measures of metabolic, cardiovascular and cognitive function and represented 12.1% of the variance with 43% heritability. The third and fourth components demonstrated low heritability and included cardiovascular and cognitive measures, respectively. These PCA-derived traits across multiple domains may help to identify underlying genetic mechanisms that drive functional longevity.

USING LONGITUDINAL DATA TO DEVELOP AGING PHENOTYPES

Q. Xue¹, B.A. Beamer², J.D. Walston¹, *1. Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland*

The identification of trajectories of change over time has been a critical component of health outcome research in older adults. However, to date, genetic research in older adults has primarily relied on phenotypes measured at one point of time. Such single time-point measurements cannot be used to determine success at maintaining a biological set-point. From scientific perspective, we hypothesize that within-person trajectories of change illustrate the concept of resilience as a dynamic process; therefore the trajectories could be better predictors of the outcomes than cross-sectional measurements and provide better protection against unmeasured confounding. An overview of statistical methodologies for constructing longitudinal phenotypes that are biologically meaningful and analytically flexible for addressing data challenges including heterogeneity, nonlinearity, measurement error, and missing data will be provided. Applications of these methods will be demonstrated in the next talk using longitudinal grip strength measures from the Women's Health and Aging Study II.

COGNITIVE FUNCTION ENDOPHENOTYPES IN FAMILIES WITH EXCEPTIONAL SURVIVAL

J.D. Walston¹, S. Barral³, R. Mayeux³, N. Schupf³, A.B. Newman², A. Matteini¹, K. Christensen⁴, 1. *Medicine/Geriatrics, Johns Hopkins University, Baltimore, Maryland*, 2. *University of Pittsburgh, Graduate School of Public Health, Department of Epidemiology, Pittsburgh, Pennsylvania*, 3. *Taub Institute and Sergievsky Center, Columbia University, New York, New York*, 4. *The Danish Aging Research Centre, Epidemiology, University of Southern Denmark, Denmark, Denmark*

Objective. To develop cognitive measures into endophenotypes and compare endophenotypes between probands of the Long Life Family Study (LLFS), their offspring and age-matched controls without a family history of longevity. **Background.** Population-based studies have shown that older adults with cognitive impairment have increased mortality, suggesting that preservation of cognitive function is associated with increased longevity. **Methods.** Principal component analysis was carried out in randomly selected individuals from each of the 511 LLFS families to identify cognitive factors. Cognitive factor scores were compared between: i) long-lived probands ii) a population based cohort of age-matched unrelated individuals and iii) offspring of probands and iv) a married-in control group. **Results.** LLFS probands and their first degree offspring performed significantly better on two tests of working memory, digit forward and digit backward, compared with their age-matched control groups. **Conclusions.** Cognitive function may be a useful endophenotype to investigate genetic factors associated with exceptional aging.

AGING PHENOTYPE DEVELOPMENT: GETTING WEAKER VS. BEING WEAK

B.A. Beamer^{1,2,3}, J.D. Walston^{3,4}, L.P. Fried^{5,3}, Q. Xue^{3,4}, 1. *University of Maryland School of Medicine, Baltimore, Maryland*, 2. *Baltimore VAMC GRECC, Baltimore, Maryland*, 3. *Johns Hopkins University Older American Independence Center, Baltimore, Maryland*, 4. *Johns Hopkins University Division of Geriatric Medicine and Gerontology, Baltimore, Maryland*, 5. *Columbia University Mailman School of Public Health, New York, New York*

We hypothesize that the trajectory of decline in muscle strength—a prominent and universal feature of aging—predicts adverse health outcomes. In the Women's Health and Aging Study II, we analyzed the associations of the trajectory of grip strength with the risks of incident falls, disability, and mortality. We found that each standard deviation increase in the rate of decline in grip strength ($= 0.2$ kg/year) reflects a hazard ratio of 2.4 for incident IADL disability, 5.2 for ADL disability and 3.3 for mortality [All $p < 0.01$; Adjusted for age, race, education, and BMI]. Cross-sectional measures of strength do not predict adverse outcomes nearly as well. Because the rate of decline in strength is quite variable in humans, it is an attractive phenotype for genetic analysis. We will discuss the implications of these results on aging phenotype development broadly, as well as specifically regarding analysis and interpretation of genetic association studies.

