The purpose of this project was to explore the relationship between residential and institutional racial/ethnic mix in an attempt to determine whether institutional diversity is consistent with residential diversity. "We compile statistics on segregation in housing, schools, and employment," however outside of periodic studies on segregation, there are no national databases on segregation patterns in nursing homes (Smith, 1999). Given the increasing focus on health care disparities and racial inequalities in health care, expanding our knowledge of nursing home segregation is necessary to adequately understand the access challenges to nursing home services faced by minority elders. The purpose of this study is to: (1) further refine our measurement of nursing home segregation; and (2) to expand our understanding of the association of organizational and market factors to area-wide diversity patterns. We used data from Medicare's Online Survey Certification Automated Report, the Minimum Data Set, and the Area Resource File. The dependent variable quantifies multiracial segregation as an area-based phenomenon. Our findings reveal that not-for-profit nursing homes were more segregated than for profit nursing homes. Larger nursing homes, nursing homes located in more competitive markets, and nursing homes located in states with higher Medicaid per diem rates were less likely to be segregated. Although, these findings suggest that nursing home segregation follows a pattern similar to that of residential segregation, in light of the market and organizational association with segregation, there is room for policy changes to improve access for minority elders.

### PROLIFERATION OF THE "VILLAGE" MODEL: NEIGHBORHOOD ASSOCIATIONS FOR AGING IN PLACE

A.E. Scharlach[1], A.J. Lehning[2], C. Graham[3], *1. Social Welfare, University of California, Berkeley, California, 2. University of California, Berkeley, California, 3. University of California, Berkeley, California*

Since the creation of Beacon Hill Village in 2001, at least 45 similar grassroots neighborhood-based associations have emerged across the United States, and hundreds of others currently are in formation. In return for annual dues, members of these "Villages" receive a variety of services and support designed to help them age in place. While these "Villages" have received substantial media attention, to date there have been no empirical examinations of the model's implementation or its potential feasibility or effectiveness as a transitional form of care for and by older adults. Our online survey of 24 of these 45 "Villages" found that older adults are highly involved in these associations, including developing and overseeing the initiatives, as well as providing services and peer support. Substantial variations were found among respondents regarding organizational structures, services, and goals. For example, one-third enroll members who are under the age of 65. Nearly all have some kind of membership dues or fees, but less than half report that these fees are their primary source of funding, and the majority indicates that funding is a major challenge to their survival. One quarter are focused primarily on building peer support networks, while another 25% emphasize primarily service provision. The "Village" model appears to be an important new consumer-driven approach designed to help individuals to age in place, at a time of shrinking public resources.

These findings prompt questions regarding the feasibility of this model, and the potential relationships between operational characteristics and member outcomes.

## SESSION 1105 (SYMPOSIUM)

### DEMISE OF THE TRADITIONAL NURSING HOME – WHAT WILL THE BOOMERS DO?

Chair: *L. Polivka-West, Florida Health Care Association, Tallahassee, Florida, Florida State University, Tallahassee, Florida*
Co-Chair: *L. Polivka, Florida State University, Tallahassee, Florida*
Discussant: *R. Kane, University of Minnesota, Minneapolis, Minnesota*

Presenters will engage in a point/counterpoint discussion of rebalancing and the Medicaid reductions across the states leaving the long term care population of vulnerable elders with dementia and minority elders with co-morbidities without the traditional nursing home. On the corporate nursing home side, there is keen interest in replacing Medicaid with Medicare funded care and targeting short term rehab, subacute stays because of higher reimbursement. The states are supportive because of growing Medicaid deficits. Meanwhile, managed care corporate entities see long term care as the last health care frontier in the US and are making expansive proposals to state legislatures about how they will be able to contain and even reduce overall long term care Medicaid costs – what they don't say is by limiting choice and reducing care opportunities. Available research outcomes on cost effective alternatives to long term nursing home placements and state comparisons of demographics and cost projections will be presented. The changing roles of residential and home and community-based services will be closely examined with predictions for future long term care models. Alzheimer's caregivers, in the absence of consistently supportive services, are far more likely to relinquish the caregiving role than non-Alzheimer's caregivers and to permit their loved ones to be institutionalized. This is a major reason that Alzheimer's is one of the leading predictors of nursing home placement. The future for Alzheimers care without the nursing home will be discussed for the traditional nursing home may no longer be available.

### WHO WILL CARE IF NURSING HOMES DISAPPEAR

L. Polivka, *The Claude Pepper Foundation, Inc., Tallahassee, Florida*

Given today's political climate there is little chance that state or national legislators will provide a cohesive, rebalanced model of long-term care that addresses both institutional and community-based needs for people in need of long-term care. This presenter will discuss how long-term care raises complex economic, social and ethical issues that influence the question of nursing home vs. home and community-based care. An individual's risk status is in constant fluctuation as life circumstances change so that a measure of status at any one point in time is not a very accurate predictor of future problems. That is one of the major problems in getting public support for a national debate on long-term care. It is when the need arises that most people get involved in long-term care. This is also why the demise of the traditional nursing home may not garner much concern.

### DIFFICULT DECISION-MAKING WITH NURSING HOME PLACEMENT

C. Fahey, *Fordham University, New York, New York*

This presenter will focus on difficult decision-making and the complexities faced in the long term care placement decisions. Today 85% of the nursing home admissions come from the hospital meaning the acuity meets the level of care for 24 hour skilled nursing care. The liabilities and risks encountered by providers of care are inexplicable to the general public and yet are a reality for the nursing home. This panelist will discuss the difficulties to be anticipated with reduced access to the traditional nursing home. Staffing shortages, pressures to hire more trained, experienced staff, and quality of care concerns continue to put nursing homes in a national spotlight of mistrust and apprehension. The nursing home is held accountable for meeting the professional, moral and legal responsibilities of being a licensed long term care provider. However, too often there are inexact outcomes that may be anticipated by decision-makers in nursing homes.

## SESSION 1110 (POSTER)

### FINANCIAL ISSUES IN AGING

### DISABILITY TRAJECTORY AMONG THE ELDERLY WITH A FUNCTIONAL LIMITATION: DIFFERENCES BY SOCIAL ECONOMIC STATUS

Y.H. Yeo, *UNC-CH, Chapel Hill, North Carolina*

Although there are many studies examining risk/protective factors of disability among the elderly, most studies are limited to their regional samples, the lack of important predictors, and their cross-sectional designs. Further most previous studies did not recognize the difference between disability and functional limitation, which was underscored by Verbruge and Jette's disablement process model. Thus, the role of SES on the progression of disability among the elderly has not been clearly known. By using the HRS 1998 through 2006, this study focuses on the moderating role of social economic status in the causal relationship from the level of functional limitation to disability severity among the elderly (aged 65 and older) having a functional limitation at the HRS 1998 (N=7,561). This study employs growth curve modeling (HGLM with negative binomial distribution) with age as time scale method to predict changes of disability severity (a composite score of ADLs and IADLs) by SES (income, education, wealth), with controlling for functional limitation (Nagi scores), health behavioral factors (BMI, alcohol, smoking, mental health), and a set of demographics (gender, race, marital status). This study finds that all of SES measures are significant predictors of disability trajectory. Further the causal relationship between functional limitation and disability is moderated by the level of income ($p<.01$) and wealth ($p<.05$). These findings underscore that SES, especially financial characteristics, is an important determinant of progression of disability among the elderly even after controlling for individual capacity measured by functional limitation.

### MULTIVARIATE ANALYSIS OF RACE AND WEALTH DISPARITIES AMONG OLDER ADULTS

B.R. Haimowitz, *Gerontology, UMass Boston, Boston, Massachusetts*

Wealth is unevenly distributed among older adults in the United States. On average, the median net worth of White non-Hispanics households 50 years and older is $239,000 while the median net-worth of non-White households is $53,000. Among non-White households there is tremendous variability in wealth. For example, Black households older than the age of 50 have a median net worth of $47,000 and Hispanic households have a median net worth of $42,000. In other words, for every dollar in wealth that White households held Black households held less than 25 cents of net worth and Hispanic households held less than 20 cents of net worth (Bucks et al., 2006). This poster proposal uses the 2006 GSS (General Social Survey) data set to determine the extent of racial wealth disparities after controlling for typical socioeconomic factors such as age, education, and income plus demographic factors such as home-ownership and marital status. Second, I analyzed which socioeconomic factor has the largest influence on wealth. Multivariate analysis identified two socioeconomic factors which were associated with wealth: family income and race. Family income was a statistically significant variable on wealth ($p < .05$). Race was nearly statistically significant ($p < .07$). Further analysis showed that family income acted as mediating variable between race, home-ownership, education and wealth. -

### METHODOLOGY TO ESTIMATE ECONOMIC IMPACT OF ELIMINATING ADULT DAY CARE SERVICE IN THE COMMUNITY

S. Shen, L. Alecxih, B. Wright, S.W. Baxter, *The Lewin Group, Falls Church, Virginia*

Adult day care services provide critical support for seniors and people with disabilities when their families cannot afford to care for them. However, California has proposed significant cuts in long term care programs and the complete elimination of ADHC as a part of plan to address budget shortfalls. We conducted analysis and estimates that the elimination of the ADHC program would produce a first year loss of $112 million to the state. We examines the direct and indirect costs by assessing the literature for evidence of the impact of adult day services on nursing home use and employment of family members; analyzing 2004-2008 MSIS data for historical trends in Medicaid use and spending to predict service use in the absence of ADHC program; estimating lost tax revenue as a result of cutting the jobs of 7,600 ADHC employees in the state based on their occupation code, median wage, and median duration of unemployment; and estimating the number and characteristics of new informal caregivers who would leave the workforce or reduce their hours in order to care for a relative based on a national 2009 caregiver survey. Our analysis found that economic loss is $112 million to the state in the first year of funding cut. Ultimately, decisions to cut ADHC programs can adversely impact state revenue streams and cause participants to shift into more expensive services. States' fiscal decision of these programs should factor in indirect costs identified in this study when determining program viability.

### THE IMPACT OF SENSE OF CONTROL ON FINANCIAL STRAIN EXPERIENCED BY OLDER AMERICANS

K.A. Zurlo, *Rutgers University, New Brunswick, New Jersey*

The government and employers have become less accountable for the provision of retirement income. As a result, older adults are expected to take greater control of their financial circumstances as they age, but often do no have the knowledge nor skill to exercise this control. By not exercising adequate control over their finances, adults may be exposed to financial risk in retirement, which can have adverse and long-term consequences. A cross-sectional, quantitative analysis utilizing data from the Health and Retirement Study was used to assess the levels of control Americans (aged 51 and greater) exercise over their financial circumstances. Results from nested regression models predicting financial strain highlight that gender is not a significant determinant of financial strain. The general and domain-specific sense of control of older adults significantly influenced the size and magnitudes of the linkages between the demographic factors of older adults, namely education, race, and income and financial strain. Control beliefs boosted explained variance in financial strain by over 70 percent. Interventions that influence an individual's sense of control could potentially decrease financial strain experienced by older Americans. This study used the psychological construct of sense of control as a factor impacting the relationship between the attributes of older adults and self-assessed financial strain. As front-line workers who can implement, manage, and assess psychosocial interventions, social workers will be in a position to advance our field by advocating and implementing policy and practice interventions that improve older adults' levels of control over their financial circumstances.

### THE WEALTH OF LATINO BABY BOOMERS: DISPARITIES ARE DRIVEN BY SOCIODEMOGRAPHICS

Z.D. Gassoumis[1], K. Wilber[1], F. Torres-Gil[2], *1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. University of California, Los Angeles, Los Angeles, California*

The racially and ethnically diverse baby boom population became eligible for early retirement under Social Security in 2008. However, as this generation enters its retirement years, little is known about the financial prospects of its minority members. Specifically, there is a dearth of information regarding the economic security of Latino baby boomers, who account for 10% of the boomer generation. This poster presents data on the wealth of an early baby boom cohort (born from 1946 to 1953) as they approach retirement, focusing specifically on the holdings of its Latino members. Data come from the Health and Retirement Study's 2008 wave, which contains 3,414 early baby boomers. An oversampling of Latinos yielded 414 Latino participants (12%); however, weights are applied to make the sample representative of this age group within the U.S. population. The dependent variable is household wealth, including all assets net of all liabilities, which is weighted for household size. In two nested models, wealth is regressed first on age, sex, race, and ethnicity, then with various other sociodemographic and economic characteristics. Preliminary analyses indicate that being Latino has a negative effect on wealth when adjusting only for age and sex, but education, health, and other markers of SES fully explain this Latino effect. Unlike African Americans, who exhibit wealth effects in both models, there is no wealth-based disadvantage directly attributable to being Latino. The discussion presents policy implications for saving and wealth building among minority communities, with an aim to securing financial security in retirement.

## SESSION 1115 (SYMPOSIUM)

### GROWING OLDER IN RURAL UNITED STATES: SOME CHALLENGES AND POTENTIAL SOLUTIONS

Chair: *S.S. Butler, University of Maine, Orono, Maine*
Discussant: *S.A. Eisenhandler, University of Connecticut, Storrs, Connecticut*

Rural elders have lower incomes, are less healthy, and have higher rates of chronic diseases than their urban counterparts. These elders face particular challenges based on the rural nature of where they live. Generally, there are fewer services and fewer service providers. Moreover, physical barriers to accessing services include limited public transportation, difficult terrain and long distances (Turner & Krout, 2006). The papers in this symposium identify some of the current challenges faced by older adults living in rural regions of the country and offer potential solutions to these pervasive problems. The opening paper by Ford, Crowther and Parmelee discusses the health disparities experienced by rural elders with a particular focus on African Americans and the need to develop culturally appropriate prevention programs. The second paper, by Call and Erickson, reports on a study examining the consequences of declining healthcare infrastructure for the elder residents of rural communities, and how to address this problem. The third paper, by Sharkey, Johnson and Dean, takes up the issue of low daily consumption of fruits and vegetables for elders in rural regions where great distances exist between food stores. The symposium concludes with a paper by Maiden and Rummel which describes an innovative service-learning project involving gerontology and marketing students, which focused on increasing awareness of a single point of entry agency for longterm care services in a rural community. Together these papers illustrate some of the unique challenges faced by rural elders, as well as promising approaches to addressing their particular needs.

### HEALTH DISPARITIES, PREVENTION AND RURAL OLDER ADULTS

C.D. Ford[1], M.R. Crowther[2], P. Parmelee[3], *1. The University of Alabama - College of Nursing, Assistant Professor, Tuscaloosa, Alabama, 2. The University of Alabama - Clinical Psychology Program, Director, Tuscaloosa, Alabama, 3. The University of Alabama - Center for Mental Health & Aging, Director, Tuscaloosa, Alabama*

Rural elders are one of the greatest at-risk groups for experiencing health disparities. Although it is not clear exactly what characteristics of poverty contribute to health disparities, several explanations have been suggested including neighborhood or residential stability and its isolating effects; lack of community resources and health services; and lack of social support. As the first set of baby boomers reach the age of 65 in the next few years, the impact of income and health education will grow in importance as we devise strategies to address health disparities among this next cohort of older African Americans. Programs are generally geared toward younger populations, however, as people age it is important that programs are offered to help prevent the development of disease and co-morbid conditions. The focus of this paper is to discuss emerging issues regarding methods for developing and enhancing culturally appropriate prevention programs for rural African American elders.

### MARKETING A SINGLE POINT OF ENTRY SERVICE IN A RURAL COMMUNITY

R. Maiden, A. Rummel, *Psychology, Alfred University, Alfred, New York*

This paper reports on a business course, which congregated gerontology and marketing disciplines to solve a community-based problem: how to increase awareness of a single point of entry (SPE) agency for long-term care services. Fifteen undergraduates in marketing labored on solving this problem as part of the course's service-learning component. They were charged with going into the rural community in four groups to survey 100 participants each from four targeted sectors primarily composed of caregivers of different types of disabilities. The four targeted community groups had been preselected after the class interviewed a focus group of employees at the SPE agency, titled NYConnect. Based on the survey, the business students proposed changing the brand of NYConnect and developed a new marketing strategy, which was adopted.

### COMMUNITY AND HOUSEHOLD FOOD ENVIRONMENT: CHALLENGES TO FRUIT AND VEGETABLE INTAKE IN RURAL SENIORS

J. Sharkey, C. Johnson, W.R. Dean, *SRPH-TAMHSC, College Station, Texas*

The purpose of this study is to examine the challenges to fruit and vegetable intake faced by rural seniors. Data came from the 2006 Brazos Valley Health Assessment for 589 rural seniors (perceived food access, household food environment, and fruit/vegetable intake) and food store data from the 2006-2007 Brazos Valley Food Environment Project (objective measures of food access). Our analyses revealed that increased distance to the nearest supermarket, food store with a good variety of fresh and processed fruit, or food store with a good variety of fresh and processed vegetables was associated with decreased daily consumption of fruit and vegetables, after controlling for the influence of individual characteristics and perceptions of community and home food resources. Findings suggest that interventions designed to increase fruit and vegetable consumption among rural seniors should consider strategies to ameliorate differential access to healthy food due to food store distance.

### HEALTH CARE ACCESS CHALLENGES FOR ELDERLY LIVING IN RURAL COMMUNITIES

V. Call, L. Erickson, *Brigham Young University, Provo, Utah*

A major challenge facing the elderly living in rural communities is the substantial decline in rural health care infrastructures (Morton, 2003). Rural elderly have difficulty accessing primary care and obtaining specialized services. This study examines patterns of health care usage relative to service options, reasons for health care choices, and the evaluation of service quality by rural elderly residents. Data come from the 2008 Rural Utah Community study (24 rural communities, n=1,282). Perceived access to primary care varied with the level of medical services in the rural community but the choice to stay or leave their community for services is mitigated by the distance to urban areas with more extensive services. Only 43% of rural residents use local primary care. Most left their community for specialized care (92%). Veterans have different use and travel patterns. The policy implications for access to quality health care by rural elderly are discussed.

## SESSION 1120 (SYMPOSIUM)

### HEALTH AND AGING POLICY FELLOWS: LESSONS LEARNED

Chair: *G.A. Hinrichsen, Office of Mental Health Services, Dept. of Veterans Affairs, New York, New York*

Discussant: *B.W. Lindberg, Gerontological Society of America, Washington, District of Columbia*

The Health and Aging Policy Fellowship Program offers gerontological professionals 9-12 month residential and non-residential opportunities to participate directly in the policy making process. In this symposium, the inaugural class of fellows will discuss policy initiatives on which they worked during the fellowship year, offer insights into the policy making process, and provide concrete recommendations to gerontological researchers and practitioners about ways to advance public policy and aging. Presentations will primarily focus on the United States Senate where most of the fellows had placements in Senate personal offices or committees or partnered with personal offices. Fellows worked on a wide range of aging-relevant policy issues including health care reform, long-term care, end-of-life, mental health, Medicaid, the geriatric workforce, and community-based services. Observations about the legislative and policy process include the structure and dynamics of Senate offices and committees, formal pathways to influencing policy, and informal "less visible" processes by which policy initiatives are developed. Recommendations for advancing the aging policy agenda include specific ways by which gerontologists can establish productive and mutually beneficial relationships with legislative staff and the means by which gerontologists can partner with local, state, and national professional and advocacy organizations.

### "ALL POLITICS ARE LOCAL" AND OTHER MAXIMS OF A WASHINGTON, DC FELLOWSHIP EXPERIENCE

G.E. Alkema, *The SCAN Foundation, Long Beach, California*

It has been said that aging is everybody's business. The deeper meaning and application of this motto to the policy process is substantial, especially since decisions are made regularly on age-related policies with little apparent connectedness to a gerontological perspective and the heterogeneity of older people whom such policies affect. Acknowledging a disconnect, this presentation will describe one gerontological fellow's perspective on ways to heighten the visibility of aging issues to legislators across policy platforms regardless of whether a particular policy appears to be "aging relevant." Several methods will be discussed including listening to legislators with a gerontological ear, connecting stated policy interests to an aging agenda, and emphasizing the value and relevance of local issues and relationships in federal policy making. The presentation will conclude by describing tangible ways that gerontologists within their area of expertise can raise awareness among policymakers on aging issues and their policy impacts.

### POSITIONING OURSELVES TO ENGAGE IN MUTUALLY PRODUCTIVE DISCUSSIONS OF AGING POLICY

K.G. Kietzman, *1. Partners in Care Foundation, San Fernando, California, 2. Health and Aging Policy Fellow, Washington, District of Columbia*

Establishing relationships with legislators and their staff is one important way in which gerontologists can begin to advance aging policy at the local, state, and national level. Working in the United States Senate as a Health and Aging Policy Fellow offered an exceptional opportunity to gain an insider's view of the types of communication that are best received and used by policy makers. The fellowship experience further revealed how the relationships developed between scholars, health and social service professionals, and legislators can become mutually productive and begin to bridge the silos represented by the oftentimes disparate worlds of academia, professional practice, and policy making. Through these collaborative relationships, members of the gerontological community will be better positioned to provide the expertise needed to demystify aging, to demonstrate its diversity and relevance across a wide array of social issues, and to maximize attention to aging within broader public policy debates.

### HEALTH INEQUALITIES: POLITICS AND POLICY IN THE LEGISLATIVE PROCESS

T.P. Miles, *Kent School of Social Work, University of Louisville, Louisville, Kentucky*

This presentation examines the politics surrounding development of policy designed to address health inequalities. New legislation evolves through a consensus process. This process begins with need and only progresses if there is sufficient political will. If this progression takes place in an atmosphere of harmony, then the process of implementation begins with united political will. On the other hand, legislation formed via a contentious route will meet with opposition at each stage of its implementation. Legislation reforming the U.S. health care markets was crafted in a politically polarized atmosphere. Any potential that this legislation has to reduce health disparities will be influenced by this larger societal argument over the process of policy development. In this speculative discussion, we examine political discord and its impact on implementation of policy designed to reduce or eliminate health inequalities.

### CREATING AND MAINTAINING RELATIONSHIPS ON THE FEDERAL AND STATE LEVEL

J.T. Zerzan, *1. General Internal Medicine, University of Colorado Denver, Aurora, Colorado, 2. Colorado Department of Health Care Policy and Financing, Denver, Colorado*

Working with local groups and finding new organizational partners to create a collaborative network can enhance your policy impact. As a non-residential fellow, I worked a few days a month in a Washington, DC Senate office, and since fellowship now work in Colorado Medicaid. Seeing both the federal and state views of health care reform have highlighted the different perspectives in health care financing and delivery and different approaches to policy in each venue. It is striking to note the gaps in federal and state program communication and coordination of benefits for Medicare and Medicaid. By working with a network of local groups, your local and national audience and policy impact are increased. Finding areas of policy overlap and ideas that can build on each other moves gerontological policy issues forward. In addition, these relationships help encourage the creative process of advocacy, sustain energy, and increase satisfaction.

### CONNECTION POWER INFLUENCING HEALTH WORKFORCE POLICY FOR THE AGED

E.J. Bragg, *Public Health Sciences, University of Cincinnati, Cincinnati, Ohio*

As a non-residential fellow, one does not have positional power, i.e., a placement in a congressional office. You are a hidden participant in the policy process. Therefore, it becomes very important to develop connections and to build reciprocal relationships so that in the future you are considered as a resource of information and new knowledge. Being an active member of the Gerontological Society of American or the American Geriatrics Society's policy committees not only allows you to review and comment on proposed bills or regulations, but educates you even more about the political processes and gives you opportunities to build credibility. Volunteering to be a contact for these organizations when they get questions from reporters is another way. This volunteer work may lead to being involved in the organization's "Hill Lobbying Day". Another avenue is to connect with other fellows who are working [or have worked] on congressional staff, government entities, or organizations.

## SESSION 1125 (SYMPOSIUM)

### HEALTH INFORMATION TECHNOLOGY (HIT) IN NURSING HOMES

Chair: *H.B. Degenholtz, University of Pittsburgh, Pittsburgh, Pennsylvania*

Co-Chair: *A.L. Resnick, University of Pittsburgh, Pittsburgh, Pennsylvania*

This panel will present new research findings from an innovative, national study of the availability and use of HIT. Previous studies of HIT adoption reports on generic technologies, such as 'electronic medical records.' Our approach has been to develop a very granular model of the ways that HIT can be used to support decision- making and quality improvement for specific clinical conditions. Our focus has been on the nursing home setting; an oft overlooked component of the health care system from the perspective of HIT. There are major gains to be had from greater and more effective use of HIT in nursing homes with regard to improving quality and efficiency. In addition, nursing home HIT is not just about interoperability with acute and ambulatory care; even though transitions to and from the nursing home are high risk events that can be improved with better and more timely information, there must be processes for that information to be used internally by the nursing home. Finally, nursing homes offer an excellent 'laboratory' to study organizational factors such as culture and leadership related to successful adoption and implementation of HIT. The panelists will present qualitative and quantitative data from multiple perspectives that address the current state of adoption, barriers to further adoption, and potential benefits and costs. Data on the use of HIT were collected from professionals (medical directors, consultant pharmacists, and advance practitioners) who are not necessarily employed by facilities, as well as nursing home administrators, directors of nursing and front-line staff.

### THE HEALTH INFORMATION TECHNOLOGY SOFTWARE MARKETPLACE

H.B. Degenholtz, M.K. Lin, S.M. Handler, A.L. Resnick, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Research Objective: The goal of this study was to characterize the HIT market for nursing homes. We analyzed the vendor landscape, market dynamics, vendor motivations, and perceived adoption barriers. Study Design: Four methods were used: (1) A thorough review of content from vendor and industry websites including product collateral and customer case studies; (2) Secondary analysis of published reports in industry journals; (3) In-depth, open-ended interviews with 17 vendors, consultant, and experts across 12 organizations; and (4) A quantitative survey of software vendor representatives to rate barriers to adoption. Population Studied: Primary population was software vendors in the nursing home HIT marketplace. Secondarily, we studied consultants who advise purchasers and industry experts. Principal Findings: The HIT landscape is crowded with many vendors and lack of a clear market share leader. There is no trusted 3rd party that can validate vendor claims about their customer base. Vendors are not meaningfully differentiated on capabilities or focus. Advantages and limitations of products are not readily apparent in vendor marketing materials. HIT software for nursing homes shows signs of being an immature technology at an early stage of adoption. Conclusions: While there are some signs of maturation in the marketplace, vendors report a number of barriers to further adoption. Our quantitative findings suggest that assistance with purchasing decisions and implementation are key factors, rather than mandates or proof of return on investment. Implications for Policy, Delivery or Practice: Many software vendors are hesitant in the face of regulatory uncertainty, however, purchasing is delayed more by organizational factors than the lack of a clear mandate. Policy makers should focus on supporting purchasing decisions and transition costs of implementation.

### DEVELOPING A FRAMEWORK FOR UNDERSTANDING USE OF HIT IN NURSING HOMES

S.M. Handler, H.B. Degenholtz, M.K. Lin, A.L. Resnick*, University of Pittsburgh, Pittsburgh, Pennsylvania*

Research Objective: The goal of this study was to identify care processes that could benefit from HIT. Study Design: We used the Nominal Group Technique (NGT); a highly structured method designed to generate and rank order concepts. All participants responded to the same question, "What care process could benefit from the use of HIT?" Answers were reviewed, coded, categorized and combined to create a conceptual framework. Population Studied: Sessions were held with: medical directors, consultant pharmacists, advance practitioners, nursing home administrators, directors of nursing, and certified nurse aides. Principal Findings: A total of 144 comments were recorded, and coded into 330 distinct 'uses' of HIT; 236 were ranked in the 'top ten' priority. The study team combined concepts based on an iterative consensus process. Cross-cutting uses of HIT that emerged were: knowledge management, operations, and infrastructure needs. Care process domains included: hand-off communication, medication use process, clinical documentation, QI, regulatory functions, and transferring data. Clinical areas that can be affected by HIT are: skin care, falls, nutrition and hydration, infections, changes in physical and behavioral status, and continence. Conclusions: Participants identified a large number of specific uses of HIT that do not fit into traditional product categories. Participants see the potential for HIT to improve the efficiency and effectiveness of their work, and expect a lot from technology. Implications for Policy, Delivery or Practice: We need to move beyond discussion of 'EMR' or 'order-entry systems' and address how front-line clinicians envision using HIT.

### IMPLEMENTING HEALTH INFORMATION TECHNOLOGY IN US NURSING HOMES: A REPORT ON CHANGE MANAGEMENT

M.K. Lin, S.M. Handler, H.B. Degenholtz, A.L. Resnick*, University of Pittsburgh, Pittsburgh, Pennsylvania*

We surveyed a sample of health care professionals located in 12 states using professional association membership criteria. Our final sample consists of 423 professionals working in a nursing home setting. Using Roger's (1962) stages of innovation model, one-third of our sample indicated that the primary nursing home in which they work is in the "agenda-setting" stage of technology adoption. This stage is characterized by an active search for HIT solutions to clinical challenges confronting the nursing home. Only 8.5% indicate their facility is in the "routinizing" stage. Although two-thirds of respondents indicate that administration is the primary driver behind the adoption of HIT solutions, our results suggest that senior leadership has not facilitated on-going efforts to implement technology. Given the limited progress towards routine use of HIT solutions, our study identifies reasons why implementation across most nursing homes is still in the agenda-setting, matching, or restructuring stages.

### IMPLEMENTING HEALTH INFORMATION TECHNOLOGY IN US NURSING HOMES: A REPORT ON ADOPTION AND USE

H.B. Degenholtz, M.K. Lin, S.M. Handler, A.L. Resnick*, University of Pittsburgh, Pittsburgh, Pennsylvania*

We surveyed health care professionals (n=423) and administrators (n=154) in 12 states regarding the availability and use of HIT for specific clinical care processes. Approximately 33% of professionals and 20% of administrators indicated that they cannot identify either trends or individuals at risk for infections, falls, poor nutrition, behavioral problems, or functional decline; about 40% indicate that their facility cannot generate alerts or reminders for those clinical areas. A majority indicate that their facility either lacks functionality, or does not use HIT, for messaging, identification of orders contrary to advance directives, or point-of-care charting. Nearly 40% of professionals, but only 25% of administrators, indicated their HIT system generates warnings about potential adverse drug reactions; use of HIT for other aspects of the medication use process was limited. We found that a range of HIT features are available, however, there is a significant gap between the potential and reality of HIT.

## SESSION 1130 (POSTER)

## MENTAL, PHYSICAL, FUNCTIONAL HEALTH

### ASSESSMENT FOR CAREGIVER NEGLECT: WHAT CAN WE LEARN FROM ADULT PROTECTIVE SERVICES CASE NARRATIVES?

J.S. Ernst*, Dept. of Sociology and Social Work, Hood College, Frederick, Maryland*

Elder neglect is the most common and least understood type of elder mistreatment reported to Adult Protective Services (APS). Victims of neglect are often hidden and embedded in complex circumstances that may include dependent adult offspring, limited resources for long term care, caregivers with poor health, inadequate support, and reluctance to engage with outside health and social service agencies. This qualitative content analysis of APS records sought to characterize risk factors for neglect by caregivers. Using a risk and vulnerability framework, the author developed a list of codes that related to vulnerabilities of older adults, and risk factors characteristic of caregivers, the family context, and the wider social context. The author and a trained research assistant coded the opening and closing summaries and risk assessment reports for each case; differences were resolved through discussion. The coded passages were categorized, grouped, and summarized. Common themes that emerged related to the older adults' vulnerabilities and the risks connected to the caregivers and to their physical and social environments. The 23 older adults (mean age 82; 59% female) shared characteristics of medical frailty (including chronic conditions such as congestive heart failure, diabetes, and arthritis), functional limitations, and dementia. The caregivers (28% spouses, 28% adult children, 42% other) also had numerous health and psychiatric problems. Environmental and social network stressors included factors related to transitions in care including family disagreements over caregiving, financial needs that kept the vulnerable adult alone while caregivers went to work, lack of appropriate community supports, and housing needs.

### AGING OF DOMESTIC VIOLENCE (DV) IN JAPAN: AN EXPLORATORY STUDY OF DV VICTIMS WHO ARE GETTING OLDER

T. Tatara, A. Katsumata*, Shukutoku University, Urayasu, Chiba, Japan*

According to anecdots discussed among practicing professionals in the fields of domestic violence and elder abuse, it is evident that domestic violence (DV) is aging in Japan. For example, DV counselors report that therre has been an increase in the number of middle age victims of DV seeking assistancer. Recently, this author watched a presentation of an elder abuse expert who stated that nearly 20% of the elder abuse victims last year in a middle-sized city outside Tokyo had been DV victims who got older. There are more stories like these everywhere, lately. Given this sort of background, this author and his assistant started the nation's first exploratory study of the aging of DV in October 2009. The objectives of the study are three, but the space is here to present only one, which is to find out about the changes in the nature and extent of abuse as DV gets older. The data have been gathered from victims of DV participating in varous counseling programs across the country, and data collection is still continuing. An interim report shows that the median age of DV victims (N=90)is 52.0, and most of the survey respondents

(87.6%) stated that the resolution of DV problems will become much harder as victims and abusers get older. In this presentation, there will be a full discussion of the study's findings, along with a review of the data from of the U.S. National Resource Center on Abuse in Later Life.

### HOW DO SELF-DIRECTED PARTICIPANTS USE THE ARTHRITIS FOUNDATION WALK WITH EASE PROGRAM?

M. Altpeter[1,2], B. Schoster[2], A. Meier[2], B. Charnock[2], L. Houenou[2], L. Callahan[2], *1. Institute on Aging, UNC at Chapel Hill, Chapel Hill, North Carolina, 2. UNC Thurston Arthritis Research Center, Chapel Hill, North Carolina*

In 2008, we revised the six-week Arthritis Foundation Walk With Ease (WWE) program and offered it to diverse adults with arthritis in two delivery formats: instructor-led group and self-directed. To identify rates of adherence among self-directed participants, we examined the extent to which they used their WWE workbooks and complied with the recommended program schedule. A total of 276 participants self-selected at baseline for the self-directed format. A post-WWE program satisfaction survey was administered, with an 83% follow-up rate. About 80% of self-directed participants reported reading at least some of their workbooks; of which 42% skimmed sections, 16% read chapters out of order, and 25% read the chapters in order. Nearly half (46%) reported not using any of the self-assessment or motivational tools and about 40% did not use the walking diary. Of those who used these tools: 39% used the starting point self-test; 28% use the knowledge and self-confidence self-checks at the end of each chapter; 36% used the diary to record times/distances walked, 26% used it for motivation and 13% to record challenges. Between 30-40% did not follow the prescribed exercises or walking schedule. Despite wide variation in self-directed use of the workbook and exercise activity, 38% reported overall that the workbook was very helpful, and between 80 - 90% reported that they learned about exercising safely and comfortably with arthritis, how to become and stay motivated, and how to address challenges. Overall, 87% of self-directed participants reported benefitting from their participation in the WWE program.

### COMPARING THE GROUP VERSUS INDEPENDENT FORMAT OF THE ARTHRITIS FOUNDATION WALK WITH EASE PROGRAM: DO BOTH FORMATS WORK?

M. Altpeter[1], B. Schoster[2], J. Shreffler[2], K.R. Martin[2], L. Houenou[2], J.M. Hootman[3], L. Callahan[2], *1. Institute on Aging, UNC at Chapel Hill, Chapel Hill, North Carolina, 2. UNC Thurston Arthritis Research Center, Chapel Hill, North Carolina, 3. CDC Arthritis Program, Atlanta, Georgia*

A quasi-experimental pretest-posttest evaluation of the revised 6 week the Arthritis Foundation Walk With Ease (WWE) program was conducted in 468 individuals with self-reported arthritis from 27 urban and rural communities. Participants selected either instructor-led group (n=192) or self-directed (n=276) formats. Baseline and post-WWE program assessments were administered, with 93% group and 83% self-directed participant follow-up rates. Adjusted mean outcome values for the group and self-directed participants posttest were determined using regression models, adjusting for baseline outcome, age, gender, race, and education. Effect sizes (ES) and 95% confidence intervals (CI) were computed. Self-directed participants were on average younger, better educated, in better health and performed better on functional tests than their group counterparts. For both delivery formats, significant adjusted mean improvements ($p<0.05$) were seen for all of the self-report and performance measures, except for arthritis self-efficacy (ASE) and the 2 min step; moderate effects were also seen for disability, pain, fatigue, stiffness and helpfulness; and self-efficacy (SE) scales had modest improvements as did performance measures; ES ranged from .09 to .39. There were no significant differences in the outcomes between the two groups. The AF's revised WWE program appears to decrease disability and improve arthritis symptoms, self-efficacy and perceived control, balance, strength, and walking pace in individuals with self-reported arthritis regardless of whether they are taking an instructor-led group class or doing the program on their own as self-directed walkers.

### NUTRITION STATUS IN A VETERANS' SETTING: A PILOT STUDY

A. Boström[1], D. Van Soest[2], B.K. Kolewaski[2], D.L. Milke[2,1], C. Estabrooks[1], *1. Faculty of Nursing, University of Alberta, Edmonton, Alberta, Canada, 2. CapitalCare Edmonton Area, Edmonton, Alberta, Canada*

Background: Many European studies have showed that older persons living in long term care (LTC) are at risk for malnutrition. Objectives: To examine the nutrition status of elders living in a LTC facility for Canadian Veterans, to explore determinants of malnutrition, and to compare the nutrition status with the results of LTC settings in Europe. Methods: The study sample consisted of 55 elders (response rate 53%). Mean age was 86.5 years for the 50 men and 88.4 years for the five women. The Mini Nutritional Assessment (MNA) tool (18 items) was used to examine the nutrition status, and selected items and scales from the MDS 2.0 substituted 10 MNA items. Data were analysed using descriptive statistics and regression models. Results: The assessment found 6 (11%) elders to be well nourished, 32 (58%) at risk for malnutrition, and 17 (31%) to be malnourished. Malnutrition were associated with depression ($p=0.002$), instability in health ($p=0.004$), and cognitive function ($p=0.010$). Conclusion: Like the LTC settings in Europe that use the MNA for nutrition assessment, the majority of elders in the Canadian facility were found to be at risk or actually malnourished. Staff and managers need to pay extra attention to residents with depression and dementia, and those who have an unstable health condition. There is a substantial knowledge base on interventions to prevent malnutrition (modifying food, assistance during meals and environmental factors), but research is needed on methods of knowledge translation for nutrition interventions that would succeed in putting these into practice in LTC.

### PATIENT PAIN FOLLOWING IN-PATIENT PALLIATIVE CARE CONSULTS: THE IMPORTANCE OF CONTINUED CARE

J.R. Laguna[1], E. Vesper[2], P. Jamison[2], S. Enguidanos[1], *1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Kaiser Permanente, Downey, California*

The efficacy of inpatient palliative care (IPC) teams in the management of pain symptoms of seriously ill hospitalized patients has been well documented (Ciemins, Blum, Nunley, Lasher, Newman, 2007; O'Mahony, Blank, Zallman, Selwyn, 2005; Jack, Hillier, Williams, & Oldham, 2003). However, little is known about patient pain-levels following IPC consultations after hospital discharge. This study examines pain levels among 130 managed care patients, ages 65 years or older, receiving IPC consults and subsequently discharged from the hospital. Patients were asked to rate their level of pain on a scale from zero ("no pain") to ten ("excruciating pain") at five different times (prior to IPC consult, 2 and 24 hours following consult, at hospital discharge, and 10 days post discharge). Results indicate that while study participants experienced a decrease in pain levels across the first four measurement points during hospitalization (mean pain change from admission to discharge = -0.94, SD=2.18; t=9.91, $p<.001$), participant pain levels increased significantly following discharge (mean pain change from discharge to 10 days = 1.72, SD=2.74; t=7.91, $p<.001$). Additionally, factors associated with higher post-discharge pain levels are also discussed. While this research confirms the efficacy of IPC teams in managing pain within the hospital setting, it also illuminates the need for more effective pain management following hospital discharge. Future research should focus on improving transitions in care settings and continuity of care to address gaps associated with the episodic nature of inpatient palliative care programs.

## THE INTERACTION OF AGING, THE MASCULINE GENDER SCRIPT, AND MALE HEALTH BEHAVIORS

T.L. Peak, J. Gast, *Social Work Program, Utah State University, Logan, Utah*

After over a decade of focus on women's health, the time has come to attend to the health needs of men. Men have become both an underserved and a difficult-to-serve population and there is growing recognition that male gender is now a health disparity that merits a public health response. More research in the area of men's health is needed for a number of reasons. First, on average, men die six years younger than women (US DHHS, 2000). Second, as compared with women, mortality rates for men (and boys) from the top 15 causes of death (except Alzheimer's disease) in the United States are higher (US DHHS, 2000). Also, men tend to seek out health care and preventive health services significantly less often than women (Courtenay, 2003). Masculine gender scripts may be an important factor in the differential response by men to health issues. Few studies have examined how masculine gender scripts impact men's health promotion behaviors and attitudes, especially as men age. The masculine script may be challenged when men can no longer ignore physical decline due to the aging process. Our study used focus group methodology with four diverse groups of white men (N=32) to explore if and/or how men adapted the masculine gender script related to aging. In our qualitative results, we found that men did change their gender scripts based in aging-related experiences. Acknowledging and accommodating the effects of masculine gender scripts in future social work practice with men may help decrease the disparities in men's health outcomes.

## FIT AND STRONG!: BOLSTERING MAINTENANCE OF PHYSICAL ACTIVITY AMONG OLDER ADULTS WITH LOWER-EXTREMITY OSTEOARTHRITIS

S.L. Hughes[1], R. Seymour[1], R. Campbell[1], P. Desai[1], G. Huber[2], H. Chang[3], *1. Center for Research on Health and Aging, University of Illinois Chicago, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois, 3. JAMA, Chicago, Illinois*

Little is known about effective ways of motivating older adults to maintain physical activity after a formal training program ends. Fit and Strong! is an award winning, evidence-based multiple-component physical activity/ behavior change program for older adults with osteoarthritis. This study used a multi-site comparative effectiveness trial (N=486) with repeated measures to compare the impact of negotiated vs. mainstreamed follow-up with and without telephone reinforcement (TR) on maintenance of physical activity (PA) after the 8-week Fit and Strong! program ended. Random effects analyses for the total sample showed significant improvements at 2,6,12, and 18 months on PA maintenance that were accompanied by decreased lower-extremity (LE) pain and stiffness, improved LE function, sit-stand, and 6-minute distance walk and decreased anxiety and anxiety/depression. Analyses by treatment condition showed that persons in the negotiated group who received TR maintained a 21% increase in caloric expenditures over baseline, with lesser benefits seen in the mainstreamed with TR, negotiated only, and mainstreamed only groups. Significant benefits of telephone dose were also seen on lower-extremity joint stiffness, pain, and function as well as anxiety and anxiety/depression. The negotiated follow-up contract that Fit and Strong! uses, bolstered by TR, is associated with enhanced long-term PA maintenance and associated health outcomes. While TR was effective, it is not inexpensive, which may impede its translation and dissemination into community-based settings. Other forms of reinforcement, like participant and instructor videos will also be important to test if we are to maximize the successful translation of evidence-based programs in the future.

## POLYPHARMACY PREDICTS MINI MENTAL STATE EXAM DECLINE OVER 12 YEARS: DATA FROM THE HISPANIC EPESE

R.F. Palmer[1], C. Mouton[2], D. Royall[1], K. Markides[3], D. Espino[1], *1. Family & Community Medicine, University of Texas Health Science Center at San Antonio, San Antonio, Texas, 2. Howard University - College of Medicine, Department of Community Health and Family Practice, Washington DC, District of Columbia, 3. Univesity of Texas Medical Branch- Sealy Center on Aging -Preventative Medicine & Community Health, Galveston, Texas*

Objective: To evaluate the impact of multiple medication use on Mini Mental State Exam (MMSE) scores over five waves (12 years) of the Hispanic EPESE study. Participants: 3050 older Mexican Americans from the southwestern states of Texas, New Mexico, Arizona, Colorado and California were followed over five waves (1993-94, 1995-96, 1998-99, 2000-01, 2004-05). Measurements & Analysis: Analytic variables included age, gender, socio economic status- education and annual household income, native vs. foreign born, body mass index, total CES-D score, total MMSE score, hypertension, diabetes, Beer's inappropriate medication use, potential major drug-drug interactions and polypharmacy (≥5 drugs). Structural equation modeling was used to assess change over time in cognitive function with the aforementioned predictors. Results: Average baseline MMSE scores were 25.4, with an average decline of 0.64 MMSE points per year. There was also significant variation around these averages. After adjusting for relevant covariates, polypharmacy was an independent predictor of the MMSE rate of change, accounting for 6.5 percent of the total variability in MMSE rate of change over 12 years. Inappropriate drug use and drug interactions were not significant predictors. Compared to those who did not classify as having polypharmacy, those who did had significantly worse decline in cognitive function over the 12 year period. Conclusions: Among older Mexican Americans in this sample, polypharmacy is a significant predictor of decline in MMSE scores over 12 years. Further studies are needed to determine if specific medication classes are contributing disproportionally to this decline. Key Words: polypharmacy, elderly, Mexican-American.

## EXERCISE INTERVENTIONS TO IMPROVE BALANCE AMONG COMMUNITY-DWELLING OLDER ADULTS: A SYSTEMATIC REVIEW

P. Allen, W. Auslander, *The George Warren Brown School of Social Work, Washington University in St. Louis, St. Louis, Missouri*

Background. Clinical trials in controlled settings have shown exercise interventions to be efficacious in improving balance among older adults, yet less is known about the effectiveness of such interventions in real world settings. To address this gap, this study will ask what types of interventions are most effective, delivered in which settings and by whom? Methods. A systematic review was conducted of studies published July 2007 through April 2009 that tested effectiveness of exercise interventions to improve balance in community-dwelling adults aged 60 and over with or without a fall in the past year. Studies published prior to July 2007 had been reviewed elsewhere. A methodological quality rating scale (MQRS) was used to rate the rigor of the studies, and outcomes were evaluated and summarized with an outcome attainment scale. Results. Fourteen studies met inclusion criteria, 12 were RCTs and 2 used quasi-experimental designs. Interventions lasting 6-weeks to 6-months included balance exercises only, or combinations of walking, leg strengthening, and balance exercises. The median MQRS score was 10, out of a possible range of 0 to 17 (rigorous methods) and actual scores of 5 to 15. Outcome balance measures varied, so no pooled effect sizes were calculated. Evidence of effectiveness was stronger for community-based supervised group exercise interventions than unsupervised home-based exercise. Interventions with trained non-licensed interventionists were as effective as those delivered by licensed personnel. Conclusions. Combination community-based group exercise sessions led by trained non-licensed personnel may be promising and cost effective to improve balance among older adults.

### THE ROLE OF SOCIAL SUPPORT AND BUILT ENVIRONMENT IN THE PATHWAY FROM FUNCTIONAL LIMITATION TO DISABILITY AMONG THE ELDERLY

Y.H. Yeo, *UNC-CH, Chapel Hill, North Carolina*

Verbruge and Jette's disablement process model posits that disability (the gap between individual capacity and the role expected in society) is different from functional limitation (individual capacity) with highlighting several important internal/external factors impacting on disability. Although there are many studies examining the role of internal individual factors (i.e., SES, race) in the disablement process model, there are limited studies focusing on external individual factors using a national representative sample of the elderly in the U.S. Using the core and topical module of 2004 SIPP wave 5, this study investigates the role of two important external individual factors, social support and built environment in the pathway from functional limitation to disability among the elderly aged 65 and older (N=12,248). This study employs zero-inflated count models to predict disability (a composite score of ADLs and IADLs). Independent variables include functional limitation (Nagi scores), social support (expectations to get help from friends, family, and others), built environment (housing satisfaction, and neighborhood satisfaction), and a set of demographics (i.e., race, age, income, marital status, education, metro residency). This study finds that social support ($p<.01$) and built environment ($p<.05$) are significant predictors of disability after controlling for functional limitation. There are also significant interactions between functional limitation and built environment ($p<.05$). The findings imply that disability among the elderly is explained not only by individual capacity but also by social supports and built environments. Further the effect of individual capacity to disability differs by the level of built environemnt.

### OLDER ADULTS AND SUBSTANCE ABUSE: PREPARING SOCIAL WORK STUDENTS FOR PRACTICE

I.A. Gutheil, J.C. Heyman, M. Hanson, L. White-Ryan, *Graduate School of Social Service, Fordham University, West Harrison, New York*

Substance abuse disorders among older adults are projected to double by 2020. Social workers need the knowledge and skills to address this growing concern. Increasingly, researchers have used narratives to help convey the lived experiences of individuals to teach students. This study developed educational vignettes from oral histories of older adults with current or past substance abuse problems to teach social work students about older adults and substance abuse. A vignette and related teaching materials were used in one session of a 15-week course on substance abuse offered several times over three semesters. A pre-test post-test design evaluated the impact of using this educational material on MSW students' knowledge and self-rated competency related to older adults and substance abuse (N=120). A repeated measure MANOVA showed a significant improvement in students' knowledge and competency between pre and post-test. It was striking that one class session was able to make a substantial difference. Implications for preparing students to work with older adults with substance abuse concerns will be addressed.

### DYING AT HOME: A CONCEPTUAL FRAMEWORK

S. Lysaght, M. Ersek, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Most older Americans express a strong preference for dying at home. Hospice services have long promoted this goal. However, recent dramatic increases in hospice inpatient facilities suggest that dying at home is a concept needing re-clarification. The purpose of this concept analysis was to develop a literature-based definition of the concept dying at home and to construct a preliminary conceptual framework which could be used to guide further research. The method used was Walker and Avant's (2005) eight-step iterative methodology. In addition to lexicon-derived definitions, 168 articles were identified through a search of three electronic databases. A total of 35 articles were analyzed to derive the final framework. Antecedents identified include adequate resources, physical location of care, patient preference, caregiver preference, and awareness of prognosis. Essential attributes of dying at home include caregiver support, a time-limited course, access to symptom management, and feeling "at home". The consequences include transitions, intensity of care, caregiver health, and place of death. There are complicated patient and caregiver meanings around the experience of dying at home that encourage a more cautious view of dying at home as a gold standard. Clinically relevant research in this area calls for a better understanding of needs, appropriateness, and evaluation of the role of dying at home in patient and caregiver outcomes.

### EXPLORING THE HOSPICE DECISION

D. Waldrop, *School of Social Work, University at Buffalo, Buffalo, New York*

Hospices provide comprehensive, high quality care that eases suffering when curative treatment has ended and death is anticipated within 6 months. However, most hospice admissions occur only during the final days of a terminal illness and 30% of all patients die within 7 days of admission. Understanding the factors that influence the decision to elect hospice is a priority in the field of end-of-life and palliative care. The purpose of the study was to investigate the factors that contribute to the decision to enter hospice care and the timing of that decision. In-depth interviews were conducted with hospice patients and their caregivers (N=64 families). Participants were contacted after they had been in hospice home care for 2 weeks, demonstrated a Palliative Performance Scale Score (PPS) of >40 and remained at home. The purpose for this selection strategy was to gather participants' perspectives in "real time." Interviews were audiotaped, transcribed and coded to identify emergent themes. The results indicate clear differences in decision-making by diagnosis (cancer vs. other [e.g. COPD, CHF]). In addition, specific physical and functional changes become triggers for hospice admission (e.g. increased care needs; symptom exacerbations [pain, shortness of breath]). The decision to enter hospice was made differentially. Decision-makers included: (a) the physician, (b) the family with or without the physician's approval and (c) the patient. Key factors in the decision process were: (a) previous experience with hospice, (b) learning about hospice through "word of mouth", and (c) the desire no further hospitalizations.

### SOCIAL WORKERS' INVOLVEMENT IN END-OF-LIFE PLANNING AND ETHICAL DILEMMAS

I.A. Gutheil, J.C. Heyman, M. Morrissey, *Graduate Social Service, Fordham University, West Harrison, New York*

Social workers often play an important role in meeting the needs of individuals and their families around end-of-life planning. This research used a correlational, cross-sectional design to ascertain social workers' professional experiences in end-of-life planning and related ethical issues. A mailed survey was sent to 2,000 National Association of Social Workers members: 1,000 in the fields of health and aging; and 1,000 in other than health and aging. Of the social workers who responded from the health and aging fields (n=495), 56.2% indicated they were involved in end-of-life planning. Of those from other than health and aging (n=329), 19.8% indicated they were involved in end-of-life planning. For social workers who indicated they were involved in end-of-life planning, 73.7% stated that they often help facilitate discussions about the health care proxy between clients and their families, and 70.4% indicated they were involved in discussing health care proxies with clients. When asked what types of ethical dilemmas they were confronted with, frequently identified areas included: confusion or conflict because there is no health care proxy; no discussion has ever taken place regarding the patient's wishes between patient and family; disagreement between patient and family; question of competency of patient; and the lack of discussion between physicians and patient regarding patient's wishes. These issues underscore the importance of training social workers and other professionals on end-of-life planning and ethical issues. Implications for education based on this research will be discussed.

### STATE VARIATIONS IN PERCEIVED QUALITY OF DYING AMONG THOSE DYING FROM DEMENTIA

S. Kuo[1], J.M. Teno[1], J. Lima[1], S. Mitchell[2], P.L. Gozalo[1], *1. Community Health, Brown University, Providence, Rhode Island, 2. Harvard Medical School, Boston, Massachusetts*

Objective: To examine whether bereaved family members in states with lower rates of feeding tube insertions (FTI) perceived better quality of end-of-life care than those in states with higher rates. Methods: A mortality followback survey of bereaved family members of persons who died of dementia in five states with "low" (MA, MN) and "high" (AL, FL, TX) FTI was used. It included the Family Evaluation of Hospice Care Instrument to examine quality of dying in the last week of life (LWOL). Ordered logit models examined the state effect adjusting for age, gender, relationship of respondent, and hospice use on overall satisfaction with care and a composite measure of quality of care based on counts of unmet needs and concerns. Results: Among 531 respondents, 46% reported having at least one problem in the end-of-life process, and 11% reported having at least 4 (14% in MA,10% in MN, 12% in AL, 11% in FL, 7% in TX,). States with "low" FTI were more likely to report that care received in the LWOL was excellent (48% in MA, 55% in MN) compared to those with "high" rates (33% in AL, 37% in FL, 43% in TX). Family members of decedents from AL and FL were significantly more likely to report poorer overall satisfaction with care received compared to MN (ORs = 1.94 and 2.00, respectively). There were no statistically significant differences in the number of problems across states. Conclusions: Perceived quality of care was lower in states with higher FTI.

## SESSION 1135 (SYMPOSIUM)

### ESPO/SRPP SYMPOSIUM: PROGRAMMATIC APPROACHES TO HEALTHY AGING AND COMMUNITY LIVING

Chair: *K.L. Phillips, Program on Aging and Care, Scott & White, Temple, Texas*
Discussant: *T. Prohaska, University of Illinois, Chicago, Illinois*

Community-based health and social services can provide unique and valuable services to the growing number of older adults who seek to maximize their well being and quality of life while maintaining community living. These unique community-based interventions and programs are especially important in light of the aging population, which will create a high demand for cost effective, programmatic approaches to health promotion for older adults. According to the Centers for Disease Control and Prevention (2003), health interventions and programs are important not only to prevent rising health care cost, but they also aid in allowing seniors to remain independent for longer, improve their quality of life, and delay nursing home use. The purpose of this symposium is to present innovative interventions and programs that further the healthy aging agenda by promoting community living and healthy aging. Four areas critical to the health and well being of community dwelling older adults will be discussed: 1) nursing home diversion 2) caregiver support 3) health promotion and 4) a health aging coalition. Each presenter will highlight how their program been successful in promoting community living and preventing adverse health events among older populations. The symposium will conclude with the distinguished discussant providing a general overview of the benefit of these programs and offer some final suggestions for continuing to promote healthy aging and how a programmatic approach to community-based programs can impact the health of older adults and impact public policy.

### RETURNING HOME THROUGH ENHANCED NURSING HOME DISCHARGE PLANNING

K. Pillemer, R. Meador, E. Kahoe, *Cornell University, Ithaca, New York*

A substantial proportion of older people will spend time in a nursing home before they die. After admission, some residents stabilize, adjust limitations, and wish to return to their own homes. This presentation describes the evaluation of an enhanced discharge planning intervention, Project Home, which targeted current nursing home residents who wished to return to community living. Project Home staff worked intensively to transition clients to more independent settings while ensuring that their care needs were met through home health care, nutrition programs, adult day care, and other services. Findings highlighted deficits in social and community resources that prevented some clients from being discharged as well as successful strategies that were applied across cases. Cost data indicate the Project Home provided significant savings over nursing home care. Overall, the effectiveness of the intervention was due to in its unusually personalized and time-intensive approach to discharge planning and long-term follow-up.

### SCOTT AND WHITE'S FAMILY CAREGIVER PROGRAM: POSITIONING AN EVIDENCED-BASED INTERVENTION WITHIN AN INTEGRATED HEALTHCARE SYSTEM

A.B. Stevens, E. Smith, *Scott & White Healthcare, Temple, Texas*

The Scott & White Family Caregiver Program (SWFCP) addresses the need for an evidence-based intervention available to dementia caregivers within a healthcare system. The SWFCP program staff utilizes the unique benefits of an integrated healthcare system to electronically identify caregivers. Once a caregiver is identified, a brief risk assessment (REACH II RAM) is used to identify key areas in which components of the REACH II (Resources for Enhancing Alzheimer's Caregivers Health) intervention could be individually tailored and delivered via a "Caregiver Notebook" and telephone support. To date, 112 caregivers have been enrolled in the SWFCP. At the six-month follow-up point, significant decreases in caregiver burden, safety and care recipient problem behaviors were noted. Furthermore, a decrease in the overall RAM score was observed. Strategies used to translate and implement the intervention will be discussed.

### THE ATLANTA HEALTHY AGING COALITION: CRAFTING A REGIONAL APPROACH TO HEALTH & WELLNESS

J. Gill, *Atlanta Regional Commission, Atlanta, Georgia*

The Healthy Aging Coalition facilitated by ARC and established in 2009 and meets quarterly is comprised of thirty-five organizations dedicated to encouraging healthy lifestyles within the area of aging. Public health entities, hospitals, voluntary health and faith-based organizations, parks and recreation departments, universities, and aging services collaborate to create an exchange of information and mutual support. The coalition goal is to consolidate efforts and resources and to identify major initiatives of interest for strategy, design, implementation and evaluation. Cross-collaboration allows for the development of a regional health and wellness plan. The objectives of this presentation are to: 1)To foster regional advocacy and implementation of creative approaches to promoting preventative health services and access to healthcare; 2)To identify methods for establishing cross-collaboration to get to a regional approach; 3)To illustrate the role that non-traditional partners play within this partnership.

### OLDER ADULT VOLUNTEERING AS A PATH TOWARD HEALTHY AGING AND COMMUNITY LIVING: A REVIEW OF EXPERIENCE CORPSR BALTIMORE CITY

E.J. Tan[1], M. Carlson[1], T. Seeman[2], Q. Xue[1], L.P. Fried[4], E. Tanner[1], K.E. Whitfield[3], G. Rebok[1], *1. Johns Hopkins Center on Aging and Health, Baltimore, Maryland, 2. University of California, Los Angeles, California, 3. Duke University, Durham, North Carolina, 4. Mailman School of Public Health, Columbia University, New York, New York*

Objectives. We describe the potential of Experience CorpsR Baltimore City (EC) to promote physical activity in older adults through volunteer roles in the Baltimore City Public School System that were specifically designed to increase physical, cognitive and social activity. Methods. We review data showing that EC can increase physical activity among initially sedentary older African American volunteers at elevated risk for poor health outcomes. Results. The 1999-2000 pilot randomized, controlled trial provided initial evidence that EC can increase physical, as well as social and cognitive, activity. We additionally demonstrated that EC volunteers sustained increased physical activity levels relative to matched controls over a 3-year period. Conclusions. The ability to increase and sustain increased physical activity among older African Americans through generative service suggests a potential avenue for embedding physical activity interventions in volunteer programs.

# SESSION 1140 (PAPER)

## BIOLOGICAL SCIENCES PAPER SESSION I

### THE REPRODUCTIVE BIOLOGY OF PARENTS AFFECTS THEIR OFFSPRING'S MORTALITY

B.A. Carnes, *Geriatric Medicine, Univ of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

We use data from a breeding colony of laboratory mice to examine the effect of maternal age on the mortality risks of her offspring. Specifically, age at birth of litter affected all offspring while premature menopause only affected male offspring. When coupled with existing literature, these findings reveal a U-shaped mortality risk curve with elevated risks at either end of a Dam's age window of reproduction. These risks have grave implications for humans because our ingenuity has allowed us to effectively escape the environments that shaped our biology. As a result, culture progressively prolongs childhood and delays reproduction. Our findings, however, suggest that the mortality consequences of our reproductive biology may be far harder to escape.

### THE ASSOCIATION OF LENS TRANSPARENCY AND CATARACT WITH TELOMERE LENGTH IN OLDER ADULTS

J. Sanders[1], A. Iannaccone[2], R. Boudreau[1], Y. Conley[1], W. Hsueh[3], R.M. Cawthon[4], T. Harris[5], A.B. Newman[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Tennessee Health Science Center, Memphis, Tennessee, 3. University of California San Francisco, San Francisco, California, 4. University of Utah, Salt Lake City, Utah, 5. National Institute on Aging, Bethesda, Maryland*

Purpose: Lens transparency is a potential in vivo marker of primary aging that can be distinguished from diseases of the lens like cataract. To validate lens transparency as a marker of aging, we determined its association with leukocyte telomere length (TL). Methods: Participants included 2,750 community-dwelling older adults from the Health, Aging, and Body Composition Study in whom leukocyte TL was measured at baseline using qPCR. We determined the association between TL and prevalent cataract or nine-year incidence of cataract surgery, markers of lens disease. To assess primary lens aging, we conducted a cross-sectional sub-analysis of 259 Health ABC participants who had their lens transparency directly measured according to Age-Related Eye Disease Study (AREDS) criteria. Using AREDS grading, we stringently categorized successful lens aging as ≤3.0 nuclear grade and 0% cortical grade. Results: TL was unassociated with prevalent cataract or incident cataract surgery. In the transparency sub-study, the 6 individuals (2.3%) with successfully aged lenses had a mean TL of 5,700 basepairs. Individuals with >3.0 nuclear grade or >0% cortical grade had a mean TL of ~4,790 basepairs. Participants with a 1,000 basepair greater mean TL at baseline had more than a 50% reduced odds of any lens opacity (OR=0.47, 95% CI 0.22-1.02), any nuclear opacity (0.48, 0.22-1.03), or any cortical opacity (0.49, 0.23-1.05) after adjustment for age and gender. Conclusions: Lens transparency, but not cataract, might be associated with longer leukocyte TL. There should be further validation of lens transparency as an in vivo marker of biologic aging.

### ARE HUMAN BEINGS BIOLOGICALLY YOUNGER THAN BEFORE? A TWO-PROCESS VITALITY MODEL EXPLORES THE AGING TREND OVER THE PAST 200 YEARS

T. Li, J.J. Anderson, *Quantitative Ecology and Resource Management, University of Washington, Seattle, Washington*

A Remarkable Gain of Life Expectancy for Human Beings has been Observed over the Past 200 Years, Which Leads to a Fundamental Question that Whether the Mortality Decline Indicates a Slowing in Aging, Such that People Today Are Biologically Younger than in the Past, or an Improvement in Environmental Condition, Such that Deaths Are Delayed from Diseases and Other Stresses. We Investigate the Question by a Model which Describes Mortality through Two Processes: an Intrinsic Process Based on the Stochastic Loss of Survival Capacity (Vitality) to a Killing Boundary and an Extrinsic Process that Kills Individuals when the Intensity of External Random Challenges Exceeds the Vitality Level. This Model Expresses Mortality by the Interaction of the Two Processes and Provides a Quantitative Way to Separate the Contributions of Improved Senescence and Improved Environmental Conditions on Increasing Lifespan. Applying the Model to Period Survival Data from Sweden, Switzerland, France, Japan and the U.S Suggests a Long and Uninterrupted Decline in the Senescence Rate over the Past 200 Years. However, It also Suggests that Mortality Reductions in the First Half of the 20th Century were Dominated by Improved Environmental Conditions, While Reductions in the Second Half of the Century were Dominated by Intrinsic Improvements in Aging, i.e., the Rate of Loss of Vitality. The Model Further Implies that Recent Deviation from the Pattern of Mortality Compression or Survival Rectangularization was the Result of Stabilizing Environment Conditions and Thus Improvements in Longevity can be Mainly Attributed to Improvements in Senescence.

### SYSTEMIC GENETIC DETERMINANTS OF HEALTHY AGING AND EVOLUTIONARY SELECTION IN HUMANS

A. Kulminski, I. Culminskaya, S.V. Ukraintseva, K.G. Arbeev, A.I. Yashin, *Center for Population Health and Aging, Duke University, Durham, North Carolina*

Majority of current studies designed to unravel genetic predisposition to aging-related processes in humans focuses on a single trait of interest. This is not conceptually compelling strategy given that the aging phenotypes are of essentially systemic origin because of their connections with global changes in an aging organism. Furthermore, typically, genetic association studies disregard the role of evolution at the time scale of couple human generations. We focus on conceptually different (systemic) approach to unravel genetic predisposition to healthy aging phenotypes using phenotypic and genotyping data on about 9,300 Framingham Heart Study (FHS) participants from three successive generations. The proposed approach recognizes that multiple complex human phenotypes and their genetic determinants can be associated at higher (systemic) level of organismal organization. We report on discovery of remarkably strong and robust genetic effect on survival/longevity in a large sample of humans. This effect was so strong that after about 60 years of follow up of the FHS participants, virtually all (98.9%) carriers of minor allele of certain single nucleotide polymorphisms had died compared with only 24% of major-allele homozygotes. Although the minor-allele carriers were strongly predisposed to unhealthy life, health traits did not alter associations with survival/longevity implying connection of the discovered genetic effect to accelerated aging. Our findings explicitly document exceptional role of the systemic level of organismal organization in the process of human aging. Furthermore, we discuss connections of the systemic level of organismal organization with evolutionary selection as documented in the three successive generations of humans.

# SESSION 1145 (PAPER)

## BIOLOGICAL SCIENCES PAPER SESSION II

### VITAMIN D SUPPLEMENTATION REDUCES BLOOD PRESSURE IN THE ELDERLY AND THIS IS MODIFIED BY FRAILTY

H. Florez[1,3,2], A. Apaza[2,1], A. Sosa-Melo[2,1], B.R. Troen[1,3,2], E. Cherniack[3,1,2], S. Levis[1,3,2], B.A. Roos[1,3,2], *1. University of Miami Miller School of Medicine, Miami, Florida, 2. Jackson Memorial Hospital, Miami, Florida, 3. Bruce W. Carter VA, Miami, Florida*

Low vitamin D is associated with cardiovascular disease(CVD) and frailty. To assess the effect of cholecalciferol (D3) treatment on blood pressure(BP), we evaluated 59 subjects (ages 59-92, 81% women) at study entry and after 6-months of daily treatment with D3 (400IU vs. 2000IU). At baseline, 33% had low 25-hydroxy-vitamin D(25OHD) levels (<30ng/ml) while 56% had frailty grip(Fried 2001). Baseline systolic BP was higher in those with low compared to those with normal 25OHD levels (141±3.4mmHg vs. 132.1±2.5mmHg, p<0.05), while diastolic BP was not significantly different (78.9±1.6mmHg vs. 75.9±1.2mmHg, p=0.15). Similar reductions were observed at 6 months in both D3 groups (400IUvs.2000IU): -11.7±3.3mmHg vs.-10.2± 2.8 mmHg, for systolic BP(p=0.75) and -4.3±2.4 mmHg vs. -3.1±1.5mmHg, for diastolic BP(p=0.68); therefore data was pooled to assess predictors of BP response to D3. BP medications were used in 34(58%) patients at entry and did not change in 30 of them, while 25(42%) patients did not receive any BP medication. The reduction of systolic BP was greater in older adults without baseline frailty grip compared to those with it (-16.4±3.2mmHg vs.-7.6±2.8mmHg, p=0.06). Diastolic BP reduction was greater in those without baseline frailty grip(-7.9±1.8mmHg vs.-1.8±1.6mmHg in those with frailty grip, p<0.05) and in those with low baseline 25OHD levels(-7.7±2.1mmHg vs.-2±1.5 mmHg in those with normal 25OHD levels, p<0.05). These results suggest that D3 supplementation reduces BP, but frailty may attenuate D3 benefits on cardiovascular health. Assessment of 25OHD levels and frailty may be important to predict the response to D3 treatment aimed at reducing CVD and frailty.

### AMPK FUEL REGULATOR: CONVERGENCE OF HIBERNATION, DIET RESTRICTION, EXERCISE, AND OBESITY

J. Smith-Sonneborn, *Zoology & Physiology Emeritus, University of Wyoming, Laramie, Wyoming*

Divergent biological phenomena have fundamental pathways that affect aging and age related diseases. This presentation highlights common characteristics in hormetic responses to diet, exercise, temperature, exercise, and obesity, i.e, response to cell energy status and suggests that opioids, inducers of hibernation, may have anti-aging potential. The ability to hibernate, appears to involve differential expression of genes common to all mammals, rather than the induction of novel gene products unique to the hibernating state. Mammalian hibernators undergo a remarkable phenotypic switch that involves profound changes in fuel usage. Levels of serum insulin increase before hibernation, then decline to their lowest measured levels in hibernation, though insulin mRNA in the pancreas is highest in animals hibernating from December through March, thought to provide rapid glucose usage reentry out of hibernation(Carey et al., 2003). A known key element, in this fuel switch during hibernation, is the differential expression of the gene encoding pyruvate dehydrogenase kinase isoenzyme 4, that inhibits pyruvate dehydrogenase and thus minimizes carbohydrate oxidation by preventing the flow of glycolytic products into the tricarboxylic acid cycle (Andrews 2004). AMP-activated protein kinase (AMPK) by hypoxia and AICAR treatment combined with fatty acid administration synergistically induce PDK4 expression in non-hibernators, a key element in this fuel switch that modulates ligand-dependent activation of peroxisome proliferator-activated receptor, a major regulator of endurance in exercise, and in insulin sensitivity. AMPK and fatty acids play a direct role in fuel selection in response to cellular energy status (Smith et al., 2005);Houten et al., 2009).

### CYTOKINE PROFILING FOR AGED LOW CAPACITY RUNNER (LCR) RATS: A RAT MODEL FOR HUMAN FRAILTY

P.M. Abadir[1], L.G. Koch[2], H. Li[1], J.D. Walston[1], S.L. Britton[2], S.X. Leng[1], *1. Johns Hopkins, Baltimore, Maryland, 2. University of Michigan Medical School, Ann Arbor, Michigan*

Our previous studies in humans suggest inflammation as an important contributing factor to the geriatric syndrome of frailty. Low capacity runner (LCR) rats, after 22 generations of selective breeding without genetic manipulation, display significantly decreased running speed and distance as well as increased mortality compared to high capacity runner (HCR) rats; as such, we chose LCR rats as a model for human frailty. To gain initial insight into whether aged LCR rats manifest an inflammatory phenotype, we hypothesized that aged LCR rats would have higher serum levels of pro-inflammatory cytokines than aged HCR rats. To test this hypothesis, we profiled 9 pro- and anti-inflammatory cytokines by bead-based multiplex assay in 9 LCR and 9 HCR rats (mean age=28 months, ranging 25-30 months). The results showed that LCR rats had higher levels of pro-inflammatory cytokines including TNF-alpha, IL-1alpha, IL-1beta, IL-2, IL-6, IFN-gamma, and GM-CSF than HCR rats with TNF-alpha being most impressive (mean+SEM: 224+35 vs 34+11 pg/ml, respectively, p<.001). Compared to the HCR control rats, LCR rats also had increased IL-4 (544+19 vs 411+39 pg/ml, p=.002) and IL-10 (1881+247 vs 1192+193 pg/ml, p=.02), likely representing compensatory anti-inflammatory mechanisms. These findings suggest an inflammatory phenotype in the LCR rats that mimics human frailty. They also provide a basis for further development and utilization of LCR rat model to investigate the role of inflammation in and anti-inflammatory interventional strategies for frailty.

### EFFECTS OF MORPHINE ON THERMAL SENSITIVITY IN AGED RATS

C.S. Carter[1], L. Koerper[1], J.D. Mitzelfelt[2], D. Morgan[2], *1. Aging and Geriatrics, University of Florida, Gainesville, Florida, 2. University of Florida, Department of Psychiatry, Gainesville, Florida*

Aim: As the population ages, the prevalence of non-malignant pain increases along with the clinical use of opioids as an intervention. However, little is known regarding older individuals sensitivity to opioids and the most effective treatment strategy. Here we describe the development of a preference procedure to assess changes to thermal sensitivity in adult vs aged rats in response to morphine administration as a preclinical screening tool. Methods: Adult (12-16 months) and aged (27-31 months) male, F344xBN rats were tested in a thermal preference procedure. Rats were placed in an apparatus containing two compartments equipped with floors that were individually temperature-controlled so that sensitivity to “hot” and “cold” thermal stimulation could be assessed during daily 10-minute sessions. Dose-effect curves for morphine (0.56 to 5.6 mg/kg, i.p.)were determined for 3 temperature comparisons [i.e.hot vs neutral), cold vs neutral and hot vs cold] during test sessions. Results: Aged rats were more sensitive to cold stimulation compared with adults at baseline. With morphine administration, the most consistently observed effect in adult rats was antinociception during the hot thermal stimulation compared to the neutral stimulus; an effect which was present but somewhat attenuated in aged rats. In addition, morphine appeared to increase sensitivity to cold stimulation in aged rats only. Conclusions: These data demonstrate age-related differences in baseline thermal sensitivity and responsiveness to opioids. Based on behavioral and physiological requirements of this procedure, it is suggested that thermal sensitivity assessment is a relevant animal model for the assessment of pain and antinociception.

## SESSION 1150 (SYMPOSIUM)

### THE CONSTRUCTION OF SELF AND THE MEANING OF CHILDLESSNESS IN OLDER WOMEN

Chair: *K. de Medeiros, The Copper Ridge Institute, Sykesville, Maryland, The Johns Hopkins University School of Medicine, Baltimore, Maryland*
Discussant: *T. Calasanti, Virginia Tech, Blacksburg, Virginia*

A great deal of research in gerontology has focused on the forms and content of parent-child relationships, which can be especially important in later life. Although there has been increasing research centered on the nearly 20% of older adults in the U.S. who do not have children, many of these studies have looked at economic issues such as intergenerational transfers of wealth. Our symposium draws from a large, qualitative study on generativity and lifestyles of childless older women (GLOW) to explore how childlessness and generativity (investing one's substance in forms of life and work that will outlive the self) are experienced and expressed in a sample of 70 women aged 65 and over who do not have biological children. Given gendered and ageist assumptions that equate "older" and "female" with "grandmother," thereby ascribing identities for older women based on fertility, we present cases which explore the cultural context of voluntary childlessness; generativity and fictive kin; the construction of self and maintenance of self through written life stories; and, in a unique subsample of recent Russian immigrants, how the constructs of gender, fertility and generativity are influenced by the State. Overall, this research sheds important new light on the flow of lives through time, the aging self, the meaning of childlessness, and the psychosocial correlates of generativity in late life.

### THE CULTURAL CONTEXT OF VOLUNTARY CHILDLESSNESS

L. Keimig[1], A. Mosby[2], S.M. Hannum[1], L. Morgan[1], J.K. Eckert[1], *1. University of Maryland Baltimore County, Baltimore, Maryland, 2. Copper Ridge Institute, Sykesville, Maryland*

Over the course of their lives, women today age 65+ have witnessed social change and medical advances offering unprecedented choice in whether or not to have children. While an increasing number of women have decided to remain childless in recent decades, little is known about the dimensions of generativity and self-conception among these women as they age. Through a narrative analysis of in-depth interviews, this paper explores the meaning of voluntary childlessness in the lives of three older women, including the advantages and disadvantages of childlessness at different points in life, and regrets, if any. Findings indicate that these informants, influenced by the advent of the women's movement, 1) continue to contend with stereotypes, 2) ascribe new meaning to the concept of family through various forms of social support, and 3) arrive at an increased sense of independence and power associated with professional accomplishment and creative expression over time.

### REDEFINING "PARENTHOOD": CONCEPTUALIZATIONS OF GENERATIVITY AMONG OLDER WOMEN

S.M. Hannum[1], R. Rubinstein[1], L. Morgan[1], L. Keimig[1], A. Mosby[2], *1. Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland, 2. The Copper Ridge Institute, Sykesville, Maryland*

While having biological children does not alone achieve generativity, it is an important aspect for many women, given the social importance of reproduction. Those who did not reproduce, however, may come to understand the parent/child relationship through the care of non-biological children, thereby achieving a similar sense of generativity as childed peers. To explore this, a subsample of three older women (aged 65+) from the GLOW research grant were studied. Each participant completed three in-depth, qualitative interviews pertaining to their life history and specific experiences related to children. The results of the analyses describe how the women functioned as parent for non-biological children and came to regard these persons as their own offspring. Such a redefined parent/child relationship has clear implications on overall health and well-being, but specifically on manifest psychosocial outcomes and ideas of generativity and should be the basis of future research.

### A LEGACY OF STRENGTH: GENERATIVE ACTIONS OF WOMEN FROM THE FORMER SOVIET UNION

A. Mosby[1], K. de Medeiros[1], L. Morgan[2], L. Keimig[2], *1. The Copper Ridge Institute, Sykesville, Maryland, 2. University of Maryland Baltimore County, Baltimore, Maryland*

Childless women make up a growing proportion of older adults, yet this cohort is understudied. Furthermore, very little is known about older women who emigrated to America and how different national, cultural, and religious events may influence how childlessness is experienced. This paper presents findings from a subsample of four recent Russian immigrants who participated in a larger qualitative study on childless older women. Interviews addressed questions on life history, generativity, meaning of childlessness, and caregiving issues. Four major themes emerged from the data: 1) religious persecution in shaping their identity, 2) familial traditions lost among younger Americanized generations and those who are childless, 3) caretaking concerns among childless women who grew up in multigenerational households, and 4) life lessons and stories as important venues for generativity. New insights into the role of an oppressive state government inform views of fertility and generativity among these childless older women.

### KNOW THIS ABOUT ME: HOW WRITTEN NARRATIVES FRAME THE ORAL LIFE STORIES OF THREE OLDER WOMEN

K. de Medeiros[1,2], A. Mosby[1], R. Rubinstein[3], *1. The Copper Ridge Institute, Sykesville, Maryland, 2. The Johns Hopkins University School of Medicine, Baltimore, Maryland, 3. University of Maryland Baltimore County, Baltimore, Maryland*

Life stories, oral and written, have been used to understand the self in old age. The underlying assumption is that events are selected and told because they reveal something integral about that person's sense of self and identity. In our paper, we closely examine the life stories of three women who participated in a large qualitative study on childless older women (GLOW). In addition to telling their story during face-to-face interviews, these women also brought unsolicited written stories with them. In contrast to the oral stories, which included information on many aspects of their lives, the written pieces detailed barriers they encountered and overcame because of race and sex. In essence, the written pieces formed larger cultural frames through which the individual events of their lives told in the oral interviews could be interpreted. This points to importance of multiple narrative perspectives in understanding complexities of self.

## SESSION 1155 (PAPER)

## CAREGIVER HEALTH: DEPRESSION

### LONGITUDINAL ANALYSIS OF LEARNED RESOURCEFULNESS AND DEPRESSIVE SYMPTOMS IN GRANDMOTHER CAREGIVERS

C. Musil, A. Jeanblanc, C. Warner, J.A. Zauszniewski, *Case Western Reserve Univ, Cleveland, Ohio*

Resourcefulness, a set of cognitive-behavioral strategies for dealing with adversity, has been inversely associated with depressive symptoms in samples of older adults, including caregivers, but has had little examination longitudinally. Therefore, this analysis examines the relationships between resourcefulness and depressive symptoms in 323 grandmothers (mean age 60) who participated in a study on caregiving to grandchildren. Participants completed the Center for Epidemiological

Studies-Depression (CES-D) Scale and Self-Control Schedule using mailed questionnaires. Grandmothers were classified into one of three categories: primary (custodial) caregivers to grandchildren, grandmothers living in multigenerational homes, and non-caregivers to grandchildren. Primary caregivers reported the most depressive symptoms but no differences on resourcefulness. The data were analyzed using a cross-lagged, longitudinal structural equation model in AMOS. Grandmother group was included using two dichotomous variables: primary v. else and multigenerational v. else for each of five time points over eight years. Our final model, with all paths significant at p<.05, and most paths significant at p<.001, yielded fit indices of $\chi2$=602.51 df=159, p.<.001, CFI =.92, TLI=.90, and RMSEA =.08, indicating good model fit. Resourcefulness had a direct effect on depressive symptoms, with higher resourcefulness associated with fewer depressive symptoms at each time wave. There were small but significant cross-lagged effects between depressive symptoms and resourcefulness at all but one time wave, with higher depressive symptoms being associated with lower subsequent wave resourcefulness. R2 values ranged from .54-.58 for depressive symptoms and .39-.49 for resourcefulness. The model suggests that interventions focused on strengthening resourcefulness could be important in reducing depressive symptoms over time.

### CAREGIVING ROLE: A CONTRIBUTOR TO DEPRESSION IN MIDDLE-AGED AND OLDER ADULT KOREAN FAMILIES

J.I. Wassel[1], H. Jun[2], *1. UNCG, Greensboro, North Carolina, 2. Yonsei University, Seoul, Republic of Korea*

Understanding the consequences of assuming the role of caregiver to a disabled family member is becoming an increasingly important private and public issue. Guided by a life course role-identity perspective, this study examines the role of caregiving as a contributor to depression in caregivers. Gender differences were evaluated, and the processes through which care-providing may lead to higher level of depression were explored. Family relationships such as marital relationships and relationships with children were hypothesized to independently mediate the effects of the role of caregiver on depression. This research used nationally representative data (the first wave of Korea Longitudinal Study of Aging data 2006). The analytic sample for this study consisted of KLSA primary respondents (N=10,254) who were 45-year old and older. Depression was measured by CES-D10. Multivariate regression analyses revealed that the depression impact of the role of caregiver was different for women and men. That is, the caregiving role was a strong contributing factor to depression in women but not for men. Results also suggested that, for women care-providers the caregiving role exerts a negative influence on marital relationships, thus further contributing to depression. But relationships with children were found not to be a significant factor in the effects of the role of caregiver on depression.

### DEPRESSION AMONG ADULT-CHILD CAREGIVERS: THE EFFECT OF CARE-RECEIVING PARENT'S FINANCIAL TRANSFER

C. Noel-Miller, *University of Wisconsin-Madison, Madison, Wisconsin*

Objective: Drawing upon equity theory and the stress and coping perspective, this study examines the effect of financial transfers from care-receiving parents on adult-child caregivers' depressive symptomology. Methods: Based on nationally representative panel data from the Health and Retirement Study (1996, 1998, 2000), we estimate a nonlinear mixed model predicting depression amongst 1,651 adult-child caregivers. Depression was measured by using an 8-item version of the Center for Epidemiological Studies–Depression (CES-D) scale. We examine additional models specifying the financial transfers' size and the recipients' caregiving intensity. Results: Overall, roughly one in ten adult-child caregivers received a parental money transfer. Accounting for measured covariates, financial support recipients were substantially less likely to report depression symptoms than were non-recipient adult-child caregivers. In addition, we find that large transfers (but not small transfers) and transfers to low-intensity care providers (but not to high-intensity caregivers) buffer adult-child caregivers' depression. Discussion: This study uncovers evidence of care-receiving parents' potential for containing the deleterious mental health effects often experienced by adult-child providers of personal care. Our findings highlight the importance of recognizing care recipients' contributions to the caregiving relationship, and of moving beyond the prevailing conception of care-recipients as being solely a source of caregiver stress.

### GENDER DIFFERENCE IN THE RELATIONSHIP BETWEEN PARENTAL CAREGIVING AND DEPRESSIVE SYMPTOMS AMONG WORKING MEN AND WOMEN

J. Kim, S. Feld, R. Dunkle, H. Kim, H. Shen, *University of Michigan-Ann Arbor, Ann Arbor, Michigan*

Two different perspectives explain how the dual responsibilities of work and elder care can influence psychological well-being. The role strain perspective argues that these dual roles are likely to decrease psychological well-being whereas the role enhancement perspective proposes these dual roles can increase psychological well-being. However, little attention has been directed to whether one of these perspectives is more likely to be useful in explaining the effects of dual roles for men and women. Based on the nationally representative 2004 Health and Retirement Study, the present sample consisted of workers (average age 55) who had at least one living parent (n= 3,152; female=1,895 and male=1,257). Multiple regression modeling examined gender differences in the relationship between the 10-item CES-D measure of depression symptoms and dual working-caregiving roles, taking into account various aspects of work and parental elder care responsibilities. Results showed that elder caregiving was associated with more depressive symptoms for working women than men. Additionally, only for women greater were caregiving hours linked to more depressive symptoms (p=.0025), but greater working hours were linked to fewer symptoms (p=.009). Findings suggest that both role stain and role enhancement perspectives are useful in explaining the effects of dual roles among female working caregivers, not male working caregivers. We discuss ways our results can help employers and practitioners understand the psychological consequences of the dual responsibilities of workers who care for their parents and develop gender sensitive strategies to reduce negative effects of these dual responsibilities.

## SESSION 1160 (SYMPOSIUM)

### CAREGIVING WITHIN HISPANIC AMERICAN FAMILIES: CULTURAL IMPLICATIONS FOR RESEARCH AND PRACTICE

Chair: *H. Fuller-Iglesias, Human Development and Family Science, North Dakota State University, Fargo, North Dakota*

Co-Chair: *C. Mendez-Luck, University of California, Los Angeles, California*

Discussant: *S. Wallace, University of California, Los Angeles, California*

Hispanic Americans represent the largest ethnic group in the U.S. and the fastest growing segment of the nation's older adult population. The implications for aging among Hispanic Americans are especially complex given diverse immigration histories, countries of origin and cultural backgrounds. Cultural views about family unity and extended kinship may serve as facilitators or barriers for families faced with navigating the system of community-based long-term care services. This symposium takes a multidisciplinary look at caregiving in Hispanic American families. Using qualitative and quantitative approaches, we examine caregiving from the perspectives of caregivers and care recipients, the experiences of caregiving in families from different Hispanic-origins, and the unique cultural views that may have direct implications for programs and policies. Mendez-Luck and colleagues examined cultural justifications for caregiving and found that caregivers with greater degrees of Mexican identity had more positive orientations to the caregiving role. Fortinsky and colleagues found that language was a common barrier for caregiving families, making translation an integral part of dementia caregivers' responsibilities. Hinton and Apesoa-Varano examined the importance of extended kin in Mexican-origin families, finding that multiple family caregivers were often present particularly in cases of dementia. Brown and colleagues found that greater time costs of caregiving predicted an increased likelihood of institutionalization; however, the risk decreased when more adult children were present. Discussants Steven Wallace and Jacqueline Angel will integrate and synthesize these findings and provide their expert insights into the implications, applications, and future directions for research on caregiving in Hispanic American families.

### HELP-SEEKING EXPERIENCES AMONG LATINO FAMILY CAREGIVERS OF PERSONS WITH DEMENTIA: VIEWS FROM NEW ENGLAND

R. Fortinsky[1], D. Gonzalez Sanders[2], J. Robison[1], I.J. Castro[1], L. Hinton[3], *1. Center on Aging, University of Connecticut Health Center, Farmington, Connecticut, 2. Central Connecticut State University, New Britain, Connecticut, 3. UC Davis Medical Center, Sacramento, California*

Little current information is available on dementia-related help-seeking experiences of Latino family caregivers in New England, where most Latinos are of Puerto Rican ancestry. As part of an ongoing study, we have completed interviews with 44 Latino caregivers (86% first or second generation Puerto Rican; 91% female; mean age/s.d.=51.5/12.0 years) to determine the amount of dementia-related advice and guidance they received from physicians, and their experiences regarding communication with physicians and other health and social service professionals. Results indicate that greater proportions receive advice and guidance about medications than about how to manage dementia-related symptoms and access community resources. Qualitative results suggest that language is often a communication barrier between health professionals and persons with dementia, and that caregivers often serve the role as translator during health care encounters. We will also explain whether and how help-seeking experiences vary by caregivers' socioeconomic status and familial relationship to care receivers.

### ADAPTING THE CULTURAL JUSTIFICATIONS FOR CAREGIVING SCALE FOR USE IN A MEXICAN-ORIGIN POPULATION

C.A. Mendez-Luck[1], R.D. Hays[2], W. Steers[2], C.M. Mangione[2,1], *1. UCLA School of Public Health, Los Angeles, California, 2. UCLA Department of Medicine/Division of General Internal Medicine & Health Services Research, Los Angeles, California*

Current literature reviews highlight the need for research on the cultural influences of elder caregiving in diverse populations. We adapted the Cultural Justifications for Caregiving Scale for a Latino population by adding original items developed from formative research. A 23-item modified instrument was administered to 51 English- and 51 Spanish-speaking female caregivers of Mexican descent recruited from flyers, word of mouth, health fairs, and targeted recruitment events. The screener response rate was 81%; 92% of screened and eligible women completed questionnaires. Exploratory factor analyses suggested two factors, one representing positive normative role beliefs (14 items, $\alpha$=.84) and the other negative normative role beliefs (9 items, $\alpha$=.75). We found a negative correlation between acculturation (ARMSA-II) and positive role beliefs (r = -.48, P=.000). Acculturation and negative role beliefs were not significantly correlated. These findings suggest that women with greater degrees of Mexican identity have more positive orientations to the caregiver role.

### BEYOND THE DYAD: PATTERNS AND QUALITIES OF FAMILY CAREGIVING TO OLDER MEXICAN AMERICANS

L. Hinton, C. Apesoa-Varano, *Psychiatry and Behavioral Sciences, University of California, Davis, Sacramento, California*

Research on caregiving to older adults with cognitive impairment has tended to focus on the level of the dyad, with relatively little attention to the broader family and social context in which caregiving occurs. This study draws on survey and qualitative data to describe patterns and qualities of family caregiving for 71 Mexican American older adults with diverse cognitive function. Subjects were recruited from on ongoing community-based epidemiological study. Family members were queried about assistance to older adult in several domains. More than one third of caregivers reported the participation of two or more family members in caregiving domains including nearly 50% of caregivers of elderly with dementia. Qualitative data shows that gender plays a significant role in the caregiving division of labor where women are more likely to take on total care and emotional labor while men are responsible for more instrumental tasks outside the domestic arena.

### TIME COSTS AND RISK OF LONG-TERM CARE IN THE OLDER MEXICAN-AMERICAN POPULATION

H.S. Brown[1], J.L. Angel[2], A.P. Herrera[3], *1. Management, Policy and Community Health, UT School of Public Health, Austin, Texas, 2. UT-Austin, Austin, Texas, 3. University of California San Diego, San Diego, California*

This study of long-term care in older Mexican Americans quantifies the time cost to the subject's adult children and how this influences the risk of nursing home admission. The data studied were taken from the Hispanic Established Populations Study of the Elderly and logistic regressions were performed to identify the effect of time cost variables (geographic proximity, presence and availability of adult children, extent of care needed) on the likelihood of nursing home use. The results of the study show that high time costs for caregiving increase the risk of institutionalization and that severity of need was the more important determinant compared to geographic distance. Having a greater number of children, who could conceivably share care loads, decreased the risk of institutionalization. In conclusion, older Mexican Americans' cultural preferences to 'age in place' may be jeopardized as their adult children, the likeliest caregivers, are faced with increasingly expensive time constraints.

## SESSION 1165 (SYMPOSIUM)

### CRITICAL GERONTOLOGY, AGING AND THE ECONOMIC CRISIS: RE-ASSESSING THEORETICAL PERSPECTIVES

Chair: *C. Phillipson, Keele University, Newcastle-under-Lyme, United Kingdom*
Co-Chair: *C.L. Estes, University of San Francisco, San Francisco, California*
Discussant: *V.W. Marshall, University of North Carolina, Chapel Hill, North Carolina*

Aging populations face major challenges given world-wide economic recession. Dimensions of the crisis have been documented in respect of increasing social inequality and reduced well-being within populations. The consequences for older people are, however, less well understood but include: deep-rooted poverty amongst most older people in the Global South and significant groups in the North; ideological disputes around the demands of the baby boom generation; pressures affecting health and social care; and the increasingly dominant role of global organisations in determining policies and programmes for old age. The implications of these changes have yet to be fully debated within gerontology. The purpose of this Symposium is to examine the implications of the crisis, using perspectives drawn from critical gerontology. Critical gerontology has offered a wide-ranging commentary highlighting many of the injustices affecting older people. However, the recession raises a challenge for critical perspectives, especially in respect of the adequacy of theories for understanding changes to the institutions supporting older people. These issues will be examined as follows: Jan Baars will make the case for critical gerontology through examining its historical origins and the basis for different types of critical research. Chris Phillipson will examine the implications of the crisis for transforming theorising about aging. Isabella Aboderin will focus on the crisis in sub-Saharan Africa and the implications for critical perspectives. Dale Dannefer and Katheryn Douthit will examine the challenge of understanding social and biological aspects of aging and the need to give greater emphasis to the power of social forces.

### WHY IS THERE A NEED FOR 'CRITICAL' GERONTOLOGY?

J. Baars, *University for Humanistics, Utrecht, Netherlands*

At first sight the adjective 'critical' seems to be superfluous as each scholar or scientist would regard himself or herself as 'critical'; and indeed, critical thinking and critical discourse are inherent in scientific. In this paper, four major modes of critique regarding scientific work will be distinguished, together with their relevance for a 'critical gerontology'. The first mode of critique targets the theoretical presuppositions and internal logic of scientific work. The second mode critically interrelates the theoretical presuppositions of scientific work and its practical contexts. A third mode of critique explicitly chooses the side of groups or categories of people who are systematically disadvantaged by a particular constellation of power and develops scientific work with the intention of changing the diagnosed constellation. And, finally, some critical approaches can be seen as clarifying articulations of a contemporary crisis.

### EXPLORING IMPACTS OF THE GLOBAL ECONOMIC CRISIS ON OLDER POPULATIONS IN SUB-SAHARAN AFRICA: CRITICAL PERSPECTIVES

I. Aboderin, *Oxford Institute of Ageing, University of Oxford, Oxford, United Kingdom*

The 2008 global food price and financial crises have significantly affected the outlook for human, social and economic development in sub-Saharan Africa (SSA) - raising pressing questions about the consequences for SSA's growing older populations. While these have not yet been formally investigated, they likely include a widening and deepening of poverty, stalling social welfare provision and reduced access to basic services such as health care. Based on a case study from Kenya, one of the most directly affected countries, this paper demarcates and describes such probable changes. It conceptualizes the impacts drawing on theoretical ideas from western critical gerontology, in particular those pertaining to the influence of global forces on conditions of old age in the poor Global South. In doing so, it reflects on limitations in the theoretical perspectives themselves and offers approaches for developing more nuanced 'critical' gerontological theory on globalization and ageing in the region.

### GENE-ENVIRONMENT INTERACTIONS, THE LIFE COURSE AND SOCIAL LEGITIMATION

D. Dannefer, K. Douthit, *Department of Sociology, Case Western Reserve University, Cleveland, Ohio*

Within the social sciences, there has been a longstanding but unwarranted reluctance to explore interconnections between social and biological processes, based on the misplaced assumption that such explorations entail an acceptance of the primacy of biololgical explanatiosn, and on a failure to recognize the extent to which biological processes are organized by social forces. Recently, however, a broad-based social science interest in gene-environment interactions has developed, and we are now beginning to explore that question in social gerontology. Studies of gene-environment interactions generally begin from the premise that the effect of genes on individuals cannot be understood apart from environmental characeristics. However, much of what has been written on GE interactions in the social gerontology formulates the interaction in a way that constricts and obscures the power of social forces, by misplaced attributions of unexplained variance to genes. We demonstrate how such assumptions in research allow too much credit to be given to genetic explanation, and at the same time result in a naturalization of existing social arrangemetns and reinforcing racist, classist and ageist aspects of existing institutions.

## SESSION 1170 (SYMPOSIUM)

### DAILY LIFE CAN WEAR YOU OUT: INDIVIDUAL AND RELATIONAL PERSPECTIVES ON DAILY STRESS, HEALTH, & WELL-BEING

Chair: *K.E. Cichy, Human Development & Family Studies, Kent State University, Kent, Ohio*
Co-Chair: *R.S. Stawski, The Pennsylvania State University, University Park, Pennsylvania*
Discussant: *M.K. Diehl, Colorado State University, Fort Collins, Colorado*

Daily stressors are the routine challenges of daily life, such as family arguments or household demands, which tax an individual's emotional, physical, and cognitive resources. Some individuals are more prone to the adverse effects of daily stressors than others. Demographic and contextual characteristics may represent vulnerabilities that increase the likelihood of experiencing stressors and exacerbate reactivity to stressful events. Daily diary approaches provide the opportunity to obtain repeated measurements of multiple aspects of individuals' daily lives, such as daily stressors, physical symptoms, and affect. Diary assessments improve ecological validity by making it possible to capture naturally occurring stressful events and to link those events to day-to-day fluctuations in individual and relational well-being. The current symposium features daily diary research exploring how certain individual characteristics and relational experiences may increase exposure to daily stressors and exacerbate stressor reactivity. Cichy, Stawski, and Almeida will examine racial differences in exposure and reactivity to naturally occurring stressful events involving family members. Stawski, Cichy, and Almeida will consider how individuals' tendencies to worry moderate exposure and emotional reactions to daily stressors. Iida, Stephens, Franks, Rook, & Salem will examine the daily relational implications of stressors associated with spouses' diabetes management. Finally, Barker, Greenberg, & Seltzer will examine daily stress exposure and physiological reactivity in the lives of midlife parents of adult children with serious mental illness. Manfred Diehl will reconcile the presentations and offer insights into how these studies further our understanding of the daily stress process.

### RACIAL SIMILARITIES AND DIFFERENCES IN EXPOSURE & REACTIVITY TO FAMILY STRESSORS

K.E. Cichy[1], R.S. Stawski[2], D. Almeida[2], *1. Human Development & Family Studies, Kent State University, Kent, Ohio, 2. The Pennsylvania State University, University Park, Pennsylvania*

African Americans remain at a health disadvantage, even after considering socioeconomic status (SES), suggesting disparities reflect more than racial differences in SES. Given the salience of family ties in African Americans' lives, they may be particularly reactive to stressors involving family. We examined differences in reactivity to family stressors among African Americans (n = 59) and European Americans (n = 1,696) aged 34 to 84 from the National Study of Daily Experiences (NSDE II). Respondents participated in 8 days of interviews where they reported daily on stressors, affect, and physical health symptoms. Results revealed racial similarities in emotional reactivity, where, regardless of race, on days when respondents argued and avoided an argument with family they reported higher negative affect and lower positive affect (p ∠ .001). Compared to European Americans, African Americans experienced more physical health symptoms on days they argued with and avoided arguments with family (p ∠ .001).

### DON'T WORRY, BE HAPPY (OR AT LEAST LESS STRESSED): FINDINGS FROM THE NATIONAL STUDY OF DAILY EXPERIENCES

R.S. Stawski[1], K.E. Cichy[2], D. Almeida[1], *1. Pennsylvania State University, University Park, Pennsylvania, 2. Kent State University, Kent, Ohio*

Worry is a form of perseverative cognition associated with thoughts and emotions about future negative events, and is thought to moderate reactions to stressful events. The current study examined self-perceptions of worry as a predictor of exposure and emotional reactivity to daily stressors. Participants included 1,815 adults (Mage = 56, SD = 12, Range = 33-84, 50% female) from the second wave of the Midlife in the United States (MIDUS) study and the National Study of Daily Experiences (NSDE). Participants identified themselves as worrying more, about the same, or less than other people, and completed measures of their experiences and positive and negative affect across 8 days. Higher levels of worrying were associated with significantly more frequent daily stressor exposure, higher levels of negative affect, lower levels of positive affect, and greater emotional reactivity to daily stressors, including stressor-related increases in negative affect and decreases in positive affect (all ps<.05).