SESSION 2170 (SYMPOSIUM)

CROSS-CULTURAL AND MULTICULTURAL FRAMING OF SYMPTOMS OF DEMENTIA

Chair: M. Iris, *Research, CJE SeniorLife, Chicago, Illinois*

From both the clinical as well as popular perspective, key symptoms of Alzheimer's disease have largely to do with memory: for example, forgetting the topic of a conversation, where the checkbook is, what the doctor said, your neighbor's name, plus difficulties in word finding. However, although memory loss is a central symptom, behavioral changes are often more salient (e.g. becoming unusually argumentative, getting lost while driving, forgetting to pay the bills). For older adults,

their clinicians and families, such lapses are difficult to distinguish from signs of 'normal' aging. Hence, how one understands normal aging becomes the frame for evaluating both memory lapses and behavioral changes. From a cultural perspective, 'normal aging' is a social construction, and so in turn is Alzheimer's disease. But culture, from an anthropological perspective, is largely invisible to its members. Cross-cultural and multi-ethnic studies can shed considerable light on the manifestations and course of Alzheimer's disease both within and outside the taken-for-granted North American/US frame-of-reference. In this session, we address symptom-beliefs and perceptions of AD among Native Americans (Henderson & Henderson), elderly Chinese (Elliot), older Russian, African American, and Mexican Americans (Iris & Schrauf), and a number of limited English proficiency speakers in a large multicultural, urban area (Morhardt). These studies provide a lens through which we can discern what is culturally variable about aging and by extension what is culturally variable in symptom-beliefs and symptom-perception in AD. Implications for aging policy and clinical practice will be discussed.

CONCEPTUALIZING SYMPTOMS OF ALZHEIMER'S DISEASE IN THREE ETHNIC POPULATIONS

M. Iris, R. Schrauf, *Research, CJE SeniorLife, Chicago, Illinois*

Understanding how different ethnic and minority populations conceptualize AD symptoms is critical to furthering the goal of early diagnosis. This paper presents results of a concept development exercise using pile sort methodology. Symptom statements derived from in-depth interviews with 10 African Americans, 10 Mexican Americans, and 10 Refugees from the Former Soviet Union were sorted into groupings by 30 additional participants from these same groups, based on self-selected principles of similarity. Using graph layout algorithms we analyzed sub-domain symptom clusters, based on proximity and interconnectedness of items. Three predominant symptom clusters emerged (physical symptoms, cognitive symptoms, and symptoms of personality change), with differing levels of within-group agreement (African Americans 55%; Mexicans 40%; FSU 50%), indicating intra-cultural variation. Inter-cultural differences will also be discussed, with implications for public and professional education noted. After attending this presentation, participants will achieve greater understanding of cultural models of AD symptoms in the three populations.

ATTRIBUTIONAL BELIEFS OF DEMENTIA

L. Henderson, J. Henderson, *American Indian Diabetes Prevention Center, University of Oklahoma, Oklahoma City, Oklahoma*

Dementia research among a 60-person, multi-tribal American Indian (AI) sample found etiologic beliefs focusing on stress as causative, medical expertise as unimportant to diagnosis, social service and family most valued, and hallucinations interpreted supernaturally. These views diverged from concepts held by the US majority. This paper uses the viewpoint of AI colonization and resultant contemporary life contexts to hypothesize explanations for the divergent dementia views. Specifically, stress is "undeserved stress" due to cultural subjugation. It is a diffuse, noxious, more or less unconscious perception interwoven into all aspects of life. Consequently, undeserved stress is a culturally connected candidate explaining the invisible loss of mind experienced in dementia. Physicians were viewed as unimportant due to perceived substandard care. Favoring social service and family caregivers was consistent with response to a non-medical condition. Hallucinations interpreted as communications with the "other side" are consistent with beliefs of a thriving non-empirical environment.

ALZHEIMER'S DISEASE IN LIMITED ENGLISH PROFICIENCY POPULATIONS

D.J. Morhardt, *Cognitive Neurology and Alzheimer's Disease Center, Northwestern University, Chicago, Illinois*

Limited data exist on how members of different cultures understand dementia. Results of Administration on Aging (AoA) Alzheimer's Disease Demonstration Grants to States (ADDGS) in 5 limited English proficiency (LEP) communities (Assyrian, Arabic, Bosnian, Hindi, Urdu) revealed 13% of enrolled subjects sought evaluation. Project goals: 1) to understand how these LEP community groups conceptualize dementia; 2) to understand reasons LEP communities sought or did not seek a diagnosis. Forty-eight interviews conducted with family members of persons identified with dementia in person's native language, translated and subjected to thematic analysis. Results: memory loss is explainable and normative – due to aging, reaction to medication or trauma experienced by war, family problems or immigration experience. The primary predictor to not seeking an evaluation was dependent upon psychosocial stressors in the family of more concern. AD education needed in LEP communities to increase awareness of early diagnosis, treatment intervention and management of difficult behaviors.

CLASH OF CULTURES IN DEMENTIA EVALUATION: A CASE STUDY OF CHINESE PATIENTS AND ANGLO-AMERICAN CLINICIANS

K.S. Elliott, *Anthropology, Minnesota State U., Mankato, Mankato, Minnesota*

This presentation explores the cultural clashes that occurred when Chinese patients at an Alzheimer's center in California were evaluated for dementia by Anglo-American clinicians. Because these clinicians were not familiar with Chinese culture, they often misinterpreted the behavior of elderly Chinese patients and their families and, as a result, were more likely to misdiagnose such patients. This presentation is based on data collected from 1993 to 1996 as part of an NIA-funded research project on the sociocultural factors influencing the medical evaluation, case management and family care of demented Chinese elders. Several case studies will be discussed drawing on the author's participation, as the clinical team's medical anthropologist, in diagnostic interviews with patients' families, case conferences with the clinical team, and with family members, and in developing care plans that were culturally appropriate. Presentation attendees will learn to identify sociocultural factors relevant to cross-cultural dementia evaluation.

LATINO FAMILY PERSPECTIVES ON DEMENTIA-RELATED BEHAVIORAL CHANGES: DEVELOPING FLEXIBLE CAREGIVERS

L. Hinton¹, R. Valle³, M. Tzuang², I. Valverde², D. Gallagher-Thompson², 1. *Psychiatry, U.C. Davis, Sacramento, California*, 2. *Sanford, Palo Alto, California*, 3. *San Diego State University, San Diego, California*

Prior research has found that Latino family caregivers report high levels of dementia behavioral problems and associated caregiver distress, and considerable unmet needs for professional help. To inform the development of culturally-tailored psychoeducational materials (i.e. a fotonovela) to help Latino caregivers manage difficult behavioral problems, eight focus groups were held with Latino family caregivers and providers with extensive experience in the Latino community. This paper will present thematic analysis of focus group data and describe how these findings informed the development of a fotonovela. Focus groups identified a broad range of behaviors that are particularly challenging for families, including aggression, depression, sexually inappropriate behaviors, and wandering. Maladaptive and adaptive strategies for dealing with behavioral problems were described by focus group participants. The over-arching theme was the importance of family members developing flexibility in their roles as caregivers and adjusting cultural expectations to the realities of caregiving

SESSION 2175 (SYMPOSIUM)

GETTING SERIOUS ABOUT EXTENDING PALLIATIVE CARE TO NURSING HOME RESIDENTS

Chair: M. Bern-Klug, *Social Work, University of Iowa, Iowa City, Iowa*
Discussant: H. Moody, *AARP, Washington, District of Columbia*

The purpose of this symposium is to discuss how a palliative care approach would benefit nursing home residents, regardless of "dying" status. Indeed, good palliative care is about providing comfort throughout the illness trajectory, not only for the final days and hours. The symposium considers changes in three areas that together would go a long way toward enhancing the nursing home staff's ability to provide excellent palliative care, including 1) the structure and processes of care; 2) a reconsideration of the meaning of the principle of autonomy in terms of residents with cognitive impairment; and 3) greater attention to psychosocial issues throughout the illness course.

THE NEED TO EXTEND THE REACH OF PALLIATIVE PSYCHOSOCIAL CARE TO NURSING HOME RESIDENTS WITH ADVANCED CHRONIC ILLNESS: THE SOCIAL WORK ROLE

M. Bern-Klug, *Social Work, University of Iowa, Iowa City, Iowa*

Improving the quality of living in nursing homes (NH) includes an emphasis on physical and emotional comfort. Comfort is a core concept in palliative care, and as such, can benefit people throughout the illness trajectory, including as the end of life draws near. This session discusses two different models of palliative care, the scope of psychosocial issues found among residents in NH, and the challenges faced by social workers as they strive to identify and address resident psychosocial comfort issues within the context of palliative care.

THE STRUCTURE AND PROCESS OF ADVANCED CHRONIC ILLNESS AND PALLIATIVE CARE IN NURSING HOMES

S. Thompson, *Nebraska Medical Center College of Nursing, Omaha, Nebraska*

All permanently placed nursing home residents will die in a nursing home or hospital. In 1987, the focus of nursing home care changed from custodial to rehabilitative; nursing homes are to improve the quality of residents' care through maximizing the physical, mental, and psychosocial well-being of residents. Focusing solely on restorative interventions, which many nursing homes do in response to fear of regulatory scrutiny and care deficiencies, leaves many residents potentially receiving inappropriate, aggressive, rehabilitative care. Palliative care is focused on the quality of life of those who live with life-limiting illnesses through the relief of physical and psychosocial suffering; thus, it is appropriate for all nursing home residents. A simultaneous approach is needed, where both restorative and palliative care interventions are provided to residents upon admission and throughout their stay, where only the balance between the two changes over time. Strategies for developing and maintaining this balance are discussed.