### CHRONIC ILLNESS AND RELATIONSHIP FUNCTIONING: A DYADIC DIARY STUDY OF OLDER MARRIED COUPLES MANAGING TYPE II DIABETES

M. Iida[1], M.P. Stephens[2], M. Franks[3], K. Rook[4], J.K. Salem[5], *1. Arizona State University, Tempe, Arizona, 2. Kent State University, Kent, Ohio, 3. Purdue University, West Lafayette, Indiana, 4. University of California, Irvine, Irvine, California, 5. SUMMA Health System, Akron, Ohio*

Chronic illnesses most often occur in late life, and spouses are frequently affected by the ill partners' condition. However, little is known about how chronic illness impacts relationship functioning on a daily basis. In this electronic diary study (N = 129 couples), we examined how diabetic patients' chronic illness management was associated with relationship functioning over 24 days. We focused on patients' daily diabetes conditions (diabetes symptoms, diabetes anxiety, and dietary adherence) and daily evaluations of the relationship (relationship enjoyment and tension) reported by both patients and their spouses. For both patients and spouses, daily dietary adherence was associated with an increase, and daily diabetes symptoms were associated with a decrease in relationship enjoyment. In contrast, daily diabetes symptoms were associated with an increase in relationship tension for both patients and spouses. For spouses, but not for patients, daily diabetes anxiety was also associated with an increase in relationship tension.

### DAILY STRESS AND CORTISOL PATTERNS IN PARENTS OF INDIVIDUALS WITH A SERIOUS MENTAL ILLNESS

E. Barker, J. Greenberg, M. Mailick Seltzer, *Waisman Center, University of Wisconsin Madison, Madison, Wisconsin*

We collected daily stress and cortisol data from 75 parents of individuals with a serious mental illness (SMI; 44 mothers, 31 fathers, M age = 58.07 years, SD = 12.81; child M age = 34.80 years, SD = 9.81). Diagnoses included major depression (n= 29), schizophrenia (n = 17), and bipolar disorder (n = 29). Compared to parents of individuals without a mental illness (N = 489), parents of individuals with a SMI experienced more stressors and higher stress severity, on average. Following days when stress severity was elevated, comparison parents experienced a typical accentuated morning rise in cortisol, but SMI parents did not. This pattern of morning rise hypoactivation in SMI parents is consistent with our studies of parents of young adults with an autism spectrum disorder, and suggests that chronic stress in the context of parenting an adult child with a disability is associated with HPA axis dysfunction.

# SESSION 1175 (POSTER)

## ECONOMICS AND EPIDEMIOLOGY

### THE IMPACT OF WEALTH ON CHRONIC ILLNESS AMONG OLDER AMERICANS

Y.G. Lee, D. Bradford, *Family, Consumer, and Human Development, Utah State University, Logan, Utah*

Much of the available literature on health and wealth focuses on poor health and low income or poverty. Using the 2006 Rand Health and Retirement Study (HRS), this study looked at the connection between wealth and chronic illness among Americans aged 65 or older (N=9,206). For the purposes of this study, "chronic illness" was defined in the following way: Zero chronic illness, mild chronic illness (1-2 chronic illnesses), and severe chronic illness (3+ chronic illnesses). Wealth holdings of older individuals were compared to their number of chronic illnesses, and it was found that individuals in the severe chronic illness category have lower levels of net worth than those with zero illnesses and those in the mild chronic illness category. Individuals in the severe chronic illness category tended to be older, less educated, divorced and widowed, and it was also found that having high levels of wealth in old age was negatively related to number of chronic illnesses. Gender, age, family size, race, marital status, and education, in addition to wealth, were significant predictors of the likelihood of having severe health problems. Identifying factors associated with chronic illness could be advantageous to educators, counselors, and policy makers because these professionals would be more capable of targeting at-risk individuals and implementing necessary programs that could enhance the financial and physical well-being of individuals.

### AGE AND INTENSITY DIFFERENCES IN REACTION TO RACE-BASED TREATMENT AND PHYSICAL/MENTAL HEALTH

P.T. Ryder, J. Mulvaney, *Coll Pharmacy & Health Sciences, Butler University, Indianapolis, Indiana*

Reactions to race-based treatment have been associated with many health outcomes, but little attention has been paid to whether associations vary by reaction intensity and age. The 2004 Behavioral Risk Factor Surveillance System Reaction to Race Module was used to examine associations of reaction to race-based treatment with self-rated health (SRH) and reported mental health impairment (MH), comparing ages 70+ with ages 18-29, 30-44, 45-59, and 60-69. Separate logistic regression models were run for SRH and MH by race/ethnicity, comparing younger ages to those 70+. Models included a 3-level variable representing reaction to race-based treatment and controlled for gender, education, and frequency of thinking of one's race. Decreasing age was associated with better SRH for blacks (N=4310) and whites (N=22,024); age was not significant for Hispanics (N=1332). Reaction was associated with better SRH for whites (OR moderate-reaction=0.42, 95% CI 0.33-0.53; OR high-reaction=0.28, 95%CI=0.20-0.38) and blacks (N=4310; OR moderate-reaction = 0.66, 95%CI=0.49-0.89; OR high-reaction 0.31, 95%CI=0.23-0.42) but not for Hispanics. Those 70+ reported less MH impairment relative to other age groups among blacks and whites. For Hispanics, those 18-29 had significantly poorer MH than those 70+. Moderate and high reactions to treatment were associated with MH for each race/ethnicity group (OR moderate-reaction-whites=2.26, 95%CI=1.71-2.99, OR high-reaction-whites-4.54, 95%CI=3.31-6.22; OR moderate-reaction-black=1.35, 95%CI=0.92-1.97, OR high-reaction-blacks=3.54, 95%CI=2.58-4.85; OR moderate-reaction-Hispanics=2.20, 95%CI=1.04-4.66. OR high-reaction-Hispanics=4.61, 95%CI=2.32-9.18). A dose-response association was found with reaction to treatment and most physical and mental health outcomes for blacks and whites and for mental health for Hispanics; these results varied by age.

### THE UAB STUDY OF AGING: 8-YEAR PREDICTORS OF LIFE-SPACE MOBILITY

R.M. Allman[1,2], P. Sawyer[2], C.J. Brown[1,2], C. Ritchie[1,2], J.M. Roseman[2], *1. Birmingham/Atlanta VA GRECC, Birmingham, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama*

This study examines independent predictors of life-space mobility eight years following enrollment in the UAB Study of Aging, a random sample of Medicare beneficiaries stratified by gender, race, and residence. Following a comprehensive baseline in-home assessment of socio-demographics, medical conditions, cognition, depression, health behaviors, and physical performance, telephone follow-up interviews were conducted every six months. Life-space mobility (LS) was measured by distance and frequency of movement and use of personal assistance or equipment in the four weeks before assessments (range 0-120, higher scores represent greater mobility). Vital status was confirmed by the Social Security Death Index. Because of the previously reported pre-death decline in LS, death was defined as a LS score of zero and one point was added to the 8-year LS score. Multivariable regression was used to define independent predictors of LS. Eligible participants (N=873) were mean age=75.2; 49% female; 49% African American. Mortality was 41.2% over 8 years. Independent predictors of LS decline controlling for baseline life-space included: older age (p<.001), white race (p=.049), male gender (p=.021), lower income (p<.001), transportation difficulty (p=.002), BMI<20 (p=.028), more pack years (p=.002), hypertension (p=.012), arrhythmia (p=.002), COPD (.011), and diabetes (0.033). Leisure time physical activity (p=.014) and better physical performance (p=.032) predicted higher life-space. Potentially modifiable risk factors for LS decline included transportation difficulty, smoking and low physical activity. LS decline may also be moderated by targeting interventions to high risk groups and with implementation of evidence-based care for specific diseases such as hypertension, COPD, and diabetes.

### DIABETES-RELATED CHANGE IN PHYSICAL DISABILITY TRAJECTORIES FROM MIDLIFE TO OLDER ADULTHOOD IN TAIWAN

C. Chiu[1], L.A. Wray[1], M. Ofstedal[2], *1. Biobehavioral Health, Penn State University, University Park, State College, Pennsylvania, 2. University of Michigan, Ann Arbor, Michigan*

One in five older adults in Taiwan has been diagnosed with diabetes. Few existing studies assess the extent to which diabetes changes physical functioning in older Taiwanese. This study drew on disability data for 5,121 adults (mean age 66.2) from the nationally-representative 1996-2003 Survey of Health and Living Status of the Elderly in Taiwan and employed a cohort sequential design to combine both cross-sectional and longitudinal data to characterize disability trajectories from midlife to older adulthood. Our results documented that diabetes explained 3.2% and 1.6% of the variance in levels of and linear changes in physical disability, respectively, and that adults with diabetes have higher levels of disability and faster rates of deterioration over time. This study provided evidence that diabetes changes physical functioning over and above natural aging processes in Taiwanese. Such data are essential in setting targets for reducing physical disability in Taiwan, especially for adults with diabetes.

### THE ROLE OF DRUG INSURANCE IN MODERATING SENIORS' COST-RELATED NON-ADHERENCE TO PRESCRIBED MEDICATIONS

G.A. Jensen[1], X. Xu[2], *1. Institute of Gerontology, Wayne State University, Detroit, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

BACKGROUND: Cost related non-adherence (CRNA) to prescribed medications can have devastating health consequences, especially for seniors with serious chronic illnesses, such as cardiovascular disease, diabetes, or depression. Yet, little is known about the role of prescription drug insurance in influencing CRNA. METHODS: We estimate multivariate logit regressions to examine the effects of drug coverage on CRNA among a nationally representative sample of 7,546 Medicare seniors from the 2002 – 2005 Medical Expenditure Panel Survey (MEPS). While doing so, we pay particular attention to whether and how the relationship between drug coverage and CRNA differs for seniors with and without major chronic health conditions and possible "self-selection" effects in the incidence of drug insurance. RESULTS: Drug insurance has a very strong and significant protective effect against CRNA. Holding drug coverage reduces the probability of CRNA by almost half. The odds of CRNA among Medicare seniors with drug insurance are 0.586 (95% CI: 0.397 – 0.866) compared to those without such insurance, ceteris paribus. Among seniors with two or more chronic conditions, the odds of CRNA when drug insurance is present are even lower, at 0.554 (95% CI: 0.336 – 0.867). However, drug insurance has no effect on the likelihood of CRNA among seniors with one or no chronic conditions. DISCUSSION: Holding drug coverage dramatically reduces the risk of CRNA. As prescription drug coverage continues to expand under Medicare Part D, we can expect to see lower rates of CRNA. However, more research is needed to understand the effects of high cost-sharing plans on CRNA.

### PERSISTENT PATTERNS OF ALCOHOL USE AND HEALTH-RELATED QUALITY OF LIFE IN OLDER AGE

M.S. Kaplan[1], N. Huguet[1], B. McFarland[2], D. Feeny[3], *1. Portland State University, Portland, Oregon, 2. Oregon Health and Science University, Portland, Oregon, 3. Kaiser Center for Health Research, Portland, Oregon*

Research investigating longitudinal patterns of alcohol use among older adults is limited. This study, funded by the National Institute on Aging, used data from the longitudinal Canadian National Population Health Survey to examine the association between persistent drinking patterns and health-related quality of life (HRQL) in older age. Participants were classified as lifetime abstainers, former, infrequent (<1 drink/week), moderate (1-14 drinks/week and <4 for men or <3 for women/occasion), excessive (>3 and <5 for men or >2 and <5 women/occasion), or binge drinkers (5+/occasion). We assessed drinking patterns at baseline and again 10 years later among 1,375 participants aged 50 or older at baseline. HRQL was assessed using the Health Utilities Index Mark 3 (HUI3). HUI3 scores were categorized into none/mild versus moderate/severe disability. Among the respondents, 11% were abstainers, 16% were former drinkers, 28% were infrequent drinkers, 41% were moderate drinkers, 2% were excessive drinkers, and 2% were binge drinkers at baseline and at the 10-year follow-up. Former drinkers accounted for the largest percentage of deaths during follow-up. Among the participants who were alive during the 10 years, abstainers and former drinkers were proportionately more likely to report moderate or severe disability on HUI3 (57.2% and 51.2%, respectively) while infrequent drinkers (59.6%, p<.01), moderate drinkers (69.1%, p<.001) and excessive/binge drinkers (72.9%, p<.05) were more likely to report mild or no disability. A discussion of the strengths, weaknesses, and implications of study will also be presented.

## CHANGES IN SOBRIETY IN THE SWEDISH POPULATION OVER THREE DECADES: AGE, PERIOD, OR COHORT EFFECTS?

K. Ahacic, *Department of public health, Social medicine, Karolinska Institutet, Stockholm, Sweden*

Objectives: While alcohol consumption is an important health determinant, sobriety has received little attention. Even the age-relatedness in abstaining from alcohol remains unclear. Moreover, in cross-sectional approaches a false impression of age related behavioral change may arise through cohort effects. This study therefore corroborated cross-sectional data with corresponding longitudinal analyses. Patterns in abstaining from alcohol were studied from 1968 to 2002 in the Swedish population. Methods: A representative Swedish panel study allowed repeated cross-sectional comparisons of ages 18-75 (5 waves n=5000), and ages 77+ at later waves (2 waves n=500). Cross-sectional 10-year age group differences in 5 waves, time-lag differences between waves for age groups, and within-cohort differences between waves for 10-year birth cohorts were examined. Results: Regular over time analysis revealed large decreases of sobriety between waves. While cross-sectional differences indicated an increased rate of sobriety with increasing age, longitudinal differences revealed little increase, contradicting cross-sectional results. Following the cohorts showed little change within cohorts but large differences between cohorts. All cohorts had aged with little change concerning their rate of abstainers; while at the same time great between-cohort differences were demonstrated. The examination of between cohort differences showed that the rate of abstainers had declined with later born cohorts until the cohorts born during the 1940s. Even later born cohorts had about the same rates. Conclusions: Almost all variation in sobriety originated before 1968. This cohort effect is probably the consequence of public opinion changes dating back several decades and results demonstrate the early socialization of health behavior.

## FINANCIAL STATUS, PATTERNS OF AGING AND MORTALITY FROM AGE 70-85

J.M. Jacobs, Y. Maaravi, A. Cohen, J. Stessman, *Geriatrics and Rehabilitation, Hadassah Hebrew-University Medical Center, Jerusalem, Israel*

Purpose: To determine the patterns of aging and survival according to financial status from age 70 to 85. Methods: The Jerusalem Longitudinal Study (1990-2010) continues to follow a representative West Jerusalem cohort, born 1920-21, with comprehensive assessment at ages 70 (n=595), 78 (n=933) and 85 (n=1165). Mortality data from age 70-88 were collected. Results: Self reported poor financial status was reported among 22%, 18%, 18% at ages 70, 78 and 85 respectively. With increasing age, the association between poor financial status with negative measures across all domains became more numerous and increasingly more pronounced. Significant associations were found at all ages between financial status and years of education, loneliness, social support and engagement, functional status, self-rated health, depression, cognition, and health service utilization. The associations were less pronounced for medical illnesses. Death rates among those with good vs. poor financial status from age 70-88, 78-88, and 85-88 were 52% vs. 64% (p=0.002), 37% vs. 56% (p<0.001), and 14% vs. 21% (p=0.008) respectively. Poor financial status was associated with increased mortality from ages 70-88 (HR 1.36, 95%CI 1.01-1.83), and 78-88 (HR 1.4, 95%CI 1.06-1.86), yet not 85-88 (HR 1.03, 95%CI 0.72-1.47), after adjusting for gender, ADL dependence, diabetes mellitus, ischemic heart disease, hypertension, physical activity, and smoking. Conclusions: Poor financial status is associated over time with numerous negative parameters across multiple domains as well as decreased survival. The oldest old, among whom financial status did not predict mortality after adjusting for common risk factors, may be resistant to its negative influence.

## A CASCADE MODEL OF THE ROLE OF SELF-REPORTED HEALTH: ANALYSIS OF HRS AND AHEAD COHORTS

S.P. DeViney[1], K. Kercher[1], K. Kosloski[1], D. Stull[2], *1. Gerontology, University of Nebraska at Omaha, Omaha, Nevada, 2. Center for Health Outcomes Research, Horsham, United Kingdom*

The role of self-reported health as both a consequence of other dimensions of physical health and a precursor of mortality has been a focus of much research. We present a “cascade model” in which self-reported health plays a mediating role between the antecedents of physical health conditions, health behavior, and functional ability (ADLs), and the outcome of mortality. Using the core respondent from 6 waves of both HRS and AHEAD surveys (N=9402), we test out cascade model with a discrete-time fragility survival analysis of mortality, with social status, illness, and health behaviors as exogenous variables, and latent growth curve models of functional ability and self-reported health as intervening variables. We find that self-reported health has a direct relationship on mortality, independent of functional ability and our exogenous variables. Persons with higher positive self-reported health at the beginning of the study and who have less decline in self-reported health are less likely to die. We conclude that a cascade model in which self-reported health is a mediating factor between functional ability and illness improves our understanding of the role of self-reported health in medical outcomes and the complex consequences of health conditions among the elderly.

## THE PREVALENCE OF DIABETES AND HEALTH BEHAVIORS AMONG THE ELDERLY IN SOUTH KOREA

D. Lee, *Kangwon National University, Chunchon, Republic of Korea*

Wild et al (2004) reported that the prevalence of diabetes for all age-group worldwide was estimated to be 2.8% in 2000 and 4.4% in 2030. Especially, The number of the elderly with diabetes is increasing in South Korea. The reason is that South Korea has had a surprising amount of economic growth for the past three or four decades, therefore, the prevalence of diabetes was very low in the past similarly to other developing countries, however now it is increasing at a pretty acute rate. The aim of this study was to explore the prevalence of diabetes among the elderly in South Korea. In addition, health behaviors of the elderly with diabetes were explored. We used data of The Korean National Health and Nutrition Examination Survey (KNHANES), a cross-sectional and nationally representative survey examining the general health and nutritional status of the Korean people, has been performed by the Korean Ministry of Health and Welfare. The 3rd KNHANES which used the data in this study was conducted in 2005 and consisted of three components: a Health Interview Survey including health behaviors and beliefs, a Health Examination Survey, and a Nutrition Survey. The target population for this study was civilian non-institutionalized individuals aged >60 years, therefore, we used the data of 1,127 subjects aged >60. The prevalence of diabetes among the elderly was 27.3% which estimated as the proportions of known cases of diabetes and the proportions of cases of diabetes as defined by ADA (a fasting plasma glucose value≥126mg/dl).

## DIFFERENTIAL AGE PATTERNS OF ORAL HEALTH BY RACE/ETHNICITY AND SOCIOECONOMIC STATUS

J. Kim, L. Baker, H. Seirawan, E. Crimmins, *University of Southern California, Los Angeles, California*

Previous studies have shown disparities in oral health by race and ethnicity and by socioeconomic status. It is not clear how differential age patterns of deterioration of oral health contribute to these differentials. This paper examines age patterns on a range of oral health indicators differentiated by race/ethnicity and socioeconomic status. Using the National Health and Nutrition Examination Surveys (NHANES) 1999-2008, we examine several indicators of oral health: edentulism, presence of caries and caries experience, root caries, and periodontal disease. Our analysis includes respondents ages 20+ who participated in the oral health examination (N=23,090). The results show that those with lower education tend to have oral health problems earlier in life; that is, blacks acquire oral problems at earlier ages than whites and poorer people earlier than those who are better off. This provides another example of how members of minority groups and those with lower socioeconomic status "age" earlier than others. Earlier and rapid development of oral health problems among racial/ethnic minorities and persons of low socioeconomic may result from a lack of dental intervention, and implies that more attention should be paid to earlier dental intervention. This study expects to provide participants with a better understanding of differential age patterns of oral health by race and ethnicity as well as socioeconomic status and clarify the importance of earlier dental intervention among these groups.

# SESSION 1180 (PAPER)

## EMPLOYMENT AND HEALTH

### THE ROLE OF SOCIAL INTEGRATION AND SUPPORT ON THE RELATIONSHIP BETWEEN JOB LOSS AND HEALTH

M.E. Canavan[1], W. Gallo[2], S.A. Burgard[3], *1. Epidemiology and Public Health, Yale University, New Haven, Connecticut, 2. Hunter College, New York, New York, 3. University of Michigan, Ann Arbor, Michigan*

Numerous studies have demonstrated that job loss precipitates adverse mental health effects. Yet studies of whether social factors moderate the effect of job loss are far fewer. While social support and social integration have consistently been linked to better health, their interaction with job loss is not thoroughly understood. In this study, we used data (N=3,258 observations) from the American Changing Lives study (ACL), a longitudinal cohort study that oversamples adults over 60 at four time periods (1986, 1989, 1994, and 2001), to investigate the moderating effect of social support and social integration on changes in depressive symptoms resulting from job loss. We hypothesized that: (1) higher levels of social support and social integration would diminish the mental health effect of job loss; and (2) the effect modification of these social variables would not operate independently of age. Our findings confirm the hypotheses. The results indicate that job losers with higher levels of social integration had smaller increases in depressive symptoms than those with lower levels. Whereas we did not find an analogous relationship for social support among individuals over fifty, a significant interactive effect was present for individuals aged 49 and younger. That is, job losers with higher levels of social support had smaller increases in depressive symptoms than those with lower levels. These findings suggest that social variables play an important role in moderating the extent of negative health consequences of involuntary job loss.

### PATH MODEL OF REDUCED EMPLOYMENT, MATERIAL HARDSHIP, AND DEPRESSION OF FAMILY CAREGIVER OF AN ALZHEIMER'S PATIENT

I. Nam, E. Choi, *School of Social Work, Univeristy of Pittsburgh, Pittsburgh, Pennsylvania*

Many studies have reported the direct and indirect costs of dementia care, however, little attention is paid to concerns about reduced employment due to caregiving needs impacting the emotional health of family caregivers. The purpose of this study was to evaluate how reduced employment and material hardship directly and indirectly influence depressive symptoms in caregivers of a demented family member. Cross-sectional and longitudinal data were examined from the Resources of Enhanced Alzheimer's Caregiver Health project. Caregivers (N = 671) were questioned on whether they stopped or reduced work because of care recipient's need for care, material hardship, and depressive symptoms (CES-D) at an initial interview and 6 month follow-up. Four structural equation path models examined the direct and indirect relationship among reduced employment, material hardship, and emotional health. The model of the effect of reduced employment on emotional health fits well to the observed data .There were significant positive predictions of depression at both the initial interview and the 6 month follow-up by material hardship and there was significant prediction of material hardship by reduced employment. There were also cross-sectionally and longitudinally significant indirect predictions of depression by reduced employment through material hardship. Results suggest that material hardship may be an important predictor of depression cross-sectionally and longitudinally, and reduced employment due to caregiving needs may influence material hardship. The effect of reduced employment may influence material hardship in the context of caregiving that may have a negative effect on depressive symptoms.

### EMPLOYMENT BARRIERS AND PSYCHOLOGICAL WELL-BEING AMONG KOREAN OLDER IMMIGRANTS IN LOS ANGELES

M. Rhee, I. Chi, J. Yi, *University of Southern California, Los Angeles, California*

During the last decade, the United States has undergone two major demographic changes: the aging of the population and the increase of immigrants. With the nation's concern on workforce shortage and increasing costs of health care and Social Security caused by the aging of the population, substantial amount of research has been done on how to recruit and retain older workers. However, limited attention has been paid to identifying employment barriers of ethnic minority older immigrants who often face multiple risks such as age discrimination, racial discrimination and language barriers when entering the labor market. Employment is a very critical component of older immigrants that affect their quality of life. Moreover, for many sub-ethnic Asian Americans, their cultural uniqueness is lost by often being lumped into Asians. This study attempts to fill the research gap by conducting more in-depth exploration of Korean older immigrants' experiences of employment barriers and their psychological well-being. A mixed-method approach was used, which consisted of focus groups (n=31), individual interviews (n=5) and self-administered questionnaires of the same participants (n=36). Either employed or unemployed Korean older immigrants aged 50 and older who live mostly in Los Angeles County participated in the study. The findings of the study provide empirical evidence that Korean older immigrants face multiple barriers of age, language, dual cultural conflict, restricted job market and lack of social network. Also, the depression level of the unemployed Korean older immigrants (CES-D mdn=26.0) was found to be significantly higher than that of the employed (CES-D mdn=12.5).

### PRE-RETIREMENT PERCEIVED HEALTH AND YEARS SPENT IN RETIREMENT AS PREDICTORS OF BRIDGE EMPLOYMENT INTENTIONS – A 16-YEAR PROSPECTIVE STUDY

M.E. von Bonsdorff[1,2], T. Rantanen[1], M. von Bonsdorff[1], J. Seitsamo[2], J. Ilmarinen[2], *1. Health Sciences, University of Jyväskylä, Jyväskylä, Finland, 2. Finnish Institute of Occupational Health, Helsinki, Finland*

Background Bridge employment, referring to any paid work after an individual retires, is likely to increase in the 21st Century. We studied the effect of the number of years spent in retirement on individuals' intentions to participate in bridge employment. Methods Participants of the baseline study in 1981 were Finnish municipal employees born between 1923 and 1937 (N=6,257). The follow-up was undertaken in 1997 (n=3,817). Altogether 3,494 retired individuals reported on their intentions to participate in bridge employment in their career job or in another field. Baseline perceived health was measured with a scale ranging between 1=very poor to 5=very good. Register-based data on retirement benefits and years spent in retirement (mean=7.5, SD=3.8, range=0-17) were collected from Finnish Pension Centre. Data was analyzed with logistic regression analysis (SPSS 15.0). Results Of the respondents 37 percent had considered bridge employment. After adjusting for age, gender, occupational group, and pension benefit, each additional year spent in retirement decreased the intention to participate in bridge employment (odds ratio [OR] 0.84, 95% confidence interval [CI] 0.78-0.91). A one-class increase in pre-retirement perceived health (OR 1.15, 95% CI 1.05-1.27) predicted bridge employment intentions in 1997. Conclusions This 16-year prospective follow-up indicated that the number of years spent in retirement and pre-retirement perceived health predicted individuals' willingness to participate in bridge employment.

## SESSION 1185 (SYMPOSIUM)

### END-OF-LIFE CARE: PREFERENCES, NEEDS, AND SERVICES

Chair: *L. Winter, Thomas Jefferson University, Philadelphia, Pennsylvania*
Co-Chair: *N. Hodgson, Thomas Jefferson University, Philadelphia, Pennsylvania*
Discussant: *J. Reifsnyder, Thomas Jefferson University, Philadelphia, Pennsylvania*

Research has identified multiple shortcomings and unmet needs in end-of-life (EOL) care for elderly individuals in the U.S. Presentations in this symposisum will explore a range of EOL care issues, from advance care planning to innovative palliative care services. These are examined in a variety of care settings and populations, including nursing homes, hospitals, and the community.

### ELDERS WHO WOULD ACCEPT VS. REJECT LIFE-PROLONGING CARE: DIFFERENCES IN LIVING WILL COMPLETION, DISCUSSIONS WITH FAMILY PROXIES, AND ACCURACY OF PROXY SUBSTITUTED JUDGMENT

L. Winter, S.M. Parks, *Thomas Jefferson University, Philadelphia, Pennsylvania*

Because most patients are decisionally incapacitated at the end of life, patient autonomy often relies on advance-care documents or proxies' substituted judgment. In a study of 202 elders-proxy dyads, we asked elders a living will question, asked their proxies their substituted judgment, and assessed whether elders had completed a living will and had discussed wishes with their proxies. We compared elders who would accept life-prolonging (LP) treatments from those who would reject it in terms of whether they had (1) completed a living will, (2) discussed wishes with family, and (3) the percent of proxies who identified their elders' wishes accurately. Elders who would reject LP treatments were significantly more likely to have completed a living will, discussed their wishes with proxies, and have proxies who correctly understand their wishes. The autonomy of elders who would accept LP treatments may be at greater risk than that of the rejectors.

### PALLIATIVE CARE REFERRAL PATTERNS IN HOSPITALIZED OLDER ADULTS

B. Reville, S.M. Parks, *Thomas Jefferson University, Philadelphia, Pennsylvania*

Palliative care intervention by an interdisciplinary consultation team has been shown to relieve symptoms and have other benefits for older adults with life-limiting illness. An in-patient palliative care consultation service established at Thomas Jefferson University Hospital in March 2006, grew rapidly from its 1st year (180 consults, 18 per month) to its 3rd year (389 consults, 32.4 per month). More than involved older adults (>65+ years) with life-limiting illness. We describe palliative care consultation referral patterns, including patient diagnoses, co-morbidities, referring specialties, reasons for consult, timing of consult during hospitalization and disposition and compare them to patients 65+ not receiving palliative care services. Despite its success, this consultation service remains under-utilized in this patient group, especially for pain and symptom management. These findings identify ways to improve utilization of palliative care services and quality of care for older hospitalized adults.

### PERCEPTION OF PALLIATIVE CARE NEEDS OF NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA

K.B. Hirschman[1,2,3], A.M. Corcoran[3,4,7], S. Panzer[1], J.M. Kapo[4,5,6], D.J. Casarett[4,5,6], *1. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania, 2. NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania, 3. Insitute on Aging, University of Pennsylvania, Philadelphia, Pennsylvania, 4. Department of Medicine, Division of Geriatrics, University of Pennsylvania, Philadelphia, Pennsylvania, 5. Center for Bioethics, University of Pennsylvania, Philadelphia, Pennsylvania, 6. Philadelphia Veterans Administration Medical Center, Philadelphia, Pennsylvania, 7. Wissahickon Hospice, University of Pennsylvania Health System, Philadelphia, Pennsylvania*

The goal of this study was to identify palliative care needs of nursing home (NH) residents with advanced dementia through in-depth qualitative interviews with their family members (N=58) and surveying NH providers (N=109). Difficulty in assessing pain was identified by 93% of NH providers and 57% of family members wanted to learn more about how to detect pain. NH providers (74%) indicated that family members of advanced dementia residents need more explanation about their relatives' illness than relatives of other NH residents. There were no racial differences in reported palliative care needs however, when asked what type of health care they think their relative would want now 56% of black family members reported a palliative approach to care versus 97% of white family members. All of the needs identified by family members and NH providers match with services provided by programs such as hospice or can be provided NH staff.

### EFFICACY OF PALLIATIVE COMPLEMENTARY THERAPIES IN NURSING HOME RESIDENTS WITH CANCER

N. Hodgson, *Center for Applied Research on Aging and Health, Thomas Jefferson University, Philadelphia, Pennsylvania*

The study investigated the efficacy of two complementary therapies for relief of distress in medically frail nursing home residents with cancer using neuroendocrinological and observational outcomes. Using repeated measures, cross-over design two types of commonly used complementary therapies (reflexology and relaxation massage) were compared in a sample of 18 nursing home residents with incident diagnoses of solid tumors. Four types of data were collected over the 8 week study period: 1) salivary cortisol; 2) Apparent Affect Rating Scale; 3) Checklist of Nonverbal Pain Indicators; and 4) other demographic measures. There was a significant reduction in cortisol (F=7.5, P=.008), and agitation (F=3.6, P=.031) following both reflexology and massage treatments compared to no treatment. No statistical differences existed between reflexology and massage conditions. No negative effects were reported. These findings can be used as a foundation for understanding the palliative effects of complementary therapies in nursing home residents with cancer. (ACS-IRG #114958)

## SESSION 1190 (SYMPOSIUM)

### EXPLORING THE CONTEXT OF NON-NORMATIVE INFORMAL CAREGIVING SITUATIONS

Chair: *T.M. Cooney, Human Dev. & Family Studies, University of Missouri, Columbia, Missouri*
Discussant: *K. Piercy, Utah State University, Logan, Utah*

This symposium considers the topic of informal caregiving in a variety of situations largely overlooked by researchers because they fall outside the parameters of "normative caregiving" generally performed by spouses or nearby adult offspring. Included in our consideration are: adults assisting chronically ill lesbian, gay or bisexual friends; women providing end-of-life care to ex-husbands; young people caregiving for grandparents; immigrants providing transnational care to older family members in Ghana; and Korean immigrants to Singapore who exchange care with aging parents across borders. Findings from these studies provide evidence as to whether the large body of findings generated from past research on more typical caregiving situations applies more generally to a broader range of care situations. Contextual factors are central to understanding the array of caregiving issues discussed in this symposium. Contextual influences include caregiver age and competing roles, relationship history, emotional investment, received support, geographic distance, cultural barriers, and social norms and attitudes. These influences appear to predict the establishment of these caregiving arrangements, the negotiations that occur within the caregiving relationship, the extent and type of care provided by caregivers, the primary and secondary stressors caregivers report, the coping strategies caregivers employ, and the outcomes they experience. Consideration is given to the adequacy of prior conceptualization and theorizing in the caregiving literature for understanding the experiences of these unique groups of caregivers. Suggestions for practice and policy are also offered.

### "THAT'S WHAT FRIENDS DO:" INFORMAL CAREGIVING FOR CHRONICALLY ILL LESBIAN, GAY, AND BISEXUAL ELDERS

A. Muraco[1], K. Fredriksen-Goldsen[2], *1. Loyola Marymount University, Los Angeles, CA, 2. University of Washington School of Social Work, Seattle, Washington*

This study examines the relationships between friends; a caregiver who provides care to a care recipient, who is a gay, lesbian, or bisexual (lgb) older adult in need of assistance due to chronic physical or mental health conditions. Using a sample of 17 care pairs (n=34), this work draws from qualitative interview data to examine the connection between caregiving and friendship for lgb elders. Findings from the study show: a) both the care recipient and the caregiver often receive benefits from the presence of caregiving in their relationship; b) these caregiving bonds often constitute kinship ties; c) caregiving alters and sometimes challenges the friendship; and d) while caregiving is implicit in some individuals' definitions of friendship, friends assume differential levels of commitment and responsibility in providing care. Studying this population of lgb adults expands our knowledge about the diversity of care arrangements and needs within a relational context.

### CAREGIVING FOR AN EX: WOMEN'S EXPERIENCES OF PROVIDING CARE TO FORMER HUSBANDS

T.M. Cooney, C.M. Proulx, J.J. Benson, L.A. Snyder, K. Haq, *Human Dev. & Family Studies, University of Missouri, Columbia, Missouri*

This study explores women's experiences of providing end-of-life care to ex-husbands. Twelve women, ages 45 – 77, completed background questionnaires and unstructured telephone interviews addressing motivations to provide care, the process leading to the care decision, their behavioral and emotional experiences of caregiving, and adequacy of support received while caregiving for an ex-husband. Preliminary analyses suggest that ex-wives often assumed the caregiver role because there were few other care options, or they wished to spare their offspring the task. These women reported varying relational experiences as caregivers: for some, caregiving provided an opportunity to resolve past differences with the ex-spouse; others reported needing to explicitly renegotiate the meaning of their relationship with former husbands. Caregivers noted varied responses from network members, as well as variation in the amount of assistance offered with caregiving. Most caregivers described a mix of positive (e.g., care) and negative (e.g., guilt) emotions in the caregiving role.

### GRANDCHILDREN CAREGIVERS: THE DECISION TO PROVIDE CARE TO GRANDPARENTS

C.A. Fruhauf[1], N. Orel[2], *1. Human Development & Family Studies, Colorado State University, Fort Collins, Colorado, 2. Bowling Green State University, Bowling Green, Ohio*

It is well documented in the caregiving literature that the majority of care is provided by family members. However, little is known about grandchildren who provide care to their frail and/or cognitively impaired grandparents. Guided by the life course perspective, qualitative research conducted over the past ten years has led us to better understand the risks and rewards of being a grandchild caregiver. Grandchildren often experience difficult peer relationships and challenges with educational/career tasks. Rewards of caregiving include building skills, closer relationship(s) with family members and grandparents, and career interests in gerontology. Further, grandchildren's decision to provide care is often influenced by how others perceive their caregiving role and the negative or positive support from other family members. Future research would benefit from two main areas: (a) a systematic quantitative exploration of the risks and rewards of being a grandchild caregiver and (b) understanding the grandparent-grandchild caregiver dyad.

### DETERMINANTS OF INTERNATIONAL LONG-DISTANCE ELDERCARE: EVIDENCE FROM GHANAIAN IMMIGRANTS IN THE UNITED STATES

S.R. Kodwo, *Social Work, University of North Carolina at Pembroke, Pembroke, North Carolina*

The objective of this study was to examine the influence filial obligation, elder vulnerability, immigrant vulnerability, and support received from elderly person have on the level of care Ghanaian immigrants give to their elderly relatives in Ghana. Using a convenient sampling method, 124 Ghanaian immigrants were surveyed for this study. Hierarchical multiple regression and logistic regression were conducted to test the research hypotheses. Study results revealed that the dominant type of eldercare provided was emotional care. However, serious financial problem experienced by elderly person, and immigrant's level of income significantly determined the level of financial support provided. Feelings of high obligation, and readiness to show love for elderly relatives also were found to influence eldercare. Overall, there was evidence to conclude that most immigrants provided care to their elderly relatives and that most were influenced by the social and cultural tenets that underlie elder caregiving in Ghanaian society.

### TRANSNATIONAL MOBILITY OF OLDER PEOPLE FOR CARE-GIVING AND CO-RESIDENCE IN A NON-CONVENTIONAL IMMIGRANT STATE: A CASE STUDY OF KOREANS IN SINGAPORE

J. Kim, *Institute for East Asian Studies, Sogang University, Seoul, Republic of Korea*

This study examines the transnational mobility and care-giving/receiving of older people who moved to provide care-giving for their grandchildren or to co-reside with their adult children who have migrated to work abroad in a non-conventional immigrant state (i.e. where there is no immigration scheme for family union). What are the challenges, dilemma and compromised practices for care-giving in a non-conventional immigrant state? Semi-structured in-depth interviews with multiple members of each family (both the migrant couples and at least one (up to all four) of their surviving elderly parents) were conducted for 26 three-generational families in Singapore and Korea in 2006 and 2007. Among them, this study focuses on cases where migrant adult children's families either co-resided with their elderly parents in Singapore or on those families with elderly parents who spent a significant part of a year with their grandchildren or who had played a significant role in care-giving for their grandchildren in the past. This study found that although family obligation for caregiving increased mobility between older people and their migrant adult children (Baldassar

2007; Finch 2007; Mason 2004), like their counterparts in conventional immigrant states (Treas and Mazumdar 2002; Treas and Mazumdar 2004; Treas 2008), immigration regulations and past family history of care and support further shaped their current arrangements of care-giving. This paper will further discuss the dilemmas, the coping strategies and the patterned arrangements of the negotiated practices of care and support across the border.

## SESSION 1195 (SYMPOSIUM)

### GETTING TO KNOW YOU: THE SOCIAL WORLD OF ASSISTED LIVING

Chair: *A. McQueen, Portland State University, Portland, Oregon*
Discussant: *D.J. Dobbs, University of South Florida, Tampa, Florida*

Assisted living has often been described as a social model of long-term care differentiated by a homelike environment and a philosophy that places primary importance on ensuring residents' dignity and autonomy, encouraging their independence, and facilitating the involvement of families and friends in their lives. Few studies, however, have examined the social world of assisted living residents in detail. This symposium will explore the social interactions and personal relationships of residents in assisted living settings through a variety of lenses, using both qualitative and quantitative data sources. Specific presentation topics include, the ways residents' form and manage relationships with each other, factors that influence social interactions among table mates during mealtimes, issues related to sexuality and intimacy among residents, how various factors influence residents' subjective health and well-being, and how social interactions involving humor impact residents' mental health. Social relationships can foster older adults' sense of belonging, as well as impact daily mood and contribute to, or detract from, their emotional well-being. Learning more about factors that influence the social environment within assisted living settings may assist practitioners in developing policies and practices that encourage positive interactions and limit negative interactions, thereby exerting a positive influence on psychological health.

### STRANGERS AND FRIENDS:RESIDENTS' SOCIAL RELATIONSHIPS IN ASSISTED LIVING

C.L. Kemp, M. Ball, M.M. Perkins, C. Hollingsworth, M. Sweatman, S. Luo, V. Stanley, *The Gerontology Institute, Georgia State University, Atlanta, Georgia*

Social relationships can have profound effects on physical and mental well-being, especially in later life when individuals are at heightened risk of social isolation. Consequently, the desire for increased social interaction is one reason many older adults relocate to assisted living facilities (ALFs). Yet few studies have examined social relationships in ALFs, and none has focused on residents' relationships with each other. This paper presents an analysis of ethnographic data from three AFLs in our NIA-funded study. We consider how residents experience relationships with others and identify influential factors. Findings suggest residents' relationships can be meaningful, but vary widely by individual and relationship partner, ranging in contact, familiarity, and attachment levels. Individual factors, including gender, age, and health, and facility factors, such as size, frailty levels, physical layout, and policies, join to influence interactions and relationships. We conclude by discussing successful strategies that help residents negotiate and manage their relationships.

### ITS MORE THAN 'FOOD ON THE PLATE'- MEALTIMES AS AN ESSENTIAL SOCIAL ACTIVITY IN FORMAL CARE

H. Keller, *Family Relations and Applied Nutrition, University of Guelph, Guelph, Ontario, Canada*

After attending this session, participants will be able to 1) describe in general terms the Life Nourishment theory and 2) how social interaction may be promoted for older adults living in formal care. Mealtimes are readily acknowledged to be an important social activity among family members, however the social nature of meals in formal care is often neglected. A longitudinal grounded theory study bridging community and long-term care for persons with dementia has resulted in the development of the Life Nourishment Theory. Developed from interviews with family care partners and persons with dementia, this theory explains how 'mealtimes mirror the way we are' through 'being connected', 'honouring identity', and 'adapting to an evolving life'. This theory will be introduced and supplemented with data from mealtime participant observations (n=63 tables) and retirement home resident interviews (n=18) to discuss how mealtimes can be a more positive social experience for residents in formal care.

### HILARIOUS OR DELETERIOUS: HUMOR, SOCIAL INTERACTIONS, AND MENTAL HEALTH OF OLDER ADULTS IN ASSISTED LIVING

A. McQueen, *Institute on Aging, Portland State University, Portland, Oregon*

Research indicates that social interactions are related to older adults' mental and physical health. Moreover, the absence of social ties has been shown to put older adults at greater risk for depression, cognitive decline, and other health risks. Social interactions involving humor may be particularly salient in the lives of older adults, who often face multiple age-related losses, especially those living in living in institutional or long-term care settings. Although having a "sense of humor" is widely regarded as a positive attribute, attempts at humor are not always received favorably. In fact, interactions involving humor may be perceived as supportive or destructive, thereby affecting the interpersonal relationships and emotional well-being of those involved. Drawing upon literature from social support and social exchanges, the psychology of humor, and long-term care policy, this study examines social interactions involving humor and how they impact the psychological well-being of assisted living residents.

### NOT SO HAPPILY EVER AFTER: EXPLORING LONELINESS, SEXUAL COMPETITION AND CONFLICT IN ASSISTED LIVING

E.O. Burgess, A.A. Bender, C.L. Kemp, C.E. Barmon, *Gerontology Institute, Georgia State University, Atlanta, Georgia*

Contrary to ageist stereotypes, many older adults are interested in intimate and sexual behavior. Yet, their intimate and sexual experiences are influenced by access to partners, health and cognitive status, and their environment, particularly for those residing in assisted living facilities (ALFs). This grounded theory study involves in-depth interviews, focus groups, and participant observations with administrators, staff, family members and residents in six ALFs in a metropolitan area. Lack of opportunity-often related to the gender imbalance among ALF residents- means some residents have unmet sexual and intimate desires which can result in loneliness. In some cases, the scarcity of intimate companionship also leads to competition, conflict, and jealousy. Furthermore, variability in the desire for intimacy or sexuality can lead to misunderstandings about relationships, including unrequited feelings and conflict about the appropriateness of intimate relationships in AL. We conclude by addressing the suitability of interventions by administrators, staff, or family members.

### AL RESIDENTS' SUBJECTIVE HEALTH AND WELLBEING: RESIDENTIAL CONTEXT AND RELATIONSHIP INFLUENCES

D. Street[1], S. Burge[2], *1. Department of Sociology, University at Buffalo, SUNY, Buffalo, New York, 2. University of Oklahoma, Norman, Oklahoma*

Using data from 411 cognitively intact AL residents 60 and older from the Florida Study of Assisted Living, we explore how residential circumstances and social relationships influence elderly assisted living

(AL) residents' subjective health and well-being. For residential context, the type of facility influenced outcomes on several wellbeing measures, but made little difference in terms of subjective health. Facility type influenced only one of the health measures, but several of the well-being measures. Having control over the move and place of prior residence were important predictors of several wellbeing measures, but none of the health measures. Relationships with family were seldom significant; contact with friends outside AL and with co-residents influence several dimensions of subjective health and wellbeing. Relationships with family, friends, AL staff and co-residents are seldom significant predictors of subjective health, but those social relationships are consistent predictors of residents' wellbeing.

## SESSION 1200 (SYMPOSIUM)

### GSA TASK FORCE ON MENTORING: LADDER MENTORING - EVERYONE CAN LEND A HELPING HAND

Chair: *E.L. Idler, Sociology, Emory University, Atlanta, Georgia*
Discussant: *E.L. Idler, Sociology, Emory University, Atlanta, Georgia*

Providing opportunity and encouragement for mentoring is a function of most professional organizations and this has historically been done well by GSA. As an organization with special insight into the growth and development of individuals throughout the life course, and and understanding of the critically important societal underpinning of intergenerational relations, GSA brings a lot of intellectual horsepower to the practice of mentoring. One of the most central insights is that mentoring should be a continuous activity across the life course of a career – from the undergraduate student attending GSA for the first time, to the retired professor, everyone needs advice, and everyone has some wisdom they can impart to others. Everyone at GSA is on the ladder; everyone can look up to those ahead for a helping hand, and everyone can extend a helping hand to those on a lower rung. It may not be easy to see yourself on the very top of the ladder, but one rung up isn't so hard to imagine. And the people who are there are the most valuable advisers of all. Transitions from one career stage to another are some of the key moments when we need advice. In this symposium we will hear from GSA members at all career stages, about their experiences of being mentored and mentoring others. Then members of the Task Force will discuss the panel's comments and new GSA mentoring initiatives.

### EMERGING STUDENTS AND PROFESSIONALS ORGANIZATION

S. Bodnar Deren, *Sociology, Instititute for Health, Health Care Policy, and Aging Research, Rutgers University, New Brunswick, New Jersey*

From refining a dissertation topic, to submitting a first paper to a research journal, to applying for postdoctoral, tenure-track faculty, or clinical or professional positions ESPO members can use advice! But they can be mentors too - by welcoming a new member to GSA, serving in leadership positions within ESPO, or serving as campus ambassadors. An ESPO member will reflect on her most important experiences of being mentored, and discuss ways in which ESPO can promote mentoring before, during, and after the annual GSA meeting.

### EARLY CAREER MENTORING

S. Sanders, *University of Iowa, Iowa City, Iowa*

Junior faculty are facing the challenges of settling into a new institution, starting research projects, learning how to teach, forming professional relationships, and generally laying the groundwork for a career in aging research and practice. At the same time many are starting families and making transitions in their personal lives. This is a critical time for mentoring, when the graduate and professional school mentors are no longer a daily presence, and new mentors may not have emerged. GSA can play a critical role in building bridges between the old and the new environments and easing those transitions. At the same time, early career professionals, from the vantage point of their new position, have a wealth of advice to offer those entering the job market or looking for postdoctoral program opportunities.

### HALF WAY UP THE LADDER: MID-CAREER MENTORING

K.E. Whitfield, *Psychology and Neuroscience, Duke University, Durham, North Carolina*

Mid-career GSA members sit halfway up the career ladder; they are close enough to get a good view of what it means to be at the top and remember what it was like in the beginning. The transitions at mid-career bring new opportunities and challenges. These challenges include more requests to mentor others by sharing experiences, more need for 'next level' mentoring, more offers for leadership at home institutions and in professional organizations, and more decisions about the focus and direction of one's scholarship. The objective of this presentation will be to demonstrate how mentorship up and down the career ladder for the mid career scholar is important by addressing three issues to discuss with mentors and mentees: 1) What is expected at the next level, 2) Setting goals and evaluating success, and 3) Identifying the right balance between scholarship and leadership.

### MATURE CAREER

R. McCarter, *Penn State University, State College, Pennsylvania*

Those who are at the zenith of their careers have a special responsibility to pass on their experiences,their trials and their successes.They are easy to think of as mentors since they have achieved senior status in a highly competitive environment.They have developed insights into successful strategies and means of avoiding pitfalls along the way.As they look ahead to future challenges and retirement they, and GSA, provide an exceptional resource to developing scientists for access people in leadership positions who have maintained intellectual curiosity and professional interest.

### RETIREMENT

M. Mezey, *New York University College of Nursing, New York, New York*

As an organization devoted to research and practice in the field of aging, GSA is extraordinarily friendly to senior scholars, who represent role models for absolutely everyone. But even those in retirement from academic or professional positions frequently are asked to serve active roles on boards and in advisory positions, for which mentors are needed. And the transition to retirement can in itself be a significant moment to get mentoring from those who have already retired.

## SESSION 1205 (POSTER)

### HEALTH PROMOTION

### COLORECTAL CANCER SCREENING AMONG CHINESE ADULTS: DECISION MAKING AND ASSOCIATE FACTORS

V. Lou[1,2], M.C. Wong[3], K. Tsoi[3], S.S. Ng[3], S. Choi[3], S. Griffiths[3], J. Sung[3], *1. Social Work & Social Administration, The University of Hong Kong, Hong Kong, Hong Kong, 2. Sau Po Centre on Ageing, The Unviersity of Hong Kong, Hong Kong, Hong Kong, 3. The Chinese Unviersity of Hong Kong, Hong Kong, Hong Kong*

Background: A colorectal cancer (CRC) screening programme targeting adults aged 50-70 by offering free CRC education and Faecal Immunochemical Tests (FITs) was launched in Hong Kong. Community elderly centres recruited participants via CRC health education talks. Objective: This study examined the decision making process for participants in the FIT screening, specifically focusing on whom participants would consider during the decision-making process, decision-making process satisfaction, and decision regret. Method: A 0.5 hour standardized videotaped education session followed by a presentation by trained instructors focusing on risks, symptoms, and screening methods was held before screening. A questionnaire was administered to 275 participants after the FIT screening to investigate whom they considered in the decision making process (i.e., self, family members, and professionals), decision-making process satisfaction, and the Decision Regret Scale (DRS). Results: Half (n=143) of the participants considered all three parties to some extent before making the decision to join the FIT screening. Almost all participants were satisfied with their decision-making process (98.2%). Decision regret was significantly associated with satisfaction with the decision-making process (r=-.41,p<.01). More consideration of self was associated with a lessened decision regret (r=-.25, p<.01). Conclusions: Half of the respondents considered self, family members, and professionals before making the decision to participate in the FIT screening. Most participants were satisfied with their decisions. Satisfaction with the decision-making process and consideration of self were associated with less decision regret. This programme successfully helped participants make CRC screening decisions with low regret and high satisfaction and thus deserves promotion.

## A SENIOR HEALTH AND WELLNESS COURSE AND THE SELF-RATED HEALTH OF STUDENTS

R.L. Lee[1], K. Kopera-Frye[2], *1. University of Nevada, Reno, Reno, Nevada, 2. University of Louisianna at Monroe, Monroe, Louisiana*

A health and wellness course was taught to older adults (60+) residing in rural counties of northern Nevada. Researchers suggest self-rated health of older adult students (n=14) would improve over the duration of the course. The class met twice a week for ten weeks; topics covered include physical activity, nutrition, social and emotional health. Self-rated health was reported by students on a five-point likert scale bi-weekly. Overall, it was found that self-rated health decreased by .50 point. Upon further investigation it was found that students attending 2/3 or more class sessions improved their self-rated health (.25). It may be possible that students participating in more of the course received health information in a more complete context and experienced the full effect of course intent. Increasing students' self-rated health, even slightly, is important due to the measures' link to predicting overall health, functionality, and survival in older adults.

## WHO LIVED HAPPILY THEREAFTER? DIFFERENTIAL EFFECTS OF SUBJECTIVE WELL-BEING ON MORTALITY

M. Wiest, B. Schüz, S. Wurm, C. Tesch-Roemer, *German Centre of Gerontology, Berlin, Germany*

Although the potential of subjective well-being (SWB) to predict mortality has been subject of some studies, findings are inconsistent with regard to several aspects. First, it is unclear whether positive indicators of SWB (life satisfaction, positive affect) and negative indicators of SWB (depression, negative affect) are independent predictors of mortality. Furthermore, the literature reports different effects of SWB in older and younger as well as in healthy and unhealthy populations. This poses the question whether the effects of SWB are stronger or weaker in different subpopulations. This study therefore examines the effects of different SWB indicators on mortality in different populations. We analyzed data of the national representative German Ageing Survey. In a sample of 5,294 participants (40-91 years old), socio-demographic, health and SWB indicators were measured up to two times (1996, 2002). Mortality data was obtained in 2009. Preliminary analyses suggest that only positive indicators of SWB are significant predictors of mortality: Higher positive affect (HR = .86, 95%CI = .75-.99, p < .05) and higher life satisfaction (HR = .81, 95%CI = .73-.91, p < .01) predicted lower mortality controlled for age, gender, and negative affect. In further analyses, different age groups and participants differing in health status will be analyzed. Results will be discussed with regard to possible underlying pathways and to previous findings in order to elucidate whether positive and negative affect are independent predictors of mortality and if effects of SWB are stronger among older and unhealthier subpopulations.

## UNDERSTANDING OLDER ADULTS' COGNITIVE TRAINING BEHAVIORS: SCALES DEVELOPMENT

C. Haley, E.M. Hudak, M. O'Connor, J. Edwards, *Aging Studies, University of South Florida, Tampa, Florida*

Due to the somewhat recent advent of evidence-based cognitive interventions, efforts to understand older adult cognitive training behavior have yet to be undertaken. A next step in improving older adults' health through cognitive training is to learn more about the determinants of participation and adherence. The aim of the current study was to develop scales for studying cognitive training behavior adoption and adherence. Using constructs from Social Cognitive Theory and the Health Belief Model, scales were adapted from existing health behavior scales to measure Self Efficacy for Cognitive Training (SECT), Outcome Expectations for Cognitive Training (OECT), Perceived Susceptibility to Cognitive Decline, Dementia or Alzheimer's Disease (PSUS), and Perceived Severity of Cognitive Decline, Dementia or Alzheimer's Disease (PSEV). Factor and reliability analyses were performed on pilot data from 50 participants recruited for cognitive intervention studies. Results indicated the existence of one factor for SECT. Three factors relating to interpersonal relationships, brain function and activity satisfaction were suggested for OECT. All retained items loaded on one factor for the PSUS and PSEV scales, respectively. Cronbach's alphas were 0.97 (SECT), 0.87 (OECT, interpersonal relationships), 0.79 (OECT, brain function), 0.83 (OECT, activity satisfaction), 0.81 (PSUS) and 0.82 (PSEV). Next steps are to 1) Complete scales validation using data from a larger sample, and 2) Identify factors that serve to motivate or discourage older adults' enrollment in, and adherence to cognitive training. Results may have implications in promoting compliance among participants in research intervention protocols, and in the design and/or promotion of cognitive training programs.

## INFLUENCES ON OLDER ADULTS' DECISION TO OBTAIN INFLUENZA AND PNEUMOCOCCAL VACCINE

C.E. Gould, *Psychology, West Virginia University, Morgantown, West Virginia*

Despite the benefits of influenza vaccination, a surprising number of older adults do not get vaccinated. Secondary analyses were conducted on the 2008 Behavioral Risk Factors Surveillance System (BRFSS) data set to examine influences on older adults' decision to obtain the influenza vaccine or nasal spray. A subset of the sample (N = 11973) was selected to examine a predictors of influenza inoculation using logistic regression analyses. The dependent variable of vaccination behavior consisted of participants who obtained the influenza vaccine and/or nasal spray. Older adult participants were 66.1% female, 81.7% white/non-Hispanic, and 48% were married. Three sets of variables were entered as predictors of influenza inoculation decision: (1) depression and anxiety, perceived health, and disability, (2) demographics, and (3) access to health care and past pneumonia vaccination behavior. The total model fit was significant, $\chi 2 = 21.9$, p = .005, and 76.1% of cases were correctly classified. Despite a significant model fit, the model classified only 53.3% of older adults who were not inoculated. Older adults who obtained previous pneumonia vaccination (OR = 6.4), had a healthcare plan (OR = 1.6), had one primary care doctor (OR = 1.2), or visited a doctor within the last year (OR = 1.9) were more likely to obtain influenza inoculation. Black/non-Hispanic individuals were at greater risk (OR = .50) of not being inoculated in the past year. However, disability, perceived healthy, anxiety and depressive symptoms did not predict influenza inoculation. Future research should why older adults may not have annual influenza vaccinations.

## TRANSLATION ISSUES IN HEALTH PROMOTION RESEARCH: ENGLISH TO SPANISH

G. Acton[1], M.A. Aguilar[2], B. Flores[1], B. Jensen[1], *1. University of Texas at Austin, Austin, Texas, 2. Texas A&M International, Laredo, Texas*

Translating materials from English to Spanish for use in research can be particularly challenging. For example, researchers have noted that although burden has been measured in several studies of Hispanic/Latino family cargivers, the Spanish language does not have a word that translates to the exact meaning of the English word burden. Thus, research measuring the concept of burden may be flawed if conceptual meaning is misunderstood by Spanish-speaking respondents. Further complicating the issue, Spanish-speaking individuals in the southern U.S. often speak a combination of Spanish and English, sometimes referred to as Spanglish. This led to a difficulty encountered in the present research when an instrument that had been previously translated to Spanish and tested for validity and reliability, was not compatible with the dialect of Spanish spoken by the study population and as such, had to be retranslated and reverified before use. This poster presents issues, problems, and solutions encountered while translating to Spanish, a health-promotion intervention and instruments developed in English for English-speaking populations. Brislin's model for translation and back-translation was used to translate the materials for use in a study of health promotion in Hispanic family caregivers of persons with dementia. Brislin's procedure included: 1) translation of English materials to Spanish; 2) review of Spanish materials by Spanish-speaking master's prepared clinicians; 3) back translation from Spanish to English; 4) comparison of original and back-translated English versions by the principal investigator and master's prepared clinicians, 5) resolution of discrepancies. The poster will present translation/back-translation issues, difficulties, solutions, and recommendations for researchers.

### FUTURE TIME PERSPECTIVE, HEALTH LOCUS OF CONTROL, AND HEALTH BEHAVIORS: THE MEDIATING ROLE OF AFFECT

B.J. Ayotte[1], J.H. Patrick[2], E. Goedereis[3], S. Stahl[2], *1. VA Boston Healthcare System, Boston, Massachusetts, 2. West Virginia University, Morgantown, West Virginia, 3. Webster University, St. Louis, Missouri*

Future time perspective (FTP), beliefs about the limited nature of time, and health locus of control (HLoC), beliefs regarding control of health outcomes, are related to health-related behaviors throughout the lifespan. The current analysis examines how FTP and HLoC relate to physical activity and nutrition, and whether these associations are mediated by affect. Data were collected from 574 adults ($M = 26.03$ years, $SD = 13.87$; range 17-88 years). Path analysis examined a model where FTP, external HLoC, and internal HLoC were related to positive and negative affect, which were related to nutrition and physical activity. The final model controlled for age, sex, and education, number of chronic illnesses, and BMI. The final model fit the data well, $\chi 2(7)= 28.77$, $p < .05$, RMSEA = 0.05, CFI = 0.98. FTP was positively related to positive affect and negatively related to negative affect, internal HLoC was positively related to positive affect, positive affect was positively related to physical activity and nutrition, and negative affect was negatively related to physical activity and nutrition. Direct paths from internal HLoC and external HLoC were added based on modification indices. FTP was indirectly related to nutrition and physical activity through positive and negative affect, while internal HLoC was indirectly related to nutrition and physical activity through positive affect. These findings suggest that positive and negative affect at least partially mediate the associations between HLoC, FTP, and health-related behaviors.

### CONTENT LINKING PHYSICAL ACTIVITY AND COGNITIVE HEALTH IN TOP-CIRCULATING MAGAZINES, 2006-2008

A. Mathews[1], S. Corwin[2], D.B. Friedman[2], S.B. Laditka[3], N. Colabianchi[2], K. Montgomery[2], *1. Health and Exercise Science, Furman University, Greenville, South Carolina, 2. University of South Carolina, Columbia, South Carolina, 3. University of North Carolina at Charlotte, Charlotte, North Carolina*

Physical activity may promote cognitive health in older adults. Popular print media plays an important role in preventive health communication. This study examined articles discussing associations between physical activity and cognitive health in top-circulating magazines targeting older adults. Focused on 2006-2008 publications, 42,753 pages from 537 issues were reviewed. Twenty-six articles were identified. Scientific studies examining the relationship between physical activity and cognitive health were described in 46.2% of the articles. An explanation for the association between physical activity and cognitive health was provided in 57.7% of articles. The explanations provided in the articles were compared to explanations in the scientific literature; the explanations presented in the articles were consistent with empirical evidence. Recommendations for physical activity were presented in 80.8% of articles; these recommendations varied greatly (90-300 minutes of physical activity per week). The prevalence of cognitive decline was discussed in 19% of articles; 27% mentioned that some degree of cognitive decline is normal with age. Memory was mentioned in 38.5% of articles; only 15.4% of articles described characteristics of cognitive decline other than memory loss. The majority of illustrations were of White persons (81.0%); ethnicity was not mentioned in the text. Results suggest an opportunity for greater coverage about the role of physical activity in promoting cognitive health in the popular media targeted toward older adults. Content would benefit from including text and illustrations that are culturally sensitive to multiple racial/ethnic groups, and recommendations consistent with the U.S. guidelines for physical activity.

### EXPLORING THE GREEN THUMBS, HEALTHY JOINTS PROGRAM: PROGRAM CHARACTERISTICS AND ENGAGEMENT

L. Schlosnagle[1], T. Karns[1], J. Strough[1], J. Hayhurst-Marshall[2], *1. West Virginia University, Morgantown, West Virginia, 2. Center for Excellence in Disabilities at West Virginia University, Morgantown, West Virginia*

Health promotion programs aimed at increasing physical activity in older adults can help to lower the prevalence of risk factors such as cardiovascular disease, hypertension, obesity, and depression (Nelson et al., 2007; U.S. Department of Health and Human Services, 1996). Physical activity modified for older adults who are suffering from a disability can be therapeutic and beneficial (Kesaniemi et al, 2001). Thus, it is prudent to maximize the effectiveness of such programs by studying their characteristics (Loeb, O'Neill, & Gueldner, 2001). The Green Thumbs, Healthy Joints program modifies gardening activities using ergonomic tools and raised flower beds with the goal of increasing the involvement of older adults with joint pain. The current study assessed the characteristics of program implementation at 23 different project sites. Project sites were independently coded as either "community" or "assisted living" sites ($\kappa = .81$). Volunteers built raised flower beds at each project site and older adults with joint pain used the flower beds to participate in gardening activities. Project sites that received a greater number of volunteer hours served a greater number of older adults ($r = .77$, $p < .01$). Neither the number of volunteer hours committed, nor the number of older adults served were related to project sites' budget requests or project site type ("community" vs. "assisted living"). This suggests that the number of older adults participating in the Green Thumbs, Healthy Joints program is primarily dependent on the number of volunteer hours each project site receives.

### INTRINSIC MOTIVATION AND WELL-BEING: HOW ARE THEY RELATED TO ACTIVITY LEVEL AMONG OLDER ADULTS?

H.A. Myers[2], K. Kopera-Frye[1], *1. Dept. of Gerontology, Sociology, & Political Science, University of Louisiana at Monroe, Monroe, Louisiana, 2. University of Nevada-Reno, Human Dev. & Fam. Studies/ Gerontology, Reno, Nevada*

Various predictors have been examined in relation to frequency of leisure activity participation among older adults, e.g. educational levels. While health status and pain levels experienced by elders have been examined, no study to date has examined the relationship between types of motivation (e.g., intrinsic motivation and extrinsic, Deci & Ryan) and leisure activity participation. One hundred seventeen older adults (M age = 81.6 yrs.) were surveyed on their frequency of leisure activity participation, well-being according to Ryff, and types of motivation (e.g., internal, for personal growth reasons or external involving reward motives). Results indicated that less frequent leisure activity participation was significantly associated with higher reported pain levels. Also, higher intrinsic motivation was associated with higher activity levels. Surprisingly, activity levels were not related to well-being, nor extrinsic motivation. Results suggest a new direction to explore in understanding older adult's motivation for leisure activity levels.

### POST-DISASTER RESILIENCE IN YOUNGER AND OLDER ADULTS

K.E. Cherry, M. Garrison, S. Wilks, E. Jackson, S. Brigman, M. Sullivan, K. Broome, *Psychology, Louisiana State University, Baton Rouge, Louisiana*

Natural disasters bring catastrophic destruction with loss of homes and property. After a disaster, some people experience physical and psychological distress, while others do not. Resilience, defined as the ability to "bounce back" or respond positively to adversity, implies successful adaptation when challenged by stressful life events (Werner & Smith, 1992). In the present research, we focus on psychological and social factors that are assumed to lessen vulnerability and promote resilience in younger and older adults who experienced Hurricanes Katrina and Rita in 2005. In particular, we hypothesize that dispositional optimism, perceived social support, use of humor and religiosity are individual difference characteristics which are positively associated with psychological well-being and resilience in a post-disaster context. As part of a larger project on post-disaster resilience and recovery, this study focuses on resilience characteristics in residents of St. Bernard Parish in South Louisiana, a geographic region that was nearly destroyed during Hurricane Katrina. Our assessment of post-disaster resilience includes the Connor-Davidson Resilience Scale (Connor & Davidson, 2003) and the Medical Outcomes Study Short Form-36 (SF-36; Ware & Sherbourne, 1992) as a measure of health-related quality of life. Our initial findings are suggestive of the positive role of dispositional optimism and perceived social support in post-disaster health and well-being. Preliminary analyses revealed that use of humor as a coping strategy was also associated with individual resilience. Implications for post-disaster resilience, health promotion, and long-term disaster recovery for researchers, educators and practitioners will be discussed.

### HEALTH-RELATED QUALITY OF LIFE AFTER HURRICANES KATRINA AND RITA

J. Silva Brown[1], K.E. Cherry[2], L. Marks[2], E. Jackson[2], J. Volaufova[3], C. Lefante[3], S. Jazwinski[4], *1. Drury University, Springfield, Missouri, 2. Louisiana State University, Baton Rouge, Louisiana, 3. Louisiana State University Health Sciences Center, New Orleans, Louisiana, 4. Tulane University Health Sciences Center, New Orleans, Louisiana*

Hurricanes Katrina and Rita (HK/R) in 2005 caused unprecedented destruction and disruption in the lives of thousands of people in the Gulf Coast region. We examined the effects of these storms on health-related quality of life and psychological well-being in 59 adults aged 47 to 95 years old from the Louisiana Healthy Aging Study (LHAS). These persons had been tested eight months before the storms and were retested using some of the original LHAS measures and other psychosocial indicators of well-being during the immediate impact period (within the first 6 months of the storms) and in the post-disaster recovery period (6 to 14 months after the storms). Analyses of pre-and post-disaster SF-36 scores yielded declines in physical function and bodily pain across waves of testing. Mental health scores were lower for women than men. Gender differences were observed in religious beliefs and religious coping, favoring women. Religious beliefs and religious coping were negatively correlated with physical function, implying that stronger reliance on religiosity as a coping mechanism may be more likely among those who are less physically capable. Implications of these data for post-disaster recovery and health promotion are discussed.

### SELF-APPRAISALS OF HEALTH GOALS IN OLDER ADULTS

C. Bolkan[1], K. Hooker[2], D. Coehlo[3], *1. Washington State University, Vancouver, Vancouver, Washington, 2. Oregon State University, Corvallis, Oregon, 3. Oregon State University Cascades, Bend, Oregon*

Older adults may maintain healthy functioning through their goal pursuits, which are tied to motivational resources. Individuals' perceptions guide action planning followed by appraisals of these efforts. This process can produce behavioral change and is an avenue for health promotion. We investigated the self-appraisals of health goals; particularly the relationship between both future and current health-related goals. Current goals perceived to be related to future goals, termed teleonomic relevance (TR), may reflect increased motivation to achieve goals. We hypothesized the pursuit of goals perceived to be meaningful and manageable was associated with skill at organizing current goals to map onto future goals (or high TR). We conducted interviews with 85 community-based older adults (mean age=74) recruited from two primary care clinics. We administered the Possible Selves Interview, Personal Projects Analysis, Health Perceptions Questionnaire, and Geriatric Depression Scale. Most participants (63%) identified future health goals and 54% reported current health goals. TR was related to current heath goals ($r=0.25$, $p=0.02$) and future health goals ($r=0.19$, $p =0.04$). Self-appraisal of current goals as meaningful was associated with increased TR ($p <0 .01$). Goal manageability was not significantly associated with TR, but was linked to depressive symptoms ($r=-0.52$, $p <0 .01$) and physical health ($r=0.45$, $p <0 .01$). Engaging in meaningful goals that are not overly challenging, may promote self-efficacy, leading to goal attainment and psychological well-being. A better understanding of goal engagement and self-regulation of health goals fits within a healthy aging framework and has implications for behavioral interventions.

## SESSION 1210 (PAPER)

## MODERATING COGNITIVE DECLINE

### COMBINED INFLUENCE OF ELEVATED PULSE PRESSURE AND APOE ε4 ALLELE EXACERBATES AGE-RELATED DIFFERENCES IN EPISODIC MEMORY

A. Bender, N. Raz, *Institute of Gerontology & Dept. of Psychology, Wayne State University, Detroit, Michigan*

Advanced age is associated with reduced cognitive performance. Vascular risk factors such as hypertension, increased arterial stiffness, and atherosclerosis exacerbate negative effects of age on cognition. Furthermore, carriers of the ε4 allele of the Apolipoprotein E gene, a genetic risk factor for late life Alzheimer's disease, show both greater age-associated vascular damage and decreased cognitive functioning in comparison to non-carriers. Pulse pressure is a common surrogate marker of arterial stiffness, and a cardiovascular risk factor associated with cognitive decline. We hypothesized that physiological (increased pulse pressure) and genetic (ApoE ε4) risk factors will exert a synergistic negative influence on episodic memory performance. We measured blood pressure, free recall, and recognition memory in a lifespan sample of healthy, normotensive adults 18-85 years of age. Among carriers of the ApoE ε4 allele, there was a pronounced, negative relationship between pulse pressure and memory performance; greater pulse pressure was associated with poorer memory. In persons without the ε4 allele, memory was unrelated to pulse pressure. Thus, in the presence of genetic risk, high-normal values of vascular indicators are associated with declines in episodic memory.

### PULMONARY FUNCTION AS A LEADING CAUSE OF COGNITIVE AGING

D. Finkel[1], C.F. Emery[2], *1. School of Social Sciences, Indiana University Southeast, New Albany, Indiana, 2. Ohio State University, Columbus, Ohio*

Reduced pulmonary function is associated with poorer cognitive performance in healthy older adults. Studies show that forced expiratory volume in one second (FEV1) predicts long-term (up to 6 years) performance on measures of fluid intelligence, but not crystallized intelligence. Furthermore, the relationship between FEV1 and fluid abilities is largely driven by genetic factors (Emery et al., 1998). Latent growth curve models demonstrate that the strong linear declines with age found for FEV1 are primarily genetically mediated (Finkel et al., 2003). Dual change score models (DCSM) allow for the identification of leading indicators of cognitive change: the extent to which changes in one variable impact subsequent changes in a related variable, and vice versa. In the current analysis we applied DCSM to data from 861 individuals aged 50-98 years who participated in up to 5 waves (16 years) of testing as part of the Swedish Adoption/Twin Study of Aging to elucidate the nature of the relationship between pulmonary function and cognitive aging. FEV1 was collected at all waves, as well as measures of cognitive function in four domains: verbal abilities, spatial abilities, memory, and processing speed. Results suggest changes in FEV1 lead to subsequent changes in verbal ability.

### DOES AGE OR HEALTH MITIGATE THE STRENGTH OF THE RELATIONSHIP BETWEEN ACTIVITY AND COGNITION?

A.A. Bielak[1], K. Anstey[1], M. Luszcz[2], *1. Ageing Research Unit, Australian National University, Canberra, Australian Capital Territory, Australia, 2. Flinders University, Adelaide, South Australia, Australia*

Research investigating the presence of a longitudinal link between activity participation and cognitive performance in older adulthood has been inconsistent. One moderating factor might be that a strong relationship between activities and cognition is only present at certain points in the lifespan, or for individuals with certain characteristics. We investigated whether baseline age, health, and self-rated health modified the activity-cognition change relationship over 15 years. Over 2000 participants (M = 78.70 years) from the Australian Longitudinal Study of Ageing completed an activity questionnaire and various cognitive measures at baseline, two, eight, and fifteen years. Multiple group bivariate latent growth curve models were evaluated between total activity participation and each cognitive measure. Significant differences in the inter-correlations between the intercepts and slopes were sparse: Individuals between 65-79 years at baseline (YO) significantly differed from those 80 years and older (OO) in the relationship between their activity intercept and change in perceptual speed ($\chi^2$change = 5.68 (1), p<.05), and change in short-term memory ($\chi^2$change = 11.8 (1), p<.001), where the older group showed stronger negative relationships (Std.$\beta$ YO = -.30, OO = -.41; YO = -.06, OO = -.50, respectively). OO also showed a stronger initial link between activity and short-term memory than the YO (Std.$\beta$ YO = .36, OO = .50). There were no significant differences as a result of the number of initial medical conditions or self-rated health. Results suggest the covariation between activity participation and cognitive performance may be weak regardless of age and health, particularly across long time frames.

### AN INVESTIGATION OF THE DEDIFFERENTIATION THEORY AMONG THE OLDEST OLD

P.E. May[1], J.L. Woodard[1], L. Miller[2], P. Martin[3], A. Davey[4], L. Poon[2], *1. Wayne State University, Detroit, Michigan, 2. University of Georgia, Athens, Georgia, 3. Iowa State University, Ames, Iowa, 4. Temple University, Philadelphia, Pennsylvania*

Objective: Considerable controversy has surrounded the notion of dedifferentiation for explaining cognitive changes associated with aging. According to dedifferentiation theory, specific cognitive abilities merge into a common factor during late life. Dedifferentiation theory was tested in centenarians and octogenarians by examining performance patterns across neuropsychological test scores. Methods: Participants were drawn from the Georgia Centenarian Study, which consists of a population-based sample of 244 centenarians and 80 octogenarians. Participants completed the Mini-Mental State Examination, Fuld Object Memory Evaluation, Behavioral Dyscontrol Scale, Controlled Oral Word Association Test, motor speed assessment, and WAIS-III Similarities. Pairwise correlations between test scores were computed for each age-group as a whole and for age-groups stratified by level of cognitive functioning. Correlations were converted to z-scores, and differences among these transformed correlations were evaluated for statistical significance. Results: There were no significant differences between centenarians and octogenarians in terms of the magnitude of correlations between cognitive measures. When age-groups were stratified by level of cognitive functioning, there were significant differences within the low functioning groups, but the direction of differences was unexpected. There were no significant differences between the two high-functioning age-groups. Conclusion: The findings do not support the dedifferentiation of cognitive functions among the oldest old. There were no significant differences between the two age-groups as a whole. Associations between scores among low-functioning centenarians were smaller in magnitude than those among low-functioning octogenarians, which is inconsistent with dedifferentiation theory. While dedifferentiation was not observed, it is possible that such changes occur before the age of 80.

## SESSION 1215 (PAPER)

## RELIGION AND SPIRITUALITY

### SPIRITUALITY, PERCEIVED AGE, AND WELL-BEING IN MIDDLE AND LATER LIFE

J. Park[1], R. Ward[2], *1. University at Albany, School of Social Welfare, Albany, New York, 2. University at Albany, Department of Sociology, Albany, New York*

Previous studies have suggested that older adults who feel older and desire to be younger than their biological age tend to be less satisfied with their life and experience a lower sense of well-being. Based on Lazarus and Folkman's stress and coping theory, the objectives of this study are to empirically investigate whether spirituality positively impacts people's age perception, and whether spirituality factors moderate the association between age perception and well-being in middle and later life. In this study, the construct spirituality was measured by ten subscales of spiritual and religious beliefs, spiritual coping, and religious attachment. We hypothesized that spirituality would moderate positive self-evaluations and contribute to younger felt age and older desired age, and that spirituality would lessen the negative implications of older perceived age and enhance people's subjective well-being. Subjects aged 40 to 74 were selected from the Midlife in the United States Survey of 1995 (N=3,897, mean age=54). Results showed a significant association among spirituality, age perception, and subjective well-being. Individuals with greater spirituality tend to feel younger, and desire to be older relative to their actual age. Also, these individuals reported higher subjective well-being in general. Notably, the interaction between felt age and religious attachment was found to counteract the negative impact of older felt age and thus increase subjective well-being. These findings reflect the positive impact of spirituality (especially religious attachment) on well-being in middle and later life, and support the integration of spirituality and religiosity into various social services for people in need.

### WORSHIP ATTENDANCE AND DISABILITY IN A BIRACIAL, COMMUNITY-BASED POPULATION OF OLDER ADULTS

G. Fitchett[1], M.R. Benjamins[2], C.F. Mendes de Leon[1], *1. Rush University Medical Center, Chicago, Illinois, 2. Sinai Urban Health Institute, Chicago, Illinois*

Results from prior studies of worship attendance and disability in older adults are inconsistent and limited by the use of composite, self-reported measures of disability. We examined the role of frequency of attendance on disability and progression of disability in older adults and whether the effects varied by race. Data come from 6,500 participants in the Chicago Health and Aging Project, an ongoing population-based, biracial study of older adults. Self-reported measures of disability included the Nagi assessment of lower and upper-body extremity function and a 6-item assessment of independence in activities of daily living. Both were reported for up to 9 years of follow-up. We also examined observed performance on 3 measures of lower extremity strength, balance, and gait, assessed every 3 years for up to 3 assessments. The analyses used GEE and mixed effect regression models. Compared to those who reported no or infrequent worship attendance, for all 3 measures of disability, we found progressively lower levels of disability at baseline for frequent and very frequent attenders (all $p<0.001$). We found no association between frequency of attendance and change in disability over time, nor did these associations vary for Whites compared to Blacks. The baseline relationship between more frequent worship attendance and lower levels of disability appears to be consistent across diverse measures of disability and for both Whites and Blacks. In contrast to some prior studies, we found no evidence that worship attendance was associated with change in disability over time.

### COGNITIVE AND AFFECTIVE DIMENSIONS OF SPIRITUAL RESILIENCY IN OLDER ADULTS: A GENDERED PERSPECTIVE

J.L. Ramsey[1], R. Blieszner[2], *1. Pastoral Care, Luther Seminary, St Paul, Minnesota, 2. Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

For many older adults, active involvement in religious and spiritual practices contributes to health and well being. Our international research project demonstrates the importance of spirituality experienced in a community-based context for sustaining resilience as elders strive to interpret the meaning of past events and cope with current aging-related challenges. The cross-cultural design employed guided discussions in women's and men's focus groups at churches in the U.S. and Germany, followed by in-depth interviews with individuals identified as exemplars of deep spirituality (N = 16; 8 women and 8 men ). Grounded in narrative theory, our analysis of coding categories and themes and patterns in the data revealed two prominent narrative strategies. One is the capacity of older adults to critique beliefs and practices using rather abstract cognitive tactics; men tended to evaluate beliefs and actions using these approaches. The other is the capacity of older adults to situate their spirituality in emotional and relational attachments with significant others; women were more likely to interpret their spirituality and personal resiliency in terms of their contributions to and benefits from relationships. We provide case studies to illustrate these gender-based approaches to spirituality, life review, and meaning making in old age, noting influences of gender-based socialization on the propensity of older adults to engage in these processes. We offer suggestions for professionals working with this cohort of elders, pointing out the importance of taking men's more analytic approach seriously while providing women with opportunities to express their affective attachments.

### THE ASSOCIATION OF RELIGIOSITY AND FOUR-YEAR OUTCOMES AMONG OLDER CANCER SURVIVORS

L. Caplan[1], P. Sawyer[2], C.L. Holt[3], R.M. Allman[4], *1. Morehouse School of Medicine, Atlanta, Georgia, 2. UAB Center for Aging, Birmingham, Alabama, 3. University of Maryland School of Public Health, College Park, Maryland, 4. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

The association between religiosity, physical and mental health, and survival among cancer survivors in the UAB Study of Aging was examined. Baseline and four-year assessments included socio-demographics and medical history. The Duke University Religiosity Index measured organizational, non-organizational, and intrinsic religiosity. Activities of daily living (ADL), cognition, and depression (GDS) were assessed. Vital status was confirmed by the Social Security Death Index. Changes were computed between baseline and 4-year measures. Chi square, ANOVA, and logistic regression analyses were used. At baseline, 177 persons had a cancer diagnosis, (mean age = 75.9; 58% male; 48% African American). Baseline church attendance (organizational) 1+ times per week was reported by 65%; private study 1+ times per week (non-organizational) was reported by 81%; and 76% endorsed the integration of religion in day-to-day living (intrinsic). At four years 58 (32.8%) had died and 45 additional persons had a cancer diagnosis. A second religiosity assessment was available for 139 (mean age = 73.7; 50% African American; 56% male). Organizational religiosity predicted survival, but was not significant after adjustment for other factors. Over 4 years, 25% had declines in organizational, 8.6% in non-organizational, and 13.7% in intrinsic measures; 12.9% reported greater ADL difficulty and 34.5% had increased GDS. Controlling for baseline values and declines in religiosity, baseline organizational religiosity was protective against increased ADL difficulty ($p=.015$) as well as increased depression ($p=.020$). Religiosity levels were high in this cohort of cancer survivors. Declines in religiosity were noted but did not predict increased ADL difficulty or depression.

## SESSION 1220 (POSTER)

## SUCCESSFUL AGING

### SUCCESSFUL AGING: IN THE SEARCH OF PREDICTORS

N.M. Mendoza-Ruvalcaba, E. Arias Merino, R. Meda Lara, J. Cueva Contreras, I. Díaz-García, *University of Guadalajara, Guadalajara, Jalisco, Mexico*

Introduction: Is not clear which factors are predictors of successful aging. Our aim was to identify predictors of successful aging according with definitions and indicators reported in different worldwide studies. Methods: Data analysis from the cross-sectional study "Mujeres Grandes" conducted in Guadalajara, Mexico 2007. Data were obtained from 638 women participants aged 60+(mean=70.9,SD=7.1), based on 19 different authors definitions, were classified as successful or not successful and logistic regression analyses were performed to identify predictors of successful aging. Results: The most powerful predictors were depression (lower score), age, to perform daily activities, and education. Among socio demographics, significant predictors were: age [range:$\beta$=-.039 to -.068,Exp($\beta$)=.93-.96] resulted in nine definitions, education [range:$\beta$=-.08 to -.168,Exp($\beta$)=.88–1.18] five definitions, while income [$\beta$=-.07,Exp($\beta$)=.93] and number of children [$\beta$=.087, Exp($\beta$)=1.09] in only one definition. Among health-functionality, significant predictors were: nutritional risk (lower score) [range:$\beta$=-.08 to -.271,Exp($\beta$)=.76–.92] in four definitions, subjective health [range:$\beta$=.40 to .87,Exp($\beta$)=1.09–2.4] three definitions, and number of diseases [$\beta$=-.46, Exp($\beta$)=.63]. Among psychological: depression (lower score) [range:$\beta$=-.087 to -.372,Exp($\beta$)=.69-.91] in fourteen definitions, life satisfaction [$\beta$=.43,Exp($\beta$)= 1.54] and satisfaction with sexual life [$\beta$=-.07,Exp($\beta$)= .93] in only one. Life style predictors were: doing daily activities [range:β=.586 to .717,Exp(β)=1.79–2.04] in six definitions, doing activities in general [range:β=.22 to 2.27,Exp(β)=1.25–9.73], leisure [range:β=.65 to .80,Exp(β)=1.92–2.23], and artistic [range:β=.76 to .85,Exp(β)=2.15–2.35] in two definitions each one; doing participative activities [β=1.14,Exp(β)=3.14] and drinking alcohol [β=1.07,Exp(β)=5.49] in one definition. Conclusion: It is necessary to establish a standard for defining, quantifying and determine the predictors of successful aging.

## HOW CHANGES IN ACTIVITIES IMPACT LIFE SATISFACTION IN LEISURE ORIENTED RETIREMENT COMMUNITIES

E.K. Smith, C. Wilken, L. Forthun, S. Bluck, *University of Florida, Gainesville, Florida*

Leisure Oriented Retirement Communities (LORCs) are an increasingly popular trend among retirees with an impact on numerous aspects of gerontology. The images of LORCs are that of neighborhoods that facilitate various activities that add to an older adult's life satisfaction. Due to the growing popularity of these communities, these images and advertisements elicit the question of how changes in social, physical, and leisure activities influence life satisfaction in an LORC. A descriptive research study was undertaken in a LORC in north-central Florida with over 50,000 residents. Twelve female residents were asked a series of questions on activities and life satisfaction before and since moving to the LORC. Content analysis was utilized to analyze the data. The findings suggest that the female respondents became more involved with their activities upon moving to the LORC. Most of the women indicated that, although they were satisfied with their activities before moving to the LORC, the community-facilitated activities had a positive impact on their life satisfaction. The respondents gave various reasons for their increased involvement in activities and life satisfaction citing the convenience of the facilities and clubs and the variety of social connections made within the community. The convenience of the community-facilitated activities and social connections of this LORC add to the ability of these women to age successfully. The findings suggest the amenities of LORCs and their impact on these respondents may warrant further research on how residents of these communities age.

## A STUDY OF CENTENARIANS WHO MAINTAIN HEALTH AND VITALITY

L. Campbell, G. Sanders, *NDSU, Fargo, North Dakota*

The purpose of this study was to explore the life-long experiences of centenarians in order to (1) identify the factors that they perceive to have contributed to maintaining their health and independence and (2) comprehend the value these experiences hold in regard to their quality of life. The study was phenomenological and used in-depth interviews to explore how individuals verbalize and interpret their lived experiences. To ascertain the essential themes of maintaining health and vitality into extreme old age, 8 participants residing in rural and urban areas of North Dakota and Minnesota were asked to respond to exploratory items relating to their life story. Upon completion of the interviewing process, the data were transcribed verbatim by a contracted transcriber who was IRB approved and a part of the research team. The primary researcher under the guidance of the Major Professor coded and organized the data. Participants attributed 5 common themes to maintaining their health and vitality into extreme old age: acceptance of life and being content, control, engagement in the world and others, moderation across life, and a lifetime of nurturing relationships. The results indicated that most individuals have the ability to increase their quality of life to some degree given the knowledge and the initiative to act on that knowledge.

## WHAT MAKES YOU HAPPY? – FINDINGS FROM YOUNG, MIDDLE-AGED, AND OLDER INDIVIDUALS

M.M. De Feo[1], D.S. Jopp[1], K. Boerner[2], *1. Psychology, Fordham University, Bronx, New York, 2. Jewish Home Lifecare, New York, New York*

Do people know what makes them happy and is there a relation to well-being scales? The present study asked for individuals' assessment of factors contributing to their happiness. Specifically, young, middle-aged and older individuals (N = 128; mean age: 45.77, range: 20-91 years) indicated what they would need or do to be happy. Content analysis extracted 22 categories. Inter-rater reliability was high. Social factors were mentioned most often (68%; including spent time with friends/family, talking to others, good relations), followed by experiential activities (40%; physical, cultural activities), and developmental activities (32%; productivity, expand horizon). Participants also mentioned resources including health (24%; optimize health, good health), time (13%; time, rest), and positive environment (13%). Furthermore, they mentioned attitudes (21%; being positive, reevaluate), problem-solving strategies (9%) and avoidance/distraction (5%). Age differences were only found for spending time, which was more often mentioned by young individuals. Women mentioned social factors and experiential activities significantly more often than men. Partial correlations controlling for age showed positive links of developmental activities and attitudes to well-being (CESD subscale). Developmental activities were also negatively linked to CESD Dysphoria and negative affect (PANAS). Regression analyses showed that well-being was predicted by age, developmental activities, and attitude. For negative affect, age and time were the only predictors. Marginal effects existed for talking with others and developmental activities. Findings may suggest that individuals have only limited insight regarding what is good for them; however, the mixed-method design may be one reason for poor correspondence between happiness factors and well-being scales.

## RELATIONSHIPS BETWEEN LEISURE ACTIVITIES, HEALTH AND WELL-BEING INDICATORS IN YOUNG, MIDDLE-AGED, AND OLDER INDIVIDUALS

M.E. Paggi[1], D.S. Jopp[1], C. Hertzog[2], *1. Psychology, Fordham University, Bronx, New York, 2. Georgia Institute of Technology, Atlanta, Georgia*

Research has demonstrated the positive effects of leisure activities on well-being and depression across the lifespan (Lampinen, Heikkinen, Kauppinen, & Heikkinen, 2006; Pressman, et al., 2009). Because physical health also relates to participation in leisure activities, it seems reasonable that physical health affects one's participation in leisure activities, which can in turn affect well-being and depression. Thus, the present study investigated the link between leisure activities and well-being indicators in more detail, and further explored the how health affected this link. The sample consisted of 267 participants 18-82 years old (mean age = 49.13). Leisure activities were assessed with the extended VLS Activity questionnaire (Jopp & Hertzog, 2010). Well-being was measured with the Satisfaction with Life Scale (Pavot & Diener, 1993), depression with the CESD (Radloff, 1977). Young, middle-aged and older individuals did not differ in their overall activity participation. With advancing age, however, individuals engaged less in sports, technology-related and developmental activities. Engagement in religious and experiential activities increased with age. Regression analysis for the total sample (controlling for age, gender, health) indicated that technology-related activities and travel were positive predictors of well-being, TV watching was a negative predictor. Social-private activities had negative and TV positive beta-weights predicting depression. Analyses further indicated that leisure activities partially mediated the relationships between health and well-being indicators, but a Sobel test underscored the mediating role of activities only for depression. Results highlight the important role leisure activities for well-being indicators and the impact of health in the context of depression.

### RELATIONSHIPS BETWEEN STRENGTH OF IDENTITY, FUNCTIONS OF IDENTITY AND WELL-BEING IN HEALTHY OLDER PEOPLE

L.S. Caddell, L. Clare, *Psychology, Bangor University, Bangor, United Kingdom*

Background: Aging is often accompanied by transitions and changes in circumstances which may influence a person's sense of identity. This in turn, could have an impact upon a person's feelings of well-being in terms of anxiety and depression. Currently, further work that directly investigates the association between aspects of identity and well-being is required, given the possible implications for care and support. Objectives: This study aimed to investigate the relationships between strength and possible functions of identity (structure, harmony, goals, future, personal control), distress relating to aspects of identity, and anxiety and depression in older adults living in the community. Method: Participants were 60 people aged 60 or over. Participants completed a number of questionnaire measures focusing on strength of identity, functions of identity, distress related to aspects of identity, and anxiety and depression. Results: Strength of identity and fulfilment of the functions of identity were related to well-being, such that a stronger sense of identity was significantly associated with lower levels of anxiety and depression, and the fulfilment each of the functions of identity was significantly associated with a lower level of depression. Anxiety was significantly positively associated with identity-related distress. Conclusion: Results suggest that aspects of identity are related to well-being in older people. This points to the need to consider how best to support self and identity in older people in order to maximise well-being amongst this population.

### EFFECT OF SOCIAL SUPPORT ON THE NEGATIVE INFLUENCE OF PHYSICAL DECLINE ON PSYCHOLOGICAL WELL BEING IN OLD PEOPLE

M. Ogawa[1], Y. Gondo[2], Y. Masui[3], H. Iwasa[4], H. Inagaki[3], H. Sugisawa[1], *1. J.F. Oberlin University Graduate School, Tokyo, Japan, 2. Osaka University, Osaka, Japan, 3. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 4. University of Tokyo, Tokyo, Japan*

The purpose of this study is to examine the effect of social support on the relationship between physical decline and psychological well-being in old people. In order to examine the different influences of support resources on the subjective well-being changes caused by the decline in physical function, latent growth curve model was used. The analysis was done utilizing four waves' panel data (collected in 1995, 1997, 1999 and 2000) conducted by the Tokyo Metropolitan Institute of Gerontology. The subjects were those who responded as first wave (n=1607). Because the effect of the support from family and support from friends was considered to be different, we tested two models which relationship between physical function and psychological well-being was mediated by support from family or by support from friends. Although subjective well-being deteriorated with physical function in both models, a different mediation effect was observed. In the friends support model, decline in subjective well-being was influenced by direct influence of deteriorated of physical function and indirect effect through the decline in support from friends caused by the deteriorated of physical function. Meanwhile, in the family support model, decline in physical function and decreased support from family was not related, and the subjective well-being was not decrease through the support from family. These results suggest that according to the physical functions decline, support from friends tend to shrink while support from family to be constant. Consequently, support from family is more important than support from friend to psychological well-being in Japanese elderly.

### ENGAGEMENT WITH LIFE: ACTIVITY PARTICIPATION AS A PREDICTOR OF SUCCESSFUL AGING AND QUALITY OF LIFE

R. Stevens-Ratchford, *Occupational Therapy and Occupational Science, Towson University, Towson, Maryland*

Introduction. This study examined the relation of long-standing occupation to successful aging and quality of life (QOL). Long-standing occupation was participation in a particular activity for a period of five years or more. QOL was a positive state of well being that was an inherent factor of successful aging. Successful aging was defined as continued good health and well being in concert with high function and active engagement with life (Row & Kahn, 1999). Engagement with life is involvement in leisure, social, and productive activities. QOL was defined as overall positive well being that included health status and life contentment. Engagement in long-standing occupation provides seniors with a vehicle for staying active and socially connected. Method. Correlational procedures were used to collect data on long-standing occupation, successful aging, and quality of life in a sample of 276 community-dwelling older adults. The Long-Standing Occupation Measure (r=.81) was used to measure activity participation. The Successful Aging Profile (r=.84) was used to measure successful aging. The Quality of Life Scale (r=.92) was used to measure QOL. Regression analyses were used to determine predictors of successful aging and QOL ($p < 0.05$). Results. Findings indicated that long-standing occupation is a significant predictor of successful aging and quality of life. Productive occupation was a significant predictor of both QOL and successful aging. Conclusion. This sample of older adults had participated in a variety of leisure, social, and productive occupations across their lifetimes. These activities related to their overall successful aging and QOL.

### EXAMINING THE EFFECTS OF EPIPHANIES ON POSSIBLE SELVES

M. Barreto, L.D. Frazier, *Florida International University, Miami, Florida*

This study examined the manifestation, underlying processes, and psychological effects of epiphanies on sense of self and goal-directed behaviors. Specifically, we examined the origins of possible selves (e.g., future self representation) with particular focus on origins that came from the psychological experience of an "aha" moment or an epiphany. The sample, based on data from two previous studies of possible selves, consisted of 411 men and women. Ages ranged from 17 – 95 with a mean of 35.9 (SD = 20). Findings indicate that hoped-for possible selves were more likely to be derived from epiphanies than feared possible selves. The specific types of experiences that generate epiphanies and epiphany-derived possible selves include a particular goal or calling (e.g., career), a positive or negative influence of others (e.g., mentorship/manipulation), health, and a particular fear (e.g., unemployment). Possible selves derived from epiphany experiences had higher levels of importance and stronger motivational power through balance (among hoped and feared selves) and the self regulatory variables (i.e., self-efficacy and outcome expectancy) than possible selves derived from other origins. This understanding of the mechanisms for how the self is shaped by epiphanies sheds light on the motivational aspects of the self-system and provides insight into ways individuals can affect greater change in their development and lead to more adaptive developmental outcomes, especially in later life. The role of an epiphany on the formation and implementation of possible selves helps pave the way for important prevention programs aimed at promoting healthy development and adaptation to age-related change.

### THE EFFECT OF PLAYING THE WII ON LONELINESS AND MOOD IN THE ELDERLY

P.E. Kahlbaugh, A.J. Sperandio, A. Carlson, *Psychology, Southern Connecticut State University, New Haven, Connecticut*

This study investigates the effectiveness of the Wii technology in promoting successful aging. The Wii represents computerized simulations of previously enjoyed activities for individuals whose participation is no longer feasible or actively pursued. Investigations of compensatory strategies (e.g., Baltes, 1997), such as those offered by the Wii, have practical and theoretical value. Technology has the potential to benefit the elderly in terms of social connectedness and enjoyment (Ijsselsteijn, Nap, de Kort, & Poels, 2007). Previous research has investigated relationships between loneliness, emotional well-being, and technology with mixed results. Elderly using the internet reported overall low loneliness, but social and family loneliness were related to more internet use (Sum, Mathews, Hughs & Campbell, 2008). Goldstein et al. (1997) found declines in emotional well-being were mitigated by videogame play, but videogame technology such as the Wii has not been studied. In the present study, 36 individuals (mean age 82.6 years) were randomly assigned to Wii, TV or control conditions. Assessments of life satisfaction, loneliness, positive mood, physical activity and general health were obtained across a ten-week interval. Elderly playing Wii had lower loneliness and greater positive mood at the end of the study compared to TV and control groups. For Wii participants, loneliness and mood predicted life satisfaction, while for TV and control groups neither were predictors. We are an aging society. The importance of promoting successful aging cannot be underestimated. This investigation provides evidence of the effectiveness of using computer simulation technology to enhance aspects of successful aging.

### THE RELATIONSHIP BETWEEN SUCCESSFUL AGING AND ACTIVITY LEVEL PARTICIPATION AMONG OLDER ADULTS

K. Kopera-Frye[1], H.A. Myers[2], *1. Dept. of Gerontology, Sociology, & Political Science, University of Louisiana at Monroe, Monroe, Louisiana, 2. University of Nevada-Reno, Human Development & Family Studies/Gerontology, Reno, Nevada*

Successful Aging (SA) has been characterized as involving three factors: Freedom from cognitive impairment, freedom from physical disability, and social engagement (Rowe & Kahn). Therefore, leisure activity participation, possibly a form of social engagement, should be significantly related to SA conceptualizations among older adults. One hundred seventeen older adults drawn from an independent/assisted senior housing community were surveyed on their conceptualizations of SA both by using a Likert SA scale and an open-ended question, in addition to frequency of leisure activity. It was expected that higher scores on the SA attribute scale would be significantly related to greater activity participation. Interestingly, higher SA scores on the Phelan scale were not related to activity level. Open-ended responses revealed that staying physically and mentally fit, having relationships with friends and family best represented SA. This suggests different dimensions to SA among healthy, educated seniors, which may be unrelated to activity levels.

### JOINT TRAJECTORIES OF MULTIPLE SUCCESSFUL AGING INDICATORS OF THE ELDERLY IN TAIWAN

H. Hsu[1], B.L. Jones[2], *1. Asia University, Taichung, Taiwan, 2. Carnegie Mellon University, Pittsburgh, Pennsylvania*

Purpose: Successful aging has been defined as multi-dimensional concept. However, most studies only showed the longitudinal pattern of one indicator at a time. The purpose of this study is to explore the multiple trajectories of successful aging among the Taiwanese elderly. Methods: Data were from the four waves of a longitudinal elderly data, 1993-2003. The survived and completely self-responded samples were included in the analysis, totally 1474 persons. Six indicators of successful aging (chronic disease numbers, instrumental activities of daily living, depressive symptoms, perceived social support, participation in productive activities, and economic satisfaction) were used as the indicators. Group-based multiple trajectories and multinomial logistic regression were applied for analysis. Results: Four joint trajectory groups were identified. The Care-Demanding group (2.0%) had medium chronic diseases, severe disability, highest depressive symptoms, increase-and decrease social support, little productive activity, and lower economic satisfaction. The Successful Aging group (57.8%) had lower risk in chronic diseases, highest IADL, lowest depressive symptoms, decrease-and-increase social support, high productive activity, and high economic satisfaction. The Physically Decline group (13.3%) had higher chronic diseases, declining IADL, lower depressive symptoms, stably increasing social support, declining productive activity, and medium economic satisfaction. And the Mentally-and-Economically in Risk group (26.8%) had higher chronic disease, higher IADL, higher depressive symptoms, increasing social support, high productive activity, and low economic satisfaction. Those who were male, higher educated, higher economic status in the childhood were more likely to be successful aging. Discussion: The high risk groups of multiple-dimension successful aging can be identified. Different health promotion strategies for the heterogeneous elderly should be accordingly developed.

### ASSIMILATION AND TRAJECTORIES OF POSITIVE AND NEGATIVE AFFECT AMONG OLDER MEXICAN-AMERICANS

J. Liang[1], N. Fultz[1], J.M. Bennett[1], B. Shaw[2], N. Krause[1], *1. School of Public Health, University of Michigan, Ann Arbor, Michigan, 2. University at Albany, Rensselaer, New York*

As two key components of subjective well-being, positive affect entails feelings of joy or active pleasure, while negative affect represents feelings of anxiety, distress, agitation, worry, and pessimism. Current research regarding subjective well-being is largely based on cross-sectional data, which confound intrapersonal changes with interpersonal variations. In addition, knowledge of SWB in ethnic minorities, particularly older Mexican-Americans, is very limited. This research analyzed the linkages between assimilation (structural and language) and trajectories of positive and negative affect among older Mexican-Americans. Data came from the Hispanic Established Populations for Epidemiologic Studies of the Elderly (HEPESE) collected in 1993, 1995, 1998, 2000, and 2004, which yielded 10,317 observations from 3,050 respondents. Multilevel models were employed to evaluate intrapersonal and interpersonal differences in positive and negative affect. Whereas positive affect increased slightly over time ($b=.134$, $p<.001$), negative affect remained stable. Whereas structural assimilation was positively associated with both positive affect ($b=.109$, $p<.05$) and negative affect ($b=.397$, $p<.001$), it was not correlated with the rates of changes in these two components. In contrast, language assimilation was associated with a higher level of positive ($b=.144$, $p<.001$) but a lower level of negative affect ($b=-.156$, $p<.001$). In addition, it was correlated with a lower rate of change in positive affect ($b=-.03$, $p<.001$) but a higher rate of change in negative affect ($b=.016$, $p<.05$). These linkages were partially confounded by socioeconomic status, social support, and attrition over time. Cultural assimilation is a key variable in understanding how subjective well-being evolves among older Mexican Americans.

### THE INTEGRATION OF NORMATIVE AND NON-NORMATIVE LIFE EVENTS INTO THE POSSIBLE SELVES REPERTOIRE

M. Barreto[1], L.D. Frazier[1], A. Osgood[2], *1. Florida International University, Miami, Florida, 2. Mount Ida College, Newton, Massachusetts*

This study examined the integration of normative (i.e., anticipated, developmentally predictable) and non-normative (i.e., unanticipated, unpredictable) stressful life events into the possible selves repertoire across adulthood. Possible selves (e.g., future self-representations) motivate individuals to adapt to new roles and circumstances throughout the lifespan. The purpose of this study was to determine what types of life events (normative and non-normative) become integrated into one’s possible selves, how they shape possible selves, and whether the integration of life events/experiences is positive for developmental and psychosocial outcomes such as coping and well-being. The sample was comprised of 198 men and women. Ages ranged from 18 to 85, with an average age of 42.5 (SD = 19). Over two-thirds of participants indicated the presence of stressful life events within their possible selves, indicating integration of stress into future self-representations. The degree to which individuals conceptualize themselves in terms of these experiences relates to their ability to cope with these challenges. The integration of life events, both normative and non-normative, into one's possible selves were related to stronger coping scores. Finally, the degree of integration was examined in relation to the extent of self-regulation of the possible selves and results showed that a greater integration was related to greater self-regulatory activities associated with the event–related self. This study indicates possible avenues for prevention/intervention programs that can teach people how to incorporate stressful life events and change into their sense of self in positive ways to promote well being.

### DEVELOPMENT OF SELF-EFFICACY SCALE ON GOING OUT AMONG COMMUNITY-DWELLING ELDERLY IN JAPAN

S. Yamazaki[1], H. Imuta[2], M. Hashimoto[2], S. Nomura[3], S. Yasumura[1], *1. Public Health, Fukukshima Medical University School of Medicine, Fukushima, Japan, 2. Tokyo Metropolitan University, Tokyo, Japan, 3. Waseda University, Saitama, Japan*

BACKGROUND: The frequency of leaving the house among the elderly is associated with the need for nursing care. Behavior change theory suggests that self-efficacy influences leaving the house, leading to a reduction in homebound states. However, few scales exist to evaluate these aspects. OBJECTIVE: To develop a self-efficacy scale on going out among community-dwelling elderly (SEGE), and to establish its reliability and validity. METHODS: In the first preliminary survey, we collected 63 items associated with self-efficacy regarding leaving the house from 18 community-dwelling elderly in Tokyo. A prototype scale was developed by selecting 13 of the original 63 items based on results from 258 elderly in the second preliminary survey. We determined the scale's reliability and validity by mailing a questionnaire that included health-related variables and the prototype scale to a total of 8,000 randomly selected elderly individuals in Tokyo. RESULTS: Responses from 2,627 elderly individuals (men, 1145; women, 1482; mean age, 73.8±6.6 years) were analyzed. We developed a six-item scale using stepwise variable selection in explanatory factor analysis. The $\alpha$ coefficient of internal consistency was 0.96. SEGE scores correlated significantly with self-efficacy for activities of daily living (ADL), self-rated health, and health-related quality of life (QOL). Confirmatory factor analysis revealed that, although SEGE scores and self-efficacy of ADL were highly correlated with each other, they measured different concepts. CONCLUSION: We developed SEGE, a six-item scale with a one-factor structure, and demonstrated its reliability and validity. SEGE may help evaluate the need for nursing care in elderly individuals.

### RISK FACTORS FOR LONELINESS IN OLD AGE: EUROPE, USA AND VIET NAM

B. Malmberg[1], A. Davey[2], G. Sundström[3], S.H. Zarit[4], *1. Institute of Gerontology, Jönköping University, Jönköping, Sweden, 2. Temple University, Philadelphia, Pennsylvania, 3. Jönköping University, Jönköping, Sweden, 4. Pennsylvania State University, State College, Pennsylvania*

Loneliness in old age varies between cultures. For example, feelings of loneliness are more frequently reported in southern Europe than in Scandinavia. Yet, factors behind loneliness are largely the same: Living alone, higher age, female gender, and poor health. We use SHARE 2008 (N=8,787), HRS 2006 (N=15,072) and a local study in Da Nang, Vietnam (N=588) to analyze risk factors for loneliness in different cultures. Levels of loneliness vary, but are consistently associated with co-residence and poor health in all these countries. We made logistic regressions of perceived loneliness with a combined independent variable of living arrangement and subjective health in Europe, USA and Vietnam. ( Adjusted for age, years of education, gender and in Europe Country and in USA ethnicity). With living alone and poor health as reference the risk for loneliness for persons living alone and in good health was in Europe .51(.42-.63) in US .43(.39-.49) and in Vietnam .42(.22-.81). Compared to persons not living alone in poor health corresponding figures are .25(.21-.30), .33(.29-.38) and .30(.17-.51) and to persons not living alone and in good health .10(.08-.12), .09(.08-.11) and .11(.06-.11) respectively. There is a strong association between loneliness and the combination of living arrangements and subjective health in all three cultures. Persons who live alone and feel unhealthy have a ten times elevated risk for loneliness compared to co-residing persons who feel healthy.

## SESSION 1223 (SYMPOSIUM)

### PRESIDENTIAL SYMPOSIUM: TRANSITIONS OF CARE ACROSS THE AGING CONTINUUM: INTERSECTION OF DRIVING CESSATION AND CAREGIVING

Chair: *C.M. Connell, Health Behavior & Health Education, U Michigan School of Public Health, Ann Arbor, Michigan*
Co-Chair: *M. Berg-Weger, St. Louis University, St. Louis, Missouri*
Discussant: *G. Hunt, National Alliance for Caregiving, Bethesda, Maryland*

With the aging of our population, increasing numbers of older adults will confront the need to limit and stop driving, despite a strong preference to continue. For many families, this transition places a burden on family members who are called on to assume an informal caregiving role by assisting with transportation needs. The purpose of this symposium is to present empirical work by members of the Transportation and Aging Special Interest Group that addresses the intersection of the driving cessation and caregiving transitions. Results of three studies will be presented. The first is based on in-depth qualitative interviews of father/daughter dyads who recount their challenges in communicating about and planning for age-related transitions, particularly the impact of driving reduction and cessation on family roles and responsibilities. In contrast to communication and planning, the second study reports reasons why family members elected the drastic measure of reporting older family members as unfit drivers to state authorities, resulting in the loss of their license. In the final study, data from a survey of older former drivers is used to assess the impact of relying on family members to provide transportation on quality of life and depression. Taken together, these three studies provide insight into how research on driving reduction and cessation fits in the broader literature on transitions to caregiving and family dynamics and roles in the face of age-related changes.

### DRIVING CESSATION AND CAREGIVING CONTINUUM: PERSPECTIVES OF FATHER/DAUGHTER DYADS

C.M. Connell[1], D.K. Vibbert[1], L. Kostyniuk[2], M. Janevic[1], *1. University of Michigan School of Public Health, Ann Arbor, Michigan, 2. University of Michigan Transportation Research Institute, Ann Arbor, Michigan*

Age-related declines in health and functioning force many older adults to reduce or stop driving, limiting their opportunities for productive activities and valued social ties. In addition to the profound impact on older drivers, this transition has ripple effects for family members who may step in to provide transportation and assist with mobility needs. The purpose of this presentation is to share results from in-depth interviews conducted with 15 adult daughter/father dyads to examine family decision making and planning about this important age-related transition. Selection criteria for fathers included being age 70 or over and living alone; all daughters had to have noticed problems with their fathers' driving. Themes were categorized as: parent/child communication and conflict; gender roles; reluctance to discuss and plan for age-related decline; sibling roles; and transition to caregiving. Implications of these qualitative findings for programs designed to facilitate planning for age-related family transitions will be discussed.

### REPORTING OLDER DRIVERS TO THE STATE LICENSING AUTHORITY: CONCERNS EXPRESSED BY FAMILY MEMBERS

T.M. Meuser[2], D.K. Vibbert[1], M. Berg-Weger[3], C.M. Connell[1], *1. Health Behavior & Health Education, U Michigan School of Public Health, Ann Arbor, Michigan, 2. University of Missouri - St. Louis, St. Louis, Missouri, 3. St. Louis University, St. Louis, Missouri*

Family members are often the first to notice safety concerns among older drivers. While many retire from driving when prompted, some reject this advice and continue to drive. Although considered a drastic measure, some family members feel as if filing a report with the state is the only option to end a driving career. This presentation will summarize the primary reasons why family members reported 460 older adults (mean age 83, 54% male) as unfit drivers in Missouri, 2001-2005. Physical/cognitive health concerns included impaired cognition (57%), impaired mobility (36%), confusion/disorientation (35%), vision problems (32%) and forgetfulness (30%) On-road concerns included dangerous lack of control (52%), getting lost (25%), and having caused a crash (20%). Concerns were used to predict three outcomes: submitted physician evaluation, referred for on-road testing, and completed on-road testing. Discussion will focus on policy and practice implications for intervention with families, older drivers, and state authorities.

### FORMER DRIVERS' RELIANCE ON FAMILY MEMBERS FOR MEETING THEIR TRANSPORTATION NEEDS

M. Bedard[1,2], G. Kafka[2], *1. Lakehead University, Thunder Bay, Ontario, Canada, 2. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada*

Further work to understand the impact of driving cessation on older adults and the role of network members who then assume an informal caregiving role by providing transportation is warranted. Data collected from 30 former drivers who had stopped driving in the past three years (as part of a larger study of 223 adults ranging in age from 55 to 91 years) is used to assess the psychosocial impact of relying on family members to provide transportation. The availability of drivers was significantly related to the ``ability to go places" (including senior centers), as well as fewer symptoms of depression and better life engagement. Caregivers who provide transportation are central to the successful aging of former drivers. Supporting these caregivers via policy and practice initiatives will indirectly enhance the quality of life of their loved ones.

## SESSION 1225 (SYMPOSIUM)

### TRANSITIONS IN CARE: INDIVIDUAL, CONTEXTUAL, AND CULTURAL PERSPECTIVES ON LONG-TERM CARE PLANNING

Chair: *S. Sorensen, University of Rochester School of Medicine and Dentistry, Rochester, New York*
Discussant: *R.S. Allen, The University of Alabama, Tuscaloosa, Alabama*

The concept of Preparation for Future Care (PFC) has been advanced as a type of health-promotion activity that combines both thoughts about future care needs and actions to determine preferences and obtain needed services. PFC may help people cope with age-related stressors, residential transitions, and gradual functional decline experienced by many older adults over a period of years or decades. In the last five years we have seen an increase in the number of researchers considering both the predictors and outcomes of long-term care planning. This symposium will provide an overview of long-term care planning in different demographic groups. Priscilla Quinn presents data from a large stratified random sample of older adults 60 in the greater Omaha metropolitan area; Kathy Black reports on one specific aspect of long-term care planning, the consideration of end-of-life decisions in a stratified random sample in South Florida. Jameson Hirsch presents combined data from two studies in New York state and addresses ethnic and personality differences in the propensity to plan for future care. Wingyun Mak presents data on the relationship of chronic diseases to PFC from a study of first degree relatives of people with Alzheimer's disease. As evidence for the importance of PFC, Silvia Sörensen presents one of the first assessments of the effect of PFC on subsequent mental health. Rebecca Allen will discuss the implications of these findings for individual decision-making, elder care planning, and policy decisions regarding transitions in care.

### FACTORS ASSOCIATED WITH LONG-TERM CARE PLANNING AMONG OLDER ADULTS

P.M. Quinn, *Gerontology, University of Nebraska Omaha, Omaha, Nebraska*

The purpose of the present study was to identify factors associated with long-term care planning in an effort to assist individuals in preparing for their long term care needs. The present study was designed to answer two research questions: (1) what distinguishes those who plan for long-term care versus those who do not; and (2) what distinguishes those who intend to pay for it themselves versus those who will rely on public support. Survey data were collected from a stratified random sample of adults 60 and over (n=651). Data were analyzed using nested logistic regression models. Findings indicated that those most likely to have a plan for long-term care were female, unmarried, with higher income, and aware of the availability of long-term care insurance. Only income was associated with taking responsibility for one's own long-term care.

### DEMOGRAPHIC AND ATTITUDINAL FACTORS ASSOCIATED WITH ADVANCE CARE PLANNING

K. Black, *College of Arts and Sciences, University of South Florida Sarasota - Manatee, Sarasota, Florida*

Our study utilized a stratified random sampling design to survey older adults (n = 203) in the state of Florida regarding their attitudes towards future care and planning behavior in social- environmental, health, and financial domains. Regression analyses were conducted to determine factors most predictive of older adults' attitudes towards future care and planning behavior by domain. Results suggests that gender, age, and functional status predict greater planning behavior and more accepting attitudes towards long-term care, while living alone and poor health status are associated with less advance care planning behavior and greater non-accepting attitudes. Factors associated with a greater likelihood to have advance care planning documents and concrete plans for future care include increased age, higher educational attainment, and female gender. Specifically, we used the Preparation of Future Care Needs Content of Plans Subscale of Sörensen et al's Preparation for Future Care Needs measure.

### OPTIMISM AND PLANNING FOR FUTURE CARE NEEDS: MODERATING EFFECTS OF RACE

J.K. Hirsch[1], S. Sorensen[2], J. Lyness[2], *1. Department of Psychology, East Tennessee State University, Johnson City, Tennessee, 2. University of Rochester School of Medicine and Dentistry, Rochester, New York*

With aging, illness and impairment may necessitate planning for future health care, a process influenced by individual and socio-cultural characteristics. We examined race, optimism and future care planning in 194 White and Black older adults aged 59-89 (60% women). Participants completed self-report measures of optimism, preparation for future care, beliefs about usefulness of planning, and perceived need for future care. In bivariate analyses, optimism was related to less future care planning, and Blacks reported greater future care planning than Whites. In multivariate analyses, Blacks had higher Awareness, Gathering Information, Decision Making, and Concrete Planning; optimism was negatively associated with Gathering Information and Concrete Planning. The association between optimism and Gathering Information and Concrete Planning was stronger for Blacks than Whites; for Blacks, very low and very high optimism were associated with more concrete planning. Future oriented, yet realistic, health information delivered in a culturally-relevant manner may facilitate future care planning.

### THE EFFECTS OF HEALTH CONDITIONS ON PATTERNS OF PLANNING FOR FUTURE CARE ACROSS SIX YEARS

W. Mak, S. Sorensen, *University of Rochester, Rochester, New York*

In the context of aging, anticipation for one's future care may alleviate stress and anxiety associated with the increased chances for disease and disability. Despite this association with better outcomes, older adults may not recognize the importance of planning until they encounter a potentially life-threatening health condition. This study examined the effects of various health conditions on the longitudinal patterns of planning for future care. Older adults who experienced a life-threatening health condition such as cancer were more likely to have greater awareness for future care planning on average and increased rates across time. A cancer diagnosis was associated with higher levels of gathering information, decision-making, and establishing concrete plans, though rates of change across time were unaffected. Non-life-threatening health conditions like arthritis, incontinence and bowel problems, and osteoporosis did not predict greater average or growth tendencies for future care planning. Implications for targeting at-risk groups will be discussed.

### MENTAL HEALTH CORRELATES OF PREPARATION FOR FUTURE CARE: LONGITUDINAL FOLLOW-UP OF PRIMARY CARE PATIENTS

S. Sorensen, W. Mak, J. Lyness, *Psychiatry, University of Rochester School of Medicine and Dentistry, Rochester, New York*

The current study examines whether Preparation for Future Care (PFC) is related to indicators of mental health among 392 primary care patients aged 65+ participating in a study of mood. Participants completed a PFC survey and several validation measures, as well as questionnaires about depression, anxiety, and affect. A subset of this sample was followed up at 24 months (N=198). We conducted analyses of the effect of the 5 PFC Subscales (Awareness of Care Needs, Avoidance, Gathering Information, Decision Making, and Concrete Planning) on depression symptom severity, anxiety scores, and positive affect. After adjusting for covariates, including depression at baseline, Avoidance at baseline was significantly related to greater depression severity at 24 months; Decision-making was related to greater positive affect at 24 months. Practical applications and implications are discussed.

## SESSION 1230 (PAPER)

## UNDERSTANDING PHYSICAL ACTIVITY

### FUNCTIONAL MOBILITY AND COGNITION IN ELDERLY PEOPLE: DO THESE FUNCTIONS DECLINE TOGETHER?

N. Galdona, U. Diaz, I. Laskibar, M. Gonzalez, P. Llavero, B. Morales, D. Facal, J. Yanguas, *Fundacion Instituto Gerontologico Matia INGEMA, Donostia-San Sebastian, Spain*

Background: Some studies show functional mobility measures as factors that may help identify people with higher risk of progressive cognitive decline (Deshpande et al., 2009; Holztzer et al., 2006; Verghese et al., 2002). Objective: The goal of the current study was to search possible correlations between functional mobility and cognitive measures in a sample of community-dwelling elderly people with normal cognitive aging. Sample and methods: 85 elders (age: x=71.23, sd=6.73) were evaluated for cognitive functions with RAVLT (Rey, 1964), specific subtests of WMS-III (Face recall, Block Design, Direct and Inverse Digit Span) and FAS-Verbal Fluency Test. Functional mobility was measured with the Tinetti Gait (TG) and Tinetti Balance (TB) scales (Tinetti, 1986), as well as with the Time Up & Go test (Podsialdlo & Richardson, 1991). Results: Statistical analyses showed significant correlations between TB and RAVLT series 1 (immediate memory) (r=0.249, p=0.025), series 5 (short-term memory) (r=0.293, p=0.007) and series 6 (r=0.260, p=0.018), and with Block Design (r=0.271, p=0.014); TG only showed significant correlations with Block Design (r=0.302, p=0.006). On the other hand, Time Up & Go correlated inversely with RAVLT series 1 (r=-0.366, p=0.001) and series 5 (r=-0.263, p=0.018). No further correlations were found between the rest of cognitive and functional mobility scales. Conclusions: Our results indicate that functional mobility and some cognitive functions, such as memory or visuospatial skills, change together in normal cognitive aging elderly. Further studies should explore whether functional mobility measures such as balance and gait speed can be reliable predictors of cognitive decline.

### PREDICTING FALLS IN A COMMUNITY SETTING USING BALANCE AND BODY COMPOSITION

J. Gaines, K. Marx, K.L. Burke, J.M. Parrish, *The Erickson Foundation, Baltimore, Maryland*

The number of falls occurring among older adults remains high despite efforts to reduce the risk through fall prevention classes. In the context of a longitudinal study entitled VIVA!, we monitor balance and body composition among older-old and oldest-old adults residing in a large-scale CCRC. For this study, we investigated the value of balance testing and bioimpedance analysis in the prediction of falls using data from Year 2 to predict falls occurring during the subsequent Year 3. Of the 250 participants (mean age 83.0 (sd=5.7), 77% female) in this study, 64 self-reported falling at Year 2 with 52 participants reporting falls at Year 3. Balance was assessed using a NeuroCom BalanceMaster. Four balance variables were included: (1) the ability to stand on a firm surface with eyes closed (sec); (2) the sit-to-stand rising index (%); (3) the limits of stability reaction time (sec); and (4) the walk across speed (cm/sec). Body Composition was assessed using a Tanita 418 Bioimpedance Analyzer. Lower extremity composition variables used were: (1) right leg fat mass; (2) right leg predicted muscle mass; (3) left leg fat mass; and (4) left leg predicted muscle mass. Using linear regression analysis, two of the chosen variables from Year 2, right leg predicted muscle mass ($\beta$=.224) and the ability to stand on a firm surface with eyes closed ($\beta$=.298) explained 15% of the variance in fall status at Year 3. Translating this data into action for older adults continues to be the upcoming challenge.

### THE APPLICATION OF SOCIAL COGNITIVE THEORY FOR UNDERSTANDING PHYSICAL ACTIVITY BEHAVIOR IN OLDER ADULTS

S.M. White, T.R. Wojcicki, E. McAuley, *Kinesiology and Community Health, University of Illinois Urbana Champaign, Urbana, Illinois*

Social Cognitive Theory (SCT) is one of the most frequently used theoretical frameworks for understanding physical activity (PA) behavior. Most applications, however, focus on self-efficacy as the sole determinant of SCT often ignoring the contributions of remaining model constructs. In this study, we prospectively tested the utility of a more comprehensive SCT model to explain PA behavior over an 18-month period in a sample of older adults (N=321; *M* age= 63.8 years). Participants completed measures of self-efficacy, goals, outcome expectations, and PA at each time point. The hypothesized relationships were examined using panel analysis within a covariance modeling framework. Self-efficacy was hypothesized to have a direct relationship with goals and physical, social, and self-evaluative outcome expectations. Goals and outcome expectations were hypothesized to directly influence PA, and self-efficacy was hypothesized to influence PA directly and indirectly through goals and outcome expectations. Overall, this model provided an excellent fit to the data ($\chi^2$ = 36.16, df= 30, p= .20; CFI= 1.00; RMSEA= .03; SRMR=.07). Self-efficacy was directly related to outcome expectations and goals and indirectly related to PA through social and physical outcome expectations. Changes in self-efficacy were significantly related to residual changes in outcome expectations, goals, and PA. Changes in self-efficacy were also indirectly related to residual changes in PA through changes in physical outcome expectations. These results provide support for the use of SCT to understand and explain PA behavior in older adults. Future studies should replicate this model in other samples and incorporate measures to test the full model.

### SOCIOECONOMIC STATUS AND THE DEVELOPMENT OF FRAILTY IN DUTCH OLDER PEOPLE; A TEN-YEAR FOLLOW-UP STUDY

M. Huisman[1,2], M. Heymans[1], D.J. Deeg[1], *1. VU medical center, EMGO+ Institute for Health and Care Research, Amsterdam, Netherlands, 2. VU University, department of Sociology, Amsterdam, Netherlands*

Background: Frailty is a geriatric concept that signals a lack of reserve functional capacity in older people. It has practical clinical implications because it constitutes a state of health that is still modifiable but is on the threshold to chronic irreversible health problems. In this study we analysed the development of frailty over a ten-year follow-up period in older Dutch men and women from different socioeconomic groups. Methods: Data came from a nationally representative cohort of 1,509 men and women aged 55-85 years. Frailty was measured with the following markers: physical activity, and grip strength, BMI, cognitive functioning, vision and hearing problems. A maximum of 4 observations of the degree of frailty were acquired over a ten-year follow-up period. Indicators of socioeconomic position were education level and household income. We conducted several types of linear mixed model analyses to assess socioeconomic inequalities in the development of frailty, including complete case analyses, and analyses with frailty imputed for those who died during follow-up. Results: Adjusted for age, sex, and a partner being present inside the house or not, primary educated had a .76 higher odds of developing frailty than tertiary educated men and women (95%CI OR: 1.05-2.97), and the lowest income groups had a .90 higher odds than the highest income groups (95%CI OR: 1.20-3.02). Interactions of education and income with time of frailty measurement suggested that the association of education and income increased during follow-up. The association of education with frailty was reduced after adjusting for income. Analyses with imputations for missing observations due to deaths yielded similar results. Conclusion: Having a high socioeconomic position is still protective against one of the core geriatric health problems; frailty. This suggests that differences in vulnerability account for socioeconomic inequalities in health in old age, but also that reversing these inequalities partly is feasible.

## SESSION 1235 (SYMPOSIUM)

### CANADA'S ROADMAP FOR RESEARCH ON AGING: A DECADE REVIEW AND FORWARD AGENDA FOR THE INSTITUTE OF AGING OF THE CANADIAN INSTITUTES OF HEALTH RESEARCH

Chair: *A. Martin-Matthews, Institute of Aging, Canadian Institutes of Health Research, Ottawa, Ontario, Canada*

The Institute of Aging is one of 13 national Institutes of the Canadian Institutes of Health Research, funding biomedical, clinical, health services and population health research. Established in 2000, the Institute of Aging's fundamental goal is the advancement of knowledge in the field of aging to improve the quality of life and the health of older Canadians. As CIHR and the Institute of Aging now embark on a decade review, and a strategic alignment of the Institute's priorities with CIHR's Roadmap, this symposium will present the research outcomes of several Institute strategic initiatives over the past ten years, by examining: (a) the findings and research gaps in its priority funding areas of cognitive impairment in aging, mobility in aging, and the Canadian Longitudinal Study of Aging; (b) the research and stakeholder issues central to a developing strategic research focus on health services and systems for an aging population; and (c) the ways in which CIHR's requirements for knowledge translation and citizen engagement, and Canada's need for research capacity development, have influenced and been shaped by these initiatives. While these issues are discussed primarily in the context of Canada's research achievements and forward agenda for research on aging, they are also framed in the context of the Institute's international collaborations with the UK, France, Japan, and China, and with the EU's ERA-AGE initiative.

### SHAPING RESEARCH ON AGING IN CANADA: THE STRATEGIC INITIATIVES OF THE CIHR INSTITUTE OF AGING

A. Martin-Matthews, *Institute of Aging, Canadian Institutes of Health Research, Ottowa, Ontario, Canada*

Since its establishment in 2000 as one of 13 national Institutes of the Canadian Institutes of Health Research, the Institute of Aging has identified strategic priorities in cognitive impairment, mobility in aging, health services and systems for an aging population, and developed and launched the Canadian Longitudinal Study on Aging. This presentation examines the changing landscape of research on aging (including biomedical, clinical, health services and population health research) in Canada over this 10 year period, the Institute's approach to CIHR's dual mission of knowledge creation and knowledge translation, and the IA's approach to stakeholder and citizen engagement over time. Canada's need for development of research capacity in aging is a cross-cutting theme in this presentation. Issues of aging in a global research context are also addressed, with a particular focus on the Institute's international collaborations with the UK, France, Japan, and China, and the EU's ERA-AGE initiative. (n=148)

### COGNITIVE IMPAIRMENT IN AGING: NATIONAL PARTNERSHIPS TO INTERNATIONAL COLLABORATIONS

M. Peel, *Institute of Aging, Canadian Institutes of Health Research, Ottowa, Ontario, Canada*

Cognitive Impairment in Aging has been a strategic priority of the Institute of Aging since 2001. A primary mechanism for strategic planning and funding of research in this area has been the Cognitive Impairment in Aging (CIA) Partnership, a consortium of private, non-governmental, voluntary and government organizations who collaborate to further research in all aspects of cognitive impairment. This presentation discusses the IA-led strategic funding initiatives on biological mechanisms and treatment of Alzheimer's disease, Vascular Health and Dementia, Caregiving and Care Practice in Dementia, and the creation of the Canadian Dementia Knowledge Translation Network. In looking to the future of research in this area, CIHR is leading the development of an International Collaborative Research Strategy for Alzheimer's Disease (ICRSAD). This presentation will discuss ICRSAD's focus on issues of risk factor identification, early diagnosis (in order to facilitate early intervention), prevention, and early and optimal response of the health system. (n= 149)

### MOBILITY IN AGING: BUILDING CAPACITY AND KNOWLEDGE TRANSLATION

S. Crawford, *Institute of Aging, Canadian Institutes of Health Research, Ottowa, Ontario, Canada*

The Institute of Aging launched its strategic initiative on Mobility in Aging (MIA) in 2005 with the goals of enhancing relevant research and knowledge translation, spanning physiological mechanisms to the built environment. Consultations with national stakeholders identified research foci that included understanding and defining mobility; maintaining and restoring mobility; measures, tools and technologies in mobility research and the assessment of mobility aids; and supportive design covering housing, communities and transportation. This presentation discusses how the mobility in aging research landscape in Canada has been shaped by this strategy, through its support of feasibility studies, demonstration projects, and emerging interdisciplinary teams; and through partnered initiatives in Canada and collaborations with research funding agencies in the U.K. Challenges in realizing policy-relevant outcomes impacting mobility in aging and age-supportive environments, are also discussed. (n=130)

### CANADIAN LONGITUDINAL STUDY ON AGING: A RESEARCH PLATFORM FOR CANADA

L. Mealing, *Canadian Institutes of Health Research, Ottawa, Ontario, Canada*

The Canadian Longitudinal Study on Aging (CLSA), launched in 2008, is a 20-year study of 50,000 Canadians between the ages of 45 and 85. Of these, 30,000 people will undergo in-depth clinical assessment at 11 sites across Canada. With over 140 research collaborators, the CLSA will examine relationships among intrinsic and extrinsic factors from mid life to old age, and capture profiles of healthy and successful aging, adaptation, disease and disability. The CLSA will provide a national research infrastructure and build research capacity for sustained high quality research on aging from biology to population health. This presentation discusses the research, innovation and opportunities of the early phases of the CLSA, through its partnership with Statistics Canada and the Canadian Community Health Survey. CLSA's collaborations, and harmonization of data and access with other international cohort initiatives, such as the US HRS, are discussed. (n=146)

## SESSION 1240 (POSTER)

## EPIDEMIOLOGY AND RESEARCH METHODS

### METABOLIC SYNDROME AND CONSUMPTION CUPANA PAULLINIA (GUARANA) IN AMAZONAS RAIFOREST ELDERLY

I.B. Cruz[1], E.E. Ribeiro[2], E.A. Ribeiro[2], E. Brito[2], K. Viegas[2], A.F. Silveira[1], M.U. Rocha[1], *1. Centro de Ciencias da Saúde, Universidade Federal de Santa Maria, Santa Maria, RS, Brazil, 2. Universidade do Estado do Amazonas, Manaus, Brazil*

Amazon for its caffeine-rich fruits. In the last two decades the guaraná was investigated and the antioxidant, anti-obesogenic proprieties were observed. Considering the guaraná biological proprieties we investigated is whether the prevalence of metabolic syndrome (MS) could be influenced by consumption in Maués's elderly population. A study was done by cluster sampling in two stages: (1) identification and analysis of health indicators of elderly enrolled in the Brazilian Public Health Services in Maués-AM. This city is compound by 174 communities scattered along rivers and streams. This step was carried out by health workers previously trained (n = 1317), (2) selection and evaluation of elderly as the sampling unit chosen. A sample of 500 subjects were analyzed (72 years, 46% men, 54% women) .The prevalence of MS was 25% (126). The intake of guarana was 65% (327). Older adults who consume guarana had a lower prevalence of MS (21%) of the remaining (32%) (p = 0.007) regardless of sex and age. Considering the bioactive principles of guarana (caffeine, theobromine, theophylline and catechin) and previous investigations the results suggest that this food could have anti-SM proprieties.

### PREVALENCE AND RISK FACTORS OF PAIN CLUSTERS: KOREAN LONGITUDINAL STUDY OF AGEING (KLOSA)

S. Cho[1], S. Jang[2], H. Phang[3], *1. Seoul National University Graduate School of Public Health, Seoul, Republic of Korea, 2. Department of Society, Human Development, and Health, Harvard School of Public Health, Boston, Massachusetts, 3. Korea Labor Institute, Seoul, Republic of Korea*

Pain may result in activity limitation and reduced quality of life, and incur treatment cost. Understanding patterns and determinants of pain can help develop preventive measures. We investigated pain symptoms in older adult Koreans. Data were obtained from a sample of adults aged 45 to 85 years (4016 men, 5003 women) who participated in the 2006 cross-sectional baseline survey of the Korean Longitudinal Study of Ageing. Questionnaire interview obtained information on pain in 13 different body sites. Grouping of pain sites was investigated by clustering algorithm. Impact of pain was assessed on the need for assistance in daily living, hospitalization, and outpatient visit during the past year. Statistical analyses were performed with SAS software. Most frequent pain sites were back, legs, and knees. Women experienced more frequent pain than men in all sites($p<0.05$). Pain sites were clustered into three groups; those associated with movement, force, and the others. First two groups significantly increased with age. History of multiple chronic diseases and traffic injury were significantly associated with all three pain groups. History of falls was associated with the first two groups. Having pain in 3 or more sites was significantly associated with greater need for assistance (OR 1.8), hospitalization (OR 1.7), and outpatient visit (OR 2.6) in men, and with hospitalization (OR 1.5) and outpatient visit (OR 2.7) in women ($p<0.01$ for all). In conclusion, pain is associated with age, gender, past exposures and health problems, and leads to increased care burden.

### HEMOGLOBIN A1C LEVEL, SELF-RATED HEALTH, AND PHYSICAL PERFORMANCE AMONG OLD JAPANESE

L. Nyquist[1], J. Liang[1], J.M. Bennett[1], S. Shinkai[2], Y. Fujiwara[2], H. Yoshida[2], *1. University of Michigan, Ann Arbor, Michigan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

There is increasing interest in using biomarkers to predict changes in physical function across time. Few studies consider the association of psychological variables in these relationships. This research examines the trajectories of physical performance among older Japanese with a focus on their linkages with hemoglobin A1c (HbA1c) and self-rated health (SRH). Data came from the annual health examinations from 2002 to 2006 in Kusatsu in eastern Japan. Participants included 1,048 Japanese aged 70 or over with 2,405 observations. The dependent variables were performance-based measures of strength (hand grip), balance (one-leg stance time), and walking (usual and maximum gait speed). HbA1c was determined from nonfasting blood samples. SRH was indexed by a rating of health as excellent, good, fair, and poor. Hierarchical linear models with time-varying covariates were applied to examine changes in physical performance over a period of up to 5 years. Linear as well as nonlinear trajectories were evaluated. All performance measures showed slight but significant linear decline over time. Higher levels of HbA1c and poorer SRH were associated with accelerated decline in physical performance. With age, gender, education, height, weight, use of diabetes medications, and attrition adjusted, higher HbA1c was negatively associated with only the balance measure. In contrast, controlling for population heterogeneity, the linkages between self-rated poor health and faster decline in all measures of physical performance persisted. In summary, trajectories of physical performance are significantly correlated with not only HbA1c but also SRH.

### RELATIONSHIP BETWEEN GAIT SPEED AND THE RISK OF FALLS IN COMMUNITY-DWELLING OLDER ADULTS: THE MOBILIZE BOSTON STUDY

L. Quach, R. Jones, M. Hannan, E. Newton, B. Manor, L. Lipsitz, *Instittute for Aging Research, Hebrew Senior Life, Boston, Massachusetts*

Since both high and low gait speeds have been linked to falls, the relation between gait speed and falls may be non-linear. Little is known about changes in gait speed and their relation to falls in community-dwelling older adults. We examined the relationship between baseline gait speed, decline in gait speed, and falls measured prospectively from baseline, September 2005 to April 2009 in a large community based cohort (n=765) using negative binomial regression and adjusting for age, race, gender, education, body mass index, vision, co-morbidity, number of medications, and physical activities. Baseline characteristics: mean age 78, 64% female, 77% white. The rate of falls was 1.0 fall/person-year (95% CI: 0.9-1.1). Mean (± standard deviation) baseline gait speed was 0.95 (±0.26) meters per second (m/s). 28% had gait speed decline at least 0.12 m/s at 18 month follow-up. We grouped persons into three groups of baseline gait speed: low (<=0.6 m/s), median (>0.6 m/s-1.2 m/s), and high (>1.2 m/s). Relative to median gait speed, persons with low and high gait speed were at higher risk of falls (RR low = 1.5, 95% CI: 1.0-2.1, RR high = 1.4, 95% CI: 1.1-1.9). Persons with decline at least 0.12 m/s were at higher risk of falls compared with person without decline in gait speed (RR = 1.5, 95% CI: 1.1-2.1). Decline in gait speed at 0.12 m/s is a predictor of falls. Interventions could target risk in slow as well as fast walkers and also aim to intercede in those with declining speed.

### IDENTIFYING OLDER ADULTS AT RISK FOR HOSPITAL READMISSION

L. Graham[1], B. Leff[1,2], A.I. Arbaje[1], *1. Department of Medicine Division of Geriatric Medicine and Gerontology, Johns Hopkins School of Medicine, Baltimore, Maryland, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland*

Background: Adequate care across transitions, particularly at hospital discharge, is critical to reducing readmission rates. Previous studies have identified individual risk factors but have not identified types of patients at risk for readmission to allow for targeted discharge interventions. Objective: To identify subsets of patients and discharge factors associated with hospital readmission Methods: Retrospective cohort study of patients aged ≥ 65 years admitted to an academic teaching hospital from January to December 2007 (n=5736). Primary outcome measure was time to hospital readmission within 30 days post-discharge. We created a Cox proportional hazards model comparing medical and surgical patients and elective and non-elective patients, adjusting for demographics, healthcare utilization, multi-morbidity, and day of discharge. Results: 11.4% of patients were readmitted within 30 days and 18.9% within 90 days. Readmission rates at 30 days were higher for patients who were admitted non-electively (11.9%) and for patients admitted to a medical service (13.2%). The most discharges occurred on Friday (20.0%) and was not different for surgical or elective patients. In multivariate analysis, Friday discharge was not significantly associated with an increased hazard of readmission (HR=1.02, 95% CI 0.84-1.24). Conclusions: Medical and non-elective admissions have higher rates of readmission, suggesting that interventions focused on these patients may have the greatest impact on readmission. A disproportionate amount of discharges occur on Friday across all types of patients. Study findings do not suggest that older adults experience increased risk of hospital readmission associated with Friday discharge. Findings have implications for organizations interested in reducing readmission rates.

### ARE THE ELDERLY PEOPLE FEELING HEALTHIER THAN 10 YEARS AGO?

C. dos Reis, M. Souza-Fischer, A. Nolte, D. Bastiani, A.J. Bos, *Institute of Geriatrics and Gerontology of PUCRS, Porto Alegre, RS, Brazil*

METHODS: We used data from two methodological comparable population based studies of elderly (60 years or older) community dwelling subjects randomly identified at their homes in Porto Alegre, Brazil, in 1995 (860 participants) and 2006 (1078 participants). The multidimensional questionnaire included HSA and socio-demographic characteristics. Health Self-Assessment was dichotomized in good or bad. Tables of HSA and study year were constructed for each characteristic and tested using chi-square test with the program Epi Info 3.5.1. RESULTS: More elderly referred their health as good in 2006 (47.3%) than in 1995 (43.1%), borderline significant (p=0.063). All age groups (decade) showed higher proportion of good HSA in 2006 comparing to 1995, but not significant. Women significantly increased good HSA from 40% to 45.5% (p=0.0470). Men also improve, from 50.4 to 52.5%, the proportion good HSA, but not significantly. Race was borderline significant for white (44% to 48.4%, p=0.077) and mulatto (26.6% to 46.6%, p=0.0861). Separated or divorced elderly improved significantly their HSA (33.3% to 49.5% p=0.0418). Participants with higher levels of education reported better levels of HSA in both years, but did not change significantly between the years. CONCLUSION: In a decade interval, elderly seems to feel healthier, particularly women and those with marital status of separated or divorced.

### PROCEDURES FOR ENSURING TRANSLATION EQUIVALENCE IN QUALITATIVE RESEARCH WITH SPANISH SPEAKING WOMEN WITH DISABILITIES

T. Harrison, S. Hendrickson, N.A. Lopez, A.G. Zegarra-Coronado, T. Scott, *The University of Texas at Austin, Austin, Texas*

Language differences may exist that prevent the inclusion of Spanish speaking older adults in qualitative research. When they are included issues related to translation often go unreported. The purpose of this study was to examine the procedures for translating large sets of Spanish text into English results. Sample: A subset of 10 Spanish speaking, Mexican American women age 55 to 75 years of age were included. The women were part of an ongoing cross cultural comparative ethnographic study currently including 45 Mexican American and 28 Non-Hispanic, White women. Procedures: Women were interviewed in the language of their choice by a bilingual investigator. Four in-depth, topical biographical, conversational interviews were done with each. A total of 40 interviews were transcribed verbatim from Spanish dialogue to Spanish text. Each interview averaged 35 pages of double-spaced text. Next, Spanish text was subjected to two different translation processes and the processes were compared for effectiveness: A professional, certified translator vs. local, bilingual team translators Analysis: Time spent in translation, error rates, meaning or coherence of text data and costs are evaluated and compared. Results: Preliminary results suggest that the use of local bilingual translators employed as part of the project translate at less initial cost, but they are slower. Error rates for local translators are higher and require multiple translation verifications. Meaning or coherence of the final text is theorized to be similar but slightly superior in the local team due to knowledge of regional words/phrases. Procedural issues to be aware of are also shared. This study was supported by a grant from NIH/NINR 1 R01 NR010360

### EVALUATING THE ATTRIBUTED DIGNITY SCALE

C.S. Jacelon, *School of Nursing, U. Massachusetts Amherst, Amherst, Massachusetts*

Dignity is important for the health and independence of older adults, and particularly important in relation to interaction with the healthcare system. One aspect of dignity, attributed dignity, defined as a cognitive component of the self, connoting self-value, and as behavior that demonstrates respect for self and others, is amenable to measurement. The purpose of this study was to test a short positively scored instrument to measure the attributed dignity of older adults. The specific aims of the study were to: 1) Determine the psychometric properties of the Attributed Dignity Scale (ADS) through a field test to ascertain the internal consistency, underlying factor structure, temporal stability, and sensitivity to change over time of the ADS. 2) Use the ADS to examine the basic structure of attributed dignity in older adults including: a) The construct validity of attributed dignity by exploring relationships between scores obtained on the ADS with scores obtained on instruments measuring self esteem and social desirability. b) Comparisons between the ADS and measures of health status, psychological and physical vulnerability, and demographic variables to determine the relationships among these variables. The sample was composed of a diverse group of 230 rural and urban dwelling older adults living in New England. The ADS can be used to measure a concept that is a core value of healthcare delivery and important to the well being of older adults that is just now being operationalized.

### ASSESSING COMORBIDITY IN OLDER ADULTS USING PRESCRIPTION CLAIMS DATA

M. Dubois[1,2], N. Dubuc[1,2], E. Kroger[3,4], R. Girard[5], R. Hebert[1,2], *1. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. Research Centre on Aging, Sherbrooke, Quebec, Canada, 3. Centre d'excellence sur le vieillissement de Québec, Quebec, Quebec, Canada, 4. Utrecht University, Utrecht, Netherlands, 5. Clinique Médicale des Cantons, Sherbrooke, Quebec, Canada*

OBJECTIVE: Comorbidity is an important variable in many studies since it may influence the results. While self-reports, medical records abstraction and medical claims databases present problems of practicability, comorbidity scores could be derived more conveniently from prescription claims databases. Existing scores were developed for people aged 18 years or older and used costs, hospitalizations, or death as outcomes of interest. Therefore, they tend to be of limited value when studying disability in older adults. Our objective was to develop the Chronic Disease Score for Disability in Older Adults (CDS-DOA) based on outpatient prescription claims data from community pharmacies. METHODS: Clark et al.'s 1995 extended Chronic Disease Score was revised and expanded to account for diseases and treatments relevant for older adults. Empirical weights for frail older adults were then derived on a development sample using a multiple regression model with disability as the outcome. Beta coefficients were used to weight the CDS-DOA, which was then assessed in a validation sample. The predictive power of the CDS-DOA was also compared to that of a simple count of distinct prescribed medications. RESULTS: The CDS-DOA explained 12 to 16% of the variance in disability, in both the development and validation samples. It performed far better than the number of distinct medications with only 2 to 4% explained variance. CONCLUSIONS: The CDS-DOA is a valid and stable comorbidity score in community-dwelling frail older adults and may be used for adjustment in epidemiological studies of disability using prescription claims data.

### DO UNBLINDED ASSESSORS BIAS OUTCOMES IN MUSCLE STRENGTH TRAINING TRIALS IN OLDER ADULTS?

C. Liu, *Indiana University at Indianapolis, Indinapolis, Indiana*

Results from randomized controlled trials (RCTs) are regarded as the highest level of evidence in evidence-based medicine and practice. However, RCTs are not without flaws if trials investigators do not preserve the internal validity. Knowledge of the intervention by participants and assessors can cause systematic detection bias. Blinding participants in the muscle strength training trials is problematic because participants have to take part in the intervention. On the other hand, blinding outcome assessors is possible. This study was undertaken to determine the difference in muscle strength outcomes measured by blinded versus by unblinded outcome assessors in progressive resistance strength training trials in older adults. Meta-regression analysis was conducted in 73 RCTs obtained from a systematic review recently published in the Bone, Joint and Muscle Trauma Group of the Cochrane Collaboration. Lack of blinded assessors is common in these trials (75%). The analysis show that trials that used blinded assessors (n=18) tend to report smaller effects of lower limb muscle strength than those that used unblinded assessors, coefficient = -.80, 95% CI = -1.35 to -.25. The result is still hold even after the variance in intention-to-treat has been controlled, coefficient = -.65, 95% CI = -1.26 to -.04. This study suggests that assessor blinding is important and is a safeguard to internal validity of exercise trials in older adults. Effects of lower limb muscle strength are exaggerated in trials that used unblinded assessors.

### TRAJECTORY CLASSES OF DEPRESSION IN AN OLDER COMMUNITY SAMPLE

M. Kuchibhatla, G. Fillenbaum, *Biostatistics and Bioinformatics, Duke University Medical Center, Durham, North Carolina*

Level of depression may vary over time in older community residents. To identify the kinds of variation present over a 10-year period, depressive symptomatology was measured using the Center for Epidemiologic Studies Depression Scale (CESD), and trajectory classes of depression were determined through latent class models, namely, growth mixture models (GMM). A sample of 4162 subjects was drawn from the Duke site of the Established Populations for Epidemiologic Studies of the Elderly (EPESE). At this site, a four-stage sampling design was used in five counties to select a stratified representative sample of households containing one or more persons 65 years of age or older with only one older person selected per household. At baseline, three, six and ten years later, all sample members were evaluated at home by trained interviewers using a structured questionnaire. GMM was used to model CESD data from four waves over 10 years, using the statistical software M-plus. A sample of 4009 subjects with one or more waves of CESD data was used for the current analysis. The analysis resulted in 5 classes of trajectories: stable non-depressed trajectory class with 74.2% of the sample, chronic depressed trajectory class with 5.7% of the sample, baseline non-depressed worsening class (4.0%), baseline depressed improving class (9.4%), and baseline non-depressed transient class (6.7%). Effects of covariates on these trajectories will be examined. CTSA grant UL1 RR024128-04 from NCRR/NIH, P30AG028716 & 2P50-MH60451

### PREDICTING 10-YEAR MORTALITY: A CLASSIFICATION TREE ANALYSIS OF EPESE DATA

S. Perera[1], S. Studenski[1], J. Brach[1], R.B. Wallace[3], K. Patel[2], J. Guralnik[2], *1. Division of Geriatric Medicine, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. National Institute on Aging, Bethesda, Maryland, 3. University of Iowa, Iowa City, Iowa*

Background/Objective: Predicting mortality of older adults is important in making decisions about getting affairs in order and aggressive treatment options. We sought to evaluate the data mining technique of classification tree analysis (CTA) in predicting 10-year mortality using measures that would (and ought) to be collected in a routine clinic visit. Methods: We used the 2547 participants from the Iowa Established Populations Epidemiologic Study of the Elderly (EPESE) study with 10-year mortality data from the year 6 assessment. We randomly selected 1547 participants (training sample) for model building, and 1000 as the validation sample. We used age, gender, self-reported global health (excellent/very good/good/fair/poor) and diseases (arthritis, heart disease, cancer, diabetes), 8-foot gait speed, body mass index, weight, systolic and diastolic blood pressure, and prior hospitalization as predictors. Criteria for optimal tree were minimal misclassification-complexity cost and greatest area under receiver operator characteristic curve (AUROC) obtained under internal cross-validation. Once optimal tree was obtained, the validation sample was used to assess predictive accuracy. Results: Participants had mean age 79.7 and were 34% male. All measures were similar between training and validation samples. CTA identified 13 participant groups based on simple thresholds: age 78.5, 80.5 and 83.5; excellent/very good, good and fair/poor health; gender; gait speed 0.34, 0.54 and 0.87 m/s; systolic blood pressure 169 mmHg; weight 59.32, 71.36 and 74.77 kg. The AUROC for training and validation samples were 0.753 and 0.704. Conclusion: Classification tree methodology, with acceptable accuracy, produces an easy-to-use grouping of subjects with respect to 10-year mortality risk.

### GERONTOLOGIC RESEARCH ALGORITHMS & STATISTICAL PROGRAMS (GRASP) - A WEB-BASED BIOSTATISTICAL REPOSITORY FOR GERONTOLOGICAL RESEARCHERS

H. Allore, *Internal Medicine, Yale University, New Haven, Connecticut*

Gerontologic biostatistics is a subdiscipline characterized by the methodological issues that arise when working with populations whose health conditions feature multifactorial etiologies and multiple morbidities. Gerontologic researchers face challenges in appropriate study design and analytic approaches to address multifactorial etiologies of geriatric health outcomes and their relationship with multiple morbidities of older patients and other risk factors. The objective of GRASP (http://grasp.med.yale.edu) is to provide a free, widely-accessible, web-based resource and platform for gerontological researchers and quantitative methodologists from different backgrounds to exchange problem-solving ideas and skills and share analytic methodology and instruments. Created by the joint efforts of Yale, Duke and Wake Forest Universities Older Americans Independence Centers with funding from the NIA, GRASP provides sample computer programs, data structures, analytic results, with links to external resources, such as reference articles, research instruments. User contributions are welcomed. Examples include controlling the overall error rate in multiple outcomes studies, missing data methods including imputation strategies for intermittent missing over repeated measures, temporal-spatial models, state transition models and floor and ceiling effects. Furthermore, to analyze geriatric syndromes examples of group-based trajectory model, structural equation modeling, and latent-growth models are included. Furthermore, extensive genetic resources for exploring conditions that have later life onset with potential genetic contributions are available for both teaching and research needs. GRASP includes Geriatric Research Instrument Library (GRIL), an online repository of data collection instruments in geriatrics research. Each instrument in GRIL includes a description, references, and links to online resources, and many entries provide downloadable PDF documents.

## SESSION 1245 (SYMPOSIUM)

### GENOMIC APPROACHES TO DISCOVERY IN AGING RESEARCH

Chair: *S.B. Kritchevsky, Wake Forest University School of Medicine, Sticht Center on Aging, Winston-Salem, North Carolina*
Co-Chair: *M. Garcia, National Institute on Aging, Bethesda, Maryland*
Discussant: *T. Harris, National Institute on Aging, Bethesda, Maryland*

At a time when resources available for health care are declining, the absolute number of disabled older adults is projected to increase. There is a wide variation in the trajectories of functional decline indicating the potential for the prevention of disability. While research has identified several potentially modifiable risk factors there are currently no proven interventions to prevent the onset of disability. Thus, there is an urgent need to expand our understanding of the metabolic / physiologic pathways that contribute to disability to generate novel intervention targets for disability prevention. There is growing evidence that many of the factors that contribute to disability are heritable which has led to the use of genomic approaches to identify novel pathways, and there are currently many large consortia pooling data to explore the genetic basis of longevity, physical and cognitive function, and common chronic disabling diseases. The objectives of this symposium are: 1) to highlight some of the recent findings from these activities and 2) to discuss the opportunities and challenges of genome-based discovery research in aging including the role of genome wide association studies, phenotype characterization in older adults, and variation in mitochondrial DNA and its role in human aging. This symposium is organized on behalf of the Research Committee of the Health Science Section.

### RECENT PROGRESS FROM CANDIDATE GENES TO GENOME-WIDE ASSOCIATION STUDIES (GWAS) AND BEYOND GWAS

Y. Hsu, *1. Hebrew SeniorLife Institute for Aging Research and Harvard Medical School, Boston, Massachusetts, 2. Harvard School of Public Health, Boston, Massachusetts*

GWAS provide the first wave of discoveries for susceptible genes to a wide variety of common diseases and traits. Up-to-date, > 500 GWAS have been published. Greater surprises are that few risk alleles involve previously suspected genes, which provide new leads to gain insight into diseases. However, current GWAS are fundamentally limited by featuring predominantly common SNPs without functional implications. Identification of disease-susceptibility genes by means of statistical signals provides limited information to unveil the molecular functions. In this presentation, I will describe (1) recent progress and challenges of GWAS. To overcome the challenges, I will describe our recent development on (2) systems biology approaches by integrating GWAS to transcriptome and proteomics; (3) multi-phenotypes GWAS analytical methods to identify pleiotropic genetic effects across different diseases; and (4) advances in the next-generation sequencing technologies for whole genome and exome resequencing to fill in the gap of the “missing heritability” phenomenon.

### FROM CANDIDATE GENES TO GWAS AND BACK AGAIN: THE VITAMIN D EXAMPLE

D.K. Houston, *Sticht Center on Aging, Wake Forest University School of Medicine, Winston Salem, North Carolina*

Over the last two decades, the role of vitamin D has been shown to extend beyond the musculoskeletal system to encompass a growing list of health consequences associated with low vitamin D status. Candidate gene studies, primarily in relation to osteoporosis and to a lesser extent in other health outcomes including physical function, cardiovascular disease, diabetes, and cancer, have examined the effects of specific genes in the vitamin D pathway including the vitamin D receptor (VDR), the vitamin D binding protein (GC), and genes involved in the hydroxylation and degradation of vitamin D metabolites (CYP2R1, CYP27B1, CYP24A1). With the advent of genome-wide association studies (GWAS), multi-cohort GWAS have identified common genetic variants influencing vitamin D status. Genetic variants identified in GWAS are then being used in a candidate gene approach to investigate whether vitamin D plays a causal role in a number of health outcomes.

### COMPREHENSIVE SNP ANALYSIS OF THE INSULIN RECEPTOR GENE USING SLIDING WINDOW HAPLOTYPE ANALYSIS

J. Purser[1], D. Crosslin[2,1], S.C. Nelson[2,1], J.S. Johnson[1], E. Hauser[1], S. Gregory[1], *1. Medicine-Geriatrics, Duke University Medical Center, Durham, North Carolina, 2. University of Washington, Seattle, Washington*

In this session, we discuss the use of dense genotyping and haplotype-based candidate gene analysis in epidemiologic studies, and when those methods might be helpful in comparison to other analysis approaches. We will present an application from the Health ABC study, using dense genotyping of Insulin receptor SNPs for 2,495 African Americans (AA) and Caucasians (CA) in the Health and Body Composition Cohort (HABC). We demonstrate how, even when dense genotyping yields insignificant bivariate associations with phenotypes (lean mass, appendicular lean mass, quadriceps torque and gait speed), novel haplotype regions can nevertheless be estimated, along with estimation of specific allelic patterns and dose-response associations within a globally-significant haplotype window. Using this approach, our research team has identified novel haplotype regions in candidate genes that are strongly associated with appendicular lean mass and walking speed.

### EXAMINING THE ROLE OF MITOCHONDRIAL GENETIC VARIATION IN HUMAN AGING

G.J. Tranah, *Research Institute, California Pacific Medical Center, San Francisco, California*

Both mitochondrial DNA (mtDNA) and nuclear DNA encode the genes responsible for assembling mitochondrial enzymes that produce energy and are essential to the normal function and survival of all cells. Impaired mitochondrial function resulting from mtDNA and nuclear DNA variation is likely to contribute to an imbalance in cellular energy homeostasis, increase vulnerability to oxidative stress, and increase the rate of cellular senescence and aging. To date, large-scale genetic studies have emphasized the role of nuclear genetic variation in human disease and aging but have not considered the role of mitochondrial genetic variation. We will present mtDNA genotype and sequence data from the Health, Aging and Body Composition Study cohort in relation to disease prevalence/incidence and several longitudinal and cross-sectional measurements of aging-related traits (e.g. glucose/insulin metabolism, body composition, metabolic rate, physical and cognitive function). The role of mitochondrial-nuclear gene epistasis in human aging will also be explored.

### DEFINING AGING PHENOTYPES

A.B. Newman, *Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*

There are numerous ways to define aging phenotypes for genetic studies. The aging process and the common age- associated chronic diseases are heterogeneous in onset and rate of progression. Important aspects of aging include the rate of change or disease progression, the age of onset of decline and the role of physiologic reserve. Using a systems approach to characterizing age related changes in physiologic systems, the spectrum of health and illness can be more fully appreciated and illustrate the potential to characterize individuals with very low mortality risk who are examples of exceptional aging. Physical functioning and disability are non-specific manifestations of disease burden that might also summarize aging processes. These relationships between disease and function in old age are confounded by the capacity for older adults to adapt to very high burdens of disease and maintain good function. Specific aging phenotypes may reveal unique pathways to longevity and healthy aging.

## SESSION 1250 (SYMPOSIUM)

### IMPLEMENTATION AND EVALUATION OF INTERVENTION RESEARCH IN THE HOME HEALTH CARE SETTING

Chair: *J.L. Locher, Medicine, University of Alabama at Birmingham, Birmingham, Alabama*
Co-Chair: *M.L. Kilgore, Medicine, University of Alabama at Birmingham, Birmingham, Alabama*
Discussant: *E. Amella, Medical University of South Carolina, Charleston, South Carolina*

Medicare home health services are provided to beneficiaries who are homebound and in need of skilled nursing or therapeutic care after experiencing an acute event or exacerbation of a chronic illness. According to the Medicare Payment Advisory Commission's most recent report to Congress (March, 2010), 3.2 million beneficiaries received home health services from 10,000 home health agencies in 2008. Fewer older persons with functional impairment are entering nursing homes, and more are choosing to remain in the community. Rising health care costs and consumer preferences for aging in place call attention to the potential for home health agencies to deliver timely interventions that may prevent costly and preventable institutionalizations. This symposium presents the experiences of two interventions involving randomized controlled trials that were undertaken in the home health care setting. For the first study, Improving Osteoporosis Care in High-Risk Home Health Patients by a High-Intensity Intervention (supported by the Agency for Healthcare Research and Quality), we report on: 1) development of the protocol and 2) initial findings. For the second study, A Multi-Component Behavioral Nutrition Intervention for Homebound Elderly (supported by the National Institute on Aging), we report on: 1) challenges involved with recruitment of participants and 2) preliminary findings. The home health care setting provides unique opportunities to implement intervention research designed to improve patients' health and prevent subsequent adverse events. There are challenges, as well, involved in undertaking intervention research in the home health environment. This symposium describes our experiences in the field and lessons we have learned.

### DESIGN OF A HIGH INTENSITY INTERVENTION TO IMPROVE OSTEOPOROSIS CARE IN HOME HEALTH PATIENTS

R.C. Outman[1], M.L. Kilgore[1], J.L. Locher[1], J.J. Allison[2], K. Saag[1], J.R. Curtis[1], *1. The University of Alabama at Birmingham, Birmingham, Alabama, 2. University of Massachusetts Medical School, Worcester, Massachusetts*

We developed a multi-modal intervention, delivered in the context of home health services, aimed at increasing osteoporosis drug prescription to prevent fragility fractures. The intervention focused on home health nurses. Key components included: nursing education, development of a nursing care plan, and creation of patient and physician education materials, and preprinted order sheets to facilitate ordering prescription medications and dietary supplements. Feedback from physicians and nurses was obtained on the materials and methods to facilitate nurse-physician communication. The intervention was piloted in one field office of a home health agency. Successful application required nurses to identify high risk patients (i.e., fracture history), initiate the nursing care plan, prompt physicians where indicated on risk status (i.e., untreated patients), and provide patient education. Home health care provides a venue where patients and physicians can be informed by nurses about the risks of osteoporosis and fractures and, consequently, initiate appropriate therapy.

### IMPROVING OSTEOPOROSIS CARE IN HIGH-RISK HOME HEALTH PATIENTS BY A HIGH-INTENSITY INTERVENTION

M.L. Kilgore[1], J.R. Curtis[2], J.L. Locher[1], R.C. Outman[2], J.J. Allison[3], K.G. Saag[2], *1. Health Care Organization & Policy, UAB School of Public Health, Birmingham, Alabama, 2. University of Alabama at Brimngham, Birmingham, Alabama, 3. University of Massachusetts School of Medicine, Worster, Massachusetts*

We conducted a cluster-randomized trial to determine the effect of an intervention designed to increase rates at which high risk home health patients received prescription drugs for osteoporosis. The trial was conducted in a home health agency with field offices located throughout Alabama. Eleven offices were randomized to receive the intervention and twelve served as controls. Nine months into the study, preliminary data were analyzed. 24.8% of high risk patients in the treatment offices received prescription drugs compared with 20.9% of those in the control offices ($p = 0.19$). However, it was also observed that when the intervention was implemented as intended, 39.4% of patients received prescription drugs compared with 23.8% who did not receive the intervention ($p < 0.001$). Thus far the intervention has produced a modest, non-significant, increase in prescription rates. However, when the treatment protocol is followed, the effect is substantial. Refinements to the intervention are ongoing.

### METHODOLOGICAL CHALLENGES OF A WEIGHT GAIN/MAINTENANCE INTERVENTION IN OLDER ADULTS RECEIVING HOME HEALTH CARE

D. Buys, L. Hartin, J.L. Locher, *University of Alabama at Birmingham, Birmingham, Alabama*

Under-eating is common among older adults receiving home health services and is associated with subsequent weight loss and a decrease in lean muscle mass, which ultimately contributes to frailty. The overall goal of our multi-component behavioral nutrition intervention is to interrupt this process during the period of recovery from illness through increased or stable caloric intake. This straightforward goal has met with controversy and resistance, particularly with respect to overweight and obese participants. First, both our institutional review board and our interventionists questioned whether it was ethical or appropriate to promote increased or maintained caloric intake in these participants. Second, overweight and obese patients have refused to participate in our study because they want to lose weight, even if it is while they are ill. Commonly held beliefs that weight loss is appropriate for all overweight and obese persons have figured prominently in our study and we describe our response.

### INITIAL FINDINGS FROM AN INTERVENTION TO IMPROVE NUTRITIONAL STATUS OF OLDER ADULTS RECEIVING HOME HEALTH SERVICES

J.L. Locher[1], A. Ellis[5], J. Lawrence[3], L. Newton[5], C. Ritchie[1], K.S. Vickers[2], C.W. Bales[4], *1. Medicine, University of Alabama at Birmingham, Birmingham, Alabama, 2. Mayo Clinic, Rochester, Minnesota, 3. University of Alabama, Tuscaloosa, Alabama, 4. Duke University, Durham, North Carolina, 5. University of Alabama at Birmingham, Birmingham, Alabama*

The purpose of the study is to evaluate the efficacy of a multi-level self-management intervention designed to improve nutritional intake in a group of homebound older adults who are at high risk for experiencing under-nutrition. A prospective randomized controlled design was used to estimate whether individually tailored counseling results in increased caloric intake. 27 participants (mean age: 79.8, sd: 8.2; 88.9% female; and 44.4% African American) were randomized to either intervention or usual care. At baseline, participants were not consuming enough calories to meet their estimated energy requirements based upon 24-hour dietary recalls (average deficits of -544.4 Kcal in the intervention group and -151.2 for the usual care group). Post intervention, caloric intake increased in both groups, but more so in the intervention group (average increase in the intervention group was 245.2 Kcal and in the usual care group was 67.2, N.S.). Findings are encouraging, and the study is ongoing.

## SESSION 1255 (SYMPOSIUM)

### MAINTAINING A FUNCTION FOCUSED APPROACH TO CARE ACROSS ALL CARE TRANSITIONS

Chair: *B. Resnick, University of Maryland, Baltimore, Maryland, University of Maryland, Baltimore, Maryland, University of Maryland, Baltimore, Maryland*

Older adults typically receive care from many different providers and move across acute care (AC), nursing homes (NHs), assisted living (AL) and home settings. Due to multiple co-morbidities and age associated changes they are at risk for the negative impact of transitions such as medication errors or missed diagnoses and treatments. Less commonly considered, however, is the impact of transitions on function and physical activity. Information about the individual's underlying functional and physical capability or the ways in which function can and should be optimized are not transferred to a new site of care. Function Focused Care (FFC), involves teaching and motivating nurses, patients, and other members of the health care team to focus on and optimize function and physical activity during all care interactions with patients. FFC is a philosophy of care in which the individual's functional capability is evaluated, functional and physical activity goals that are part of routine activities established, which focus on care persistently provided "with" (i.e., doing hand over hand bathing, walking individuals or helping them to self-propel a wheelchair) rather than "for" (e.g., bathing or dressing individuals, pushing them in wheelchairs) older adults. In this symposium we provide evidence of the need for FFC and the successful ways in which to implement Function Focused Care in NHs, AL settings, and AC. We will discuss the challenges to implementing FFC in each setting and the ways to overcome those challenges. Lastly, we will provide a plan for how to transition the Function Focused Care Philosophy across settings.

### FUNCTION AND PHYSICAL ACTIVITY ACROSS SETTINGS: WHERE ARE WE AND WHERE DO WE NEED TO GO?

M. Boltz[2,5,6], E. Galik[1,3,4], B. Resnick[1,3,4], *1. University of Maryland, Baltimore, Maryland, 2. New York University College of Nursing, New York, New York, 3. University of Maryland, Baltimore, Maryland, 4. University of Maryland, Baltimore, Maryland, 5. New York University, New York, New York, 6. New York University, New York, New York*

Physical function is an important determinant of health. Descriptive information related to activities of daily living status (Barthel Index) and physical activity (actigraphy data) across NHs, ALs, and ACs can guide interventions. We found NH residents were the most functionally impaired [mean Barthel score was 58.8 (SD 1.9)] compared to AL residents [mean Barthel 72.3 (SD 12.1)] or AC patients [mean Barthel 89.0 (SD 3.8)]. Conversely, NH residents engaged in more physical activity [mean 63,673.2 (SD 17,378.4) counts and 94.0 (SD 176.0) kilocalories] versus AL residents [40,594.9 (SD 33,239.7) counts and 54.4(SD 47.9) kilocalories] or patients in AC [mean of 17, 224 (SD 9969.5) counts and 16.7 (SD 1.7) kilocalories]. In no settings did the level of activity meet public health guidelines and higher functional ability in AL and AC sites did not relate to more physical activity. Recommendations to improve function and physical activity using FFC will be provided.

### IMPACT AND IMPLEMENTING FUNCTION FOCUSED CARE ACROSS SETTINGS

A.L. Gruber-Baldini[2,3,1], S. Zimmerman[4,5,6], *1. University of Maryland, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland, 3. University of Maryland School of Medicine, Baltimore, Maryland, 4. University of North Carolina, Chapel Hill, North Carolina, 5. University of North Carolina, Chapel Hill, North Carolina, 6. University of North Carolina, Chapel Hill, North Carolina*

FFC has been successfully implemented across multiple settings. There is evidence of acceptance of FFC in each setting with consent rates ranging from 65% among NH and AL nursing assistants to 82% among AC nurses, and from 58% among AC patients to 65% among NH and AL residents. Following exposure to the four components of the FFC intervention, nursing assistants had stronger beliefs in their ability and/or the benefits associated with FFC for themselves and residents, demonstrated improved knowledge and performance of FFC in all settings, and in NH settings reported improved job satisfaction. Residents demonstrated improved function, grip strength and physical activity in AL settings and improved function, gait and balance among NH residents. Details of outcomes at four and twelve months post implementation of FFC will be provided and compared across the settings with recommendations for optimal outcome measures discussed.

### IDENTIFYING AND OVERCOMING CHALLENGES ACROSS CARE SETTINGS

E. Galik, *1. University of Maryland, Baltimore, Maryland, 2. University of Maryland School of Nursing, Baltimore, Maryland, 3. University of Maryland School of Nursing, Baltimore, Maryland*

Challenges to implementing FFC across AL, NH, and AC settings are similar and include lack of understanding and belief in the benefits of physical and functional activity; unpleasant symptoms such as fear, pain, fatigue, and anxiety in residents; and fear of punitive responses from administration; lack of administrative support for FFC versus task completion; and policies and environments that create barriers to physical activity. This session will summarize themes (facilitators, barriers and benefits of FFC) from focus groups with nursing participants. The Social Ecological model and Diffusion of Innovation theory provide the theoretical framework for strategies to overcome challenges and sustain FFC. Motivational techniques for older adults and staff include understanding intrapersonal factors, interpersonal interventions using social cognitive theory, environmental interventions and policy initiatives. We will also address use of change agents and champions to integrate FFC in real world settings.

### NEXT STEPS IN TRANSITIONS OF CARE: TRANSFERRING FFC BETWEEN CARE SETTINGS AND INTO HOMES

B. Resnick, *1. University of Maryland, Baltimore, Maryland, 2. University of Maryland School of Nursing, Baltimore, Maryland, 3. University of Maryland School of Nursing, Baltimore, Maryland*

Acute events provide opportunities to change behavior and increase physical activity, which may subsequently prevent functional decline and rehospitalization. To optimize care transitions, the goals established in acute care need to follow individuals to their discharge setting. FFC interventions, which have been implemented successfully across multiple care settings, can be transitioned between settings via the Nurse Change Agent(NCA). Based on prior findings, the NCA needs to provide ongoing education and motivation for health care team members regarding FFC skills (assessment of capability, goal identification and ways to overcome motivational challenges by setting); implement environmental interventions, such as establishing appropriate bed and chair height or setting up walking paths; and developing or changing policies to facilitate a focus on function and physical activity for older adults in each setting. Details for how to transition FFC across settings will be described during the session as well as ways to overcome transition challenges.

## SESSION 1260 (SYMPOSIUM)

### REP SYMPOSIUM: MODELS OF CARE THAT SUPPORT LIFE TRANSITIONS

Chair: *T. Teasdale, Dept of Geriatric Medicine, University of Oklahoma, Oklahoma City, Oklahoma, Veterans Affairs, Oklahoma City, Oklahoma*

Symposium speakers will explain how existing service delivery programs support the care transitions that older adults traverse over their life course. While many examples exist, these models of care were selected based on their innovation and success. Taken together, the presentations illustrate many of the phases of program development: from idea to implementation, evaluation, replication, and sustainability. The session will emphasize the roles of research, education, practice, and policy in support, diffusion and sustainability of effective innovations. Dr. Beverly will present a statewide initiative to improve health outcomes of older Arkansans using interdisciplinary clinical care, innovative education programs, and influence on state policy regarding rural elders; Dr. Shay will present several VA programs that ease transitions between home, acute, and long-term care needs; Dr. Lokon will present on an innovative arts program for people with dementia, which relies on student volunteers who are paired with a participating artist (life course transitions occur for persons moving through stages of dementia and for students transitioning through stereotypical thinking about dementia); the final presentation will describe the role of public policy, national leadership, and the aging services network in supporting transformation of the long-term care system. The symposium chair will lead the audience in a vibrant discussion period with symposium speakers.

### THE ARKANSAS AGING INITIATIVE: SUPPORTING HEALTHY LIFE TRANSITIONS IN A RURAL STATE

C.J. Beverly, R.E. McAtee, *College of Nursing, University of Arkansas for Medical Sciences, Little Rock, Arkansas*

The population in Arkansas ranks number six nationally in percentage of adults 65 and over. Further, the majority of older adults have a high school education or less, live in predominately rural parts of the state, have a higher percent of poverty (16%) compared to national average (10%) and experience worse health outcomes compared to the rest of the country. Challenged with how to care for the burgeoning number of older adults, Arkansas citizens voted through a referendum, to devote a portion of Arkansas' share of the Master Tobacco Settlement to develop the Arkansas Aging Initiative through the Donald W. Reynolds Institute on Aging. An analysis of this Initiative in the context of combining research, clinical practice, education and policy initiatives to facilitate a healthier life transition of older adults will be presented . Additionally, the success of providing geriatric expert clinical care and education statewide will also be examined.

### NEW TRANSITIONS OPTIONS FOR VETERANS WITH EXTENDED CARE NEEDS—REGARDLESS OF AGE

K. Shay, *Department of Veterans Affairs, Ann Arbor, Michigan*

This presentation will describe several new VA programs for optimizing transitions within extended care. The VA convened a State Of The Art (SOTA) Conference in March 2008 to set groundwork for a new Strategic Plan for Geriatrics and Extended Care. SOTA participants were polled on the relative importance of topics to set strategic priorities for the plan. The highest-ranking responses concerned caregivers, transitions among programs, coordination with community services, and need for adapting services to younger veterans. As a result, the new Strategic Plan emphasizes growth in these areas. As an example, this presentation will highlight o "Veteran-Directed Care"—based on the AOA's Cash and Counseling; o "Veteran-Community Partnerships— to reduce barriers to seamless VA/community transitions through VA partnerships with AAAs, caregivers, and other key partners; and o Initiatives for fostering geriatrics knowledge and skills among primary care providers practicing in rural settings

### TRANSFORMATIVE EXPERIENTIAL LEARNING FOR STUDENTS WORKING IN AN ART PROGRAM FOR PEOPLE WITH DEMENTIA

E. Lokon[1], J. Kinney[2,1], T. Yamashita[2], O. Hautz[2], *1. Scripps Gerontology Center, Oxford, Ohio, 2. Miami University, Oxford, Ohio*

This presentation will describe an innovative art program for people with dementia (PWD), which pairs student volunteers with PWD. In addition to outlining the principles behind the program, the presentation will present data on the transformative learning that most of the students experience. Results are measured via a quantitative survey of attitudes toward PWD, and through qualitative analysis of students' reflective journals. Journals and survey data reveal that students typically move from positions of fear and anxiety about working with PWD, to having a meaningful relationship with their artist partner. The program is successful as a model of care for people transitioning through the stages of dementia, and as a means to assist students in their transitions from stereotypical and fearful thinking about dementia to an ability to see a person with dementia as a whole person.

### THE ROLE OF NATIONAL LEADERSHIP IN SUPPORTING TRANSFORMATION OF THE LONG-TERM CARE SYSTEM

S. Kunkel, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

Education about aging and the provision of effective services are essential building blocks for a system that helps people stay in their communities for as long as possible, living full and independent lives even as they experience health transitions. The foundation of that system is public policy that provides core services, seeks to maintain a balanced system of long-term care options, and encourages innovations to meet changing needs of the population. In this presentation, we will describe the role of federal, state, and local levels of the aging network in creating supportive communities for people of all ages. Several specific innovations undertaken by the aging network will be presented: community living programs, evidence-based health promotion and disease prevention, expanded caregiver programs, a streamlined consumer-centered access to information and services, and a collaboration with the Veterans Health Administration to provide veteran- centered home and community based services.

## SESSION 1265 (SYMPOSIUM)

### THE HARTFORD FOUNDATION'S IMPACT ON THE CARE OF OLDER ADULTS IN TRANSITIONS

Chair: *L.L. Popejoy, Univ of Missouri Columbia Sinclair School of Nursing, Columbia, Missouri*
Co-Chair: *D.E. Holland, Mayo Clinic, Rochester, Minnesota*
Discussant: *K.C. Buckwalter, Univ of Iowa College of Nursing, Iowa City, Iowa*

In 2000 the John A. Hartford Foundation, in partnership with the American Academy of Nursing, launched the Building Academic Geriatric Nursing Capacity (BAGNC) program to produce expert researchers, academicians, and practitioners to lead the field of gerontological nursing and change the landscape of care for older adults. This symposium highlights the current work of BAGNC scholars in the Midwest who have focused on strategies to improve the care of older adults in transition across levels of care. The research targets innovative approaches to improving patient care that focus on: A chronic grief intervention for Alzheimer's caregivers; Transitional rehabilitation for cardiac patients in post-acute care settings; The influence of polypharmacy, medication regimen complexity, and inappropriate medications on rehospitalization of older adults in nursing homes; Barriers to medication reconciliation in nursing homes and; Correlates risk factors of functional decline and new institutionalization among critically ill older adults. These papers illustrate and address needs of seniors as they face life-changing transitions across the continuum of care and represent improvements in elder care made possible through Midwest BAGNC scholar initiatives.

### MEDICATION RECONCILIATION IN THE NURSING HOME

A.A. Vogelsmeier, *Nursing, University of Missouri, Columbia, Missouri*

Frail nursing home (NH) elders are at risk of medication order discrepancies and discrepancy- related adverse drug events when transitioning between healthcare settings. Medication reconciliation is a safety practice designed to identify and resolve medication order discrepancies when transitions in care settings occur. In this study, 42 RN and LPN staff from 8 NH were interviewed and observed to describe medication reconciliation practices in the NH when residents transition from other settings. Findings suggest nursing staff did not consistently detect medication order discrepancies, in part because of variable processes. The inadequate detection of order discrepancies was exacerbated by evidence that NH physicians often relied on nursing feedback for medication order decision-making. Future research is needed to explore the differences between RN and LPN staff detection and management of medication order discrepancies when residents transition to the NH.

### TRANSITIONAL REHABILITATION FOR CARDIAC PATIENTS USING POST-ACUTE CARE

M.A. Dolansky[1], R.S. Boxer[4,1,2], P. Murray[3,1], M. Williams[5], S. Landers[2,1], M. Mount[4], M. Rocco[2], *1. Nursing, Case Western Reserve University, Cleveland, Ohio, 2. Cleveland Clinic Foundation, Cleveland, Ohio, 3. Metrohealth Medical Center, Cleveland, Ohio, 4. University Hospitals Case Medical Center, Cleveland, Ohio, 5. Creighton University, Omaha`, Nebraska*

Transitional cardiac rehabilitation (CR) maybe a useful intervention for older adults recovering from a cardiac event discharged to a skilled nursing facility (SNF) or home health care (HHC). This pilot study tested the feasibility, safety, and efficacy of a novel post-acute care- based CR program, "Transitional Rehabilitation Using Self-management Techniques (TRUST). TRUST CR is a family-focused intervention that includes progressive low intensity walking and education on self-management skills to facilitate recovery and promote future participation in a CR program. A quasi- experimental two-group design was used (N=30 SNF; N=10 HHC). Groups were comparable at baseline and at discharge the intervention group had higher levels of outcome expectancy than the usual care group. At 6 weeks, the groups differed in CR attendance and exercise maintenance (number of steps taken). The majority of participants were satisfied with the intervention. The innovative intervention has potential to improve cardiac patient outcomes after transitional care.

### CORRELATES AND RISK FACTORS OF FUNCTIONAL DECLINE AND NEW INSTITUTIONALIZATION AMONG CRITICALLY ILL OLDER ADULTS

M.C. Balas, *CBH, University of Nebrasaka Medical Center College of Nursing, Omha, Nebraska*

Older adults experience multiple transitions as they recover from a serious or life-threatening illness. The aim of this study is to identify correlates and risk factors of functional decline and new institutionalization at hospital discharge among critically ill older adults. Subjects will be fifty, adults, age 65 and older, admitted to an intensive care unit (ICU) at the Nebraska Medical Center and managed by either the medical or surgical CCS. A comprehensive, structured assessment of the older adults' preadmission physical, functional, and cognitive ability will be conducted within 24-48 hours of ICU admission. Subjects will undergo daily delirium and sedation/agitation evaluations throughout their hospitalization. Finally, 24-48 hours prior to hospital discharge, the subjects' functional status and discharge disposition will be assessed. A greater understanding of the variables that influence functional recovery after serious-illness will help us better understands this significant transition in an older person's life.

### MEDICATION RELATED PREDICTORS OF READMISSION IN ELDERLY HOME CARE PATIENTS

M.T. Dierich, *University of MN, Minneapolis, Minnesota*

Nearly 70% of the $177.4 billion dollars spent on drug related morbidity and mortality in the U.S. is due to hospitalizations (Grizzle, 2001). Due to definitional and measurement issues, it is unknown whether high risk medication regimens (HRMR) predict readmission to the hospital. Understanding this relationship is important when evaluating potential errors in administration, the risk-benefit ratio, and readmission risk of medication regimens. Polypharmacy, inappropriate medications or medication complexity have been proposed as indicators of HRMR. Using path analysis, OASIS and medication records from 931 elderly home care clients were analyzed to evaluate the influence of polypharmacy, inappropriate medications, and medication complexity on the odds of readmission. Preliminary results indicate both polypharmacy and medication complexity are significant predictors of readmission. The results add to secondary data analysis strategies, test operational definitions, and increase knowledge about risk stratification in elders receiving home health care.

### A CHRONIC GRIEF INTERVENTION FOR ALZHEIMER'S CAREGIVERS

O. Paun, C.J. Farran, L.F. Fogg, *Rush University College of Nursing, Chicago, Illinois*

Our Hartford-sponsored study indicates that Alzheimer's disease (AD) caregivers (CGs) continue to experience depressive symptoms even after having placed their loved one in a long-term care facility (LTCF). This finding suggests that new losses and chronic grief prevent improvement of CGs' mood. There are no documented interventions to decrease AD caregivers' grief post LTCF placement. This pilot study examined the feasibility of a Chronic Grief Management Intervention (CGMI) designed to increase knowledge and skills and decrease grief and depression in family caregivers of persons with AD. The CGMI is a 12 week group-based program designed to deliver knowledge of AD and teach chronic grief management skills. To date, in a pretest and posttest, two condition randomized design, 66 family CGs received either the CGMI or attention control at different LTCFs. Data were collected at baseline, 12 and 24 weeks. We anticipate that knowledge and skills will increase and chronic grief and depression will decrease for the CGMI group but not for the control condition. This grant was funded by the National Institute of Nursing Research (R21)

## SESSION 1270 (POSTER)

### COGNITIVE, MENTAL, PHYSICAL HEALTH

### PATTERNS OF SOCIAL BEHAVIOR AND VERBAL DESCRIPTIONS OF FRIENDSHIP EXPRESSED BY PERSONS WITH DEMENTIA

D.W. Gavel, S. McFadden, *University of Wisconsin-Oshkosh, Oshkosh, Wisconsin*

Two studies investigated friendship among persons with dementia through observation of their social interactions and interviews with them about their subjective experience of friendships. The research used four of Kitwood's (1997) "access routes" to obtain information directly from 17 persons diagnosed with some form of dementia and living in two community based residential facilities (n = 10 and n = 7). The first study used the Oshkosh Social Behavior Checklist to measure the type and quantity of behaviors using a systematic time-sampling procedure. Results showed a significantly greater number of social verbal and non-verbal behaviors (M = 8.65, SD = 5.99) compared to non-social verbal and non-verbal behaviors (M = 2.59, SD = 1.73) (p = .002). This suggests a preference for social interaction as opposed to isolation. The second study investigated the subjective experience of friendships in two phases. The first employed a semi-structured interview in which participants responded to questions that asked them share their thoughts on friendship. The second phase involved a story telling activity in which participants created stories about photographs of older people interacting. Study two was analyzed by means of Interpretive Phenomenological Analysis (Quinn & Clare, 2008) and revealed two predominant themes: "Time Is of the Essence" and "Friends Are All or Nothing". Resident contribution rates (85% contributed statements to at least one theme and 54% contributed to both) suggest that persons with dementia share common ideas about friendship.

### DOGS, HORSES, AND WALLABIES - OH MY! BENEFITS AND CHALLENGES OF ANIMAL THERAPY IN DEMENTIA CARE

R.J. Karasik[1], J. Berry[2], *1. Community Studies, St. Cloud State University, St. Cloud, Minnesota, 2. The Dementia Care Foundation, Darwin, Minnesota*

While the use of Animal Assisted Therapy (AAT) in health care is not new (Johnson et al., 2002; Odendaal, 2000), its place in the care for persons with dementia is now coming to the forefront (Sellers, 2006; Williams & Jenkins, 2008). Much of the current attention comes as providers seek new ways to improve care quality. To date, animal assisted therapy has been found effective in managing dementia care challenges including agitation (Williams & Jenkins, 2008), social interaction (Richeson, 2003), and nutritional intake (Edwards & Beck, 2002). Despite the growing body of literature on the effectiveness of AAT, little information is found on the practical challenges associated with implementing AAT in dementia care settings. The current case study examines 10 years of data regarding the implementation and practice of AAT in specialized dementia care. Animals are a key component of the Lakeview Ranch (LR) model which focuses on preventing (rather than treating) aggressive symptoms of dementia. Additional components include: a high staff to resident ratio (1:3), in-house full-time RN's, interdisciplinary teamwork, medication reviews, attention to residents' emotional needs, and specialized staff training. Since its inception, LR has been home to a variety of domestic, farm, and exotic animals. While numerous benefits have been documented, so have several logistical challenges, including: state regulations, availability & cost of trained therapists, and cost of animal care. Additional challenges documented in similar settings include concerns regarding attitudes (staff/family/resident), allergies, responsibility for care/cleanup, and the potential for zoonosis (animal born disease) (Simpson, 2003).

### PROBLEM SOLVING THERAPY FOR SUBTHRESHOLD DEPRESSION IN OLDER HOMEBOUND PATIENTS WITH CARDIOVASCULAR DISEASE

Z. Gellis[1], M.L. Bruce[2], *1. School of Social Policy & Practice, University of Pennsylvania, Philadelphia, Pennsylvania, 2. Cornell Weill Medical College, White Plains, New York*

Background. Randomized controlled trial evaluated Problem Solving Therapy in Homecare (PST-HC) for homebound older adults with cardiac disease receiving acute home healthcare services. This study hypothesized that compared to usual care plus education intervention, home-based PST-HC would significantly reduce depression and anxiety scores, lead to improved quality of life, and greater satisfaction with treatment among elderly with cardiac disease. Methods. Thirty-eight participants were recruited from a university-affiliated home health care agency for the trial. Six 1-hour PST-HC sessions included depression education, problem solving, pleasurable activity scheduling, homework, and weekly telephone calls over a 6 week period. The control comparison group received usual care plus two sessions of education and a depression brochure. Outcome measures included the Beck Depression Inventory, Hamilton Rating Scale for Depression, Beck Anxiety Inventory, and the SF-36 quality of life measure. Following the intervention, both groups completed the Patient Satisfaction Questionnaire. Results. Compared with the control group, the PST-HC group showed a significant decrease in depression but not anxiety scores. The PST-HC group generally reported more favorable satisfaction with treatment than the control group. The PST-HC group improved significantly as compared to the control group in only 2 of 8 health-related quality of life subscales: mental health and emotional role function. Conclusions. The brief PST-HC intervention demonstrated that depression improved among cardiac homecare elderly. However, there was no change in 6 out of 8 quality of life measures. Authors discuss integrated depression treatment in the homecare setting.

### EVALUATING SERVICE NETWORKS FOR PERSONS WITH DEMENTIA AND THEIR INFORMAL CAREGIVERS: THE EVIDENT-PROJECT

M. Reichert, *FK 12, Social Gerontology, University TU Dortmund, Dortmund, Germany*

In an aging society like Germany, efficacy of care provision and other support services for people with dementia and their informal caregivers is of particular importance. The project "EVIDENT" - funded by the German Ministry of Health - aims to evaluate the work of six dementia service networks in the Western part of Germany using case study as a method. Every network intends to link different parts of dementia supply (e.g., medical and nursing services, support and counselling for people with dementia and their caregivers) in order to facilitate access to information and to increase service use. In this presentation selceted results from the six case stuides will be presented. They refer especially to the development of networks in community care systems, conditions necessary for success and sustainability (e.g., client centred approach), and barriers for collaboration within the networks (e.g., competition amoung services). Finally, recommendations for effective networking and for social policy to support dementia networks are made.

### RISK FACTORS ASSOCIATED WITH HOSPITAL READMISSIONS AMONG DIABETES PATIENTS

H. Kim[1,2], J. Ross[3,4], Z. Zhao[5], *1. Seoul National University Graduate School of Public Health, Seoul, Republic of Korea, 2. Seoul National University Institute of Health and Environment, Seoul, Republic of Korea, 3. James J. Peters, VA Medical Center, New York, New York, 4. Mount Sinai School of Medicine, New York, New York, 5. New York University College of Dentistry, New York, New York*

The purpose of this population-based study is to examine the rates and risk factors of planned and unplanned hospital readmissions among mid-life and older diabetes patients. Using the 2006 California hospital discharge abstract data, we identified 124,967 patients aged 50 or older with diabetes, who were discharged from acute care hospitals between April and September 2006, and examined readmissions within the 3 months following their index hospitalizations. More than one-quarter (26.3%) of the patients were readmitted within the 3-month period, and about 87.2% of the readmissions were unplanned. Unplanned readmissions were more likely to occur in patients with a higher comorbidity, ethnic minorities with public insurance, and those living in lower income neighborhoods. Having a preceding hospitalization was also a strong predictor of unplanned readmissions. Almost one-fifth of the unplanned readmissions were potentially preventable based on AHRQ's PQI definitions, making up nearly 27,500 inpatient days and costing approximately 72.7 million dollars. Planned readmissions were less likely to occur in patients aged 80 or older, those with no insurance or self-pay, and those with an unplanned index hospitalization. The predictors of planned and unplanned readmissions were different. Transition care to prevent unplanned readmissions in acutely ill diabetes patients may help reduce rates, improving care. Further studies are necessary on potential disparities in planned readmissions.

### COGNITIVELY IMPAIRED OLDER ADULTS: BALANCING AUTONOMY AND BENEFICENCE ON THE SCALES OF JUSTICE

M. Henry, *Utah Commission on Aging, University of Utah, Salt Lake City, Utah*

Various disciplines have shown an association between well being and autonomy, but when older adults with impaired cognitive capacity control their own finances, living arrangements, and health care decisions, they may risk their financial security, health, and safety. These risks create a tension between the principles of autonomy and beneficence. When conflicts between these principles arise, the courts are often forced to resolve them. In this study, more than 150 appellate judicial decisions were reviewed to identify opinions that balance autonomy versus beneficence and contain substantial text describing older adults with impaired cognitive capacity; six cases meeting these criteria were identified. Guided by critical discourse analysis, the language in the opinions was evaluated to gain a better understanding of how judges balance autonomy and beneficence and how they characterize older adults with impaired cognitive capacity. The study showed that even when autonomy was cited as an objective, beneficence drove the results. In some instances, however, a court's emphasis on technical legal requirements worked to promote the older adult's autonomy. Language describing older adults showed a lack of understanding of older adults with dementia. Finally, the opinions revealed an uncritical acceptance of the opinions of medical professionals. The findings of this preliminary study suggest the need for more research on how to assure that judges who decide cases that restrict the autonomy of older adults with cognitive impairment have an accurate understanding of the individuals and the evidence they are considering when engaging in this difficult balancing process.

### ALCOHOL DIAGNOSES AMONG OLDER MEDICARE BENEFICIARIES: RACE AND GENDER DIFFERENTIALS

S. Cummings[1], B. Kilbourne[2], *1. College of Social Work, University of Tennessee, Nashville, Tennessee, 2. Tennessee State University, Nashville, Tennessee*

Little is known about the descriptive epidemiology of alcohol disorders among older adults, especially among older minority subpopulations. Study examined differences between alcoholic and non-alcoholic older adults and differences in alcohol-related diagnoses based on race and gender. Medicare physician-billing records were analyzed for all Tennessee Medicare Part B beneficiaries who saw a physician in 2000. Alcohol-related diagnoses were coded using ICD-9 codes for non-dependent alcohol abuse, dependent alcohol abuse, alcohol psychosis, and alcohol related liver disease. Analyses included difference of proportions tests, logistic and multinomial logistic regression. Among Medicare beneficiaries, 1663 (0.4%) were diagnosed as having a alcohol disorder. Alcoholic beneficiaries were younger and had more chronic illness than did their non-alcoholic counterparts. Alcoholic black men and men had higher rates of health conditions compared to whites or women ($Z=7.22$ & $27.45$ respectively, $p<0.001$). Alcohol dependence comprised the greatest percentage of diagnoses (36.5%), followed by alcoholic cirrhosis (22.9%), alcoholic psychosis (22.3%), alcohol abuse, (16.7%), and alcohol psychosis (1.5%). Black men were twice as likely as other subgroups to be diagnosed as alcoholic. The percent of alcoholic white men exceeded white and black women's prevalence ($Z=20.46$, $p<0.001$; $Z=37.84$, $p<0.001$, respectively). The percent of black men diagnosed as alcohol dependent exceeded that of white men ($Z=2.29$, $p<0.05$), white women ($Z=3.52$, $p<0.001$) and black women ($Z=2.69$, $p<0.01$). Black and White women had significantly higher percentages of cirrhosis diagnoses than did black men. The percent of beneficiaries diagnosed with alcohol abuse was invariant across race and gender groups. Research and clinical implications are discussed.

### IMPLEMENTING A CULTURE OF CHANGE MODEL IN A RESIDENTIAL CARE PROGRAM FOR PERSONS WITH DEMENTIA

D.J. Monahan[1], M. Koenig[2], K. Cahill[2], *1. School of Social Work, Syracuse University, Syracuse, New York, 2. Loretto—Heritage, Syracuse, New York*

A "culture of change" model (Kotter, 1997) provided the theoretical framework for examining how care could be improved for older adults diagnosed with dementia living in a residential care program. An evaluation was conducted to assess the organizational culture and determine how resident "quality of life" could be improved. A steering committee was formed and met 23 times during this period to develop a strategy for change. The New York state EDGE program was adapted for use by the program staff. A 16 hour training program was developed to assess staff perceptions of resident quality of life. Staff reviewed Droes (1996) seven adaptive tasks in dementia care, quality of life in dementia (Edelman, etal. 2005), and the Ettema (2007) quality of life scale. Significant findings were that the average length of stay was 1.8 years, the majority of residents were involved in three activities per week, residents took an average of 11-12 medications per day, average age was 83 and health status was relatively stable. Staff satisfaction with training was high as was their participation in training (95%). Recommended action included the development of a new employee orientation handbook to increase understanding of the resident population, their functional level and their bio-psycho-social needs. An increased use of communication technology for training was also proposed as well as the development of further incentives for collaboration with central administration in curriculum development activities.

### THE MEANINGS OF DELUSIONS IN DEMENTIA

J. Cohen-Mansfield[1,2], H. Golander[3], *1. The Herczeg Institute on Aging, Tel Aviv University, Tel Aviv, Israel, 2. Department of Health Promotion, School of Public Health, Sackler Faculty of Medicine, Tel-Aviv University, Tel Aviv, Israel, 3. Department of Nursing, Faculty of Medicine, Tel Aviv University, Tel Aviv, Israel*

Objectives: Delusions, hallucinations, and a misidentification syndrome in dementia had been often classified under the general term of psychosis, thus reducing the search for understanding the characteristics of these behaviors including their content and meaning. We aim to describe the delusions experienced by older persons with dementia and their context of occurrence, with the goal of elucidating the etiology of such delusions. Method: Participants were 74 nursing home residents aged 65 and over, diagnosed with dementia, from 9 nursing homes in Israel. Assessments included: Behavioral Pathology in Alzheimer's Disease Rating Scale, Neuropsychiatric Inventory: Nursing Home Version, Etiological Assessment of Psychotic Symptoms in Dementia, Activities of Daily Living (ADL), Mini Mental State Examination. Results: Participants with delusions had significantly more difficulties in performing ADLs, poorer vision and hearing, and were more likely to have experienced the Holocaust. Six categories of delusions were identified: 1.One's home is not one's home 2. Theft 3. Danger 4. Abandonment 5. Misidentification 6. Other Non-paranoid. Delusions of theft were most prevalent. Common themes appeared across types of delusion. These included: reality, disorientation, re-experience of past events, loneliness and insecurity, boredom, and trigger. Conclusions: The definition of delusions most often does not apply to the beliefs of persons with dementia, as they sometimes represented reality, or were neither firm nor incontrovertible. Thus, utilizing the term delusion relegates the person's behavior to the domain of severe psychiatric phenomena and precludes understanding the true meaning of it. Implications for care of persons with dementia are discussed.

## SESSION 1275 (PAPER)

## DIVERSITY IN AGING I

### DECREASING RACIAL/ETHNIC DISPARITIES IN ACCESS TO HEALTHCARE AMONG SENIORS: 2000-2007

E. Mahmoudi[1,2,3], G.A. Jensen[1,2,3], *1. Economics and Institute of Gerontology, Wayne State University, Detroit, Michigan, 2. Institute of Gerontology, Detroit, Michigan, 3. Department of Economics, Detroit, Michigan*

Background: Eliminating racial and ethnic healthcare disparities is a major goal of Healthy People 2010. Even though most older adults have Medicare, significant racial/ethnic disparities in access to healthcare have been documented for this age group. Objective: To determine how much progress the U.S. is making toward achieving this goal among adults ages 65 and older, using nationally representative data from the 2000 and 2007 Medical Expenditure Panel Survey (MEPS). Methods: Two access measures are examined: whether the individual reports having a usual source of care, and whether he/she had any doctor visits during the past 12 months. For each measure we examine trends in disparities between White and African American seniors, and between White and Hispanic seniors over the 2000-2007 period. We then estimate multivariate regression models and use regression-based decomposition to quantify the role of various factors underlying the trends observed. Principal Findings: Significant progress occurred between 2000 and 2007. Access improved for older Whites, African Americans, and Hispanics, but the gain was statistically significant only for Whites. When this period began, significant disparities were evident between Whites and African Americans, but they dissipated entirely by 2007. Significant disparities between White and Hispanic seniors were evident in 2007, however. Thirteen percent of Hispanics reported having had no doctor visits during the past 12 months, compared to only 6.2 percent among Whites. Regression decomposition reveals that most of these remaining disparities are due to measurable differences in income, education, and type of Medicare coverage between Whites and Hispanics.

### ETHNICITY, CULTURE AND MIGRATION IN ELDERLY CARE: AN ANALYSIS DAILY PRESS' COVERAGE ON ELDERLY CARE FROM 1995-2008

S. Torres[1], J. Lindblom[2], *1. NISAL, Linkoping University, Norrkoping, Sweden, 2. Malardalen University, Vasteras, Sweden*

This presentation departs from the broader debate on what the globalization of international migration means for different European elderly care regimes and the manner in which they try to adapt to increasing ethnic diversity among both elderly care providers and elderly care recipients. Observations regarding the way in which the media mediates public opinion on these issues are also of interest since the elderly care sector is becoming an increasingly multicultural sector. The presentation will shed light on what daily press reporting on migration, ethnicity and culture-related issues within the context of elderly care has focused on and how the issues in question have been discussed. The empirical material is constituted of the 101 articles published in a daily newspaper between 1995 and 2008. The presentation departs from a quantitative content analysis and shows that although the articles portray migrants as a burden, they also portray them as an asset to this particular sector. Moreover the analysis shows that the articles were mostly about the need to increase the culture-appropriateness of services for elderly immigrants but neglected to address that an increase in the recruitment of migrants to the sector could end up jeopardizing the quality of care that is offered to elderly people from the ethnic majority. The presentation will, therefore, problematize the malleable way in which media representations of ethnic 'Otherness that focus on the context of elderly care are constructed.

### A MULTI-METHOD ASSESSMENT OF OLDER GLBT NEEDS

R. McCaslin, L.A. Smith, *School of Social Work, Cal State Univ, San Bernardino, San Bernardino, California*

This session will report the findings of a recent assessment of the needs of older GLBT people, conducted collaboratively by an Area Agency on Aging and a BASW service learning research methods class in response to the first state mandate for their inclusion in planning. A multi-method survey including an Internet-based questionnaire resulted in a sample that was more diverse than most research on this population, suggesting that this approach was a viable means to reach this largely hidden population. Data analysis indicated areas of greatest unmet need were GLBT-friendly legal advice, social events, grief and loss counseling, social workers, and assisted living. Many participants expected existing services to be unfriendly or even hostile to GLBT persons. Findings are discussed in the context of the personal histories of this "preliberation" generation. Also explored are the risks for late life onset PTSD that may raised by being forced back into the closet by dependence on services unaccepting of their sexual orientation.