A CONCEPTUAL FRAMEWORK FOR EVALUATING MEASURES OF END OF LIFE IN LONG-TERM CARE

J. Munn, *College of Social Work, Florida State University, Tallahassee, Florida*

Although an estimated one-quarter of older adults die in long-term care settings, less end-of-life research has been conducted in these settings when compared with hospitals or community-dwelling older adults. This is an important omission that is exacerbated by the dearth of well-validated assessment instruments specifically designed to measure the quality of care, quality of life, and quality of dying in nursing homes and assisted living facilities. This presentation will examine some of the conceptual and methodological challenges of evaluating end-of-life care in this and other settings. Furthermore, the author will provide an overview of existing measures and will describe issues specific to the

long-term care setting such as high rates of dementia and long periods of chronic illness prior to death. In addition, the presentation will examine issues such as surrogate respondents and timing of evaluation. Finally, the author will make suggestions regarding both formal and informal assessment

GETTING SERIOUS ABOUT ETHICAL ISSUES IN ADVANCED CHRONIC ILLNESS AND AT THE END OF LIFE

C.E. Gessert¹, D.F. Reynolds², 1. *Education and Research, SMDC Health System, Duluth, Minnesota*, 2. *University of Missouri, Columbia, Missouri*

Most of the principles and concepts currently used in American bioethics were conceived and nurtured in the world of acute care. These principles are based on an idealized model of autonomy, in which the patient provides or withholds consent for surgical procedures or participation in research, acting as a free agent. There are well-recognized differences between autonomy in the acute care setting, where the focus is on decisions that are discrete in time and place, and autonomy in the family or nursing home setting, where individual autonomy is tempered by the demands and constraints of ongoing living in an intimate community. This presentation provides an overview of common ethical issues encountered in nursing homes, and an analysis of how familiar ethical principles may be applied in the resolution of these issues. The presentation focuses on a preventive ethics approach, in which potential ethical problems are anticipated and addressed.

SESSION 2180 (PAPER)

HOME AND COMMUNITY BASED CARE - PAPER

HEMOCARE WORKERS' RISKS OF OCCUPATIONAL INJURIES AND CREATIVE SELF-PROTECTION IN TAIWAN'S CULTURAL CONTEXT

P. Wang, *None, Pingjen City, Taoyuan County,, Taiwan*

Prior studies that explored healthcare workers' occupational injuries tended to focus on the physical working environment at institutional settings, such as nursing homes or hospitals. Few studies have attended to the physical challenges that community healthcare workers encounter at their clients' homes in various cultural contexts. This study aims to investigate the challenges that homecare workers have encountered when carrying out various care tasks at their clients' home in Taiwan's cultural context. This study used qualitative methods to investigate the ways in which homecare workers (both men and women) carried out various homecare tasks at 100 service users' homes in Taiwan's National Homecare Program in 2006 and 2007. Findings reveal that in addition to high risks of musculoskeletal disorders, homecare workers in the Taiwanese cultural context have faced a higher risk of motorcycle accidents than their counterparts in institutional settings. Also, the source of homecare workers' hazards of musculoskeletal disorders arose not only from the workers' having to carry out heavy-duty tasks frequently but also from having to do so on their own (without any co-worker) and often within the constraints of clients' small bathrooms in typical Chinese housing styles. Such hazards were exacerbated by three program-design problems: (1) the program's mandated organization of tasks, which lacks rectification of the imbalance between clients' quality of life and workers' long-term well-being, (2) the problematic evolution of client-worker power relationships under the program's "rights-talk" framework, and (3) the characteristics of the highly skewed client population drawn into using Taiwan's National Homecare Program.