## SESSION 1280 (SYMPOSIUM)

### INDEPENDENCE OR DEPENDENCE IN LATER LIFE? EVIDENCE FROM THE NEW DYNAMICS OF AGEING PROGRAMME

Chair: *A. Walker, University of Sheffield, Sheffield, United Kingdom*

This symposium reflects the theme of transitions of care and, specifically, the topic of the loss of independence and autonomy associated with the need for care in later life. Its objective is to examine the causes and outcomes of autonomy loss from a mixture of perspectives: life course, macro policy, individual and professional. Participants will be introduced to new evidence on the independence/dependence transition from multidisciplinary perspectives that span both biomedicine and behavioural and social sciences. Thus the symposium will provide a novel, multidisciplinary and multilayered approach to the association between ageing and independence/dependence. The symposium begins with a brief overview of the New Dynamics of Ageing Programme. The aim here is to provide some essential context for the substantive research papers that follow and, therefore, it will be relatively brief. Then Kuh presents a life course perspective on the risk factors that are associated with physical capability. This research draws on multiple cohort studies. The third paper by Jagger and her colleagues takes a view of quantitative perspective and looks at trends in mortality and morbidity and their implications for healthy ageing. It also adopts the same approach for the discussion of the need for and availability of care and the prospects for financial independence. In contrast, the fourth paper, by Lloyd and colleagues, is a qualitative examination of the everyday lived experiences of the loss of autonomy. The special emphasis here is on dignity (and its loss) and the role it plays in adaptation at the end of the life course. Continuing this theme, the final paper, by Gilhooly et al, concentrates on an extreme case of loss of dignity: the relatively unexplored field of financial abuse. Papers in order: Walker, Kuh, Murphy, Lloyd, Gilhooly

### THE NEW DYNAMICS OF AGEING: A MULTIDISCIPLINARY PROGRAMME OF RESEARCH

A. Walker[1], D. Kuh[3], C. Jagger[4], L. Lloyd[2], M.L. Gilhooly[5], *1. University of Sheffield, Sheffield, United Kingdom, 2. University of Bristol, Bristol, United Kingdom, 3. MRC Unit for Lifelong Health and Ageing, London, United Kingdom, 4. University of Leicester, Leicester, United Kingdom, 5. Brunel University, London, United Kingdom*

This paper provides an introduction to the symposium by briefly locating the following four paper presentations in the context of the overall research programme from which they are drawn. The New Dynamics of Ageing Programme 2005-12, is the largest research initiative on ageing ever mounted in the UK or any other European country. It is multidisciplinary and covers all relevant disciplines from the arts and humanities to the biological sciences. This paper describes the programme and highlights its unique features in terms of disciplinary spread, focus on policy and practice impact and engagement with older people.

### HEALTHY AGEING ACROSS THE LIFE COURSE: FINDINGS FROM THE HALCYON COLLABORATIVE RESEARCH PROGRAMME

D. Kuh, *MRC Unit for Lifelong Health and Ageing, London, United Kingdom*

The Healthy Ageing across the Life Course (HALCyon) collaborative research programme is funded from 2008-2012. It brings together an interdisciplinary group of scientists working with nine UK longitudinal cohort studies on eight inter-related work packages. The purpose is the scientific discovery of life course influences on three aspects of ageing: physical and cognitive capability (the capacity to undertake the physical and intellectual tasks of daily living); psychological and social wellbeing; and the underlying biology of ageing, including genetic programming and physiological regulation (www.halcyon.ac.uk). Cohort participants currently span the fifth decade to the oldest old and most have been followed from childhood. The presentation summarises recent HALCyon findings identifying potential common risk factors, from the cellular to the societal, that impact on capability and wellbeing. It focuses on the effects of lifetime socio-economic conditions and body size on physical capability across these cohorts, including measures of grip strength, walking speed, chair rise time and balance.

### DEMOGRAPHIC CHANGE AND ITS IMPLICATIONS FOR HEALTH, FAMILY SUPPORT, NEED FOR CARE AND PENSIONS: RESULTS FROM THE MODELLING AGEING POPULATIONS TO 2030 (MAP2030) STUDY

C. Jagger[1], M. Murphy[1], A. Comas-Herrera[1], E. Grundy[2], R. Hancock[3], L. Pickard[1], *1. London School of Economics and Political Science, London, United Kingdom, 2. London School of Hygeine & Tropical Medicine, London, United Kingdom, 3. University of East Anglia, East Anglia, United Kingdom*

As in other countries, in the UK the number of people aged 80 and over, where care needs are greatest, is set to nearly double in the next 25 years. The financial, family, social and health resources of the older population have substantial implications for the well-being of those concerned and for public policy, but consistent projections of their likely future circumstances are lacking. This paper brings together the key issues being investigated by the MAP2030 project including how trends in mortality and morbidity will evolve, and if the extra years of life will be lived in good health; the consequences of changes in family circumstances on the availability of informal sources of care and for older people's social participation; the willingness and ability of people to save for their old age; and how these influence future long-term care and pension needs up to 2030.

### PERSEVERANCE: OLDER PEOPLE'S EXPERIENCES OF ADAPTATION TO LOSS OF INDEPENDENCE

L. Lloyd[1], A. Cameron[1], R. Smith[1], K. White[1], M. Calnan[2], J. Seymour[3], *1. University of Bristol, Bristol, United Kingdom, 2. University of Kent, Kent, United Kingdom, 3. University of Nottingham, Nottingham, United Kingdom*

This paper presents emerging findings from an ongoing qualitative research project (Maintaining Dignity in Later Life) which examines participants' everyday experiences of support and care over a period of 2-3 years. Health problems and growing frailty present significant challenges for this group of participants, who place a high value on their independence but who through their everyday experience face questions over how long they will be able to maintain it. Participants' accounts demonstrate a range of ways of thinking about these questions and of strategies for coping with challenges, as their familiar routines and activities are disrupted and curtailed. A key issue concerns the ways in which participants' perceptions of burdensomeness and the consequent loss of dignity are constructed and how these influence their willingness to ask for help or to accept offers of help. The importance of perseverance in maintaining independence can be seen in references to 'doing my best' and 'trying my hardest', which indicate the moral pressure participants feel. However, this needs to be understood in relation to their awareness of the inevitability of their increasing dependency, which can be seen in statement such as 'I know I must be sensible'. This presentation highlights the complex and demanding nature of adaptation at this stage of the life-course.

### DETECTING AND PREVENTING FINANCIAL ABUSE OF OLDER ADULTS: DECISION MAKING BY MANAGERS AND PROFESSIONALS IN HEALTH, SOCIAL CARE AND BANKING

M.L. Gilhooly[1], D. Cairns[1], M. Davis[1], E. Notley[1], P. Harries[1], K. Gilhooly[2], *1. Brunel University, Middlesex, United Kingdom, 2. University of Hertfordshire, Hertfordshire, United Kingdom*

With increasing numbers of cognitively impaired older people cared for in the community, there are growing challenges associated with money handling. Financial abuse of vulnerable older people is of growing concern. It is equally important to protect professionals and carers from unfair allegations of financial abuse. The aim of this project is to examine decision-making in relation to the detection of financial elder abuse. Health, social care and banking professionals are the focus of this study. There are three phases to this study: Phase I - In-depth interviews, using critical incident methods, with health, social care and banking professionals. Phase II - Experiments aimed at testing hypotheses about decision-making using case scenarios. Phase III - Examination of policy documents and guidelines. This research is funded by the UK New Dynamics of Ageing Programme. The aim of this presentation is to present findings from Phase II of the study.

## SESSION 1285 (SYMPOSIUM)

### NEW APPROACHES TO ADDRESSING NURSING HOME INDUSTRY CHALLENGES: INSIGHTS FROM BUSINESS, MANAGEMENT, AND ORGANIZATIONAL SCIENCES

Chair: *E.O. Siegel, Betty Irene Moore School of Nursing, UC Davis Health System, Sacramento, California*
Co-Chair: *B.J. Bowers, University of Wisconsin - Madison, School of Nursing, Madison, Wisconsin*
Discussant: *H.M. Young, Betty Irene Moore School of Nursing, UC Davis Health System, Sacramento, California*

Personnel issues continue to plague our nation's nursing homes, with challenges relating to recruitment of a qualified workforce, training, job satisfaction, staffing practices (appropriate resident/staff ratios and type of staff), and high job turnover across nursing staff and management positions. Limited federal and state reimbursement rates and heavy regulatory requirements are often highlighted as barriers to establishing a well-qualified and stable nursing home workforce. While the impact of reimbursement and regulatory systems are significant and noteworthy, the purpose of this symposium is to consider the personnel challenges within a context of our existing systems and explore new approaches to remedying these challenges based on well-established scientific foundations from a variety of business and management disciplines. The symposium will begin with presentation of a case study that exemplifies several of the challenges listed above, providing a common context for the presentations and facilitated discussions that follow. Our first presentation will offer insights regarding personnel selection, work designs, and leadership, drawing from Industrial and Organizational Psychology, Human Resource Management, and Organizational Behavior. Our second presentation will focus on executive leadership, including executive decision-making processes, organization design and managing innovation in rapid-change environments. The presentations will be followed by a facilitated discussion, exploring conceptual and methodological considerations and practical implications associated with drawing from the business and management sciences to inform directions for future nursing home research.

### PERSONNEL SELECTION, WORK DESIGNS, AND LEADERSHIP IN NURSING HOMES: BUSINESS, ORGANIZATIONAL, AND MANAGEMENT PERSPECTIVES

F.P. Moregson, *Department of Mangement, Michigan State University, East Lansing, Michigan*

This presentation will offer conceptual and methodological insights for addressing personnel selection, work designs, and leadership, drawing from well-established scientific foundations in Industrial and Organizational Psychology, Human Resource Management, and Organizational Behavior. The issues raised in the symposium case study will guide the focus of discussion, highlighting common nursing home challenges. Dr. Frederick P. Morgeson, Professor of Management and Valade Research Scholar at the Eli Broad College of Business at Michigan State University, focuses his research and interests in four distinct areas: (1) leadership, particularly with respect to the role of leadership in self-managing teams and the nature of the relationship between leaders and followers; (2) fundamental questions about the nature of work, which includes how work is structured and how people perceive their work; (3) the effectiveness and consequences of different personnel selection techniques; and (4) theory development to support integrative research in the substantive research areas noted above.

### ORGANIZATIONAL INNOVATION: A DECISION-MAKING MODEL TO INFORM CHANGE EFFORTS

A.L. Delbecq, *Management Department, Leavey Sch of Business & Administration, Santa Clara University, Santa Clara, California*

Accumulating evidence from culture change initiatives suggests that organizational innovations have often fallen short of expectations. Additionally, innovations in long term care frequently focus on the front line workers, providing little guidance for management. This presentation sets forth a step-process decision sequence that can be utilized across organizational settings to address various types of innovation challenges. This model of innovation decision-making is theoretically defensible and can be implemented by practicing organizational leaders. The process can be used to inform both intra-organizational and inter-organizational change efforts. Drawing on research and scholarship on executive decision-making processes, organization design, and managing innovation in rapid-change environments, this presentation will address the case study focusing on decision making by organizational leaders to support organizational innovation.

## SESSION 1290 (PAPER)

### STATE LEVEL POLICY INITIATIVES II

### ASSESSING PATIENT SAFETY CULTURE IN MASSACHUSETTS NURSING HOMES TO PROMOTE SAFE MEDICATION ADMINISTRATION

T.E. Anderson[1], C. Silveira[2], S.M. Handler[3], *1. Commonwealth Medicine, University of Massachusetts Medical School, Shrewsbury, Massachusetts, 2. Massachusetts Board of Registration in Nursing, Boston, Massachusetts, 3. University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania*

Purpose: As an initial step to promoting safe medication administration in Massachusetts nursing homes, the UMass Medical School's Center for Health Policy and Research (CHPR) and the Massachusetts Board of Registration Nursing (BRN) assessed patient safety culture, determined barriers to medication error reporting, and evaluated the social desirability of responses from the perspective of nurses in Massachusetts nursing homes. Methods: The project combines the unaltered Agency for Healthcare Research and Quality (AHRQ) Nursing Home Survey on Patient Safety with two other instruments: "Determining the Barriers to Medication Error Reporting" and the "Marlowe Crowne Social Desirability Scale," to capture response bias. Challenged without a master list of employed nurses for sampling, CHPR used a cluster sampling strategy, randomly selecting a group of nursing homes stratified by the number of licensed beds, to reach 25% of nursing staff. Composite scores will be created by calculating the proportion of positive responses for each SOPS domain. Barriers to reporting will be ranked. Results: Seeking participation from 25% of the 437 facilities, CHPR contacted 142 homes, successfully recruiting 110, for a recruitment rate of 77.5%. We then distributed 3,300 surveys receiving 1,286 returns. Overall average response rate was 41.4%. While a large proportion (86%) of the nurses rated the overall patient safety culture as positive, lower proportions gave positive domain scores for compliance with procedures (57%), training and skills (64%), non-punitive responses to mistakes (41%) and communication openness (52%). Nurses' reporting of medication errors varied directly with the resulting level of harm to the patient. Perceived barriers seen as likely modifiable were lack of an anonymous medication error reporting system, fear of disciplinary action, lack of recognition that a medication error has occurred, fear of being blamed, fear of liability or lawsuits Conclusions: The results funded by the National Council of State Boards of Nursing will establish the first statewide nursing home patient safety culture benchmarks, advise NESP both curriculum development and regulatory stakeholders nationally. A second measure is planned post implementation of the NESP, a non punitive, education oriented,facility based alternative to remediate nursing practice and to promote systems change

### STATE FUNDING FOR DEMENTIA ASSESSMENT - CALIFORNIA'S 25 YEAR EXPERIENCE

F. Segal-Gidan, *1. Rancho/USC CA Alz Disease Center (CADC), Downey, California, 2. University of Southern California, Los Angeles, California*

In 1984 legislation mandated the creation of the Alzheimer's Disease Program in California which included funding in 1985 for 6 dementia assessment centers, each affiliated with a medical school. The number of centers has changed over time, with funding eventually supporting 10 centers from 1998 to the present. The creation of these centers provides a core of funding to support an infrastructure that has been able to attract additional funding, federal and private, to create a statewide, collaborative network that is a model for clinical care, training and research in Alzheimer's disease and related dementias. The State centers developed a collaborative data base which over multiple iterations provides a snapshot of the patient population seeking care at academically-affiliated dementia assessment centers. In 2009 severe budget cuts threatened to dismantle the program. This paper reviews the history of the California Alzheimer's Disease Centers over 25 years, their economic impact in attracting additional funding to the State, the impact of the Centers on training and policy.

### EXPLORATORY ANALYSIS OF THE SILVER ALERT PROGRAM IN NORTH CAROLINA USING THE GEOGRAPHIC INFORMATION SYSTEM (GIS)

T. Yamashita[1,2], D.C. Carr[1,2], J. Brown[1,2], *1. Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

As of March, 2009, 23 states in the US had Silver Alert (SA) (or related media alert) policies in place as the primary mechanism to manage the problem of wandering among adults with dementia or other cognitive impairments (DOCI), and 14 states had imminent plans to implement one. These media alert policies utilize both law enforcement and the general public to locate missing adults by providing information to media outlets and/or by activating an emergency alert system to create a coordinated search effort. Despite investments made in SA policies, very little research has examined the problem of wandering among individuals with DOCI; therefore, little is known about how SA programs have been disseminated and utilized to manage the problem. North Carolina (NC) has posted publically available data on Silver Alerts that have been activated since the program began in mid-2007, providing the unique opportunity to examine the characteristics of individual cases as well as the geographical distributions of Silver Alerts activated. Using GIS, a computer-based data management, visualization and analytical tool for spatially referenced data (e.g., county-level data), this paper examines Silver Alerts activated in NC in 2008 and 2009. Results indicate that there are salient geographical patterns related to activation of alerts during this time period across NC counties, with most alerts concentrated in the middle-eastern part of the state. Theoretical and Policy implications will be discussed.

### DATA COLLECTION TO AID IN THE DEVELOPMENT OF LONG-TERM CARE POLICY FOR OLDER PENNSYLVANIANS

C.M. Mara, *School of Public Affairs, Penn State, Middletown, Pennsylvania*

The tendency to need long-term care increases with age. With the fastest growing part of the population being the 85-years-and-older cohort and the leading edge of the baby boomers entering their 70s in six years, long-term care is becoming an area of increasing concern. Related costs for individuals needing such care are escalating as are state Medicaid long-term care budgets. Medicaid, the primary source of long-term care funding, is available only after people have become impoverished. In helping to shape policy for the long-term care system in Pennsylvania, especially as it pertains to Medicaid, the related state agencies required information about older Pennsylvanian's perceptions, preferences, and expectations regarding long-term care. If they would need long-term care, where would older Pennsylvanians want to receive it? How would they expect to pay for it? How worried are they about being able to afford long-term care? From whom would they seek the information they would need to make decisions? Have they planned for the possibility of needing such care? Do they currently provide or receive informal long-term care? A Random Digit Dial telephone survey of 2,630 Pennsylvanians 50 years of age and older was conducted to find the answers to these and other questions. Information about survey construction will be presented as will survey findings and policy and practice implications.

## SESSION 1295 (SYMPOSIUM)

### THE FEDERAL SERVE AMERICA: ACT AND 50+ CIVIC ENGAGEMENT: PROMISING FUNDING, PRACTICE MODELS AND RESEARCH

Chair: *C. Hegeman, Foundation for Long Term Care, Albany, New York*
Discussant: *N. Morrow-Howell, Washington University, St. Louis, Missouri*

There is tremendous potential for Federal support of civic engagement of older adults. Sagawa (2010) notes the ability of the Corporation for National and Community Service (CNCS) to expand and administer additional grants and programs in national service. Focus area four of the Corporation for National and Community Service (CNCS) strategic plan is to "harness the experience of baby boomers." This symposium is a presentation on four diverse projects that used or are using CNCS funding to develop civic engagement programs for older people. Three of these programs use older adults to serve other elders. Two are intergenerational models of civic engagement, joining college students and elders together in service to other elders. The other engages baby boomers to recruit other baby boomer volunteers. Funding for these three programs are the AmeriCorps and the Learn and Serve Components of the CNCS. The last program described is a curriculum development model for agencies on how to recruit and retain older adults in service. Presentation on each project will cover (a) program descriptions as exemplars for other civic engagement programs; (b) lessons learned in the area of project implementation and evaluation design; (c) research findings; and, (d) recommendations for replication. The session will conclude with a summary of CNCS funding options and comments by the discussant.

### INTERGENERATIONAL SERVICE LEARNING: SERVICE WITH (NOT SERVICE FOR) ELDERS

C. Hegeman, K. Bliss O'Flathabhain, *Foundation for Long Term Care, Albany, New York*

In "Intergenerational Service Learning (IGSL): Linking Three Generations," a project funded by Learn and Service Higher Education in the Corporation for National and Community Service, college students from a variety of disciplines, like design, occupational therapy, and social work, served with retirees to provide services to elders in institutional and community settings and also participated in classroom discussions about their joint service projects. As such, it is a prime example of retiree generativity. Generativity, or the sense of "giving back to the community," is a term coined by Erik Erikson, and is seen as an integral part of the aging process. Using a pre/post design, the research showed that students who participated in this IGSL project had modest increases in civic engagement scores. However, older adults who volunteered with the students showed no change in generativity. This session will discuss these findings, successes, challenges, lessons learned, and ideas for replication.

### ELDERS IN AN AMERICORPS PROJECT

C. Hegeman, K. Revitt, K. Bliss O'Flathabhain, *Foundation for Long Term Care, Albany, New York*

AmeriCorps in Eldercare Settings (ACES) is a program that harnesses the experience of baby boomers, eldercare professionals, and graduate students in service to older Americans, using the funding of an AmeriCorps grant and reflecting the new interest of AmeriCorps in engaging baby boomers in service. ACES recruits and supports 50 AmeriCorps members (a mix of retirees and graduate students) to serve at elder care entities in the greater Albany and NYC areas as well as Connecticut. Service models include support of aging in place, increasing volunteerism of other older adults and many unique, site-specific projects, This session provides an overview of the ACES project, its potential as another exemplar for using Federal AmeriCorps dollars to increase civic engagement, recommendations for replication and findings to date, including ways to prepare elder care entities and elders for effective AmeriCorps programs.

### CAPTURING THE ENERGY AND EXPERTISE OF PEOPLE 50+: ENGAGING BOOMERS IN VOLUNTEERISM AND SERVICE

A. Taylor, *Temple University, Philadelpphia, Pennsylvania*

As millions of people in the U.S. enter their second half of life with a new vision and approach to aging, many communities are eager to leverage their talents and skills. Across the country, non-profits see a wealth of possibility as people 50+ reach a stage in life where they may have time to connect and contribute. Through an initial cooperative agreement with the Corporation for National and Community Service, the Intergenerational Center has developed curricula and training materials focused on the recruitment of the 60 million leading edge baby boomers that are poised to turn their skills and passions into action to support communities. This session will focus on some strategies and lessons learned for recruiting, training and supporting older adults in a continuum of volunteer roles. At the conclusion of this session participants will: 1. Understand the changing paradigm of volunteerism and service; and 2. Identify three strategies for successfully engaging people 50+ in a continuum of roles to support non-profits

### AN INTERGENERATIONAL APPROACH TO HEALTH LITERACY

N. Henkin, *Temple University, Philadelpphia, Pennsylvania*

Promoting the civic engagement of culturally diverse older adults and college students to improve the health literacy skills of older immigrants is a strategy that is both cost effective and culturally appropriate. Through a national AmeriCorps grant from the Corporation for National and Community Service, The Intergenerational Center at Temple University is coordinating a national initiative designed to enhance healthy aging and improve access to health services among older immigrants and refugees. This session will discuss best practices for recruiting, training, and supporting multi-generational /cultural service teams, share effective strategies for building the capacity of ethnic-run organizations to support the leadership development of elders, and provide data on early evaluation results. At the conclusion of this session participants will: 1. Understand the ways in which older refugees/immigrants are civically engaged in their communities; and 2. Identify three strategies utilized by community-based non-profits in engaging foreign-born elders as volunteers.

## SESSION 1300 (SYMPOSIUM)

### OCCUPATIONAL INJURIES AMONG HOME HEALTH AIDES WORKING IN HOME HEALTH AND HOSPICE AGENCIES

Chair: *G. Khatutsky, Aging, Disability and LTC, RTI, International, Waltham, Massachusetts*

Home health aides working in home health and hospice agencies are at significant risk for work-related injuries, but little is known about the frequency and types of such injuries or how newly available technology such as patient lifts affect injury rates and whether this technology is available in patient homes. Aside from determining the direct impact of injuries on workers, understanding the prevalence and nature of injuries is important for assessing their impact on productivity, retention, and job satisfaction. This descriptive study uses data from the newly released 2007 National Home Health Aide Survey (NHHAS) to describe the prevalence and nature of self-reported injuries among home health aides. Preliminary analysis suggests that 12% of home health aides reported work-related injuries to their employers in the past year and 14% reported a need for more equipment to make their jobs safer. Moreover, when reporting the causes of their injuries, home health aides attributed their injuries to abuse and assault by their patients twice as often as back injuries, strains, and pulled muscles.

### NURSE AIDES OPINIONS OF HAZARDS IN THE WORKPLACE

N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

In this research, a survey was developed and used to assess nurse aides opinions of hazards in the workplace. The survey was sent to nurse aides included in the Pennsylvania nurse aide registry. A total of 4,117 questionnaires were returned (response rate = 59%). The descriptive results show more than half of the nurse aides indicated that they had suffered an injury while working, but only 12% had taken time-off (over the prior 2 years). Most of these were back-related injuries. Responses also indicated that some nursing homes were perceived to be more hazardous than others. The multivariate results show that these opinions of the workplace environment were not related to available equipment or training, but to the type of residents and staffing levels. Further details of the scale and scope of nurse aides opinions of injuries and hazards in the workplace will be discussed.

### THE HOME CARE WORK ENVIRONMENT FOR PERSONAL ASSISTANCE SERVICE WORKERS

R. Newcomer, J. Faucett, T. Kang, R. Eversley, *University of California, San Francisco, California*

Occupational injury is a prevalent problem in long-term care. However, there is a noticeable lack of research related to workers providing Personal Assistance Services (PAS) – the personal care and housekeeping tasks that enable elderly and other disabled adults to live in community settings. We conducted a statewide computer assisted telephone survey of PAS providers (n=855) from California's In Home Supportive Services program to describe the homecare environment and its impact on the worker's health and ability to provide care. PAS providers reported on a variety of household and personal care tasks, including client lifting and transfers, as well as on barriers to care delivery. 283 providers (33%) reported musculoskeletal problems or acute injuries causing at least moderate pain that had occurred in the prior 12 months. Because of these, 30 workers missed work, 57 changed their work duties, and 13 had to drop work hours or clients. Funded by NIOSH.

### AVOIDING INJURY: DEVELOPMENT AND IMPLEMENTATION OF AN EMPLOYEE SAFETY PROGRAM FOR DIRECT CARE PROVIDERS IN LONG TERM CARE

E.G. Weingast, A.R. Wathen, *Jewish Home Lifecare, New York, New York*

Jewish Home Lifecare has grown its employee safety program significantly over the past two years. Worker's compensation costs have a great impact on our budget, this led us to scrutinize the type of employee incidents that cause injury. We found that patient handling is the primary cause of work-related injury in our organization, with slips and falls a close second. Utilizing resources from both our insurance broker and insurance company, we have developed programming to avoid these injuries. The presentation will include the development and implementation of a safe-lifting policy to minimize patient handling injuries as well as structured environmental rounds to avoid the slips and falls leading to injury. Barriers to safe handling practices and possible solutions will also be discussed. Jewish Home Lifecare is an organization with nearly 3,000 employees providing care to elders in nursing homes, day centers, and their own homes. An overwhelming majority of our workforce provides hands on personal care, these caregivers are Certified Nursing Assistants and Home Health Attendants.

## SESSION 1305 (SYMPOSIUM)

### HUMAN LONGEVITY GENES

Chair: *G.J. Lithgow, Buck Institute for Age Research, Novato, California*

Healthy aging is clearly a combination of genetics and environmental influences. Many genes that determine lifespan have been discovered in lab animals. Do the same genes influence longevity in humans? Do humans have a unique set of genes that modulate aging? What do human longevity genes tell us about the link between aging and disease? Speakers: Cummings, Steve M.D., California Pacific Medical Center Yousin Suh Ph.D., Albert Einstein College of Medicine Thomas Perls M.D. M.P.H., Boston Medical Center Paola Sebastiani, PhD, Boston University Greg Tranah, PhD., California Pacific Medical Center

## SESSION 1310 (PAPER)

## AFTER HOSPITALIZATION: HEALTH CARE DILEMMAS

### CAREGIVER AND CARE RECIPIENT AGENCY: TRANSITIONS FROM CURE TO CARE, AND BACK AGAIN

J. Ford, *Child and Family Development, University of Georgia, Athens, Georgia*

In 2008 there were 23,442,000 veterans in the United States; with 7.3 million enrolled in the Veterans Affairs (VA) Health Care System; over one-third were 65 years old or older. Enrolled aging veterans and their caregivers face innumerable mental and physical health care dilemmas. Challenging transitions from curative interventions to provision of comfort care, and sometimes back again, were salient in this research. Four-stage grounded theory methodology was applied to explore health care delivery at a Veterans Affairs Medical Center (VAMC). Atlas.ti qualitative software was used to systematically analyze data. All veterans aged 65 years or older (n=15) were selected from a population of veteran cases (N=25), representing all inpatient cases between October 2003 and January 2008 requiring involvement of the VAMC ad hoc ethics committee. The purpose was to clarify health care decision making processes and develop substantive theory with the potential to improve outcomes. Social structural symbolic interaction theory guided the research. Agency emerged as the core category. Agency was capacity to make choices and act on those choices in ways that impacted attempts to cure or comfort. When veterans' agency was compromised, due to schizophrenia or brain injury for example, formal caregivers' roles were more salient. Substantive theory was the dynamic process of clarifying agency. Dynamics of changing case circumstances, a patient choosing to stop dialysis knowing he would die, another only responsive to pain, meant that resolution of health care dilemmas was elusive and transitory.

### CHARACTERISTICS OF OLDER ADULTS REHOSPITALIZED WITHIN SEVEN DAYS OF DISCHARGE FROM A COMMUNITY HOSPITAL

D.J. Hain, S. Diaz, J.G. Ouslander, R.M. Tappen, *Christine E Lynn College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Rehospitalizations of older adults consume a significant portion of healthcare costs. It is important to gather preliminary data before developing potentially effective interventions. The purpose of this pilot study was to examine 7 day rehospitalizations rates and characteristics of older adults (≥75) who were discharged from a community hospital. A retrospective analysis of data was collected over one year. Descriptive statistics were used to describe the rates of rehospitalization and the characteristics associated with 7 day rehospitalization of all people who were discharged. There were 5, 282 people discharged during the project period. Of this population 352 people were rehospitalized within seven days, almost half were ≥85 and there were slightly more males (56%) than females (44%). People who discharged to skilled nursing facilities (36%) had the highest rehospitalization, followed by home with home health care (31%) and home with self-care (27%). The most prevalent index admission diagnoses were related to cardiovascular conditions (32%), infections (22%), or musculoskeletal disorders (10%). The most frequent reason for rehospitalization was digestive disorders, and if the index admission diagnosis was digestive disorders the most common reason for rehospitalization was pneumonia or other infections. A substantial number of rehospitalizations came from SNFs, which warrants further attention. Interventions aimed at improving care of older adults during transition to SNFs may be an effective way to reduce rehospitalization. These include: improved communication, education, disease specific protocols, and/or using an advanced practice nursing model for follow up visits on targeted patients who at risk for rehospitalization.

### CARE TRANSITIONS POST HIP FRACTURE: WHAT'S WORKING FROM THE HEALTH PRACTITIONER PERSPECTIVE?

J. Sims-Gould[1], K. Byrne[1], K. Khan[1], P. Stolee[2], *1. The University of British Columbia, Vancouver, British Columbia, Canada, 2. The University of Waterloo, Waterloo, Ontario, Canada*

Transitions between health care settings are a high-risk period for care quality and patient safety (Coleman, 2003; Picker Institute 1999), particularly for older patients - such as those with hip fracture who have complex needs and may undergo multiple care transitions. We sought to understand the key elements of "success" in care transition, including characteristics of effective communication among health care providers and the successful transfer of patient information. Using a strengths-based perspective (Rapp, 1998; Saleebey, 2009), we focused on health care providers' perspectives of what constitutes a 'good' care transition for elderly hip fracture patients. Data were gathered and analyzed using an interpretive descriptive approach (Thorne et al, 2004). Participants were purposively sampled. Semi-structured interviews were conducted with fifteen health providers (e.g., occupational therapists, social workers, nurses, surgeons, etc.) employed across the continuum of post-hip fracture management in a large teaching hospital in Vancouver, British Columbia, Canada. Documents that facilitated transitions were collected and analyzed. We found three hallmarks of "success" in care transitions: (i) multiple and flexible modes of communication; (ii) role clarity (i.e., responsibilities of health care providers, patients and families) and, (iii) health care provider ingenuity – the ability to engage in divergent thinking and respond to the dynamic needs of patients, families and other health care providers.

Strategies for promoting and improving success in transitions, ranging from individual practitioner level solutions to system wide suggestions, will be discussed.

## SESSION 1315 (SYMPOSIUM)

### AN EXCITING RANGE OF SCIENTIFIC DISCOVERIES ON WOMEN AND AGING: THE WOMEN'S HEALTH INITIATIVE

Chair: *S.A. Shumaker, Wake Forest University School of Medicine, Dept of Social Sciences and Health Policy, Winston-Salem, North Carolina*
Co-Chair: *L. Coker, Wake Forest University School of Medicine, Dept of Social Sciences and Health Policy, Winston-Salem, North Carolina*
Discussant: *S.B. Kritchevsky, Wake Forest University School of Medicine, Sticht Center of Aging, Winston-Salem, North Carolina*

An Exciting Range of Scientific Discoveries on Women and Aging: the Women's Health Initiative Memory Study (WHIMS) Chair: Sally A. Shumaker, PhD; Co-Chair: Laura H. Coker, PhD; Discussant: Stephen B. Kritchevsky, PhD Ancillary to the WHI hormone therapy (HT) trials, WHIMS was the first large, long-term study to address the cognitive effects of postmenopausal HT. WHIMS consisted of two parallel, randomized, double-blind, clinical trials of conjugated equine estrogen with medroxyprogesterone (E+P) or E-Alone compared to placebo. The primary objective was to examine whether postmenopausal HT reduced the risk of all-cause dementia and, secondarily, mild cognitive impairment and global cognitive functioning in healthy women age 65-79 (mean 69) years at WHIMS baseline). WHIMS E+P and E-Alone trials began in 1996 and ended in 2003 and 2004, respectively, when the WHI parent studies were terminated earlier than planned due to significantly more non-cognitive adverse events associated with active HT. Subsequently, the WHIMS E+P trial reported a two-fold increase in incident probable dementia in the active HT group compared to placebo; and E-Alone increased the risk for probable dementia by 49%, but this was not significant. To explore a possible mechanism of the WHIMS cognitive findings, the WHIMS MRI study was designed to examine the association of HT compared to placebo on silent cerebrovascular disease. WHIMS MRI reported a significant association between HT and smaller frontal lobe and hippocampal brain volumes, but no association between HT and ischemic lesion volumes. WHIMS post-trial cognitive assessment continues annually. The current WHIMS GSA symposium highlights new findings on how women's cognitive health is associated with cardiovascular disease, prior education, retinopathy, and postmenopausal hormone therapy. Data to support these abstracts are from the WHI, WHIMS and the WHIMS MRI studies.

### RELATIONSHIP OF RETINOPATHY TO REGIONAL BRAIN VOLUMES AND COGNITIVE FUNCTION

M.A. Espeland[1], M.N. Haan[2], K. Yaffe[2], S.A. Gaussoin[1], S.M. Resnick[3], J.E. Rossouw[4], S.A. Shumaker[5], *1. Dept of Biostatistical Sciences, Wake Forest University Health Sciences, Winston-Salem, North Carolina, 2. University of California, San Francisco, San Francisco, California, 3. Intramural Research Program, National Institute on Aging, Baltimore, Maryland, 4. National Heart, Lung, and Blood Institute, Bethesda, Maryland, 5. Division of Public Health Sciences, Wake Forest University Health Sciences, Winston-Salem, North Carolina*

Retinopathy, even without frank diabetes, may serve as a marker of early microvascular changes that signal increased risk for cognitive deficits and adverse neuroradiologic findings. We examined associations between the presence of retinopathy and several markers of neurodegeneration (ischemic lesion and regional brain volumes from structural MRI and longitudinal Modified Mini-Mental State test scores) collected from 511 women, aged 65-80, who had standardized retinopathy evaluations. In models adjusted for diabetes and other risk factors for cognitive impairment, the 39 women classified as having retinopathy, compared to those without retinopathy, had approximately 50% greater mean total brain ischemic lesion volume (p=0.02) but little difference in mean total brain volume. Similar relationships were found for sub-regions of the brain. These women also had lower mean levels of global cognitive function over time (p=0.02). Retinopathy is associated with greater levels of diffuse brain ischemic lesion volumes and lower cognitive function in older women.

### EDUCATIONAL ATTAINMENT, MRI CHANGES AND COGNITIVE FUNCTION IN POSTMENOPAUSAL WOMEN

S. Rapp[1], M.A. Espeland[2], J.E. Manson[3], S. Resnick[4], N.R. Bryan[5], L.H. Coker[6], L. Phillips[7], M.L. Stefanick[8], *1. Wake Forest University School of Medicine, Dept of Psychiatry, Winston-Salem, North Carolina, 2. Wake Forest University School of Medicine, Dept of Biostatistics, Winston-Salem, North Carolina, 3. Harvard School of Public Health, Department of Epidemiology, Boston, Massachusetts, 4. National Institutes on Aging, Baltimore, Maryland, 5. University of Pennsylvania, Department of Radiology, Philadelphia, Pennsylvania, 6. Wake Forest University School of Medicine, Dept of Social Sciences and Health Policy, Winston-Salem, North Carolina, 7. Emory University, Department of Internal Medicine, Atlanta, Georgia, 8. Stanford University, Stanford Prevention Center, Stanford, California*

Educational attainment predicts performance of a wide range of cognitive abilities. Whether it predicts cognitive decline and pathological changes in the brain has important implications for the cognitive reserve hypothesis. The present analysis of is of a subset (n= 1,394) of postmenopausal women (> 65 yr.) in the Women's Health Initiative Memory Study (n = 7,479). Participants received assessments of cognitive performance and magnetic resonance imaging used to derive total ischemic lesion and brain volumes. Incident cases of probable dementia and mild cognitive impairment were centrally adjudicated. After adjustment for total lesion and total brain volumes (atrophy), higher educational attainment predicted better cognitive performance (p<0.001). Following conversion to dementia/MCI, higher education predicted steeper declines in cognitive function (p<0.001). Higher educational attainment may protect cognitive performance and delay functional decline enabling maintenance of a higher level of cognitive function in the face of growing neuropathological load and delay diagnosis of dementia.

### APPLICATION OF MACHINE LEARNING METHODS TO DESCRIBE THE EFFECTS OF CONJUGATED EQUINE ESTROGENS THERAPY ON REGION-SPECIFIC BRAIN VOLUMES

R. Casanova[1], M.A. Espeland[1], J. Goveas[2], C. Davatzikos[3], S.A. Gaussoin[1], B. Wagner[4], J.A. Maldjian[4], S.M. Resnick[5], *1. Wake Forest University of Health Sciences Department of Biostatistical Sciences, Winston-Salem, North Carolina, 2. Medical College of Wisconsin Department of Psychiatry, Milwaukee, Wisconsin, 3. University of Pennsylvania Department of Radiology, Philadelphia, Pennsylvania, 4. Wake Forest University of Health Sciences Department of Radiology, Winston Salem, North Carolina, 5. National Institute on Aging, Baltimore, Maryland*

Conjugated equine estrogens (CEE) have been linked to smaller hippocampal and frontal lobe volumes in older women; however, it is unknown whether this results in a broad-based regional pattern. Regional volumes of normal tissue and ischemic lesions were measured using structural MRI in 513 women who had been enrolled for an average of 6.6 years in a randomized clinical trial of CEE therapy, when aged 65-80 years. A multivariate pattern analysis was applied to identify patterns of regional volumes associated with therapy and to discriminate treatment groups. Women assigned to CEE therapy had smaller normal tissue volumes within the limbic and temporal lobes. Mean decreases (5-

7%) were found in the left entorhinal and perirhinal cortex. CEE in older women is associated with lower regional brain volumes, but may not induce a characteristic spatial pattern of changes in brain volumes of sufficient magnitude to discriminate the active from the placebo groups.

### COGNITIVE FUNCTION AND COGNITIVE CHANGE ON INCIDENT CVD: THE WHI MEMORY STUDY (WHIMS)

S.A. Shumaker[1], M.A. Espeland[2], X. Leng[2], M. Limacher[3], J.E. Manson[4], M.L. Stefanick[5], *1. Wake Forest University School of Medicine, Department of Social Sciences and Health Policy, Winston-Salem, North Carolina, 2. Wake Forest University School of Medicine, Department of Biostatistics, Winston-Salem, North Carolina, 3. University of Florida, Division of Cardiovascular Medicine, Gainesville, Florida, 4. Harvard School of Public Health, Department of Epidemiology, Boston, Massachusetts, 5. Stanford University, Stanford Prevention Research Center, Stanford, California*

There is growing recognition that vascular disease increases cognitive decline and impairment. There is less knowledge of how cognitive decline may signal increased risks of cardiovascular disease. The WHIMS cohort presents a unique opportunity to provide critical information on how cardiovascular disease and cognition interact later in life. We describe the associations among global cognitive function (3MS) and a battery of cardiovascular disease (CVD) risk factors and examine the relationships that baseline 3MS scores have with risk of CVD events. Using baseline and changes in 3MS scores as time-varying covariates, we develop proportional hazards regression models to explore how the hazard of CVD events are related longitudinally to cognitive function. Finally, we will examine the degree to which these associations may be influenced by changes in traditional CVD risk factors and medication use. The WHIMS data support the hypothesis that cognitive decline is associated with increased CVD in older women. A number of possible mechanisms will be discussed.

## SESSION 1320 (SYMPOSIUM)

### APPLICATIONS OF REMINISCENCE AND LIFE REVIEW TO DIVERSE ASPECTS OF GERONTOLOGICAL RESEARCH AND PRACTICE

Chair: *L. Yancura, University of Hawaii, Honolulu, Hawaii*
Discussant: *T.W. Pierce, Radford University, Radford, Virginia*

Reminiscence and Life Review are techniques used in both research and clinical settings with older adults. Although there are many variations on these techniques, they all involve the core aspect of the recollection of memories of one's self in the past. This recollection may be volitional or nonvolitional, and can be done alone or in the company of others. These techniques may be extremely useful in many aspects of gerontological research and practice because they have been associated with positive development in psychological, physical, and spiritual domains. Research presented in this symposium will cover applications of Reminiscence and Life Review to a broad range of issues of interest to gerontologists. Presenters will discuss applications of reminiscence theory to: preserving identity and planning for advance care for individuals with dementia; exploring how community-dwelling older adults use reminiscence to construct their social identities around health and social activity; demonstrating the value of reminiscence with stigmatized minorities from the transgendered population; and strengthening intergenerational bonds between grandparents and grandchildren. After attending this symposium, participants will be able to describe basic aspects of some reminiscence and life review techniques, recognize the applicability of these techniques to a wide range of theoretical and applied gerontological issues, and come away with practical strategies for incorporating reminiscence into their own work.

### IDENTITY CONSTRUCTION AND REMINISCENCE: HOW CENTER-GOERS CREATE "HEALTHY," "SOCIAL" SELVES

J. Weil, *University of Northern Colorado, Greeley, Colorado*

This study utilizes the theory of integrative reminiscence to illustrate the way community-dwelling persons 70 years of age and older attending a senior center use narratives to construct their social identities around topics of health and social activity. As part of an on-going ethnographic project begun in 2008, narratives of thirteen focal cases explore how individuals use reminiscence as a spontaneous, evolving, and dynamic process to construct identities. Through content analysis of interviews and participant observation, it is found that integrative reminiscence, although not always positive, allows individuals to work through conflicts about their current health and social statuses, gives their lives a sense of meaning, and re-shapes their identities. Reminiscence lets individuals put their current health and activity statuses, favorable or unfavorable, in the larger context of their life's experience. More work is needed to see how reminiscence can affect the resolution of past and current identities for elders.

### PRESERVING IDENTITY IN THE EARLY STAGES OF DEMENTIA: FEASIBILITY OF A BRIEF REMINISCENCE-BASED INTERVENTION

M.M. Hilgeman[1,2,3], D.W. Durkin[1,3], G. Harris[1,3], P.P. Haley[1,3], R.S. Allen[1,3], *1. The University of Alabama, Tuscaloosa, Alabama, 2. VA Boston Healthcare System, Boston, Massachusetts, 3. Center for Mental Health & Aging, Tuscaloosa, Alabama*

Self-maintenance therapy techniques (Cohen-Mansfield et al.) have recently emerged to address psychosocial needs of individuals with dementia. However, this approach has not been applied in the early stages of the disease, when there could be the greatest benefit. The Preserving Identity and Planning for Advance Care intervention uses reminiscence activities to guide the creation of a project (e.g., scrapbook) documenting an important role from the individual's life (e.g., mother, artist). A second component uses "living well" questions to guide discussion of future care. Seventeen individuals with dementia (M=80.1 yrs; CDR=0.5 or 1) and a family contact were randomly assigned to the four-session intervention or a phone-call control group. Pilot data results suggest reminiscence-based activities increased coping strategies from Time 1 to Time 2 for intervention individuals compared to controls (M=27.0 & M=22.75, respectively). Self-rated quality of life also increased for intervention individuals compared to controls (M=54.4 & M=51.8, respectively).

### GRANDCHILD-GRANDPARENT LIFE REVIEW: STRENGTHENING INTERGENERATIONAL BONDS

L. Yancura, *University of Hawaii, Honolulu, Hawaii*

Structured life review has positive psychological benefits for older adults. Life review shared with grandchildren may have the additional benefit of strengthening intergenerational bonds. This presentation describes a project within which grandparents and their adolescent grandchildren worked together to make short reminiscence films about the grandparent's lives. Participants were six grandparent-grandchild dyads. The protocol for film making included five sessions, an introductory session and four sessions each based on a phase of the grandparents' lives: childhood, adolescence, young adulthood, and the present. Films made with i-movie used scanned family photographs, period-appropriate musical selections, and videotaped interviews of grandparents describing important events in their lives. Grandparents and grandchildren reported benefits associated with joint participation in this project. After attending this presentation participants will be able to identify the benefits of dyadic reminiscence between grandparents and grandchildren and describe the one process by which grandchildren can make reminiscence films.

### REMINISCENCE WITH STIGMATIZED MINORITIES: EXAMPLES FROM THE TRANSGENDER-IDENTIFIED POPULATION

T.M. Witten, *Center for the Study of Biological Complexity, Virginia Commonwealth University, Richmond, Virginia*

Oral histories can document much history, not just of an individual but of a community as well. Reminiscence can help an individual to find closure on a life. However, in many cases revisiting the past, especially when an individual is a member of a stigmatized minority, can bring up memories that may have been suppressed, may be disturbing or may lead to unwanted discussion. Thus, oral history documentation and reminiscence methodologies must understand the history of the stigmatized/marginalized community within which they seek to record a history. In this presentation we address the challenge of reminiscence within the transgender-identified population. We provide a variety of examples from the presenter's ongoing fieldwork and open the floor for discussion.

## SESSION 1325 (POSTER)

## AT THE END OF LIFE

### END OF LIFE PLANNING: DO PARENTS WITH DISABLED ADULT OFFSPRING STAND OUT?

J.J. Benson, T.M. Cooney, *Human Development and Family Studies, University of Missouri, Columbia, Missouri*

Current research documents the influence of several sociodemographic characteristics, such as gender, age, marital status, education, and religious affiliation on the propensity to engage in end-of-life planning. Prior experience with end-of-life issues is also known to influence end-of-life planning. Older adults who know someone with a severe cognitive impairment, or a serious illness or injury, are more likely to make plans for end-of-life. Less attention has been directed toward examining the influence of caregiving experiences, such as whether caring for a disabled adult child affects aging parents' end-of-life decision-making. Using data from the 2004 wave of the Wisconsin Longitudinal Study we explore whether having a developmentally disabled, mentally ill, or severely depressed adult child distinguishes the end-of-life planning of 358 older adults (aged 65, on average) from 6373 peers who are parents without a disabled child. Both informal and formal measures of end-of-life planning were examined (durable power of attorney for health care, having a living will, and discussions of plans). Preliminary chi-square analyses yielded no differences in end-of-life planning either between parents in the three disability groups, or between parents with a disabled child versus those without. Further analyses explore factors such as the adult child's health and living arrangements, level of care required for the child and future care decisions for the child that may influence end-of-life planning among parents with a disabled child. Policy and practice implications are considered.

### AN EVALUATION OF THE INTERNATIONAL CLASSIFICATION OF FUNCTIONING, DISABILITY AND HEALTH (ICF) AS A PREDICTOR OF SIX MONTH SURVIVAL AMONG HOSPICE PATIENTS WITH DEMENTIA

J.Y. Allen[1], R.S. Schonwetter[2], S. Kim[2], B. Small[1], W.E. Haley[1], *1. Aging Studies, University of South Florida, Tampa, Florida, 2. HPC Healthcare, Inc, Tampa, Florida*

Objective: Although hospice can provide quality care to dying dementia patients and their families, research suggests that difficulty determining survival prognoses has limited service utilization (Schonwetter et al., 2003; Hanrahan, & Luchins, 1995). Recently, a Medicare intermediary encouraged use of the International Classification of Functioning, Disability and Health (ICF) to determine patient eligibility. The goal of the present study was to assess the validity of the ICF for use in predicting survival. Methods: A retrospective chart review of over 150 hospice patients with dementia admitted to a large community-based hospice was conducted. Additionally, longitudinal follow-up until time of patient death or discharge was performed. The predictive validity of the Reisberg FAST Scale and the Palliative Performance Scale (PPS) were also assessed. Results: Cox regression analysis revealed that a subscale of the ICF (i.e. Impairments of Body Functions) was a significant predictor of survival ($p < .05$) such that greater impairment was associated with increased risk of death. However subscales that assessed impairments of body structures and activity limitations and participation restriction, as well as the FAST scale were not significantly associated with survival. Finally, analyses revealed that the PPS was a significant predictor ($p < .001$) such that lower scores were associated with increased relative risk. Implications: ICF assessments of impairments of body functions and PPS scores may improve estimates of prognostication and determining hospice eligibility among patients with dementia. Health care providers and policy makers should consider if utilization would be improved by revising eligibility guidelines.

### PATIENT CHARACTERISTICS OF THE 2007 NATIONAL HOME AND HOSPICE CARE SURVEY

R.C. Intrieri[1], C.A. Yeager[2], L. Hyer[3], *1. Psychology, Western Illinois University, Macomb, Illinois, 2. Essex County Hospital Center, Cedar Grove, New Jersey, 3. Mercer University School of Medicine & The Georgia Neurosurgical Institute, Macon, Georgia*

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies and their current patients and discharges. The National Center for Health Statistics (NCHS) began surveying these agencies in 1992 as a result of their explosive growth throughout the United States. Participating agencies were either Medicare and/or Medicaid certified or held a state license to provide home health and/or hospice services. Survey data were collected in person from agency directors and staff between August 2007 and February 2008. Patient data were abstracted from the medical records. One thousand thirty-six agencies participated with data for 9,416 home health and hospice patients. There were 4,733 individuals identified that received hospice services. This presentation focuses on the characteristics of the hospice care patients. The survey consisted of 2,117 men and 2616 women. Men were on average younger (M=74.98; SD=13.48) than women (M=79.28; SD=13.57) with the mean age for the sample being 77.36 (SD=13.70). The racial composition of the sample was 91.6 percent white (n=4335), 6.7 percent black (n=315), 1.8 percent other racial groups. Approximately 43 percent of the sample was married or living with a partner, 39 percent were widowed, 8 percent were divorced or separated, 6 percent were never married, and 4 percent were missing information. Approximately 53 percent of the sample lived with family members before entering hospice. Information regarding the diagnosis at admission and the current primary diagnosis will be provided along with additional information regarding services received.

### AGENCY CHARACTERISTICS OF THE 2007 NATIONAL HOME & HOSPICE CARE SURVEY

R.C. Intrieri[1], C.A. Yeager[3], L. Hyer[2], *1. Psychology, Western Illinois University, Macomb, Illinois, 2. The Georgia Neurosurgical Institute and Mercer University Medical School, Department of Psychiatry, Macon, Georgia, 3. Essex County Hospital Center, Cedar Grove, New Jersey*

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies and their current patients and discharges. The National Center for Health Statistics (NCHS) began surveying these agencies in 1992 as a result of their explosive growth throughout the United States. Survey data were collected between August 2007 and February 2008. Participating agencies were either Medicare and/or Medicaid certified or held a state license to provide home health and/or hospice services. Data were collected in person from agency directors and staff. Patient data were abstracted from the medical records. One thousand thirty-six agencies participated with data for 9,416 home health and hospice patients. This presentation will report on the characteristics of the agencies providing hospice care. There were 695 agencies that provided hospice divided between those that provided only hospice care (n= 359) and those that provided both home health and hospice care (n= 336). Twenty-two percent of agencies that provided hospice only were part of chain while 78 percent were not. Fourteen percent of home health and hospice agencies were part of a chain compared to 86 percent that were not part of a chain. Thus, 18 percent of all agencies belonged to a chain compared to 82 percent that did not. Approximately 22 percent of all agencies were for profit while 78 percent were designated as private, not-for-profit, or government. Additional data will be presented further describing the agencies and the services provided.

### NURSES' AND CARE WORKERS' ATTITUDES TOWARD DEATH AND CARING FOR DYING OLDER ADULTS IN LONG-TERM CARE SETTING

M. Matsui[1], K.L. Braun[2], *1. Nagasaki University, Nagasaki, Japan, 2. University of Hawaii, Honolulu, Hawaii*

Background:Japan is a super-aging society. Nurses (RNs) and care workers (CWs) play an important role in the care of older adults at the end-of-life. This study examined RNs' and CWs' attitudes toward death and caring for dying older adults. Method:In the present study, a self-administered questionnaire was completed by 388 RNs and CWs employed in convalescent hospitals, intermediate nursing homes, and group homes in Nagasaki Japan. Survey items included demographic data, experience with death or dying patients, experience of providing end-of-life care, and previous seminar attendance regarding end-of-life care. Attitudes toward caring for dying patients were assessed by the Frommelt Attitude Toward Care of the Dying Scale, Form B, Japanese version (FATCOD-Form B-J). Attitudes toward death were measured Death Attitude Profile (DAP), Japanese version. The researchers obtained institutional review board approval from Nagasaki University. Results:The convenience sample consisted of 388 individuals (190 RNs, 177 CWs, and 21 unknown). 80.7% were female, with a mean age of 37.9 years. Mean years of work experience were 9.2, 71.9% were experienced with death and dying patients, 33.5% provided end-of-life care, and 32.6% had attended educational seminars on end-of-life care. Multiple regression analysis showed the better attitudes toward caring for the dying were positively associated with seminar attendance and negatively associated with fear of death. Job type and work setting were not associated. Conclusions:Education for staff regarding end-of-life care is key to promoting positive attitudes and better end-of-life care for older adults.

### ATTITUDES TOWARD LIFE-SUSTAINING TREATMENTS AMONG KOREAN AMERICAN AND MEXICAN AMERICAN OLDER ADULTS

E. Ko*, Social Work, San Diego State University, San Diego, California*

Increasing number of ethnic minority older adults heightened the needs for culturally appropriate health care practice. The use of Life Sustaining Treatments (LST) has brought much attention in relation to beliefs and attitudinal difference among ethnic groups. This study aims to explore the factors influencing attitudes toward LST among Korean American and Mexican American older adults. This study used a cross sectional research design that 122 Korean American (n = 64) and Mexican American (n = 58) community-dwelling older adults were interviewed at the selected sites. Measures included attitudes toward LST, End-Of-Life(EOL) decision making preference, acculturation, fatalism, spiritual perspectives, and other socio-demographic variables. Bivariate analysis showed the significant ethnic difference in personal LST preferences. As compared to Korean Americans, Mexican Americans significantly favored for CPR (9.4% VS, 27.6%), Artificial Ventilation (12.5% vs. 32.8%), Artificial nutrition/hydration (17.2% vs. 46.6%) and surgery (10.9 vs. 31.0%). Multivariate analysis showed that attitude toward LST was significantly accounted for by ethnicity, gender, EOL decision making preference, and fatalism. Mexican Americans and males were more likely to have positive attitudes toward using LST. EOL decision making preference and fatalism had positive effects. Culture is an abstract term. These two ethnic groups share some similarities including collectivism and fatalism, yet their LST preferences was dissimilar. It is important for health care professionals to recognize the unique needs of each population in EOL care. At the same time, EOL care approach needs to be individualized, focusing on quality of care, regardless of their ethnicity or cultural background.

### COMPLEMENTARY AND ALTERNATIVE THERAPIES (CAT) IN HOSPICE CARE

A. Bercovitz, M. Sengupta, A. Jones, *National Center for Health Statistics, Hyattsville, Maryland*

Anecdotal studies find provision and use of CAT (products and practices not part of standard care) is relatively common in end-of-life care. However, nationally representative data are not available. Using data from the 2007 National Home and Hospice Care Survey, we examined the provision and use of CAT in hospice. Forty-two percent of providers of hospice care offered CAT services, had a CAT provider on staff, or both. Providers offering only hospice care were more likely to offer CAT than providers offering both home health and hospice care (54% vs. 21%). Among providers offering CAT services, the most commonly provided services were massage (78% of providers), supportive group therapy (75%), music therapy (68%), pet therapy (64%), guided imagery and relaxation (58%), and therapeutic touch (53%). Over half of hospice discharges received care from a hospice provider which offered CAT. There were no differences in demographics or length of service between hospice discharges who received care from providers which offered or did not offer CAT. Among hospice discharges receiving care from a provider which offered CAT, only 9% received a CAT service from the provider. There were no differences between hospice discharges who received at least one CAT service and those who did not in demographics, care location, length of service or diagnoses, with the exception of symptoms and signs, which were more common among discharges receiving CAT. Results of this study suggest that CAT services are being more widely offered by hospice providers than they are being used.

### RELIGION AND FORMAL PREPARATIONS FOR END OF LIFE MEDICAL CARE: ASSESSING THE EFFECTS OF RELIGIOUS DENOMINATION, BELIEFS, AND PRACTICES

S. Sharp[2], D. Carr[1], *1. Rutgers University, New Brunswick, New Jersey, 2. University of Wisconsin, Madison, Wisconsin*

We use data from the Wisconsin Longitudinal Study (WLS) to assess whether religious denomination, beliefs, and practices affect older adults' formal (i.e., living will and durable power of attorney for health care [DPAHC] appointments) and informal (i.e., discussions) preparations for end of life care. The WLS is a large random sample survey of persons who graduated from Wisconsin high schools in 1957. Slightly more than half have a living will (55%) and a DPAHC (52%), while nearly three-quarters have discussed their end of life treatment preferences with significant others or care providers. We find no significant differences among religious denominations (i.e., Catholic; liberal, moderate and conservative Protestant; Jewish; other; no religion) in advance care planning. Persons who say that their religious beliefs would guide their end-of-life medical decisions did not have significantly higher rates of advance care planning. However, other religious beliefs and practices are powerful predictors of preferences. Persons who endorse Fundamentalist beliefs, attend religious services weekly, and identify closely with their religious group are significantly less likely to engage in advance care planning. General attitudes towards death and medical decision making were powerful predictors of advance care planning. Persons with high levels of death avoidance, low levels of death acceptance, and strong beliefs that doctors rather than patients should dictate medical decisions – were less likely to engage in end of life planning. The effects of religious attitudes and practices on advance care planning did not differ significantly by denomination. We discuss the implications for policy and practice.

### DISCLOSURE OF TERMINAL DIAGNOSIS AND PROGNOSIS: WHETHER AND HOW KOREAN AND MEXICAN AMERICAN OLDER ADULTS TO BE INFORMED?

E. Ko, *Social Work, San Diego State University, San Diego, California*

Disclosure of medical information provides opportunities for a patient to have an appropriate end-of-life plan and also enhances self- determination. Many people prefer to be informed of their diagnosis and prognosis, but there has been a concern about how health care professionals deliver the bad news. The purpose of this study was to explore whether and how Korean American and Mexican American older adults to be informed of their terminal diagnosis and prognosis. This study used a mixed method design. At stage one, 122 Korean American (n = 64) and Mexican American (n = 58) community-dwelling older adults were interviewed with a structured questionnaire. At stage two,38 participants (20 Korean Americans and 18 Mexican Americans) of the total samples were interviewed in depth. Bivariate analysis indicated no ethnic difference in the preferences for a physician informing 1) a patient and2) family members that a patient has cancer and informing 3) a patient and 4) family members that a patient might die of cancer. Majority of the participants agreed with each statement. The themes from qualitative interviews include 1) truth telling with empathy; 2) providing information in timely manner; 3) cautions in the selection of words, and 4) ending conversation with leaving hope. Both ethnic groups preferred to know their terminal diagnosis and prognosis, but opinions and expectations about how they should be addressed varied. Health care professionals need to be sensitive toward what is culturally expected in patient-health care professional communication regarding end-of-life care.

## SESSION 1330 (PAPER)

## BODY WEIGHT AS A HEALTH FACTOR

### BODY MASS AND C-REACTIVE PROTEIN LEVELS IN US ADULTS AND ELDERLY: SHAPE OF THE ASSOCIATION

A. Zajacova, *University of Wyoming, Laramie, Wyoming*

OBJECTIVE. This paper determines the shape of the relationship between body mass index (BMI) and C-reactive protein (CRP), a marker of systemic inflammation. We describe the association in the total population, by age, and across demographic subgroups. BACKGROUND. Excess body weight is known to be associated with chronic inflammation. Previous studies have not considered whether this association is linear or takes on other forms. Little is known also about the influence of age on the BMI-CRP association, although both BMI and CRP vary systematically from young adulthood to old age. METHODS. Analyses are based on NHANES 2005-2008 data. The sample includes adults age 20-80, with measured BMI (from 15 to 45) and CRP. Nonparametric regression-based multivariate linear and logistic models (generalized additive models) were used to model the shape of the BMI-CRP association, both in stratified analyses and in interaction with age. Results are presented as line graphs and 3D plots illustrating the shape of the BMI-CRP association. RESULTS. Among women, CRP levels increased monotonically from lowest to highest BMI across all ages. Among men, the results were similar except for younger white men, who evidenced a J-shaped association, with lowest CRP at high-normal BMI. Age was a significant modifier of the BMI-CRP association (p<.01 for men and women). CONCLUSION. CRP levels increase systematically with BMI for most population groups from underweight to morbid obesity. The findings are useful for health-behavioral recommendations, as well as for study of biological mechanisms linking adiposity to inflammation.

### OBESITY: ADVERSE HEALTH EVENTS AND THE UPDATING OF SURVIVAL EXPECTATIONS IN 1996 AND IN 2006

B. Novak, *University of Wisconsin-Madison, Madison, Wisconsin*

Context: There has been an increasing trend in obesity prevalence, observed worldwide during the last decades. Consequently, the interest in investigating the causes and consequences of this trend has also increased. How individuals perceive the effect of their excessive body weight on their health and ultimately on their survival expectations have been scarcely studied. Objective: Determine whether individuals at different levels of body weight update their survival expectations differently after acquiring information regarding their health (health shocks). Data: Health and Retirement Study (HRS): 1996, 1998, 2004, 2006 waves. Subjects: Individuals aged 50-59 in 1994 and 50-59 in 2004. Method: Survival expectations at time, are hypothesized to be a weighted function of two things. First, of the individuals' own survival expectations stated at time . Second, of an unobserved risk equivalent that is implied by any new information the individual acquires regarding a new fatality risk. This new fatality risk may have appeared between times and, and could induce a revision of the previous survival assessment. Two measures are estimated: the risk equivalent value of the new health information and the relative informational value of the new information. Two different groups of health shocks are considered: obesity-related health shocks and general health shocks. Results: The relative informational value shows that the new health information is not viewed as more instructive than the information previously had. However, among the obese health shocks occurring between 2004 and 2006 lead to slightly higher mortality risk assessments in 2006 compared with 2004 assessments.

### BMI TRAJECTORIES AS PREDICTORS OF MORTALITY AMONG OLDER ADULTS

A. Zajacova[1], J.A. Ailshire[2], H. Beltran-Sanchez[2], *1. University of Wyoming, Laramie, Wyoming, 2. Andrus Gerontology Center, USC, Los Angeles, California*

OBJECTIVE. The aim of the project is to analyze how changes in body weight among older adults predict future mortality. The paper will determine the most common types of body weight trajectories, and analyze which trajectories are associated with an increased risk of dying. BACKGROUND. A large body of literature has documented a U-shaped association between BMI and mortality, with high-normal weight or overweight typically associated with lowest mortality. These descriptive survival-analysis results are often interpreted in terms of a causal effect of body mass on health and longevity. This is despite well-known methodological problems in this literature, especially 'reverse causality' whereby a low body weight is the result of a disease process ending in death. This problem can be solved with longitudinal data and appropriate methodological approaches, as proposed here. METHOD. Using 8 waves of the Health and Retirement Survey (HRS) collected biannually from 1992 to 2006, the sample (N>8,000) includes respondents aged 50-80 at baseline (mean BMI=26.4). Mortality followup is available through 2007. Data are analyzed using generalized growth mixture models (GGMM). First, age-adjusted GGMMs are used to determine the optimal number and shape of BMI trajectories. Second, the classes are used as predictors in discrete-time survival models. EXPECTED RESULTS. It is expected that data will fit multiple classes of BMI trajectories, with considerable variability within each class. It is further expected that declining BMI trajectories, indicating weight loss during the study, will be associated with higher mortality than stable or increasing body weights.

# SESSION 1335 (PAPER)

## CAREGIVER BURDEN

### DOES CAREGIVER BURDEN MEDIATE THE EFFECTS OF BEHAVIORAL DISTURBANCES ON NURSING HOME ADMISSION?

J.E. Gaugler[1], M.M. Wall[1], R. Kane[1], J. Menk[1], K. Sarsour[2], J.A. Johnston[2], K. Schuh[2], R. Newcomer[3], *1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. Eli Lilly and Company, Indianapolis, Indiana, 3. University of California-San Francisco, San Francisco, California*

The primary objective of this study was to determine whether caregiving burden mediated the relationship between specific behavior disturbances and time to nursing home admission (NHA) in persons with dementia. The study used secondary longitudinal data from The Medicare Alzheimer's Disease Demonstration, a Medicare-covered home care benefit and case management program for family caregivers of persons with dementia. Primary caregivers of persons with dementia were assessed via in-person and telephone interviews every 6 months over a 3-year period. Dementia caregivers were recruited from 8 catchment areas throughout the United States. The baseline sample included 5,831 dementia caregivers. Just over 40% (43.9%; n = 2,556) of persons with dementia permanently entered a nursing home during the 3-year study period. Individual behavior problems were measured with the Memory and Behavior Problem Checklist. Caregiving burden was assessed with a short version of the Zarit Burden Inventory. Key covariates, including sociodemographic background, functional status, and service utilization was also considered. Event history analyses revealed that time-varying measures of caregiver burden mediated the relationship between 4 behavioral disturbances (episodes of combativeness, property destruction, repetitive questions, and reliving the past) and NHA. The findings highlight the multifaceted, complex pathway to NHA for persons with dementia and their family caregivers. The results emphasize the need for comprehensive treatment approaches that incorporate the burden of caregivers and the behavioral/psychiatric symptoms of persons with dementia.

### SUBJECTIVE VERSUS OBJECTIVE SLEEP OUTCOMES: DOES THE CAREGIVER ALWAYS KNOW BEST??

S.M. McCurry, K.C. Pike, R.G. Logsdon, L. Teri, M.V. Vitiello, *University of Washington, Seattle, Washington*

In most insomnia treatment studies, improvements in self-reported sleep equal or exceed those for objective sleep outcomes. In dementia sleep studies, however, subjective sleep ratings are obtained from proxy caregivers rather than patient self-report. We compared subjective and objective sleep outcomes for 132 patients enrolled in a randomized clinical trial testing the efficacy of walking, light exposure, and a combination treatment to improve sleep in community-dwelling patients with Alzheimer's disease. Patients were 81 years old (range 59-95), 55% female, with a mean MMSE score of 19 (range 0-30). Caregivers were 71 years old (range 36-96), 65% female, and 72% spouses. Active treatment patients had significant ($p < .05$) post-test actigraphic reductions in total wake time (TWT) at night compared to control subjects, but no significant improvements on caregiver ratings of patient sleep on the Pittsburgh Sleep Quality Index (PSQI). We subsequently defined objective sleep improvement as a reduction of 40+ minutes TWT/night (actigraphy), and subjective improvement as PSQI < 5 or a drop of 5+ points. Subjective ratings more often agreed with actigraphy non-improvement than improvement. All cases showing congruent actigraphy and PSQI score improvement had a minimum TWT decrease of 66 minutes/night. No patient or caregiver demographic, mood, health, or behavioral variables predicted congruence. However, 8 of the 12 patients (67%) with objective TWT improvement but no PSQI improvement had caregivers who slept in a different room. Findings suggest large changes in TWT and close sleeping proximity are necessary for caregivers to recognize patient sleep improvements when they occur.

### ASSESSING QUALITY OF LIFE OF FAMILIES CARING FOR MEMBERS DIAGNOSED WITH DEMENTIA

I. Canty Williams, K. Rose, S. Parvulescu-Codrea, *School of Nursing, University of Virginia, Charlottesville, Virginia*

A diagnosis of a dementing illness affects the entire family unit and the person with the diagnosis. The diagnosis often forces the family to confront numerous issues that influence the entire family's quality of life. Yet, there is a paucity of studies on the impact that dementia has on the family of the person with the diagnosis. The purpose of this study was to develop and pilot-test an instrument to measure family quality of life in dementia (FQOL-D). The first phase employed professionals with expertise in dementia care and providers of services for persons with dementia and their families, to reach a consensus on items to be included in a FQOL-D scale. Twelve expert health care providers completed three Delphi survey rounds to determine face validity of items that they deemed important for determining FQOL care. Results indicated that 42 items (with a mean rating of 3.5 or higher on a 5 point scale), representing five overall domains, remained: family interactions; direct care/activities of daily living support; emotional/behavioral well-being; physical and cognitive well-being; and disease-related support/medical care. We also examined preliminary data from focus group interviews with persons with mild-moderate stage dementia and their family members. The focus group interviews allowed us to refine the instrument and fully capture the participants' unique perspectives on FQOL-D. Findings will be used to develop and test a clinically-meaningful instrument to be used to evaluate the effectiveness of interventions and supportive services for families and persons with dementia.

### THE EFFECTS OF INCIDENT AND PERSISTENT BEHAVIORAL PROBLEMS ON CHANGE IN CAREGIVER BURDEN AND NURSING HOME ADMISSION

J.E. Gaugler[1], M.M. Wall[1], R. Kane[1], J. Menk[1], K. Sarsour[2], J.A. Johnston[2], D. Buesching[2], R. Newcomer[3], *1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. Eli Lilly and Company, Indianapolis, Indiana, 3. University of California-San Francisco, San Francisco, California*

The individual contributions of behavior problems to key outcomes in dementia, such as nursing home admission (NHA) or caregiver distress, remain unclear. Similarly, whether changes in specific behavioral disturbances account for expedited NHA or increases in caregiving burden is not well understood. This study sought to determine the ramifications of temporal change in individual behavior problems when accounting for increases in caregiver burden and time to NHA. A sample of 4,545 dementia caregivers who participated in the Medicare Alzheimer's Disease Demonstration Evaluation was selected for this secondary analysis. Various patterns of change in individual behavior problems were considered as predictors of time to NHA and increases in caregiver burden over a 3-year period via Cox proportional hazards and mixed effects models, respectively. Caregivers who did not indicate a care recipient's dangerous behavior initially but did so subsequently (i.e., an "incident" behavior problem) were more likely to experience increases in burden. Alternatively, the persistent occurrence of behavior disturbances (particularly memory problems) emerged as the strongest predictors of time to NHA. The findings of this study suggest the benefit of examining temporal patterns of individual behavioral disturbances, and that incident and persistent problems account for different dementia outcomes over time. Considering the temporal ramifications and potency of specific behavior problems can facilitate the targeted and timely delivery of effective clinical interventions.

## SESSION 1340 (SYMPOSIUM)

### CHALLENGES AND STRATEGIES IN DOING RESEARCH IN END OF LIFE: LESSONS LEARNED FROM THREE SUCCESSFUL STUDIES

Chair: *D. Parker Oliver, University of Missouri, Columbia, Missouri*
Co-Chair: *E. Wittenberg-Lyles, University of North Texas, Denton, Texas*
Discussant: *D. Porock, University of Nottingham, Nottingham, United Kingdom*

Although methodological rigor is one of the central tenets of scholarly training, real-world applications of methodology can reveal true learning curves in the establishment of scientifically sound research. The leap from textbook instruction to application of inquiry can expose key gaps that far exceed a scientific lens. This learning curve can be especially problematic for researchers studying end-of-life care (namely hospice and palliative care), as there are additional challenges related to ethics, funding and recruitment. Recent literature in palliative medicine has documented these challenges with reports of studies that were not successful because they were unable to overcome the ethical challenges presented by un-informed institutional review boards or the gatekeeping barriers presented by professional staff. This symposium extends the discussion of these challenges by identifying methodological barriers to end-of-life research and sharing successful strategies previously used in four separate research projects. Each participant will share their experiences and lessons learned in their role as PI while conducting funded research in this population. Strategies used to address the challenges will be compared between studies, providing various ideas for future researchers seeking to successfully implement research with this population. Themes common to all projects will include ethical issues, funding obstacles, grant management demands, and subject recruitment barriers.

### ASSESSING CAREGIVER NEEDS IN HOSPICE: A PROBLEM SOLVING INTERVENTION

G. Demiris[1], D. Parker Oliver[2], *1. University of Washington, Seattle, Washington, 2. University of Missouri, Columbia, Missouri*

This pilot equivalency trial, funded by the National Institute of Nursing Research, randomized hospice caregivers into a group that received a problem solving intervention face to face and one that received the intervention via videophone technology. The presentation will discuss the strategies used in designing the study, partnering with diverse hospice agencies, selecting clinical measurement instruments, and managing a complex intervention in two large urban hospice agencies. Furthermore, the presentation will highlight two successful referral processes pursued in this study and the challenges of using information technology as a platform for cognitive behavioral interventions. In addition, the management of a changing community technology infrastructure, randomization challenges with hospice caregivers, budgetary considerations, staffing challenges, and subject recruitment in the context of hospice will be shared.

### ASSESSING CAREGIVERS FOR TEAM INTERVENTION VIA VIDEO ENCOUNTERS (ACTIVE)

D. Parker Oliver[1], G. Demiris[2], E. Wittenberg-Lyles[3], K. Washington[4], D. Porock[5], *1. Family and Community Medicine, Univesity of Missouri, Columbia, Missouri, 2. University of Washington, Seattle, Washington, 3. University of North Texas, Denton, Texas, 4. University of Louisville, Louisville, Kentucky, 5. University of Nottingham, Nottingham, United Kingdom*

This pilot project, funded by the National Cancer Institute, was a two phase mixed methods study which used videophone technology to empower hospice caregivers to join hospice interdisciplinary team meetings in two rural hospice programs. This two year pilot study gave us the experience necessary for a full scale RCT to begin in the Summer of 2010. The presentation will discuss the challenges of moving from a pilot into a larger study. Issues discussed will include funding for large scale projects, working across multiple sites at a geographic distance from the PI, strategies for managing large amounts of video data, experiences coordinating an international research team, challenges imposed by weather emergencies, and strategies for managing the new NIH public access for manuscripts from NIH funded work.

### EXPLORING CAREGIVING AT END-OF-LIFE: THE QUALITATIVE RESEARCH EXPERIENCE

K. Washington[2], D. Parker Oliver[1], *1. Family and Community Medicine, Univesity of Missouri, Columbia, Missouri, 2. University of Louisville, Louisville, Kentucky*

Researchers using qualitative approaches to study caregiving at end-of-life must often employ strategies to meet the sometimes conflicting demands posed by a commitment to the qualitative process, desire to obtain funding, and real or perceived need to demonstrate the rigor of one's work to others. Drawing from qualitative research experiences gained during a dissertation study funded by the John A. Hartford Doctoral Fellows Program, this presentation will consist of a candid discussion of the rewards and challenges associated with conducting qualitative work in end-of-life settings. Special attention will be paid to the unique circumstances facing students whose research will contribute to completion of their dissertation and serve as a mechanism to market themselves to potential employers.

## SESSION 1345 (POSTER)

## FAMILY CAREGIVING II

### RURAL AFRICAN AMERICANS' RETROSPECTIVE PERCEPTIONS OF NURSING HOME PLACEMENT

Y. Eaves, *University of Alabama at Birmingham, Hoover, Alabama*

Few studies have examined developmental, situational, and illness related transitions in rural African American caregiving families. Therefore, little is known about the experiences of African American older adults and their family caregivers and how they manage during critical transitions, and how and when they make decisions about long-term care (LTC). The purpose of this ethnographic study was to identify and analyze episodic and/or emergent health events that result in caregiving transitions, namely decision-making about LTC placement, in rural African American families. This study is ongoing, but at this point nine care recipients (older adults who were current LTC residents) and primary caregivers ages 36-91 have participated in semi-structured audiotaped interviews. Ethnographic analytic techniques are being used to code and classify the data and then formulate meaningful categories, themes, and patterns into an explanatory framework. One-half of the older adults living in the nursing home scored too low on the MMSE during pre-screening to take part, thus, only their primary caregivers were interviewed. Preliminary data analysis uncovered two stories of previous elder abuse, neglect, and violence by an unknown perpetrator. Two older adults verbalized satisfaction with care provided by the nursing home staff and viewed their stay at the nursing home as an improvement over previous living conditions and arrangements. The remaining older adults were angry at family members for institutionalizing them, and expressed a desire to go home. Next, findings from this work will be used to develop culturally relevant caregiving transitions interventions for this vulnerable group of older adults.

### THE BIRTH OF THE BLUES: DESCRIPTION AND VALIDATION OF A COMPOSITE MEASURE OF CAREGIVING DISTRESS

P.C. Griffiths[1,2], B. Center[3], K. Lindstrom Bremer[4], K. Hepburn[5], *1. Rehab R&D, Atlanta VAMC, Decatur, Georgia, 2. Emory University School of Medicine, Atlanta, Georgia, 3. University of Minnesota, Minneapolis, Minnesota, 4. Minnesota State University, Mankato, Minnesota, 5. Emory University School of Nursing, Atlanta, Georgia*

BACKGROUND: This study reports on an effort to establish validity for a multidimensional measure of caregiving Distress developed for use in the Partners in Caregiving Study (PIC). We report the results of a confirmatory factor analytic study of a dementia caregiving population entirely independent from the population on which we developed the Distress measure, using an exploratory factor analytic strategy. METHODS: We sought to validate a Distress measure derived and calculated on the original PIC data which was an efficacy study (Hepburn et al.,2005) using a new sample, recruited for the SAVVY Caregiver Program (Hepburn et al.,2007) a translational study led by volunteer trainers in three totally different locations in the US. We did not re-compute our formula for Distress, or optimize it in any way for the new data. RESULTS: Our Distress measure demonstrated strong content, construct, external and discordant validity, good stability over time and showed itself generalizable to three different populations under vastly different circumstances. A confirmatory factor analysis on this new population showed an excellent fit (GFI=.91; CFI=.98; NF=.95; RMSEA = .058). Our factor loadings ranged from $\lambda = .31$ to $\lambda = .85$ and were all significant ($p < .0001$). The Distress measure provides the field with a measure that is robust, stable over time, sensitive to experimental manipulation (such as our intervention), generalizable, applicable to a wide variety of caregiver populations, and relatively easy to compute and to use.

### UNDERSTANDING CAREGIVERS: VALIDITY OF THE CAREGIVING STYLE SCALE

K.S. Page[1], B. Hayslip[1], J. King[1], C. Henderson[2], *1. Department of Psychology, University of North Texas, Denton, Texas, 2. Sam Houston State University, Huntsville, Texas*

Caregivers face many challenges including financial issues, family conflict, time limitations, and conflicting role demands. The Caregiving Style Scale (CSS; King & Hayslip, 2005) was constructed to identify unique caregiving styles among caregivers in various contexts. The sample consisted of 437 caregivers (M age = 56.63; SD age = 11.13). Caregivers either cared for their grandchildren (N = 278) or a person with a dementia diagnosis (N = 159). Exploratory factor analysis identified the following factors (styles): authoritative, supportive/obligatory, authoritarian/anger, physical/emotional control, child-centered, and structured (see Page et al., 2010). The alpha coefficients of the factors ranged from .70 to .85. For the current study, these factors were correlated with measures relating to caregiving to establish the construct validity of the CSS. All but one of the six caregiving styles (not structured) correlated with the Positive Aspects of Caregiving scale (PAC; Tarlow et al., 2004), the Caregiver Appraisal Scale (CAS; Lawton et al., 1989), the Modified Caregiver Strain Index (MCSI; Thornton & Travis, 2003), and the Medical Outcomes Study 36-item Short Form (SF-36; Ware & Sherbourne, 1992). The authoritarian/ anger style correlated with various scales indicating poorer mental and physical health, fewer positive aspects of the caregiver role, and increased caregiver strain. These data speak to the construct validity of the CSS and suggest that professionals consider the manner in which caregivers interact with the family for whom they are providing care and their potential impact on both the caregiver and the care receiver.

### RECIPROCITY IN OLDER CAREGIVERS OF ADULTS WITH INTELLECTUAL DISABILITIES

E.A. Perkins[1], W.E. Haley[2], C. Vanderweerd[3], *1. University Center for Excellence in Developmental Disabilities, University of South Florida, Tampa, Florida, 2. School of Aging Studies, University of South Florida, Tampa, Florida, 3. College of Public Health, University of South Florida, Tampa, Florida*

Background: Parent caregivers of adult children with intellectual disabilities (ID) are unique because the lifespan duration of their caregiving responsibilities. Previous research has indicated that adult children with ID may provide help with household chores, and be an enduring source of companionship. The purpose of this study was to determine whether reciprocity (i.e. the balance between what is given versus what is received) was associated with quality of life variables of older caregivers of adult children with ID. Reciprocity was investigated using both tangible reciprocity (e.g. help with household tasks), and emotional reciprocity (e.g. verbal/non verbal affection). Method: A cross-sectional convenience sample of 91 parental caregivers (aged 50+ years, M=60.8) of coresiding adult children with intellectual disabilities, (aged 18+ years, M=29.7), were interviewed. Results: Caregivers reported giving more tangible support and emotional support than received. Relative disadvantage (i.e. giving more than received) in tangible reciprocity was associated with increased depressive symptomatology and poorer mental health, but also reduced desire for seeking alternative residential placement of the care recipient. Tangible reciprocity was not associated with physical health or life satisfaction. Emotional reciprocity was not associated with any quality of life measures. Discussion: In older caregivers, the salience of reciprocal imbalance with tangible tasks may be particularly noteworthy for ascertaining current psychological well-being. The greater commitment to the continued coresidence of less reciprocal care recipients, suggests a reticence of these lifelong caregivers to consider alternative residential placement, and may indicate captivity in their caregiving role.

### HOW DO INFORMAL CAREGIVERS AFFECT FUNCTIONAL DEPENDENCE OF OLDER ADULTS RECEIVING FORMAL HOME HEALTH CARE SERVICES?

E. Cho, *Yonsei University College of Nursing, Seoul, Republic of Korea*

Aim: The aim of this study was to examine differences in functional dependence between older adults with and without informal caregivers. Furthermore, this study examined whether those differences were attributable to the type of informal caregiver. Background: Most dependent older adults receive care from informal caregivers. Nevertheless, few studies have investigated the effects of informal caregivers on the functional dependence of older adults. Methods: We performed a secondary data analysis using a computerized patient care database, the Outcome and Assessment Information Set (OASIS). Our sample population included 8,750 people aged 65 and more who were admitted to a home health care (HHC) agency from acute care hospitals between January 1 and June 30, 2002. We conducted multiple linear regression analysis with functional dependence after a 60-day episode of formal HHC as the outcome variable. Results: The majority of older adults (83.4%) receiving formal HHC services also receive care from informal caregivers. These older adults show less functional dependence at discharge ($\beta=-0.821$, $p<0.05$) than do those with no informal caregiver, and older adults who have a spouse ($\beta= -3.886$, $p<0.001$), offspring ($\beta= -3.614$, $p<0.001$), relative ($\beta= -4.360$, $p<0.001$), or non-relative ($\beta= -4.977$, $p<0.001$) caregiver show less functional dependence at discharge compared to those who have a paid caregiver, when controlling for risk factors. Conclusions: The professional nursing staffs at HHC agencies need to fully assess caregiver arrangements. HHC agencies should consider interventions aimed at reducing the functional dependence of older adults with no caregiver or with a paid caregiver.

### CORRELATES OF POSITIVE AND NEGATIVE APPRAISAL OF CAREGIVING IN VARIOUS TYPES OF CARE RELATIONSHIPS

M. Broese Van Groenou[1], A.D. Boer[2], J. Iedema[2], *1. Sociology, VU University, Amsterdam, Netherlands, 2. The Netherlands Institute for Social Research, The Hague, Netherlands*

The present study investigated the pathways underlying the dual (positive and negative) appraisal of caregiving in different types of relationships. Based on the caregiver stress model, it is examined to what degree objective stressors, motivational factors, coping behavior, external support and background characteristics of caregivers impact positive and negative appraisal of caregiving among spousal, adult child and other types of caregivers. Data from a large national sample of informal caregivers of 1434 older persons in the Netherlands allowed structural equation modeling (SEM) to examine the direct and indirect effects among independent and dependent variables. Descriptive results showed that spouses report more positive appraisal and more burden than adult children and other types of caregivers. The SEM analyses showed that the correlates of burden differed from correlates of positive appraisal and in part varied by type of relationship. Motivational factors were most important for positive appraisal, whereas objective stressors, coping style and assistance from others were, in addition to motivation, more important for burden. Which type of motivation, which type of assistance and which objective stressors impact caregiver appraisal, depended on the type of care relationship. In none of the care relationships, positive appraisal was directly associated with burden. The results underscore the dual nature of caregiving and showed that the pathways underlying appraisal of caregiving vary by type of care relationship. Implications for different types of intervention programs to support caregivers are discussed.

### CARE NEEDS OF OLDER ADULTS WITH DEPRESSION AND THEIR FAMILIES: A QUALITATIVE ANALYSIS

M. Luptak, *College of Social Work, University of Utah, Salt Lake City, Utah*

As the most widespread mental health issue in late life, depression affects the lives of numerous older adults and their families in this country. To better understand care needs in these families, this study explored the experiences of families involved with community-dwelling relatives age 60 and above with a diagnosis of major depression. In-depth individual face-to-face interviews were conducted with family members in 20 families to elicit their views about various aspects of their experiences (e.g., how they understand and respond to the older adult's depression, needs that surface, and coping strategies employed to meet those needs). Interviews were digitally recorded and transcribed and qualitative analysis was conducted using QSR NVivo 8 software to identify and refine codes and categories as new themes and patterns emerged within families and across families. Family members included primary kin (spouses, adult children, siblings, and significant others), secondary kin (nieces, grandchildren, step-relations, and in-laws), as well as individuals who were identified as family by the older relative with depression. Results provide rich descriptions of the family members' roles (e.g., providing hands-on assistance, helping with decision making, offering emotional support to the older adult and/or to other family members) and needs (e.g., affordable family therapy, educational resources, respite), and suggest family-centered approaches should be considered when planning interventions for older adults with depression.

### CAREGIVER STRAIN AND FUNCTIONAL STATUS

J. Saunders, C. Cookman, *Texas Tech University Health Sciences Center, Lubbock, Texas*

Most research is focused on the relationship between caregiver strain and the care recipient's functional status; however, equally important is an understanding of the caregiver's functional status and it relationship to strain. A study (n= 613) was conducted using mailed surveys to explore health-related needs of older adults (65 & older) in West Texas, which included caregivers (n=365). This analysis examines differences in functional status between two groups of caregivers; one that reported caregiver strain and one that did not. Caregivers completed a demographic questionnaire, the 13-item Caregiver Strain Index (CSI) and the Medical Outcomes Study Short Form 36 (SF-36). The mean age was 75.26 with a range of 65 to 95. The majority were female (61%), married (58%), Caucasian (85%), living in a house (85%), 2 person household (52%), retired (81%), and caring for spouse (33%). An item analysis was conducted to explore mean differences in functional status between caregivers who indicated that an item was a source of strain and those that indicated that it was not a source of strain for them. The three sources of caregiver strain with the greatest numbers of significant differences in functional status mean scores (p=<.05)—hence most likely to influence functional status were (1) financial strain, (2) feeling completely overwhelmed, and (3) changes in personal plans. It is important to understand that quality of care for the care recipient is intertwined with the functional status of both the care recipient and the caregiver: empirical knowledge of each is needed.

### INFORMAL CAREGIVING IN STROKE FAMILIES: LINKS BETWEEN THE MENTAL HEALTH FUNCTIONING OF CAREGIVERS AND CARE RECEIVERS

G. Smith, *Kent State University, Kent, Ohio*

Prior research on family care for stroke survivors has relied mainly on data from caregivers (CG) without corresponding data obtained from care recipients (CR). Especially lacking are investigations of relationships between diverse indices of psychosocial functioning as reported by each member of the CR-CG dyad, despite the growing belief that the mental health of both members is entwined. The present study extends past research by examining the patterns of interrelationships between baseline measures of psychological distress, competence, mastery, self-esteem, and social support obtained from 30 male stroke survivors (SS) and their CG spouses enrolled in a randomized clinical trial of a psychoeducational intervention for stroke families. Pearson Product Moment correlations revealed that multiple indices of CG distress (depression, anxiety, anger, and burden) were related significantly and adversely to the levels of perceived overprotection, mastery, self-esteem and social support reported by SS. However, the relationships between SS psychological distress (depression and anxiety) and all indices of CG psychological distress failed to reach significance. From a stress and coping perspective, these findings suggest that psychological distress experienced by the CG may operate to erode the coping resources of the SS. Implications for interventions with caregiving families will be discussed. [Funded by R21NR010189-01A1].

### PHYSICIANS' AND NURSES' PERCEPTIONS OF THE INFORMATION NEEDS OF CAREGIVERS OF PERSONS WITH DEMENTIA

V. Steiner, L.L. Pierce, *University of Toledo, Toledo, Ohio*

Understanding of and attention to family caregivers' challenges/needs are essential aspects of caring for people with dementia. This study identified information needs of dementia caregivers as perceived by primary care physicians (PCPs) and registered nurses (RNs). Both groups were mailed a 48-item survey and asked to choose the top ten information needs they thought family caregivers experienced in caring for someone with memory problems. PCPs (n=44) worked in outpatient clinics in two Midwest states and were primarily white males who were, on average, 49 years old and had spent 21 years caring for dementia patients. RNs (n=102) worked in long term care settings in the eastern half of the United States and were primarily white females who were, on average, 56 years old and had spent 24 years caring for dementia patients. Managing the care recipient's (CR's) loss of bladder/bowel control was the top information need identified by both PCPs (59%) and RNs (67%). Although in a different order of frequency for the two groups, the next three top needs were also the same. These included: 1) managing the CR's forgetfulness/confusion [PCPs=57%; RNs=55%], 2) dealing with the caregiver's changing relationship with the CR [PCPs=52%; RNs=52%], and 3) providing personal care to the CR [PCPs=57%; RNs=50%]. The top needs related mostly to help the caregivers required in caring for the person, and not help they required for themselves. These information needs can be used by healthcare professionals who care for families experiencing dementia to develop educational materials and supportive interventions.

### THE ROLE OF EMBARRASSMENT IN CAREGIVER DISTRESS: MEASURE DEVELOPMENT AND VALIDATION

J. Montoro-Rodriguez[1], K. Kosloski[2], K. Kercher[2], R. Montgomery[3], *1. California State University San Bernardino, San Bernardino, California, 2. University of Nebraska at Omaha, Omaha, Nebraska, 3. University of Wisconsin, Milwaukee, Wisconsin*

Recent research indicated that two factors that appear to capture the effect of embarrassment associated with the care receiver's illness appeared to increase depression in a sample of caregivers. Embarrassment was measured as two distinct factors, with two indicators of each factor. The goal of the present study was to develop a broader measure of embarrassment and to evaluate the construct validity of this measure by relating it to relevant antecedent and outcome variables. Data were obtained from 280 adults participating in the League of Experienced Family Caregivers (LEFC) who were caregivers primarily of dementia patients. The League is a registry of family caregivers who volunteer to complete questionnaires and share information about their caregiving experiences. Data were collected on the antecedent variables of problem behaviors and neuroticism. Three types of burden (stress, interpersonal, and objective burden) served as logical outcomes. Twelve embarrassment items were added to the original four. The analyses proceeded in two phases. First, exploratory factor analyses revealed three embarrassment factors – two originally hypothesized by Goffman: (1) discredited embarrassment (e.g., I avoid company in my home), (2) discreditable embarrassment (e.g., It is embarrassing to take my relative out in public), and a third embarrassment factor that reflects fear of public exposure (e.g., I often feel the need to hide my relative's illness from others). Second, a causal model linking the three embarrassment models to the antecedents and outcomes fit the data reasonably well (CFI=.93, T-L=.92, RMSEA=.05), offering substantial support for the construct validity of the embarrassment factors.

### ASSOCIATIONS OF POSITIVE AND NEGATIVE AFFECT WITH STRESS BIOMARKERS IN CAREGIVERS AND NON-CAREGIVERS

L. Fredman[1], C. Mezzacappa[1], S.O. Stuver[1], T. Heeren[2], *1. Epidemiology Department, Boston University School of Public Health, Boston, Massachusetts, 2. Biostatistics Department, Boston University School of Public Health, Boston, Massachusetts*

The protective associations between optimism and positive affect with stress-related biomarkers are thought to be distinct from the absence of depression, but few studies have compared these relationships. We evaluated associations between optimism (LOT-R scale), the 4-item positive affect (PA) and 7-item depressive affect (DA) subscales from the Center for Epidemiologic Studies-Depression Scale on Interleukin-6 (IL-6), Dehydroepiandrosterone-Sulfate (DHEA-S), and Cortisol in a sample of 51 caregivers to a person with Alzheimer's Disease or Parkinson's Disease and 124 non-caregivers from the Boston metropolitan area. Caregivers were significantly younger (mean age=71.6 vs. 75.6, $p<0.01$) and more stressed than non-caregivers, but did not differ on optimism (mean = 18.8), PA (mean = 10.5), or DA (mean = 2.3). They had lower lnDHEA-S scores than non-caregivers (mean=3.7 vs. 4.0, p=0.09), but did not differ on lnIL-6 or lnCortisol. The LOT-R and PA were highly correlated (r=0.61), and were negatively correlated with DA score (r=-0.48 and -0.63, respectively). In linear regression analyses adjusted for age, gender, and comorbidities, optimism and PA had the same association with lower lnIL-6 (LOT-R beta=-0.038, $p<0.01$; PA beta =-0.037, p=0.16) as DA had with higher lnIL-6 (beta = 0.033, p=0.11). There were non-significant trends toward higher PA and elevated lnDHEA-S (beta = 0.039, p=0.21) and higher optimism and lower lnCortisol (beta = -0.023, p=0.13). Most of these associations were stronger in caregivers. These results suggest that the associations between optimism and PA with IL-6 are similar to the inverse of depressive affect, while those with neuroendocrine markers are less consistent.

### CAREGIVER IDENTITY DISCREPANCY SCALE: RELIABILITY, CONSTRUCT VALIDITY AND UNIDIMENSIONALITY

K. O'Connell Valuch[1], J. Kwak[1], M. Brondino[1], K. Kosloski[2], R. Montgomery[1], *1. Applied Gerontology, UW-Milwaukee, Milwaukee, Wisconsin, 2. University of Nebraska-Omaha, Omaha, Nebraska*

The Caregiver Identity Discrepancy (CID) Scale, a six-item global measure, was originally developed to measure the discrepancy between caregivers' expectations about their roles and actual behaviors based on the Caregiver Identity theory (Montgomery & Kosloski, 2009). The current study examines reliability, validity and unidimensionality of the CID scale. The sample of 399 family caregivers from four states was screened for a large randomized control study of a care management intervention. Cronbach's alpha for the scale was 0.8320. Results from the CFA analysis indicate that the fit of the model to the data is acceptable (X2=1121.46, p=0.001; CGI=0.98, T-L=0.98; RMSEA=0.046; and SRMR=0.051). For the Rasch analysis, the person reliability for non-extreme persons was low (Real RMSE=0.74, Model RMSE=0.80), however, the item reliability for all 6 items was high (Real RMSE=0.97, Model RMSE=0.97). Infit statistics for 5 of the 6 variables were within normal range (-2 to 2), as were outfit statistics for 4 of the 6 variables. The PCA of the residuals suggested unidimensionality of the scale, with 51.6% of the raw variance being explained by the scale, 35.9% of the raw variance explained by the items, and the first eigenvalue of the first contrast being less than 2. Findings from this study demonstrate (1) reliability and validity of the CID Scale and (2) CID as a distinct unidimensional construct.

### PARTNERS IN CAREGIVING: EFFECTS OF A PSYCHOEDUCATIONAL INTERVENTION ON ALZHEIMER'S CAREGIVING DAUGHTERS

K. Hepburn[1], K. Lindstrom Bremer[2], P.C. Griffiths[3,4], B. Center[5], *1. Emory University School of Nursing, Atlanta, Georgia, 2. University of Minnesota, Minneapolis, Minnesota, 3. Rehab R&D, Atlanta VAMC, Decatur, Georgia, 4. Emory University School of Medicine, Atlanta, Georgia, 5. Minnesota State University, Mankato, Minnesota*

Adult daughters provide much of the informal care for elders with Alzheimer's disease, at substantial cost to their own health and well-being. Because daughters will be providing much of the care for the millions of AD sufferers over the next 50 years, it is imperative that interventions be developed and tested to help these caregivers. This study evaluated a six-week group psychoeducational intervention on daughter caregivers using data from a larger study: The Partners in Caregiving program (PIC). PIC was a randomized-waitlist control trial which aimed to strengthen caregivers' skills, caregiving strategies, knowledge of AD, and acceptance of the caregiving role (Hepburn et al., 2005). We tested the PIC intervention's ability to relieve caregiver distress in a subsample of daughters only (N=54) using a mixed methods approach of standardized quantitative instruments augmented by qualitative interviews. The daughters ranged in age from 33 to 70 (mean=48,sd=9) and were caring for recipients who ranged in age from 55 to 96 (mean=78,sd=7) and who were predominately mothers to the caregivers(87%). Half(.50) of the dyads lived together in the same home. Unlike the larger PIC study, there were no significant differences in the global measure of caregiver distress for the daughters. However, significant increases in Caregiving Competence were found for the caregivers in the intervention group. The results of the qualitative analysis are used to discuss these findings and to highlight directions for future research in light of the unique needs of caregiving daughters.

### FAMILY CAREGIVERS OF ADRD PATIENTS IN LTC: AN EXPLORATION OF STAFF & FAMILY PERCEPTIONS

T. Walker, M.K. Keaveny, V. Felix, D.W. Coon, *Arizona State University, Phoenix, Arizona*

This research project used structured surveys and focus groups as well as focused interviews to explore staff (N = 51) and family member (N=19) perceptions of the needs of family caregivers of ADRD (Alzheimer's disease and related disorders) patients in long-term care (LTC) facilities. Four overarching themes emerged regarding family caregiver needs: 1) REASSURANCE that this was "not your grandma's nursing home" (e.g., reliance on family member expertise, the power of touch, provision of comfort and safety, and embracing the circle of care); 2) EMOTIONAL SUPPORT (e.g., helping families face fears about dementia and accept patient decline, as well as normalize emotions, such as guilt, grief, and loneliness); 3) INFORMATION & EDUCATION about LTC facilities, ADRD, and available resources, as well as, the need for permission to place their loved ones; and, 4) IMPROVED COMMUNICATION & ADVOCACY to address frequent staff turnover, poor channels of communication, and lack of relationships with physicians. Ways to address these needs emerged at multiple levels of interventions: 1) INDIVIDUAL & INTERPERSONAL (e.g., communication skills training, dementia education); 2) ORGANIZATIONAL/SYSTEM (e.g., fax referral systems, staff orientations, video series on LTC & dementia); 3) COMMUNITY (interprofessional education on LTC; public awareness campaigns to reduce LTC stigma); and, POLICY (including local, state and national policy such as demonstration project on LTC and family caregiving, as well as organizational policy such as active use of family advisory councils, and revised policies and procedures for family orientation and involvement in care planning).

### ROLE OF SPIRITUALITY/RELIGIOUS PRACTICES AMONG HISPANIC FAMILY CAREGIVERS: A QUALITATIVE APPROACH

S.S. Koerner, Y. Shirai, R. Pedroza, *Family Studies and Human Dev., University of Arizona, Tucson, Arizona*

There is evidence that religion/spirituality may be a coping strategy that is particularly important for Hispanic caregivers (Dilworth-Anderson et al., 2002; Mausbach et al., 2003). However, because the extant research relies almost entirely on quantitative standardized measures, it does not permit insights into the way in which religion/spirituality functions in the daily lives of Hispanic caregivers and it does not fully reveal how these caregivers themselves view religion/spirituality as beneficial in their role as caregiver. To obtain a more nuanced, emic look at the role of religion/spirituality in the lives of Hispanic caregivers, we posed an open-ended question to a sample of 67 informal caregivers of Mexican-descent, living in southern Arizona. 86.6% cared for an older parent; mean age of the caregivers and care-recipients was 52.9 and 80.6 years, respectively. The caregivers described (in English or in Spanish) how their spiritual beliefs and practices have been important or meaningful in their role as a caregiver. Inductive thematic analyses conducted by a bilingual-bicultural coder (and confirmed via a secondary coder) yielded 6 thematic categories with 2-7 codes per category. Example categories and codes include: (a) Practices: pray, meditate, attend mass; (b) When Practiced: daily, at difficult caregiving times; (c) Beliefs: fate/God's desire, bible/God's teachings (honor thy parents); and (d) How Practice/Belief Helps Caregiver: provides inner strength/peace, helps caregiver manage the many day-to-day caregiving tasks, allows caregiver to vent, helps caregiver to forgive past resentments, provides caregiver hope for the future. Implications for further research and scale development will be discussed.

### DEMENTIA CAREGIVERS WHO REPORT CLOSER RELATIONSHIPS WITH CARE RECIPIENTS DISPLAY DECREASED EMOTIONAL WELL-BEING OVER TIME

E.B. Fauth[1], K. Piercy[1], M.C. Norton[1], K. Hess[1], A. Morrison[2], P. Rabins[2], C. Lyketsos[2], J. Tschanz[1], *1. Family, Consumer, and Human Development, Utah State University, Logan, Utah, 2. Johns Hopkins University, Baltimore, Maryland*

Recent research finds that higher care dyad closeness (as reported by the caregiver) predicts slower cognitive decline in the person with dementia (PWD). The current study examines whether physical and emotional outcomes for caregivers also change in relation to care dyad closeness. We would not expect that closer relationships necessarily protect caregivers. In fact, research suggests that cognitive impairment in the PWD is related to poorer emotional outcomes for the caregiver, which we suspect may be exacerbated in caregivers who are more emotionally attached to the PWD. The current analyses use longitudinal data from a representative sample of dementia caregivers residing in Cache County, Utah (N=247 caregivers assessed every 6 months for up to 6 years; 76.5% female, 56% with at least some college, 90% married). Mixed models tested whether baseline caregiver-reported dyad closeness (6-item scale, 6-24) predicted change in affect balance, the Beck Depression Inventory (BDI), and all eight SF-12 subscales (caregivers' physical and emotional well-being), adjusting for covariates of caregiver age, gender, education, and PWD dementia duration. On average, caregivers' scores on the BDI and the four physical health and one vitality SF-12 subscales did not change over time, nor were interactions present with caregiver closeness. For affect balance, and the mental, emotional, and social SF-12 subscales, there was no significant change over time for the whole sample, but significant interactions emerged with caregiver closeness, with closer caregivers reporting decreases in well-being over time. This study suggests that closer caregivers may need greater monitoring for changes in well-being.

## SESSION 1350 (PAPER)

## IMMIGRATION AND CAREGIVING

### RESOURCES PREPAREDNESS AND CAREGIVING SELF-RATING AMONG OLDER INFORMAL CAREGIVERS

S. Ahn[1], A. Hochhalter[2,1], M.L. Smith[1], J. Covin[3], A.B. Stevens[2,1], M. Ory[1], *1. Texas A&M University System Health Science Center School of Rural Public Health, College Station, Texas, 2. Scott & White Healthcare, Temple, Texas, 3. University of Mary Hardin-Baylor, Belton, Texas*

Background. Current research documents that having sufficient social support, financial preparedness, and satisfactory health status is associated with increased probability of being an informal family caregiver. The purpose of this study was to identify characteristics associated with being a family caregiver and one's self-rating of the quality of care provided in community-based sample of older Texans. Methods. Data were collected from 1,071 adults (≥ 60 years) responding to a statewide telephone survey of a random sample of Texas households in 2008. The survey was designed to evaluate aspects of successful aging. Study variables included: demographics; community and family support system; caregiving resources (financial, other preparedness); health resources; and caregiving duration. Logistic regression analyses were performed. Results. Respondents who had sufficient resources were more likely to provide informal care. Caregiving was more common among those who talked to family or friends on the phone daily (OR=1.78); were married (OR=1.61); and had better physical health (OR=1.71). However, caregiving was less common among those who were non-Hispanic white (OR=0.53) and well prepared for future financial needs (OR=0.60). High self-rated quality of care provided was associated with better physical health (OR=3.18); not having limitations in activities of daily living (ADL) (OR=2.5); and caregiving longer than 10 years (OR=3.96). Conclusions. Findings suggest that interventions to encourage preparing financially, maintaining strong support systems, and encouraging maintenance of optimal health may foster informal caregiving and more positive feelings about the care provided to loved ones.

### WE ARE THEM: MULTICULTURAL WORKERS AND FAMILIES CARING FOR A PERSON WITH DEMENTIA

D.L. Boughtwood[1,2], C. Shanley[2], J. Adams[1], Y. Santalucia[2], H. Kyriazopoulos[3], *1. University of Queensland, Sydney, New South Wales, Australia, 2. Aged Care Research Unit, Liverpool Hospital, Sydney, New South Wales, Australia, 3. Alzheimers Australia South Australia, Adelaide, South Australia, Australia*

‘We are them’ is an extract from an interview with an Arabic Multicultural Worker who was discussing the culturally appropriate services she provided in dementia day-care. In Australia, where this study was conducted, the term culturally and linguistically diverse (CALD) has been used since 1996 to refer to groups from backgrounds other than the majority Anglo culture. This study examined Arabic, Chinese, Italian and Spanish speaking family carers of people with dementia, living in South Western Sydney, which has a high proportion of people from CALD backgrounds. The specific aspect of the study discussed in the paper is qualitative interviews with multicultural aged care workers. These workers have an important role in assisting people with dementia and their families in accessing health and welfare services, yet despite their essential role, little research has focused on what workers actually do. The paper explores the roles of workers in individual family work, in supporting carers and in community education and engagement. These findings offer valuable evidence to inform policy and practice and further support the need for workers to receive ongoing training, supervision and support.

### PATIENTS’ RIGHT NOT TO KNOW: EXPLORING THE ATTITUDES OF OLDER IRANIAN IMMIGRANTS ABOUT MEDICAL DISCLOSURE OF TERMINAL ILLNESS

S.S. Martin, *social work, university of alabama, Tuscaloosa, Alabama*

Health care providers in America have legal and ethical responsibilities to disclose a diagnosis of terminal illness to their patient, no matter how painful the news may be to the patient. The literature reveals that the desire to know about terminal illness is not shared by all people. As noted by Brotzman and Butler (1991), “All cultures do not share Western views on the positive value of disclosure” (p. 426). Few studies have explored patients’ preferences for disclosure of unfavorable medical information. Despite the large number of older Iranian immigrants in the United States, little research has been conducted concerning the health of this population. Salari (2002) described older Middle Eastern immigrants as “invisible” in the aging literature. This study aimed to explore 1) the attitudes of older Iranian immigrants about disclosure of terminal illness by health care providers, 2) how attitudes about medical disclosure of terminal illness may influence the care seeking behaviors of older Iranian immigrants in the U.S.? Using a phenomenological methodology, in-depth, semi-structured interviews were conducted with 15 older Iranian immigrants. Data was analyzed using methodology developed by Colaizzi (1978). The major themes were: 1) preferences for delivery of bad news, 2) the right not to know, 3) treat me without scaring me to death, 4) strength of the heart (quvvat-I qalb). The participants’ desire to not know about terminal illness was demonstrated by their reluctance to seek preventive care as well as an equal reluctance to seek care when a serious illness was suspected.

## SESSION 1355 (SYMPOSIUM)

### INTERACTION SETTINGS IN INSTITUTIONS OF RESIDENTIAL CARE

Chair: *R. Rupprecht, Institute of Psychogerontology, Friedrich-Alexander-University of Erlangen-Nuremberg, Erlangen, Germany*
Co-Chair: *F. Oswald, Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University, Frankfurt, Germany*
Discussant: *H. Chaudhury, Department of Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

Residential care has been in the focus of gerontology for a long time and a great body of empirical research work shows the importance of the physical as well as the social environment for the residents quality of life in care settings. However, there are open questions concerning the complex role of interaction patterns between residents, relatives, staff, the physical setting and the administration. The aim of this symposium is to gather recent findings on interaction settings, conducted in institutions of residential care. We start with a paper by Doyle and deMedeiros presenting findings from an ethnographic study of social environments within a dementia care residence emphasizing the importance of friendly contacts among small group of residents. The second paper by Oswald et al. focuses on the role of processes of social interaction and everyday behavior in a combined resident and caregiver assessment of life quality. In the third paper Engel and Heyder will present a training program that attempts to improve the interaction of dementia care triads (patients, staff members and relatives) in long-term care facilities. Next, Rupprecht and Lang deal with aspects of organizational environment in nursing homes. Different models of administration are analyzed with reference to the satisfaction with quality of nursing care by residents, their relatives and staff members. Finally the study findings will be discussed by Chaudhury in the light of existing challenges in the field.

### NESTED SOCIAL GROUPS WITHIN THE SOCIAL ENVIRONMENT OF A DEMENTIA CARE ASSISTED LIVING

P.J. Doyle[2,1], K. de Medeiros[1,4], P. Saunders[3], A. Mosby[1], *1. The Copper Ridge Institute, Sykesville, Maryland, 2. Doctoral Gerontology Program, University of Maryland - Baltimore County, Baltimore, Maryland, 3. Department of Neurology, Georgetown University, Washington, District of Columbia, 4. Department of Psychiatry and Behavioral Sciences, Johns Hopkins University, Baltimore, Maryland*

The social environments of people with dementia are unique and complex. Research investigating how residents in a dementia care setting successfully/unsuccessfully navigate and participate within social groups is critical as the therapeutic benefit of social engagement is unequivocal. This paper will present findings from an ethnographic study of social environments within a dementia care residence. While previous literature has highlighted the importance of cognitive abilities in maintaining social relationships, this study found that there is active socialization between residents and even strong and lasting friendships formed. Interestingly, many of these friendships exist within small groups that are ‘nested’ within the larger social environment. These ‘nested social groups’ have unique social dynamics and are often influenced by outside forces (e.g., staff preferences). These groups and their composition have implications for the larger social environment and individual residents. The importance of nested social groups in this setting will be discussed.

### THE DEVELOPMENT OF A COMBINED RESIDENT AND CAREGIVER ASSESSMENT OF QUALITY OF LIFE IN INSTITUTIONAL SETTINGS: QUALITATIVE FINDINGS

F. Oswald[1], I. Himmelsbach[1], H. Wahl[2], C. Koniecny[2], C. Heusel[3], *1. Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany, 2. Institute of Psychology, Dept. of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany, 3. Paul Wilhelm von Keppler-Foundation, Sindelfingen, Germany*

The presentation is based on the development of a multidimensional quality of life assessment for people living in institutional settings, including both a semi-structured face-to-face interviews with the resident and a moderated group session addressing the resident from the caregivers' perspective. The assessment addresses 12 dimensions for life quality. The aim of this presentation is to analyze the content structure of each category in relation to processes of interaction. Currently, 634 assessments have been accomplished (78.2% women; 33.2% demented) in 21 nursing homes (mean duration: 3.9h), of which 250 have been analyzed qualitatively. Among other aspects, findings revealed that 5 out of 12 dimensions are particularly characterized by processes of social interaction and everyday behavior (e.g., spirituality, social relationships, meaningful activities, eating and drinking). The results contribute to a more complex understanding of life quality in institutional settings as well as to the important role of fit between the residents' and the caregivers' perspectives.

### EDUKATION TANDEM – AN INTERVENTION TO IMPROVE COOPERATIVE TRIADIC COMMUNICATION BETWEEN NURSING HOME STAFF, FAMILY MEMBERS AND DEMENTED RESIDENTS

S. Engel, M. Heyder, *Institute of Psychogerontology, Friedrich-Alexander-University of Erlangen-Nuremberg, Erlangen, Germany*

The authors report on a pilot study designed to develop a model program that attempts to improve the triadic interaction of dementia care triads in long-term care facilities. Data were collected from focus groups of nursing home staff and of family members of demented resident to understand the different adversarial positions leading to conflicts, stress and dissatisfaction. Addressing these results EduKation TANDEM was designed to improve the relationship between families and nursing and to enable dementia communication. EduKation TANDEM consists of eight 2-hour joint sessions for staff and family participants, to be conducted weekly. EduKation TANDEM was pilot tested in a nursing home and revised accordingly. To evaluate this program interviews with the participants were conducted and a communication observation instrument was developed and tested. The program and findings will be presented.

### MODELS OF NURSING HOME ADMINISTRATION: EFFECTS AND IMPLICATIONS ON SATISFACTION WITH CARE QUALITY

R. Rupprecht, F.R. Lang, *Institute of Psychogerontology, Friedrich-Alexander-University of Erlangen-Nuremberg, Erlangen, Germany*

It is not well understood, in what ways models of nursing home administrations have direct or indirect effects on the living conditions and life quality of the residents. In 2008 we have compared three prototypical administration models in a sample of 75 randomly selected nursing homes: (1) standard model (one nursing home administrator (NHA) and one director of nursing (DoN) are responsible for one nursing home), (2) alternative "A" (one NHA is responsible for more than one nursing home) and (3) alternative "B" (the NHA is also responsible for the tasks of the DoN). N=404 residents, N=468 nurses, N=417 relatives and N=140 NHDs respectively DoNs volunteered for the study. Assessing information from different perspectives of professionals, respondents and relatives allowed for improved understanding on the context-dependent effects of administrative nursing home models. Generally, standard models were adequate in larger units, whereas concatenated functions prove more adequate in small units.

## SESSION 1360 (SYMPOSIUM)

### INTRODUCING PROJECT TALENT: DEVELOPMENT OF A COMPREHENSIVE LONGITUDINAL DATABASE FOR STUDYING AGING

Chair: *S.J. Lapham, American Institutes for Research, Washington, District of Columbia*
Discussant: *R. Suzman, NIH/NIA, Bethesda, Maryland*

This symposium is specially designed to introduce Project TALENT (PT) to the GSA membership. PT is a large-scale longitudinal study of 440,000 people, and began in 196, when the participants were in high school. The American Institutes for Research (AIR), with support from the National Institute on Aging, is planning a 50-year follow-up study to measure early life influences on participants who are now in their mid-sixties. The base year survey collected information on hundreds of items measuring aptitude and ability, spatial visualization, personality and inventories, and a 394-item background questionnaire. Plans for data expansion include linkages to the National Death Index, Social Security Administration employment and disability records, and Veteran Administration military records. Plans for additional data collection include measures of cognition, saving and financial literacy, behavioral genetics, health and mortality. Dissemination and broad use of the data by the research community is a major goal and through presentations such as this, we plan to inform researchers about the study's aims, design, data content, and availability. This presentation also provides the Project TALENT team with the opportunity to hear from the research community as the study is being developed. Individual presentations will cover the following topics: 1) Overview of Project TALENT: Design, Data and Dissemination; 2) Designing Data Linkage Systems for Project TALENT; 3) Cognition in Later Life; and 4) Financial Literacy and Savings.

### OVERVIEW OF PROJECT TALENT

P.K. Peltola, *American Institutes for Research, Washington, District of Columbia*

This paper examines the scientific, public policy, and organizational background out of which Project TALENT emerged. It describes the evolution of the major parameters of the survey and the unique planning structure designed to ensure that the substantive insights of the research community were fully reflected in the content of the database; highlights key survey innovations contained in Project TALENT; and provides a preliminary assessment of the quality of the data as reflected by sample size, sample composition, response rates, and survey content. This paper also describes the types of administrative data that are expected to be added to Project TALENT: mortality and cause of death from the National Death Index and earnings and benefits data from the Social Security Administration.

### DESIGNING DATA LINKAGE SYSTEMS FOR PROJECT TALENT

C.B. McPhee, *AIR, Washington, District of Columbia*

Probabilistic linkage techniques make it feasible and efficient to link large databases in a statistically reliable manner. The problem addressed by the methodology is that of matching two files of individual data under conditions of uncertainty. This paper describes the process used to improve the linking algorithm for deaths and Project TALENT data to achieve a high matching rate. Mortality ascertainment is based primarily upon the results from a probabilistic match between the Social Security Administration's Death Master File (DMF), the National Death Index (NDI), and Project TALENT. Linkage of Project TALENT with the NDI provides the opportunity to conduct studies designed to investigate the association of early adulthood health factors with mortality, using the richness of the Project TALENT questionnaires.

## SESSION 1365 (PAPER)

## LIFE COURSE AND DEVELOPMENTAL CHANGE

### AGE EXACERBATES PHYSIOLOGICAL VULNERABILITY TO INCREASING NEGATIVE WORK-FAMILY SPILLOVER AMONG WOMEN

N. Dmitrieva[1], S.T. Charles[2], D. Almeida[1], *1. Human Development and Family Studies, The Pennsylvania State University, University Park, Pennsylvania, 2. University of California, Irvine, Irvine, California*

Strength and Vulnerability Integration (SAVI; Charles & Piazza, 2009) posits that although older age is linked to better skills in avoiding or minimizing exposure to negative emotions, age-related physiological vulnerabilities—defined by difficulties in returning to physiological homeostasis—will make regulating emotional experiences more difficult, particularly under conditions of persistent or inescapable chronic stressors. As a result, increasing conflict between family and work domains over time may produce a greater physiological toll in the later years. The current study assessed the extent to which age exacerbates the impact of increasing negative family-to-work spillover (NFWS) on endocrine system functioning—a primary system linking stressor exposure to physical health. Participants were a subsample of women from the National Study of Daily Experiences (N=376, mean age at Wave I: 41 years old, mean age at Wave II: 50 years old) who reported working for pay at least 20 hours/week and having at least one child living at home. Respondents reported NFWS at Waves I and II, and provided bedtime salivary cortisol samples for four consecutive evenings at Wave II. Taking control variables and Wave I NFWS into account, a greater longitudinal increase in NFWS over nine years was associated with higher bedtime cortisol level among older, but not younger women. Results suggest that heightened arousal produced by persisting NFWS may make it particularly challenging to disengage from stressful events at the end of the day for older working women with children, and underscore how age-related physiological vulnerabilities become amplified under conditions of chronic stressors.

### CHANGES IN ACTIVITY AND INTEREST IN THE THIRD AND FOURTH AGE: ASSOCIATIONS WITH HEALTH, FUNCTIONING AND DEPRESSIVE SYMPTOMS

K.B. Adams, A. Roberts, *Mandel School of Applied Social Sciences, Case Western Reserve University, Cleveland, Ohio*

This study examined changes in activity investment among older adults, differences in these changes between the Third Age (ages 64-79) and the Fourth Age (age 80 plus), and how these affect the association of health concerns with depression. Residents (N = 178) of six independent or assisted living facilities with an average age of 82.9 completed self-administered questionnaires including the Geriatric Depression Scale (GDS), health and functioning measures, and the Revised Change in Activity and Interest Index (CAII-R). The CAII-R measures older persons' perceived changes in interest level in social and leisure activities from ten years previous to the present day. We examined three relevant subscales: Active Instrumental, Active Social, and Passive Social Spiritual. Mean subscale scores indicated overall more disengagement from Active Instrumental and Active Social activities and more engagement in Passive Social Spiritual activities. Fourth Age adults reported greater reductions in Active Instrumental activities than Third Age adults, suggesting there may be a normative reduction in these activities over time. Reduced investment in Active Social activities had the strongest direct association with depression and appeared to increase the association of health concerns with depression. The study provides evidence of distinct differences in activity investment within the parameters of normal aging and suggests that some changes may be more adaptive than others. The activity categories identified and their associations with depression may guide health and mental health providers in selecting the focus of intervention for older clients according to their life stage.

### TRANSITIONING ACROSS THE LIFESPAN WITH TOURETTE SYNDROME

L.E. Cox[1], M.C. Fulcomer[2], M.M. Sass[3], *1. School of Social & Behavioral Sciences, The Richard Stockton College of New Jersey, Pomona, New Jersey, 2. University of Medicine and Dentistry of New Jersey, Piscataway, New Jersey, 3. University of Medicine and Dentistry of New Jersey, Piscataway, New Jersey*

Information on what happens to people with Tourette Syndrome (TS) as they age across the lifespan is nearly non-existent. Researchers have not adequately studied how tics and psychosocial stressors change with age. This research elucidates how older TS persons, from a community sample, described their experiences and adaptive abilities. Data were collected via structured interviews, visual analogue scales, YGTSS, QOL, Hope, Gratitude and Creativity scales. Descriptive statistics from a first stage analysis of 19 of the 31 study participants revealed that study participants ages ranged from 28-77 (median age of 56) and their co-morbidities included ADHD (42%), OCD (73%), and anxiety (37%). Participant's symptom severity levels ranged from mild (n=8) and moderate (n=8) to severe (n=3). Unlike previous studies that have reported that tics diminish with age, 79% of this study's preliminary sample analysis reported that they still found their TS to be annoying. Also unlike previous research mostly deficit focused and on clinic samples of the severest sort, this study theorizes that while TS symptoms and co-morbidities might still trouble TS persons, many have learned to successfully adapt by creatively hiding their TS. Therefore, after attending this presentation, participants will be encouraged to consider an asset model wherein the condition of TS may confer advantages as well as symptoms to its population over the life course. The reported experiences of the current older TS persons in this study may be applied to others who must also cope with similarly challenging and stigmatizing late-life disabilities or conditions.

### IS THERE A LINK BETWEEN PARENTAL DIVORCE DURING CHILDHOOD AND STROKE IN ADULTHOOD?: FINDINGS FROM A POPULATION BASED SURVEY

E. Fuller-Thomson, A.D. Dalton, R. Mehta, *Faculty of Social Work, University of Toronto, Toronto, Ontario, Canada*

Few studies have focused on the association between adverse childhood experiences and stroke in adulthood while controlling for age, gender, race and a wide number of known risk factors. This study examined the parental divorce-stroke association. Data from the provinces of Manitoba and Saskatchewan were selected from the 2005 Canadian Community Health Survey (n=13,093). The regional level response rate was 84%. Respondents with missing data on either the parental divorce question or the stroke question were excluded from the analysis, resulting in a final sample of 13,066. During their childhood, 10.4% of these respondents (n=1,361) had experienced parental divorce. Of the 13,066 respondents, 1.9% (n=248) reported that they had been diagnosed with a stroke at some point in their life. When adjusting for age, race and gender, the odds of stroke were much higher (OR=2.30, 95% CI=1.45, 3.65) for those who had experienced parental divorce. When other risk factors including socioeconomic status (education, household income), health behaviors (obesity, smoking status, alcohol consumption, inactivity), mental health (history of mood disorders, anxiety disorders, self-reported stress) and other adverse childhood experiences (parental abuse, parental addictions, long-term parental unemployment) were controlled in the logistic regression analysis, the odds ratio of stroke for those who had experienced parental divorce remained significantly elevated (OR=2.63, 95% CI=1.56, 4.43). Further research is needed to investigate the "biological embedding" of adverse childhood experiences and other potential pathways through which parental divorce and stroke may be linked.

## SESSION 1370 (SYMPOSIUM)

### PARTNERS IN DEMENTIA CARE: DESCRIPTION AND RESULTS OF A CARE COORDINATION INTERVENTION FOR INDIVIDUALS WITH DEMENTIA AND THEIR INFORMAL CAREGIVERS

Chair: *K. Judge, Department of Psychology, Cleveland State University, Cleveland, Ohio, The Margaret Blenkner Research Institute, Benjamin Rose Institute, Cleveland, Ohio*
Discussant: *M.E. Kunik, Houston Center for Quality of Care & Utilization Studies, Health Services Research and Development Service, Houston, Texas*

Dementia affects the entire family unit and negatively impacts multiple domains including physical health, emotional health, social relationships, and legal and financial issues. Particularly challenging is the provision of services and programs that address the diverse care needs of both care partners. This symposium describes an innovative Care Coordination intervention, Partners in Dementia Care (PDC) that was delivered to 508 caregiving families, where the individual with dementia was a veteran receiving primary care from the VA healthcare system. PDC is a telephone-based coaching intervention that is consistent with components of the Chronic Care Model and assists families by: 1) providing disease-related education and information; 2) offering emotional support and coaching; 3) linking families to medical and non-medical services and resources; and 4) mobilizing and organizing the informal care network. Distinguishing features of PDC include: 1) a formal partnership between a VA medical center and a local Alzheimer's Association Chapter; 2) a comprehensive assessment and treatment protocol; and 3) a shared computerized record for tracking and documenting intervention use. Paper presentations will: 1) describe the PDC intervention and present findings about the assessment and treatment components of PDC; 2) discuss and present data regarding recruitment and retention, sample attrition, and inclusion/exclusion criteria for the sample; 3) present caregiver data collected at baseline that examined caregiver characteristics and predictors of caregiving outcomes at T1; and 4) present and discuss 6-month outcome data for caregivers that examined the impact of PDC on Unmet Needs, Care-Related Strains, and Depression.

### IDENTIFICATION OF PERSONS WITH DEMENTIA IN PRIMARY CARE, A JOINT EFFORT OF PHYSICIANS, CLINICAL TEAMS, AND RESEARCHERS: PARTNERS IN DEMENTIA CARE RECRUITMENT AND RETENTION EFFORTS

A. Snow[1], E. Archambault[2], J. Moye[2], B. Murry[5], G. Odenheimer[3], P. Pirraglia[4], T. Teasdale[3], *1. Cntr for Mental Health & Aging/Psychology, University of Alabama/Tuscaloosa VAMC, Tuscaloosa, Alabama, 2. VA Boston, Brockton, Massachusetts, 3. Oklahoma City VA Medical Center, Oklahoma City, Oklahoma, 4. Providence VA Medical Center, Providence, Rhode Island, 5. Michael E. DeBakey VA Medical Center, Houston, Texas*

Successful recruitment for the Partners in Dementia Care (PDC) trial rested upon a foundation of successful identification of persons with dementia in the VA primary care clinics that served as the study sites. This was a significant task, given that 24-72% of cases go undiagnosed by primary care physicians, with a 4-year delay in dementia diagnosis after the onset of symptoms (Leifer, 2003; Bradford et al., 2009). Strategies to improve identification included education sessions for physicians and clinical teams to discuss the need for identification and provide multiple identification strategies and tools. A second recruitment strategy was case finding through computerized search of VA patient databases for dementia diagnoses as well as acetylcholinesterase inhibitor prescriptions. Relationship building between research staff and PDC participants was key to recruitment and retention success. Clinical implications for implementation of PDC and similar primary care interventions for dementia care will be discussed.

### UNDERSTANDING THE SCOPE OF NEEDS AND ACTIONS IN THE PARTNERS IN DEMENTIA CARE INTERVENTION

N.L. Wilson[1], K. Judge[2], *1. Huffington Center on Aging, Baylor College of Medicine, Houston, Texas, 2. Department of Psychology, Cleveland State University, Cleveland, Ohio*

The PDC intervention encompassed two individuals collaborating by telephone and a computerized information system across two different locations and care systems (VA and AA). Using structured protocols and tools care coordinators assessed needs of veterans and primary caregivers to develop, monitor, and refine care plans and action steps. Care coordinators addressed needs through providing education; offering emotional support and coaching; linking families to services and resources; and mobilizing informal care. This presentation presents findings of an analysis of the computerized intervention records of 93 veterans and their caregivers after 12 months of participation in PDC. Caregiving spouses were most typically involved in completing action steps and participants were contacted an average of twice monthly by PDC coordinators. Addressing the diverse medical and non-medical needs required use of VA resources as well as services from the AA chapters and the broader community. Implications for further refinement and replication will be discussed.

### PREVALENCE AND PREDICTORS OF DEPRESSION AND CARE-RELATED STRAIN AMONG CAREGIVERS OF PATIENTS WITH DEMENTIA

K. Judge[1,2], D. Bass[2], *1. Department of Psychology, Cleveland State University, Cleveland, Ohio, 2. Margaret Blenkner Research Institute, Benjamin Rose Institute, Cleveland, Ohio*

This paper presents findings from baseline interviews completed with 486 caregivers who participated in PDC that examined characteristics related to negative caregiver outcomes across twelve diverse outcomes: Caregiver Depression, five Care-Related Strains, and six categories of Unmet Needs. Overall, data suggest some but not all caregivers in PDC experienced negative outcomes. Specifically, one-half of caregivers had clinically significant symptoms of depression and one-third were at high risk on at least one care-related strain, with Emotional Strain and Social Isolation most common. Nearly two-thirds were high risk on at least one category of unmet need, with VA Benefits, Service Access, and Understanding Memory Problems most common. The strongest predictors of variation in outcomes included characteristics of the Caregiving Context and Veteran Impairments. These findings highlight the need for supportive interventions that specifically target negative caregiver outcomes and revealed important disparities in care for minority veterans and their caregivers.

### OUTCOMES FOR CAREGIVERS AFTER SIX-MONTHS IN PARTNERS IN DEMENTIA CARE

D.M. Bass[1], W.J. Looman[1], C. McCarthy[1], A. Walder[2], R.O. Morgan[3], *1. Margaret Blenkner Research Institute, Benjamin Rose Institute, Cleveland, Ohio, 2. Michael E. DeBakey Veterans Medical Center, Houston, Texas, 3. University of Texas School of Public Health, Houston, Texas*

A variety of psycho-social outcomes were examined after six months of enrollment in "Partners in Dementia Care" (PDC) for 400 family caregivers of veterans with diagnosed dementia. Outcomes included caregiver depression, five types of care-related strain, and six categories of unmet needs. Multiple regression analyses were used to test for intervention effects after controlling for any baseline differences. Five of the six categories of unmet needs were significantly reduced after six months in PDC. The strongest benefits were for unmet needs related to understanding memory problems and accessing services. For caregivers with more unmet needs at baseline, improvements also were found for managing care tasks, managing medications, and legal-financial issues. Fewer significant differences were found for caregiver depression and care-related strains. Results indicated that after six months the PDC intervention was effective in meeting a variety of dementia-related care needs.

## SESSION 1375 (SYMPOSIUM)

### PERSONALITY AND HEALTH RESEARCH IN ADULTHOOD AND OLD AGE

Chair: *H. King, The Pennsylvania State University, University Park, Pennsylvania*
Discussant: *I.C. Siegler, Duke University, Durham, North Carolina*

Psychological research has long been interested in the links between personality and health. The purpose of this symposium is to highlight recent directions and advances. Staudinger examines positive personality development in later life and demonstrates the importance of distinguishing between the goals of adjustment and growth. Choun, Mejia, Pham, Metoyer, and Hooker investigate how personality traits, specifically neuroticism and conscientiousness, as well as state positive affect are related to daily health goal progress. Turiano, Spiro, and Mroczek identify three facets of conscientiousness: carelessness, responsibility, and orderliness; only increases in orderliness are associated with a reduction in mortality risk. King, Almeida, Mroczek, Gerstorf, Turiano, and Stawski show that higher neuroticism is associated with more within-person variation in and higher levels of salivary waking cortisol, particularly in old age. Finally, Sliwinski, Smyth, Stawski, and Mogle demonstrate that unconstructive repetitive thought connects daily stressors and aspects of personality such as neuroticism to a variety of health-related outcomes. This set of presentations is diverse, incorporating several features of personality such as various traits, states, facets, and personality change as well as multiple indicators of physiological functioning, health, and well-being from daily biomarkers and health goal progress to mortality. In addition, the various methods employed in the studies (e.g., longitudinal, daily diary, measurement-burst, experience sampling, and internet-based designs) illustrate the possibilities and versatility of examination of the links between personality and health. The discussant, Ilene Siegler, integrates the studies and comments on the future of personality and health research in adulthood and old age.

### PERSONALITY DEVELOPMENT IN ADULTHOOD AND OLD AGE: ADJUSTMENT AND/OR GROWTH?

U.M. Staudinger, *Jacobs Center, Jacobs University Bremen, Bremen, Germany*

Does personality stay stable after young adulthood or is there continued change throughout middle and later adulthood? For decades, this question caused heated debate. Over the last couple of years, a consensus has emerged based on recent cross-cultural as well as longitudinal evidence. This consensus confirms that indeed there is personality change in middle and later adulthood. Many authors have labeled this change, personality maturation or growth. Growth and maturity are clear development goals, when we speak of biological development at the beginning of life. When it comes to the development of personality characteristics in later stages of life, however, many different goals can be observed. In this vein, two goals of positive personality development are distinguished and defined, adjustment and growth, and empirical findings are presented to support the distinction. A lack of differentiation between these two phenomena may severely hamper the development of further related insights.

### THE EFFECT OF TRAITS AND STATES IN PREDICTING HEALTH GOAL PROGRESS

S. Choun[1], S. Mejia[1], T. Pham[2], R. Metoyer[2], K. Hooker[1], *1. Human Development and Family Sciences, Oregon State University, Corvallis, Oregon, 2. School of Electrical Engineering and Computer Science, Oregon State University, Corvallis, Oregon*

We examined how daily health goal progress can be predicted by personality traits and positive affect. Our analysis utilized data collected from the Personal Understanding of Life and Social Experiences (PULSE) Project, a 100 day internet-based study of Oregonians over the age of 50. Health goal progress was self-reported daily by participants. Data visualization techniques were used to encourage compliance with the daily measurement design. With specific interest in neuroticism and conscientiousness, which are acknowledged to predict longevity, disease progression, and mortality, we used the NEO-FFI at Time1 to measure personality traits. Positive affect was measured using the Affect Scale. Multivariate latent growth curve modeling was used to test dynamic processes of intraindividual and interindividual changes over time in health goal progression and positive affect by integrating neuroticism and conscientiousness as predictors in the longitudinal model. Results will be discussed within the comprehensive framework of the six-foci model of personality.

### FACETS OF CONSCIENTIOUSNESS AS PREDICTORS OF MORTALITY

N.A. Turiano[1,2], A. Spiro[3,4], D. Mroczek[1,2], *1. Child Development & Family Studies, Purdue University, West Lafayette, Indiana, 2. Center on Aging and the Life Course, West Lafayette, Indiana, 3. Normative Aging Study, VA Boston Healthcare System, Boston, Massachusetts, 4. Boston University School of Public Health, Boston, Massachusetts*

Conscientiousness is a significant predictor of health behaviors and health outcomes, including mortality. We sought to identify specific facets of conscientiousness that might predict mortality. The current investigation utilizes data from the VA Normative Aging Study that includes 20 Conscientiousness adjectives of the Goldberg Unipolar markers of the Big Five. In 1990-91, 1,349 men (mean age =64.9) completed the personality measure and were followed until 2008 (mean survival =15.47 years), during which 547 deaths occurred. We used principal axes extraction with oblimin rotation to identify 3 facets of conscientiousness: Carelessness (inefficient, negligent), Responsibility (systematic, thorough), and Orderliness (conscientiousness, careful). Proportional hazards modeling examined the 18-year mortality risk for each facet. Controlling for age, education, and smoking status, only the Orderliness facet predicted mortality risk. A 1-unit increase in Orderliness was associated with a 7% reduction in mortality risk. Results suggest specific facets of conscientiousness may be protective for mortality risk.

### NEUROTICISM, AGE, AND DAILY SALIVARY CORTISOL

H. King[1], D. Almeida[1], D. Mroczek[2], D. Gerstorf[1], N.A. Turiano[2], R.S. Stawski[1], *1. The Pennsylvania State University, University Park, Pennsylvania, 2. Purdue University, West Lafayette, Indiana*

Personality research has long been interested in how personality features are interrelated with aspects of health; however, the role of neuroticism in the functioning of the hypothalamic-pituitary-adrenal axis is less well understood. We investigated links between neuroticism and salivary cortisol in 2,022 participants (mean age = 56 years, range = 33 – 84; 57% women) of the second wave of the National Study of Daily Experiences (part of MIDUS). Respondents completed 8 consecutive daily telephone interviews and provided 4 saliva samples per day on 4 days. Multilevel models indicated that higher neuroticism was associated with greater day-to-day fluctuations in and higher levels of waking cortisol. Analyses also revealed age interaction effects with older participants high in neuroticism experiencing the highest waking cortisol. The results are discussed within the context of stress and suggest a link between neuroticism and hyperactivity of the HPA axis, particularly in old age, perhaps due to kindling.

### UNCONSTRUCTIVE REPETITIVE THOUGHT AS A COMMON PATHWAY LINKING STRESS AND HEALTH

M. Sliwinski[1], J. Smyth[2], R.S. Stawski[1], J. Mogle[1,2], *1. Pennsylvania State University, University Park, Pennsylvania, 2. Syracuse University, Syracuse, New York*

Unconstructive repetitive thought (URT) consists of repeated and attentive thinking about problematic situations or events and encompasses a wide range of related concepts, such as worry, rumination and preservative cognition. We hypothesize that URT operates as a final common pathway that links environmental influences (e.g., daily stressors) and personality characteristics (e.g., neuroticism) to adverse age-related cognitive, physical and mental health conditions. We describe findings from several studies of health and aging, including measurement-burst and experience sampling designs. Across these studies our findings point to URT as a mediator stress effects on a wide range of outcomes, including cognition, metabolic risk, sleep quality, and hypothalamic-pituitary-adrenal activity. Results from an experience sampling study suggest that URT functions to amplify and prolong negative emotional responses to stressful events. We discuss these findings in light of theories of stress and aging.

## SESSION 1380 (SYMPOSIUM)

### SHIFTING AGING’S PARADIGM TO HEALTH AND WELLNESS: THE CREATIVE GENIUS AND LEGACY OF GENE D. COHEN

Chair: *T.A. Abramson, New York Institute of Technology, New York City, New York*

This symposium honors the life work of Gene D. Cohen, MD PhD, a founder of geriatric psychiatry and researcher who broke new ground producing seminal work documenting the health benefits of creativity in later life. The session explores the importance of Dr. Cohen’s work in shaping new research and policy agendas and protocols for service delivery in aging services and in the humanities and arts. Dr. Cohen’s research investigated the assets and potential of the mature mind in gaining mastery through immersion in creative activities, thereby improving health and well-being. His research abandoned the prevailing paradigms centered on decline and decrement and uncovered the strengths and satisfaction elders’ derived from creative engagement. Consequently, new avenues were opened for practitioners in the design of health promotion and disease prevention programs focused on creative and artistic expression. In terms of policy, his research provides an evidence base for public funding of services that bridge the aging services and arts community and are less costly and more empowering for older people. As such, it supports a new level of workforce development by fostering health and social services and arts and humanities collaboration designed to extend person-centered care. This session will be used to set the stage for the announcement of the first NCCA/GSA Gene D. Cohen Research Award for Creativity in Aging. The award winner will deliver remarks on his or her work in this area of endeavor and personal experience of the elders’ benefits from creative engagement in later life.

### VISIONARY INVESTIGATOR AND ADVOCATE: GENE D. COHEN

S. Perlstein, *National Center for Creative Aging, Washington, District of Columbia*

Gene D. Cohen, M.D., Ph D., a visionary leader in the field of aging and a rare human being that embraced both the ability to conduct outstanding research and advocate effectively and influence public opinion and policy. Not long ago, aging was seen as a time of disease. Today, greatly due to Dr. Cohen’s extraordinary work, we understand the potential of aging and have begun to create structures to change the way Americans see themselves growing older. My presentation will illuminate his achievements with examples from my professional experience working with Dr. Cohen. I was the Research Project Director for the New York City component of the landmark “Creativity and Aging Study.” Dr. Cohen served as a member of the NCCA Board of Directors and invited the NCCA to Washington, DC in order to put practice, research and policy under one roof.

### IMPACT OF AGING PARADIGM CHANGES ON PRACTICE

A. Basting, *University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

This presentation will translate Dr. Cohen’s research in terms of its growing impact on new practice developments. Dr. Basting will explore his work particularly in the area of practice serving people with dementia and memory loss. Dr. Cohen conducted extensive research and developed practices that profoundly improved the quality of life for people with these conditions. Combined with Dr. Basting’s research and practice, Dr. Cohen’s legacy has contributed to new models building upon imagination and brain reserve to encourage confidence and increase communication. Dr. Basting will focus on model programs used in Dr. Cohen’s studies as well to illustrate the ability of these centers of excellence to raise the standards of care thereby increasing the quality of life experience founded in promoting creativity as vital to healthy aging. These practices challenge the mind with engaging and meaningful activities that are authentic contributions to self and community worth.

### CONTRIBUTIONS TO THE EVIDENCE BASE FOR BENEFITS OF ARTS PARTICIPATION

L. Noelker, *Benjamin Rose Institute, Cleveland, Ohio*

This presentation features Dr. Cohen’s research contributions to the evidence base regarding the health and well-being benefits of older adults’ participation in professionally-led creative and performing arts programs. It also reports on a meta-analysis of the research literature in this area that identified 11 empirical studies meeting the inclusion and exclusion criteria. These studies’ findings are presented; the conclusion reached is these programs appear to have a significant impact on delineated health outcomes, however, the scant body of literature and design limitations preclude wide generalizations. The results are used to frame the agenda for future research in this area and to advocate for closer connections between the aging network and the arts community.

### THE ADVOCACY AND POLICY AGENDA: FURTHERING DR.COHEN’S WORK

R. Blancato, *Matz, Shea & Blancato, Washington, District of Columbia*

This presentation will explore the implication of Dr. Cohen’s research on policy development. Mr. Blancato will re-display Dr. Cohen’s research in relationship to healthcare reform. He will discuss the potential for it impact related to the re-authorization of the Administration on Aging in terms of shifting the paradigm of aging services to person center care encouraging independence through community based strategies to engage older adults in meaningful cultural activities in the humanities and the arts. He will correlate the potential costs saving of these high quality low costs programs with reducing the risk of long term care.

## SESSION 1385 (POSTER)

### SOCIAL NETWORKS AND SUPPORT

### OLDER ADULTS’ MARITAL STATUS AND SOCIAL NETWORKS

H. Kang, *HDFS, Texas Tech University, Lubbock, Texas*

This study examined the relationships between social networks and marital status of older adults. Social networks include quantity and quality of relationships with family, friends, and religious networks in the current study. Data from the National Social Life, Health, and Aging Project (NSHAP) survey (Waite et al., 2007) were used. The NSHAP study sampled persons 57-85 years of age (n=3005). The respondents completed a telephone survey in which they reported their background information (e.g., income, gender, race, age, health, retirement status, and marital status) and social network characteristics. It was hypothesized that older adults' marital status differentially influenced their social networks' size and quality. In comparison to married older adults, divorced or never married older adults had more trouble (smaller and lower quality) social networks. In order to identify the associations between marital status and social networks, multiple regression analysis was used. This study's findings will build on an ambivalence theory to account for how divorced and life-long single older adults associate with their family, friends, and religious networks.

## DAILY SOCIAL EXCHANGES AND AFFECT IN MIDDLE AND LATER ADULTHOOD: THE IMPACT OF LONELINESS AND AGE

A. Russell, C.S. Bergeman, *Psychology, University of Notre Dame, Notre Dame, Indiana*

Are lonely individuals more profoundly affected by characteristics of their daily social exchanges? The present study assesses a community sample of adults ranging in age from 31 to 91, and specifically explores whether loneliness moderates the relationship between daily affect and a) daily social exchange exposure and b) daily social exchange appraisal. Results suggest that there are differences between social events involving family and friends, and that lonely individuals may be more affected by positive events than less lonely adults. Moreover, results suggest that older adults' affect is more independent of both positive and negative social events when compared with middle-aged adults. Results are interpreted with regard to the importance of daily social exchanges, daily social stress vulnerability, and the influences of loneliness across middle and later adulthood.

## RECIPROCAL RELATIONSHIP BETWEEN SOCIAL SUPPORT AND PSYCHOLOGICAL DISTRESS IN OLDER ADULTS

A. Robitaille[1], H. Orpana[1], C.N. McIntosh[2], *1. University of Ottawa, Ottawa, Ontario, Canada, 2. Independent Statistical Consultant, Ottawa, Ontario, Canada*

The current study investigated the longitudinal relationship between the different dimensions of social support and psychological distress using an autoregressive cross-lagged model for fives waves of data. A total of five models were tested to investigate the various dimensions of social support (affectionate support, tangible support, positive social interaction, emotional/informational support, and structural support). Data from 2564 older adults who participated in a multiwave national survey were included in the analyses. Support for the reciprocal relationship between affectionate support and distress with higher distress being associated with higher affectionate support and higher support being related with higher distress two years later was found. Higher distress was related with subsequently higher levels of positive social interaction but little support was found for the role of support on distress two years later. Higher psychological distress was significantly related with subsequently higher emotional/informational support. No support was found for a reciprocal relationship between tangible and structural support and psychological distress. This study is among the first to demonstrate that different results can be found for the long-term relationship between social support and psychological distress depending on the type of support being studied. It would appear that psychological distress in the general population of older adults may be important in predicting levels of social support two years later. Implications of findings and future research needs are discussed.

## THE ASSOCIATIONS BETWEEN MARITAL STATUS, SOCIAL SUPPORT AND WELLBEING

L.K. Soulsby, K.M. Bennett, *University of Liverpool, Liverpool, Merseyside, United Kingdom*

The physical and mental health benefits of marriage are well documented in the literature, and there is a large body of research suggesting that being married has a positive impact on psychological wellbeing compared to being divorced, widowed or single. In addition, married individuals typically have more social and emotional support compared to their unmarried counterparts, and a link has been made between higher levels of social support and better health. The poster presents findings from a questionnaire study investigating the relationships between marital status, perceived social support, and psychological wellbeing. Measures included the General Health Questionnaire (GHQ-12), Center for Epidemiologic Studies Depression Scale (CES-D), and the Medical Outcome Study (MOS) Social Support Instrument. Men and women across a broad range of ages, marital status and social backgrounds were surveyed (n=510). Mediation analyses were performed in SPSS using techniques outlined by Preacher and Hayes (2008). Results suggest that perceived social support acts a mediator in the relationship between marital status and psychological wellbeing. Put another way, the results showed that compared to being married, being widowed, divorced or single significantly affects psychological wellbeing through its effect on perceived social support. Being widowed, divorced or single predicted lower levels of psychological distress, through lower levels of perceived social support. Gender was not found to be a significant predictor. The findings have important implications for the provision of support to widowed, divorced and single marital status groups.

## THE ROLE THAT COMPANION ANIMALS PLAY IN SOCIAL SUPPORT IN LATER LIFE

M.P. Meehan, A. Ueda, B. Massavelli, N.A. Pachana, *School of Psychology, The University of QLD, Brisbane, Queensland, Australia*

Animals play an important role in providing social support to older adults in a variety of settings. Relationships between animal companions and mood, social interaction, loneliness, perceived quality of life, and agitation associated with dementia are reported in the literature. However, measuring such relationships has proven problematic, and many measures used in such research have not demonstrated strong psychometric properties. Studies with student and older community samples investigated the psychometric properties of new scales of perceived social support and pet attachment, as well as the relationship between companion animals, attachment and attachment hierarchy, and perceived emotional social support. 161 university student pet owners completed an adapted measure of perceived social support and a pet attachment scale with items derived from attachment theory. Results showed pets are perceived as a unique source of emotional social support and the perceived social support scale showed good reliability ($\alpha = .97$) as did the new pet attachment scale ($\alpha = .96$). Pets were included in a person's attachment hierarchy and ranked higher than siblings but lower than romantic partners, parents and close friends. In a second study, 167 community dwelling older adults completed the measures of perceived social support and pet attachment; 60% of participants cited pets as a key source of emotional support, with 20% ranking their pets as the most important source of such support. These findings speak to the power of the human-animal bond, which may be just as critical for the well-being of older people as the human-human bond.

## TREMOR AND REDUCED FACIAL EXPRESSIVITY IN PARKINSON'S DISEASE STIGMATIZE MEN AND WOMEN DIFFERENTLY

A. Hemmesch[1], L. Tickle-Degnen[2], L.A. Zebrowitz[1], *1. Psychology, Brandeis University, Waltham, Massachusetts, 2. Tufts University, Medford, Massachusetts*

Many individuals with Parkinson's disease (PD) report difficulties with their social relationships after diagnosis, which may be related to the stigmatizing appearance of PD symptoms. This study investigated the effects of tremor and facial masking on older adults' interest in getting to know individuals with PD, and how gender may moderate these effects, since physical competence is valued in more men and social competence is valued more in women. Thirty-one older adult observers viewed thin-slice videotapes of 24 individuals (12 women) with PD who varied in tremor and facial masking. Results showed that observers were more positive toward individuals who had lower facial masking than higher facial masking, F(1, 30) = 37.89, $p < .01$. The negative effect of high masking was stronger when greater tremor was present, F(1, 30) = 5.00, $p < .05$, but this was qualified by a three-way interaction, F(1, 30) = 6.36, $p < .05$. The tendency for tremor to increase the negative response to high masking was significant for men, but not for women. The fact that physical disability exacerbated the stigma of facial masking for men, but not for women, is consistent with the greater social value placed on physical competence in men. This research demonstrates that the presence of PD symptoms can have stigmatizing effects on social relationships across the lifespan as it may violate expectations regarding gender norms.

### FINANCIAL STRESS, NEIGHBORHOOD QUALITY, AND WELL-BEING: MEDIATIONAL AND MODERATIONAL MODELS

A.E. Kapp[1], M.A. Montpetit[1], C.S. Bergeman[2], *1. Illinois Wesleyan University, Bloomington, Illinois, 2. University of Notre Dame, Notre Dame, Indiana*

This study explores how aspects of the community environment might facilitate the stress-and-coping process – specifically, the protective effects of social integration and high quality neighborhoods on psychological well-being. Previous research suggests that low levels of financial stress, positive neighborhood quality, and social integration are each associated with greater levels of well-being; few studies, however, investigate these contextual variables in conjunction with one another. Data from the Notre Dame Study of Health and Well-Being were used to investigate whether (1) neighborhood quality moderates the relationship between financial stress and psychological well-being and (2) social integration mediates the relationship between neighborhood quality and psychological well-being. Although the results did not support the moderational hypothesis, *post hoc* analysis did indicate that neighborhood quality mediates the financial stress → psychological well-being relationship. Data supported hypothesis 2. From an ecological systems perspective, these results suggest that proximal contextual variables such as social integration and neighborhood quality can buffer individuals' psychological well-being from the negative effects of less proximal contextual variables, such as economic conditions.

### CHILDHOOD SOCIAL ACTIVITY PREDICTS PARTICIPATION IN GROUP ACTIVITIES AND VOLUNTARY WORK IN LATER LIFE

H. Hietanen[1], S. Read[2], T. Lyyra[1], *1. Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland, 2. London School of Hygiene and Tropical Medicine, London, United Kingdom*

Background and objective: Even though previous research has revealed many factors related to social engagement, less is known how lifetime factors predict engagement later in life. The purpose of this study was to assess how social activity in childhood predicts participation in group activities and volun-tary work in later life with a follow-up time of 35 years. Material and methods: The data was derived from a longitudinal the National Child Development Study (NCDS), seeking to follow the lives of 17 500 persons born in March 1958 in England, Scotland and Wales. Subjects of this study consisted of 3519 men and 3666 women who were followed from the age of 11 to the age of 46-47 years. Frequency of participating in clubs outside school was asked from the participants at the age of 11 and participation in different group activities and voluntary work at the age of 46-47. Results: Logistic regression analysis showed that participating in clubs outside school in childhood predicted social engagement in later life. Those women who often had participated in clubs in the age of 11 were over one and a half times more likely to attend in group activities in later life (OR 1.57; 95% CI 1.34, 1.84) compared to those who hardly ever participated. In men the association was slightly weaker (OR 1.36; 95% CI 1.15, 1.60). The corresponding figures for voluntary work participation were in women (OR 1.34; 95% CI 1.06,1.70) and in men (OR 1.47; 95% CI 1.12, 1.94). The models were con-trolled for middle age self-rated health, and personal assessments of financial situation and control of life as well as childhood socioeconomics, depressiveness and cognitive ability. Conclusion: This study shows that social activity in childhood is likely to have long-term effects on social engagement in later life.

### VARIETIES OF SPOUSAL AGREEMENT ABOUT EMOTIONAL AND INSTRUMENTAL SUPPORT

E.Y. Sakai, B. Carpenter, *Psychology, Washington University, Clayton, Missouri*

Social support is an important component of late-life marriage, as couples face new challenges such as retirement, illness, and loss. In this study we examined agreement about social support in 68 married couples. We identified three types of agreement between spouses based on perceptions of emotional and instrumental support: consensus (the difference between the support one spouse reported receiving and the other reported giving), reciprocity (the difference between the support a spouse reported having received and given), and equity (the difference between support each spouse reported they had given, or had received). Discrepancies in consensus, reciprocity, and equity were more common in reports of instrumental than emotional support. Husbands reported receiving more instrumental support than they gave ($t = 6.667$, $p < .001$), and more than their wives reported receiving ($t = 3.166$, $p = .002$). Wives' responses were consistent with their husbands', reporting that they received less instrumental support than what husbands said they received ($t = -3.946$, $p < .001$). Although there are different ways to measure agreement about social support, across methods, spouses are more likely to disagree about instrumental than emotional support exchanges. Agreement should be better regarding relatively observable activities, yet the discrepancies identified in this study suggest real differences in perspectives that could influence marital adjustment.

### THE ROLE OF SIMILARITY, PERSONALITY, AND ATTRACTIVENESS IN SAME-SEX AND CROSS-SEX FRIENDSHIP FORMATION

A.H. Coats, M. Owen, S. Daroga, M.E. Miller, K. Sorceneau, *Department of Psychology, Westminster College, Fulton, Missouri*

Past studies suggest that maintenance of friendship ties is important for achieving life satisfaction in late adulthood. When older adults move to new communities or have friends pass away, they may choose to initiate new friendships. Platonic friendships with adults of the opposite sex can provide important emotional support, especially for older men, whose available new friends are likely to be women. Further research is needed to explore factors related to friendship formation in young and older adults of both sexes. The present study examined how similarity, personality, and attractiveness relate to same- and cross-sex friendship formation in young and older adults. After a context instantiation procedure, participants reflected on two of their recent friendship formation experiences (one with a male friend and one with a female friend). For each friend, participants completed a researcher-developed questionnaire about the importance of different factors for the formation of that friendship. The questionnaire had good psychometric properties. Results suggested that having positive personality traits, such as dependability and loyalty, is important for both young and older adults. Similarity in interests and values was important for friendship formation in both genders and age groups. Young adult participants placed greater value on attractiveness in forming cross-sex friendships than same-sex friendships. In older adults, attractiveness was relatively unimportant for both cross-sex and same-sex friendships. The results have implications for designing interventions to help adults form new friendships.

### LET'S HAVE FUN: THE MEANING OF LEISURE FOR OLDER ADULTS LIVING WITH LOW VISION

S. Berger, *Boston University, Boston, Massachusetts*

Vision loss significantly impacts participation, defined broadly as engagement in life activities. Participation in life activities has been shown to facilitate health and well-being. Researchers have demonstrated the importance of social participation and engagement in meaningful activities to quality of life for persons with physical disabilities. Yet most of the research on participation about older adults with vision loss focuses only on activities of daily living (ADL) and/or instrumental activities of daily living (IADL). Fewer researchers have explored participation beyond ADL and IADL for persons with low vision. Yet leisure participation has been shown to be related to quality of life, successful aging, and depression for older adults. Therefore, the purpose of this research was to learn about the lived experience of older adults with acquired vision loss, specifically related to participation in leisure activities. Using the International Classification of Functioning, Disability and Health (WHO, 2001) as a framework to guide the research, this study focused on the outcome of leisure participation and the many factors that influence it. Through in-depth, repeated interviews and observations of participation in leisure activities of 26 older adults living with low vision, five themes emerged pointing to the meaning of leisure for these individuals. These themes include engaging in leisure to have fun, to be social, to stay current, to be generative, and to pass time. Understanding the meaning of leisure for these older adults has implications for practice (e.g., substituting one activity for another) and policy (e.g., transportation, universal design).

### PERCEIVED EMOTIONAL AND INSTRUMENTAL SOCIAL SUPPORT: MEASUREMENT ISSUES AND CORRELATES

K.J. Kimbler, L.A. Ferrante, S.A. Lacy, *Social & Behavioral Sciences, Florida Gulf Coast University, Fort Myers, Florida*

Prior studies demonstrate that perceived social support relates to a variety of positive outcomes in several domains (e.g., Avlund, Lund, Holstein, & Due 2003; Krause 1997; McCulloch 1995). This study examines the utility of a modified version of the Social Support Questionnaire (SSQ; Sarason, Levine, Basham, & Sarason, 1983) in a sample of 102 middle-aged and older adults with ages ranging from 50 to 92. This version of the SSQ was designed to measure emotional support (3 items) and instrumental support related to instrumental activities of daily living (7 items). To assess social support quantity, participants were asked to list people that they could depend on for each of the 10 items. Participants also indicated social support quality by rating their level of satisfaction with the available social support for each item. Exploratory factor analyses indicate that two factors (representing the instrumental and emotional support items) explain 69.21% of the variance in the social support quantity component of the SSQ. Only one factor was identified with an eigenvalue over 1.0 for the social support quality items, explaining 67.47% of the variance. The items loading high on this factor included a combination of instrumental and emotional support. Overall, results suggest that this modified SSQ is appropriate for measuring specific aspects of social support in middle-aged and older adults but distinct factors related to instrumental and emotional support were only found regarding social support quantity. Correlates (e.g., marital status and sex) of social support quality and quantity will also be discussed.

### SOCIAL INTERACTIONS AND SELF-RATED PHYSICAL HEALTH AMONG MIDLIFE AND OLDER AFRICAN AMERICANS

J. Warren-Findlow, J.N. Laditka, M.E. Thompson, S.B. Laditka, *Department of Public Health Sciences, The University of North Carolina at Charlotte, Charlotte, North Carolina*

Positive social connections may be associated with better physical health. Negative social interactions, such as discrimination, may be associated with poorer physical health. We examined associations between the type, contact frequency, and quality of social connections and self-rated physical health among middle age and older African Americans, and the analogous effect of discrimination. Data were from the 2005-2006 Milwaukee African American sample of the second Midlife Development in the United States (MIDUS II) study (n=568, ages 35-85). Social relationship measures included type (marital, family, friend), contact frequency, and quality (support-strain levels). Two-thirds of participants reported better (excellent, very good, or good) self-reported physical health (SRPH), the remainder poor or fair SRPH. Logistic regression controlled for demographic factors, types of perceived discrimination, neighborhood quality, and psychosocial characteristics. In adjusted results, each unit increase on a family support quality scale was associated with 50% higher odds of better SRPH (OR 1.50, CI 1.07-2.10, p=0.017). Each additional type of perceived daily discrimination was associated with 8% lower odds of reporting better SRPH (OR 0.92, CI 0.84-1.00, p=0.049). Participants reported an average of 2.2 types of daily discrimination; thus, on average, experiences of daily discrimination reduced the odds of better SRPH by 17.6%. Providers of health and social services should be aware of the possibility that discrimination may reduce physical health among middle age and older African Americans. Researchers should consider the importance of family social connections in studies examining the physical health of African Americans.

### EXAMINATION OF THE WILLINGNESS OF ELDERLY PERSONS IN RESIDENTIAL FACILITIES TO USE VOLUNTEERS WHO PROVIDE DIALOG

Y. Hoshina[1,2], H. Matsuda[2], *1. Saitama Prefectural University, Koshigaya, Japan, 2. University of Tsukuba, Tsukuba, Japan*

This study aims to discover the physical and psychological conditions under which elderly persons in residential facilities are willing to use volunteers who provide dialog and interaction. We surveyed 56 elderly persons living in five residential facilities for elderly persons in Japan. In 2008 and 2009 we asked the elderly persons questions about their willingness to use volunteers (on a 4-point scale), and at the same time we obtained an evaluation from the staff of the residential facilities of the ADL and dementia level of the elderly persons.We performed the U Test and the Kruskal-Wallis Test with the willingness to use volunteers as the dependent variable and membership of the ADL independent group or the assistance-required group, the psychological condition of the elderly persons divided into a normal group, a depressive-tendency group, and a depressed group, and the presence or absence of dementia as independent variables. The results showed that among elderly persons in residential facilities there was a greater willingness to use volunteers in the assistance-required group with poor physical functionality and in the depressive-tendency group. However, the willingness to use volunteers was lowest in the depressed group. Furthermore, there was no relationship observed between dementia and the willingness to use volunteers. It appears that as the physical functionality of elderly persons declines, the range of activities in which they can participate becomes narrower, reducing their opportunities to engage in dialog and interaction, and so their willingness to use volunteers who provide dialog and interaction increases.

## SESSION 1390 (SYMPOSIUM)

### SPOUSAL RELATIONSHIPS IN DEMENTIA: CONNECTIONS BETWEEN RELATIONSHIPS, CARE AND WELL-BEING

Chair: *J.R. Oyebode, School of Psychology, University of Birmingham, Birmingham, United Kingdom*
Co-Chair: *L. Clare, Bangor University, Bangor, United Kingdom*

For many people with dementia, the principal person who provides support and care is the spouse/partner. Thus care is provided against the backdrop of an intimate relationship that has often lasted for several decades. Dementia becomes a party in the relationship, disturbing its nature and quality and demanding considerable adjustment. This symposium draws together papers from two research groups in the UK which address aspects of the spousal relationship in dementia. The aim is to focus attention on the relationship and disseminate research about the connections between relationship and well-being of both caregiver and care-recipient. The first paper, by Clare and colleagues, establishes that there are significant differences between spouses' views of their relationship quality in couples where one has dementia in comparison to control couples, with links also between discrepancy between partners' views, mood and quality of life. In the second paper, Quinn, Clare and Woods consider how caregiver ratings of the marital relationship influence caregiver well-being, finding that good ratings of the pre- and post-dementia relationship are associated with better well-being. In the third paper, Fisher, Riley and Oyebode describe the development of a valid, reliable instrument to assess caregiver perceptions of relationship continuity in dementia and in the final paper (Singleton, Oyebode and Riley) this measure is applied to establish whether those with a greater perception of continuity also provide more person-centred care to their spouse. These recent research findings demonstrate the strong influence of relationship perceptions on both partners' well-being when one has dementia.

### PERCEPTIONS OF RELATIONSHIP QUALITY IN PEOPLE WITH DEMENTIA AND THEIR SPOUSE CAREGIVERS

L. Clare[1], S. Nevis[1], A. Martyr[1], I.S. Markova[2], I. Roth[3], R.T. Woods[1], R.G. Morris[4], *1. Bangor University, Bangor, United Kingdom, 2. Hull University, Hull, United Kingdom, 3. Open University, Milton Keynes, United Kingdom, 4. Institute of Psychiatry, Kings College London, London, United Kingdom*

We compared ratings of marital relationship quality made by people with dementia (PwD) and their spouse caregivers, explored how these differed from ratings made by control couples, and examined factors associated with discrepancies in ratings within dyads. Participants were 54 married couples including one partner with early-stage dementia. Each partner independently rated his/her perception of the quality of the relationship. PwD rated their own mood and quality of life. Spouses rated their partner's symptoms and their own mood, distress and stress. Ratings of relationship quality were also made by 54 control couples; their ratings were the most positive, with mean discrepancy close to zero. PwD rated relationship quality more positively than the carers, and this was reflected in higher discrepancy scores. A greater discrepancy was associated with higher levels of distress, stress and depression in carers, but with less anxiety and depression and better quality of life in PwD.

### THE IMPACT OF CAREGIVING ON THE SPOUSAL RELATIONSHIP

C. Quinn, L. Clare, R.T. Woods, *Bangor University, bangor, United Kingdom*

Background: Numerous theoretical models have been developed to explore how caregiving can impact on caregivers' wellbeing. However, less attention has been given to the caregivers relationship with the care-recipient. Objectives: The aim of this study was to explore how both the pre-caregiving and current relationship between the caregiver and care-recipient can influence the caregivers' wellbeing. Method: This was a large-scale cross-sectional postal questionnaire study. The questionnaires were completed by 304 spousal caregivers. Results: Ratings of pre-caregiving relationship quality were higher than current relationship quality. Both a good pre-caregiving and current relationship were associated with higher wellbeing. Conclusions: Based on these findings it is recommended that interventions aimed at reducing caregiving stress should take into account the impact of the quality of the relationship. More longitudinal research is needed to explore how relationship quality changes over the caregiving career.

### THE DEVELOPMENT OF A MEASURE OF CARERS' SENSE OF RELATIONSHIP CONTINUITY WITH THEIR SPOUSE WITH DEMENTIA

G.A. Riley, G. Fisher, J.R. Oyebode, *School of Psychology, University of Birmingham, Birmingham, United Kingdom*

Research shows that carers' perceptions of continuity in their relationship with a spouse with dementia may be central to their adaptation and impact upon quality of support provided for their spouse. Our aim was to develop a valid and reliable questionnaire of relationship continuity. The questionnaire was drafted using data from qualitative interviews with spouse caregivers; then discussed with a focus group of caregivers who commented on content, wording and layout. 50 spouse caregivers then completed a refined version to establish internal consistency. The subsequent shortened questionnaire was administered to a further sample along with other measures to assess construct validity, and a sub-sample completed it a second time to establish test-retest reliability. The resultant questionnaire provides a reliable, valid measure of relationship continuity in spouses caring for a relative with dementia and this is now being used in further research to explore links between continuity and care.

### DO SPOUSE CAREGIVERS' PERCEPTIONS OF RELATIONSHIP CONTINUITY LINK WITH THEIR DELIVERY OF PERSON-CENTRED CARE?

G.A. Riley, J. Singleton, J.R. Oyebode, *School of Psychology, University of Birmingham, Birmingham, United Kingdom*

Spouse caregivers vary in whether they perceive the relationship with their spouse to be a continuation of their former marital relationship. For some there is a sense ofcontinuity whereas others feel they now have a very different relationship. Person-centred care involves acting to retain a sense of personhood for the person with dementia. It therefore seems possible that a positive sense of relationship continuity might maintain empathic and person-centred care. The aim of this study is to understand whether this is the case. Spouse caregivers of people with dementia complete the scale of relationship continuity (Fisher et al, this symposium) and talk about how they respond to situations that are challenging to them. 1:1 interviews with the researcher allow generation and content analysis of caregivers' own responses as well as their ratings of a standardised set. Content analysis and preliminary statistical analyses will be provided.

## SESSION 1395 (SYMPOSIUM)

### THE STORIES THEY TOLD US: USING NARRATIVES IN GERONTOLOGICAL RESEARCH

Chair: *R.B. Meraz, Leadership and Counseling, Eastern Michigan University, Ypsilanti, Michigan*
Co-Chair: *J.R. Smith, Fordham University, New York, New York*
Discussant: *K. de Medeiros, The Copper Ridge Institute, Sykesville, Maryland*

The "narrative turn" which includes entering the perspective of our research subjects by listening to and analyzing their stories is becoming an increasingly vibrant part of the field of gerontology. A narrative or case-centered approach allows for discovery of human agency, as well as how larger social institutions frame how and why a particular event is storied and what a narrator accomplishes by developing the story in a particular way. The papers in this session include both thematic analyses which focus on what is "told" by the research subjects and structural analyses which focuses on the "telling" or how the story it told (Riessman, 2008). In this session, some of the researchers focus on the "bigger" institutional stories that are revealed in the individual's story, while others investigate how the person's life story is constructed to make sense of local spheres of meaning within their families and communities (Gubrium, 1997). The papers include: 1) Life histories of Vietnam veterans and their wives; 2) Grand-parenting an adult child with mental health problems; 3) Social and power relations influencing older men in Lebanon; 4) Residents' perceptions of living in a retirement community based on life-long learning; and the 5) Experiences of Latino family caregivers. This session will clarify the purpose and process of narrative inquiry and help participants see how incorporating narratives into their own research can provide powerful and thought provoking insights into the reality of the lived experiences of aging individuals.

## LIFE HISTORY NARRATIVES OF VIETNAM VETERANS AND THEIR WIVES

E. Covan*, Health and Applied Human Sciences, UNC Wilmington, Wilmington, North Carolina*

Life history narratives of Vietnam veterans and their wives are analyzed to preserve historical memories and to understand how aging individuals attach meaning to pivotal experiences in their lives. Veterans note that discussing combat experience with those who were not there is impossible, although combat experience in young adulthood influenced all subsequent events in their lives. Each spouse of a Vietnam veteran describes a marital history that required her to alternate between "tiptoeing around trauma," and "begging for information" as she attempted to understand how "Vietnam veteran" became a master status for her spouse. The narratives are analyzed in terms of four elements of the gerontological life course perspective: personal attributes, social stratification, period effects and cohort effects. The author argues that employing the life course perspective in the analysis of these narratives is critical to understanding the tension that accompanies the intersecting roles of spouses in military families, and also in illuminating gender differences in American society for the birth cohort that reached adulthood in the late 1960s.

## I DON'T KNOW WHAT TO DO WITH HER: PARENTING AN ADULT CHILD WITH MENTAL ILLNES

J.R. Smith*, Graduate School of Social Service, Fordham University, New York, New York*

This narrative analysis examines an African-American woman's struggle to make sense of the difficulties she experiences in parenting her adult granddaughter who has behavioral and mental health problems. The data is part of a project on elder abuse conducted in a suburb of New York City that included both focus groups with social service providers and interviews with women directly affected by abusive relationships with their adult children. My work builds on the work of researchers who use a narrative or life story approach to examine adult identity development (Josselson, 1996, Linde, 1993; Mishler, 1999). The interview includes Mrs. M describing her life story in chapters (McAdams, 1993) and how parenting has been central to her identity. She is now at a "turning point" (Mishler, 1999) in her life long career of parenting, as she feels "tired" and without the energy or resources to be the kind of parent she expects herself to be. Understanding the pressure women feel to protect their children and themselves from the public acknowledgement of abuse within their families is critical for the development of outreach programs to successfully address the growing incidence of elder abuse by impaired adult dependent children.

## CULTURE AND CONVOYS: SOCIAL RELATIONS AMONG OLDER MEN IN LEBANON

K.J. Ajrouch[1,2], T.C. Antonucci[2]*, 1. Eastern Michigan University, Ypsilanti, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

Today social relations are widely recognized in multiple disciplines as a critical pathway to health and well-being among older adults. We conceptualize social relations as a convoy. Convoys constitute an important and ever-present concept in studies of the life course. To broaden and better specify theoretical understandings of social relations, it may be instructive to consider the social and cultural contexts that shape, influence, and condition their expression in a non-Western country. Our findings draw from ethnographic field notes over a six month period in Lebanon and cognitive interviews from 11 older men to provide narrative analysis about social relations. Our use of narrative inquiry allows for discovery of a framework that delineates how 1) power dynamics; and 2) sense of self informs convoys of social relations in distinctive ways. Such work informs larger quantiative work as well as future qualitative studies, thus enhancing our fundamental understanding of social relations.

## A REBIRTH OF DYNAMISM AND ENTHUSIASM': RESIDENTS' REFLECTIONS ON SELF AND BELONGING IN A UNIVERSITY-LINKED RETIREMENT COMMUNITY

R.B. Meraz*, Leadership and Counseling, Eastern Michigan University, Ypsilanti, Michigan*

Utilizing narrative inquiry and life course theory, this session explores the important role that University-Linked Retirement Communities can play in helping older adults negotiate their retirement transitions and develop post-retirement identities. University-linked retirement communities (ULRCs) are designed and built for retirees who want to live near or on college campus. There is a dearth of research on this phenomenon of ULRC living and, particularly absent, is an in-depth qualitative understanding of what this living experience means to the residents. This qualitative study utilized an interpretative ethnographic approach with site visit observations conducted at three distinct ULRCs located in the Midwest, Northeast, and Southern regions of the United States. Findings were synthesized through coding and thematic analyses of 47 in-depth individual and partner interviews. This presentation highlights findings from one ULRC where an overwhelming number of residents cited their desire for "intellectual community" as integral to their housing decision-making process. Personal narratives provide rich insight into how an individual's life course and previous identity shaped his/her desire to seek a retirement life that offered a variety educational and lifelong learning opportunities. Furthermore, the emergent themes provide insight into how the opportunity for intellectual pursuits and exchange of ideas with "likeminded others" helped residents cultivate a sense of home, self, and belonging.

## LATINO FAMILY CAREGIVERS OF PATIENTS WITH ALZHEIMER'S DISEASE: A NARRATIVE ANALYSIS OF THEIR EXPERIENCE

C.R. Gelman*, Hunter College School of Social Work, New York, New York*

Caregivers of patients with Alzheimer's disease (AD) experience increased depression and stress, poorer self-rated health, and even increased mortality. Latino caregivers face special challenges, yet relatively few studies explore their experiences qualitatively, which can provide important insights. We discuss a narrative analysis of extensive contacts with 24 Latinos caring for relatives with AD, and focus on an emerging theme less commonly noted in the literature: despite the cultural value of familismo, defined as an identification, attachment, loyalty and reciprocity of individuals with their families and typically ascribed to Latinos, these caregivers report experiencing insufficient support from their extended families. Reasons for this gap between cultural ideal and reality, the impact on Latino caregivers, and the implications for provision of supportive services for AD caregivers and their families, are discussed.

## SESSION 1400 (SYMPOSIUM)

### YEARS OF GERIATRIC NURSING RESEARCH THROUGH THE JOHN A. HARTFORD FOUNDATION BUILDING ACADEMIC GERIATRIC NURSING CAPACITY PROGRAM

Chair: *A. Perez, College of Nursing and Health Innovation, Arizona State University, Phoenix, Arizona*
Discussant: *A.L. Silva-Smith, University of Colorado, -Colorado Springs, Colorado*

The 2008 report from the Institute of Medicine, Retooling for an Aging America, has emphasized the need for nurses prepared to care for our growing aging population who will continue to test the capacity of our current U.S. healthcare system. The John A. Hartford Foundation/ Building Academic Geriatric Nursing Capacity (BAGNC) program has invested in the development and growth of expert researchers, academicians and practitioners who will lead the field of gerontological nursing and ultimately improve the care of the elderly. This symposium highlights 10 years of geriatric nursing research through the BAGNC program, which has awarded 172 predoctoral scholars and postdoctoral fellows. Alumni from the BAGNC program will describe their research focused on the diverse and unique needs of older adults. First, Dr. Hansen will share her research describing the family experience of rural elders dying from chronic illnesses. We will hear from Dr. Williams about multidisciplinary research strategies to improve nursing communication with older adults and Dr. Wagner Baycrest's program of research related to nursing home resident safety. She will discuss resident falls; adverse event reporting and disclosure; and resident safety culture. Dr. Yu will report on research contributions related to promoting aerobic capacity in persons with Alzheimer's disease and Dr. Enderlin will present her team's work examining the effectiveness of new objective measures of sleep in older women with breast cancer. Following the presentations, we will discuss key aspects of the BAGNC program in the development of these accomplished researchers and invite comments and questions from everyone.

### END-OF-LIFE CARE FOR RURAL-DWELLING OLDER ADULTS AND THEIR FAMILIES

L. Hansen, J. Cartwright, C. Craig, *Oregon Health & Science University, Portland, Oregon*

Older adults dying from chronic illness in rural areas are understudied and of concern because of their limited access to health services. This study's purpose was to explore the family perspective on the rural, end-of-life care experience for older adults dying with a chronic disease. Semi-structured interviews were conducted with 23 family members following the death of a relative. Qualitative description analysis was conducted using constant comparative analysis of the family member's experiences before, during, and after death. Findings include that decedents and family members generally realized when death was imminent yet varied in their preparedness for death. Family members had both positive and negative experiences with care resources and services provided during the last weeks of the older adult's life and after the death. These findings reflect some key concerns related to end-of-life care in rural settings. Capturing these concerns is essential for developing interventions to improve care.

### MULTIDISCIPLINARY RESEARCH STRATEGIES TO IMPROVE NURSING COMMUNICATION WITH OLDER ADULTS

K.N. Williams, *University of Kansas School of Nursing, Kansas City, Kansas*

Communication with older adults is central to Gerontological Nursing practice and is critical for improving the quality of nursing care for the growing population of older adults. A synthesis of interdisciplinary research strategies provide effective approaches for understanding the importance of communication as a basis for tailoring nursing communication to meet the needs of older adults in a variety of health care settings. This session will describe how research strategies including psycholinguistic analysis, qualitative and communication analyses, and sequential behavioral analyses have been integrated in a program of research to improve communication in dementia and long-term care settings. Steps in this process include research projects that describe communication practices, establish relationships between nursing communication styles and resident outcomes, and develop and test interventions to improve communication and outcomes for older adults in dementia and long-term care settings. Student participation in this research fosters a new generation of Gerontological nurse scholars.

### IMPROVING RESIDENT SAFETY IN NURSING HOMES

L. Wagner, *Baycrest Centre for Geriatric Care, Toronto, Ontario, Canada*

Since the 1999 release of the Institute of Medicine (IOM) Report "To Err is Human", there has been an explosion of research aimed at improving safety in health care settings. While this has focused primarily in the acute care setting, there is an emerging body of literature aimed at improving nursing home resident safety. Nursing home residents are highly vulnerable to errors due to multiple co-morbidities, age associated changes, and organizational conditions. This presentation will highlight a program of research focusing on: resident falls; adverse event reporting and disclosure; and resident safety culture in the nursing home setting. The presentation will emphasize how the John A. Hartford Foundation Building Academic Geriatric Nursing Capacity Fellowship provided the foundation for building this program of research. Future directions will be highlighted and both research priorities and suggestions for building academic geriatric nursing capacity in patient safety and quality will be explored.

### OBJECTIVE AND SUBJECTIVE SLEEP IN OLDER WOMEN WITH BREAST CANCER

C. Enderlin[1], E.A. Coleman[1,2], K. Richards[3,4], C. Cole[1], R.L. Kennedy[1], J.A. Goodwin[1], L.F. Hutchins[2], *1. University of Arkansas for Medical Sciences College of Nursing, Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences College of Medicine, Little Rock, Arkansas, 3. Polisher Research Institute, Abramson Center for Jewish Life, North Wales, Pennsylvania, 4. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

This study described objective and subjective sleep of older women with and without breast cancer (BC), using Actigraphy (ATG) and the Pittsburgh Sleep Diary (PSD). Mean sleep onset latency was similar for methods (ATG 34.83 vs PSD 25.64 minutes BC group, $p=0.20$; ATG 15.64 vs PSD 20.37 minutes comparison group, $p=0.16$; expected <35 minutes). Nocturnal awakenings were significantly different between methods (ATG 9.2 vs PSD 6.23 BC group, $p<0.01$; ATG 7.3 vs PSD 2.49 comparison group, $p<0.01$; expected < 6/night). Wake after sleep onset was similar for methods (ATG 37 vs PSD 34.47 minutes BC group, $p=0.77$; ATG 33.46 vs PSD 20.21 minutes comparison group, $p=0.27$; expected < 30 minutes). Daytime sleep duration (naps) was significantly different between methods (ATG 128.63 vs 30.5 minutes BC group, $p=0.0006$; ATG 119.45 vs 38.33 PSD comparison group, $p=0.0004$; expected 14-31 minutes/day). These findings support adjunct ATG use to assess sleep in this population.

### AEROBIC CAPACITY IN OLDER ADULTS WITH ALZHEIMER'S DISEASE: CASE ANALYSES

F. Yu, J.F. Wyman, *University of Minnesota School of Nursing, Minneapolis, Minnesota*

Little is known about whether aerobic capacity plays a role in aerobic exercise-induced benefits in persons with Alzheimer's disease (AD). The purpose of this case study was to describe aerobic capacity pre- and post-2-month cycling training in four older men with AD (age 61-82 years, baseline Mini-Mental State Examination scores 2-12). Symptom-limited cycle ergometer testing was conducted using a graded protocol that increased power by 25 Watts every 3 minutes (9-15 minutes). Peak VO2 was estimated from achieved peak Watts. The results showed that peak relative VO2 (mL/kg/min) was increased in two subjects: 18.7→26.2 and 24.6→26.2, and decreased in two: 19.3→17.2 and 26.8→17.1. However, it was unclear whether the two subjects who had decreased VO2 gave peak effort. Further studies are needed to examine how to best assess aerobic capacity given cognitive challenges, and how to implement appropriate exercise training to assure adequate physiologic stimulus when testing cognitive benefits.

## SESSION 1405 (PAPER)

## END OF LIFE TRANSITIONS OF CARE

### PREDICTORS OF HOSPICE CARE UTILIZATION BY OLDER ADULTS HOSPITALIZED WITH HEART FAILURE

L.G. Jones[1], M.A. Feller[1], F. Bailey[1,2], D. Bearden[1], Y. Zhang[1], A. Ahmed[1,2], *1. Univ. of Alabama at Birmingham, Birmingham, Alabama, 2. Veterans Affairs Medical Center, Birmingham, Alabama*

Background: The prevalence of end-stage heart failure (HF) is expected to be high among older adults hospitalized with HF, many of whom may benefit from hospice care. However, selection of HF patients for hospice may be difficult. Methods: Of the 8555 Medicare beneficiaries discharged with a primary diagnosis of HF in 1998-2001 from 106 US hospitals, 8032 were discharged alive and had data on hospice care. Multivariable logistic regression models were used to estimate odds ratios (OR) and 95% confidence intervals (CI) for the post-discharge receipt of hospice care. Results: Patients (n=8032) had a mean (±SD) age of 76 (±11) years, 57% were women, 25% were African American, and 182 (2.3%) were discharged to hospice care. Predictors of hospice care utilization included age (OR, 1.03; 95% CI, 1.01–1.05; P<0.001), prevalent HF (OR, 1.72; 95% CI, 1.12–1.63; P=0.013), stroke (OR, 1.68; 95% CI, 1.21–2.33; P=0.002), dementia (OR, 1.58; 95% CI, 1.05–2.37; P=0.027), admission pulmonary edema (OR, 2.01; 95% CI, 1.39–2.90; P<0.001), pre-admission loop diuretic use (OR, 1.70; 95% CI, 1.15–2.50; P=0.007), and intensive care unit use (OR, 1.89; 95% CI, 1.05–3.40; P=0.033). Six-month post-discharge mortality occurred in 74% and 20% of hospice and non-hospice patients respectively (chi-square P<0.001). Conclusion: Several baseline demographic, clinical and care characteristics predicted hospice care use, which may help identify HF patients who may benefit from hospice care. The rather high rate of six-month mortality of hospice patients suggests that the vast majority of hospice patients had end-stage HF.

### BURDENSOME TRANSITIONS AMONG NH RESIDENTS WITH ADVANCED COGNITIVE IMPAIRMENT: A NATIONAL STUDY

J.M. Teno[1], P. Gozalo[1], J. Skinner[2], J. Bynum[2], S. Mitchell[3], D. Tyler[1], V. Mor[1], *1. Community Health, Brown Medical School, Providence, Rhode Island, 2. The Dartmouth Institute, Hanover, New Hampshire, 3. Harvard Medical School, Boston, Massachusetts*

Objective: Our goal was to create a burdensome transition (BT) index, describes change with over time, measure regional variation, and examine associations. Methods; Using the 2000-2007 MDS and Medicare Claims, we created an index of 4 events (1 point each, rage 0-4) based on expert advice that was a BT: 1) a transition in the last 3 days of life ; 2) lack of continuity of NH providers with before and after a hospitalizations in the last 90 days; and 3) three or more hospitalizations for a pneumonia, UTI, dehydration, and/ or sepsis in the last 180 days; and 4) three or more hospitalizations in the last 90 days of life . These events were described for NH residents with CPS >=5. Descriptive frequency of its variation, change with time, and ordinal multivariate model describing associations of BT index. Results: Between 2000 and 2007, 30.7% of the 534,490 NHR with advance cognitive impairment had two or more BT. The average number of BT increased with time from 0.76 (2000) to 0.85 (2007) with state variation in two or more BT varying from 14.2% (VT) to 66.3% (MS). Blacks (AOR 1.4 95% CI 1.39 to 1.52 ), Hispanics (AOR 1.5 95% CI 1.31 to 1.66) and those without an advance directive (AOR 1.26 95% CI 1.22 to 1.30 ) were at increase risk of BT. Conclusion: BTs are common, increased with time, and varies by geographic regions. Blacks, Hispanics, and those without advance directives are at increased risk of BT.

### TRANSFERS TO HOSPITAL NEAR THE END OF LIFE OF NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA

B.S. Black[1,2], K.L. Hicks[1], P. Rabins[1,2], *1. Psychiatry & Behavioral Sciences, Johns Hopkins University, Baltimore, Maryland, 2. Berman Institute of Bioethics, Baltimore, Maryland*

Palliative care is recommended for individuals with end-stage dementia, yet these individuals often undergo aggressive interventions, including transfers to hospital. Data from the CareAD study conducted at three Maryland nursing homes were used to examine the frequency of, reasons for, and correlates of hospital transfers among residents with advanced dementia near the end of life. Nursing home (NH) residents (n=123) who met hospice criteria for dementia were prospectively followed over a 44-month period to identify when and why residents were transferred for evaluation in an emergency department (ED) or for hospitalization. Additionally, data analysis identified characteristics of residents transferred within 6 months of death. During follow-up, 45% of participants were transferred to hospital, including 16% who had multiple transfers. The most common reasons for ED evaluations (n=30) were falls, abrasions/lacerations, respiratory distress, and pain; hospitalizations (n=37) occurred most often for urinary tract infections, respiratory distress, pneumonia, and withdrawal, lethargy or delirium. Among the 92 participants who died during the study, 43% were transferred to hospital within 6 months of death and 25% were transferred within 1 month of death. Residents transferred within 6 months of death had significantly lower baseline quality of life (QOL) (t=2.63, p=.010) and fewer days from study enrollment to death (t=2.60, p=.012) than residents not transferred within 6 months of death. This study demonstrates that a large proportion of hospice-eligible NH residents with dementia experience potentially burdensome transfers to hospital during their final months of life. Alternative approaches that provide care without compromising QOL are needed.

### SYMPTOMS IN ADVANCED HEART FAILURE

L. Miller[1], N.A. Perrin[2], *1. Oregon Health & Science University, Portland, Oregon, 2. Kaiser Permanente Center for Health Research, Portland, Oregon*

Despite the broad consensus that end-of-life care should be focused on symptom relief, the burden of unrelieved symptoms in several chronic, eventually-fatal diseases is high and the complex relationships between and among symptoms have not been well described. We examined the relationship between symptoms and psychological and social functioning as measured by the Kansas City Cardiomyopathy Questionnaire in a sample of 90 persons with mild to severe heart failure. Hierarchical regression was used to test the relationship between symptoms and functioning after controlling for demographics, heart failure characteristics, and comorbidity. In the first step of the model age, gender, duration of heart failure, and ejection fraction were entered and accounted for 7.3% (p=.284) of the variance in social functioning and 5.7% (p=.433) of the variance in psychological functioning. Next, the Charleson comorbidity score was added to the model which explained an additional 6.1% (p=.038) and 0.5% (p=.565) of the variance in social and psychological functioning, respectively. The last step of the model included presence/absence of symptoms such as difficulty concentrating, lack of energy, constipation, and shortness of breath. Symptoms accounted for a significant proportion of variance in social functioning 38.5% (p=.002) and physical functioning 43.0% (p=.001) controlling for demographics, heart failure characteristics and comorbidity. No single symptom accounted for a significant amount of unique variance. These findings not only highlight the importance of symptoms in end-of-life care but that care may need to focus on clusters of symptoms rather than a single symptom to improve social and psychological functioning.

## SESSION 1410 (SYMPOSIUM)

### EVALUATING GERIATRICS TRAINING OF DIRECT CARE WORKERS IN LONG TERM CARE: TRANSITIONS IN OUTCOMES

Chair: *J.C. Morgan, UNC Institute on Aging, Chapel Hill, North Carolina*
Co-Chair: *M.H. Palmer, School of Nursing, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*
Discussant: *M. Mezey, The John A. Hartford Institute for Geriatric Nursing, New York, New York*

Many education and training initiatives implicitly make a link between the initiative and improved quality of care. As a sector plagued by problems in quality and high staff turnover, long-term care (LTC) will need to increase the skills and competencies of direct care workers to meet the growing demand for highly competent geriatric care as the population ages. Geriatric education and training initiatives have emerged in recent years to address this gap. But, how do researchers establish the link between these initiatives and quality of care? Many initiatives have established the link between education and training with changes in knowledge, skills and competencies. However, serious problems emerge in designing and executing rigorous evaluation studies aimed at drawing the link between those improvements and quality of care. The purpose of this symposium is to stimulate discussion about the second generation outcomes, that is away from proximal changes in workers to distal changes in residents and/or clients at the individual or organizational level. Each speaker will describe a geriatric education initiative, describe the methodology and target outcomes used to evaluate the training and enumerate the experienced and perceived challenges in designing, implementing and completing evaluations aimed at linking increased knowledge and skills and quality of care in LTC. The discussant will frame the findings within the context of geriatric education and quality of care literature and lead a discussion to identify the most promising strategies to help researchers establish the evidence base needed to move the field forward.

### LINKING DIRECT CARE WORKER SKILL ACQUISITION AND RESIDENT CARE THROUGH OBSERVATION AND RESIDENT INTERVIEW METHODS

D.L. White, C. Lopez*, Portland State University Institute on Aging, Portland, Oregon*

Five assisted living facilities implemented a competency-based, 27-module work-based learning program for direct care workers (DCW) through the Jobs to Careers Program. Based on focus groups and DCW surveys, the program was successful (e.g., increased self-efficacy, improved staff relationships, increased organizational support to provide care). To determine whether the training program could be linked to quality of resident care, DCWs were observed as they worked with residents. Residents also were interviewed to discover their assessment of DCW competence and to identify areas of care and support that were most important to them. These data provide insight into areas of strength in DCW knowledge and practice as well as identify additional training needs. Implications for routine use of observation and resident interview data in LTC research will be discussed.

### IMPROVING THE CARE OF ACUTELY ILL ELDERS: USING CLINICAL SIMULATIONS IN EVALUATING NURSING ASSISTANT OUTCOMES

M.H. Palmer[2,1], V. Kowlowitz[2]*, 1. UNC Institute on Aging, Chapel Hill, North Carolina, 2. UNC at Chapel Hill School of Nursing, Chapel Hill, North Carolina*

Nursing assistants in nursing homes provide most of the direct care yet little evidence exists regarding the adequacy of their geriatric clinical competencies. Geriatric clinical simulations were developed and used in continuing education with nursing assistants alone and with licensed practical nurses. Increasing knowledge was only one expected outcome, improving communication skills relative to changes in patient condition was another desired outcome. We will discuss the challenges in developing clinical simulations and methodological issues to measure clinically relevant outcomes.

### EDUCATIONAL PROGRAMS ON GERIATRIC CARE FOR DIRECT CARE WORKERS: CHALLENGES IN DESIGN, IMPLEMENTATION AND EVALUATION OF OUTCOMES

B. Barba*, UNC at Greensboro School of Nursing, Greensboro, North Carolina*

The Geriatric Workforce Enhancement Project faculty developed face-to-face training programs for direct care workers that consist of seventeen modules of content in geriatric best practices based on national and state standards of care. We will describe the challenges to designing and implementing these educational programs and to evaluating the outcomes on the quality of geriatric care provided by the participants. We will discuss innovative and creative strategies used to overcome the challenges based on current research and personal experience. We will propose strategies to evaluate outcomes based on worker, patient and system characteristics.

### BETTER CARE THROUGH BETTER JOBS: CHALLENGES IN DESIGNING AND IMPLEMENTING EVALUATIONS TO ADDRESS QUALITY OF CARE

J.C. Morgan[1], J. Dill[2,1], T.R. Konrad[1,3]*, 1. UNC Institute on Aging, Chapel Hill, North Carolina, 2. Department of Sociology, UNC, Chapel Hill, North Carolina, 3. Cecil G. Sheps Center for Health Services Research, Chapel Hill, North Carolina*

The UNC Institute on Aging has developed a program of research in evaluating educational and training initiatives targeted at the frontline healthcare workforce. In evaluating such initiatives, we have used a variety of strategies including: 1) using propensity score matching to compare participants to controls based on supervisor ratings of nurse aide (NA) performance, measures of short-term retention, and NA ratings of perceived quality of care, 2) employing statewide longitudinal survey data to link program participation to organizational-level NA turnover rates, and 3) using longitudinal Nursing Home Compare (NHC) data to link program participation to quality outcomes. Further, we have employed a qualitative case study approach that uses interview data to explore changes in perceived quality of care from multiple perspectives. This presentation will overview these strategies and the strengths and weaknesses of the multiple approaches. Finally, we will address how these strategies might be improved or combined to reach toward quality of care metrics.

## SESSION 1415 (SYMPOSIUM)

### EXBELT: REDUCING BELTS FROM NURSING HOMES

Chair: *J. Hamers, School for Public Health and Primary Care (Caphri), Department of Health Care and Nursing Science, Maastricht University, Maastricht, Netherlands*
Discussant: *E. Capezuti, New York University, Hartford Institute for Geriatric Nursing, New York, New York*

The use of physical restraints still is common practice in nursing home care of older people with dementia. Physical restraints are defined as any limitation in an individual's freedom of movement. The use of restraints in Dutch nursing homes ranges from 41% to 64%; recent data show that 10% to 14% of nursing home residents are restrained with belts. Restraints have negative physical, psychological and social consequences for older persons. Their use is associated with pressure sores, loss of muscle, joint contractures, incontinence, demoralization, depression, aggression and impaired social functioning. Staff report that physical restraints are mainly used to prevent falls. However, there is accumulating evidence that restraint reduction does not lead to an increased number of falls or fall-related injuries and that restraint use can result in falls, balance and coordination problems. Since physical restraints have shown to be ineffective and sometimes even harmful, interventions are needed to reduce their usage. This symposium presents the rationale and effects of a recently developed tailored multi-component intervention program (EXBELT) on belt restraint reduction in Dutch psychogeriatric nursing homes. In three presentations the design, effect evaluation and process evaluation of this study will be discussed. The presenters will discuss outcomes of their research with respect to their attempt to reduce restraint use in clinical practice. The audience is invited to participate in a discussion about these outcomes and implications for future research and practice.

### BELT RESTRAINT REDUCTION IN NURSING HOMES: DESIGN OF AN INTERVENTION STUDY

E. van Rossum[1,2], M. Gulpers[1], M. Bleijlevens[1], E. Capezuti[3], J. Hamers[1], *1. School for Public Health and Primary Care (Caphri), Department of Health Care and Nursing Science, Maastricht University, Maastricht, the Netherlands, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Research Centre on Autonomy and Participation, Heerlen, Netherlands, 3. New York University, Hartford Institute for Geriatric Nursing, New York, New York*

Several attempts have been made to reduce the use of physical restraints (especially belts) in nursing homes. Most studies used educational approaches and introduced a nurse specialist as a consultant. However, the success rate of these interventions has been inconsistent. We developed an innovative multi-component intervention (EXBELT) comprising of (1) an educational intervention for nursing home staff, (2) a policy change that discourages belt use, (3) support of a nurse specialist and nursing home director, and (4) availability of alternative interventions. The effects of EXBELT were tested in a quasi-experimental longitudinal study in 26 psychogeriatric nursing home wards from 13 Dutch nursing homes. In addition, experiences and feasibility were monitored among all stakeholders involved. This paper presents the background and design of the EXBELT study.

### EFFECTIVENESS OF AN INTERVENTION PROGRAM ON BELT RESTRAINT REDUCTION IN DUTCH NURSING HOMES

M. Gulpers[1], M. Bleijlevens[1], E. van Rossum[1,2], E. Capezuti[3], J. Hamers[1], *1. School for Public Health and Primary Care (Caphri), Department of Health Care and Nursing Science, Maastricht University, Maastricht, the Netherlands, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Research Centre on Autonomy and Participation, Heerlen, Netherlands, 3. New York University, Hartford Institute for Geriatric Nursing, New York, New York*

A tailored multi-component intervention program (EXBELT) on belt restraint reduction in Dutch psychogeriatric nursing homes has been evaluated in a quasi-experimental study. Psychogeriatric nursing home wards with a belt use prevalence of at least 10% were eligible for the study. A total of 26 wards, including 714 residents, were assigned to the intervention (n=403) or control (n=311) group. The intervention included education, an institutional policy change, consultation by a nurse specialist, and availability of alternative interventions. The control group received usual care. Data were collected at baseline, and five and eight months after baseline. The primary outcome measure of the effect evaluation was the use of belts. Secondary outcome measures include other restraints, psychoactive drug use, and falls. Preliminary analyses demonstrate significant between group differences in the use of belts at eight months, in favor of the intervention group (odds ratio (OR)=0.44;P=.006).

### PROCESS EVALUATION OF AN INTERVENTION PROGRAM ON BELT RESTRAINT REDUCTION IN DUTCH NURSING HOMES

M. Bleijlevens[1], M. Gulpers[1], E. van Rossum[1,2], E. Capezuti[3], J. Hamers[1], *1. School for Public Health and Primary Care (Caphri), Department of Health Care and Nursing Science, Maastricht University, Maastricht, Netherlands, 2. Zuyd University of Applied Sciences, Research Centre on Autonomy and Participation, Heerlen, Netherlands, 3. New York University, Hartford Institute for Geriatric Nursing, New York, New York*

A tailored multi-component intervention program (EXBELT) on belt restraint reduction in Dutch psychogeriatric nursing homes has been evaluated in a quasi-experimental study. This paper presents the results of the process evaluation which aims to assess the feasibility of the intervention and possibilities to optimize the intervention in the future. Information about the implementation process of the intervention, nursing staff's attendance and adherence with the educational part, and the opinion of residents' relatives, nursing home staff, instructors, and nursing home management about the program was collected by means of registration forms, questionnaires, and interviews. Results show that the intervention program appears to be feasible. A total of 87% of the nursing home staff attended all three educational sessions. However, some improvements with regard to the educational sessions are recommended such as better staggering of the educational meetings, and applying the newly acquired knowledge in actual practice.

## SESSION 1420 (PAPER)

### MANAGEMENT OF DISEASE AND FUNCTIONAL HEALTH IN PRIMARY CARE

### CORRELATES OF MEDICATION ADHERENCE IN OLDER ADULTS WITH HYPERTENSION

T.M. Ruppar, *1. Sinclair School of Nursing, University of Missouri, Columbia, Missouri, 2. Katholieke Universiteit Leuven, Leuven, Belgium*

Problem: Much of the existing literature describing influences on medication adherence (MA) focuses on cognitive influences on behavior (e.g., beliefs, perceptions, knowledge). Evidence linking medication beliefs to MA is inconclusive. This study aimed to evaluate the relationship between medication beliefs and MA among older adults with hypertension. Methods: This prospective descriptive study enrolled adults who were age 60 years or older, self-administered at least one daily antihypertensive medication, and had no cognitive deficits. Data were collected on participants' age, medications, years with hypertension, education level, and beliefs about medications (Beliefs about Medicines Questionnaire [BMQ]). MA was measured by electronic monitoring for six weeks, using the percentage of doses taken within the prescribed intervals during the final two weeks of monitoring. Results: Of the 33 participants, (mean age: 74.60 [±7.59]), 17 were considered adherent (MA ≥ 85%). Non-adherent participants scored higher than adherent participants on the BMQ Specific-Concerns subscale (median: 14.5 vs. 12.0; U=81.00, p=.046). No difference was found between adherence groups on the Specific-Necessity subscale. African-American participants had lower adherence than Caucasians (p=.006). Participants with some college education were more adherent than those with less education (p=.005). Participants with once-daily regimens were more adherent than those with multiple daily doses (p=.032). Discussion: Concerns about medication safety and side effects were related to antihypertensive MA in this small sample of older adults. Further study is needed in larger samples to more fully explore the impact of potential influences on MA and on the effectiveness of MA interventions for older adults.

### TRANSITIONAL CARE AND PRIMARY CARE: ARE BOTH NEEDED TO DECREASE HOSPITAL READMISSIONS?

C. Blaum[1,2], K. Ward[1], B. Williams[1], S. Bernstein[1,2], *1. University of Michigan, Ann Arbor, Michigan, 2. Veterans Affairs Ann Arbor Health System, Ann Arbor, Michigan*

The Physician Group Practice (PGP) Medicare Demonstration tested whether large group practices could coordinate care to an attributed Medicare population. Our Faculty Group Practice (FGP), part of a large integrated academic health system, participates in the PGP Medicare Demonstration. Medicare patients are attributed to our FGP yet maintain fee-for service and can receive care anywhere (attributed patients have about 30% of hospitalizations elsewhere). For the Demonstration, the FGP implemented or enhanced several transitional care interventions: post hospital calls, rapid transitional appointments, coordination of these with home care and complex care management. We compared readmission rates after index hospitalizations of attributed Medicare beneficiaries at our University Hospital (UH) vs. index hospitalizations at other hospitals (OHs) using complete Medicare claims from 2004 (before Demonstration) to 2008 (third year of Demonstration). Results show: Patients with UH index admission had decreasing 15 day readmission rates (2004, 13.7 decreasing to 13.0 in 2008 vs. index admission OHs 12.8 in 2004, 15.4 in 2008). Trends were similar for patients with HF, COPD, and diabetes, and for 30 day readmissions. Readmissions varied by index admission hospital and whether the patient was established with FGP primary care (PC). For example, 14 day readmissions 2008: UH/PC, 12.1%; OHs/PC, 13.9%; UH/noPC, 14.3%; OHs/noPC 16.8%. The same pattern held for 30 day readmissions. Both a transitional care program with several interventions targeted at post-discharge patients, and primary care, may play a role in decreasing readmissions. Future research is needed to understand roles of illness burden and patient attribution.