EXPANDING COMPREHENSIVE HOME CARE TO INDIAN COUNTRY

T. Edes¹, B. Finke², R. Greene¹, G. Hoffman¹, H. Tompkins¹, 1. *Department of Veterans Affairs, Washington, District of Columbia*, 2. *US Indian Health Services, Washington, District of Columbia*

The missions of both VA and IHS include providing health care for American Indian and Alaska Native (AIAN) veterans. In comparison to other veterans, AIAN veterans have higher prevalence rates of Post Traumatic Stress Disorder and greater unmet health needs. The growth of the AIAN elderly population and prevalence of chronic disease among AIAN contributes to a medically complex population with increasing disability and long term care needs. Many AIAN receive care from both VA and IHS/Tribal health programs. Lack of primary care coordination between these systems may result in duplicated care, potential conflicts in treatment, increased possibility for medication errors, delays in treatment, and longer patient visits in primary care settings. Home Based Primary Care (HBPC) is comprehensive longitudinal primary care delivered in the homes of veterans with complex chronic disease and disability – veterans for whom routine clinic-based care is not effective. HBPC provides on-going monitoring of the veteran's chronic care needs and identifies problematic conditions before they require acute interventions. VA HBPC has challenges in outreach to rural areas, limited by driving distances. IHS and Tribes have limited outreach to those with chronic disabling disease. To better serve rural AIAN veterans, VA and IHS entered into a partnership to extend HBPC using IHS and tribal clinics and hospitals involving 14 tribes. This innovative partnership will infuse geriatric competencies and care coordination models into settings that are medically underserved and serve as a template upon which to build future partnerships among VA, other federal agencies and non-VA partners.

SOCIAL WORKERS AND DISTRICT NURSES IN COMMUNITY CARE PRACTICE: FRAMING IDEOLOGIES AND INTERACTIONS WITH OLDER PEOPLE

M. Sullivan, *Brunel University, Uxbridge, Middlesex, United Kingdom*

This paper reports on the outcomes of a grounded theory study that examined ideology within social work and district nursing practice interactions with older people. Erving Goffman's frame analysis was applied to examine the principles of organisation governing subjective meanings within the professional encounter. Semi-structured depth interviews were conducted with 40 practitioners in two locations in England. The raw data was coded to generate concepts and then recontextualized for analysis within the developed categories which were conceptually and empirically grounded. The data underwent further examination to establish substantive relationships between the categories allowing both themes and explanations to emerge. The study's major findings were as follows: (1) meanings projected into the encounter were anchored within government and professional discourse, as well as individual perceptions about what was best for older people; (2) the described encounter was professionally managed in that the practitioner's understanding of the social events enabled him/her to organize and influence the interaction in absence of any strategic intention; and (3) practice dilemmas arose as practitioners attempted to intervene with older people informed by their professionally based values juxtaposed against those supported within official discourse. The frames governing interaction varied among and within the two professional groups leading to varied care pathways for older people, and fostering conflict within interprofessional working. The findings demonstrate the need for practitioners to develop an understanding of how they construct their social realities in a complex community care environment, and ultimately how they organise the experience of community care for older people.

HOME- AND COMMUNITY-BASED SERVICE USE AND AGING-IN-PLACE ANTICIPATION AMONG COMMUNITY-DWELLING OLDER ADULTS

F. Tang, Y. Lee, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Increasing numbers of older adults, especially the oldest-old and those aging with disabilities have created an increasing demand for a board array of home- and community-based services (HCBS). The traditional long-term care that entailed long-term placement in the nursing home institution has given way to transient post-acute and rehabilitation placement; assisted living facilities and HCBS such as adult day care, which have become more prevalent and available. Also a majority of older Americans have the preference for living independently and receiving long-term care in their homes or community settings. The expansion of HCBS is expected to help meet the increasing needs for remaining in the community among the older population. Using the data from Community Partnership for Older Adults Program Survey which is a representative sample of older adults aged 50 and older in 13 communities (N=4,501), this study examines the prevalence of utilization of HCBS and its association with aging-in-place anticipation among community-dwelling older adults. Very few elders have ever used these services; from 1.4% using assisted living to 16.5% using senior centers. However, the previous experience with adult day programs, house-keeping, senior lunch, helpline, and personal assistance was associated with the likelihood of anticipation for remaining at home under regular help, especially among vulnerable adults who were older than 75 or reported fair or poor health status. The findings have implication for raising the public awareness of HCBS and the effective use of the services in serving the community-dwelling elders.

COMPASSION FATIGUE – THE SILENT EPIDEMIC FACING HELPING PROFESSIONALS WORKING WITH OLDER ADULTS IN RURAL COMMUNITIES

E.T. Jurkowski, *School of Social Work, Southern Illinois University Carbondale, Carbondale, Illinois*

Compassion Fatigue (CF) is becoming recognized in helping professions as a silent disease which is beginning to impact people in the helping professions who are increasingly stressed, and impacted by trauma for prolonged periods of time. Professionals working with older adults are a group of silent victims, whose vulnerability is often unnoticed and underestimated. Thus, unrecognized CF for professionals can lead to a lack of ability to detect signs of mental distress for older adult consumers. This presentation will describe some of the signs and symptoms of CF, differentiate CF from ‘burnout’ and present some findings on the incidence and prevalence for professionals working with older adults. Data examining three subscales, compassion fatigue, compassion satisfaction and burnout (Stamm, 2003) were used to identify the level of CF experienced by helping professionals working with older adults in rural settings in the Midwest. (n=212). Findings suggest that the longer a person has been in their specific helping role, the more likely they are to be suffering from burnout and compassion fatigue, and the more likely they are to suffer from dissatisfaction with their role. Training and education do not seem to serve as a mediating factor, however, marital status does serve as a protective factor. Solutions will be addressed at the conclusion of the paper.