### USE OF BIPHOSPHONATES AFTER OSTEOPOROTIC FRACTURES: THE BIPHOSPHONATES EFFICACY-SAFETY TRADEOFF (BEST) STUDY

M. Di Bari[1,2], F. Lapi[3,2], G. Corrao[4], M. Sturkenboom[5], F. Carle[6], N. Montanaro[7], A. Caputi[8], G. Mazzaglia[3], *1. Department of Critical Care Medicine & Surgery, Unit of Gerontology & Geriatrics, University of Florence, Florence, Italy, 2. Dept. of Preclinical & Clinical Pharmacology, and Center of Pharmacoutilization, Pharmacoepidemiology, & Pharmacoepidemiology, Univ. of Florence, Florence, Italy, 3. Regional Centre for Drug Evaluation and Information (CREVIF), Department of Pharmacology of Bologna, Bologna, Italy, 8. Department of Medicine and Pharmacology, University of Messina, Messina, Italy*

AIM. The Biphosphonates Efficacy-Safety Tradeoff (BEST) study was designed to evaluate efficacy and safety of oral BP in primary care. METHODS. Hospital discharges and pharmacy claims, collected over a population of 19 million enrolees in the Italian National Health System, were used to select records of subjects aged 55+ years, discharged from hospital with a primary diagnosis of fracture at osteoporotic sites. Exclusion criteria included cancer, Paget disease, and previous BP use. Post-discharge prescription of oral BP was recorded. Outcomes of the BEST study are: 1) occurrence of osteonecrosis of the jaw (ONJ), 2) gastro-intestinal bleeding, and 3) recurrent fracture. Data on BP utilization and ICD9CM-based diagnoses of ONJ are currently available. RESULTS. Out of 72,675 eligible subjects (mean age: 67 years; 71% females), 11% (females: 16%, males: 6%; p<0.001) received at least one BP prescription in the follow-up. Peak prescription rate (26% in females and 19% in males) was reached at age 70-74 years and declined sharply thereafter, being below 7% after the age of 85 in both sexes (age trend: p<0.001). Based upon selected ICD9CM codes, 135 cases of possible and 162 of probable ONJ were identified; the corresponding incidence densities were 0.15 and 0.22 per 10,000 person-years, respectively. Association with BF use will be evaluated after adjudication of final diagnoses by an expert panel. CONCLUSIONS. In this large sample of Italian population with such a compelling indication as an osteoporotic fracture, BP are substantially underprescribed, especially in oldest subjects.

### CARE MANAGEMENT PLUS: ASSESSING PRIMARY CARE'S READINESS FOR INTERDISCIPLINARY TEAMS AND SYSTEM REDESIGN

C.P. Brunker[1,2], D.A. Dorr[3], B.E. Gardner[1], L. Widmier[1], K.A. Radican[4], *1. Intermountain Healthcare, Salt Lake City, Utah, 2. University of Utah School of Medicine, Division of Geriatric Medicine, Dept of Medicine, Salt Lake City, Utah, 3. Oregon Health and Science University, Dept of Medical Informatics & Clinical Epidemiology and Dept of Internal Medicine, Portland, Oregon, 4. Oregon Health and Science University, Portland, Oregon*

Managing the health care needs of older adults with multiple chronic conditions is costly and complex. Care Management Plus (CM+) is an effective and efficient interdisciplinary team model for primary care practice redesign that fills core gaps through a proactive, flexible system, with an emphasis on care coordination and follow-up. Two main components are the introduction of a specially trained care manager(CM) at the clinic and addition of information technology(IT) tools to help organize and track the needs of their patients/caregivers. We describe the steps of assessing interested practices/groups in our dissemination efforts from 4/06-10/09 and enrollment. DESCRIPTION. Following initial contact and introduction, we asked interested healthcare sites (usually an administrative or physician lead) to complete a 25 item Readiness Assessment: practice description, identification of project lead/champion, committed resources and asked them to identify adoption goals/barriers, tools for Self-Management, information system functions, quality measures, etc. We requested information in response to every question, even if they felt their prior efforts in an area were ineffective or lacking. A consultation(usually phone) followed to: 1. present CM+ in context of their goals, for example use of CM+ database to track PHQ-2 results for screening for depression. 2. assess capabilities of the site's existing IT. 3. answer questions RESULTS. By using a streamlined process we were able to assess sites for readiness to participate, but also help them to recognize missing pieces. For example, sites that did not have a report of their insurance mix, patient populations were able to take first steps for redesigning care. The questions required communication with clinical and others promoting communication and team work. The process produced more efficient use of CM+ team resources in helping sites through the steps of implementation. 93 sites completed Assessment and subsequent implementation, increasing CM+ from 7 original sites to 100. We met our goal of reaching underserved populations and a variety of practices: large and mid-size and small non-affiliated rural primary care practices in 14 states. We've trained 178: 106

CMs, 11 (11%) from Social Work(2 RN-LCSW); 82 (77%) from Nursing: 69 RN, 7 MSN(or >), 6 LPN; 13 (12%) Other. In addition, 72 leaders: 42 (58%) Nursing, 15 (21%) MD. A carefully designed, systematic process has been crucial for this dissemination of interdisciplinary teams and IT in primary practice redesign, www.caremanagementplus.org

# SESSION 1425 (PAPER)

## MOBILITY AND FRACTURES: A FOCUS ON OUTCOMES

### HOW NURSES DECIDE TO GET OLDER PATIENTS MOVING: DEVELOPMENT OF A CONCEPTUAL MODEL

B.J. King, B.J. Bowers, *School of Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

New walking dependence has been found to occur in 16.8% to 59% of older adults in hospital settings. For older adults, the incidence of walking dependence has been associated with limited mobility during their hospital stays. Nursing has been identified as the health care provider best positioned to increase mobility and decrease new walking dependence. Studies have shown that nurses infrequently mobilize patients. Unfortunately, results from research studies are lacking in insights as to how nurses assess mobility in hospitalized older adults, when nurses consider mobilizing patients, and what barriers nurses face. The purpose of this study was to explore how nurses think about mobilization of hospitalized older adults and what affect this has on the care they provide. Grounded theory methodology was used. In- depth interviews were conducted. Initial questions were open, becoming more focused as analysis proceeded. Constant comparative analysis was used to identify core categories, dimensions and influencing conditions. Twenty-five RNs were interviewed. A conceptual model has been constructed which identifies how nurses decide whether, how, and when to mobilize patients. Key categories in the model which affect the RNs actions include a Risk/Opportunity Assessment made by nurses, the influence of a Unit Expectation, and the Purpose for Mobilizing patients. The results of this study are the first to identify how nurses conceptualize mobility. Findings indicate that experience with moving and lifting patients, knowledge about mobility, placing mobility within the nurse's domain, and unit culture has a significant impact on whether or not nurses will mobilize patients.

### EFFECT OF MOBILITY DURING HOSPITALIZATION ON FUNCTIONAL RECOVERY OF OLDER ADULTS

A. Zisberg[1], E. Shadmi[1], G. Sinoff[2,4], H. Admi[3], N. Gur-Yaish[4], E. Srulovici[1], *1. The Cheryl Spencer Department of Nursing, Haifa University, Haifa, Israel, 2. Carmel Medical Center, Department of Geriatrics, Haifa, Israel, 3. Rambam Medical Center, Haifa, Israel, 4. Haifa University, Center for Research and Study of Aging, Haifa, Israel*

Objectives: to examine mobility levels of older hospitalized adults according to their pre-admission functional trajectories and to determine the degree to which mobility affects recovery to baseline function at discharge and at one month follow-up. Methods: Five hundred and ten older (age 70 or older) acute medical patients hospitalized for a non-disabling diagnosis in a large tertiary medical center in Israel. Mobility during hospitalization was assessed using a previously developed scale. Patients were categorized according to their pre-hospitalization functional trajectory (with or without pre-admission functional decline). Outcomes were: ability to recover to baseline functional status at discharge and at one month follow-up. Results: Fifty one percent experienced a decline in functional status during the 2-week pre-admission period. Overall, 54% of patients recovered to baseline functional status. Mobility during hospitalization was twice as high among patients with no pre-admission decline. Low or moderate mobility patients experienced worse outcomes than patients with high mobility. The high, compared to the low and moderate mobility groups, had an adjusted odds ratio (OR) of 5.47, (confidence interval (CI):3.07-9.68) for functional recovery at discharge, and (OR) 3.29 (CI) 1.8-6.01 for functional recovery at follow-up, controlling for the pre-admission functional trajectory, comorbidity, age, length of stay, and other risk-factors. Conclusion: Mobility during hospitalization is an important modifiable factor affecting both patients with and without pre-hospital functional decline. High mobility is associated with better proximal and distal functional outcomes in older patients.

### THE HIP FRACTURE INTERVENTION TRIAL (HIPFIT): EFFECTS ON MORTALITY, FUNCTIONAL STATUS AND CLINICAL OUTCOMES AT ONE YEAR

M.A. Fiatarone Singh[1,2,3], S. Quine[7], L.M. Clemson[6], B. Lloyd[1], D.A. Williamson[1], T.M. Stavrinos[4], N.A. Singh[6,4,5], *1. Exercise Health and Performance Research Group, The University of Sydney, Lidcombe, New South Wales, Australia, 2. Hebrew SeniorLife, Harvard Medical School, Boston, Massachusetts, 3. Jean Mayer USDA Human Nutrition Research Centre on Aging at Tufts University, Boston, Massachusetts, 4. Balmain Hospital, Sydney, New South Wales, Australia, 5. Royal Prince Alfred Hospital, Sydney, New South Wales, Australia, 6. Faculty of Health Sciences, The University of Sydney, Lidcombe, New South Wales, Australia, 7. School of Public Health, The University of Sydney, Sydney, New South Wales, Australia*

Aims We hypothesised that HIPFIT (a multi-modal intervention to improve outcomes after hip fracture by targeting clinical syndromes related to disability or fall risk) would reduce functional dependency, and that this would be mediated by improvements in body composition, strength, gait and balance, neuropsychological function, and medical management. Methods Community-dwelling older adults (n =124; mean age 79+10 yrs) with hip fracture were randomised to 12 months of HIPFIT or usual care/control group. The intervention group received up to 11 treatments targeted to baseline deficits. The blindly assessed primary outcome was functional dependency, assessed by residential status, mortality, and observed (FIM, ALSAR) and selfreported (NHANES, KATZ) disability. Results The groups were frail and similar with respect to baseline demographics (69% female), comorbidities (9+4 medications/d), body composition (81% sarcopenic/sarcopenic-obese), nutritional status (87% undernourished/at risk; 88% vitamin D insufficient), prior functional status and falls history (39%), physical performance, cognition (38% impaired), affect (45% depressed), physical activity level pre-fracture (41% low), and quality of life (all $p>0.05$) except for bodily pain, which was worse in controls ($p<0.04$). Age-adjusted risk of death was significantly reduced in the intervention group (n=4) compared to controls [n=8; OR=0.19 (0.04-0.91; p=0.038)], but functional dependency was not. There were significant improvements in muscle strength, gait speed, balance, depressive symptoms, cognition, vision, and nutritional status in the intervention group (all $p<0.05$). Conclusion The HIPFIT intervention significantly reduced death rate and improved many postulated mediators of frailty and mortality in this cohort. However, functional independence itself in survivors was not changed significantly.

### DIABETES, PERIPHERAL NERVE FUNCTION, AND PHYSICAL FUNCTION IN OLDER ADULTS

N. Chiles[1], C.L. Phillips[2], J. Guralnik[2], K. Patel[2], *1. University of Maryland Baltimore, Baltimore, Maryland, 2. Laboratory of Epidemiology, Demography, and Biometry, National Institute on Aging, Bethesda, Maryland*

Background: Diabetes causes many complications in older adults, including decreased lower extremity function and disability. One pathway through which diabetes might decrease physical function is peripheral nerve dysfunction. We sought to determine whether diabetes is associated with objective measures of physical performance in older adults and whether peripheral nerve function (PNF) tests mediate this relationship. Methods: Cross-sectional data on 983 participants of the InCHIANTI Study, ages 65 and older were analyzed. Diabetes was diagnosed using clinical criteria. Physical performance was assessed using the Short Physical Performance Battery (SPPB; scored 0-12 with 12 as best) and usual walking speed (m/s). PNF was assessed by standard surface electroneurographic study of the right peroneal nerve and by vibration and touch sensitivity. Clinical cut-points of PNF tests were used to create a neuropathy score ranging 0 to 5 (higher values, greater neuropathy). Multiple linear regression models were used to test associations. Results: 12.8%(n=126) of participants had diabetes. Adjusting for age, sex, education, and other confounders, diabetes was associated with a decreased SPPB (β= -0.99; p< 0.01), decreased walking speed (β= -0.1m/s; p< 0.01), decreased nerve conduction velocity (β= -1.7m/s; p< 0.01), and increased neuropathy (β= 0.25; p< 0.01) compared with non-diabetics. The effect of diabetes on SPPB decreased by 20% after adjusting for nerve conduction velocity and neuropathy score; however, the association of diabetes with walking speed was unchanged when adjusting for PNF tests. Conclusions: PNF partially mediates the effect of diabetes on lower extremity function in older adults; further longitudinal studies are needed.

## SESSION 1430 (POSTER)

## PHYSICAL ACTIVITY AND FUNCTIONAL OUTCOMES

### RISK FACTORS OF FUNCTIONAL DECLINE IN THE ELDERLY IN TAIWAN

T. Lan[1], C. Chen[1], H. Chiu[2], *1. National Health Research Institutes, Miaoli County, Taiwan, 2. Kaohsing Medical University, Kaohsiung, Taiwan*

Multiple factors contribute to the decline of physical function in older adults. Results from many studies have found several risk factors of this decline, but rare studies have been conducted in Taiwan. The aim of this five-year cohort study was to examine the association between functional decline and several risk factors identified in the previous studies. Data were from a three-wave cohort study of aging, the Functioning and Aging Study in Taipei. The cohort includes 907 older adults participating in the 2005 National Health Interview Survey in Taiwan. Two follow-up interviews were conducted in 2006 and 2008-9. Functional status was assessed using six items of the Activities of Daily Living and six items of the Instrumental Activities of Daily Living. The physical functioning was further classified as being independent, with mild disability, with moderate disability, with severe disability, and dependency. Risk factors considered in the study include several factors of sociodemography, depressive status, cognitive function, chronic diseases and conditions, and lifestyle behaviors. We used both the GEE and mixed linear regression models to identify factors in relation to the decline of physical function across different waves of data. In the final models, older adults with the characteristics of older age, women, depressive symptoms, cognitive impairments, stroke, diabetes, and being sedentary had higher risk of being disabled. The factors found in the study may help understand the causes responsible for the functional decline in the elderly, and be further used to identify older people at risk of developing physical disability.

### TIME TRENDS IN AND THE DETERMINANTS OF DISABILITY AMONG ELDERLY TAIWANESE, 1994-2004

C. Chen[1], J. Mullan[2], D. Griffiths[2], I. Kreis[2], H. Chiu[3], T. Lan[1], *1. Division of Geriatric Research, National Health Research Institutes, Miaoli County, Taiwan, 2. University of Wollongong, Wollongong, New South Wales, Australia, 3. Kaohsiung Medical University, Kaohsiung, Taiwan*

This longitudinal study was conducted between 1994 and 2004 in a cohort of southern Taiwan community-living elderly residents. This study aims to investigate the longitudinal change in disability, by using a ten-year longitudinal data set with six set cross-sectional data to examine the trends of disability and the determinants. Disability was assessed using the Physical Activities of Daily Living (7PADLs) and Instrumental Activities of Daily Living (7IADLs) scales. Socio-demographic factors; socioeconomic factors; living arrangements; lifestyle behaviours and health status were chosen as the predictors of each specific disability. Generalized estimating equation (GEE) regression models were used to analyse longitudinal data on variation in disability change over time and its determinants across the same cohort. The study showed great increase in the development of disability. Especially, the PADL disabilities increased even more than IADL disabilities. The study highlighted that respondents who were older female from low SES, being single, divorced or widowed, did not exercise regularly and poor health status, especially due to hypertension, diabetes, gastrointestinal problems and depression, were at a higher risk of being disabled. It was interesting to note the moderate/severe disability (PADL) increased even more persistent than mild disability (IADL). It seems likely that chronic diseases are of central significance of most disabilities, while depression is observed as the most significant risk factor for IADL disability only. Effort to lower the trends of disability in the elderly should target the risk factors that identified in this study, and have better management of the persistent disability.

### CONCURRENT VALIDITY OF THE GAIT STABILITY RATIO DURING THE 5-METER WALK AND 6-MINUTE WALK TESTS

R.L. Cromwell[1], R.A. Newton[2], R. Buccello-Stout[1], P. Meyers[3], *1. Universities Space Research Association, Houston, Texas, 2. Temple University, Philadelphia, Pennsylvania, 3. University of Houston Clear Lake, Houston, Texas*

Age-related changes in older adults produce walking patterns that are less dynamic, demonstrate increased stability and are less efficient at moving the body forward. The Gait Stability Ratio (GSR) is an indicator of walking stability. The GSR is calculated as the ratio of cadence to walking velocity and is expressed as steps/meter. GSR can be measured during a 5-meter walk test or as part of the 6-minute walk test. The purpose of this study was to determine the concurrent validity of the GSR as measured during these two tests. Ten healthy, community dwelling older adults participated in a 5-meter walk and a 6-minute walk test. Cadence and walking velocity were measured for 3 passes of the 5-meter walk and all laps of the 6-minute walk. GSR was calculated. Analysis of variance was used to compare the mean GSR of the 5-minute walk against the mean GSR of the first 3 laps, middle 3 laps, final 3 laps and total laps of the 6-minute walk. No significant difference (p = 0.723) was found among the GSR values. Results indicate that GSR can be effectively measured in healthy older adults during both the 5-meter walk and 6-minute walk tests.

### FUNCTIONAL MOBILITY PERFORMANCE AND BALANCE CONFIDENCE IN OLDER ADULTS AFTER SENSORIMOTOR ADAPTATION TRAINING

R.R. Buccello-Stout[1], R.L. Cromwell[1], J. Bloomberg[2], G.D. Weaver[3], *1. Universities Space Research Association, Houston, Texas, 2. NASA, Houston, Texas, 3. University of Texas Medical Branch, Galveston, Texas*

Research indicates a main contributor of injury in older adults is from falling. The decline in sensory systems limits information needed to successfully maneuver through the environment. The objective of this study was to determine if prolonged exposure to the realignment of perceptual-motor systems increases adaptability of balance, and if balance confidence improves after training. A total of 16 older adults between ages 65-85 were randomized to a control group (walking on a treadmill while viewing a static visual scene) and an experimental group (walking on a treadmill while viewing a rotating visual scene). Prior to visual exposure, participants completed six trials of walking through a soft foamed obstacle course. Participants came in twice a week for 4 weeks to complete training of walking on a treadmill and viewing the visual scene for 20 minutes each session. Participants completed the obstacle course after training and four weeks later. Average time, penalty, and Activity Balance Confidence Scale scores were computed for both groups across testing times. The older adults who trained, significantly improved their time through the obstacle course $F(2, 28) = 9.41$, $p < 0.05$, as well as reduced their penalty scores $F(2, 28) = 21.03$, $p < 0.05$, compared to those who did not train. There was no difference in balance confidence scores between groups across testing times $F(2, 28) = 0.503$, $p > 0.05$. Although the training group improved mobility through the obstacle course, there were no differences between the groups in balance confidence.

### MEASUREMENT ERROR AND MINIMAL DETECTABLE CHANGE IN TIMED UP AND GO IN OLDER ADULTS

A. Goldberg[1,2,3], S. Schepens[4,1,2], *1. Dept. Healthcare Sciences, Mobility Research Laboratory, Program in Physical Therapy, Wayne State University, Detroit, Michigan, 2. Institute of Gerontology, Wayne State University, Detroit, Michigan, 3. Dept. Internal Medicine, Wayne State University, Detroit, Michigan, 4. Dept. of Physical Medicine and Rehabilitation, University of Michigan, Ann Arbor, Michigan*

Introduction: Timed Up and Go (TUG) score is a measure of functional mobility and falls risk in older adults. Minimal detectable change (MDC) represents a value for real change in TUG exceeding that of chance variation in measurement, and can be used to interpret whether changes in TUG over time represent real change in mobility, or are within the boundaries of measurement error. The purpose of this study was to quantify measurement error and MDC in TUG in community-dwelling older adults. Methods and Materials: Thirty-nine community-dwelling older adults (mean age 72.7 yrs) were included. TUG was assessed as mean time to get up out of a chair, walk 3m and return to the chair over three trials. The intraclass correlation coefficient (ICC 3,1) was computed to assess test-retest reliability of TUG. Standard error of measurement (SEM), which quantifies measurement error in absolute values, was calculated as the standard deviation of TUG score x square root (1-ICC). MDC at a 95% confidence level (MDC95) was calculated as z*SEM*÷2, where z=1.96. Results: Mean TUG was 11.94 seconds. Test-retest reliability was 0.97. SEM was 0.53s and MDC95 was 1.47s. Measurement error and MDC95 expressed as a percentage of mean TUG were 4.4% and 12.3% respectively. Discussion/conclusions: TUG has excellent test-retest reliability, low measurement error, and low minimal change in community-dwelling older adults. Real change in TUG is >1.47s in community-dwelling older adults. These results will assist clinicians and researchers in interpreting whether real change has occurred when comparing repeated TUG assessments.

### THE BURDEN OF FALLING ON QUALITY OF LIFE AMONG OLDER ADULTS WITH MEDICARE SUPPLEMENT INSURANCE

K. Hawkins[1], S. Musich[1], R.J. Ozminkowski[3], M. Bai[1], C. Yeh[2], R.J. Migliori[3], *1. Ingenix, Ann Arbor, Michigan, 2. AARP Services, Inc., Washington, District of Columbia, 3. UnitedHealth Group Alliances, Ann Arbor, Michigan*

Research Objective: To estimate the burden of falling on quality of life (QoL) among older adults with AARP® Medicare Supplement (i.e., Medigap) Insurance underwritten by UnitedHealthcare (or UnitedHealthcare of New York for insureds residing there). Study Design: A mail survey was sent to a random sample of 1,500 Medigap insureds in each of 10 states in 2008. The Medicare Health Outcomes Survey was used, but renamed the Health Update Survey (HUS) for use with a Medigap sample. Population Studied: 5,875 (39%) of the sample members responded to the study. About 21% (1,212) fell sometime in the last year; 17% (1,000) did not fall but reported balance or walking problems so were at high risk of falling; and 62% (3,663) were in the low-risk, no-fall comparison group. Principle Findings: Multiple regression analyses showed the strongest predictors of falling or being at high risk of falling to be advancing age, obesity, heart conditions, stroke, respiratory issues, inflammatory bowel disease, arthritis, sciatica, diabetes, and hearing problems. Having more of these problems increased the likelihood of falling or being at risk of falling. Average physical (PCS) and mental component scores (MCS) were about 5.6 and 3.1 points lower, respectively ($p < 0.001$ in both cases) for those who fell, than among the comparison group. Likewise, those at risk of falling averaged significantly lower PCS (-9.11, $p<0.0001$) and MCS (-2.85, $p<0.0001$) scores. Conclusions: Falling or being at risk of falling had a stronger negative influence on QoL than most of the comorbidities measured.

### THE EFFECTIVENESS OF TAILORING MULTIMEDIA-BASED FALLS PREVENTION EDUCATION FOR OLDER ADULTS

S. Schepens[1], A. Goldberg[2], V. Panzer[3], *1. University of Michigan, Ann Arbor, Michigan, 2. Department of Healthcare Sciences, Physical Therapy Program, Mobility Research Laboratory, Institute of Gerontology, Department of Internal Medicine, Wayne State University, Detroit, Michigan, 3. University of Connecticut Health Center, Farmington, Connecticut*

Objective: To determine if tailoring multimedia falls prevention education by employing evidence-based instructional strategies increases knowledge of fall threats and fall prevention behaviors in older adults. Design: Randomized control trial including two educational groups employing instructional strategies focused on Authenticity or Motivation, and compared to Controls. Participants: 53 community-dwelling older adults (ages 65+). Intervention: Multimedia-based educational interventions were designed to improve knowledge of situations representing personal fall threats and encourage fall prevention behaviors. The Authenticity group received education tailored to enhance authenticity with realistic content reflecting participants' living situations and independence levels. The Motivation group received education tailored using three motivational strategies: statement of program goals, emphasis on program benefits, and participant selection of program content. Measurements: Knowledge was measured by ability to recognize fall threats presented in ten standardized multimedia clips at baseline and ten novel clips at one-month follow-up. Participants recorded fall prevention behaviors daily for one month. Results: Unlike Controls, each intervention group showed improvements in fall threats knowledge from baseline to follow-up ($p<0.01$). Additionally, participants recognized more fall threats at follow-up than Controls ($p<0.05$). The Motivation group engaged in more fall prevention behaviors over one month compared to both the Authenticity and Control groups ($p\leq0.05$). Conclusion: Tailoring multimedia falls prevention education by utilizing evidence-based strategies addressing educational authenticity and learner motivation was equally successful in improving older adults' knowledge of fall threats. Combining motivational strategies with falls education was more effective than addressing content authenticity, however, in encouraging older adults to engage in fall prevention behaviors.

### DANCE AND OLDER ADULTS: A SYSTEMATIC REVIEW

D. Klima, E. Kuhn, K. Fiackos, D. Ethier, R. Patel, M. Treuth, *UMES, Princess Anne, Maryland*

Purpose: Recent interest in the therapeutic benefits of dance in the elderly has prompted research initiatives. Studies have used a wide variety of dance methods to improve different areas of health in older individuals. While multiple studies have been performed, there exists no single analysis of the benefits of dance with both physical and psychosocial variables. The purpose of this systematic review was to examine both the physical(balance and gait) and psychosocial (balance confidence and mood) benefits of dance among older adults. Methods: The initial literature search was completed through the Medline, CINAHL, and PsycINFO search engines. Searches were performed in each search engine with pair combinations of key words related to "dance" and "elderly." The searches were limited by the years 1996-2009, the English language, and dance as a primary intervention in an experimental or quasi-experimental study. The PEDro and APTA data bases were further reviewed for pertinent studies, along with a final hand search. Studies were categorized and rated according to levels of evidence and methodologic quality established by Sackett, the Dept. of US Health Policy and Research(USHPR), and Downs and Black. Results: Of the initial 224 studies retrieved, 20 met the designated inclusion criteria. These studies were categorized according to the following USHPR levels of evidence: 2-Level IA, 8-Level IB, 1-Level IIA, and 9-Level IIB. Within the physical performance domain, 12 studies cited significant improvement in balance ability following a dance intervention. Balance assessment occurred through both salient clinical tests and forceplate posturography. Six studies demonstrated significant improvement in gait parameters following a dance intervention, either in velocity or specific kinematic parameters. Only one study examined the fear of falling variable; however, findings demonstrated significant improvement in balance confidence using the Activities-specific Balance Confidence Scale. Of the four studies which assessed mood, there was no improvement noted in depression ratings following the dance intervention. Methodological limitations among the included studies were small sample size, limited follow-up of participants, and lack of randomization. Conclusions: Findings from this systematic review suggest areas where dance may prove particularly beneficial when targeting interventions for older adults. Older adults may benefit from dance interventions to improve overall gait and balance performance.

### THE SMILING PROJECT: DEVELOPMENT OF A NEW PROGRAM FOR GAIT AND BALANCE TRAINING

S. Rochat[1], C. Hoskovec[1], K. Aminian[2], B. Mariani[2], C.J. Bula[1], *1. Service of Geriatric Medicine, CHUV, Lausanne, Switzerland, 2. LMAM, EPFL, Lausanne, Switzerland*

Introduction: The SMILING project, a multicentric project funded by the European Union, aims to develop a new gait and balance training program to prevent falls in older persons. The program includes the "SMILING shoe", an innovative device that generates mechanical perturbation while walking by changing the soles' inclination. Induced perturbations challenge subjects' balance and force them to react to avoid falls. By training specifically the complex motor reactions used to maintain balance when walking on irregular ground, the program will improve subjects' ability to react in situation of unsteadiness and reduce their risk of falling. Methods: The program will be evaluated in a multicentric, cross-over randomized controlled trial. Overall, 112 subjects (aged ≥65 years, ≥1 falls, POMA score 22-26/28) will be enrolled. Subjects will be randomised in 2 groups: group A begin the training with active "SMILING shoes", group B with inactive dummy shoes. After 4 weeks of training, group A and B will exchange the shoes. Supervised training sessions (30 minutes twice a week for 8 weeks) include walking tasks of progressive difficulties.To avoid a learning effect, "SMILING shoes" perturbations will be generated in a non-linear and chaotic way. Gait performance, fear of falling, and acceptability of the program will be assessed. Conclusion: The SMILING program is an innovative intervention for falls prevention in older persons based on gait and balance training using chaotic perturbations. Because of the easy use of the "SMILING shoes", this program could be used in various settings, such as geriatric clinics or at home.

### CALORIC EXPENDITURE IN WII BOWLING OLDER ADULTS

E. Orsega-Smith, C. Kukich, *Department of Health, Nutrition & Exercise Science, University of Delaware, Newark, Delaware*

With the advancement of technology, new channels for individuals to become physically active have been developed. There have not been any studies which have investigated the energy expenditure of this game technology with older adults. Given that 40% of older adult females and 30% of males ages 70 and older do not participate in any physical activity, the United State faces growing health problems in this aging population. The purpose of this study was to investigate the caloric expenditure of independent older adults playing the Nintendo Wii bowling game. Fifty-one participants from local senior centers (82.4 % females, 17.6 % males) ranging in age from 59-91 years (79.37 + 7.68 years) played Wii bowling on a regular basis once per week. These were independent community dwelling overweight adults (BMI= 31.54 kg/m2). We measured energy expenditure using ACTICAL accelerometers which were placed on the participant's dominant wrist. Caloric expenditure for Wii bowling for 30 minutes ranged from 10.91- 86.09 kcals ( 46.48 + 15.73 kcals). We also compared the accelerometer data to the Wii bowling scores. Bowling scores ranged from 97-226. There was a significant correlation between Wii bowling scores (164.29 + 25.79) and kcals expended during the bowling (r =.350, p <0.05). The results of this study suggests that for some older adults, Wii bowling may be a vehicle for participating in low to moderate level physical activity. Future studies may investigate ways in which older adults maintain participation in such game technology over time.

### FEMORAL BONE DENSITY AND PHYSICAL ACTIVITY LEVEL IN OLDER ADULTS: NHANES 2004-2006

Y. Lee[1], J. Baek[1], K. Yang[2], *1. San Diego State University, San Diego, California, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

BACKGROUND: Osteoporosis is a silent but debilitating disease that can threat older adults' daily life. Regular physical activity (PA) can promote bone health. PURPOSE: To examine the status of femoral bone mineral density (BMD) and the awareness of one's own bone health condition and to determine the association of PA levels and bone conditions among older adults residing in the community. METHODS: In the National Health and Nutritional Examination Survey (NHANES) 2005-2006 data, femoral neck BMD, intensity and step counts by accelerometers, body mass index, history of fracture, and survey questions were used for the study purposes. FINDINGS: Of the total 1488 adults aged 60 years and older, 1108 were examined the BMD test; 67% and 37% of women and men represented lower than normal in bone density on the femur neck and 18% of them (n=103) were told about their low bone status; women and those with increasing age and normal body mass index had lower BMD. In PA measured by accelerometers (ACC), inactive (low) intensity activities yielded 85% of daily counts; total ACC counts, light activity counts, and step counts in light activities were higher in those with normal BMD than those with low BMD, but moderate or vigorous activities were not different between two groups. CONCLUSIONS: Low bone mineral density indicates a common health problem among older adults, but most of them are not aware their bone health condition and conduct inactive lifestyles. Public awareness about bone health is necessary to maintain older adults' physical function.

### WALKING SPEED: THE 6TH VITAL SIGN

K.K. Chui[1], M. Lusardi[1], S. Fritz[2], P.W. Duncan[3], *1. Physical Therapy and Human Movement Science, Sacred Heart University, Fairfield, Connecticut, 2. University of South Carolina, Columbia, South Carolina, 3. Duke University, Durham, North Carolina*

Background: Walking speed has been described as a nearly perfect clinical measure. Normative self-selected walking speed (SSWS) data is available for interpretation of patient data. Minimal detectable change and minimal clinically important difference for walking speed are approximately 0.1 m/sec, for meaningful improvement as well as loss of function. Consistent findings support the usefulness of walking speed as an indicator of overall health status, functional decline, morbidity and mortality. Methods: Integrative review of the literature on use of SSWS as a key indicator of functional and health status, and development of a risk "classification". Results: We present evidence supporting inclusion of SSWS speed as a "vital sign" indicator of health and functional status in the physical therapy examination. Optimal SSWS appears to be 1.2 m/s or faster. Minimum "safe" walking speed as an indicator of fair to good health and community function appears to be 1.0 m/s. Walking speeds between 0.6 and 1.0 m/s are indicative of need for further examination of potential remediable contributors to risk of functional decline and morbidity. Individuals walking at < 0.6 m/s are most at risk of dependence, institutionalization, falls and death within the next 5 years. Clinical Relevance: SSWS is a meaningful and important indicator of health and functional status. Walking speed can be used as a screening tool to identify those aging adults most in need of exercise intervention to improve endurance, muscle performance, and functional status. We, therefore, advocate that all physical therapists measure SSWS for all patients in all settings.

### THE DIAGNOSTIC ACCURACY OF THE FOUR SQUARE STEP TEST UNDER SINGLE- AND DUAL-TASK CONDITIONS FOR HEALTHY OLDER ADULTS WITH A HISTORY OF FALLS

S. Bastos, M. Lusardi, K.K. Chui, *Physical Therapy and Human Movement Science, Sacred Heart University, Fairfield, Connecticut*

Objectives: This descriptive study examined the diagnostic accuracy of the Four Square Step Test (FSST) under single- and dual-task conditions. The clinometric properties calculated include: sensitivity (SN), specificity (SP), and positive (+) and negative (-) likelihood ratios (LR). Participants: Fifty-nine healthy community-dwelling older adults (mean age = 84.97±11.38 years) participated in a functional assessment clinic at their continuing care retirement community. Subjects were dichotomized as fallers (n = 18) or non-fallers (n = 41) based on a self-reported history of falls in the previous six months. Measures: The FSST was performed as a single-task and under two dual-task conditions (manual = holding a glass of water and cognitive = counting back from 100 by serial 3s). ROC analyses were used to determine cutoff scores. Results: The optimal cutoff score for discriminating between fallers and non-fallers for the FSST as a single-task was 12 seconds (SN = .61, SP = .68, +LR = 1.91, -LR= .57). The addition of a manual or cognitive task did not improve the diagnostic accuracy of the FSST. Optimal cutoff scores for the FSST-manual was 12 seconds (SN= .61, SP= .56, +LR= 1.39, -LR=.70) and for the FSST-cognitive was 15 seconds (SN= .50, SP= .59, +LR= 1.22, -LR= .85). Conclusions: The FSST demonstrated acceptable SN and SP and the addition of a manual or cognitive task did not improve its diagnostic accuracy. Given a pre-test probability of 44% for falling, a positive FSST increased the post-test probability to 60% and a negative FSST decreased the post-test probability to 31%.

## SESSION 1435 (SYMPOSIUM)

### UNCONVENTIONAL TARGETS FOR THE STUDY OF AGING PROCESSES FROM THE NIA INTRAMURAL RESEARCH PROGRAM

Chair: *E.M. Simonsick, National Institute on Aging, Baltimore, Maryland*

Discussant: *L. Ferrucci, National Institute on Aging, Baltimore, Maryland*

The Laboratory of Epidemiology, Demography and Biometry and the Longitudinal Studies Section of the Clinical Research Branch of the Intramural Research Program of NIA have a long tradition of initiating and supporting longitudinal observational studies of aging processes. These studies and datasets serve as somewhat "timeless" resources for investigation of new and emerging research questions. In this symposium we present findings from three of these studies, InCHIANTI, the Health, Aging and Body Composition (Health ABC) study and the Age Gene/Environment Susceptibility-Reykjavik Study (AGES) with the aim to provide both an overview of these rich data resources and highlight specific and novel findings related to multiple aspects of the aging process. Data from InCHIANTI, a cohort study of older adults residing in the Tuscany region of Italy, was used to examine the relationship between olive oil consumption and longevity over 10 years, the association between vitamin D deficiency and risk of depressive symptomatology over 6 years and the genetic variation in soluble advanced glycation end product receptor concentrations which regulate inflammatory response. Data from Health ABC, comprising a biracial sample of initially well-functioning men and women aged 70-79, was used to understand how personality relates to maintenance and decline in walking speed. Lastly, data from AGES, a cohort of Iceland residents aged 66-98 was used to evaluate the relationship between red blood cell characteristics and MRI-acquired brain parameters and cognitive function. These findings add to the wealth of insightful research generated by these cohort studies and provide impetus for future work.

### OLIVE OIL INTAKE AND LONGEVITY IN OLDER ITALIANS

S. Bandinelli[1], A. Corsi[2], F. Lauretani[2], R. Vazzana[4], A. Kisialiou[2], Y. Milaneschi[3], J. Guralnik[5], L. Ferrucci[3], *1. Azienda Sanitaria Firenze, Florence, Italy, 2. Tuscany Health Regional Agency, Florence, Italy, 3. National Institute on Aging, Baltimore, Maryland, 4. University "G. D'Annunzio" of Chieti, Chieti, Italy, 5. National Institute on Aging, Bethesda, Maryland*

Adherence to a Mediterranean diet has been consistently associated with lower mortality. Olive oil, a key component of this diet, may contribute to the protective effects through high levels of monounsaturated fatty acids and other components ($\alpha$-tocopherol, carotenoids, phenols) having anti-inflammatory and antioxidant properties. We examined the association between olive oil intake and mortality over 10 years in 1139 elderly individuals (mean age 75.9) participating in InCHIANTI. Nutrient intake was estimated from the EPIC food frequency questionnaire. Using Cox regression models, higher olive oil intake was associated with lower mortality risk (1.046, 95% CI: 1.002-1.92, p=0.041) independent of BMI, caloric intake, physical activity and inflammatory markers. Persons in the third quartile of olive oil intake (22.5 - 31.1 g/day) had the best survival independent of covariates. The association between olive oil intake and reduced mortality particularly in a Mediterranean population strongly supports olive oil as a healthy diet component.

### VITAMIN D AND AND RISK OF ELEVATED DEPRESSIVE SYMPTOMS IN OLDER PERSONS: THE INCHIANTI STUDY

Y. Milaneschi[1], M. Shardell[2], A. Corsi[3], R. Vazzana[4], S. Bandinelli[5], J. Guralnik[6], L. Ferrucci[1], *1. National Institute on Aging, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland, 3. Tuscany Health Regional Agency, Florence, Italy, 4. University "G. D'Annunzio" of Chieti, Chieti, Italy, 5. Azienda Sanitaria Firenze, Florence, Italy, 6. National Institute on Aging, Bethesda, Maryland*

Recently, it has been hypothesized that hypovitaminosis D may contribute to late life depression. The few studies investigating the association between Vitamin D and depression have been cross-sectional with conflicting findings. We examined the relationship between 25-hydroxyvitamin D [25(OH)D] and depressive symptoms over time in 954 participants aged ≥65 years from the InCHIANTI Study. Serum 25(OH)D was measured at baseline. Depressive symptoms were assessed at baseline and at the 3- and 6-year follow-ups using the Center for Epidemiological Studies-Depression Scale (CES-D). Women with 25(OH)D<50nmol/L compared to those with higher levels, had significantly higher risk of developing depressed mood (CES-D≥16) over 6 years (HR=1.97, 95%CI=1.13-3.43, p=0.02). A trend was evident in men (HR=1.7, 95%CI=0.9-3.3, p=0.1). Hypovitaminosis D is a risk factor for the development of depressive symptoms in older persons. Normalization of Vitamin D levels may positively contribute to the successful treatment of depression in older persons.

### GENETICS OF OXIDATIVE STRESS: AGER GENE VARIANTS AND ADVANCED GLYCATION END PRODUCT RECEPTOR

T. Tanaka[1], R. Semba[2], J.D. Walston[2], A. Singleton[1], D. Hernandez[1], S. Bandinelli[3], L. Ferrucci[1], *1. National Institute on Aging, Baltimore, Maryland, 2. Johns Hopkins University, Baltimore, Maryland, 3. Azienda Sanitaria Firenze, Florence, Italy*

Advanced glycation end products (AGE), indicators of oxidative stress, are elevated in diabetes, cardiovascular disease and advanced age and can affect inflammation through interaction with specific receptors. Soluble AGE receptor (sRAGE) is thought to have anti-inflammatory effects by inhibiting the interaction of AGE with cell receptors. As such sRAGE have been associated with chronic inflammatory conditions. It is unknown if there are genetic variants that affect circulating levels of sRAGE, although preliminary data suggest a possible role of the AGE receptor gene (AGER) G82S polymorphism. To determine whether there are other genetic loci associated with sRAGE concentration, we conducted a genome-wide association study in the InCHIANTI study. The variant with the strongest evidence of association was located the AGER gene on chromosome 6. We replicated this finding in the Women's Health and Aging Study. This polymorphism may be used to investigate the role of AGE in pathogenesis of inflammatory diseases.

### PERSONALITY AND WALKING SPEED DECLINE: FINDINGS FROM THE HEALTH, AGING AND BODY COMPOSITION STUDY

M. Tolea[1], P.T. Costa[1], A. Terracciano[1], L. Ferrucci[1], K. Faulkner[2], M. Coday[3], H.N. Ayonayon[4], E. Simonsick[1], *1. National Institute on Aging, Baltimore, Maryland, 2. National Institute for Occupational Safety and Health, National Personal Protective Technology Laboratory/OD, Atlanta, Georgia, 3. The University of Tennessee, Health Science Center, Memphis, Tennessee, 4. University of California San Francisco, Department of Epidemiology and Biostatistics, San Francisco, California*

The relationship between personality and lifestyle behaviors and risk of specific health conditions suggests that personality may also impact mobility loss in old age. This study examines the association between openness to experience and conscientiousness and initial gait speed and decline over 3 years in 907 older adults from the Health ABC study, 740 of whom had walking speed assessed three years later. Gait speed averaged 1.2 m/s at baseline and 1/3 experienced meaningful decline. Higher conscientiousness was associated with faster initial walking speed and less decline, independent of socio-demographics, co-morbidity and depressive symptoms. Lifestyle factors mediated the baseline but not the longitudinal association. Openness was not associated with either initial gait speed or decline. Findings extend the evidence of a protective effect of conscientiousness on physical function to objective assessment of gait speed. Future studies should focus on identifying mechanisms underlying the conscientiousness mobility connection in aging adults.

### RED CELL DISTRIBUTION WIDTH AND BRAIN TISSUE VOLUMES, CEREBRAL INFARCTS, AND COGNITIVE FUNCTION

K. Patel[1], J. Vidal[1], M. Garcia[1], G. Eiriksdottir[2], V. Gudnason[2,3], T.B. Harrris[1], L.J. Launer[1], *1. National Institute on Aging, Bethesda, Maryland, 2. Icelandic Heart Association, Kopavogur, Iceland, 3. University of Iceland, Reykjavik, Iceland*

This study determined whether greater variation in red blood cell (RBC) volume in the circulation, as measured by red cell distribution width (RDW), is associated with magnetic resonance imaging (MRI) markers of brain pathology and measures of cognitive performance. Blood count, brain MRI, and cognitive function data from 4,664 participants of the Age Gene/Environment Susceptibility-Reykjavik Study (AGES) were analyzed. Participants had a mean age of 76 years and 58% were women. After adjusting for demographic and biomedical risk factors, higher RDW values were associated with significantly decreased white matter, gray matter, and total brain tissue volumes as well as increased white matter hyperintensity volume ($p=0.001$) and more cerebral infarcts ($p<0.001$) and microbleeds ($p=0.02$). Additionally, higher RDW was associated with decreased speed of processing ($p=0.003$) and executive function ($p=0.001$), but not memory performance ($p=0.49$). Greater variability in RBC volume is associated with vascular brain injury and cognitive impairment in older adults.

## SESSION 1440 (SYMPOSIUM)

### VA GRECC SYMPOSIUM: EDUCATING RURAL PRIMARY CARE PROVIDERS ON CARE OF OLDER VETERANS

Chair: *B. Kramer, VA Greater Los Angeles Healthcare System, Los Angeles, California*

Discussant: *K. Shay, VA Office of Geriatrics and Extended Care, Washington, DC, District of Columbia*

Forty per cent of Veterans live in rural areas and these Veterans are often older and in poorer health than their urban counterpart. At the VA rural Community Based Outpatient Clinics (CBOCs) there is a severe shortage of VA physicians who have had training and/or certification in geriatric medicine to serve this population. The Geriatric Scholars Program (GSP) was developed to fill this gap by providing highly focused and on-going education in geriatrics. GSP is delivered as collaboration among eight Geriatric Research Education and Clinical Centers (GRECCs). GSP is an innovative national VA in-service educational program that uses multiple educational modalities for individualized, tailored education. The program includes mandatory components (didactic education in geriatric medicine and quality improvement) and elective options (clinical practicum, distant education, mentoring). The individualized needs assessment directs each learner's program and indicates need to develop new educational activities. A web-based learning community provides ongoing support and interactions. The evaluation approach was based on Kirkpatrick's chain of impact. Key educational outcomes include enhanced knowledge and skills, greater self-perceived confidence in skills related to care of older patients, and application of new knowledge through changes in personal practices and in a quality improvement projects that would systematically impact the CBOCs. Presenters will provide an overview of the development and implementation of GSP and results from the outcome and process evaluations.

### GERIATRIC SCHOLARS PROGRAM: AN ANALYSIS OF THE LEARNING COMMUNITY

L.I. Jones, *Veterans Administration, North Hills, California*

In this paper, the experience of creating a Learning Community (LC) for the Geriatric Scholars Program (GSP) will be discussed. Both live and website components of the LC were designed to supplement the Program's mandatory in-person courses. Live online education is offered as elective educational experiences to the Scholars. As a supplement to this live online education, a web-based site was created to offer a space in which the Scholars' learning may continue to occur individually and collectively. Preliminary results indicate that Scholars utilize a wide array of LC components, with an average Scholar utilizing at least 40% of components. In a national program in which the participants are often isolated geographically and confront barriers in accessing technology, constructing an engaging and flexible LC is arguably a necessary and valuable tool to support the GSP's goal of improving care for older Veterans who live in rural areas.

### ASSESSING AND ADDRESSING GERIATRIC CARE COMPETENCY NEEDS OF RURAL PROVIDERS

N. Tumosa[1], J.L. Howe[2], J. Huh[3], *1. GRECC, Saint Louis VAMC, St Louis, Missouri, 2. Bronx VAMC, New York City, New York, 3. Palo Alto VAMC, Palo Alto, California*

The educators for the VA Geriatric Scholars Program sought to provide instruction in geriatric healthcare to physicians, nurse practitioners, and physician assistants (Scholars) who practice in rural Community Based Outpatient Clinics (CBOCs) using multi-modal educational techniques. They developed a self-evaluation assessment tool to identify Scholars' needs and learning priorities in order to develop individualized learning experiences to address those needs and priorities. A total of 63 competencies derived from the ACGME, the American Association of Colleges of Nursing, and the American Geriatrics Society were evaluated and cross-walked for a comprehensive set of interprofessional competencies. Thirty-three Scholars indicated that their greatest priorities for further geriatric education fell within the areas of Patient Care and Medical Knowledge. Six specific competencies within those two areas were identified as critical areas for additional learning. Scholars participated in a commitment to practice and systems change exercise and optional practicum experiences to address learning needs.

### THE GERIATRIC SCHOLARS PROGRAM: AN OVERVIEW

B. Kramer, *1. VA Greater Los Angeles Healthcare System, Los Angeles, California, 2. David Geffen School of Medicine at UCLA, Los Angeles, California*

The Geriatric Scholars Program (GSP) is a national in-service education program for VA primary care providers (PCP) who work in rural community-based outpatient clinics (CBOCs) that serve 40% of the nation's Veterans. The GSP is an innovative concept in VA in-service education based on individualized, tailored education through mandatory and elective options to increase knowledge and skills in geriatrics for PCP. GSP has enrolled 103 VA practitioners, representing 87 CBOCs, in 34 states, 90% of VA regional management units (VISNs); 66% of participants are physicians, 28 % are nurse practitioners, and 6% are physician assistants. Each of the current class of GSP has initiated personal practice changes to improve care for older Veterans (e.g., screening for dementia, using a standardized assessment instrument, screening for fall risk) and is leading a local quality improvement project (e.g., screening for osteoporosis risk among male Veterans, reducing polypharmacy, improving recognition of dementia).

### CLINICAL PRACTICA: AN EDUCATIONAL ENHANCEMENT OF THE GERIATRIC SCHOLARS PROGRAM

R. Chernoff[1], C. Alessi[2], B. Kramer[2], M.J. Saunders[3], N. Tumosa[4], *1. Central Arkansas Veterans Healthcare System GRECC, Little Rock, Arkansas, 2. VA Greater Los Angeles GRECC, Los Angeles, California, 3. South Texas Veterans Healthcare System GRECC, San Antonio, Texas, 4. St. Louis VAMC GRECC, St. Louis, Missouri*

In order to expand opportunities for Geriatric Scholars to gain skills in geriatric assessment, GRECCs collaborating in this program provide a variety of mentored clinical experiences. One strength of the GRECC network is that each center has unique research, clinical and educational foci. Building on each Centers' expertise, we developed a variety of practical clinical experiences to support the intensive didactic education in geriatrics the Scholars receive, and to address additional educational needs self-identified by the Scholars. The Clinical Practicum educational strategies include: 1) observational clinical experiences in various care settings such as Geriatric Evaluation Units, Geriatric Rehabilitation Units, Adult Day Health Care, Home Based Primary Care, Medical Foster Homes, ACE Unit Delirium Rooms, and Geriatric Emergency Rooms, 2) practical experiences performing geriatric assessments with volunteer or standardized patients, and 3) self-study materials. These clinical practica enhance the Scholars' clinical experience with geriatric patients.

## SESSION 1445 (SYMPOSIUM)

### DEVELOPING NEW OR ADAPTING INTERVENTIONS: SETTING SPECIFIC CONSIDERATIONS IN LONG-TERM CARE

Chair: *S. Zimmerman, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*
Discussant: *K. Pillemer, Cornell University, Ithaca, New York*

Researchers appreciate the importance of efficacy and effectiveness research, but they are not as familiar with how to adapt efficacious/effective interventions for use in settings other than those for which they were developed (which limits their utility); further, little has been written about setting-specific issues to consider when developing interventions that are intended to be adopted into practice. This symposium will present issues, challenges, and proven strategies to develop and/or adapt efficacious/effective setting-specific interventions in four areas. The first presentation will address how an efficacious falls prevention program developed for nursing homes was adapted for assisted living; it will present matters related to the program's development as well as implementation and outcome data indicating marginal success despite limited implementation. The second presentation will address how and why an efficacious intervention on staff-family "conflict" in nursing homes was modified into one focused on family involvement to improve resident quality of life in assisted living and nursing homes, and the activities families chose to increase their involvement. The third presentation will address the development of a new intervention to reduce antibiotic prescribing in nursing homes and assisted living; it will discuss how information was obtained to guide the program's development and differences in implementation across settings. The last presentation will discuss why and how prior work to use lighting to reduce behavioral symptoms of dementia in long-term care settings was adapted for use in home-based settings, as well as considerations related to assessing fidelity while minimizing caregiver burden.

### IMPLEMENTATION OF A FALLS PREVENTION PROGRAM IN ASSISTED LIVING SETTINGS

C. Mitchell[1], S. Zimmerman[1], C. Giuliani[1], P. Sloane[1], A.M. Greene[2], K. Nyrop[1], E. Walsh[3], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. RTI International, RTP, North Carolina, 3. RTI International, Waltham, Massachusetts*

Falls have a significant impact on resident quality of life in residential care/assisted living (RC/AL) settings. Each year, over half of residents in these settings experience a fall, many of which result in fractures or other serious injuries. Staff in RC/AL often have little or no training in how to assess or manage resident falls risk. In this presentation, we will describe the adaptation to RC/AL of an efficacious falls reduction program for nursing homes to the RC/AL setting. Facilitators and barriers to implementation encountered in this preliminary study will be discussed. Additionally, we will describe the residents who participated in the evaluation (n=227) and present resident-level outcome data. Pre-post resident falls risk scores as measured by the Morse Falls Scale were marginally better (p=.07) between intervention and control sites. These results suggest that it is possible with modest changes in facility procedures and staff training to improve resident outcomes.

### DEVELOPING AN INTERVENTION TO PROVIDE FAMILIES A ROLE IN LONG-TERM CARE

S. Zimmerman, L.W. Cohen, J. Cagle, T. Washington, L. Penny, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Families Matter in Long-Term Care is an intervention based on an efficacious communication program originally developed to reduce staff-family conflict in nursing homes. Use of the original program and translational testing in assisted living indicated cause to focus staff-family communication on strategies to better involve family in promoting resident quality of life. To date, over 150 families have participated in Families Matter and created personalized activity plans (comprised of 274 distinct activity ideas; average 1.8 activities/family). This presentation will overview the development and implementation of Families Matter in the context of the larger randomized controlled trial in which it occurs, and also will discuss facilitators, barriers, and solutions for implementing a collaborative intervention in long-term care. Finally, it will present data about the specific activities (coded into 6 macro and 30 micro codes) in which families desire greater involvement, and the family, resident, facility, and activity characteristics associated with success.

### DEVELOPING A FEASIBLE INTERVENTION TO REDUCE INAPPROPRIATE ANTIBIOTIC PRESCRIBING IN LONG-TERM CARE

P. Sloane, S. Zimmerman, *University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Inappropriate overprescribing of antibiotics is believed to be a significant factor contributing to drug resistance. Using experiences from an ongoing project, this presentation will discuss issues involved in developing an intervention aimed at reducing inappropriate antibiotic prescribing in nursing homes and assisted living. Steps in intervention development included identifying key conditions where inappropriate prescribing is most likely, conducting an evidence-based literature review, selecting study sites, and using community-based participatory approaches to fashion the study intervention. Issues that will be discussed include: (a) how to manage the fact that the decision-making process involves a nurse/offsite physician dyad; (b) accommodating differing points of view in protocol design (e.g., between specialists in infectious disease and geriatricians); (c) selection of facilities and practices (randomization versus purposive strategies); (d) how to most effectively present recommendations to physicians; and (e) from a research perspective, how to study instances when antibiotics are not prescribed.

### DEVELOPING A HOME-BASED INTERVENTION TO TEST THE EFFECTS OF LIGHT THERAPY ON SENIORS WITH DEMENTIA

L.W. Cohen[1], P. Sloane[1], M. Figueiro[2], S. Zimmerman[1], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. Rensselaer Polytechnic Institute, Troy, New York*

For older adults with dementia who live at home, abnormal sleep patterns disrupt the entire household. Medications are only modestly effective and have prominent adverse effects; so a safe, effective alternative could help persons with dementia remain at home. Light therapy can effectively treat many sleep disorders by entraining the body's circadian system, and has shown some success in institutional settings. Based on prior studies and new laboratory findings regarding the impact of various light spectra on circadian systems, we designed a randomized, controlled clinical trial to examine the effect of two lighting interventions, (two intensities and light spectra) on sleep, mood, and retinal health of older adults with dementia who live with a family caregiver. This presentation will present the rationale and approaches used to implement an individualized, technically–sophisticated lighting intervention in the home setting, including innovative ophthalmologic screening procedures, and promising new tools to establish treatment fidelity.

## SESSION 1450 (PAPER)

## HOUSING, NURSING HOMES, AND RESIDENTIAL CARE I

### IMPACTS OF A "RESIDENT FOR A DAY" EXPERIENCE ON INFLUENCING CULTURE CHANGE AND PERSON-CENTERED CARE

J. Johs-Artisensi, P. Lentz, J. McKee, *Health Care Administration, University of Wisconsin - Eau Claire, Eau Claire, Wisconsin*

Many nursing homes today are still providing resident care based on an institutional medical model. Although there has been a grassroots effort over the past decade to shift to a more social-model that delivers person-centered care in a homelike environment and better supports the social well being of older adults living in long term care settings, finding ways to influence leaders to take on the challenge of undergoing such a transformation has been difficult. We conducted a content analysis of the discourse in reflective narratives of a 24 hour simulation experience where future administrators live as a resident for 24 hours – pushing a call light when they need to toilet, eating pureed food, being transferred using a Hoyer lift, and a variety of other activities, to evaluate the impact of the experience on future leaders to implement Culture Change. This qualitative study reviewed 55 narratives from participants in 42 different long-term care settings. Our analysis revealed perspective changes in participants, both in terms of a more empathetic view of the resident experience, as well as organizational practices necessary to support resident-centered care. Major themes emerged from the discourse that suggest a deeper understanding of and appreciation for the resident experience and the value of resident-centered care. In addition, participants indicated they experienced significant perspective changes and indicated a desire to lead their future organizations with a resident centered care philosophy.

### CHOICES OF CONSUMERS IN PURCHASING HIGH-QUALITY NURSING HOME CARE

N.J. Zhang, *Department of Health Management and Informatics, University of Central Florida, Orlando, Florida*

Objective: Consumer-directed care has been designed to produce incentives for consumers to utilize low cost and high quality healthcare services. This study aims to understand the consumers' choices and behaviors of purchasing high-quality nursing home care. Data and Measures: Residents admitted in nursing homes in 2008 and long-term stay nursing home residents in 2008 in U.S. are the target study populations. 2008 Minimum Data Set, Online Survey Certification and Reporting data, CMS QM and ARF data are main data sources. High-quality nursing homes are hypothesized to attract not only local residences but also consumers who live in remote areas. Results: The study results show that about 25% nursing home residents live in the same zip code as their prior primary residence. About 70% of them chose a nursing home that is within 10 miles distance from their prior primary residence. There is a weak but statistically significant association between the quality of nursing home care and the average distance customers travel to seek care in a facility after controlling for resident characteristics including severity, family, organizational and market characteristics. Conclusions: It suggests that consumer choices of purchasing nursing home care are not completely quality driven and closeness to prior home and family are still the primary factors in their decision making in choosing nursing homes. How to encourage consumers to utilize high-quality nursing homes within acceptable distances using financial leverage and education strategies is a challenge to improve wellbeing of resident outcomes and reduce the cost of Medicare and Medicaid.

### NURSING HOME CULTURE CHANGE: ASSESSING CORE ELEMENTS OF IMPLEMENTATION OVER TIME

M. Lepore, S. Miller, R.R. Shield, *Brown University Center for Gerontology & Health Care Research, Providence, Rhode Island*

Nursing homes (NHs) are striving to transform from medical-like institutions to homelike environments offering personalized care. Core elements of NH "culture change" include resident-centeredness, staff empowerment, and homelikeness. Planetree—an emergent culture change initiative—drives change in NHs through a multistage process of continued assessment, including focus groups with stakeholders, guidelines for change, and annual evaluation of organizational progress following implementation. To identify barriers and facilitators of culture change, we examined transcripts from focus groups with residents and non-supervisory staff in two NHs during the preliminary stages of Planetree implementation (n=162) and after one year of implementation (n=173). Analysis of focus group data reveals numerous themes associated with the core elements of culture change and shows successes and shortcomings associated with Planetree implementation. Several factors regarding resident-centeredness are identified as beneficial, including resident involvement in committees. Identified barriers to resident-centeredness include the lack of staff response to residents' concerns. Rude treatment by leadership and lack of involvement in decision-making are commonly noted hindrances to staff empowerment, whereas strong orientation programs and flexible scheduling are identified as empowering. Space for guests to gather and accessible outdoor areas are identified as important environmental features, but small rooms and lack of amenities, such as adequate storage spaces, are characterized as deterrents to homelikeness. Overall, findings highlight feasible strategies for, and common hindrances to changing NH cultures. Focus groups aid the assessment of NH culture change initiatives and suggest that integrated community-wide efforts be employed. Research to explore variations among stakeholders' priorities is encouraged.

### PERCEPTIONS OF ADVERSE EVENT DISCLOSURE AMONG NURSES IN NURSING HOME SETTINGS

L. Wagner, K. Hodgson, K.C. Reid, *Baycrest Centre for Geriatric Care, Toronto, ON, Canada*

There is increasing attention being paid to disclosing harmful events to nursing home (NH) residents and their families; however, there is a significant gap between these expectations and current practice. The purpose of this study is to identify and list the factors influencing nursing error disclosure among nursing staff working in NH settings. Self-administered mailed surveys were sent to a randomly selected sample of 3000 registered nurses and registered practical nurses employed by Ontario NHs. From the 1180 nurse respondents, differences were found between groups assigned to two clinical scenarios, whereby participants responding to the serious error scenario were more likely to provide full disclosure than those participants responding to the minor error scenario. Only 18.7% of respondents had received education on disclosing errors to residents; 95.4% of respondents indicated that they are somewhat (32.5%) or very (62.9%) interested in receiving this type of education. The data obtained in this study aids to quantify and prioritize the necessary areas of disclosure education needed for nurses, and will be used in future studies to assist in the development of intervention strategies and policies aimed at improving nursing error disclosure.

## SESSION 1555 (SYMPOSIUM)

### OLLIE RANDALL AWARD SYMPOSIUM: LONG-TERM CARE AND THE ROLE OF THE NON-PROFIT AGING NETWORK

Chair: *L. Polivka, The Claude Pepper Foundation, Inc., Tallahassee, Florida*

Long-term care policy has not been a major priority at the national level for several years and only a handful of state legislatures have treated the issue as a priority. Over the next 20 years, however, LTC is likely to become a top domestic policy issue at the state and federal levels as the 80plus population grows and costs of care escalate. This panel will explore the implications of the latest research for the future of LTC policy, focusing on the relative roles of the public and private sectors, including families and individuals in the financing and administration of LTC services. Two of the panelists (Applebaum and Polivka) will use findings from the analysis of state level costs and outcome data to assess the effectiveness of current publicly funded LTC systems and the implications of these findings for state and federal LTC policy. The other 2 panelists (Richard Browdie and James Firman) will make presentations on the capacity of the private, non-profit aging network to provide a comprehensive array of LTC services efficiently and effectively, the implications of the health reform debate and outcomes for LTC policy at the state and federal levels. These 2 presentations will also address the potential for enhancing the aging network's LTC capacities through changes to the Older Americans ACT.

### IF OHIO CAN DO IT, SO CAN YOUR STATE: REFORMING LONG-TERM CARE, A STATE EXAMPLE

R. Applebaum, *Miami University, Oxford, Ohio*

By most indicators Ohio has trailed the nation in creating a balanced system of long-term services and supports. The state has a large supply of nursing home beds per capita, has ranked in the top ten in reimbursement, and has spent a larger portion of its Medicaid funds on nursing homes than most other states. On the other hand, Ohio has changed the ratio of Medicaid long-term care users from 91% nursing home in 1993, to 60% nursing home in 2008. Ohio's home care waiver program for older people is one of the largest in the U.S., serving more than 30,000 participants in 2008. Ohio has now established a Unified Budget Workgroup,created to restructure the state's approach to financing and delivering long-term services and supports. Using 16 years of longitudinal data this presentation describes changes in Ohio's system that have occurred and the barriers to develop a more balanced system.

### USING THE AGING NETWORK TO CREATE AN EFFICENT AND COMPASSIONATE LONG-TERM CARE SYSTEM

L. Polivka, *The Claude Pepper Foundation, Inc., Tallahassee, Florida*

In many states most publicly supported LTC services offered in the community are administered through the private, non-profit aging networks, which include Area Agencies on Aging and service providers. This LTC system stands in contrast to the U.S. health care system which is dominated by for-profit insurance and managed care companies. Some of these companies have moved into LTC services in several states in recent years and are now emerging as a competitive alternative to the aging network. This presentation will review results from several studies conducted in Florida since 2003 which consistently show aging network managed LTC programs are more cost-effective than for-profit HMO managed programs. These findings plus those from other states will then be integrated into a broader perspective (efficiency and ethics) to make the case for making the aging network the administrative centerpiece for all publicly supported LTC services.

### THE OPTIMAL ROLE OF THE AGING NETWORK

R. Browdie, *Benjamin Rose Institute, Cleveland, Ohio*

Long term services and supports is distinguished from health care by the extended time frame over which services are provided, the prepndernce of paraprofessional roles involved, and the intimacy and repetitive nature of those services. As a result, the role of personal discretion and preferences and the assurance of autonomy and personal dignity are significantly more important in the making of decisions. In addition, the service systems themselves are widely different from place to place. A locally based and state supervised approach to suporting decision-making of people needing LTSS and their families, as well as to manage the outflow of public resources has proven flexible and effective.

The Aging Network is best suited to the necesssary mission of optimizing the match between conumer needs and preferences and the effective use of scarce public resources.

### NATIONAL LONG-TERM CARE POLICY AND THE ROLE OF THE AGING NETWORK

J. Firman, *National Council on Aging, Washington, District of Columbia*

Against all odds, several major long-term services and supports provisions were included in final health care reform bill including the CLASS Act, the Elder Justice Act, and key elements of Community First Choice Act and the Empowered At Home Act. Jim Firman will discuss the political dynamics that led to these succesful outcomes as well as the important implications of these provisions for the aging services network.

# SESSION 1560 (PAPER)

## NATIONAL POLICY ISSUES AND AGING II

### THE BRIGHT SIDE OF AGING: REFRAMING THE DEBATE

M.K. Gusmano[1], K. Okma[2], *1. The Hastings Center, Garrison, New York, 2. New York University, New York, New York*

In last three decades of 20th century public debates about population aging has often been framed in alarmist terms, with little attention to underlying assumptions of the claims in the debate or to developments in other countries. A nested set of assumptions about long term developments and future expectations - regarding the level and direction of public spending and inter- and intra-generational transfers – shape this debate. In this paper, we seek to unravel these arguments, clarify empirical evidence and critically assess the underlying assumptions in the debates about the aging of our society. We argue that the framing of the debate is based on a fundamental shift in the image of older persons from an image of older persons as the source of wisdom and advise, to objects of government policies and, finally, to older persons as a burden to society. To address the consequences of aging, we need to reframe the debate in more realistic terms, based on empirical evidence and realistic assessments of the changing needs and demands of older persons, rather than on imagery. Furthermore, we must provide more opportunities for older persons to participate actively in debates about pension and health policy.

### WELFARE REFORM AND OLDER IMMIGRANTS' LABOR MARKET OUTCOMES:THE IMPACTS OF MEDICAID ELIGIBILITY RESTRICTIONS ON EMPLOYMENT AND WORK HOURS

Y. Nam, *1. Washington University, Saint Louis, Missouri, 2. SUNY, Buffalo, Buffalo, New York*

Background: The welfare reform bill of 1996 limited noncitizen's access to Medicaid and other public benefits by imposing restrictive eligibility rules. The bill prohibits states from providing federally-funded Medicaid benefits to recent immigrants who came to the U.S. less than 5 years ago. As a result, only 10 generous states provide Medicaid to recent immigrants through state-funding program. This study investigates whether and how Medicaid eligibility affected older immigrants' labor market outcomes after welfare reform, focusing on state eligibility rules. Method: This study conducts secondary data analyses using individual level data from the Current Population Survey and state-level Medicaid policy data. Individual-level data cover both pre- and post-reform periods (1994 to 1996 and 2003 to 2008). State-level data were collected by the author, using various sources (e.g., state Medicaid manuals and interviews with Medicaid directs). The dependent variables in this study are labor market status (active or retired), current employment status, and work hours. This study employs a differences-in-differences analysis that compares changes in labor market outcomes among older immigrants who live in generous states to those who live in non-generous states. Results: Multivariate analyses show that older immigrants' labor market status and current employment do not differ between pre- and post-reform periods and between generous and non-generous states. Older immigrants' work hours significantly increased after welfare reform but did not differ between generous and non-generous states. Conclusions: The results suggest that generous Medicaid eligibility rules did not have negative impacts on older immigrants' work efforts.

### NEWSPAPER PORTRAYALS OF NURSING HOMES IN THE U.S.: EPISODIC TREATMENT OF TOPIC AND TONE, 1998-2008

E.A. Miller[1], J. Rozanova[2], V. Mor[2], *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. Brown University, Providence, Rhode Island*

Policy theory reserves a prominent role for the mass media in the agenda setting process, both by shaping political messages and defining problems for the general public and government officials. Although observers have long highlighted media depictions of nursing home (NH) scandals, no study has systematically examined the way in which NHs have been portrayed in the national media. This study examines how NHs were depicted in four widely read national newspapers—The New York Times, Washington Post, Chicago Tribune, and Los Angeles Times. Keyword searches of the Lexus Nexus database were used to identify 1,464 articles about NHs during 1998-2008. The content of each article was analyzed and general tone and themes assessed. Fifty percent were published from 1999 to 2001; a comparatively high percentage (10.5%) was published in 2005 as well. Most articles were negative (45.2%) or neutral (44.7%) in tone; very few were positive (10.2%). General tone varied over time, however. Broad themes included quality/quality improvement (42.3%), financing (30.9%), rebalancing (6.5%), and negligence/fraud (24.6%). These too varied over time. Articles about rebalancing were least frequently negative (31.6%), followed by quality and financing (~45.0% each), and negligence/fraud (76.7%). Findings highlight the episodic framing of NH coverage among four national newspapers, not only with respect to tone but also with respect to shifts in media attention from one aspect of this complex issue to another. Future research should examine the relationship between media framing and changes in the policy agenda related to NHs, both across jurisdictions and over time.

### THE DEMISE OF SOCIAL HMOS: THE RISE AND DECLINE OF INTEGRATION IN ACUTE AND LONG-TERM CARE POLICY IN THE U.S

W. Leutz, *Heller School, Brandeis University, Waltham, Massachusetts*

After 25 years of coordinating acute care and long-term care (LTC) in a managed care model, Social HMOs will end operations in December 2010. This presentation provides (1) a brief history of the Social HMO and what was learned, (2) 25 years of data on benefits, populations, utilization, and costs, (3) Medicare policy changes that ended the project, and (4) reflections on service integration in the U.S. Pursuant to 2003 reforms of Medicare insurance for acute care, in 2007 the federal government informed Social HMOs that two key supports would be phased out: disability-adjusted Medicare payments, and the ability to transfer savings on acute care costs to LTC. These two supports for integrated services were maintained only for two special programs serving low-income persons who are also eligible for Medicaid insurance for low-income persons: the PACE program (in 30 states serving about 18,000 persons) and dual-eligible demonstrations (limited to three states serving about 50,000 persons). By ending Social HMOs, Medicare withdrew its support for integrating acute and LTC for non-poor persons. Concurrently, Medicaid attention turned to integrating LTC services under the banner of consumer choice. Integration with acute care services is not a goal of these initiatives. Serious efforts to coordinate acute and LTC in the US will require a return of a willingness to acknowledge the problems of fragmented acute and LTC services, a readiness to develop strong policy initiatives to compel public programs and private providers to participate, and willingness to continue initiatives until results are achieved.

## SESSION 1565 (SYMPOSIUM)

### SOCIAL INEQUALITIES IN HEALTH AMONG OLDER POPULATIONS IN DEVELOPING WORLD SOCIETIES: COMPARATIVE PERSPECTIVES

Chair: *I. Aboderin, Oxford Institute of Ageing, University of Oxford, Oxford, United Kingdom*

Discussant: *A. Chan, Department of Sociology, National University of Singapore, Singapore, Singapore*

A growing body of research examines social inequalities in health in old age within and between nations. Most studies have focused on Europe and North America showing clear disparities in health - with higher social position related to better outcomes. The gradient is thought to reflect differential levels of socio-economic resources, environmental or occupational exposures and stress-related effects of relative social position over the life course. Much less is known about health disparities among older populations in the developing world. Patternings observed in the industrialized world cannot simply be generalized to developing regions, given their very different historical, economic, social, cultural and policy contexts. Yet, only few Asian and Latin American studies have emerged in recent years, while research in Africa has barely begun. A greater understanding of old age health inequalities in developing world societies is urgently needed: not only to promote apposite policies for their ageing populations, but also to advance the scientific debate on health and ageing globally. The symposium illuminates social disparities in health among older populations in Africa, Asia and Latin America from a unique comparative perspective. Three speakers will present new evidence on SEP-health gradients, underlying determinants and policy implications from Nigeria, Thailand and Chile. A subsequent discussion will reflect on major cross-regional (dis)similarities and themes and distil key queries for further debate and research.

### ASSOCIATIONS BETWEEN SOCIOECONOMIC STATUS INDICATORS AND HEALTH OUTCOMES AMONG OLDER ADULTS IN THAILAND: RESULTS OF A LARGE SAMPLE SURVEY

Z. Zimmer[1], V. Prachuabmoh[2], *1. University of Utah, Salt Lake City, Utah, 2. Chulalongkorn University, Bangkok, Thailand*

While socioeconomic status (SES) has long been recognized as an important correlate of health in developed countries associations in developing societies are less apparent. Thailand is an interesting example, being characterized by both rapid aging and socio-economic development. This combination generates questions regarding how SES functions to influence health and what associations might mean for health inequalities in a developing and aging society. This study uses survey data collected by Thailand's National Statistical Office in 2007 from over 50,000 Thais aged 50+. Analysis test the hypothesis of a relationship between a set of SES indicators (education, income, wealth) and health outcomes (functioning and self-assessed health). Results are contrasted with a previous study using 1994 data. Since social and economic development over the thirteen years has been dramatic, the comparison can serve to highlight changes in the way in which the social environment is acting upon the health of older adults.

### SOCIAL FACTORS AND HEALTH: RESULTS FROM THE IBADAN STUDY OF AGEING

O. Gureje, L. Kola, *University of Ibadan, Ibadan, Oyo State, Nigeria*

Social factors bear important relationships to health outcomes as well as to access to health care in old age. The rapid changes taking place in developing countries may deepen social inequalities in health among the elderly in those countries. This presentation will focus on data derived from the Ibadan Study of Ageing, a longitudinal cohort study of community-dwelling elderly persons aged 65 years and over, being conducted in the Yoruba-speaking parts of Nigeria with a population of over 25 million people. Results from the baseline and follow-up assessments have shown that health outcomes, both mental and physical, are related to social factors such residence, economic status, and availability of social support and network. These factors also often affect the availability of informal caregiving to elderly persons in need as well as the burden experienced by persons providing such care to elderly persons.

### SOCIAL AND ECONOMIC FACTORS SHAPING OLDER PEOPLE HEALTH DISPARITIES IN LATIN-AMERICA. THE CASE OF CHILE

C. Albala, *Public Health Nutrition, INTA, University of Chile, Santiago de Chile, Chile*

This paper examines older people disparities in a cross sectional population based representative sample of people residing in Chile done in 2009. Inequalities in the social security, access to education and income as the main social determinants of health disparities will be presented. We will be able also to show the effects of the demographic origin, the income and the education in gender and social differentials in health status based in the follow up of 3 cohorts of different socioeconomic status and demographic origin. The results of the cross sectional study evince important differentials in chronic diseases, functional limitations, disability, cognitive impairment and depression with higher rates in women than in men and higher in the low socio economic status (SES) than in the high SES. Low levels of education arise as one of the main determinants of gender and SES health inequalities in Chile.

## SESSION 1570 (POSTER)

### SUCCESSFUL AGING - SRPP POSTER SESSION

### THE KEY POINT OF SUCCESSFUL AGING—EFFECTS OF SOCIAL PARTICIPATION AND RECREATIONAL ACTIVITIES OF ELDERS

S. Tseng, M. Lu, *Chia-Nan University, Kaohsiung City, Taiwan*

Aging societies have been focusing on the issue of successful aging globally, and paying more attention to the level of elders' physical function for a long time. In fact, there are not enough data indicated that how the elderly who have chronic diseases adjust the aged life successfully. This study aims to find out the styles of elders' daily activities from two perspectives: social participation and recreational activities and to analyze the effects of elders' daily activities on their life. The subjects were the elderly living at home in Taiwan. The data were collected by the semi-structural questionnaires with face to face interviews. Elders' 7-day activities were recorded by the open recording method. There were 995 subjects that excluded the unqualified cases and the ones with incomplete data. The responding rate was 90.4%. The results showed that the most popular social participation activity is neighborhood exchange visits (89.6%) and the second is aged group organizations (61.2%). The mainly recreational activities were raising pets and traveling (were 84.6% and 70.1%). In a word, the elderly had more interests to join the recreational activities than to participate in the social/community activities. The results also revealed the elders' physical function, social support and life satisfaction all have positive effects. Meanwhile, their social /community participation status, and the physical function, mental health and family relationship were significantly influenced by elders' recreational activities when other variables were controlled in the regression analysis. The researcher suggested that the policies of the elders' social welfare should be more stressing on their social activities from diverse viewpoints.

## VARIANCE IN ACTIVITY MEASURES ACROSS PUBLIC USE AGING SURVEY INSTRUMENTS: CONTENT ANALYSIS FINDINGS

M. Putnam[1], N. Morrow-Howell[3], M. Inoue[2], J.C. Greenfield[3], *1. School of Social Work, Simmons College, Boston, Massachusetts, 2. Boston College, Boston, Massachusetts, 3. Washington University in St. Louis, St. Louis, Missouri*

This poster presents findings of a study investigating the variance in activity measures across five public use data sets: National Health Interview Survey, Panel Study on Income Dynamics, Midlife in the United States, Health and Retirement Study, and Americans Changing Lives. Aims were: 1) To determine the amount and type of activity-related variables, 2) To determine if discrete activities can be grouped into conceptual domains to facilitate parsimonious empirical analysis of activity engagement among older adults. Data collection/analysis was completed using the qualitative method of content analysis. Methodology and means of establishing reliability and ensuring scientific rigor are discussed. Results indicate existence of 10 distinct conceptual activity measurement domains with all data sets containing at least 6 domains. Number of variables ranged from 41 in HRS 2007 to 165 in MIDUS Wave 2. Activity measures were divided into primary and descriptive. Dominant measurement type varied by data set with binary, ordinal and interval represented most often. Similarity of measures between data sets and within waves of a single data set is reported. Three primary findings - variation in the number and type of activity measures, predominant types of activity measures, and variance in content covered within a domain are discussed in terms of their relevance to empirically consolidating activity measures into composite variables to assess antecedents and outcomes of participation in multiple activities by older adults.

## THE CHANGE OF SELF-RATED HEALTH AND ECONOMIC STATUS OVER TIME AMONG KOREAN WIDOWED AND MARRIED ELDERS

Y. Lim[1], H. Yoon[1,2], *1. Hallym University Institute of Aging, Chuncheon, Republic of Korea, 2. Hallym University, Department of social welfare, Chuncheon, Republic of Korea*

Cross sectional studies about the quality of life among elderly suggests that widowed elders are unhealthier and poorer than married elders. Using longitudinal data of Korean elders, this paper examines: (1) the difference of the self-rated health status changes over time between widowed and married elders, (2) the difference of the self-rated economic status changes over time between widowed and married elder. Analyses are based on data from Hallym Aging Panel Data that is the Survey on the Quality of Life of the Elderly, a stratified multi-stage probability sample of older adults living in the cities of Seoul and Chuncheon in Korea. The first wave of data collection occurred in 2003 followed by additional surveys in 2005, 2007, 2009. Analytic sample consists of 232 widowed and 355 married individuals who are 60 and over. We applied the latent growth model and multiple group analysis using Amos. The results were as follows (1) both groups evaluated their economic status getting better over time, (2) widowed persons rated their economic status lower than married older adults, (3) widowed elders evaluated their health status same as married elders and the changes over time were not different, (4) through additional analysis, widowed age was an important variables to influence the economic status. Findings suggest that (1) social service for widowed elders may be focused more financial supports and (2) the widowed persons in later life is much more vulnerable in their finance, so the social consideration is needed for older-older persons.

## PRODUCTIVE ENGAGEMENT IN LATER LIFE AMONG RETIREES IN FIVE MAJOR CITIES IN CHINA

A. Mui, H. Chen, *Columbia University School of Social Work, New York, New York*

This study examines perception of later life satisfaction and productive engagement activities among Chinese aged 60 and older in Beijing, Shanghai, Guangzhou, Changchun, and Urumchi (n = 409) in 2004. Findings show that about 90% of the study participants reported excellent to good health when compared to their peers. Almost 70% of respondents were socially active and had been involved in different kinds of social activities in the community. Forty-five percent expressed interest in lifelong learning and education programs. However, 35% had not been informed about late-life educational opportunities. With regard to volunteering, 65% of the respondents did not know about the concept of volunteering but 47% expressed interest in participating in volunteering activities if given the opportunity. When asked about their perception in life, respondents expressed that they would be happy and satisfied if they had support from spouses and relatives; had the ability to do self-care and to adapt when they became ill; had opportunities to participate in social activities; had regular contact with adult children and grandchildren; and had opportunities to be with older acquaintances and to make new friends. Findings point to the need to design different productive-aging programs in these major Chinese cities.

## THE RELATIONSHIP BETWEEN FUTURE TIME PERSPECTIVE, INTRINSIC REWARDS OF WORK AND RETIREMENT PLANNING

T. Yang, S. DeVaney, *Purdue University, West Lafayette, Indiana*

The purpose was to examine how future time perspective and intrinsic rewards of work influence retirement planning. Data from the first wave of the Health and Retirement Study were used. It was hypothesized that future time perspective would increase retirement planning, while intrinsic rewards of work would have a negative relationship with retirement planning. Future time perspective was measured by: the remaining work life expectancy, chance of working full-time after 62, and chance of working full-time after 65. Intrinsic rewards of work was measured by: the importance of work compared to money and whether a person would work if no pay was available. Retirement planning was measured by whether the participant: had thought about retirement, discussed retirement with friends, attended meetings on retirement, and had a plan for retirement. Structural equation modeling were used with 5 covariates: education, gender, race, marital status, and pension eligibility. The results showed that each construct had a significant positive relationship with their indicators. The indices of overall model fit were acceptable (GFI=.97; AGFI=.95; RMSEA=.06). As hypothesized, future time perspective positively influenced retirement planning ($\gamma$=-.04, p=.001) and intrinsic rewards of work negatively influenced retirement planning ($\gamma$=.04, p<.001). This is the first study using a national sample to explore the relationship between future time perspective and retirement planning. The results suggest that those who thought they were closer to retirement and those who didn't perceived intrinsic rewards of work would plan for their retirement.

## THE RELATIONSHIPS BETWEEN RETIREMENT, SOCIAL CAPITAL, AND SELF-PERCEIVED HEALTH

J. Wang[1], W. Lin[1], L. Chang[2], *1. Department of Health Care Management, Chang Jung Christian University, Kway Jen, Tainan, Taiwan, 2. National Cheng Kung University, Tainan, Taiwan*

Previous studies on the relationships between retirement and health were rarely conducted in Asian countries. There also has been no study that examined how retirement affects social capital. This longitudinal cohort study examined how retirement affected social capital and self-perceived health of elderly Taiwanese. 3538 elderly who participated in the 1999 and 2003 wave of the "Survey of Health and Living Status of the Elderly in Taiwan" constituted the study sample. Social capital was measured by levels of participation in various social groups and associations as well as levels of social support received and provided. Health was measured by a question on self-perceived health. Control variables included socio-economic factors, comorbidity scores, pain, and functional limitations. Logistic regression models and multivariate regression models were used for analyses. Results indicated that retirement is associated with better self-perceived health. Retirement is also associated with higher levels of social participation. However, social support is not significantly different between retirees and non-retirees.

### ELDER SATISFACTION AND OUTCOMES OF ARTS WORKSHOP PARTICIPATION

J.A. Krout, *Gerontology Institute, Ithaca College, Ithaca, New York*

Researchers have found that participation in arts activities has many social, psychological and health benefits for older adults. This presentation reports findings on such impacts from 35 older adults living in a small city and its rural environs who participated in a variety of arts activities, including choral singing, printmaking, memoir writing, mural painting, acting and drawing. Activities were led by professional artists and typically involved five to six sessions` and 10 to 15 hours of group instruction. Participants were overwhelmingly female (80%) with a mean age of 68. Gaining personal satisfaction (82%) was the most frequently noted reason for participation followed by learning a new skill (74%), gaining arts knowledge (76%), social contact (50%) and making new friends (45%). A post activity survey found that 75% were completely satisfied with the activity (25% satisfied) and that most respondent's pre activity goals were met. Two-thirds of the participants indicated they saw themselves as more creative (one-third saw no change). No change was found in participant self perception of overall health or life satisfaction. No differences on these measures were found based on the nature of the activity but females and older participants were more likely to report increases in social contacts, making friends and learning a new skill. Participant comments also reveal a high degree of activity satisfaction and a variety of explanations as to the importance of creativity for elders. The implications of the findings are limited to the small N, short duration of activities and geographic area.

### A TALE OF THREE WOMEN: SURVIVORSHIP THROUGH CREATIVE EXPRESSION

C. Corley, *Human and Organizational Development, Fielding Graduate University, San Gabriel, California*

Gene Cohen notes the power of creativity in managing adversity (2000), stating it can "lift the emotional darkness of adversity, and even contribute to physical healing." A model inspired by three Hungarian women artists who survived the Holocaust is illustrated through their experience of the Holocaust, their creative expression, and the impact of their work on engagement of self and others. Through their work, the healing power of art is demonstrated, while comprehension of the intersection of each personal story with history is enhanced. The artistry of these three women provides a visual narrative that contributes to scholarship on incorporating images in understanding life story. Additionally, theories of gerontology which to date have largely overlooked creativity and its enhancement of well-being of self and others can be expanded through examining the role of art. Managing adversity through creativity via the specific example of the art of Holocaust survivors has implications for incorporating creative modalities in working with survivors of trauma at large. The experience/expression/engagement model is discussed in light of the power of art to heal, to inform, and to address negative stereotypes about older adults. It reinforces the groundbreaking work of Cohen (2006) by addressing the "conceptual sea change in aging" and exemplifying the later life developmental stage Cohen posited as "Encore". Selected illustrations from their recent work are included to highlight the power of story, lifelong resilience, and creative expression. Their collective works contribute toward understanding survivorship and promoting global awareness of the long-term impact of genocide.

### WHO BENEFITS MORE FROM VOLUNTEERING AND WHY?

N. Fatimah, *National University of Singapore, Singapore, Singapore*

There are rising number of organizations that have volunteer programs specialized for older adults in response to an increase in aging population and their interest in active aging in Singapore. Due to the lack of previous studies on the differences in perceived benefits of older volunteers by program characteristics which facilitate older adults' needs, this study examines differences in benefits and experiences between specialized and non-specialized volunteer programs for older adults. Of 461 agencies contacted, 72 participated in this study, but those volunteering in multiple agencies (53) were dropped. A total of 357 senior volunteers were included in this study. The survey was conducted via mailing. A wide range of benefits (generativity, productivity, socialization, personal growth, and health), volunteers' perception of organizational facilitation (role flexibility, recognition, compensation, training, and physical accommodation), and satisfaction with the program were measured in this study. The perceived benefits of volunteering for productivity, socialization benefits, personal growth and health status are higher for participants in specialized senior volunteer programs. In contrast, volunteers in non-specialized programs perceived higher generativity benefits. In addition, those in specialized volunteer programs reported higher levels of role flexibility and recognition, compensations and physical accommodation, but lower values for training and satisfaction with the volunteer program. The findings suggest that volunteer programs put more efforts to facilitate older adults' need for their satisfaction with their volunteering and to meet their specific expectations for maximization of perceived benefits from volunteering.

## SESSION 1575 (PAPER)

## TRANSPORTATION AND DRIVING ISSUES IN LATER LIFE

### IMPACT OF DRIVING STATUS ON TRANSPORTATION SUPPORT THAT OLDER ADULTS RECEIVE FROM THEIR PEERS

M. Choi[1], E. Kahana[2], *1. Epidemiology and Community Health, Virginia Commonwealth University, Richmond, Virginia, 2. Case Western Reserve University, Cleveland, Ohio*

This study examined the impact of driving status on transportation support that older adults receive from their peers in retirement communities. Data were obtained from the first wave of the Florida Disability Study (1990; N=983). The study population consists of generally healthy community-dwelling old-old persons residing in Florida retirement communities. Respondents had a mean age of 79.2, and 51.8% of respondents lived alone. A multinomial logistic regression model was employed. The outcome variable has three levels indicating degree of transportation support from their peers: none, little/some, and much/very much. Driving status consists of four attributes: (1) kept driving; (2) ceased driving within five years; (3) ceased driving more than five years ago; and (4) never drove. Other informal transportation support as well as sociodemographic and health factors were controlled in this analysis. The results showed that driving status was the most influential factor for respondents to receive much/very much transportation support from their peers while no impact was found on receiving little/some transportation support. The likelihood of receiving much/very much transportation support from peers increased by years of non-driving (reference group=current drivers): those who ceased driving within five years (OR = 5.76, $p < .001$), those who ceased driving more than five years ago (OR=8.45, $p < .01$), and those who never drove (OR=11.93, $p < .01$). These results imply that the adaptation to marshal support from peers for transportation becomes greater over time among retirement community residents who are not able to drive.

### POLICIES FOR RESTRICTING MEDICALLY AT-RISK OLDER DRIVERS: PROFILE OF CANADIAN JURISDICTIONS

A.M. Myers[1], B. Vrkljan[2], S. Marshall[3], R.A. Blanchard[1], *1. Health Studies and Gerontology, University of Waterloo, Waterloo, Ontario, Canada, 2. McMaster University, Hamilton, Ontario, Canada, 3. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada*

Not surprisingly, surveys show that seniors would rather have their license restricted than removed, although some restrictions (e.g., daytime) are more acceptable than others (e.g., distance). Licensing authorities are being pressured to move away from controversial age-based renewal policies, and in some provinces, to expand conditional licensing (CL). Two Canadian studies (Marshall et al., 2002; Nasvadi and Wister, 2009) have shown that licensing restrictions may be effective in reducing crashes. However, these studies were conducted in two provinces with distinctly different policies. One aim of this project was to document and compare policies and procedures pertaining to medically at-risk drivers across Canada. At the time, policies for several jurisdictions were unknown as prior surveys of ministry personnel had poor response rates (54% to 62%). Through a more targeted approach we achieved a 100% response rate. Using this data, the 13 provincial and territorial jurisdictions will be profiled and compared with respect to: renewal requirements, reporting procedures, criteria for assessment centres, CL options, mechanisms for enforcement and appeals. For instance, several jurisdictions have some (albeit different) age-based renewal requirements. Physicians are required to report medically at-risk drivers in 10 jurisdictions, optometrists in 8, and others (e.g., nurses) in 3 provinces. Apart from corrective lenses and adaptive equipment, 12 provinces issue CLs (the most being time of day, distance and roadways). A clear understanding of the linkages between policies (e.g., renewal and CL), together with evaluation evidence, will assist policy advisors in making informed decisions.

### COGNITIVELY IMPAIRED DRIVERS AND THEIR FAMILY MEMBERS: PERCEPTIONS OF DRIVING ABILITY AND BEHAVIORS

N.M. Silverstein[1], A. Gottlieb[1], N. Kwan[1], L.J. Molnar[2], D.W. Eby[2], T. Materdey[3], E. Van Ranst[1], *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. University of Michigan Transportation Research Institute, Ann Arbor, Michigan, 3. University of Massachusetts Boston-Engineering, Boston, Massachusetts*

Drivers with dementia are among those considered at greatest risk for unsafe driving performance. It is estimated that about one-third of drivers with dementia continue to drive for 3 to 5 years post diagnosis. Most drivers are early in the disease process when cognitive deficits are generally mild and changes to driving performance are minimal. Yet, decisions to enforce driving cessation are not straightforward and pose a difficult challenge to family members, licensing authorities, and health care professionals. Telephone interviews were conducted with 22 dyads of drivers and family members to assess areas of convergence of perceptions related to driving ability, history, and behaviors. As part of the eligibility for study inclusion drivers needed to pass a specialized clinical and on-road driving assessment by an occupational therapist/driving rehab specialist. Several significant findings were revealed. Drivers tended to underrate driving difficulties, while family members assumed greater levels of self-regulation among the drivers. Stronger agreement was found in reporting general physical fitness such as upper body strength and ability to climb stairs; identifying chronic conditions and medications taken; and the likelihood of utilizing alternative transportation. The findings illustrate that self-screening and family reports may not be sufficient or reliable indicators for determining fitness to drive in persons with dementia.

### IMPACT OF AN AUTOMOBILE-BASED TRANSPORTATION ALTERNATIVE TO DRIVING ON REPORTED COMMUNITY MOBILITY SELF-EFFICACY

R. Fortinsky[1], J. Vine[2], K. Freund[2], L. Hennig[3], *1. Center on Aging, University of Connecticut Health Center, Farmington, Connecticut, 2. ITNAmerica, Westbrook, Maine, 3. MaineHealth, Portland, Maine*

Background: Very little is known about the impact of using personal transportation alternatives after driving reduction or cessation. Accordingly, we studied a cohort of community-dwelling older adults and adults with visual impairment who joined Independent Transportation Network® (ITN), a demand-response transportation service designed to replicate the comfort and convenience of private automobile ownership, to determine whether their reported community mobility self-efficacy (CMSE) changed over 6 months after joining one of five ITN affiliate community programs. Methods: Subjects were interviewed by telephone soon after joining an ITN affiliate (T1), and again 6 months later (T2). To measure CMSE, we asked subjects 12 questions about degree of confidence in arranging rides for purposes commonly associated with independent living, including grocery shopping, medical appointments, and social engagement; confidence was reported on a 1-10 scale. Paired t-tests were used to determine whether scores for each CMSE item, and for an 8-item CMSE scale with demonstrated reliability and validity, changed significantly from T1 to T2. Results: 136 subjects (80.1% female; mean age=77.2+11.4years; 96% White) completed T1 and T2 interviews. Cohort mean scores increased from T1 to T2 for each CMSE item (all $p<0.05$), and the 8-item scale increased from 55.2 to 67.8 ($p<.001$). While at T1 non-drivers had lower CMSE scale scores than still-driving subjects, these group differences disappeared at T2, with non-drivers increasing to driver levels of CMSE. Conclusions: Availability and use of the ITN model of automobile-based transportation increased reported confidence in arranging rides to sustain community mobility after driving reduction or cessation.

## SESSION 1580 (SYMPOSIUM)

### EVOLUTION, EDUCATION, AND HEALTH

Chair: *S.N. Austad, Cellular & Structural Biology, University of Texas Health Science Center, San Antonio, Texas*

In 2008, the Louisiana State Legislature passed a law which allows local school boards to approve supplemental classroom materials specifically for the critique of scientific theories – read "Evolution." In response, this symposium will outline the educational consequences of this new law and explain why a foundation in evolutionary science is important for making more informed decisions about one's own health and about societal issues with scientific content. The symposium will feature three speakers: 1. Barbara Forrest, philosophy professor at Southeast Louisiana University and a Board member of the National Center for Science Education. Dr. Forrest was an expert witness for the plaintiffs in Dover School Board Case (2005) and is co-author of Creationism's Trojan Horse: The Wedge of Intelligent Design (2004). Dr. Forrest's talk will explain the consequences to science education of the Louisiana law. 2. Carl Zimmer, a multiple award-winning science journalist – contributing regularly to the New York Times, National Geographic, and Discover magazine on topics related to biological evolution. His most recent book is The Tangled Bank: An Introduction to Evolution (2009). Mr. Zimmer will discuss how understanding evolution allows Americans citizens to formulate more informed decisions about societally important matters. 3. Dr. Stephen C. Stearns is Edward P. Bass Professor of Ecology and Evolutionary Biology at Yale University with a special interest in evolutionary biology, medicine, and health. He has edited two editions of Evolution in Health & Disease (1998, 2009). Dr. Stearns will discuss how an understanding of evolution can affect your personal health decisions and interpretation of current medical research.

## SESSION 1585 (SYMPOSIUM)

### THE RELATIONSHIP OF METABOLITES AND CYTOKINES WITH FUNCTION AND PHYSICAL PERFORMANCE: RESULTS FROM THE DUKE PEPPER CENTER

Chair: *C.F. Pieper, Duke University Medical Center, Durham, North Carolina*

Co-Chair: *L.R. Landerman, Duke University Medical Center, Durham, North Carolina*

Discussant: *M.C. Morey, Duke University Medical Center, Durham, North Carolina*

Numerous studies have linked individual cytokines with a variety of functional and performance outcomes, and a growing literature is relating metabolites (acylcarnitines, fatty acids, and amino acids) to these outcomes. Assessing the relationship between biologic markers and function presents several analytic issues. First, in most data sets, the number of subjects is small relative to the number of predictors, leading to the potential for Type-I error in the assessment the marker to function relationships. Second, individual markers are often highly correlated. Finally, validation and replication of results across studies is often not possible. In this symposium, we will (1) list the analytic solutions we have developed to these analytic/methodologic issues and (2) present results of our analyses. Using a common battery of biomarkers (45 acylcarnitines, 15 amino acids, 7 fatty acids) assayed under a standard protocol, we analyzed 5 intervention studies (total n=346) designed to assess the impact of physical activity and diet on the markers as well as physical performance and function. Using Principal Components Analysis, the dimensionality of the problem was reduced from 67 markers to 7 factors. Consistency of these results across studies will be shown. In addition, the impact of the cytokine and metabolites factors on subsequent function and performance and the change in the markers over time in several of the individual studies is explored. Finally, results from a meta-analysis, exploring the consistency of the relationships between and within studies is shown.

### METHODS FOR DATA REDUCTION OF BIOMARKERS ACROSS STUDIES

C.F. Pieper, R. Sloane, L.R. Landerman, K.M. Huffman, W.E. Kraus, *biometry and bioinformatics, duke university medical center, Durham, North Carolina*

Biomarkers were measured under a standard protocol in 5 interventional studies assessing the impact of diet and exercise on function. Separately for each study, Principal Components Analysis extracted 3 factors from the 45 acylcarnitine markers, 3 from the 15 Amino Acids, and a single Fatty Acid factor. Factor loading segregated as expected allowing aggregation of theoretically similar biomarkers. Across studies, the loadings were remarkably consistent for the initial factors (reliability coefficient=0.92 for the acylcarnitine factor, 0.88 for the first Amino Acid factor, and 0.98 for the single FA factor), but were less consistent for subsequent factors.. From the individual study analysis, we developed summary loadings and normalizing equations available for use in longitudinal analysis of these studies as well as for use in future studies. An example of longitudinal change in the biomarkers will be shown in the CALERIE study.

### THE RELATIONSHIP BETWEEN ACYLCARNATINES AND PHYSICAL PERFORMANCE IN OSTEOARTHRITIS

R. Sloane, V.B. Kraus, D. Thompson, *biometry and bioinformatics, duke university medical center, Durham, North Carolina*

POP2 was analyzed as a cross-sectional study of 138 subjects with osteoarthritis (OA) in the knee. Physical function was assessed with the Short Physical Performance Battery (SPPB) based on timed short distance walk, repeated chair stands, and a set of balance tests. Each test was scored as a 0-4 ordinal categorical measure. In addition, the battery of 45 acylcarnitines (ACs) were measured. Principal Components Analysis was employed to estimate the 1-factor solution for the ACs for each subject. Spearman correlation analysis was used to measure the association between the AC 1-factor estimate with the individual and summed SPPB scores. Unadjusted correlation analyses showed that AC 1-factor estimates were significantly negatively associated with SPPB balance and chair stand scores. The association was sustained with serial adjustment for BMI, comorbidity burden, and radiographic measures of knee and ankle OA. However, age appears to be acting as a mediating factor in the AC-function relationship.

### THE RELATIONSHIP OF CYTOKINES WITH PHYSICAL PERFORMANCE: THE POP STUDY

D. Thompson, V.B. Kraus, R. Sloane, *biometry and bioinformatics, duke university medical center, Durham, North Carolina*

The Duke University Pepper Center seeks to identify metabolites and signaling molecules as potential biomarkers of physical function during aging. The present study explored a wide array (n=20) of cytokines selected for their involvement in a broad range of physiologic processes (inflammation, coagulation, oxidation, etc.) Serum was collected from subjects in the POP Study (Predicting Osteoarthritis Progression, n = 138, 73% female, all with knee osteoarthritis, mean age 66, age range 37-86). Physical performance was assessed by the Short Physical Performance Battery (SPPB), evaluating three domains of lower-extremity function: rising from a chair 5 times, standing balance, and an 8 foot walk. Statistically significant associations were found between lower extremity function and serum D-dimer, soluble VCAM-1, TNF receptors, and Hyaluronan. This comprehensive multi-marker approach has the potential to identify individual biomarkers of functional decline during aging, and also pathways in systems required for maintenance of physical performance.

### CALORIC RESTRICTION AND IMPROVEMENTS IN METABOLIC FLEXIBILITY

K.M. Huffman[1], L.M. Redman[2], L.R. Landerman[1], C.F. Pieper[1], J.B. Bain[1], V.B. Kraus[1], C.B. Newgard[1], E. Ravussin[2], *1. biometry and bioinformatics, duke university medical center, Durham, North Carolina, 2. Pennington Biomedical Research Center, Louisiana State University, Baton Rouge, Louisiana*

Metabolic flexibility has been defined as the efficient transition between different energy substrates depending on energy substrate availability and demand. We wished to determine if caloric restriction (CR) would enhance metabolic flexibility by reducing plasma concentrations of fatty acid oxidation byproducts from the fasted to the fed condition. Fasting and postprandial plasma samples were obtained at baseline and at months three and six in 36 volunteers randomized a weight maintenance diet (Control), 25% CR, or 12.5% CR plus 12.5% energy deficit from structured aerobic exercise (CR+EX). Over three and six months, there was a significantly greater decline in fasting-to-postprandial difference (FPPD) in medium and long chain acylcarnitine concentrations in the CR and CR+EX groups. Time-varying FPPD in acylcarnitines and amino acids were independently related to time-varying insulin sensitivity. CR imparted improvements in SI and metabolic flexibility, as defined by a greater reduction in fatty acid oxidation following a food challenge.

### ASSESSMENT OF THE RELATIONSHIP OF CYTOKINES WITH AGE, BMI, GENDER AND RACE: A META-ANALYSIS OF THE DUKE PEPPER STUDIES

L.R. Landerman, C.F. Pieper, K.M. Huffman, M.C. Morey, W.E. Kraus, H. Cohen, V.B. Kraus, *biometry and bioinformatics, duke university medical center, Durham, North Carolina*

Data on 20 cytokines were collected using a standard protocol as part of four studies assessing the impact of a diet/exercise intervention on physical performance. With multiple independent studies, meta-analysis can be used to obtain more precise estimates, estimate overall (average) effects, and determine whether significant between study differences are present, and detect effects which may be obscured in small samples. We used it to examine the associations between each cytokine and within-study measures of age, ethnicity (white vs. other), gender, and bmi. We first estimated study-specific effect sizes (standardized mean differences and z-transformed correlations) and their variances . SAS PROC MIXED was then used to weight these effect sizes by their variances and estimate overall effect sizes and their standard errors. Twenty two significant overall associations were present between ethnicity, gender, age, and bmi on the one hand, and cytokines on the other. Differences in effects across different individual studies were also observed.

## SESSION 1590 (PAPER)

## ADVERSITY AND TRAUMA

### THE PERSISTENCE OF ADVERSE CHILDHOOD EVENTS: THE CASE OF OLDER OFFENDERS

T.L. Young, B. Stanback, *School of Aging Studies, University of South Florida, Tampa, Florida*

Adverse childhood events (ACEs) are negative experiences or stressors that an individual may encounter before the age of 18. The current research on ACEs is only now extending into late life. This is an extremely important issue as it speaks to the persistence of early negative events throughout the life course. The goal of this study was to explore demographic and offense predictors in offenders age 50 or older (n= 548) who reported 4 or more ACEs in the 2004 wave of the Survey of Inmates in State and Federal Prisons (National Department of Justice, 2004). ACEs, demographic, and controlling offenses were examined using descriptive, Chi square, and logistic regression analyses. Chi square tests indicated that age, gender, mental health, education, violent offense, race, and marital status were significantly associated with individuals experiencing 4 or more ACEs. A logistic regression analysis significantly predicted individuals with 4 or more ACEs to be more likely to be women, between the ages of 50-59, have a violent controlling offense, and a history of mental illness, and less likely to have a high school diploma/GED, be married, and Caucasian. Findings from this study are framed in the life course perceptive and implications for future research are discussed.

### CUMULATIVE TRAUMA: A MODEL FOR UNDERSTANDING AGING ACROSS THE LIFE COURSE

M.E. Davis, *Social Work, George Mason University, Fairfax, Virginia*

The concept of trauma has increasingly been utilized to identify reactions linked to physical and psychological injury. This paper/poster describes a model of cumulative trauma as it impacts individuals throughout the life course. Cumulative trauma is typically defined as a condition when a physical body has been injured repeatedly causing trauma to that body part. When it occurs over a period of time, trauma results in damage. The concept of cumulative trauma can also be applied to conditions that impact the individual psychologically resulting in a buildup of traumatic injury. This model is based on the life course perspective as developed by Glen Elder. The life course perspective suggests the importance of time, context, process and meaning on human development and family life ( Bengston and Allen, 1993). The experience of aging for the individual is impacted, shaped and develops meaning from the context of the person's life, historical events and life events. (Bengton, Burgess and Parrot,1997). Cumulative trauma has implications in several areas. First, Elder's concept of linked lives suggests that trauma has the ability to impact those who experience it, but also those connected to the person.(Elder et al 2002). Secondly, trauma can be linked to many conditions. Trauma causing events are disasters, violence, abuse, torture,effects of war and others. Other conditions also cause trauma such as unemployment and even racism. Emotional and psychological trauma can result from stressful events that trigger a feeling of helplessness, threaten safety and security and increase vulnerability. The subjective experience is critical in defining trauma. Working with older adults to assess cumulative trauma is an important strategy for assessment.Important information about the life course experience of the individual helps to increase our understanding of behavior and thought that may be directly linked to long term effects of cumulative trauma. This workshop will describe the cumulative trauma model and the literature that supports its core concepts. It will then share with participants specific strategies to incorporate the model into the assessment process and work with older adults in service delivery settings. The model has special utility in working with cultural groups of older adults, as they often experience racism, discrimination and oppression as trauma. Bengston, V. L., & Allen, K. R. (1993). The life course perspective applied to families over time. In P. G. Boss, W. J. Doherty, R. LaRossa, W. R. Scham, & S. K. Steinmetz (Eds.), Sourcebook of families, theories and methods: A contextual approach (pp. 469-499). New York, NY: Plenum.

### CHARACTERISTICS OF AGING HOMELESS VETERANS

J.A. Schinka, R. Casey, *VA National Center on Homelessness, Tampa, Florida*

In this study we examined the characteristics of 14,742 homeless veterans who received supportive transitional housing services in the VA Grant Per Diem (GPD) program. The GPD program provides transitional housing for up to two years, access to health care services, substance abuse and mental health supports, education and employment assistance, and access to legal aid. Veterans age 55 and older were found to represent 21.5% of the sample. They were almost exclusively male (98.4%) and the majority (55.7%) were nonwhite. Chi-square analyses showed that, in comparison to younger veterans, the older veterans were more likely to be male, nonwhite, to need medical treatment, and to be mentally ill (55.2% of older veterans, 51.8% of younger veterans). This difference, however, was largely explained by the fact that 17.4% of the older veterans, as opposed to 5.7% of the younger veterans were believed to have PTSD. A greater percentage of older veterans successfully completed the program (56.3% versus 48.8% of younger veterans). This was possibly due to the greater frequency of alcohol and substance abuse in younger veterans and the higher frequency of service-connected, non-service-connected, and nonVA disability payments to older veterans. Logistic regression analyses revealed that any use of illegal substances, but not alcohol abuse, and age were the most highly associated with failure to complete the GPD program. In contrast, alcohol use, but not illegal substance abuse, and age were most highly associated with subsequent re-admission to the GPD program. The results of these analyses suggest that older homeless veterans differ significantly from younger homeless veterans on key factors that may relate to long-term health and mental health outcomes.

### TARNISHED GOLDEN YEARS: LATE LIFE FIRST TIME OFFENDERS IN U.S. JAILS

B. Stanback, *School of Aging Studies, University of South Florida, Tampa, Florida*

This study focuses on late life first time offenders, arrested for their first criminal offense at 50 years of age or older, in national samples of U.S. jail data. Participants 50 years or older in the 1996 and 2002 Waves of the Survey of Inmates in Local Jails were grouped as late life first time offenders (n=62) and offenders with previous arrests (n=357). Childhood, adolescent and adult variables and sociodemographic items were used in descriptive and comparative analysis to determine if life course differences were present by group. Late life first time offenders were older than offenders with previous arrests, t (419) = 214.53, $p<.001$. Fewer men were late life first time offenders ($\chi 2$ (1) = 7.26, $p <.01$), and more late life first time offenders were married (χ2 (1) = 16.13, p<.001). Late life first time offenders were significantly more likely to have lived with their father only or some other relative, although less likely to have extended family that served time, to receive public assistance as a child, and to have parents that used drugs or alcohol. Late life first time offenders were less likely to have delinquent friends (χ2 (1) = 19.23, p<.001) and to use alcohol (χ2 (1) = 32.13, p<.001) as adolescents. As adults, offenders with previous arrests were more statistically likely to be homeless (χ2 (1) = 4.76, p<.05). This preliminary inquiry suggests that differences exist between late life first time offenders and offenders with previous arrests, which future studies should explore.

## SESSION 1595 (SYMPOSIUM)

### BENEFITS OF SENSE OF MASTERY AND POTENTIAL FOR ITS ENHANCEMENT

Chair: *D.J. Deeg, LASA, VU University Medical Centre, Amsterdam, Netherlands*
Co-Chair: *J.P. Ziegelmann, Freie Universitaet, Berlin, Germany*
Discussant: *M.K. Diehl, Center on Aging, Colorado State University, Colorado*

Sense of mastery (SoM) is defined as the extent to which individuals views their life as within their own control rather than ruled by chance or other persons. With aging, SoM is considered an important psychosocial resource, because when confronted with e.g. physical decline, a high SoM may lead older persons to appraise their new situation as challenging, rather than feeling helpless, and this may have a beneficial influence on their success of adaptation. Vice versa, older persons with a low SoM may adapt to physical decline less successfully, e.g., because they will be less likely to engage in health promoting behaviors, and to indicate their care needs to the right people. A high SoM has been shown to have a beneficial effect on physical and mental health. However, to take it one step further, no studies have addressed the effect of SoM on maintenance of independence and the quality of care received. Furthermore, insight is growing that SoM is not a fixed trait but changes with changing circumstances. This suggests that SoM can be enhanced by appropriate intervention. This symposium presents findings from both observational research and from intervention studies. The general aim of the symposium is to contribute new insights on the beneficial effects of sense of mastery, in particular on maintenance of independence and satisfaction with care, and to show that sense of mastery can be enhanced even in groups of frail older persons. Results are based on studies in England, Germany and The Netherlands.

### MASTERY, PHYSICAL PERFORMANCE AND MAINTENANCE OF INDEPENDENCE: FINDINGS FROM LASA

R. Cooper[1], M. Huisman[2], D. Kuh[1], D.J. Deeg[2], *1. Epidemiology and Public Health, MRC Unit for Lifelong Health and Ageing, London, United Kingdom, 2. VU University Medical Center, Amsterdam, Netherlands*

Higher mastery may explain why some older people are better able to maintain their independence than other people with similar levels of physical performance. We tested this hypothesis using data from the Longitudinal Aging Study Amsterdam. We found that poorer physical performance was associated with greater odds of subsequent functional decline and institutionalisation, after adjustment for a range of covariates. There was no evidence that mastery modified the association between physical performance and subsequent functional decline. The association between physical performance and subsequent institutionalisation was weaker in those people with higher levels of mastery however this modifying effect was no longer evident after adjustment for health status. This suggests that mastery at baseline does not play an important modifying role in associations between physical performance and subsequent functional decline. Mastery may not be a stable trait but decline with declining health.

### MASTERY, CARE TRANSITIONS, AND PERCEIVED SUFFICIENCY OF CARE

D.J. Deeg[1], M. Broese Van Groenou[2], *1. LASA, VU University Medical Centre, Amsterdam, Netherlands, 2. VU University / Sociology, Amsterdam, Netherlands*

Older people with a low sense of mastery may not be able to articulate their care needs well enough to obtain sufficient care. Using data from two recent waves of the Longitudinal Aging Study Amsterdam (n=1876, ages 64-94), we examined if a lower sense of mastery was associated with less satisfaction with the amount of care received after experiencing a transition in home-based care. Perceived insufficiency of care was lowest among first users of informal or professional care (both 7%). Among those who had informal care at baseline and experienced a transition to professional care, 15% perceived their care as insufficient. Controlling for socio-demographic and health variables, lower mastery was associated with less perceived sufficiency of care. However, this was the case only among those receiving care paid for out-of-the-pocket, i.e. when their additional care needed to be obtained from sources other than informal or state-subsidized care.

### CHRONIC DISEASE SELF MANAGEMENT INTERVENTION AND MASTERY

A. Jonker, H.C. Comijs, K. Knipscheer, D.J. Deeg, *VUmc EMGO+, Amsterdam, Netherlands*

Objectives: We conducted a randomized controlled trial on Lorig's Chronic Disease Self-Management Program (CDSMP) in frail older persons using day care, with expected outcomes improved coping resources and well-being. We also investigated which subgroups of older persons benefited most from the CDSMP. Methods: Sample sizes were 63 (intervention group) and 69 (contorols). Outcome measures were mastery and self-efficacy (coping resources) and depression and valuation of life (well-being), which were assessed post-treatment and at 6-month follow-up. Results: We found that intervention participants improved their mastery and had better valuation of life than controls, but showed no differences in self-efficacy. Those with lower education and those with higher cognitive functioning benefited most. The attendance rate remained high. All participants scored positively on the content and style of the program. Discussion: Both the observed beneficial effects and the positive evaluation are indicative for the applicability of the CDSMP for this specific target group.

### STRATEGY USE AND MASTERY ENHANCEMENT: A SELF-REGULATION INTERVENTION FOR OLDER ADULTS

J.P. Ziegelmann, P. Gellert, *Freie Universitaet Berlin, Berlin, Germany*

Objectives: Strategy use is central for self-regulation of health behaviors. This study aims to develop an intervention fostering strategy use and investigates whether the increase in strategy use explains intervention success and leads to the experience of mastery in the domain of physical activity. Methods: Individuals aged 60 to 85 completed an intervention with the goal to foster physical activity and were randomly assigned to a standard treatment or to a treatment with a focus on strategy use. Questionnaires assessed strategy use, mastery experience and physical activity. Results: Compared to the standard group there was a significant increase in strategy use, mastery experience, and physical activity. Strategy use emerged as mediator of intervention success in terms of physical activity. Conclusions: This study shows that strategy use and mastery can be enhanced in interventions focusing on older adults and that strategy use is an important component in interventions fostering physical activity.

# SESSION 1600 (POSTER)

## COGNITION II

### US PHYSICIANS' PERCEPTIONS, KNOWLEDGE, AND PRACTICES OF COGNITION IN OLDER ADULTS: A REVIEW

K. Day[1], P. Buckmaster[1,7], L. Anderson[1], L.L. Bryant[6], A.J. Caprio[3], D.B. Friedman[2], A. Hochhalter[4], B. Wu[5], *1. Healthy Aging Program, Centers for Disease Control and Prevention, Atlanta, Georgia, 2. University of South Carolina, Columbia, South Carolina, 3. University of North Carolina, Chapel Hill, Chapel Hill, North Carolina, 4. Texas A&M Health Science Center, Temple, Texas, 5. University of North Carolina at Greensboro, Greensboro, North Carolina, 6. University of Colorado Denver, Aurora, Colorado, 7. Georgia State University, Atlanta, Georgia*

The need to examine the current literature was driven in part by the release of The Healthy Brain Initiative: A National Public Health Road Map to Maintaining Cognitive Health as well as formative research conducted by the Centers for Disease Control and Prevention's Healthy Aging Research Network. Interest in how healthcare practitioners think about cognitive health and cognitive impairment have escalated in recent years. The purpose of this review is to broadly identify and describe research on U.S. physicians' perceptions, knowledge, and practices related to cognitive health and cognitive impairment in older adults. A two-wave search process identified eligible articles; a multi-step screening process followed to assess whether articles met the inclusion criteria (e.g. examined knowledge, perceptions and practices of U.S. physicians, examined specific conditions including Alzheimer's disease, dementia, cognitive health). Fifty eligible articles were identified and independently abstracted by at least one reviewer. The articles appeared in over 28 journals published between 1984 and 2008. Research outcomes most commonly reported were in the domain of physicians' perceptions, followed by physicians' practices and knowledge. Efforts to better address gaps in U.S. physicians' perceptions, knowledge and practices can be enhanced by systematically describing the current state of the published literature. This presentation will describe the systematic review methods, and provide summary findings on studies identified which include study designs, journals where published, and major findings of the study. It will also identify gaps in the literature and propose areas to guide future research efforts to promote and protect cognitive health.

### AGE-DEPENDANT CHANGES IN MOTOR LEARNING CAPABILITIES: A CONTEXTUAL INTERFERENCE STUDY

M.J. Cohen[1], S.L. Schandler[2], D.E. Young[1], G. Meir[1], R. Ho[1], J. Perez[1], W. Wu[1], *1. Kinesiology, California State University, Long Beach, Long Beach, California, 2. Chapman University, Orange, California*

INTRODUCTION: Learning to perform a skilled motor behavior has been found to be affected by the structure of the practice session1,4 and the schedule of augmented-feedback6. With young adults, moderately increased cognitive demands produce by practice variations (the contextual interference effect [CI] produces a seemingly paradoxically finding of poorer target acquisition, but superior retention and transfer of the learned skills. We sought to discover if the CI effect is robust across the adult lifespan. METHODS: A 4 (age groups) x 2 (practice schedules) x 2 (feedback schedules) randomized factorial design was used to evaluate the effect of practice context and schedule of feedback on the acquisition and retention of a ballistic, bi-directional lever movement pattern to four different target locations. The four age groups were young adults 21-30 years), middle-aged adults (41-50) young-old (61-70) and old-old (75 +). The practice and feedback conditions: low CI (targets presented in block order) or high CI (random order) and either augmented feedback after every trial or faded (feedback systematically reduced during practice), were fully crossed with the age groups. RESULTS: We found main effects of age for accuracy and response speed during acquisition and main effects of practice schedule (the CI effect), but no age interactions with practice of feedback schedules. CONCLUSIONS: As expected, young adults showed superior performance compared to older participants; yet all age groups performed better in the conditions with higher cognitive demand. We discuss the results implications for the rehabilitation of motor skills. ACKNOWLEDGEMENTS: This research is supported by a grant from the National Institute on Aging.

### REMINISCENCE BUMP OBSERVED FOR THE FREQUENCY BUT NOT THE LOCATION OF LIFE EVENTS IN THE LIFE LINES OF OLDER ADULTS

T.W. Pierce[1], J. Schroots[2], *1. Psychology, Radford University, Radford, Virginia, 2. ERGO | European Research Institute on Health and Aging, Amsterdam, Netherlands*

Twenty-nine adults (56 – 84 years, mean age = 67.3, SD = 7.9) drew life-lines documenting the course of their lives from birth to their current age using the Life-line Interview Method (LIM) (Schroots et al., 2003). Participants labeled significant life events on the life-line and provided (a) their age at the time of each event and (b) their rating of the degree to which the event was perceived as positive or negative. We also identified the location across the life-line at which the event was placed. Consistent with previous research, a reminiscence bump was observed, with the frequency distribution of ages for life events showing a sharp peak between the ages of 10 and 30. However, the frequency distribution of locations across the LIM graph for life events was significantly more flat than the distribution of chronological ages for life events, Chi-Square (7, N = 153) = 18.58, p = .010. This pattern is hypothesized to indicate that, for older adults, events from the teens and 20s are not merely reported more frequently; they occupy a disproportionately large proportion of the retrospective autobiographical landscape of the self. This same pattern was observed in analyses using positively, but not negatively rated life events. The non-significant effect for negative life events can be traced to the presence of a reminiscence bump for positive, but not negative life events. Flat distributions for the physical locations of life events across LIM life-lines were observed for both positive and negative life events.

### INTENSIVE INDIVIDUAL COGNITIVE TRAINING IN ALZHEIMERS DISEASE: EVIDENCE FOR LIMITED EFFECTS

J. McDowd, S. Kanaan, P. Pohl, *KU Medical Center, Kansas City, Kansas*

Research exploring cognitive interventions in Alzheimer's disease (AD) suggests that cognitive training holds "promise" (Sitzer et al., 2002) for improving mental function in AD. Sitzer's (2002) meta-analysis indicated that cognitive training effects were larger when delivered one-on-one, when the training approach emphasized restoration rather than compensation, and when the "dose" or intensity of the training was relatively high. These findings are also in line with recent work applying Constraint Induced Therapy to the cognitive domain (Lillie & Mateer, 2006), Based on these principles, we developed an intervention that required individuals to participate in cognitive activities six hours per day, five days per week, for two weeks. Cognitive activities included word games, memory tasks, mazes, puzzles, computerized attention tasks, working memory tasks, and reasoning tasks. Outcome measures included a battery of neuropsychological tests including Digit Span, Trail-Making, word fluency, letter fluency, Logical Memory, and quality of life. The outcome battery was administered before the intervention, on the final day of the intervention, and two months after completing the intervention. Sixteen adults with very mild or mild AD (CDR scores of 0.5 or 1.0; mean age 73.3 years, mean MMSE 24.7) participated in the study. Each completed the 60 hours of training with perfect attendance. Tasks that were practiced during training showed improved performance across the two weeks, but tasks in the outcome battery generally showed little improvement, indicating little generalized benefit of training. These findings indicate that cognitive performance can be improved in people with AD, but requires task-specific, intensive training.

## MEMORY STABILITY AND CHANGE AMONG SEXAGENARIANS, OCTOGENARIANS, AND CENTENARIANS

J. Margrett[1], G.D. Da Rosa[1], P. Martin[1], L. Poon[2], *1. Iowa State University, Dept. of Human Development and Family Studies & Gerontology, Ames, Iowa, 2. University of Georgia, Institute of Gerontology, Athens, Georgia*

Little research has addressed cognitive change among very long-lived individuals and how the pattern may differ from young old adults. Thus, the aim of the current study was to investigate longitudinal change in memory performance in community-dwelling sexagenarians (N = 70; M = 64.84), octogenarians (N = 63; M = 82.73), and centenarians (N = 68; M = 100.76) from Phases 1 and 2 of the Georgia Centenarian Study. The overall sample was 70% female, and 31% of participants were African American and 69% were White. The test-retest period was approximately 20 months for centenarians and 60 months for sexagenarians and octogenarians. Participants completed the Expanded Paired Associate Test (EPAT; Trahan, et al., 1989) and two summary scores were created to reflect task difficulty (i.e., easy and hard recall items). Examination of Time 2 – Time 1 change scores revealed inter-individual variation in the degree of cognitive performance change. Using individuals' standard error of measurement as an index to assess each person's degree of reliable change, the majority of the longitudinal sample, including centenarians, was remarkably stable. However, differences were observed in the degree of intra-individual change in EPAT performance (i.e., stable, increase, and decline) between age groups and across test difficulty.

## OVERWEIGHT IN MIDDLE AGE IS RELATED TO COGNITIVE FUNCTION 30-YEARS LATER

L.B. Hassing[1], A. Dahl[2], N. Pedersen[3,4], B. Johansson[1], *1. Department of Psychology, University of Gothenburg, Gothenburg, Sweden, 2. Institute of Gerontology, School of Health Sciences, Jönköping University, Jönköping, Sweden, 3. Department of Medical Epidemiology, The Karolinska Institute, Stockholm, Sweden, 4. Department of Psychology, University of Southern California, Los Angeles, California*

Background: The evidence is growing strong that overweight in middle age is related to increased dementia risk in old age. Few studies have, however, addressed the question if overweight affects cognitive abilities among those who do not develop dementia. Aim: To examine if Body Mass Index (BMI) in middle age is related to cognitive function 30-years later in a dementia free sample. Methods: BMI was reported in 1963 at age 50 to 60 years, and cognitive abilities were examined 30-years later on five measurement occasions at 2-year intervals (N = 417). The cognitive abilities examined included tests of long-term memory, short-term memory, speed, verbal and spatial ability. Results: Multilevel modeling adjusting for demographic- and lifestyle factors, and relevant diseases, showed that higher BMI in midlife predicted lower test performance 30 years later. Significant associations between BMI and level of performance were found in all cognitive abilities, however, a higher midlife BMI was not associated with steeper cognitive decline. Conclusion: Our results indicate that midlife overweight is related to lower overall cognitive function in old age. The fact that BMI-related effects were noted in mean level cognitive performance, whereas only one ability showed differences in slopes, suggests that the negative effect of overweight has an onset before the entry into very old age.

## USE OF SIGNAL DETECTION METHODS IN THE IDENTIFICATION OF RESPONDERS TO COGNITIVE TRAINING PROGRAM

J. Fairchild[1], L. Friedman[2], J. Yesavage[1,2], *1. VA Palo Alto Health Care System / MIRECC, Palo Alto, California, 2. Stanford University, Stanford, California*

The literature supporting the use of cognitive training as a means of improving memory in older adults is extensive. Unfortunately there is significantly less published regarding those who respond to treatment. The identification of such characteristics is important as providers can then tailor cognitive interventions to the person. While analyses such as logistic regression can provide some information about these characteristics, an alternative approach is the use of signal detection methods. The goal of the current study was to identify characteristics of responders to a trial of acetylolinesterase (AChE) inhibitor in combination with cognitive training in older adults. Participants included 168 non-demented community-dwelling older adults who participated in a randomized controlled trial during which they received either donepezil or placebo in addition to cognitive training. Outcome variables of interest included performance on a delayed word recall task and a names and faces memory task. For the model including a delayed word recall task, participants' baseline performance on measures of story recall, associative learning, and attention predicted response. For the model including the names and faces task, baseline performance on measures of attention and associative learning predicted response. These findings suggest that older adults draw from multiple areas when approaching a cognitive training intervention and that future researchers should take this into consideration when designing cognitive training activities for older adults.

## THE EFFECTS OF ILLNESS-RELATED STRESS ON INFORMATION SEARCH AND RATINGS IN TREATMENT DECISION MAKING

J.M. Jacobs-Lawson[1], M. Schumacher[2], C.L. Ortz[1], E. Waddell[1], S.M. Arnold[2], *1. Gerontology, University of Kentucky, Lexington, Kentucky, 2. University of Kentucky College of Medicine, Lexington, Kentucky*

Understanding how older cancer patients and non-patients search and use information provides insight into the role that stress plays in treatment decision making. The purpose of the current study was to compare how older lung cancer patients and older cancer-free adults searched and rated cancer treatment-related information. Participants, 58 lung cancer patients (Mage= 59.4) and 29 older adults (Mage= 60.3) were asked to make a hypothetical cancer treatment decision. Participants were presented with a computerized information display table such that columns represented six treatment options (e.g. surgery, chemotherapy and radiation) and rows described the treatments on six dimensions (e.g.; side effects, survival rates). Participants were able to view one piece of information at a time and were asked to rate each piece as positive, neutral, or negative. Results indicated that cancer patients were more likely than older adults to focus on positive information such as survival rates and least likely to consider information related to palliative care. Furthermore, cancer patients tended to display a positivity effect in that they tended to rate information more positively than older adults. An examination of the relationship between the average information rating for each treatment and the final treatment decision revealed that cancer patients were more likely to select a treatment consistent with how they rated the information whereas the older adults tended to select the treatment they had rated more negatively. Implications are discussed in terms of how the stress associated with cancer and positivity may have influenced information processing.

## STRESSFUL EVENTS IN LATE-LIFE: EFFECTS ON COGNITIVE DECLINE. THE CACHE COUNTY STUDY

J. Tschanz[1,4], R. Pfister[1], D.C. Steffens[2], C. Corcoran[1,6], K. Smith[3], T. Ostbye[2], K. Welsh-Bohmer[2], M.C. Norton[1,5,4], *1. Center for Epidemiologic Studies, Utah State University, Logan, Utah, 2. Duke University, Raleigh, North Carolina, 3. University of Utah, Salt Lake City, Utah, 4. Utah State University Department of Psychology, Logan, Utah, 5. Utah State University Family Consumer and Human Development, Logan, Utah, 6. Utah State University Department of Mathematics and Statistics, Logan, Utah*

Stressful life experiences can have detrimental neurophysiological effects that in turn may increase the risk for cognitive decline and dementia in late-life. We examined the role of late-life stressful events on rate of cognitive decline among elderly individuals in Cache County, Utah. At baseline (1998) a total of 2789 participants (42% males) completed a life-events questionnaire querying about potential stressful life events (stressors) over the preceding three years: changes in residence, finances, marital and occupational status, and illnesses and deaths of relatives and close friends. Each reported stressor was rated according to its importance, expectedness, and impact (positive, negative, neutral). The questionnaire was re-administered three and seven years post-baseline. Mean (SD) age and educational attainment were 76.9 (6.2) and 13.5 (2.8), respectively. Cognition was assessed with the Modified Mini-Mental State Exam at baseline and each follow-up. Using linear mixed models, we examined the effects of time-varying cumulative stressors (grouped as 0, 1, 2 or more) and subjective ratings in predicting cognitive decline. Covariates were: age, gender, ApoE genotype, and education, as well as their interactions with stressors. Greater number of stressors predicted faster cognitive decline among those with fewer years of education (p interaction $< 0.04$). The effects did not differ by gender ($p > 0.05$). Subjective ratings of stressors did not predict cognitive decline (all $p > 0.05$). Our results suggest that the effects of stressful life events may be mitigated by education. Mechanisms may include greater cognitive reserve or other resources associated with or underlying higher levels of education.

## COGNITIVE STATUS AND EXECUTIVE FUNCTIONS IN OLDER ADULTS: THE MODULATING EFFECTS OF ACTIVE LIVING

C. de Frias[1], R. Dixon[2], *1. Stockholm University, Stockholm, Sweden, 2. University of Alberta, Edmonton, Alberta, Canada*

In a recent report from the Victoria Longitudinal Study (VLS), we observed a multidimensional (3-factor) structure for six executive function (EF) tests in cognitively elite (CE) older adults, a unidimensional structure for cognitively impaired (CI) older adults, and mixed structure for the cognitively normal (CN) older adults (de Frias, Dixon, & Strauss, 2009). The three EF constructs were "Shifting" (Color Trails, Brixton), "Inhibition" (Stroop, Hayling), and "Updating" (Reading and Computational Span). In this study, we examine whether (a) there are cognitive status (CE, CN, CI) differences in the kind and degree of everyday lifestyle activities, and (b) an engaged lifestyle moderates or mediates the effects of cognitive status on EF and verbal speed (lexical decision, semantic verification). Level of cognitive, social, and physical engagement was assessed using the VLS-Activity Lifestyle Questionnaire (VLS-ALQ: Hultsch et al., 1999). Participants (N=501, 53 to 90 years) were from the VLS (Sample 3, Wave 1). MANOVAs showed that higher cognitive status was associated with better inhibition, updating, and shifting, more active cognitive engagement, and faster verbal speed. Mediator/moderator analyses (hierarchical regressions) showed that passive cognitive engagement was associated with poorer inhibition for CI, but not for CN and CE groups. Greater active cognitive engagement (novel/integrative information seeking) was associated with slower lexical decision-making speed in CI, but faster speed for CN. A cognitively engaged lifestyle partially mediated the effects of cognitive status on EF and speed. Studies of executive function and aging will benefit from considering concurrent cognitive status and everyday lifestyle engagement.

## RELATIONSHIP BETWEEN COGNITION AND GAIT IN STROKE SURVIVORS

S. Foster[1], M.C. Dux[1], G.F. Wittenberg[2], R.L. Kane[1], A.N. Cernich[1], *1. VA Maryland Health Care System, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland*

Individuals with hemiparetic stroke generally experience gait and cognitive changes that interfere with their functional independence. To better understand the relationship between aspects of cognition and gait performance in individuals who have experienced a stroke, baseline data from a rehabilitation trial were analyzed. Individuals (N = 35) ranged in age from 43-81 years (M = 60.17, SD = 7.77) and education from 8-20 years (M = 13.66, SD = 2.41). Most participants were men (65.7%) and either African American (51.4%) or Caucasian (42.9%). The relationships between two measures of cognition [i.e., TrailsA, attention; TrailsB, executive functioning (EF); higher scores on both reflect poorer performance] and measures of gait speed and efficiency [i.e., self-selected walking speed (SSWS), higher scores reflect better performance; timed 6-meter walk (6MW), higher scores reflect poorer performance] were explored using Pearson product-moment correlations. Significant relationships ($p < .05$) were identified between the cognitive variables and 6MW (TrailA = -.43, TrailsB = -.60), as well as SSWS (TrailsA = .39, TrailsB = .40). Specifically, better attention and EF were related to faster gait speed and increased efficiency. These findings highlight the importance of assessing cognition in stroke survivors, especially those who have gait disturbances. Further, they suggest that interventions designed to simultaneously improve gait and aspects of attention and EF (e.g., aerobic exercise programs) are likely to likely to confer greater benefit with respect to functional independence in stroke survivors.

## INDICATORS OF CHILDHOOD QUALITY OF EDUCATION IN RELATION TO COGNITIVE FUNCTION IN OLDER ADULTHOOD

M. Crowe[1], O.J. Clay[1], V. Howard[2], V.G. Wadley[3], P. Sawyer[3], R.M. Allman[4,3], *1. Department of Psychology, University of Alabama at Birmingham, Birmingham, Alabama, 2. Department of Epidemiology, University of Alabama at Birmingham, Birmingham, Alabama, 3. Division of Gerontology, Geriatrics, & Palliative Care, University of Alabama at Birmingham, Birmingham, Alabama, 4. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

We examined indicators of childhood educational quality as predictors of cognitive function in later life. We also investigated whether reading ability accounted for any observed associations. The sample consisted of 434 older adult participants who reported living in Alabama during childhood and completed in-home assessments of cognitive function and reading ability at four-year follow-up of the UAB Study of Aging. Participant reports of residence during school years were matched to county-level data from the 1935 Alabama Department of Education report for school funding (per student), student-teacher ratio, and length of school year. A composite measure of cognitive function was created by summing z-scores for performance on a spontaneous clock drawing task (CLOX1) and a 30-point mental status examination. The Wide Range Achievement Test-3 was used to assess reading ability. Mean age of participants at cognitive testing was 77 years (SD=5.4), 52% were African American, and 55% were female. We examined separate multiple regression models for each of the three educational quality indices. In analyses controlling for age, race, sex, and rural residence (current), both student-teacher ratio and school days per year were significant predictors of cognitive function. However, after controlling for years of education, only school days per year was a significant predictor of cognitive function ($p=.02$). The association between greater number of school days and better cognitive performance remained statistically significant after additionally controlling for reading ability ($p=.03$). Our findings support the idea that educational factors other than years of schooling may influence cognitive performance in later life.

### DIABETES AND COGNITIVE CHANGE IN MIDLIFE AND OLDER ADULTHOOD

L.A. Wray[1], D.F. Alwin[1], S.M. Hofer[2], K. Zeiser[1], C. Chiu[1], *1. Biobehavioral Health, Penn State University, University Park, Pennsylvania, 2. University of Victoria, Victoria, British Columbia, Canada*

Diabetes is a serious but largely modifiable chronic condition that affects 1 in 5 middle-aged and older Americans and is associated with other diseases, complications, and disability, including cognitive decline. To the extent that population aging is likely to result in an increasing prevalence of both diabetes and cognitive decline, understanding more about that link—and the modifiable and non-modifiable factors that may reduce both—is an important public health issue. Using 8 years of data from the nationally representative Health and Retirement Study of middle-aged and older adults in the U.S., we explored two key issues: (1) if levels of and changes in cognitive functioning in middle-aged and older adults differed by the timing of diabetes diagnosis; and (2) if documented social and health correlates of diabetes and cognitive functioning explained those potential differences. We found strong significant effects of diabetes diagnosis and longer diabetes duration on both levels and change in three measures of cognitive functioning—delayed word recall, immediate word recall, and serial subtraction—net of the effects of increasing age. Further, the significant effects of diabetes were partly explained by selected social, health, and behavioral risk factors; however, the link between diabetes and cognitive functioning remained strong, and particularly for levels of cognitive functioning. Our findings that diabetes—a disease largely associated with behavioral health risks—and other modifiable factors emerged as predictors of both levels of and change in three separate measures of cognitive performance, may inform both research and practice in future years.

### SPATIAL NAVIGATION ABILITIES IN OLDER PILOTS AND NON-PILOTS

M.M. Adamson[1], H. Weinstein[1], M. Cherrier[2], H. Diep[1], J. Taylor[1], *1. VA Palo Alto Health Care System, Palo Alto, California, 2. VA Puget Sound Health Care System, Seattle, Washington*

Assessing navigation ability can serve as an important marker for cognitive and associated neural deficits as reported in Alzheimer's Disease and Mild Cognitive Impairment by DeIpolyi and colleagues (2007). The Stanford/VA Aviation Safety Laboratory has reported several studies that attest to the advantage of aviation expertise on flight simulator performance despite the existence of age-related decline in flight simulator performance and other cognitive domains (Taylor et al., 2007). Identifying individual differences in performance between pilots and non-pilots can provide insight into how specialized expertise may influence general domains such as navigation. Therefore, spatial navigation skills were assessed in 20 aviators and 20 non-aviators (n=40) using a virtual reality Taxi task. This task is comprised of a computer generated town that requires the subject to deliver passengers to target stores as a taxi driver. Precise time measurements are recorded throughout the task as drivers drop off the passengers to target locations and serve as the main outcome measure for this study. This task has been shown to activate hippocampus place cells robustly in pre-surgical procedures on patients (Ekstrom et al., 2005). The difference in performance of older pilots and non-pilots will be analyzed. Finally, this behavioral study will be used as pilot work to design an fMRI experiment with the Taxi task which will help elucidate the differences in the neural network that underlies navigation in pilots and non-pilots.

### PREDICTORS OF MEMORY PERFORMANCE AMONG ASIAN OLDER ADULTS

W.N. Liu, T. Kuo, *Central Taiwan University of Technology and Science, Taicung, Taiwan*

Background: The symptom of memory decline is one of the most frequently encountered complaints in the elderly. However, cognitive aging, specifically memory function is less systematically investigated in Taiwan than in Western countries. The purpose of this research was to study factors that predict memory performance in elderly Taiwanese. Methods: A cross-sectional design was used in this study. A total of 130 participants recruited from senior activity centers from central Taiwan were included in the data analysis. Besides demographics, well established instruments included Self-Rated Health Scale (SRHS), subjective memory attitudes and knowledge (Metamemory in Adulthood), memory self-efficacy (Memory Efficacy), and objective memory performance (RBMT). Results: The average age for the sample was 71.76 (SD = 5.53), and the mean years of education was 10.74 (SD = 3.76). Males outnumbered females. A hierarchical regression analysis was employed. Certain assumptions of the regression analysis were examined in order to adequately interpret the results. Age and education collectively explained 45% of variance. After adding the health factor, 56% of the variance was accounted for. With the addition of metamemory and memory self-efficacy, the variance accounted for was increased from 56% to 65%. Implications: Age, education, health and memory self-efficacy contribute to memory performance in elderly Taiwanese adults. Therefore, initiating a cognitively stimulating and healthy lifestyle may preserve the successful memory function of older adults. Given the fact that older adults who have higher memory efficacy have better memory performance, they are encouraged to undertake activities that could enhance their confidence about their memory.

## SESSION 1605 (SYMPOSIUM)

### ESPO/BSS SYMPOSIUM: CORRELATES OF FUNCTIONAL DISABILITY IN OLDER ADULTS: IMPLICATIONS FOR MINORITY POPULATIONS

Chair: *A. Aiken Morgan, Rush University Medical Center, Chicago, Illinois*

Discussant: *R.N. Rooks, University of Colorado Denver, Denver, Colorado*

While functional disability and underlying physical, cognitive, and sensory limitations are not a normal part of aging, disability is a major health concern among adults aged 65 years and older and places a burden on the health care system, as well as individuals and their families. Further, prevalent health disparities put minorities and individuals of lower socioeconomic status at higher risk, relative to majority groups, of functional disability in late life. The purpose of this symposium is to discuss salient factors regarding functional disability among minority older adults. Specifically, symposium participants will examine psychosocial, health, and community influences on selected physical and medical conditions in African American, Caucasian, and Latino samples. While numerous health conditions and diseases may lead to varied changes in functional abilities, this symposium will focus on 1) predictors of mobility limitations, 2) individual and community predictors of frailty, 3) physical and psychological function in cancer patients, and 4) a caregiving approach to managing diabetes. To conclude the session, the distinguished discussant will integrate concepts presented and stimulate deeper discussion on the impact of health disparities on disability outcomes in minority elders.

### PREDICTORS OF MOBILITY LIMITATION IN MIDDLE TO OLD AGE AFRICAN AMERICANS

R. Thorpe[1], C. Bell[1], S.L. Szanton[4], J.C. Allaire[2], K.E. Whitfield[3], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. North Carolina State University, Raleigh, North Carolina, 3. Duke University, Durham, North Carolina, 4. Johns Hopkins School of Nursing, Baltimore, Maryland*

The capacity to walk unaided is the hallmark of independence and a key indicator of quality of life among older adults. However, little is known about mobility among middle-age adults and African Americans. We examine the associations of mobility limitation with socioeconomic and health-related factors in adults ages 50 and older in the Baltimore Study of Black Aging. Mobility limitation was defined as any difficulty or inability to walk several blocks or climb several flights of stairs. Of the 602 adults, 53% were limited in mobility and mean age was 69.1 years. Women and older adults were more likely to be mobility-limited compared to men and younger adults, respectively. In the multivariate models, factors associated with being mobility limitation were CVD and arthritis. Efforts to maintain mobility in African Americans should focus efforts on reducing CVD and arthritis.

### MOBILITY LIMITATIONS AMONG OLDER ADULTS WITH TYPE 2 DIABETES

O.J. Clay, M. Crowe, *Psychology, University of Alabama at Birmingham, Birmingham, Alabama*

Diabetes is a contributor to the rising healthcare costs in the U.S with an estimated average medical cost 2.3 times higher in individuals with diagnosed diabetes. Illnesses such as type 2 diabetes are among the leading causes of mobility limitations and physical disability in older adults. These impairments have multiple causes that are due to diabetes complications and comorbidities. Diabetes increases the risk of conditions such as cardiovascular disease, stroke, vision loss, cognitive impairment and reduced physical function, all of which can contribute to mobility restriction in older adulthood. A primary goal of the Diabetes and Aging Study of Health (DASH) is to investigate predictors of mobility decline in African American and Caucasian older adults with type 2 diabetes. Telephone interviews are being conducted to collect data on psychosocial factors, health behaviors, cognitive function, health literacy, and mobility. Preliminary findings identifying factors associated with mobility limitations will be presented.

### INDIVIDUAL AND COMMUNITY PREDICTORS OF FRAILTY IN LATE-LIFE: FINDINGS FROM THE H-EPESE

M.P. Aranda[1], L.A. Ray[2,3], S. Al Snih[4,2], K. Ottenbacher[5], K. Markides[6,3], *1. School of Social Work, University of Southern California, Hacienda Heights, California, 2. Sealy Center on Aging, UTMB, Galveston, Texas, 3. Preventive Medicine and Community Health, UTMB, Galveston, Texas, 4. Division of Rehabilitation Sciences/School of Health Professions, UTMB, Galveston, Texas, 5. Neurological Rehabilitation Division, Rehabilitation Sciences, UTMB, Galveston, Texas, 6. Division of Sociomedical Sciences, UTMB, Galveston, Texas*

Prevalent with increasing age, frailty is associated with elevated risk for deleterious health outcomes such as poor quality of life, falls, hospitalization, institutionalization and mortality. We examined two-year follow up data to ascertain the rates and determinants of frailty along a continuum (none, pre-frailty, and frailty status) among 2,069 Mexican American adults (75+ years) from the Hispanic- EPESE). About 26% (n=842) met criteria for frailty or pre-frailty status. Using SAS Survey logistic procedure, frailty was predicted by the following: older age (p=<.001), no private insurance (p=<.01), higher medical comorbidity (p=<.001), higher functional impairment (p=<.001), baseline frailty (p=<.001), lower cognition ((p=<.05); lower positive affect (p=<.05), and lower percentage of Mexican Americans living in the neighborhood (p=<.05). Individual as well as neighborhood characteristics confer protective effects on health in a representative sample of older Mexican Americans. The implications that a barrio advantage persists in later life will be discussed.

### PHYSICAL FUNCTIONING, PSYCHOLOGICAL DISTRESS AND SYMPTOM MANAGEMENT IN OLDER CANCER PATIENTS

T. Baker, *University of South Florida, Tampa, Florida*

Functional status has important implications for policy, health and long-term care needs for many aged adults. An estimated 49 million persons report some degree of physical disability due to a chronic illness(es) or the aging process. This prospective study examined the relationship between physical impairment, distress, and symptom severity (e.g., cancer pain) in a sample of adults (N = 125) ≥ 55 (mean ± sd; 64.4 ± 6.46) receiving outpatient services from a large comprehensive cancer center. Results underscore the influence identified demographic characteristics, distress, pain and psychological well-being have in the day-to-day functional status of older cancer patients. This investigation emphasizes the need for further studies examining functional capacity and symptom management in older adults and other marginalized populations.

### MANAGING DIABETES AT HOME: A QUALITATIVE LOOK INTO THE PRACTICES OF MEXICAN-ORIGIN ELDERS AND THEIR CAREGIVERS

C.A. Mendez-Luck[1], E. Durazo[1], R. Ben-Ari[2], B. Chaudry[2], *1. Community Health Sciences, UCLA School of Public Health, Los Angeles, California, 2. Keck School of Medicine at USC, Los Anggles, California*

Families can play an important role in helping elders manage their diabetes at home. This study qualitatively examined the assistance family caregivers provided to Mexican-origin elders with type 2 diabetes. We observed six caregiver-care receiver dyads in East Los Angeles. Each dyad was visited at home 10-15 times over 3-4 months. Observational notes were analyzed for patterns in diabetes management across dyads. We found that all elders were functionally independent and relied on caregivers primarily for instrumental support rather than basic care. In terms of diabetes-related care, caregivers in all dyads were solely responsible for meal preparation, and three helped with medication management. Most dyads performed some diabetes management, but only two performed multiple practices on a regular basis. Our results suggest involving caregivers is a promising strategy for better glucose control among elder diabetics, however, both dyad members would benefit from more education and training in diabetes management skills.

## SESSION 1610 (SYMPOSIUM)

### BIOLOGICAL SECRETS TO HEALTHY AGING

Chair: *B.J. Willcox, Geriatric Department, John A. Burns School of Medicine, University of Hawaii, Honolulu, Hawaii, Kuakini Medical Center, Honolulu, Hawaii, Queen's Medical Center, Honolulu, Hawaii*

Centenarians are expert survivors. Japan has among the highest documented prevalence of such survivors in the world. Do the Japanese have particular genetic and/or other biological advantages? The relative contribution of genes and environment to healthy aging and longevity are not known but both appear important. In this session we will explore biological contributions to longevity. Did this centenarian have long-lived siblings or parents? Is there evidence of maternal transmission of longevity, as one would expect from protective mitochondrial genes? Were particular dietary habits common in the centenarian's family? What about particular health habits such as smoking, alcohol consumption or physical activity? This centenarian's experience will be compared and contrasted with findings that appear to enhance odds for healthy aging and longevity from the Hawaii Lifespan Study and the Okinawa Centenarian Study, ongoing studies of long-lived ethnic Japanese in Hawaii and Okinawa, Japan, respectively.

### DISTAL AND PROXIMAL EVENTS, COPING AND PERSONALITY CONTRIBUTORS TO LONGEVITY

P. Martin, *Iowa State University, Ames, Iowa*

This interview will explore the influences of distal and proximal events, personality and coping strategies, as well as supportive resources that would impact the health and longevity of a healthy centenarian.

### SURVIVING A CENTURY OF TRANSITIONS: THE ADAPTATIONAL STRATEGIES OF A 104 YEAR OLD MALE EXPERT SURVIVOR

D. Willcox[1,2], B. Willcox[2], M. Suzuki[1], *1. Okinawa International University, Ginowan, Japan, 2. Pacific Health Research Institute, Honolulu, Hawaii*

Male centenarians usually make up less than 15% of the centenarian population. The few men that do manage to survive a century or longer might therefore be thought of as "expert survivors" from whom we may have much to learn about healthy aging. Role loss through retirement, becoming a widower, and losing a child, are all extremely stressful life events that may increase risk for death. This seems to be particularly true for men. The existential challenge of going on with life following loss of a child is often mentioned by centenarians as one of their most difficult life course transitions. This interview session will focus upon life course transitions in the area of work, family and social relationships and the adaptational strategies and support systems of a healthy, male "expert survivor" who has outlived his wife, children, and most others in his social convoy.

## SESSION 1615 (SYMPOSIUM)

### CUSTODIAL GRANDPARENTS: THE IMPACT OF CAREGIVING AND THE EFFECTIVENESS OF SUPPORT SERVICES

Chair: *T.A. LaPierre, The Gerontology Center, University of Kansas, Lawrence, Kansas*

Discussant: *L. Yancura, University of Hawaii, Honolulu, Hawaii*

Despite a growing body of research on the impact of caregiving on custodial grandparents and the effectiveness of support services, a number of research questions remain under examined or unexplored. This symposium brings together a diverse group of empirical papers that take a fresh look at the positive and negative consequences of raising grandchildren, and the impact of support services on enhancing custodial grandparent empowerment and personal competency. The first paper in this symposium adds to the current body of research on the impact of raising grandchildren by looking at understudied predictors of burden. This paper, by Page and colleagues, focuses our attention on the importance of grandchild characteristics in predicting burden among custodial grandparents. The second paper, by LaPierre, draws our gaze to an understudied aspect of well-being among married and cohabiting grandparent caregivers: relationship quality. In a mixed methods study of custodial and non-custodial grandparents the third paper in this symposium, by Little and colleagues, examines the positive and negative consequences of raising grandchildren in a rural setting – an understudied population. The final two papers in this symposium assess the impact of support services on enhancing custodial grandparent empowerment and personal competency. Whitley and Kelley describe how a 12-month program designed to strengthen the social, physical and emotional states of custodial grandparents was able to improve some, but not all, aspects of family empowerment. In the last paper, Smith and Dannison report on the impact of the Grandparent Resource Site project on custodial grandparents' perceptions of personal competency.

### GRANDCHILD CHARACTERISTICS AND GRANDPARENT WELL-BEING

K.S. Page[1], B. Hayslip[1], J. King[1], C. Henderson[2], *1. Department of Psychology, University of North Texas, Denton, Texas, 2. Sam Houston State University, Huntsville, Texas*

Grandparents raising grandchildren often feel stressed and have difficulties in parenting. This study evaluated how well grandchild characteristics predicted well-being in a sample of grandparents (N = 185) raising their grandchildren. Participants completed surveys pertaining to their experiences of being a caregiver for a grandchild. For this study, self-perceived levels of burden served as the indicator of well-being. When several types of grandchild characteristics were investigated (demographic, structural/setting, and grandchild strengths and difficulties), hierarchical regression analyses indicated that structural/setting (e.g., locale and duration of caregiving) and strengths and difficulties predicted burden levels, $R2 = .28$, adjusted $R2 = .23$, $F(11, 174) = 6.14$, $p < .001$. Results suggest that as the number of hours caring, frequency of conflict and disagreement, and extent of conduct problems increases, so too does the grandparent's level of burden. Professionals may find this information useful in understanding grandparent caregivers and designing interventions for them.

### RELATIONSHIP QUALITY AMONG CUSTODIAL GRANDPARENTS

T.A. LaPierre, *The Gerontology Center, University of Kansas, Lawrence, Kansas*

A number of studies have investigated the consequences of raising grandchildren on the individual well-being of custodial grandparents; however, the impact of raising grandchildren on relationship quality has largely been ignored. This study explored relationship quality among married and cohabiting grandparents raising grandchildren in skipped generation households, compared to married/cohabiting grandparents living alone, married/cohabiting grandparents living with children, and married/cohabiting grandparents living in multi-generation households. Data come from 1,803 partnered grandparents in the 1992-1994 wave of the National Survey of Families and Households. Measures of relationship quality included perceived fairness, happiness and reported disagreements in a number of areas such as household chores, money, childcare/parenting, sexual intimacy, affection, and spending time together. Significant differences in some, but not all, measures of relationship quality were observed. Sometimes these differences reflected the effect of having dependents in the household, other times they reflected the unique experiences of grandparent caregivers with co-resident grandchildren.

### POSITIVE AND NEGATIVE IMPACT OF RURAL CUSTODIAL GRANDPARENTING

C.M. Little, M.R. Crowther, J. DeCoster, *The University of Alabama, Tuscaloosa, Alabama*

Much has been written about the phenomenon of custodial grandparenting. However, few studies have examined both the positive and negative consequences of rural custodial grandparenting. The present study examined 200 rural African American grandparents, half custodial and half non-custodial using both quantitative and qualitative methods. The mean age of the sample was 55.38 years old, with 83.8% female. Findings indicate that custodial grandparents reported stress or burden levels much higher than those of non-custodial grandparents $p=.01$. Custodial grandparents reported experiencing stress, decreased social and economic well-being, and reduced physical and mental health as a result of caregiving. The grandparents also reported many positive consequences of caregiving including: being able to provide their grandchildren with love, caregiving provided the grandparents with a sense of belonging, many grandparents reported a second chance at "parenting", along with providing socialization strategies necessary for survival, and the grandparents learned new skills such as computer literacy.

### PERCEPTIONS OF FAMILY EMPOWERMENT AMONG GRANDPARENTS RAISING GRANDCHILDREN

D. Whitley, S. Kelley, *Georgia State University, Atlanta, Georgia*

Empowerment is defined as a process that enhances an individual's sense of capacity to affect positive change within their environment. Many grandparents raising grandchildren (GRG) feel disempowered as they struggle to identify and access appropriate services to address family needs. This presentation reports on the findings from a quantitative study of perceived empowerment involving 311 GRG who are participating in a 12-month program designed to strengthen their social, physical and emotional states. All participants are African American grandmothers (95.5%), or great-grandmothers (4.5%), raising an average of 2.3 grandchildren. The Family Empowerment Scale (FES) was used as the primary measure of empowerment; it comprises three dimensions of empowerment (family, service and community/political) within four subscales (advocacy, knowledge, self-efficacy, and competency). Pre/post comparative analyses suggest grandparents' empowerment measures increased across all FES dimensions and subscales, except competency. This presentation highlights the findings and the implications for community-based practice.

### ENHANCING PERSONAL COMPETENCY IN GRANDPARENT CAREGIVERS: LESSONS LEARNED

L.L. Dannison, A.B. Smith, *Teaching, Learning and Educational Studies, Western Michigan University, Kalamazoo, Michigan*

The Grandparent Resource Site project, implemented in 9 states over a 2 1/2 year period, provided information and social support to grandparent caregivers. Program goals focused on enhancing grandparents' perceptions of personal competency by providing access to information, socialization opportunities and respite. Session topics included refining parenting skills, accessing community resources, building supportive networks, advocating for grandchildren and enhancing communication with extended family members. Post-test results (n = 115) showed significant improvement in grandparent caregivers' abilities to more effectively meet the unique challenges associated with this role. Isolation was reduced and social networks expanded through group participation. At post test, a significant majority ($p < .05$) of grandparents responded that they now had friends who understood the stresses and joys of being a "parent" to grandchildren. Lessons learned about building successful kinship care group services in diverse settings and results related to personal empowerment of grandparent participants will be shared.

## SESSION 1620 (SYMPOSIUM)

### ELDER ABUSE AND MISTREATMENT IN LONG-TERM CARE SETTINGS

Chair: *N. Castle, University of Pittsburgh, Pittsburgh, Pennsylvania*
Discussant: *T. Fulmer, New York University, New York, New York*

Issues of abuse are extremely important in the daily lives of residents; having implications for both morbidity and mortality. It certainly can also influence quality-of-life, is an issue of neglect, in addition to an issue of resident safety. Many barriers (such as underreporting, varying definitions, and differences in state regulations) make elder abuse in long-term care settings difficult to study. As such, relatively few characterizations of resident abuse in these settings exist. In this symposium, recent research on elder abuse and mistreatment is presented. Descriptive empirical analyses of nurse aides opinions of resident abuse is presented; in addition qualitative information of resident-to-resident elder mistreatment is presented. The symposia will present multiple methods of examining elder abuse and mistreatment including event reconstruction to create a typology of causes of incidents as well as contextual factors related to such incidents.

### NURSE AIDES OPINIONS OF RESIDENT ABUSE IN NURSING HOMES

N. Castle, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Verbal, physical, psychological, caregiving, medication, material, and sexual abuse perpetrated by staff is examined. Information came from nurse aides included in the Pennsylvania nurse aide registry. A total of 4,117 nurse aides returned a 46 item questionnaire (response rate = 59%). Nurse aide responses to the verbal abuse and psychological abuse items were higher than for the other categories of abuse examined. For example, 36% of nurse aides observed argumentative behavior with residents and 28% observed intimidation. Lower figures were reported for physical abuse (6% observed pushing, grabbing, or pinching), caregiving abuse (10% observed staff to threaten to stop taking care of a resident), medication abuse (19% observed inappropriate delays in medication administration), material exploitation (10% observed taking assets), and sexual abuse (1% observed unwelcome discussion of sexual activity). These findings show that some types of resident abuse by staff are reported to be a common occurrence by nurse aides.

### WHY THEY FIGHT: EVENT RECONSTRUCTION OF RESIDENT TO RESIDENT ELDER MISTREATMENT (RREM) IN LONG TERM CARE FACILITIES

M. Lachs[1], K. Van Haitsma[3], J.A. Teresi[2], K. Pillemer[4], E. Haymowitz[4], T. Del Carmen[1], *1. Division of Geriatrics, Weill Cornell Medical College, New York, New York, 2. Hebrew Home for the Aged, Riversdale, New York, 3. Polisher Research Institute, Abramson Center for Jewish Life, North Wales, Pennsylvania, 4. Cornell University, Ithaca, New York*

Elder abuse by nursing home staff has been the focus of research and policy debate, but aggression between nursing home residents, which is probably more prevalent, has received little attention. In a large NIA-funded prevalence study of RREM in 10 nursing homes, we are conducting a qualitative component involving "event reconstruction" in a subsample of individual RREM episodes. This study is an exploratory effort to understand and categorize possible causes, processes, and consequences of aggression between older adults in long term care. Information was obtained from multiple sources regarding details about the event itself, exploration of potential inciting factors, previous health and behavioral characteristics of the participants, and outcomes of the RREM event (e.g., injury, escalation). A typology of RREM events was identified as well as contextual factors that influence and modulate the nature of events including participants' comorbidity, medication use, aspects of personality, environmental stressors, and physical space configurations.

### DEVELOPING A MEASURE OF RESIDENT-TO-RESIDENT ELDER MISTREATMENT: THE USE OF QUALITATIVE METHODS TO INFORM QUANTITATIVE DESIGN

B. Watkins[1,2], M. Lachs[2], J.A. Teresi[4], M. Ramirez[4], K. Pillemer[3], *1. Medicine, New York University School of Medicine, New York, New York, 2. Weil Medical College of Cornell University, New York, New York, 3. Cornell University, College of Human Ecology, Ithaca, New York, 4. Research Division, Hebrew Home at Riverdale, Riverdale, New York*

In an NIA-funded effort to develop and evaluate a quantitative survey examining resident to resident elder mistreatment (R-REM) in long term care, we used mixed-methods to identify, revise and improve the conceptual equivalence of the RREM instrument. Face-to-face survey questionnaires and semi-structured cognitive interviews were administered to a purposeful convenience sample of African-American [n=10], Hispanic [n=7] and White [n=10] nursing home residents. This allowed us to identify problematic items using two different methodologies, one that combines the quantitative and qualitative methodologies in a single questionnaire and one that separates out the quantitative survey items from the qualitative survey items. In an iterative process, our interdisciplinary team used the qualitative interview data to assess the conceptual equivalence of the indicators and develop a better measure. Using examples of items that changed as a result of the cognitive interviews, the benefits of qualitative methods for modification of measures will be illustrated.

## SESSION 1625 (PAPER)

## NEIGHBORHOOD MACRO-VARIABLES AND AGING

### AGE DIFFERENCES IN PERCEPTIONS OF NEIGHBORHOOD SOCIAL ENVIRONMENT

J.A. Ailshire[1], D. Keene[2], K. Cagney[3], *1. Andrus Gerontolgoy Center, University of Southern California, Los Angeles, California, 2. University of Michigan, Ann Arbor, Michigan, 3. University of Chicago, Chicago, Illinois*

Neighborhoods play a central role in shaping the health and well being of residents. One source of information on the neighborhood social environment is respondent perceptions of neighborhood characteristics, yet we know little about how these perceptions are shaped by individual characteristics, particularly age. This study uses data on 3,103 adults aged 18 to 92 from the Chicago Community Adult Health Study (2001-2002) to determine whether perceptions of neighborhood social cohesion, reciprocal exchange, and social disorder vary by age. We find that older residents reported higher levels of cohesion, but lower levels of disorder and that the highest level of exchange was reported by middle age adults (40-59). We hypothesize that home ownership and length of residence might explain the observed age differences in neighborhood perceptions since both of these factors increase with age and are likely associated with personal investment in and exposure to one's neighborhood. Home ownership and living in the neighborhood for at least 10 years are both positively associated with perceptions of cohesion and exchange, and home ownership is negatively associated with perceptions of disorder. Home ownership is more strongly associated with cohesion and disorder, while length of residence is more strongly associated with perceptions of exchange. With adjustment for home ownership, age differences in perceptions of cohesion, disorder, and exchange are reduced by 19-28%, 11-16% and 22-56%, respectively. Accounting for length of residence results in reductions in age differences in cohesion and exchange of 12-17% and 17-86%, respectively, with no reduction for disorder.

### MEASURING ASPECTS OF SOCIAL CAPITAL IN A GERONTOLOGICAL PERSPECTIVE

T. Poulsen, R. Lund, U. Christensen, K. Avlund, *Department of Public Health, Institute of Social Medicine, University of Copenhagen, Copenhagen K, Denmark*

Within the last 10 years there has been a growing interest in the relation between social capital and health in older people. The purpose of the present study is to develop theoretically grounded measurements covering different aspects of social capital at community-level (contextual level) related to older people, and to analyse how these measurements differ between 34 municipalities in Denmark. Data are from a Danish prospective cohort study on preventive home visits among 4,034 old people 75+ in 34 municipalities in Denmark. The measurements of aspects of social capital at community- level are based on theory of bonding, bridging, and linking social capital. The analyses show that municipalities with high social capital in bonding, bridging and linking have significantly higher levels of social diversity ($p=0.0047$), social participation ($p=0.0140$), satisfaction with social relations ($p=0.0012$), and trust to the home care in the municipality ($p=0.0006$).

### RESIDENTS ROLES IN PROGRAM DEVELOPMENT AND SERVICE UTILIZATION IN FOUR URBAN NORCS

L.D. Lovegreen[1], E. Kahana[2], B. Kahana[3], J. Brown[2], C. King[2], *1. Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada, 2. Case Western Reserve University, Cleveland, Ohio, 3. Cleveland State University, Cleveland, Ohio*

This study examined the impact of resident involvement in program development and service utilization in urban Naturally Occurring Retirement Communities (NORCs). Our study of 187 residents of four diverse NORCs (mean age = 77.9, SD = 8.7), allowed us to consider resident participation at different stages of service program implementation. We explored experiences of residents living in two government subsidized NORCs in early stages of service program implementation (less than six months) and two privately owned NORCs where service programs were of long-term (5 years) duration. The majority of NORC residents were older women, living alone. Our data revealed the continuing influence of informal social supports for NORCs residents and that the availability of social networks (primarily adult children and friends), facilitated awareness of services and service utilization. Synergies existed between social capital afforded by the service programs of the NORC and personal social resources. Our data also indicate the important role of agency and proactivity among elderly NORC residents. Many residents actively contributed to program planning and participated as volunteers in implementation of services. Our data contributes to an understanding of service development in the context of an empowerment paradigm. NORCs offer an important arena for the exploration of consumer driven and naturally occurring service development. However cumulative disadvantages constrain benefits derived by lower income and by minority residents of NORCs.

### THE IMPACT OF URBAN PLANNING ON AGING-IN-PLACE: THE ATTITUDES OF MINORITY ELDERS IN NEW YORK CITY

A.W. Costley, *CUNY-York College, Queens, New York*

Aging-in-place requires establishing a successful balance between individual needs and environmental demands. It is not yet clear how many urban planners have come to terms with the environmental needs of aging populations, especially minority elders. The Jamaica Gateway Urban Renewal Area (JURGA) in Queens, New York, presents a unique opportunity to explore the impact of major redevelopment and rezoning efforts on the potential for "aging in place" in a regional urban community where 98 percent of residents are non-white and 27 percent of households have one or more persons over 65. Scaled attitude surveys and structured focus groups were used with 48 community residents at six senior centers within the designated urban renewal study area to assess unmet needs and attitudes toward safety, affordability, access, and opportunity. Data collection addressed two key domains: preferences among many essential city features proposed by the WHO Global Age Friendly Cities project (2005), and the potential impact of this development on quality of life and accessibility within the central business district of a community with over 25,000 adults over age 65. Descriptive statistics were used to document mean scores and preferences for age-friendly features including: lack of physical barriers, affordable housing, accessible transportation, and safe and attractive public spaces. Grounded theory and thematic analysis were used to explore shared views on the potential benefits and liabilities of the renewal plan of this size and scope and challenges for aging-in-place for older adults and their families.

## SESSION 1630 (PAPER)

## PERCEPTIONS OF AGE AND AGING

### CAN PHYSICAL OBJECTS ACTIVATE AGING STEREOTYPES?

G. Moriello[1,2], J. Cotter[2], N.J. Shook[2], D. Dodd-McCue[2], E. Welleford[2], *1. The Sage Colleges, Troy, New York, 2. Virginia Commonwealth University, Richmond, Virginia*

Stereotypes can be activated in everyday life through exposure to objects. Objects hold meanings which symbolize certain values and ideas and the presence of an object can activate constructs related to it. Although the use of objects representing the business world has been found to activate the trait of competition, the use of objects to activate stereotypes of aging has not been evaluated. The purpose of this study was to determine which objects represent stereotypes of aging and if exposure to these objects truly elicits aging stereotypes. A group of 18 older adults were interviewed to determine which particular objects represent stereotypes of aging. The seven most negative and seven most positive objects were utilized for the study. A separate group of 23 older adults were randomly assigned to a prime or no prime group. Participants in the prime group were exposed to the objects representing aging stereotypes and those in the no prime group were exposed to objects in a neutral condition. Participants were then required to complete a word fragment completion task which has been found to be sensitive to recently activated constructs. Chi Square testing was utilized to determine whether the participants who were primed were more likely to complete stereotypical words in the word fragment completion task than those in the no prime group. The types of objects representing stereotypes of aging and whether they elicited stereotypes will be discussed.

### DEATH OCCURRENCES AND STIGMATIZATION IN RESIDENTIAL CARE COMMUNITIES

D.J. Dobbs[1], J. Schumacher[2], M.C. Nemec[2], N. Park[1], *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Maryland Baltimore County, Baltimore, Maryland*

Residential care homes have been associated with a stigmatizing social environment for reasons such as the loss of autonomy that comes with institutionalization, increased dependency, and the power differential between residents and staff, or between healthier residents and more frail residents. Older adults who try to form social relationships in residential care often experience death among their peers. The occurrences of death often make residents avoid building new relationships in fear of loss. A narrative analysis of over 400 ethnographic fieldnotes and interviews with residents, families, and staff, over a three-year period at five senior housing communities was conducted to: (a) explore death occurrences among residents in residential care settings and the role they play in stigmatization of the setting; (b) discuss how facility practices may contribute or negate the perpetuation of stigma as it relates to death occurrences; and (c) explore its relevance to issues of resident quality of care. Salient themes emerged including: emotional avoidance with the actively dying among residents; expectations of death among friends; sadness due to loss of relationships from both residents and staff; and lack of bereavement support and other coping mechanisms offered to residents, staff or families. The overarching theme of senior housing communities being the last stop before death perpetuates the stigma of these settings. The impact of the stigmatizing behaviors in these settings as well as suggestions for addressing these behaviors will be discussed.

### THE EFFECT OF IMPLICIT STEREOTYPES ON THE PHYSICAL PERFORMANCE OF OLDER ADULTS

G. Moriello[1,2], J. Cotter[2], N.J. Shook[2], D. Dodd-McCue[2], E. Welleford[2], *1. The Sage Colleges, Troy, New York, 2. Virginia Commonweath University, Richmond, Virginia*

Research has shown that exposure to stereotypes of aging can influence cognitive performance and behavioral outcomes in older adults. To date, there has been little research on the effect of stereotypes on physical performance in more real life situations. The purpose of this study was to explore how stereotypes affect physical performance in older adults. A multi-group pretest posttest design was utilized to determine whether implicit activation of positive or negative stereotypes has an effect on physical performance. 96 community dwelling older adults 65 years of age or older were included in the sample. Participants were randomly assigned to one of three groups: exposure to positive stereotypes of aging, exposure to negative stereotypes of aging, or a control condition. In order to simulate how older adults are exposed to stereotypes in real world settings, participants were primed with objects representing aging stereotypes. Gait speed, standing balance, and lower extremity muscle performance were tested before and after exposure to the stereotypes. Results of MANCOVA analysis, using self-relevance as a covariate, show the effect on those exposed to positive stereotypes, negative stereotypes, or the neutral condition. The study extends lab results of implicit stereotypes of aging on physical performance in a more real world setting. The session also considers the effect of other factors, like motivation and self-focus, competing for the control of behavior which are not present in the lab. These psychosocial factors may affect stereotype activation on physical performance.

### DOING AGE WITH HUMOUR – REPRESENTATIONS OF (OLD) AGE IN WEB-BASED GLBTQ COMMUNITIES

A. Siverskog, *National Institute for the Study of Ageing and Later Life, Linköping University, Norrköping, Sweden*

Internet offers new forms of establishing contacts and presenting the self and can, as a social arena, be seen as particularly important for homosexual, bisexual and transsexual persons in old age. Many old persons within the GLBTQ community have experienced shame and stigma during their lives since non-normative sexuality has been seen as deviant, perverted - and during certain time periods in a Swedish context - even as a disease or as criminal. In web-based gay communities where persons seek friends, partners and sexual contacts, the personal profiles vary from shorter personal descriptions with mug shots to more explicit pornographic texts with pictures of the naked body. This study aims to explore how age is expressed, used and negotiated in these personal profiles. The qualitative analysis concerns profiles from two different web-based gay communities of persons identifying as non-heterosexual aged 60 and over. These profiles constitute the empirical material supplemented by qualitative in depth interviews conducted with persons in these communities. Results point at humour being central when negotiating old age in these profiles. Self-irony is recurring and dark humour is used to speak against ageist notions of old age. Humour is also used through the use of proverbs and puns related to ageing and old age. Notions of old age as connected to passivity, slowness, humorlessness and asexuality are challenged through these ways of "doing age with humour". The analysis thus indicates that these web-based communities can be an arena for agency and for challenging ideas of old age.

## SESSION 1635 (POSTER)

## PHYSICAL ACTIVITY AND EXERCISE

### ATTITUDES AND BELIEFS INFLUENCE STRENGTH TRAINING ADOPTION IN OLDER ADULTS

M.K. Baker[1], D.J. Kennedy[4], P.L. Bohle[4], M.A. Fiatarone Singh[1,2,3], *1. Exercise Health and Performance Research Group, The University of Sydney, Lidcombe, New South Wales, Australia, 2. Jean Mayer USDA Human Nutrition Research Centre on Aging at Tufts University, Boston, Massachusetts, 3. Hebrew SeniorLife, Harvard Medical School, Boston, Massachusetts, 4. Ageing and Human Development Research Group, The University of Sydney, Lidcombe, New South Wales, Australia*

Participation in progressive resistance training is very low in older adults, despite its known benefits. We therefore sought to identify convergent themes associated with older adults' attitudes towards, and adoption of, PRT in a retirement community. METHOD Two interviewers conducted separate convergent interviews with 20 retirement village residents. Convergent themes that arose from the interview process were extracted and transformed into questionnaire format. All residents were next invited to complete questionnaires assessing demographics, physical activity, general health and questions based on the results of the convergent interviews. Finally, all residents were invited to take part in an on-site, 10-week randomized controlled trial (RCT) of PRT-based exercise program. RESULTS From the total population of 358 residents, 20 participated in the convergent interview process, 118 completed the questionnaires, and 38 people were recruited into the RCT. Convergent themes related to PRT included: health, injury, group activity, supervision, age, and location. Hierarchical regression analysis to predict adoption of PRT indicated that demographic variables accounted for 38% of the variance, and convergent themes ($\beta = .655$) explained an additional 18% of the variance in PRT adoption ($\Delta R2 = .179$, $p = .002$). DISCUSSION Identified convergent themes associated with older adults' attitudes towards PRT accounted for significant additional variance in the prediction of PRT adoption, beyond the effect of known demographic factors. A better understanding of the attitudinal factors that influence PRT participation is essential for the development of interventions promoting higher levels of participation among older adults.

### INTERGENERATIONAL TRANSMISSION OF PHYSICAL ACTIVITY: THE ROLE OF PERCEIVED FAMILY RESOURCES

S. Stahl, J.H. Patrick, *West Virginia University, Morgantown, West Virginia*

Research suggests individuals within a dyadic relationship exert mutual influences on one another's beliefs and behaviors (Bell, 1978; Kelley & Thibaut, 1978). The parent-child dyad is one of the most central, long-lasting, and emotional bonds between two people (Bowlby, 1980); however, relatively few studies have examined partner- and individual-level influences on health promotion from this dyadic perspective. The current study used an actor-partner interdependence model (APIM, Kenny, Kashy, & Cook, 2006) to explore the effects of internal health locus of control and perceived family resources on self-reports of physical activity within middle-aged mothers and young adult children dyads. We proposed that partners will indirectly influence one's own self-reported physical activity. Data were derived from 48 parent-child dyads (mothers' mean age = 48.54 years, SD = 3.93; children's mean age = 19.71 years; SD = 1.74). A number of differences between middle-aged mothers and their young adult children emerged. Mothers perceived fewer family health resources ($M = 12.68$; $SD = 4.66$) than children ($M = 15.62$; $SD = 4.22$), $t(47) = -3.35$, $p < .01$, and engaged in less physical activity ($M = 10.00$; $SD = 5.81$) than children ($M = 12.56$; $SD = 4.82$), $t(47) = -2.49$, $p < .05$. Results are discussed within a life-span developmental perspective and focus on ways in which both mothers and adult children can influence each other's engagement in health promoting behaviors.

### ASSESSING ACTIVITY IN OLDER ADULTS: A STUDY COMPARING STEP ACTIVITY MONITORING AND SELF-REPORT

K. Hall[1], R. Sloane[2], C.F. Pieper[2], H. Bosworth[1,2], K.M. Huffman[1,2], J.T. Cavanaugh[3], M. Pearson[1], M.C. Morey[1,2], *1. Geriatric Research, Education, and Clinical Center, Veterans Affairs Medical Center, Durham, North Carolina, 2. Duke University, Durham, North Carolina, 3. University of New England, Portland, Maine*

The degree to which self-reported physical activity (PA) and walking behavior corresponds to objectively-assessed ambulatory activity data in older adults is not well known. Methods: Sixty six older men (M age=67.12, Range=60-79 yrs.) participating in an on-going randomized controlled exercise trial were identified at baseline. Their baseline level of PA was assessed by the CHAMPS PA Questionnaire for older adults (Stewart et al., 2001; 1997) and the StepWatch Activity Monitor (SAM). The CHAMPS was used to assess the average duration and frequency of moderate-intensity activities over the previous 4 weeks. After completing the CHAMPS, patients were instructed to wear the SAM for 7 days. The SAM was used to quantify total number of steps, and minutes/week spent in light-, moderate-, and high-intensity activity. Associations between the CHAMPS items and the SAM outcomes were examined using bivariate analyses. Results: Minutes of high-intensity activity/week measured objectively by the SAM was significantly ($p \leq 0.05$), albeit weakly, associated with the following items from the CHAMPS: frequency of all moderate-intensity exercise-related activities ($r=0.29$), frequency of all exercise-related activities ($r=0.30$), frequency of walking/jogging activities ($r=0.39$), minutes/week of walking/jogging activities ($r=0.30$), and minutes/week of moderate-intensity activity ($r=0.32$). No other significant associations were reported. Conclusion: The lower-than-expected associations between the self-report items and the SAM suggest that these measures may be measuring related, but different, domains of PA. Future validation studies of the SAM criteria to classify activity intensity in older adults and studies that more closely align the assessment periods of the SAM and the CHAMPS are warranted.

### THE ASSOCIATION BETWEEN TAI CHI AND MEMORY IN OLDER ADULTS

A. Overton-McCoy, *UAMS-Texarkana Regional Center on Aging, Texarkana, Arkansas*

Each year there are increasing numbers of older adults within the United States. By the year 2030, 1 out of every 5 Americans will be 65 or over. By the age of 80, 1 out of every 2 older adults will be affected by a cognitive impairment. A growing body of literature supports the positive impact of cardiovascular/aerobic physical activity on cognition; however, little is known about mind–body physical activities and the impact on cognition of older adults. With the rising costs of health care, it is vital to explore physical activities that are physically feasible, such as Tai Chi, for older adults that can preserve or restore cognitive function. A quantitative, preexperimental, static group comparison design was utilized to assess the impact of Tai Chi on the cognitive abilities of older adults. A significant association between the practice of Tai Chi and global cognition, verbal memory, and process timing was found. Older adults who participated in Tai Chi not only performed better on testing but were faster in generating the correct answers.

### INVESTIGATING THE EFFECTIVENESS OF GUIDED RELAXATION AND EXERCISE IMAGERY IN LEISURE-TIME EXERCISE BEHAVIORS FOR OLDER ADULTS

B. Kim[1], R.A. Newton[1], M.L. Sachs[1], P.R. Giacobbi[2], *1. Public Health, Temple University, Philadelphia, Pennsylvania, 2. University of Arizona, Tucson, Arizona*

The main purpose of this study was to examine the effects of a repeated measures six-week intervention that used Guided Relaxation and Exercise Imagery (GREI) techniques in regards to leisure-time exercise behavior among older adults. A total of 93 older adults (Mage = 70.38; SD = 8.15; 66 female) were randomly placed into either a placebo control group (PCG) or an intervention group (IG). The IG received instructions to listen to an audio CD containing a GREI program and the PCG received an audio CD that contained two relaxation tracks and instructions to listen to their music of choice for six weeks. Results revealed that listening to a GREI CD for six weeks significantly increased leisure-time exercise behaviors. Further exploration of GREI and its effects on the psychological variables related to perceived exercise behaviors may substantiate its effectiveness as an intervention.

### BASELINE ACTIVITY LEVELS OF OLDER ADULTS WITH DISABILITIES

S. Stark, E. Somerville, M. Rothenberger, J.C. Morris, *Washington University, St. Louis, Missouri*

The health benefits associated with physical activity for older adults include decreased falls, lower mortality rates, and lower incidence of several debilitating conditions. To achieve a health benefit, older adults should participate in moderate to vigorous amount of physical activity for 30 minutes on five or more days of the week. Only one of three of older adults meet the recommended level of activity and baseline activity levels for disabled older adults are unknown. The aim of this study was to objectively assess physical activity levels of chronically diseased older adults with one or more mobility impairments. Older adults age 65-95 years, who reported a chronic health condition and mobility impairment, were recruited to participate in the study (n=20). Objective physical activity levels were gathered for 48 hours using the SenseWear® Pro3 actigraph monitoring system. Average metabolic equivalent (MET) levels and step count were calculated for each participant. Participants were primarily female and Caucasian with a range of 2 - 16 health conditions. Overall, physical activity was in the sedentary range. The participants overall average MET level was .95. Participants with a higher body mass index had lower average MET levels. There were no relationships found between number or severity of co-morbid conditions and MET levels. Most participants fell below the recommended levels of physical activity. These results suggest that chronically diseased older adults with mobility impairments are at risk for not meeting minimum daily exercise guidelines.

## DOG OWNERSHIP AND PHYSICAL ACTIVITY IN OLDER ADULTS

K. Gretebeck[1], R.J. Gretebeck[2], *1. University of Michigan, Ann Arbor, Michigan, 2. Wayne State University, Detroit, Michigan*

Dog ownership has been suggested as an intervention for promoting physical activity among older adults. The purpose of this study was to examine the relationship between walking, physical activity, functional ability, and perceived control and difficulty of performing physical activity between older adults who owned dogs and those who did not own dogs. Questionnaires were mailed to retired non-faculty staff members from a large university. Measures included the Physical Activity Scale for the Elderly, Physical Functioning Questionnaire and items related to dog ownership and perceived control and difficulty in performing physical activity. Participants included 1,091 (53.8% female) older adults (65-98 years, M age=75.47 ± 6.67). The analyses revealed that compared to non-dog owners, dog owners spent more time walking (M= 1-2 hrs/day ±.91 vs M= <1 hr/day ±.78, t=5.65, p<.001), had greater total physical activity scores (M= 153.08 ± 79.96 vs M=125.29 ± 72.35, t=4.42, p<.001), and reported significantly greater perceived behavioral control (t=6.21, p<.001) and less difficulty to be physically active (t=4.84, p<.001) when accompanied by their dog. No significant differences were found in functional ability scores between dog and non-dog owners. In this group of older adults, those who owned a dog walked more hours/day and were more physically active than those who did not. Dog ownership could be an effective strategy for increasing physical activity in older adults who walk.

## EFFECT OF FREQUENCY OF BEHAVIORAL APPROACH ON HOME-BASED EXERCISE ADHERENCE IN FRAIL OLDER ADULTS

R. Shigematsu[1], R. Nakanishi[1], K. Tanaka[2], *1. Faculty of Education, Mie University, Tsu, Mie, Japan, 2. Graduate School of Comprehensive Human Sciences, University of Tsukuba, Tsukuba, Ibaraki, Japan*

A behavioral approach to voluntary home-based exercise in frail older adults is essential; however, the effective frequency of such an approach is undetermined. The purpose of this study was to examine the effect of the frequency of behavioral approach on home-based exercise adherence. Thirty-nine frail older adults (aged 67-85 years) participated. They were placed into one of two groups: weekly session (n = 14; W group) or biweekly session (n = 25; BW group). Each session, which consisted of home exercise practice and a behavioral approach, was 90 minutes over a 3-month period. The home exercise routine included 4 stretches and 6 muscular-strength exercises. An exercise log was given to each participant. The log was checked by intervention staff members at each session. Participants explained how they would exercise at home until the next session. Illustrated stories or panel cartoons, shown behavioral change techniques, were given on 6 occasions to each group. Functional fitness (i.e., tandem balance, standing up 5 times from a chair, and sit-and-reach) was measured at pre- and post-intervention periods. During the 3 months, home exercise adherence in the BW group (77.2%) was not significantly different from that in the W group (78.7%). Significant improvements in functional fitness were observed in both groups. No interactions were found. In conclusion, the biweekly behavioral approach used in this study appears to be as effective in enhancing exercising adherence at home and in improving functional fitness in frail older adults as the weekly approach.

## PHYSICAL ACTIVITY AND DEPRESSION IN OLDER ADULTS FROM ELEVEN EUROPEAN COUNTRIES: RECIPROCAL RELATIONSHIPS ACROSS TIME?

M. Lindwall, P. Larsman, *Department of Psychology, University of Gothenburg, Gothenburg, Sweden*

This prospective study investigated the reciprocal nature of the physical activity-depression relationship in 18,373 older adults (Mage =63.46, SD =10.03) from eleven European countries across a two year follow up. Data was drawn from the Survey of Health, Ageing and Retirement in Europe (SHARE) database. A two-wave cross-lagged panel design and structural equation modelling was used to analyse data. Depression was measured at baseline (T1) and follow-up (T2) through the EURO-D scale, capturing the two factors of affective suffering and motivation. Physical activity was measured at T1 and T2 as frequency of moderate physical activity and vigorous physical activity. Age, gender and education at T1 were controlled for in the analyses. In cross-sectional analyses, higher levels of physical activity at T1 and T2 were associated with lower levels of affective suffering and motivation at T1 and T2 respectively. Physical activity at T1 had a prospective significant effect on affective suffering and motivation at T2. The effects of depression factors at T1 on physical activity at T2 were however not significant. When comparing different models, the analyses demonstrated strongest support for the effect of physical activity on future depression rather than vice versa. However, the best fitting model were the fully-cross lagged model, indicating the existence of a reciprocal causal relationship between physical activity and depression in older adults.

## DAILY CHANGES AMONG PHYSICAL ACTIVITY GOAL PROCESSES AND SUBJECTIVE WELL-BEING DURING MIDLIFE

E. Goedereis[1], J.H. Patrick[2], B. Ayotte[3], *1. Behavioral & Social Sciences, Webster University, Saint Louis, Missouri, 2. West Virginia University, Morgantown, West Virginia, 3. VA Boston Healthcare System, Boston, Massachusetts*

Because obesity rates may be highest during midlife, it is valuable to examine health-promoting behaviors such as regular physical activity during this period of the life span. Data from 35 individuals between the ages of 35 and 60 were collected three times per day for six days via Palm® handheld computers in order to investigate individual variability in the daily processes of physical activity goal pursuit within a sample of middle-aged adults who were obese or overweight and actively trying to lose weight. Results from within-person correlation analyses with repeated measures revealed a number of findings: (1) increases in control were associated with increases in goal-directed effort (r = 0.17), perceived progress (r = 0.21), positive affect (r = 0.25), and life satisfaction (r = 0.25); (2) decreases in control (r = -0.22) and perceived progress (r = -0.13) were associated with increases in negative affect; (3) increases in goal-directed effort (r = 0.19) and perceived progress (r = 0.60) were associated with increases in physical activity; and (4) increases in physical activity were associated with increases in positive affect (r = 0.14), all p < .05. Results from this study contribute to life-span perspectives in health and aging by considering the short-term trajectories of overweight and obesity, as well as the psychological processes and consequences associated with physical activity goal pursuit during midlife.

### MEASURING LOW RATES OF PHYSICAL ACTIVITY IN HEALTHY & MILDLY DEMENTED OLDER ADULTS

A. Watts[1], D.K. Johnson[1], J.M. Burns[2], E. Zelinski[3], *1. University of Kansas, Lawrence, Kansas, 2. University of Kansas Medical Center, Lawrence, Kansas, 3. University of Southern California, Los Angeles, California*

Physical activity is associated with positive outcomes in older adults including lower disease rates, decreased risk of falls, and better cardiovascular and cognitive function. Accurately measuring physical activity in older adults with self-report questionnaires is difficult and no known assessment tools exist to measure physical activity specifically in persons with dementia. Our aim was to assess the measurement properties of the Physical Activity Scale for the Elderly (PASE) and determine its applicability to individuals with mild dementia. We compared the PASE in two independent samples of adults aged 60+ including 604 non-demented adults from The Long Beach Longitudinal Study (LBLS), 78 mildly demented, and 83 healthy controls from a University of Kansas Alzheimer and Memory Program clinical sample. We used confirmatory factor analysis to assess the factor structure in the two samples. We found that the majority of older adults in both samples had low rates of participation in many of the PASE items (e.g. <8% participated in light sports); the demented participants had particularly low participation (e.g. walking and light housework were the only items with 50% or greater participation). We found a two-factor structure described the PASE in the LBLS sample using zero-inflated Poisson distributional assumptions to account for the low rates of participation. This approach was unsuccessful in the clinical sample, both healthy and demented, due to low rates of participation. We conclude that improved measures are needed to assess physical activity in demented and non-demented older adults with very low rates of activity participation and offer suggestions for improved assessment.

### PHYSICAL ACTIVITY AND WELL-BEING IN OLDER AND YOUNGER ADULTS WITH CHRONIC PAIN

J.L. Wetherell[1,2], J. Bougie[3], *1. VA San Diego Healthcare System, San Diego, California, 2. Dept. of Psychiatry, UCSD, La Jolla, California, 3. Loma Linda University, Loma Linda, California*

We compared 41 older adults (age 60-89) with 73 younger adults (age 26-59) presenting for treatment of chronic pain. The older adults reported lower levels of pain severity, interference, and depression, and higher levels of mental health-related quality of life, than did the younger adults. Although self-reported physical activity levels did not differ between the groups, activity was associated with lower levels of pain interference ($r = -.467$, $p = .001$) and depression ($r = -.420$, $p = .006$) and higher levels of quality of life ($r = .512$, $p = .001$) among the older adults; this was not true among the younger adults (r's = .27-.79). Objective data on physical activity using accelerometer-based actigraphy were also collected and will be used to examine these relationships. These preliminary data suggest that physical activity may be a particularly important component in the maintenance of well-being among older people with chronic pain and support the need for an emphasis on physical activity in treatment of geriatric pain.

### EFFECTS OF WEATHER CONDITIONS ON PEDOMETER-DETERMINED PHYSICAL ACTIVITY IN JAPANESE ADULTS

T. Sakai, *Doshisha University, Kyotanabe, Japan*

Seasonality has been reported to affect physical activities of adults; however, the role of weather conditions remains unclear. This study aimed at evaluating whether pedometer-determined physical activity was affected by the weather conditions in spring and summer. This study population consisted of 48 community-dwelling men and women (69.3 ± 6.3 years; 7 men and 41 women). All the participants were given an Active Style Pro HJA-350IT pedometer for 25 weeks (Omron Healthcare Co. Ltd, Japan). The participants were instructed to wear the pedometer on their waistline all day, except when bathing, showering, swimming, or sleeping. Access to data from the weather stations was provided by the Japan Meteorological Agency. Daily values of the highest and lowest temperatures (∞C), rainfall (mm/day), wind speed (m/s), and duration of daylight (h) were obtained from local meteorological stations. The data were classified into 3 categories. Overall, the participants had a mean step count of 6911.1 ± 4299.2 steps/day. The step counts on days when the lowest temperature was <15∞C, daylight was <2 h, or wind speed was >3.4 m/sec, the step counts were significantly different from those on other days ($P < 0.05$). However, there was no significant correlation between the step counts and the highest temperature. The change in physical activity may be partly explained by not only seasonality but also daily weather conditions. Increasing opportunities for the field of physical activity during spring and summer, when weather conditions are not very conducive, may mitigate the decline in physical activity.

## SESSION 1640 (SYMPOSIUM)

### POPULATION-BASED STUDIES OF STROKE AND INFORMAL CAREGIVING: THE REGARDS AND CARES PROJECTS

Chair: *D.L. Roth, University of Alabama at Birmingham, Birmingham, Alabama*
Discussant: *R. Schulz, University of Pittsburgh, Pittsburgh, Pennsylvania*

Stroke is the leading cause of adult disability in the United States and is known to disproportionately affect African Americans and residents of Southern States. The REasons for Geographic and Racial Differences in Stroke (REGARDS) project is a national epidemiologic investigation of stroke incidence and mortality that seeks to explain the reasons for these racial and geographic disparities. The Caring for Adults Recovering from the Effects of Stroke (CARES) project is enrolling stroke survivors from REGARDS along with their primary family caregivers into an ongoing longitudinal observational study. In this symposium, we will describe the methods used in these projects, including summaries of the recruitment and enrollment methods and the measures being used to address hypotheses concerning stroke survivor and caregiver outcomes. Quality of life (QOL) data have been collected for the stroke survivors both before and after their stroke events, providing a rare opportunity to measure changes in QOL from a prospective, population-based study. Questions pertaining to caregiving duties were asked of each REGARDS participant, and over 3,700 such caregivers were identified. The health and mortality risks associated with key caregiving-related variables will be examined for this diverse sample of caregivers. Questions of caregiving outcome are best addressed by comparing caregivers with carefully matched samples of non-caregivers. Case-by-case matching methods have been implemented in both CARES and REGARDS, including the application of a propensity score matching method to test whether caregivers are at a heightened or reduced risk for mortality compared to non-caregivers.

### DESIGN OF REGARDS AND CARES: ENROLLING NATIONAL SAMPLES OF STROKE SURVIVORS AND FAMILY CAREGIVERS

V.G. Wadley[1], G. Howard[2], V.J. Howard[3], O.J. Clay[4], J.S. Grant[5], J. Rhodes[5], W.E. Haley[6], D.L. Roth[2], *1. Medicine, University of Alabama at Birmingham, Birmingham, Alabama, 2. UAB Dept. of Biostatistics, Birmingham, Alabama, 3. UAB Dept. of Epidemiology, Birmingham, Alabama, 4. UAB Dept. of Psychology, Birmingham, Alabama, 5. UAB School of Nursing, Birmingham, Alabama, 6. University of South Florida, Tampa, Florida*

The REasons for Geographic and Racial Differences in Stroke (REGARDS) study enrolled a cohort of 30,239 White and African American adults aged >45 from 2003 – 2007. This cohort is followed every six months for reported stroke events, which are then adjudicated from medical records. In 2005, the CARES project was initiated to track the long-term effects of stroke on REGARDS stroke survivors and their primary family caregivers. Stroke survivor/family caregiver dyads are enrolled and interviewed by telephone approximately 9 months after the stroke events. An in-home evaluation of the stroke survivor's objective functional recovery is also completed using standardized stroke impact and recovery measures. Psychosocial outcomes of these stroke survivor/family caregiver dyads are compared to a matched sample of control dyads drawn from the same REGARDS cohort. This presentation will describe the methodological details of the REGARDS and CARES projects and establish the context for the remaining presentations.

### QUALITY OF LIFE AFTER STROKE: A PROSPECTIVE LONGITUDINAL STUDY

W.E. Haley[1], D.L. Roth[2], B. Kissela[3], M. Perkins[2], G. Howard[2], *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. University of Cincinnatti, Cincinnatti, Ohio*

Participants in the REGARDS study with no history of stroke completed baseline SF-12 Mental (MCS) and Physical Component Summary (PCS) measures and a 4-item CES-D scale. Follow up QOL measures were completed later (M=35.1 months) by 114 stroke survivors nine months after an incident stroke event and 114 demographically matched stroke-free control participants. Analyses examined the association of incident stroke with QOL changes and whether race, gender, age, income, or social support moderated those changes. Compared with controls, stroke participants showed significant declines in all three QOL measures. Standardized effect sizes based on covariate-adjusted differences between the two groups were similar across the three measures and ranged from 0.30 to 0.41 standard deviation units. None of the other variables predicted differential decline after stroke. The inclusion of mild cases of stroke may allow for a more accurate estimation of these effects than research using clinical samples and without stroke-free controls.

### CAREGIVING STRAIN AND SELF-RATED HEALTH AS RISK FACTORS FOR MORTALITY AMONG FAMILY CAREGIVERS

M. Perkins[1], V.J. Howard[1], M. Safford[1], V.G. Wadley[1], M. Crowe[1], W.E. Haley[2], D.L. Roth[1], *1. Univ of Alabama at Birmingham, Birmingham, Alabama, 2. University of South Florida, Tampa, Florida*

We examined the relationship between caregiving strain, self-rated health, and risk for all-cause mortality in 3,718 REGARDS participants who indicated in baseline interviews that they were providing care to a disabled family member. These caregivers also indicated how much mental or emotional strain (none, some, or a lot) was associated with providing care. Highly strained caregivers were more likely to be White and female and reported worse mental and physical health than caregivers reporting moderate or no strain. Over a subsequent 4-year period, 153 caregivers (4.1%) died. Proportional hazards models that accounted for the effects of demographic and socioeconomic covariates revealed that highly strained caregivers were at an increased risk for mortality compared to no strain (HR = 1.69) and moderate strain caregivers (HR = 1.87). Self-rated health was also a significant risk factor for mortality (HR = 1.48). Implications for improving the health of caregivers will be discussed.

### METHODOLOGICAL APPROACHES FOR MATCHING CAREGIVERS WITH NON-CAREGIVERS IN POPULATION-BASED STUDIES

D.L. Roth[1], M. Perkins[1], M. Hovater[1], M. Henry[1], W.E. Haley[2], *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. University of South Florida, Tampa, Florida*

Multiple methods have been used to match caregivers with non-caregiving controls in the literature, but many such studies are subject to serious selection biases. In REGARDS, participants were asked if they were currently a caregiver and to identify their likely caregiver in the event that they were to become seriously ill or disabled. This allowed us to determine whether potential caregivers became actual caregivers after stroke, and to match actual caregivers in CARES with non-caregivers on several demographic and relationship variables. Descriptive data from the first 114 stroke caregivers and matched non-caregivers confirm the effectiveness of this matching method. Furthermore, we are using a propensity score method to individually match over 3000 REGARDS caregivers with non-caregivers on demographic, socioeconomic, and medical history variables. Survival analyses suggest that family caregivers are at reduced all-cause mortality risk compared to propensity-matched non-caregivers, supporting research that suggests some positive health benefits from caregiving.

## SESSION 1645 (SYMPOSIUM)

### PSYCHOSOCIAL, PHYSICAL, AND SPIRITUAL INFLUENCES ON ADVANCE CARE PLANNING IN AN ETHNICALLY DIVERSE SAMPLE: EVIDENCE FROM THE NEW JERSEY END OF LIFE STUDY

Chair: *D. Carr, Rutgers University, New Brunswick, New Jersey*
Discussant: *W.E. Haley, University of South Florida, Tampa, Florida*

Despite widespread public support for advanced care planning, only half of Americans make such plans, with Blacks and Latinos far less likely than whites to do so. In this session, we explore the ways that race, religion, beliefs, and physical functioning affect three aspects of advance care planning: living wills, durable power of attorney for health care appointments, and holding discussions with loved ones. All papers use data from the New Jersey End of Life Study, a study of 305 terminally ill White, Black, and Latino patients residing in NJ. Idler et al. investigate religious differences in end-of-life care, and find that Conservative Protestants are most likely to say their religious beliefs would influence their treatment preferences, yet are least likely to have discussed their plans with others. Garrido et al. explore how values and beliefs affect end-of-life planning. They find that persons who highly value heroic measures and who believe that God should control the length of life are less likely to engage in advance care planning. Carr finds that Blacks are far less likely than Whites to make end-of-life plans, due largely to their belief that God controls death. Bodnar-Deren documents that persons with higher levels of functional impairment and who perceive that their illness is highly intrusive for everyday life are more likely to engage in advance care planning. Implications for policy and practice are discussed.

### ADVANCE CARE PLANNING AND BELIEFS ABOUT CONTROL OVER THE LENGTH OF LIFE

M.M. Garrido[1], E.L. Idler[2], H. Leventhal[1], *1. Institute for Health, Health Care Policy, and Aging Research, Rutgers University, New Brunswick, New Jersey, 2. Emory College, Atlanta, Georgia*

Advance care planning (ACP) improvement efforts emphasize patient values and beliefs, but these may either facilitate or deter advance directive (AD) completion or durable power of attorney (DPA) appointment. Using data from 305 chronically ill adults ≥55, we developed scales reflecting belief that God controls life length (GC) ($\alpha$=0.85) and that death is a natural part of life (ND) ($\alpha$=0.70). In multivariate models, minority respondents and those with higher importance of spirituality and religion, any religious affiliation, and monetary difficulties held stronger GC beliefs. Respondents with lower religious importance, higher spirituality importance, and higher education held stronger ND beliefs. Respondents with stronger GC beliefs valued being at peace with God. Respondents with stronger ND beliefs valued controlling death location and feelings of life completeness. Respondents valuing heroic measures and with stronger GC and weaker ND beliefs had lower

DPA likelihood. Respondents valuing controlling death location had higher AD likelihood.

### RACIAL DIFFERENCES IN END-OF-LIFE PLANNING: WHY DON'T BLACKS AND LATINOS PREPARE FOR THE INEVITABLE?

D. Carr, *Rutgers University, New Brunswick, New Jersey*

I evaluate the extent to which ethnic disparities in advance care planning reflect cultural and religious attitudes, and experience with painful deaths of loved ones. Data are from a sample of 293 chronically ill older adults who are seeking care at one of two large medical centers in urban New Jersey. Blacks and Hispanics are significantly less likely than Whites to have a living will, a durable power of attorney for health care (DPAHC), and to have discussed their end of life treatment preferences. Multivariate analyses reveal that the Black-White gap in advance care planning is largely accounted for by Blacks' belief that God controls the timing and nature of death. The Hispanic-White gap is partially accounted for by the belief that one's illness negatively affects one's family. Ethnic disparities are starkest for living will and DPAHC use, and less pronounced for discussions. Implications for policy and practice are discussed.

### UNDERSTANDING ADVANCE CARE PLANNING IN OLDER ADULTS: THE SALIENCE OF FUNCTION

S. Bodnar Deren, *Sociology, Instititute for Health, Health Care Policy, and Aging Research, Rutgers University, New Brunswick, New Jersey*

The aim of this study is to examine if there is a relationship between patient's function (objective and subjective) and the odds that a patient engages in formal advance care planning. Data come from a recent survey of 305 chronically ill, non-institutionalized adults in New Jersey aged 55 years and older. Logistic regression reveals that patient function is a significant factor in the likelihood that older adults formalize their advance care plans. Individuals with higher levels of functional limitations, pursuant to the SF-12 (objective function) are 40% more likely to have an advance directive (AD). Perceived intrusiveness (subjective function) also significantly increases the odds for having an AD. Individuals who perceived their functional limitations have major consequences were 50% more likely to have an AD. These findings broaden what we know about ACP, planning that focuses on function, may provide a framework to better meet EOL planning needs of patients.

### RELIGIOUS INFLUENCE ON AVOIDING END-OF-LIFE DECISION-MAKING

E.L. Idler[1], M.M. Garrido[2], H. Leventhal[2], D. Carr[2], *1. Emory University, Atlanta, Georgia, 2. Rutgers University, New Brunswick, New Jersey*

Recent studies show higher levels of religious coping among cancer patients associated with less use of advance directives and hospice care, and more use of aggressive treatment. What context of religious belief and practice makes patients reluctant to specify preferences for end of life care? Do religious traditions differ? We address these questions in a sample of elderly chronic disease patients who were diverse in terms of race, ethnicity, and religion (N=305). Conservative Protestants were significantly more likely than any other group to say their religious beliefs would influence their medical decisions and that they would prefer to die at home. However, they were least likely to have discussed their future health plans with anyone, or to choose hospice. In multivariate models, non-Hispanic blacks and Hispanics and those for whom religion was important had significantly fewer discussions with anyone about end of life preferences, and those with disabilities had more.