SESSION 2185 (PAPER)

IMPROVING CARE IN RESIDENTIAL SETTINGS

THREE DIMENSIONS OF MEDICATION REGIMENS FOR RESIDENTS IN LONG-TERM CARE SETTINGS

T. Shaffer, 1. *University of Maryland, Doctoral Program in Gerontology, UM/UMBC, Baltimore, Maryland*, 2. *University of Maryland, The Peter Lamy Center for Drug Therapy and Aging, Baltimore, Maryland*, 3. *University of Maryland, School of Pharmacy, Department of Pharmaceutical Health Services Research, Baltimore, Maryland*

Medication use in institutional long-term care settings is dynamic due to the in-house ability to prescribe new or adjust current medications. To date there are only a few studies that characterize drug use in this setting, and they only offer snapshots that describe the use of any medication during the year, or during the time of survey. What is not captured in these studies is the temporal aspect of changes in medication use over time. Using data from the Medicare Current Beneficiary Survey for the years 2001-2004, monthly medication regimens for approximately 2,700 unique residents are constructed and then tracked for changes over time. This presentation reviews the unique qualities of medication administration in this setting and how that influences the construction of medication regimens and the measurement of their change when looked at by time, depth of regimen, and resident characteristics. First, the presentation of medication regimens by single therapeutic classes will be used to illustrate broad temporal aspects of use as a whole, and then introduces the idea of volatility (or changes) within class. From these single class examples, depth of regimens will be featured by combining multiple classes to form more complex and realistic medication regimens. Finally, an assessment of regimens by resident characteristics and type of residential setting will be shown. The implications of the three dimensions of time, regimen depth, and resident characteristics on the use of medication regimens as an indirect measure of medication quality will be discussed.

PLANNING THE DEVELOPMENT OF AN ELECTRONIC INFORMATION SYSTEM FOR RESIDENTIAL CARE FACILITIES FOR THE ELDERLY

C. Flores¹, R. Newcomer¹, J. Hiratsuka², 1. *Social and Behavioral Sciences, University of California, San Francisco, San Francisco, California*, 2. *California Department of Social Services, Sacramento, California*

This study was designed to facilitate the planning and development of enhancements to the Residential Care Facility for the Elderly (RCFE) information system in California. These enhancements are intended to produce a consumer-oriented web-accessible information resource, as well as improve the efficiency for the state regulatory agency by utilizing data that it is collected by the state agency and RCFE providers. Information related to quality of care, such as facility, staff, and resident characteristics; types of services provided; regulatory compliance; and resident outcome data are collected. The project is collaboration with the California Department of Social Services, Community Care Licensing Division (CCLD). A multidisciplinary workgroup, including state licensing managers and staff, RCFE providers, advocates, consumers and researchers, was organized. The workgroup participated in the identification and formulation of necessary and optional components of RCFE information. Web and electronic data system consultants aided in the development of the reporting formats, web site presentation formats, and planning for pilot testing the electronic web service system. Reported in this presentation are the information collection and screen prototypes for licensee web portal services, and the alternatives considered in the planning and development of an electronic information system for RCFEs. The product is designed to use health information technology to make information available to consumers, to increase

access to care, and to improve the quality of long term care by providing information for facility management, industry and regulatory planning and policy purposes. This study was funded by the California Healthcare Foundation (grant #08-1915).

MULTIMEDIA EDUCATIONAL TOOL TO IMPROVE OUTDOOR ACCESS IN LONG TERM CARE

S. Rodiek, *Architecture, Texas A&M University, College Station, Texas*

Access to nature and the outdoors has been found to promote health and well-being in older adults in long term care (LTC) settings, and may be especially critical for those with limited mobility. In spite of recently increased interest in environmental influences on health, many LTC facilities do not employ evidence-based design principles when creating outdoor space for residents. To improve the quality of outdoor access, an interdisciplinary team of architects, gerontologists, landscape architects, and educational psychologists have developed an innovative media-based educational tool, geared toward a broad range of decision-makers in the LTC industry. This multimedia DVD program provides evidence-based guidelines on key issues such as outdoor walkways, shade, accessibility, and connection with the indoors. Psychosocial goals are linked to specific architectural features, and multiple examples show how the central concepts can be applied in diverse situations. Interactive exercises assess user comprehension of important concepts, and provide immediate feedback. The presentation will demonstrate this new educational tool, funded by National Institute on Aging SBIR Grant #R44AG024786-02, and describe how decision-makers can use design guidelines to improve residential environments for frail older adults.

REPORTING ADVERSE EVENTS IN NURSING HOMES

L. Wagner¹, N. Castle², J. Engberg³, 1. *Baycrest, Toronto, Ontario, Canada*, 2. *University of Pittsburgh, Pittsburgh, Pennsylvania*, 3. *Rand, Pittsburgh, Pennsylvania*

Each year, approximately 8 million adverse events such as falls, medication errors, burns, abuse, and nosocomial infections occur among vulnerable nursing home residents across the U.S. The most commonly used method of reporting an adverse event in nursing homes is through documentation on an incident report. The practice of monitoring adverse incidents in nursing homes is unclear since there is currently no standardized method to investigate, document, and disseminate information- though a standardized taxonomy has been developed for hospitals. We conducted a mailed survey to a randomly selected group (n=1,000) of nursing home administrators across the U.S. to examine the incident reporting practices in nursing homes and identify to what extent these data are used for improving the safety of residents. Of the responders (n=256), the average number of incident reports collected per month/per facility was 23. Only 16% of the homes use a computerized entry system of incidents, whereas the majority use a written format. Events such as falls, skin tears, medication errors, and pressure ulcers are reported "Always" in a majority of facilities (95%) and only reported to the State Health Department when a sentinel event occurs. However, events such as abuse, elopement, suicide, and violence issues are "Always" reported to the State. Most events are reported to the State through a fax (59%) or phone call (66%) whereas only 17% of facilities report using electronic methods. Only 30% of respondent homes report notifying the U.S. Food and Drug Administration for events involving medical devices or drug events. Implications for practice and policy will be addressed.

SESSION 2190 (SYMPOSIUM)

TEACHING INNOVATIONS FOR GERIATRIC MENTAL HEALTH COMPETENCIES: MULTIDISCIPLINARY APPROACHES

Chair: S. Diwan, *San Jose State University, San Jose, California*

Discussant: R. Watman, *John A. Hartford Foundation, New York, New York*

Demographic data show a critical need for educating the workforce in social work, medicine, and nursing to address mental health needs of a burgeoning older population. Currently, very little training on geriatric mental health is provided to students in these fields. This symposium highlights teaching innovations to increase geriatric mental health competencies in the three disciplinary curricula which have been developed through separate grants from the John A. Hartford Foundation. For social work: Gellis et al describe web-based teaching modules focusing on schizophrenia, dementia, depression, and anxiety. Designed as mini reviews, they contain empirically-based lecture notes, presentation slides, case studies, and class exercises. Gelman et al describe computer-mediated modules containing video segments of actual intern encounters with older adults and supervisory sessions that model openness and self-reflection. Both projects provide qualitative evaluations of the modules from faculty and students. For geropsychiatry: Moutier et al describe the development of a clinical case of dementia utilizing "standardized patients" as a learning encounter to enhance competence of medical students in geriatric psychiatry during their psychiatry rotation. Tew et al describe an interdisciplinary educational intervention for psychiatry, social work, and nursing to successfully improve patients' transitional care outcomes by increasing rates of accepted home health referrals for patients discharged from inpatient units. For nursing: Evans et al describe process, outcomes, and policy impacts related to development and dissemination of Geropsychiatric Nursing Enhancements to current competencies for various educational levels and specialties. Goals and challenges to dissemination are discussed within a national and interdisciplinary context.

DEVELOPING EVIDENCE-SUPPORTED MENTAL HEALTH & AGING CURRICULA FOR ADVANCED GRADUATE SOCIAL WORK PRACTICE

Z. Gellis¹, S. McCracken², S. Diwan³, 1. *University of Pennsylvania, Philadelphia, Pennsylvania*, 2. *University of Chicago, Chicago, Illinois*, 3. *San Jose State University, San Jose, California*

The current and projected shortage in the mental health workforce point to a critical need in social work education to prepare graduate MSW students to address the mental health needs of an aging population. In a recent NASW survey, 75% of licensed social workers reported working in some capacity with older adults and their families. Yet few MSW students are trained to address geriatric mental health issues. We describe the development of a web-based Mental Health and Aging Teaching Module that addresses aging competencies and content designed for advanced practice and mental health courses in social work curricula. The evidence-based modules focus on schizophrenia, dementia, depression, and anxiety and are designed as mini reviews containing empirically-based lecture notes, presentation slides, case studies, and class exercises that are faculty user-friendly. Through faculty and student focus groups, we report on ease of use, quality, and content of these teaching modules.

USING WEB-BASED MODULES TO ENHANCE CLINICAL SKILLS AND SELF-AWARENESS IN SOCIAL WORK STUDENTS

C. Gelman, D.S. Gardner, *New York University, New York, New York*

This paper describes the development, implementation and evaluation of computer-mediated modules designed to expose all social work students to geriatric behavioral health practice. The modules introduce clinical assessment, diagnosis, and intervention skills and knowledge

about depression, substance abuse, family caregiving, and supervision in work with older adults. Each unit contains video enactments of an actual student's home or agency-based clinical interview followed by a supervision session that models openness and self-reflection. Accompanying discussion questions, classroom exercises, supplemental readings and resources help to promote learning and enhance usefulness for educators in a range of social work classes. Preliminary evaluations suggest positive responses among students, who report increased knowledge about and interest in working with older adults and their families. Participants found the supervisory segments to be particularly effective in promoting learning.

AN APPROACH TO ENHANCING GERIATRIC PSYCHIATRY EDUCATION DURING A MEDICAL SCHOOL CURRICULUM REFORM

C. Moutier, A. Sciolla, J. Keri, B. Winegarden, H.M. Hoffman, D.D. Sewell, D. Jeste, *Psychiatry, University of California, San Diego, La Jolla, California*

In June 2006 the American Association of Medical Colleges announced an intent to expand the number of American medical students by 30% by year 2015 to meet the projected demand for skilled physicians capable of caring for the growing population, particularly older individuals. At UCSD School of Medicine, we completed a thorough survey of preclinical and clinical curricula, and found relatively few and poorly integrated didactic hours dedicated to geropsychiatric education. A multi-pronged approach was utilized to enhance the education during all four years of medical school. One method, which is the focus of this presentation, was the creation of a learning encounter to enhance competence of medical students in geriatric psychiatry. This involved development of two standardized patient cases presenting with depression and dementia to teach third year medical students during their Psychiatry rotation. Qualitative and quantitative data on student and faculty feedback on the learning encounter will be presented.

ENHANCING TRANSITIONAL CARE SERVICES FOR OLDER PATIENTS DISCHARGED FROM PSYCHIATRIC HOSPITALS

J.D. Tew¹, S.A. Miller¹, T. Priestley², J. Rosen¹, K. Gopalan¹, F. Ghinassi¹, C.F. Reynolds¹, *1. Dept. of Psychiatry, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. UPMC Health System, Pittsburgh, Pennsylvania*

Background: Older patients discharged from psychiatric hospital experience many barriers to attending follow-up care. Suicide risk is greatest in the months following discharge. The lost-to-follow-up rates are high. Needed in-home services are often overlooked in discharge plans of psychiatrically impaired elders. **Intervention:** As part of a broader effort to improve transitional care at discharge, our interdisciplinary team (a psychiatrist, social workers, and home health nurses) at Western Psychiatric Institute & Clinic's 41-bed inpatient geropsychiatry unit identified barriers to home-health referral prior to discharge. We created a pre-printed order form to educate referring and receiving parties on functional impairments resulting from psychiatric illness, and instituted monthly referral practice review meetings with inpatient psychiatry and social work. **Results:** An increase in rates of home health referrals from 18.5% to 43.7% (including 70% of patients discharged to their homes). This was sustained over a year, even after the practice review meetings ended.

GEROPSYCHIATRIC NURSING COLLABORATIVE: PROGRESS AND PROMISE

L.K. Evans², C. Beck³, K.C. Buckwalter¹, *1. College of Nursing, University of Iowa, Iowa City, Iowa, 2. University of Pennsylvania, Philadelphia, Pennsylvania, 3. University of Arkansas, Little Rock, Arkansas*

This presentation highlights activities of the Geropsychiatric Nursing Collaborative, a four-year, multi-site (Penn, Arkansas, Iowa) initiative funded in 2008 by the Hartford Foundation and housed at the American Academy of Nursing. Specifically, background, process and outcomes related to the development, vetting, and dissemination of Geropsychiatric Nursing Enhancements to extant competencies for various levels and specialties within nursing are presented. Next, current efforts to identify, adapt and develop curricula and continuing education offerings to enable nurses to meet those competencies and to expand the knowledge base and policy impact of geropsychiatric nursing are discussed. Finally, future project goals and challenges are described within a national and interdisciplinary context.