## SESSION 1650 (PAPER)

## SOCIO-PHYSICAL DIMENSIONS IN LONG-TERM CARE

### PERSONAL RELICS: A TOUCH OF HOME IN ASSISTED LIVING

R. Hrybyk, *Center for Aging Studies, UMBC, Baltimore, Maryland*

This study looks at the meaning of personal possessions in residents' rooms in an assisted living facility and on the process of moving from home to assisted living. Data is drawn from an on-going multi-site qualitative study, Stigma and the Cultural Context of Residential Settings for the Elderly, J. Kevin Eckert, P.I., and from in-depth interviews with nine residents and the admissions coordinator of an urban assisted living home. In the move to assisted living, it is not only one's living space that is being downsized; one's sense of self may be diminished during the disruptions of the move. Bringing cherished objects from home can mitigate this disruption. Reminiscence theory informs us that treasured objects act as repositories of memories and symbols of the self. Home and object become shrine and relic as they cue remembrances. Because connections to the past may be supported with personal objects, a touch of a past home in the AL room can bolster a fragile sense of self and foster continuity in the person. Autonomy of the elder, especially as it relates to the selection of items to bring to assisted living, is put forth as a moderator of disruptions to self. Practical suggestions to reinforce autonomy are offered for adult children, who often are conflicted during transitions of their aging parents. Guided by new insight, the well-being of residents in their adjustment to the new living situation could be impacted.

### THE IMPACT OF THERAPEUTIC DESIGN ON SOCIAL ENGAGEMENT AMONG RESIDENTS WITH DEMENTIA DURING PROGRAMMED ACTIVITIES IN DEMENTIA CARE UNITS

K.D. Frazee, H. Chaudhury, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

There is growing evidence that therapeutic physical and social environments in special care units (SCU) can enhance quality of life and help reduce negative responsive behaviours among residents with dementia. A therapeutic milieu can be created within smaller units that have a homelike ambience, increased wayfinding opportunities, regulation of sensory stimulation, and access to secure wandering paths. Policies and programs can also reflect a holistic model of care that respects residents' personhood, fosters relationship building, and provides meaningful activity programming. While the body of literature on therapeutic design in dementia care has been expanding steadily since the early 1980's, little is known about the physical environment of SCU activity spaces, particularly what environmental features are conducive to successful activity programming and positive resident outcomes. Using a mixed-methods approach, this study explored the nature of residents' social engagement during programmed group activities in two dementia special care environments purposively selected for their contrasting physical environments. Findings from resident behavioural observations, staff member questionnaires, and family member focus groups shed light upon the complex interactions between physical, social, and organizational factors that come together to shape residents' experiences during group activities. The presentation will highlight findings on the role of the physical environmental on levels and quality of residents' social engagement, and staff members' abilities to offer successful activity programs. Finally the advantages and challenges of employing a mixed-methods approach to this type of study will be discussed. Implications for architects, interior designers, and facility planners will also be advanced.

### TRANSITIONAL CARE IN NURSING HOMES: THE POST ACUTE CARE TRANSITIONS (PACT) MODEL

M. Toles, R.A. Anderson, J. Barroso, C. Colon-Emeric, E.S. McConnell, K. Corazzini, *Duke University, Durham, North Carolina*

Annually, 2 million older Americans complete 3 - 4 weeks of post-acute care in nursing homes and many return home; however, scant research describes services to protect older adults during their transitions home. In hospital-based studies, transitional care interventions were associated with improved health outcomes for older adults; however, interventions added new staff positions, which is likely cost-prohibitive in nursing homes. This research aimed to develop and test a conceptual model of transitional care that will be used to guide observational research of the transitional care provided in nursing homes. Studies of transitional care and staff interaction processes were reviewed to identify critical elements in care aimed at preparing older adults for safe transitions from nursing homes to home. Finally, two case studies were conducted to explore the feasibility of using the new model to describe transitional care in a nursing home. Based on literature reviews and pilot research results, the Post-Acute Care Transitions (PACT) Model was developed. Using the PACT Model to describe transitional care for post-acute care patients in 2 case studies, five dimensions of care were described for each case, including: patient characteristics, nursing home structure, care processes, interaction processes, and anticipated outcomes. Use of the PACT Model also facilitated description of strengths and weakness in care for two cases. The PACT Model may be an effective tool for guiding transitional care research in nursing homes. Moreover, results indicate that existing nursing home staff may be an effective strategy for providing transitional care in nursing homes.

### MEDIUM-TERM HEALTH AND LIFE OUTCOMES OF NURSING HOME RESIDENTS FOLLOWING POST-KATRINA RELOCATION

J. Engberg[1], N. Castle[2], *1. RAND Corporation, Pittsburgh, Pennsylvania, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

In August 2005, Hurricane Katrina led to the closing of several nursing homes (N=13) in southern Louisiana. We use the 2005-07 Minimum Data Sets (MDS) to investigate the medium term consequences for residents (N=1958) in order to better understand the impact of relocation stress and the resulting change in the quality of care. We match these residents with residents elsewhere in the South based on Nursing Home Compare quality measures, facility characteristics, resident demographic characteristics and resident health status prior to August 2005. The MDS allows us to follow all residents who live in same state for two years following Katrina. In particular, we examine 3 month, 1 year and 2 year survival rates, as well as rates of ulcers, falls, depression and behavioral problems, and cognitive performance and ADL performance at these three intervals following relocation. Many, but not all, of the dislocated residents lived in low quality facilities prior to Katrina. We find that these residents mostly were relocated to facilities with higher values of NHC quality measures and higher staffing rates. We find that this increase in facility quality more than offsets the impact of relocation stress, leading to better outcomes on later health measures than for the matched comparison group. We use the variation in pre-Katrina facility quality and health status to estimate the trade-offs between the improvement to health prospects due to moving to a higher quality facility versus the risk to health prospects due to moving when very frail.

### NURSING HOME DIVERSION AND TRANSITION: A POPULAR IDEA, BUT DOES IT WORK?

E. Carpio[1], D.C. Carr[2], R. Applebaum[1,2], *1. Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Oxford, Ohio*

The growing demand for long-term services and supports has and will continue to place an enormous strain on state Medicaid budgets. Therefore, it is essential for long-term care systems to make sure that individuals receive services and support in the appropriate setting. With institutional care paid for by Medicaid costing $5000 per month, identifying ways to keep individuals out of institutions as well as developing mechanisms to help transition individuals who are in institutions back to the community have become critical to state Medicaid programs. Although the expansion of home and community-based services began in the 1970's, more aggressive diversion and transition efforts are now on the policy agendas of many states. In this presentation, we describe Ohio's nursing home transition and diversion initiative. Diversion and transition strategies employed in Ohio include such efforts as placing case managers in nursing homes to assist with transition, working with hospitals that include licensed nursing home beds to assist with community placements, using state data systems to identify nursing homes with low case mix scores to better target transition activities, care transition models, and high risk case management. The presentation will include preliminary data about the outcome of these strategies on participants following transition/diversion efforts including the programs and services utilized to facilitate diversions/transitions and the extent to which consumers successfully remain in the community. Implications for policy and practice are discussed.

## SESSION 1655 (SYMPOSIUM)

### THEMES IN FAMILY'S RESPONSES TO DEATH OF ELDERLY FATHER/HUSBAND

Chair: *M.S. Moss, Arcadia University, Glenside, Pennsylvania*
Discussant: *B. De Vries, San Francisco State University, San Francisco, California*

An ongoing study of the impact and meaning of the death of the first elderly parent—a father—yields rich and complex themes when viewed from a family perspective. Findings are presented based upon in-person interviews with multiple members of 15 bereaved families, found through newspaper obituaries. Deceased fathers ranged in age from 72 to 95 were primarily Caucasian, and included Catholics, Protestants, and Jews. Their occupations ranged from cab driver to professor. Two qualitative interviews with 39 surviving family members, (12 widows and 27 adult children), each averaging about 1 ½ hours, were audio taped and transcribed. Interviews were qualitatively analyzed for themes and general patterns in responses within and across families. Each of the four presentations raises significant questions in relation to our themes: 1) A case example questioning the meaning of family solidarity after the death (Rubinstein); 2) How does reciprocal protectiveness in the family get played out during bereavement? (S. Moss); 3) Does a folk spirituality replace traditional religious tenets and spiritual themes in the family narratives? (Black) and, 4) What are the artifacts that were not initially of direct interest to our research team (e.g. socio-cultural norms, interview context) and how might these artifacts influence our research findings? (M. Moss) Discussion (DeVries) will examine the implications of the study methodology and themes of family solidarity, protectiveness, and spirituality for understanding bereavement within the family. Funded by NIH 1R01AG031806-01A2 ARRA.

### IS FAMILY SOLIDARITY A ZEN CONCEPT?

R. Rubinstein, *UMBC, Baltimore, Maryland*

This paper develops an extended case study of the aftermath of the death of a 90 year old man through interviews with his widow and two surviving children. The family both does and does not have a degree of solidarity. While coming together around the death, the family described returned to a former pattern of both intimacy and non-intimacy at a distance. Although no family members believe in an afterlife, the widow feels the presence of her deceased husband in her home, a form of supernatural solidarity because he is 'there' for her. The children, especially the daughter, have become more solicitous of the mother since the father's death, but the mother wishes for continued independence, pulling away from the family as it, at times, grows closer to her. The paper examines in detail the patterns and shifts in family relation as perceived by the three family members after the death of the father/husband.

### DON'T ASK, DON'T TELL: PROTECTIVE COMMUNICATION PATTERNS IN BEREAVED FAMILIES

S. Moss, M.S. Moss, *Arcadia University, Glenside, Pennsylvania*

Family members frequently recall examples of protecting each other over the life course. For many bereaved families reciprocal protectiveness emerges as a salient theme with two complementary foci: (1) family members control expressions of thoughts and feelings around dying and death, and (2) family members express caring to enhance the quality of life of other members. This is exemplified by: adult children protecting the widow, the widow protecting the adult children, and each protecting themselves. Additionally, the deceased elderly father may be perceived as a continuing source of protection. Discussion examines: the morality of protectiveness; the conceptual differences between self-protection and protection of others; the Dual Process Model of bereavement focusing on loss and restoration (Stroebe, et al). Reciprocal protectiveness can be adaptive for bereaved families.

### THE PRAGMATIC SPIRITUALITY OF GRIEF

H.K. Black, *Behavioral Research, Arcadia University, Glenside, Pennsylvania*

This presentation reports on 10 families (20+ individuals) and the significance of religion/spirituality in reactions to the father's/husband/s death. Three themes emerged: 1) Context of death. Duration of prior illness, perceived suffering, and where death occurred (home, hospital, nursing home) influences family's need for solace, which religion/spirituality have traditionally provided; 2) Tension of beliefs. Belief in religious tenets along with belief that tenets are "not logical" results in tension between religious belief and a realistic approach to death and, 3) Rituals after death. A family's discussion of after-death rituals, such as memorials and graveside services, discloses their beliefs in a concrete way. A key finding of our presentation is that families interviewed find comfort in traditional religious doctrine only if they have done so throughout life. They also find solace in memories, as well as in highly personalized messages they believe the husband/father sends to them after his death.

### CONSIDERATION OF ARTIFACTS IN QUALITATIVE BEREAVEMENT RESEARCH

M.S. Moss, *Arcadia University, Glenside, Pennsylvania*

Several artifacts were discovered in our data that initially were not of direct interest to our research team. They include interviewees' and interviewers' perceptions about the research, its purposes, and how each may perform as "good" interviewees and interviewers. Three mutually interacting artifacts are: (1) How socio-cultural values and attitudes define what is seen to be normal and healthy responses to bereavement. (2) How interviewees, who bring a sense of evaluation apprehension, reflect their concern about whether and how the interviewer is judging them. (3) How each interviewee's awareness that we have or will interview one or two of his/her family members has an impact on the interviewee's responses . These and other "artifacts" of this special form of symbolic interaction ( our interviews) are discussed as they may impact the general patterns of themes and concepts that emerge from our study.

## SESSION 1660 (SYMPOSIUM)

### TRANSLATING INTERVENTIONS FROM PALLIATIVE CARE TO DEMENTIA CARE

Chair: *B. Ingersoll-Dayton, University of Michigan, Ann Arbor, Michigan*

Discussant: *S.H. Zarit, Penn State University, University Park, Pennsylvania*

A growing body of literature suggests that actively engaging both caregivers and care receivers in interventions may be especially promising. This symposium examines different methods by which Legacy Therapy, an empirically-based model developed for a palliative care population (Allen, Hilgeman, Ege, Shuster, & Burgio, 2008) can be translated to a dementia care population. The first paper in the symposium provides an overview of the different ways in which translational research can be conducted when adapting an intervention from one population (e.g., palliative care) to another population (e.g., dementia care). The three remaining papers provide findings from clinical research interventions that have translated the Legacy Therapy approach to dementia care in different settings and/or with different sets of caregiver-care receiver dyads. The first intervention, based upon a U.S. sample, incorporates family caregivers (e.g., adult children) to create a legacy object and to discuss advance directives. The second intervention, also using a U.S.-based sample, focuses on couples (e.g., spouses/partners) who reminisce about their lives together and create a book as their legacy object. The third intervention, based on a Japanese sample, focuses on husbands and wives who recollect their lives together and, through photographs as well as text, create a book as a legacy. Highlighted in each of the presentations will be a description of how the translation process occurred, the manner in which caregiver-care receiver dyads are incorporated into the intervention, and the outcomes for each member of the dyad following the intervention.

### DISENTANGLING THE TRANSLATIONAL SCIENCES: A SOCIAL SCIENCE PERSPECTIVE

L. Burgio, *University of Michigan, Ann Arbor, Michigan*

Translational efforts in the social sciences are at a crossroads, and its greatest challenge involves the movement of interventions gleaned from clinical trials to community settings. Four strategies for reaching this goal are discussed: the use of methods derived from health services research, a yet-to-be-developed strategy where decisions to modify aspects of an intervention derived from a clinical trial are triggered by data-based criteria, community based participatory action research (CBPR), and a hybrid system wherein methods from CBPR and traditional experimental procedures are combined to achieve translation. The author ends on an optimistic note, emphasizing the impressive advances in the area over the existing barriers and calling for a unified interdisciplinary science of translation

### COPING AND VALUES IN MILD DEMENTIA: PILOT DATA FROM A NEW PATIENT-CENTERED INTERVENTION

M.M. Hilgeman[1,2,3], R.S. Allen[1,2], L. Miller[1,2], J. Rhodes[1], R. Magnuson[1], C. Turgeon[1], *1. The University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health & Aging, Tuscaloosa, Alabama, 3. VA Boston Healthcare System, Boston, Massachusetts*

Qualitative studies suggest that individuals with early/mild dementia cope through self-maintenance (prioritizing connections with their past) and self-adjusting strategies (acknowledging the disease/course). This paper presents pilot data from the Preserving Identity and Planning for Advance Care intervention, which targets these two coping strategies by guiding individuals with dementia (M=80.1 yrs; CDR=0.5 or 1) through the creation of a Legacy-based project and a patient-centered advance care planning discussion. Seventeen dyads were randomly assigned to a four-session intervention or phone-call control group. Intervention individuals with dementia reported more coping strategies and higher self-rated quality of life than control group individuals at Time 2. Intervention individuals also reported decreased decisional conflict related to advance care across domains (i.e., information, values clarity, and support) compared to control group individuals at Time 2. Interestingly, both groups reported reduced uncertainty about care planning from Time 1 to Time 2. Feasibility issues in implementation are also discussed.

### A COUPLES LIFE STORY APPROACH TO DEMENTIA CARE

B. Ingersoll-Dayton[1], B. Spencer[2], *1. Social Work, University of Michigan, Ann Arbor, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

This paper describes a systematic effort to translate principles from Legacy Therapy to couples-oriented dementia care. The first phase of the translation process identified necessary adaptations (e.g., dyadic reminiscence and dyadic communication skills) based on data collected from pilot testing and focus groups with couples (in which one partner had mild or moderate dementia) augmented by observations from expert clinicians. The adapted intervention focused on teaching communication skills to caregiver-care receiver dyads. These skills were practiced as they created a Couples Life Story Book with labeled pictures and personal stories that was used to facilitate talk about positive memories. The second phase of the translation process monitored the acceptability and feasibility of the intervention and assessed change over time on the outcome measures. The data from this translational research project were quantitatively and qualitatively analyzed with respect to couples' communication, relationship satisfaction, and quality of life.

### SECONDARY TRANSLATION OF LIFE STORY APPROACH WITH JAPANESE COUPLES

R. Campbell[1], Y. Kurokawa[2], *1. Gerontology Institute, University of Tokyo, Tokyo, Japan, 2. Sophia University, Tokyo, Japan*

In Japan, with 21.5% of its population over age 65, increasing attention is focused on the quality of life for people with dementia and their caregivers. A key issue is the increase in couples-only households (37%), leading to "rourou kaigo," older people caring for older people, a departure from the Japanese tradition of intergenerational caregiving. This paper reports on a "secondary translation" (i.e., the translation of a translational research project) that applies the Couples Life Story approach to Japanese couples in which one partner has dementia. With an interventionist, these couples practiced communication skills and told the story of their marriage, facilitated by a diagram outlining the early years, middle years, recent years and hopes for the future. Couples selected and labeled photographs to assemble their Life Story Book. Outcomes included the care recipient's increasing participation in each session and the caregiver's expressing more positive feelings about the future.

## SESSION 1665 (SYMPOSIUM)

### HS PRESIDENTIAL SYMPOSIUM: CHANGES IN LATITUDES, CHANGES IN ATTITUDES: TRANSITIONS OF CARE IN TIMES OF DISASTER AND POVERTY

Chair: *C. Alessi, VA Greater Los Angeles Healthcare System, Los Angeles, California, University of California, Los Angeles David Geffen School of Medicine, Los Angeles, California*

Older people are particularly vulnerable to adverse consequences in times of disaster and poverty. Put simply, disasters are sudden events that overwhelm local capacity, require national or international assistance, and may result in great damage and suffering. The relationship between disaster and poverty is strong, and most disaster-related deaths around the world occur in developing countries, likely due to poverty and related problems of poor infrastructure and disease. In addition, health problems (such as cardiovascular and respiratory disease) and psychological problems (such as stress and depression) are common in older people after disasters. Transitions of care may be particularly problematic. Forced relocation; loss of livelihood; and limited access to medications, health care and personal care are all key problems for older adults in these settings. The first speaker, a leader in academic medicine who participated in the recovery and rebuilding of health care in New Orleans in the aftermath of Hurricane Katrina, will describe his experiences and important lessons learned from this disaster. The second speaker will recount her experiences volunteering as a wound care expert in Haiti after that impoverished country's recent devastating earthquake. Finally, the third speaker will draw on his experiences as a volunteer physician providing medical care in impoverished areas of Honduras. With compelling descriptions of first-hand experiences, these speakers will provide insights into key issues of disaster and poverty as they relate to older adults, calling on us all to accept the challenge to help address the needs of these most vulnerable elders.

### HURRICANE KATRINA: PERSONAL OBSERVATIONS AND LESSONS LEARNED

L.L. Hamm, *Internal Medicine, Tulane University, New Orleans, Louisiana*

Hurricane Katrina was among the worst natural disasters to affect the United States. Although this tragedy provided many lessons, the harsh outcomes inflicted upon the most vulnerable populations was dramatic and visible for the nation. Everyone in the region was affected, but the poorest, the most ill, and the elderly were impacted the most. These populations had the most difficulty evacuating before the storm and the most difficulty rebuilding their lives. Katrina forced us to re-examine our disaster preparations. The elderly, ill, and poor deserve our attention most. Every community is subject to some disaster. Is yours prepared? In re-building after Katrina, the opportunity arose to re-think many aspects of our city. Schools and medical services have been drastically altered. Does each community need to wait for a disaster to change?

### WOUND CARE IN HAITI 1 MONTH POST EARTHQUAKE: INFECTION, REPAIR, AND REHABILITATION

B. Bates-Jensen, *1. School of Nursing, University of California, Los Angeles, Los Angeles, California, 2. VA Greater Los Angeles Healthcare System, Los Angeles, California*

As the chief of wound services at the University of Miami tent hospital in Port Au Prince 1 month after the earthquake, I coordinated outpatient and inpatient wound care for the pediatric and adult tent, scheduled all wound surgeries and adult wound procedures and managed outpatient wound care and 'home' visits. Three transitions that occurred included: shifts in wound type and surgery, increased infections, and first discharges and rehabilitation efforts. Infection was evident from the initial surgeries and was a direct reflection of the environment. Pressure ulcers occurred from lying in rubble and on army cots for 4 weeks with limited mobility. As most patients were homeless, they were discharged to a small tent city erected on the compound and followed in the outpatient wound tent for wound care and rehabilitation. Lack of basic supplies, inadequate patient information, and limited community resources were all issues.

### THE IMPORTANCE OF AN EFFECTIVE CARE TRANSITION IN IMPOVERISHED AREAS OF HONDURAS: PARTNERSHIPS, RESPONSIBILITIES AND OPPORTUNITIES FOR VOLUNTEER HEALTH PROFESSIONALS

S. Barczi, *1. Madison VA Geriatric Research, Education & Clinical Center (GRECC), Madison, Wisconsin, 2. University of Wisconsin School of Medicine & Public Health, Madison, Wisconsin*

Honduras is one of the poorest countries in Central America with over 35% of the population living on less than $2 a day. Its economy has suffered from complicated regional politics and several natural disasters in the past 2 decades. Access to health care is problematic in that the population is widely dispersed in rural areas and the majority of medical resources are located in the most developed cities. Poverty, under-developed government health system infrastructure, discontinuity of medical providers and variable access to appropriate medications provide great challenges for older Hondurans. This speaker will recount personal experiences in providing care in partnership with Honduran health practitioners in the setting of abject poverty and unpredictable resources. He will offer insights into the complex relationships between international aid organizations, short-term volunteer health professionals, Honduran-financed health clinics and older patients, and the associated transitions of care issues that develop with these interactions.

## SESSION 1670 (PAPER)

## FRACTURE, FATIGUE & FUNCTIONAL OUTCOMES

### THE INFLUENCE OF WALKING AIDS ON THE ASSESSMENT OF FUNCTIONAL OUTCOMES IN GERIATRIC REHABILITATION

M. Schwenk, P. Oster, K.A. Hauer, *Bethanien-Hospital at the University of Heidelberg, Heidelberg, Germany*

Background: Walking aids are frequently used by geriatric patients and often incorporated in motor assessment. The use of assistive devices has been discussed as a potential confounder when assessing functional outcomes in geriatric rehabilitation. However, no study has investigated the influence of walking aids on the assessment of changes over time in motor performance within rehabilitation. Methods: One hundred and nine geriatric patients took part in a longitudinal study with functional evaluation at the beginning and prior to discharge of inpatient rehabilitation. Subjects performed three established motor tests (Electronic gait analysis [GAITRite] during walking at maximum speed [parameters: gait speed, cadence, stride-time, stride-length, base-of-support, double-support]; Tinetti's Performance-Oriented-Mobility-Assessment [POMA]; Timed–Up-and-Go [TUG]) with and without a 4-wheeled rollator. Relative differences between test results obtained with vs. without walking aid were calculated for baseline assessment and for functional outcomes (changes between pre- to post test). Results: At baseline, performances in all tests were significantly higher when a walking aid was used compared to unaided assessment (Differences with vs. without aid: GAITRite: 4.6-84.1% $p \leq 0.001$-0.060 dependent on parameter; POMA: 82.7% $p<0.001$; TUG: 6.5% $p=0.002$). Improvements in functional performance during rehabilitation were significantly more pronounced when patients' performed motor assessment without a walking aid (Differences between test outcomes assessed with vs. without aid: GAITRite: 4.9-39.8% $p \leq 0.001$-0.008 dependent on parameter; POMA: 39.8% $p<0.001$; TUG: 6.5% $p<0.001$). Discussion: The use of rollators during motor testing limits the assessment of initial motor deficits and leads to an underestimation of functional gains achieved during geriatric rehabilitation.

### THE HIP FRACTURE INTERVENTION TRIAL (HIPFIT): A 12 MONTH RANDOMIZED CONTROLLED MULTI-MODAL INTERVENTION TO IMPROVE FUNCTIONAL OUTCOMES

M.A. Fiatarone Singh[1,2,3], S. Quine[6], L.M. Clemson[7], C. Russell[7], B. Lloyd[1], D.A. Williamson[1], T.M. Stavrinos[4], N.A. Singh[7,4,5], *1. Exercise Health and Performance Research Group, University of Sydney, Lidcombe, New South Wales, Australia, 2. Hebrew SeniorLife, Harvard Medical School, Boston, Massachusetts, 3. Jean Mayer USDA Human Nutrition Research Centre on Aging at Tufts University, Boston, Massachusetts, 4. Balmain Hospital, Sydney, New South Wales, Australia, 5. Royal Prince Alfred Hospital, Sydney, New South Wales, Australia, 6. School of Public Health, The University of Sydney, Sydney, New South Wales, Australia, 7. Faculty of Health Sciences, The University of Sydney, Lidcombe, New South Wales, Australia*

Aims Our aim was to reduce long-term disability following hip fracture, using a multi-modal treatment protocol targeting known modifiable precipitants. Methods Participants were recruited from 3 hospitals in Sydney and randomised to 12 months of active intervention or usual care/contact-only control group. The intervention group received up to 11treatments specifically targeting baseline deficits related to long-term disability. These included supervised high intensity resistance and balance training, dietary advice and nutritional supplementation, home assessment and referral to community services, evaluation and management of fear of falling and falls risk, cognitive impairment, vitamin D deficiency, visual impairment, depression and social isolation, low self-efficacy, and poly-pharmacy. The blindly assessed primary outcome was functional dependency, assessed by residential status and observed and self-reported disability across a wide range of basic and instrumental ADLs. Results Fifteen percent (248) of hip fracture patients were eligible and 124 were enrolled. At baseline, the groups were well matched for age (79+10 years), gender (69% female), marital status (57% widowed), living situation (92% lived independently), co-morbidities, quality of life, pre-fracture functional status, type of fracture and surgical treatment. Only twelve participants (9.7%) dropped out. Dropouts tended to be younger, less disabled, with fewer chronic diseases but more sedentary than completers, and no dropouts were related to study procedures. Conclusion It is possible to safely target and treat multiple complex precipitants of disability in a frail older cohort for 1 yr after hip fracture, including the provision of high intensity resistance training, with minimal dropout and no major adverse events.

### 6 MINUTE WALK PERCEIVED FATIGUE AND EXERTION IN OLDER ADULTS WITH HIP OR KNEE OSTEOARTHRITIS

N.B. Alexander[1,2], S.L. Murphy[1,2], A.K. Lyden[2], J.F. Koliba[2], B. Grincewicz[1], E. Pear[2], *1. VAAAHCS GRECC, Ann Arbor, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

Background: Fatigue is common in older adults with osteoarthritis (OA), but few studies have evaluated the fatigue response to specific activities which may impact overall function. Methods: Eighty-nine older adults with painful knee or hip OA and reported fatigue (i.e., "moderate amount" or "most of the time" within the past week) (mean age 72) performed a six minute walk (6MW) test, reported fatigue at pre-test (PreF), and at post-test (PostF), and rated perceived exertion (RPE) at 2 minutes and at post-test (2minRPE, PostRPE), using a 0-10 scale. Change scores were also computed for fatigue (PostF - PreF) and RPE (PostRPE - 2minRPE). Results: While participants walked mean (SD) 1115 (231) feet, mean distances at 2, 4, and 6 minutes were similar (approx 370 feet). Both mean fatigue and RPE increased by at least 50% ($p<0.001$), PreF 1.4 (2) to PostF 3.9 (2), and 2minRPE 2.3 (2) to PostRPE 4.6 (2). Nearly all fatigue and RPE ratings were significantly correlated ($p<0.05$ for all $r>0.25$). Highest correlations were seen with PostF (range 0.39-0.88) and PostRPE (0.36-0.88), both of which were correlated with 6MW distance (0.44 and 0.42 respectively). Conclusion: In symptomatic knee or hip OA, even with steady 6MW walk speed, fatigue and RPE increase. Post-walk ratings of fatigue and RPE may be the best indicators of distance as well as effort, i.e. indicators of functional ability.

### TIRED AND WEAK: FATIGUE AND ITS LONG-TERM DISABILITY OUTCOMES

C. Cigolle[1,2,3], P. Lee[2,3], N.B. Alexander[2,3], Y. Lee[2], C. Blaum[2,3], *1. University of Michigan Department of Family Medicine, Ann Arbor, Michigan, 2. University of Michigan Department of Internal Medicine, Ann Arbor, Michigan, 3. VA Ann Arbor Healthcare System Geriatrics Research, Education and Clinical Center (GRECC), Ann Arbor, Michigan*

Fatigue is common among older adults and predicts disability and mortality. Yet, research is lacking on its long-term outcomes. We hypothesized that the disability outcomes of fatigue persist over years. We analyzed waves 2000-2008 of the Health and Retirement Study, a nationally-representative longitudinal health interview survey. Our study sample included community-dwelling adults >=65 years (n=10,121, representing 32.1 million) in 2000. Respondents were asked whether they had severe fatigue/exhaustion as a persistent/troublesome problem in the previous two years. Outcomes included prevalent and new (compared to baseline) dependency in activities of daily living (ADL) and instrumental activities of daily living (IADL) in 2002-2008. Covariates included six demographic characteristics and eight chronic diseases. We performed logistic regression modeling and investigated mortality as a competing outcome. 19.3% (n=1,963, representing 6.2 million) reported fatigue at baseline. Their prevalence of ADL dependency was increased, compared to respondents without fatigue (p<0.0001 for each): 2002: 18.0% vs. 6.8%, 2004: 15.4% vs. 7.6%, 2006: 14.1% vs. 7.8%, 2008: 12.1% vs. 7.7%. New ADL dependency was also increased, compared to those without fatigue (p<0.0001 for each): 2002: 16.2% vs. 6.1%, 2004: 17.8% vs. 8.5%, 2006: 22.9% vs. 10.6%, 2008: 24.4% vs. 11.8%. Similar results were found for prevalent and new IADL dependency for 2002-2008. The association between fatigue and ADL dependency (unadjusted odds ratio [OR]=1.7, p<0.0001) persisted after adjusting for covariates (OR=1.4, p<0.0001). Older adults with fatigue have increased disability that persists for years. Further investigation is needed to understand the pathophysiology of fatigue in affecting daily function over years.

## SESSION 1675 (PAPER)

## GLOBAL PERSPECTIVES ON AGING: THE EVOLVING EXPERIENCE IN CHINA

### MODERNIZATION AND ITS IMPACT ON THE IMAGE OF AGING IN CHINA - REPORTING THE FINDINGS OF A SCALE VALIDATION STUDY

X. Bai[1], N. Chow[1], K. Chan[2], *1. The University of Hong Kong, Hong Kong, Hong Kong, China, 2. The University of Macau, Macau, Macau, China*

This presentation reports the findings of a study which examines the impact of modernization on the image of aging in China. We successfully interviewed 454 elderly people living in Wuhan, an industrial and highly populated city in central China, by using a structured questionnaire with a 20-item Self-Image of Aging Scale (SIAS-C). The Scale is a revised version of the 18-item Image of Aging Scale developed by Levy in 2004 (Permission has been obtained to use Levy's Scale). The 20 items in our revised Scale are all translated into the Chinese language to suit the understanding of our interviewees. Exploratory factor analyses showed that five areas, including general physical health, life attitudes, cognitive functioning and capacity, social virtues, and mental status, stood out from the Scale. Results also showed that the SIAS-C attained overall acceptable internal consistency (Cronbach's alpha= 0.804), as well as the subscales (alphas ranged from 0.544 to 0.764). Criterion validity of SIAS-C further demonstrated correlations with the life satisfaction, number of daily activities and chronic illnesses, all pointing in the expected directions. We suggest that our revised version of the SIAS-C can be used to objectively assess the image of aging in Chinese communities. Since a positive image of self can permit older people to maintain feelings of well-being and life satisfaction, we believe that our findings would help better understand how modernization has changed the image of aging in China and the mapping of an effective strategy to promoting a constructive image among the Chinese elderly.

### CHRONIC DISEASES AND GERIATRIC CONDITIONS AMONG OLDER PEOPLE: EVIDENCE FROM ASIA

H. Kim[1,2], Y. Jung[1], S. Cho[1,2], *1. Seoul National University Graduate School of Public Health, Seoul, Republic of Korea, 2. Seoul National University Institute of Health and Environment, Seoul, Republic of Korea*

The high prevalence of multiple chronic conditions and geriatric syndromes among the older adult population and their impacts on health and health care use have been widely reported in North America and Europe, yet limited comparable evidence exists on older adults in Asia. The purpose of this population-based study was to examine the co-occurrence of three major chronic diseases (hypertension, arthritis, and diabetes) and two key geriatric conditions (incontinence and falls) using the 2006 baseline data from Korean Longitudinal Survey of Aging Study (KLoSA), a survey comparable to the Health and Retirement Study (HRS) in the United States. Among 4,165 survey respondents representing approximately 4 million community-dwelling Korean older adults, about 62.9% had at least one of the five conditions and 27.7% had two or more conditions. Older adults with more conditions were more likely to be female and unmarried, and to have a lower education level and Medicaid (p<.05). Of the respondents with one condition, 19.2% to 42.5% had two or more additional conditions (depending on the index condition). The study findings show a high co-occurrence of the observed conditions in Korean older adults, suggesting a need for better awareness of the complex care needs of older adults and the provision of coordinated chronic care management programs in Korea, the country with the most rapidly aging population in the world. Also beneficial would be cross-national comparison studies to understand the health services use and outcomes of older adults with high comorbidities in different health care systems and socio-cultural contexts.

### EXPLAINING OLDER PARENTS' AMBIVALENT FEELINGS TOWARD THEIR ADULT CHILDREN: THE CASE OF RURAL CHINA

M. Guo[1], M. Silverstein[2], I. Chi[1], *1. School of Social Work, University of Southern California, Los Angeles, California, 2. University of Southern California - Davis School of Gerontology, Los Angeles, California*

The concept of intergenerational ambivalence, the coexistence of both positive and negative elements in intergenerational relationships, has been rarely studied in Asian context. Using data from a survey of 1,224 older adults and their 4,449 children in rural Anhui province, China, this study explored the sources of ambivalence among Chinese elders toward their children. The results of multilevel analyses showed that most variance in intergenerational ambivalence lied within rather than between families. Among the parental characteristics examined, the level of depression of the parent was associated with greater ambivalence toward their children. Widowed mothers were less ambivalent toward their children than non-widowed mothers. Among children's characteristics, the household registration status of the child, specifically, being a registered rural rather than a urban resident, was the most significant predictor of parent's ambivalence. Both mothers and fathers reported greater ambivalence toward their sons than toward their daughters. Mothers were also more ambivalent toward the oldest child and those who did not work. The amount of monetary support provided by the child reduced fathers' ambivalence. Both parents had greater ambivalence if they helped with caring grandchildren. Taken together, the findings of this study suggested that the failure of adult children to achieve certain social status and independent living generated the feelings of ambivalence among older adults in rural China. We conclude that the issues of intergenerational ambivalence among Chinese elders need to be understood in the larger context of social transformation and involving parental expectations on their adult children in contemporary China.

### STRESS-RELATED MORTALITY AFTER A MAJOR EARTHQUAKE AMONG CHINESE NONAGENARIANS

J.H. Flaherty[1,2], B. Dong[3], H. Wu[3], Y. Zhang[3], T. Malmstrom[5], J. Guralnik[4], J.E. Morley[1], *1. Internal Medicine/Geriatrics, Saint Louis University, St. Louis, Missouri, 2. St. Louis VA GRECC, St. Louis, Missouri, 3. West China Hospital, Sichuan University, Chengdu, Sichuan, China, 4. NIA/NIH, Baltimore, Maryland, 5. Saint Louis University - Department of Neurology & Psychiatry, St. Louis, Missouri*

Background: Several reports link the psychological stress related to earthquakes to an increase in non-trauma mortality rates. This study compared one-year mortality rates between two groups of age-matched Chinese nonagenarians: a pre-earthquake group and a post-earthquake group; and examined other predictors associated with mortality using pre-earthquake health assessment data. Methods: Three years prior to the China earthquake of May 2008, geriatric assessments were performed on 870 Chinese age >90 years, in Dujiangyan, 30 miles from the epicenter. The pre-earthquake group (subset of the 870) were ages 93-95 at the beginning of "Time Frame 1" (July 2005-June 2006) (n=229). The post-earthquake group (a different subset of the 870) were ages 93-95 years (and alive) at the beginning of Time Frame 2 (July 2008-June 2009). (n=235). Deaths due to possible trauma related to the earthquake were excluded. Results: The one year mortality rate among the pre-earthquake group was 8.3% (19/229) and that of the post-earthquake group was 16.2% (38/235) (P<.001). The 12-month Kaplan-Meier survival curve also showed a difference (Mantel-Cox log rank chi-squared = 6.8, P<.009). In adjusted Cox regression analyses, being in the post-earthquake group was the strongest predictor of mortality [OR 2.46, (1.38-4.39), P<.002]. Other predictors included impaired cognition [OR 1.96, (1.09-3.54), P<.024), decreased albumin [OR 0.90, (0.82-0.98), P<.015] and increased triglycerides [OR 1.52, (1.16-2.00), P<.003]. Demographics, ADL impairment, comorbidities and hyperlipidemia were not predictors. Conclusion: These data suggest that among nonagenarians, a major psychological stress may be a more important predictor of mortality than other health variables.

# SESSION 1680 (POSTER)

## HEALTHCARE SETTINGS: ORGANIZATIONAL AND CARE ISSUES

### LONG TERM CARE SETTINGS AND ELDER MISTREATMENT: A REVIEW OF DEATHS BY THE MEDICAL EXAMINER

M.W. Baker[1], R.C. Harruff[2], *1. University of Washington School of Nursing, Seattle, Washington, 2. Seattle/King County Public Health, Office of the Medical Examiner, Seattle, Washington*

Elder mistreatment (EM) includes acts of omission or commission by a "trusted other" that result in harm or threatened harm to the health or welfare of older adults. Medicolegal professionals have concerns that EM causes or contributes to death, but that cases are being missed. The study purpose is to analyze medicolegal factors in deaths of older (65+) LTC residents in King County in 2005. Specific aims are to describe LTC resident characteristics and death reporting factors to identify potential EM forensic markers. The medical examiner (ME) assumed jurisdiction in 109 of 2,885 cases, with 26 autopsies and 31 external examinations. Mean (SD) age was 84 (8.8) years; 60% were female. Jurisdiction assumption was highest when the person reporting the death was a family member or funeral worker; lowest when the reporter was an adult family home or hospice worker. Non-natural manners of death were accident (n=55), homicide (n=1), suicide (n=1), undetermined (n=2), and complication of therapy (n=2). Twelve cases had "red flags" for EM; manners of death were natural except accidental (n=1) and undetermined (n=2). All deaths were reported by someone other than the LTC representative. Results suggest that reporter is an important factor in ME jurisdiction decisions. Law enforcement reporters may be proxies for concerned family members, healthcare professionals, and others. Care setting transitions at end-of-life complicate efforts to identify LTC-related deaths and responsibility for possible EM-related injuries. Further research is needed to validate reporter as an EM forensic marker and identify and validate other EM forensic markers.

### TIMING OF ADVERSE EVENTS IN NURSING HOMES IN MANITOBA, CANADA

P. St. John[1], D. Strang[1,2], M. Doupe[1], *1. University of Manitoba, Winnipeg, Manitoba, Canada, 2. Deer Lodge Hospital, Winnipeg, Manitoba, Canada*

Objective: to determine if there are high risk periods for adverse events (AEs) in nursing homes (NHs.) Setting: All NHs in the Canadian province of Manitoba for the years 1999 to 2004, except those administered directly by the federal government (N=2); and chronic care hospitals (N=2). Methods: Secondary analysis of administrative data. Population: 122 NHs were included, with 22,846 residents representing 45,691 person-years at risk. Data: Administrative data on NHs and individuals were used. NH variables include profit status (for profit vs not for profit); size (number of beds); and juxtaposition next to an acute hospital. Resident-level data include demographic characteristics, comorbid conditions derived from ICD-9CM codes, and level of care. Time periods of risk were considered based on time after admission and prior to death: a) 30 days following their first NH admission; b) 30 days following transfer between NHs; c) 60 days preceding death; and d) all other times. Outcomes considered were: hip fracture, non-hip fracture, falls requiring hospitalization; respiratory infection, and skin ulcers. These were also derived from ICD-9CM codes from administrative data. Analysis: Bivariate analysis and multilevel poisson regression models. Results: AEs were much more common immediately after admission to NH, and immediately prior to death. The combined rate of AEs per 100 person-years was: 45.9 in the first 30 days following transfer from community; 64.7 in the first 30 days following transfer from hospital; 46.3 following transfer from another NH; 174.3 in the 60 days before death; compared to 30.9 at all other times. Most of these differences persisted after adjusting for NH-level and resident-level factors. Conclusions: The time immediately after admission and immediately prior to death are high risk periods for AEs. Clinicians should monitor residents closely after admission. Administrators should also consider these high risk periods when developing policies to reduce AEs.

### CHANGE IN SEVEN YEARS OF RATES OF EMERGENCY DEPARTMENT VISITS AND HOSPITAL ADMISSIONS ACCORDING TO AGE

R. Rozzini[1,2], P. Barbisoni[1,2], I. Sleiman[1,2], M. Trabucchi[2], *1. Poliambulanza Hospital, Brescia, Italy, 2. GRG, Brescia, Italy*

Background/aim: it has been reported that patients aged over 65 years account for 25% of Emergency Department (ED) attendances, but there have been few studies on time trends of older people's attendance of ED in the last years. This study describes ED attendance patterns over 7 years of older people using data from a middle sized general hospital (Poliambulanza Hospital, Brescia, Italy). Setting and methods: ED attendance data were collected for the period from 1 January 2003 to 31 December 2009. Patients seen in the ED were identified, and their further fate was traced, including transfer to a Medical or Surgical ward in the same hospital and DRG weight (proxy of clinical complexity). Results: An overall trend in the rate of ED visits for the older patients was observed (+14.2 and +54.1 for 75-84 and 85+ age groups respectively); the same trend in the percentage of patients attending the ED and subsequently admitted to hospital was seen. In medical wards for 75-84 and 85+ age groups the increase was respectively of 14.0 and 49.5%; in surgical ward the increase was 12% for 75-84 and 61% in patents 85+. An increased trend of DRG weight was also found (p<0.000). Conclusions: this study shows a significant increasing level use of ED by those aged over 65 years during the last 7 years. This highlights the need for continued systemic monitoring of ED attendance patterns, in order to enable planners and physicians to accommodate the specific needs of ageing population.

### WORKPLACE HAZARDS IN IOWA NURSING HOMES: PERCEPTIONS OF CERTIFIED NURSING ASSISTANTS

K. Culp, S. Ramey, D.P. Burdsall, *College of Nursing, University of Iowa, Iowa City, Iowa*

Certified nursing assistants (CNAs) are the principal bedside caregivers in nursing homes, yet little is known about their perceptions of the work environment. This population-based, cross-sectional study used a mailed questionnaire and was sent to a random sample of Iowa CNAs (N = 584), representing 166 nursing homes. Key workplace hazards reported were musculoskeletal injuries, exposure to body fluids, and being bitten or kicked by confused residents. However, what was surprising were how often these incidents were reported to their employer. Estimates of incidence and prevalence will be presented including reports of inappropriate touching and verbal abuse by supervisors. These workplace hazards will be paired with nursing home ratings, data collected on site visits by the Department of Inspections and Appeals.

## CHANGE IN LOCUS OF CARE PRIOR TO THE HIP FRACTURE

N. Leland[1], J.M. Teno[1], J. Bynum[2], P.L. Gozalo[1], V. Mor[1], *1. Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island, 2. Dartmouth College, Hanover, New Hampshire*

Objective: The objectives of this study are: 1) to identify the number of patients with a nursing home (NH) stay prior to admission to a United States (U.S.) hospital for a first hip fracture between 1999 and 2007 and 2) examine difference in their survival compared to their community-living peers. Method: We used Medicare claims and MDS data to examine prior locus of care among Medicare beneficiaries 75 years of age and older were not enrolled in managed care and underwent surgical repair of initial hip fracture and were discharged alive between 1999 and 2007 (N=1,264,573). Results: Between 1999 and 2007, 15% of all first time hip fracture hospitalizations were patients residing in a NH at the time of the fracture with an additional 5% having a prior NH stay in the six months prior to hip fracture. Between 1999 and 2007, NH as the locus of care at the time of fracture decreased from 17.9% to 12.8%. Those with a prior NH stay slightly increased from 5.3% to 6.1%. Those residing in the NH at the time of the HF died sooner (514.07 vs.756.47 days, p <.001) than those living in the community prior to index event with no history of a NH stay. Conclusion: Over an 8 year period, NH as the locus of care prior to hip fracture has decreased.

## FEEDING IN ELDERLY WITH LATE-STAGE DEMENTIA (THE FIELD TRIAL): FIDELITY TO TREATMENT IN AN EFFICACY TRAIL IN THE NURSING HOME SETTING

M.B. Aselage[1,2,4], E. Amella[1], D. Garrow[3], L. Bowers[1], *1. Medical University of South Carolina College of Nursing, Charleston, South Carolina, 2. University of North Carolina Wilmington School of Nursing, Wilmington, North Carolina, 3. Medical University of South Carolina Digestive Disease Center, Charleston, South Carolina, 4. John A. Hartford Foundation BAGNC Scholar, Charleston, South Carolina*

Background: Fidelity to treatment is a critical methodological concern in trials conducted in multiple sites by multiple persons over time and is essential to the internal validity of an efficacy trial. This presentation outlines steps taken to increase fidelity in an efficacy study that compares hand feeding with tube feeding in individuals with late-stage dementia developed by an interdisciplinary team and conducted in the three nursing home settings. Methods: Using the NIH Behavior Change Consortium recommendations (Bellg, et al., 2004), steps taken to ensure fidelity include: assuring congruence with study design, monitoring and improving training, delivery of treatment, receipt of treatment, and improving enactment of treatment skills. Results: Certified Nursing Assistants and licensed nursing staff in all sites were trained using various media to adhere to mealtime protocols. A shared-decision making model guided the research and framed the relationships. Training was standardized across sites, as were performance criteria. Booster sessions were held monthly and trainees were debriefed at the close of each subject's participation. Using the best evidence, scripted intervention protocols and treatment manuals and role-play scenarios were developed; videos were produced. Using an extensive checklist, trainees confirmed abilities and were observed at least monthly by the study coordinator. Discussion & Conclusion: While this study is in progress and full results will be available at the meeting, it is expected that through minimizing threats to design validity, we will be able to better insure quality, fidelity and implementation of the tested effect.

## SLEEP AND THERMAL COMFORT IN NURSING HOME RESIDENTS

D.L. Sturdevant, B. Holtzclaw, *College of Nursing, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma*

Environmental conditions in nursing homes are often overlooked as factors influencing sleep quality in older adults, yet the feeling of being too hot or too cold can significantly disturb sleep. Structural design of care facilities, heating and cooling systems, and air circulation in nursing homes generally influence ambient temperature over entire units, making it difficult to maintain an environmental temperature that is comfortable for all residents. Current literature pays little attention to this problem, yet emerging science may inform care and comfort of vulnerable residents. Purpose: A systematic review research findings was performed to determine the state of the science regarding 1) effects of thermal discomfort on sleep in nursing home patients, and 2) cross-disciplinary research on thermal comfort that may be amenable to translation. Methods: A literature search of MEDLINE, CINAHL, EMBASE, PubMed, PsychINFO databases, included research from physiology, gerontology, environmental science/technology, psychiatry, sleep science, chronobiology, medicine, and nursing. Discipline-specific interpretations were compared for relevance to an interdisciplinary care approach. Descriptive and intervention studies were included and evaluated for design and sampling adequacy, clear description, ease and validity of measurement, conceptual congruence for use with other measurements. Findings: Evidence that age-related changes affect thermal sensitivity, thermal comfort, and risks for insomnia in older adults, has produced few studies or application to nursing home settings. Advances in thermal physiology, industrial/environmental technology, and measurement of thermal comfort in non-institutional settings, offer clear rationale and possibilities for translation into interdisciplinary research on assessment and care of older nursing home residents.

## ELDERS' ADHERENCE TO NEUROPATHIC PAIN TREATMENT PLAN

D.M. Burge, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Purpose: Study purposes were to examine the effects of medication side effects, cognitive impairment, depression, and medication affordability on adherence of elders to a neuropathic pain treatment plan and to identify additional variables predicting non-adherence. Design: The study utilized a correlational study design. Setting: Study setting was an outpatient pain clinic. Sample: 95 adults age 65 or older participated. Methods: Descriptive information was collected from each participant's medical record. Cognitive ability was measured by the Mini Mental Status Exam. Depression was measured using the Center for Epidemiologic Studies Depression Scale. Descriptive statistics were used to identify the means and standard deviations. Correlation statistics, independent two-sample t-test, and linear regression were utilized to identify statistically significant relationships between variables. Findings: Thirty (32%) patients demonstrated non-adherence. Medication side effects were found to be the primary reason for non-adherence (n=25, 83.3%). No participants demonstrated cognitive impairment or depression. Some participants reported difficulty in affording treatment plan medications (n=10, 10.5%) but did not give medication affordability as rationale for non-adherence. Failure to understand the treatment plan was an unanticipated reason for non-adherence (n=5, 16.7%). No relationship was found between non-adherence and cognitive impairment, depression, or medication affordability. In the regression model, medication side effects were a significant predictor of non-adherence (p=0.04). Conclusions: As frequency of medication side effects increased, participant non-adherence increased. There is no effect on non-adherence by cognitive impairment, depression, or medication affordability. Misunderstood treatment plans may lead to non-adherence.

### DEVELOPMENT OF CARE SYSTEM TO ACTIVATING FRAIL OLDER ADULTS' ACTIVITIES IN DAILY LIFE: III. EFFECTIVENESS OF EXERCISE BY SYNTHETIC TECHNIQUES OF CHROMA-KEY

Y. Lau[1], K. Yamauchi[2], A. Ogita[3], S. Oshita[4], T. Ichikawa[5], R. Izawa[1], H. Tamura[6], *1. Tokyo Women's Medical University School of Nursing, Tokyo, Japan, 2. Keio University Institute of Physical Education, Kanagawa, Japan, 3. Osaka City University Research Center for Urban Health and Sports, Osaka, Japan, 4. Izumi Junior College Department of Child Welfare, Kanagawa, Japan, 5. Matsuyama Shinonome Junior College Department of Early Childhood Education and Care, Ehime, Japan, 6. Kokushikan University, Tokyo, Japan*

Introduction: Audio visual system by synthetic techniques of Chroma-key as learning material of exercise for older adults has been developed and part of it has been reported in GSA2009. Further development of the audio visual system based on the effectiveness has been carried out. Some problems that we encountered were demonstrated in a survey that we present here. Purpose: The purpose of this research was to clarify the effectiveness of audio visual system by synthetic techniques of Chroma-key as learning material of exercise. Methods: Two types of learning materials were provided for older adults living in the suburb of K prefecture in Japan for a trial. One type of learning materials was a DVD in which pictures of the learner were synthesized into the pictures of the instructor on the screen in real-time. Another type was that pictures of the instructor were cut into the pictures of the learner on the screen. Different types of background on the screen, such as scenery of nature or learner's house, were also compared. After these trials, learners were asked for their impression in questionnaires and interviewed regarding these learning materials. Results: The learners stated that although they felt comfortable if the background on the screen was their house, they were not interested in doing exercise. On the other hand, the background of scenery of nature made them experience virtual reality and enjoy exercise. Choosing the background on the screen by the learners was effective for them to be motivated and continue exercising regularly.

### RELATIONSHIP OF EMOTION AND COGNITION TO WANDERING BEHAVIORS OF PEOPLE WITH DEMENTIA (PWD)

K. Lee, D. Algase, *School of Nursing, University of Michigan, Ann Arbor, Michigan*

Background: Wandering is one of the most frequently encountered dementia-related behaviors and has been associated with negative consequences such as higher morbidity and mortality. However, little research has focused on the influence of emotion on wandering. Purpose: To explore the relationship of cognitive and emotional factors to wandering behavior of persons with dementia. The Need- driven Dementia-compromised Behavior (NDB) model guided this study. Design and methods: A cross-sectional, descriptive study design was used. Subjects were recruited from 17 nursing homes and 6 assisted living facilities in Michigan. A total of 31 PWD data was coded for preliminary analysis. Wandering was rated by nursing staff to answer a question "He/she is a wanderer" with a 4-point Likert scale. Cognition was measured by score by the MMSE; emotion was measure by the Observable Display of Affect Scale (ODAS). Hierarchical multiple regression was used to determine factors associated with wandering. Mediation analysis was used to examine whether cognition mediates the association between emotion and wandering. Results: Preliminary results showed that wandering was significantly associated with positive affect ($\beta$ =0.989, p=0.011), negative affect ($\beta$ =-1.123, p=0.004), and cognition ($\beta$ =-0.509, p=0.004). Specifically, problematic wanderers tended to show more positive affect, less negative affect, and more cognitive impairment. Mediation analysis did not support cognition as a mediator of the impact of emotion on wandering. Conclusions: Positive/negative affect and cognition independently influence wandering. Therefore, a tailored intervention addressing both emotions and cognitive functioning may be required to improve wandering behaviors of PWD.

### CARE-RELATED QUALITY OF LIFE IN DEMENTIA CARE – ACTUALLY MEASURABLE?

J. Gräske[1,2], T.W. Fischer[2], A. Kuhlmey[1], K. Wolf-Ostermann[2], *1. Charité Universitätsmedizin Berlin, Institute for Medicine Sociology, Berlin, Germany, 2. Alice Salomon University of Applied Sciences Berlin, Berlin, Germany*

Objectives Given the Fact that there Is No Cure for Dementia Currently Available, the Outcomes of Care for People Suffering from Dementia are of Great Importance. Quality of Life (QoL) is Now Considered a Major Outcome. Nevertheless Definitions of Quality of Life Lack of Homogeneity and are Not yet Fully Comprehensive, especially in Regard to Care-Related Characteristics. Vaarama (2009) First Developed a Model of Care-Related Characteristics of QoL in Old Age. Our Aim Was to Examine if Existing Dementia-Specific QoL-Instruments Cover the Domains of this Model. Method In December 2009 We Conducted a Systematic Search of the Literature - using the Terms "Dementia" OR "Alzheimer" AND "Quality of Life" in the Databases Cinahl, Embase, Gerolit, PsycInfo, and Pubmed to Identify Articles Including Dementia-Specific QoL - Instruments. We Compared if the Domains Included in These Instruments Match with the Domains of the Model of Care-Related Quality of Life. Results We Identified 154 Studies Satisfying these Criteria. No Study Aimed to Investigate Care-Related QoL. We Identified 21 Dementia-Specific Quality of Life Instruments, Including Self- and Proxy-Ratings as well as Observational Methods. We Found no Dementia-Specific Instrument that Includes all Domains of Care-Related Quality of Life. Of all instruments QUALIDEM (Ettema et al. 2007) has the Best Match for Care-Related QoL. The Domain Care Relations includes seven Items. Conclusion Actually In Dementia Care there is No Instrument Available to Measure Care-Related Quality of Life although there clearly is a need to include this aspect in patient assessment.

### A SYSTEMATIC REVIEW OF INTERVENTIONS TO PROMOTE EFFECTIVE TRANSITIONAL CARE FROM HOSPITAL TO HOME

S. Ramsaroop, A. Nagarajan, C. Reid, E. Siegler, *Internal Medicine/ Geriatrics, Weill Cornell Medical College, New York, New York*

Background/ Purpose:The transition from hospital to home is often a complex process vulnerable to miscommunication and error. Approximately half of all patients experience a medical error after discharge. One in 5 patients suffers an adverse event within three weeks of discharge. The consequences of poor transitions include increased emergency room visits and readmissions, increased mortality and increased health care expenditures. The purpose of this study is to systematically review studies designed to promote effective transitions from hospital to home. Design/ Methods:Extensive bibliographic searches of English-language literature published from January 1970 through July 2009 were conducted. Investigators abstracted pre-specified information (e.g. design, study duration, types of interventions employed) and outcomes measured. Results: 64 studies met inclusion criteria. Two thirds of studies employed an intervention post discharge. Nurses or advance practice nurses were the most common providers delivering the interventions. The most commonly utilized interventions were regularly scheduled telephone calls to patients post discharge and regularly scheduled home visits post discharge. 71% of studies showed reductions in unplanned readmission rates. The most successful studies all provided 24 hour phone availability to patients. Conclusions: The most successful interventions for effective transitions from hospital to home utilized regularly scheduled, direct communication and follow up with providers.

These time and labor extensive measures may not be feasible for busy, primary care practices. Further study is needed to develop effective and efficient interventions for the transition from hospital to home.

### A SURVEY ABOUT SKILL MIX IN OCCUPATIONAL THERAPY IN QUEBEC WITH ELDERS WITH BATHING DIFFICULTIES

M. Guay[1,2], M. Dubois[1,2], J. Desrosiers[1,2], J. Robitaille[2], J. Charest[2], *1. Université de Sherbrooke, Sherbrooke, Quebec, Canada, 2. Research Center on Aging, Sherbrooke, Quebec, Canada*

Introduction: Occupational therapists working in Quebec (Canada) have to deal with a shortage of human resources. In the case of bathing-equipment recommendations, a proposed solution—albeit controversial—is to use skill mix, defined as “a more efficient deployment of employee skills and competencies through the introduction of extended roles and cross-skilling” (Stanmore and Waterman, 2007). The purpose of this study is to describe the use of skill mix in home-care occupational therapy in Quebec (Canada) with clients with bathing difficulties. Methods: All provincial health and social services centres (N=95) were contacted by phone and surveyed on their setting and use of skill mix. Results: The participation rate was 91% and results indicate that 89% of the clinical organizational models in home-care services involve skill mix to determine the need for technical assistance with bathing. Generally, occupational therapists collaborate with physical therapists or with home-health aides; substitution occurs by task assignment. Clinical occupational therapists provide informal training, lasting between 1 and 40 h (mean of 8 h), and have developed 63 versions of “home-made” protocols to assist those involved in the task. Contribution: This study provides a portrait of the use of skill mix in home-care occupational therapy in the province of Quebec (Canada) with clients with bathing difficulties, an internationally sensitive topic for which research is much needed.

### DOES ILLNESS BURDEN INDEPENDENTLY PREDICT NURSING HOME ADMISSION IN AN ELDERLY COHORT?

K.D. Sheppard[1,3], C. Ritchie[1,3], M. Hovater[2], R.M. Allman[1,3], D.L. Roth[2], C.J. Brown[1,3], *1. University of Alabama at Birmingham Division of Gerontology, Geriatrics, and Palliative Care, Birmingham, Alabama, 2. University of Alabama at Birmingham School of Public Health Department of Biostatistics, Birmingham, Alabama, 3. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

The purpose of this study is to assess whether illness burden independently predicts nursing home (NH) placement in community-dwelling older adults over an eight-year follow-up. Methods: A random sample of Alabama community-dwelling Medicare beneficiaries stratified by race, gender, and rural/urban residence had baseline in-home assessments of socio-demographic measurements, Charlson comorbidity score, symptoms, and cognition. Illness burden was created from a composite score of patient reported symptoms. Every 6 months, participants (or proxies) completed telephone interviews to ascertain nursing home placement. Cox proportional hazard modeling was used to examine the significance of illness burden as a predictor to nursing home placement after adjusting for other variables. Results: The mean age (N=1000) was 75.3 years (S.D. = 6.7). The sample was 51% rural, 49% African American, and 50% male. Seventy six participants (7.8%) were identified as being admitted to the nursing home during the eight years. Sixty-three percent of the cohort has a Charlson co-morbidity index score of ≥2. Sixty-eight percent of the cohort demonstrated illness burden scores ≥2. Using Cox proportional hazard modeling, illness burden remained independently associated with time to nursing home placement (HR=1.11, p-value=0.02). Other significant factors included: Charlson comorbidity score (1.30, p-value=0.0001), African American race (HR=0.53, p-value=0.008) and age (HR=1.12, p-value<0.0001). Conclusion: Illness burden is a risk factor for nursing home placement, even after controlling for existing comorbidity and other known risk factors. This project was supported by Grant Number T32HS013852 from the Agency for Healthcare Research and Quality.

### POST-ACUTE CARE AND 30-DAY HOSPITAL READMISSION RATES

S.E. Hardy[1], H.D. Lum[1], S. Studenski[1], H.B. Degenholtz[2], *1. University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, 2. University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania*

Thirty-day readmission rates are frequently considered an indicator of the quality of hospital care, but little is known about the role of post-acute care (PAC) in determining hospital readmission rates. We use data from the 2001-2003 Medicare Current Beneficiary Survey (MCBS), a nationally representative sample of Medicare beneficiaries, to determine readmission rates for hospitalized older adults who receive no PAC, PAC through a home health agency (HHA), or PAC through a skilled nursing facility (SNF). Between fall 2001 and fall 2003, 985 Medicare beneficiaries aged 65 years or older were admitted to a short-term acute care hospital and discharged home without PAC (74%), home with HHA (10%), or to a SNF (15%). 30-day readmission rates were 12% for participants discharged home with no PAC, 18% for those with HHA, and 21% for those with SNF (p=0.04). After adjustment for age, gender, race, socioeconomic status, social support, self-rated health, functional status, cognitive and psychiatric symptoms, smoking, comorbidity, body mass index, ICU utilization, and length of stay, the relative odds of readmission were significantly increased for SNF but not HHA compared to no PAC [OR (95% CI) 1.75 (1.05-2.94) and 1.39 (0.74-2.60), respectively]. Older adults who receive PAC after an acute hospitalization are more likely to be readmitted than those who do not receive PAC. After adjusting for numerous biopsychosocial factors, only SNF-based PAC is associated with an increased 30-day readmission rate. Older adults receiving SNF-based PAC are a good target for interventions to decrease readmission.

## SESSION 1685 (SYMPOSIUM)

### IS 85 THE NEW 75? HEALTHY AGEING IN THE NEWCASTLE 85+ STUDY

Chair: *C. Jagger, Institute for Ageing and Health, University of Newcastle, Newcastle upon Tyne, United Kingdom*
Discussant: *E. Crimmins, USC Davis School of Gerontology, Los Angeles, California*

There is remarkably little up-to-date information about the health of the oldest old (over 85 years), demographically the fastest growing section of the population of most developed countries. There is a need, from both a policy and scientific perspective, to describe in detail the health status of this population and the factors that influence individual health trajectories. For a very large proportion of medical conditions, age is the single largest risk factor. Gaining new knowledge about why aged cells and tissues are more vulnerable to pathology is likely to catalyse radical new insights and opportunities to intervene. The Newcastle 85+ Study aims to determine the spectrum of health within an unselected inception cohort of 800 85 year-olds (1921 birth cohort); to examine health trajectories and outcomes as the cohort ages, and their associations with underlying biological, medical and social factors; and to advance understanding of the biological nature of ageing. The study secured a high level of participation from 85 year olds in the target area of Newcastle and North Tyneside, UK; 851 people (59% of those eligible) were recruited to a detailed domiciliary health assessment plus review of general practice medical records, 188 (13%) to record review only, and 3 (0.2%) to health assessment only. The cohort was representative in terms of the proportion of people living in institutions and also included the cognitively impaired. This symposium describes the study’s first results on health, dependency and biological markers of ageing.

### HIGH LEVELS OF DISEASE AND HEALTH SERVICE USE BUT GOOD FUNCTIONAL STATUS AND SELF-RATED HEALTH ARE FOUND IN 85 YEAR OLDS

J. Collerton[1], K. Davies[1], C. Jagger[1], A. Kingston[1], J. Bond[2,1], M.P. Eccles[2,1], L. Robinson[2,1], T. Kirkwood[1], *1. Institute for Ageing and Health, Newcastle University, Newcastle upon Tyne, United Kingdom, 2. Institute of Health and Society, Newcastle University, Newcastle upon Tyne, United Kingdom*

High levels of disease were found in 85 year olds; the prevalence of diagnosed hypertension (58%), atherosclerotic disease (47%), osteoarthritis (52%), and cataract (47%) were each close to 50% and almost 90% of participants had at least 3 chronic diseases, median (interquartile range (IQR)) count 5 (3-6). Hearing impairment was reported by 60%, visual impairment 37%, falls 38%, severe/profound urinary incontinence 21% and moderate/severe cognitive impairment identified in 12%. Use of health services was high; in the previous year 22% were admitted to hospital (median (IQR) length of admission(s) 7 (3-20) days) and 94% had consulted their general practitioner (median (IQR) annual consultation rate 5 (2-8)). Surprisingly good levels of functional ability and self-rated health were found; the median (IQR) number of activities of daily living undertaken with difficulty was 3 (1-8) and 78% rated their health, compared with others of the same age, as good/very good or excellent.

### DISABILITY AND DEPENDENCY: HOW MUCH CARE IS IN THE COMMUNITY?

C. Jagger[1], J. Collerton[1], L. Robinson[2,1], M.P. Eccles[2], A. Kingston[1], T. von Zglinicki[1], T. Kirkwood[1], J. Bond[2,1], *1. Newcastle University Institute for Ageing and Health, Newcastle upon Tyne, United Kingdom, 2. Newcastle University Institute for Health and Society, Newcastle upon Tyne, United Kingdom*

Despite considerable diagnosed morbidity, people aged 85 born in 1921 living in Newcastle and North Tyneside are remarkably independent. Using the concept of interval need operationalised by the need for help with IADLs and ADLs, we estimate that just over 11% have short-interval dependency (help required at regular intervals each day) and 8% have critical-interval dependency requiring help potentially at any time or constant supervision. Although three-quarters of those with critical interval needs and almost a third of those with short interval need were in care homes, the main helper for 20% of the critically dependent and 4% of those with short interval need was a spouse. If dependency levels remain constant and assuming our cohort represents those aged 80+ years we estimate that the number of people aged 80+ years with critical or short interval dependency will increase by 25% in England and Wales between 2010 and 2020.

### BIOMARKERS OF AGEING AND THEIR RELATIONSHIP TO DISABILITY AND COGNITION

T. Kirkwood, C. Martin-Ruiz, C. Jagger, J. Collerton, A. Kingston, T. von Zglinicki, *Newcastle University Institute for Ageing and Health, Newcastle upon Tyne, United Kingdom*

Ageing is the single greatest risk factor for death and major diseases. However, biological age can differ significantly from chronological age. Various biomarkers of age have been developed in recent years, including measures such as telomere length in white blood cells but multiple biomarkers may need to be measured simultaneously to reliably capture biological age. We present data on the relationship between an extensive set of biomarkers and both disability (measured by difficulty in 17 activities of daily living) and cognitive function (measured by the Mini-Mental State Examination (MMSE)). Disability was categorised into 4 levels (difficulty with 0/1-6/7-12/3-17 activities) and MMSE into 4 categories (0-17/18-21/22-25/26-30). Biomarker values were categorised into gender specific centiles (<10th,10-90,>90th). We evaluated the effect of high and low values of biomarkers on disability and MMSE by ordered polytomous regression models adjusted for gender.

## SESSION 1690 (SYMPOSIUM)

### SMARTSENIOR - INTELLIGENT SERVICES FOR SENIOR CITIZENS

Chair: *M. Gövercin, Geriatric Medicine, Charité- University Medicine Berlin, Berlin, Germany*
Co-Chair: *M.C. Balasch, Deutsche Telekom AG, Berlin, Germany*
Discussant: *E. Steinhagen-Thiessen, Geriatric Medicine, Charité-University Medicine Berlin, Berlin, Germany*

Forming the German project SmartSenior – Intelligent services for senior citizens, 28 renown industry companies and research institutes have allied to develop and validate technologies in the service of elderly people. In the first session, objectives and approaches are introduced from the comprehensive point of view of the coordinator. In the second session a solution for the challenge of safe and secure medical data collection and transmission from home care devices into patient records is presented: mdoc, the generic electronic health record. A third session deals with the results from focus groups – a qualitative social research tool – on the potentials and the requirement of an interactive trainer. The fourth session presents data of a novel sensor based activity monitoring and fall detection tool that recorded data from a full week at elderly peoples homes. The project is funded by the German Federal Ministry of Education and Research.

### HIGH RESOLUTION ACTIVITY RECORDING ON ELDERLY FOR SEVERAL DAYS AND NIGHTS

R. Feichtinger[2], M. Gövercin[1], R. Walter[3], T. Hortmann[4], E. Steinhagen-Thiessen[1], *1. Geriatric Medicine, Charité- University Medicine Berlin, Berlin, Germany, 2. Humotion GmbH, Münster, Germany, 3. Universitätsklinikum Tübingen, Tübingen, Germany, 4. Medical Park Bad Wiessee St. Hubertus, Bad Wiessee, Germany*

Accelerometers for activity monitoring have often been used in recent years. We built a sensor system adding gyroscopes in 3 dimensions and validated the readouts on an isokinetic dynamometer (IsoMed2000) with co-linearity factors Rx=0,999962, Ry=0,999968, Rz=0,999987, respectively. We measured with accelerometers and gyroscopes at the lower lumbar (L5). We found a placement variability of 2cm to be tolerable. A first study on 22 rehabilitation patients with hip-TEP (average 22 days post OP) to 31 age- and BMI-matched controls (64,9y/62,4y; BMI 27,1/27,3) revealed significant differences in several gait asymmetry and irregularity parameters derived from autocorrelation. We present data on (A) progression during rehabilitation therapy, (B) activity patterns at home for up to seven days comparing an elderly to a young urban population and (C) assessment of quantitative parameters correlated to risk of fall.

### AAL CONNECTED TO DAILY ROUTINE IN CLINICS

M. Schröder, *Tembit Software GmbH, Berlin, Germany*

The prolongation of living in their home environment is one of the main targets of older people. This objective requires new technology to collect and transmit medical data safely and securely from home care devices into patient records considering a data handling conform to all constraints of (tele-)medicine services. Thereto mdoc - the generic electronic health record - provides a rule based decision matrix to identify and estimate critical values and initiate the appropriate steps depending on predefined levels of escalation. mdoc is used in medical consultations to work on (importable) clinical pathways including the necessary telemedicine data. mdoc offers interfaces to the local hospital information system and supports physicians to select and monitor patients for clinical trials. Necessary parameters of the patients can be added, modified, and archived by treating physicians at any time.

### FOCUS GROUP DISCUSSION FOR THE DETECTION AND USER CENTERED DESCRIPTION OF REQUIREMENTS FOR THE DEVELOPMENT OF AN INTERACTIVE TRAINER

M. Gövercin, J. Kiselev, M. Haesner, Y. Költzsch, E. Steinhagen-Thiessen, *Geriatric Medicine, Charité- University Medicine Berlin, Berlin, Germany*

User centered design is a key method to develop new technologies especially in assisting health care technologies for elderly people. Here we present data of a focus group discussion that was conducted in the context of the SmartSenior project. The three focus groups consisted of six users with a fall history, six users with stroke and a group of health care experts like nurses, therapists, health insurance employees, general practitioners etc. According to a focus group discussion guide including an interactive presentation to demonstrate the user the planned development, we discussed and questioned relevant topics. 75% of the multimorbid elderly had previous contact with IT. As an example for results and consequences of the focus groups, we decided to implement a live Audio-Video stream because there was a clear consensus that patient-professional contact has to be essential in the design of an interactive trainer.

### COMPREHENSIVE OVERVIEW OF THE OBJECTIVES AND APPROACHES OF THE SMARTSENIOR PROJECT

M.C. Balasch, *Deutsche Telekom AG, Laboratories, Berlin, Germany*

SmartSenior strives towards an integration of solutions to maintain life standard of elderly with regards to economic, health and social aspects. The project focuses on three scenarios: safe mobility, health and healing as well as independent living at home. Concepts, prototypes and services of integrated and intelligent environmental technologies are being developed. Particular emphasis is put on a comprehensive ICT-infrastructure, intuitive user interfaces, a mobile emergency detection device, an integration of services for the prevention and rehabilitation of functional limitations, and solutions to enhance the safety of elderly at home and away. These solutions will be evaluated in a field test including 35 homes of elderly people. SmartSenior covers the whole value chain along the mission of an independent life for elderly by partners in the essential fields. It focuses on solutions within one concept and will ensure impulses for health industry and the economic changes within an ageing society.

## SESSION 1695 (SYMPOSIUM)

### TRENDS AND TRAJECTORIES OF ORAL HEALTH: LINKING COGNITIVE FUNCTION, SYSTEMIC DISEASES, AND ORAL HEALTH IN OLDER ADULTS

Chair: *B. Wu, Gerontology, University of North Carolina at Greensboro, Greensboro, North Carolina*
Discussant: *R. Nowjack-Raymer, National Institutes of Health, Bethesda, District of Columbia*

This symposium aims to address gaps in the gerontological and oral health literatures: oral health disparities for minority elders, linkages between oral health and systemic diseases, and relationship between cognitive function and oral health trajectories. The first study presents national trends of edentulism (complete tooth loss) among Americans aged 50 and over. Overall, there was a significant downward trend of edentulism from 1999 to 2008. However, significant variations existed across five major racial/ethnic groups. This is one of the first known studies to examine edentulism trends for Native Americans and Asians alongside those for Whites, Blacks and Hispanics. The second study compared the oral health of young and old Mexican American and European Americans from 3 socioeconomically-matched neighborhoods. The third study assessed the oral health-systemic disease link in low income older patients of a mobile dental clinic who experienced higher rates of diabetes, depression, osteoporosis and hypertension than the U.S. population. The study found that elders with chronic diseases, especially diabetes, osteoporosis and depression, and those on some prescriptions were more likely to have poorer oral diseases and conditions. The fourth study examined the linkages between cognitive functioning and oral health over a five-year period. The study found that cognition predicted the levels of filled teeth and a DMFT summary measure (i.e., decayed, missing, and filled teeth), whereas these linkages were partially mediated by oral hygiene behaviors. Dr. Ruth Nowjack-Raymer will discuss potential NIH funding sources for oral health research in older adults.

### ETHNIC VARIATIONS IN EDENTULISM AMONG MIDDLE-AGED AND OLDER AMERICANS, 1999-2008

B. Wu[1], J. Liang[2], C. Remle[1], B. Plassman[3], X. Luo[1], *1. Gerontology, University of North Carolina at Greensboro, Greensboro, North Carolina, 2. University of Michigan, Ann Arbor, Michigan, 3. Duke University, Durham, North Carolina*

Research on ethnic variations in oral health trends is rare, particularly those involving American Indians and Asians. This study examined the trends of edentulism (complete tooth loss) among Americans aged 50 and over. Data came from the National Health Interview Surveys between 1999 and 2008. Respondents included 616 American Indians/Alaska Natives (AIAN), 2,666 Asians, 15,295 Blacks, 13,068 Hispanics, and 86,755 Whites. Overall, there was a significant downward trend of edentulism from 1999 to 2008 (OR=0.97, 95% CI: 0.96, 0.98). However, significant variations existed across five major racial/ethnic groups. AIAN had the highest rate of edentulism (27.7%), followed by Blacks (19.8%), Whites (17.4%), Hispanics (14.6%), and Asians (12.9%). Controlling for population heterogeneity, multivariate analyses revealed that relative to Whites, Hispanics were less likely to lose all teeth (OR=-.53, 95% CI: 0.50, 0.57), whereas AIAN remained at higher risk of being edentulous (OR=1.33, 95% CI: 1.07, 1.66).Supported by NIH/NIDCR (1R01DE019110).

### DISPARITIES OF AGE, GENDER AND ETHNIC STATUS IN DENTAL CARIES

M.J. Saunders[1,2], C. Yeh[1,2], S. Lee[1,2], J.E. Cornell[1,2], H.P. Hazuda[1], *1. UTHSCSA, San Antonio, Texas, 2. GRECC, STVHCS, San Antonio, Texas*

This study documents the disparity of dental health status among younger and older Mexican and European Americans (MAs and EAs) using a dataset from the cross-sectional component of the aging study since there is no longitudinal oral health data at this time—Oral Health: San Antonio Longitudinal Study of Aging (OH: SALSA). The ratio of coronal caries to existing teeth were analyzed based on two age groups (younger <65 and older >or=65 yrs), sex, and ethnic status. There were significant differences in dental caries between age (p<0.0001) and ethnic status (p<0.0005) groups. Older subjects have more caries compared to their younger counterparts and MAs have worse caries experience than EAs. The caries rate is almost three times more in older MAs than younger EAs. These results confirm that disparities of oral health exist among younger vs. older and EAs vs. MAs in a community-based population.

### SYSTEMIC AND ORAL DISEASES: WHAT IS THE LINK?

A.H. Kiyak, *Institute on Aging, University of Washington, Seattle, Washington*

There is growing evidence that oral health is impaired in elders with chronic diseases, especially diabetes, osteoporosis and depression, and those on some prescriptions (e.g. antidepressants, antihypertensives). This presentation summarizes findings of two studies (n=87 and 72) that assessed the oral-systemic disease link in low income older patients of a mobile dental clinic, with higher rates of diabetes, depression, osteoporosis and hypertension than the U.S. population. Elders with hypertension and arthritis had more denture problems (p=.01, p=.001), while those with osteoporosis were missing more teeth (p=.01). Those using antihypertensives had worse soft tissue (p=.03) and those on cholesterol meds had more caries (p=.04). The sheer number of Rx meds used (5.45 on average) is associated with tooth loss (p=.001), suggesting that tooth loss is a good marker of poor general health. Despite small samples, these data suggest the importance of maintaining good oral health among elders with systemic diseases.

### COGNITIVE FUNCTIONING, ORAL HYGIENE, AND ORAL HEALTH TRAJECTORIES AMONG OLD ADULTS

J. Liang[1], B. Wu[2], B. Plassman[3], Y. Lee[1], C. Remle[2], L. Bai[2], J. Beck[4], *1. University of Michigan, Ann Arbor, Michigan, 2. Gerontology, University of North Carolina at Greensboro, Greensboro, North Carolina, 3. Duke University, Durham, North Carolina, 4. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

There is little research on the dynamic linkages between cognitive functioning and oral health over an extended period of observation. This study analyzes how cognitive functioning is associated with oral health trajectories directly and indirectly via dental hygiene. Data came from the Piedmont Dental Study and the Duke Established Populations for Epidemiologic Studies of the Elderly. The sample consisted of 810 older Americans who were dentate at the baseline with up to 4 repeated observations between 1988 and 1994. Multilevel models with ordered logit were employed to chart the trajectories of oral health including decayed teeth, filled teeth, missing teeth, and DMFT (a summary measure of decayed, missing and filled teeth). Cognitive functioning predicted the levels of filled teeth and DMFT, whereas these linkages were partially mediated by oral hygiene (i.e., brushing, flossing, and rinsing). Supported by NIH/NIDCR (1R01DE019110).

## SESSION 1700 (SYMPOSIUM)

### WHERE DO I GO FROM HERE? ELDERS' TRANSITIONS FROM ED TO HOME

Chair: *L.R. Phillips, Nursing, UCLA, Los Angeles, California*
Discussant: *G. Guo, Peking University, Beijing, China*

While older individuals seek care in a variety of settings, recent data from the 2006 Emergency Department (ED) Summary of the National Center for Health Statistics National Hospital Ambulatory Medical Care Survey indicate that compared to the overall per capita ED visit rate (40.5 visits per 100 persons), the rate for those 65+ is 48.5 visits per 100 persons. For elders living in the community, 65% percent of ED visits result in discharges to home. Data also shows that compared to younger persons, older adults have poorer ED outcomes including more repeat visits, longer stays and higher rates of adverse outcomes following ED visits. This symposium frames the problem of poor ED outcomes in the context of the special needs of older adults and poorly managed "ED to home transitions." The first paper focuses on describing, from the perspectives of elders and caregivers, the factors that influence ED encounters and transitions home. The second paper reports on geriatric syndromes as a factor that complicates transitions to home. The third paper characterizes the contribution of dehydration as a complicating factor in ED encounters. The last paper explores the influence of cognitive problems as they complicate ED encounters and transitions to home. The goal is to design ED interventions that more adequately account for these unique transitional care problems among community dwelling older adults.

### WHEN 2 + 2 = 6: GERIATRIC SYNDROMES AS PART OF THE ED EQUATION

L.R. Phillips[1], M. Cadogan[1], J. Mentes[1], D. Woods[1], H. Aronow[2], *1. Nursing, UCLA, Los Angeles, California, 2. Cedars-Sinai Medical Center, Los Angeles, California*

Dealing with geriatric syndromes is a fact of life for many older persons and their caregivers. However, the degree to which geriatric syndromes complicate ED encounters and transitions to home is unknown because our current record-keeping systems are not designed to capture data specifically about geriatric syndromes. This study was designed to use an existing database (archived ED records) to describe the characteristics of vulnerable community-dwelling elders who seek and receive urgent care in a large, urban emergency department and return to home without a hospital admission with a focus on the frequency of geriatric syndromes and patterns of co-morbidity. Two ED outcomes are considered in the analysis: (1) repeat ED visits and (2) admission to the hospital within 6 months.

### DEHYDRATION AS BACKGROUND NOISE IN THE EMERGENCY DEPARTMENT

J. Mentes[1], G. Guo[2], H. Aronow[3,1], *1. UCLA Center for the Advancement of Gerontological Nursing Science, Los Angeles, California, 2. Peking University School of Nursing, Beijing, China, 3. Cedars Sinai Health Services, Los Angeles, California*

Dehydration is a common, yet often overlooked, precipitating or co-occurring factor in emergency room contacts in older adults. The purpose of this study was to characterize the contribution of dehydration to ED contacts in adults older than 65 years. We used one fiscal year of ED data, n=1000, of a large urban medical center to compare older adults who present to the ED with a primary diagnosis of dehydration to those adults who present with a secondary diagnosis of dehydration. Characterizing these different presentations can provide meaningful information for individually tailored interventions to minimize dehydration in this population.

### REVOLVING DOORS: TRANSITIONS OF ELDERS FROM ED TO HOME

M. Cadogan, L. Phillips, *UCLA School of Nursing, Los Angeles, California*

Older adults are frequent users of emergency department (ED) services and most return to their original places of residence. Little is known about the experiences of older adults who are discharged home from the ED without a hospital admission. Using qualitative data from interviews with older adults and/or their caregivers, this presentation will describe, from the perspectives of elders and their caregivers, factors that influenced their ED encounters and transitions home. Their perceptions of (a) the antecedents of their ED visit (health concerns, co-morbid conditions and geriatric syndromes); (b) the events that occurred in the ED; and (c) their post-ED experiences (problems encountered in interpreting instructions and following through with changes in treatment protocols, and the degree to which their original problems were resolved) will be highlighted.

### WHO'S CONFUSED: HOW COGNITIVE AND BEHAVIORAL PROBLEMS CONTRIBUTE TO ED ENCOUNTERS

D. Woods, *UCLA Center for the Advancement of Gerontological Nursing Science, Los Angeles, California*

Behavioral symptoms of dementia (BSD) rooted in cognitive problems associated with dementia are known to influence seeking services which contribute to upwards of 30% of acute care hospital admissions. Currently, however what is not known is the influence of cognitive problems on Emergency Department (ED) encounters, how they complicate these encounters, and subsequent discharge to home. This study was designed to utilize an existing database (archived ED records) to describe the characteristics of vulnerable community-dwelling elders who receive urgent care in a large, urban ED and return to home without a hospital admission. Three ED outcomes are considered in the analysis: (1) the frequency of cognitive problems and/or BSD as a presenting problem; (2) the frequency of cognitive problems and/or BSD as a secondary problem; and (3) the frequency of ED revisits.

## SESSION 1705 (SYMPOSIUM)

### BRIDGING THE WORLDS OF RESEARCH, ADVOCACY, POLICY AND PRACTICE: THE NATIONAL ALLIANCE FOR CAREGIVING

Chair: *G. Hunt, National Alliance for Caregiving, Bethesda, Maryland*
Co-Chair: *D. Wagner, Towson University, Towson, Maryland*
Discussant: *R. Schulz, University of Pittsburgh, Pittsburgh, Pennsylvania*

The National Alliance for Caregiving (NAC), a non-profit coalition of national organizations, works to advance the understanding of family caregiving, foster research that instructs policy in family caregiving, and educates policy makers and advocates about informal caregiving. The first national survey of family caregivers was conducted using a telephone survey instrument by NAC in 1997. This survey was replicated in 2004 and again in 2009. Although each sample was unique in the surveys, the surveys provide a snapshot of family caregiving that has been used to educate policy makers, employers and advocacy groups interested in aging, family issues and family caregiving. This symposium is designed to explore the contributions of the NAC caregiving study, the challenges associated with blending the policy and research agenda and the development of appropriate material for the array of audiences. An overview of the NAC survey design and data collection as well as key findings from the 2009 survey will be provided as will information about the use of the data by the research community.

### NAC SURVEY DATA AS A RESOURCE FOR ENRICHING CAREGIVER POLICY RECOMMENDATIONS

R. Schulz, *University of Pittsburgh, Pittsburgh, Pennsylvania*

The NAC survey data is an invaluable resource for addressing key questions regarding the prevalence of caregiving, the types of care being provided, the effects on the caregiver and changes over time in these parameters at the population level. In addition to providing data useful in addressing core policy questions it can also provide useful insights regarding subpopulations of caregivers varying in ethnic/racial diversity, care recipient characteristics, and age. AS an example of the in-depth of analysis possible with these data we test several multivariate models identifying factors associated with technology use among caregivers, caregiver burden and distress, and caregiver needs, These types of analyses are important supplements to the basic findings reported from this survey and can provide greater precision in making policy recommendations for caregivers.

### DEVELOPING RESEARCH AND REPORTS TO SHAPE PRACTICE AMONG EMPLOYERS WITH CAREGIVING EMPLOYEES

D. Wagner, *Gerontology, Towson University, Towson, Maryland*

Approximately 10% of the workforce is involved in providing help to an older family member or friend. The NAC surveys (1997, 2004, 2009) estimate that 60% of those providing help to an older person are employed, most of them on a full-time basis. NAC and other advocacy groups undertook efforts to educate employers about productivity issues related to caregiving. Using data from the surveys with funding from MetLife Mature Market Institute, the hidden costs to employers were estimated and reports issued. These estimates have been widely circulated among employer groups and used as a rationale for making change in the workplace to better support caregiving employees. Other data have been collected to explore workplace issues such as gender, intervention effectiveness and health effects. This presentation reviews the strategy used by NAC to effect practice change through strategic research and publications targeted at employers and employer groups as well as the key findings of the research conducted.

## SESSION 1710 (SYMPOSIUM)

### ECONOMIC ASPECTS OF TRANSITIONS FOR OLDER ADULTS

Chair: *C.E. Bishop, Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Although health and social needs drive many transitions made by older adults, economic assets, financing, regulation, and provider payment also play important roles. The information that might flow among providers during care transitions may be impeded by payment and resource issues, with potentially costly outcomes. The symposium will present research concerning three important transitions of older adulthood. Decline in physical function may highlight shortcomings of a home as a supportive environment; but household assets also affect whether desired residential transitions occur. Long-term care insurance has the potential to provide care resources to insured elders at the time when care is needed, shaping transitions among types of care. In the end-of-life period, failures of coordination associated with transitions may lead to poor outcomes and further transitions. Systems that do not provide resources for information sharing, or that provide incentives for inappropriate transitions, may be in part responsible for these outcomes. The symposium will present analyses of these transitions of older adults incorporating both economic and other factors.

### THE IMPACT OF HOUSEHOLD WEALTH ON LATE LIFE RESIDENTIAL CHANGES

K. Stoeckel, *Gerontology, University of Massachusetts - Boston, Jerusalem, Israel*

The economic status of older adults influences what residential options are available for their consideration. This research examined the relationship between residential transitions and an array of factors, including housing characteristics, functional status, physical health, and economic resources. Relocation into non-institutional settings was emphasized. Data were drawn from the 1998-2006 waves of the Health and Retirement Study with a sample of non-institutionalized respondents age 70+ at baseline. A household wealth variable, inclusive of income and net worth, was created to sensitize the results to the combined influence of income and assets on residential transitions. Results showed that greater overall household wealth was a significant predictor of actualization of residential transitions. Conference participants will be able to discuss the prevalence of residential transitions made by a nationally representative sample of community residing older adults. Participants will be able to explain the influence of economic status on residential transitions in later life.

### LONG-TERM CARE TRANSITIONS AMONG PEOPLE WITH PRIVATE LONG-TERM CARE INSURANCE

M. Cohen, J.S. Miller, X. Shi, *LifePlans, Inc., Waltham, Massachusetts*

Presentation of results from a study of an admissions cohort of private long-term care (LTC) insurance policyholders and the factors associated with using and choosing long-term care services. Specific emphasis is placed on establishing a profile of individuals as they begin using paid LTC services and tracking their patterns of service use, satisfaction and transitions over a 28 month period. Although many factors may affect care setting transitions, this study focuses on understanding the decision making process while exploring the connection between the availability of financing for LTC and choosing or transitioning to a care setting.

### TRANSITIONS AT THE END OF LIFE AND ASSOCIATED COSTS: A NATIONAL STUDY

P.L. Gozalo, J.M. Teno, V. Mor, *Community Health, Brown University, Providence, Rhode Island*

Objective: Poorly executed transitions are associated with medical errors, information discontinuity, functional decline, often leading to additional transitions. Our goal is to provide time and regional variation estimates for patterns of transitions and their associated expenditures in the last year of life. Methods: Using the national 2000-2007 MDS and Medicare Claims, we created a measure of last year of life transitions across providers among all decedent Medicare Beneficiaries with no Managed Care coverage. Descriptive analyses illustrate geographic and temporal variations of total, complicated and potentially burdensome transitions. A multivariate model examines state policy associations with end-of-life transitions adjusting for person specific case-mix. Results and Conclusions: There are substantial regional variations in transitions and expenditures experienced by people in their last year of life, both in the community and among institutionalized populations. Blacks, Hispanics, and those without advance directives are at increased risk of transitions.

## SESSION 1715 (SYMPOSIUM)

### EVALUATION OF INNOVATIVE MODELS FOR FAMILY AND INFORMAL CAREGIVING

Chair: *D.J. Sheets, School of Nursing, University of Victoria, Victoria, British Columbia, Canada*
Co-Chair: *M. Marcus, Harry and Jeanette Weinberg Foundation, Inc, Owings Mills, Maryland*
Discussant: *R. Stone, Institute for the Future of Aging Services, Washington, District of Columbia*

In September 2009, the Harry and Jeanette Weinberg Foundation launched a 3 year funding initiative providing nearly $8 million in funding for the development of innovative and evidence-based community projects to help support family and informal caregivers. This initiative was one of the first in the nation to focus on family caregivers rather than the care recipient. This symposium compares and contrasts the different evaluation activities for 4 nonprofits implementing innovative caregiver programs under the Weinberg initiative. Evaluation of the CARES project which adapts the Wraparound System of Care to caregivers (commonly used for children with mental illness) focuses on issues of treatment fidelity, training and implementation. Another presenter considers evaluation of a project designed to enhance services in two rural and resource scarce counties in Maine which is implementing a caregiver navigator role. A third presenter assesses evaluation in the context of the Caregiver Central project which is testing the effectiveness of using computer technology to support family caregivers as well as the involvement of community stakeholders. A fourth presenter is using several innovative evaluation methodologies, including Appreciative Inquiry, Assets Based Mapping, and Most Significant Change. This presentation describes the theory and practice behind these methodologies and their use as evaluation tools to identify needs, develop priorities, engage stakeholders, and assess sustainability of the resulting caregiver support network. All presenters will describe implementation successes and challenges, using examples from the first year of program evaluation.

### PROJECT EVALUATION FOR CARES: CAREGIVERS ACCESSING RESOURCES & ESSENTIAL SERVICES

K. Black*, College of Arts and Sciences, University of South Florida Sarasota - Manatee, Sarasota, Florida*

The CARES project is an innovative caregiver program being conducted by Jewish Family and Children's Services of Sarasota, Florida. The main intervention is based on the Wraparound System of Care, an approach used throughout the nation in the care of children with serious mental illness. For the CARES project, the Wraparound process was modified for application to caregivers and is conducted over four distinct phases which encompass the following four principles for practice: Voice and Choice; Strengths Based, Collaborative Team Approach, and Planned Outcomes. A logic model of the project will be presented. Aspects of treatment fidelity will be discussed along with the training and implementation of this innovative approach to caregivers. Measurement of outcomes to caregivers will also be reviewed.

### USING AND EVALUATING THE IMPACT OF TECHNOLOGY WITH FAMILY CAREGIVERS

A. Kelly*, Florida Southern College, Lakeland, Florida*

Caregiver Central addresses the needs of family caregivers in central Florida. Key components are the Caregiver College, an information hub of resources with computers, trainers and training software in four community locations, and the Web Tool, an interactive website featuring evidence-based self-assessment tools, referral to direct care and case management, education and support. Novice internet users are assisted in using the Web Tool at four Caregiver College campuses. By emphasizing personal caregiver needs along the specific continuum of care, the project connects caregivers with appropriate and timely solutions. Anticipated program outcomes for caregivers include increased internet comfort and facility, appropriate use of direct services, enhancement of caregiving skills, improved caregiver self-efficacy, relief of caregiver strain, and an awareness of the caregiving role earlier in the caregiving trajectory. This paper describes the evaluation which examines the specific impact of technology on caregivers as well as high involvement among local community stakeholders.

### INNOVATIVE METHODOLOGIES FOR EVALUATING THE DEVELOPMENT OF A CAREGIVER SUPPORT PARTNERSHIP

R. Berman, M. Iris*, Leonard Schanfield Research Institute, CJE SeniorLife, Chicago, Illinois*

Caring Together, Living Better (CTLB) is a partnership of non-profit community and faith-based organizations. The goal of the partnership is to develop and sustain culturally sensitive programs and services for low-income, minority caregivers in south suburban Chicago. Evaluation activities include several innovative methodologies, such as Appreciative Inquiry, Assets Based Mapping, and Most Significant Change. These methods are being used to identify needs, develop priorities, engage stakeholders, and assess sustainability of the resulting caregiver support network. This presentation will describe the theory and practice behind these methodologies and their use as evaluation tools. Presenters will describe implementation successes and challenges, using examples from the first year of the program evaluation.

### EVALUATION CHALLENGES IN ASSESSING CAREGIVER NETWORK PROGRAMMING IN RURAL COMMUNITIES

J. Crittenden[1], L.W. Kaye[1], N. Merrill[2], D. Poulton[2]*, 1. Center on Aging, University of Maine, Bangor, Maine, 2. Eastern Area Agency on Aging, Bangor, Maine*

Maine's Weinberg Foundation-funded caregiver network project focuses on building enhancements in the community service infrastructure of two of the most rural and resource scarce counties in the state. It emphasizes a broad partnership collaborative among cooperating organizations, university-community linkages, intergenerational programming, and expanding/sustaining a range of enriched caregiver support services including adult day care, home care, respite, transportation, education, and training programs. The establishment of an available and affordable caregiver navigator is a linchpin programmatic component. Evaluation and needs assessment methodologies are premised on maintaining a modified participatory research design in which community stakeholders significantly participate in the process. In rural communities, trust building, cultural and political sensitivity, attention to literacy and dual relationship issues, assessing capacity and discovering informal caregiver support networks is particularly challenging. Working with small agencies without formalized intake procedures has required constructing data tracking strategies that are both user friendly and efficient.

## SESSION 1720 (PAPER)

## HOUSING, NURSING HOMES, AND RESIDENTIAL CARE II

### TRENDS IN LONG-TERM CARE TRANSITIONS: LESSONS FROM A POORHOUSE IN DEPRESSION-ERA DETROIT

J. Tucker, R. Dunkle, *Social Work & Anthropology, University of Michigan, Ann Arbor, Michigan*

While discussions of care transitions (Kane & Kane 1989) increasingly include populations at risk for long-term care and the important role of social workers in the aging experience for elders, social work literature that takes a comparative historical approach is scant. This paper discusses original, qualitative, ethnographic research conducted in the archives of the Hannan Foundation, a nonprofit organization that assisted over 800 community dwelling elders with pensions in Detroit between 1927 and 1971. Focusing on the U.S. Great Depression era, this study deals with Hannan elders who were sent to Eloise, a Detroit county poorhouse and mental institution with over 14,000 people in its care. Addressing the conference theme "Transitions of Care," we compare risk factors among Hannan elders who were institutionalized during the 1930s with current trends in social work literature on long-term care transitions. Findings identify similar factors for elders who were institutionalized 80 years ago as for those institutionalized today: age, gender, lack of social support, and health and mental health, with mental health as the most predictive variable. Our findings also support the prevailing historical role of social workers in elder transitions to long-term care. Discussion incorporates the political and moral dilemmas that social workers continue to face in elder institutionalization and implications for current understanding about the experience of aging for elders at risk for long-term care transition.

### KITCHEN LIVING IN LATER LIFE: A UK DISCUSSION

S. Peace[1], J. Percival[1], M. Maguire[2], C. Nicolle[2], R. Marshall[2], R. Sims[2], *1. The Open University, Milton Keynes, United Kingdom, 2. Loughborough University, Loughborough, United Kingdom*

The kitchen in often a focal point within the domestic home: a material, social and psychological environment encompassing both public and private space of varied meaning and purpose. This research from the UK's New Dynamic of Ageing Research Programme brings together social gerontologists with ergonomists and specialists in design and technology to consider through ethnographic and ergonomic methods both oral histories of kitchen living and examination of contemporary living conditions. The research is based on a purposive sample of 48 older people in their 60s, 70s,80s and 90s living in two locations – Loughborough and Bristol living in both mainstream and supportive housing. Through this paper, participants will gain an understanding of the role, function and design of the current kitchen from older people living in a range of British housing types; consider the value of multi-disciplinary research within environmental gerontology, and address issues of person-environment interaction through the juxtaposition of individual health and well-being, kitchen living and the potential for adaptation to meet needs. Issues of time, space and setting will be central

### TESTING ASSISTED LIVING STAFF KNOWLEDGE OF MEDICATION ADMINISTRATION PRACTICES

D.A. Reed[1], S. Zimmerman[1,2,3], L.W. Cohen[1], P. Sloane[1,4], K. Love[5], J. Brickley[6], *1. Cecil G. Sheps Center for Health Services Research, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. School of Social Work, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 3. School of Public Health, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 4. Department of Family Medicine, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 5. Center for Excellence in Assisted Living, Falls Church, Virginia, 6. North Carolina Division of Health Service Regulation, Raleigh, North Carolina*

Assisted living communities provide care for approximately one million older persons, the majority of whom have chronic illnesses and require multiple medications. With the numbers and acuity of persons in assisted living continuing to increase, concern has been raised about the competence of assisted living staff to ensure that medication errors do not occur in this setting. This presentation reports on the evaluation of a knowledge of medication administration practices test (MAP) that was completed by 40 assisted living staff who administered medications in 11 different assisted living communities in two states. Domains of knowledge included in the test were terminology, medication monitoring, techniques of administration, documentation, infection control, and regulations. These staff were also observed administering more than 4300 medications with the observations then compared to the medication administration record to determine if errors had occurred. Results indicate that the MAP demonstrated internal consistency reliability (> 0.90 for the entire test). In addition, the MAP discriminated among staff with different levels of licensure/certification. In a logistic regression, the MAP was a significant predictor (P = .002) of the occurrence of a medication error with moderate to significant potential for harm. Better performance on the MAP was associated with lower odds of committing such an error. The findings suggest that training staff on the items included in the MAP and using it to evaluate staff who administer medications or assist residents with self-administration could reduce medication errors in assisted living. Next steps in refining the MAP also will be discussed.

### PREDICTORS OF ORGANIZATIONAL TENURE AMONG STAFF IN ASSISTED LIVING: A MULTILEVEL ANALYSIS

E. Sikorska Simmons, *Sociology, University of Central Florida, Orlando, Florida*

Retention of adequate staff is becoming a major challenge in assisted living (AL). Little, however, is known about factors that foster staff retention. This research examines the role staff characteristics (Level 1) and organizational factors (Level 2) as predictors of organizational tenure (Level 1) among AL staff. The sample consisted of 950 staff in 22 AL facilities. All staff members who were hired and paid by the facility during a 12-month period were included. Organizational tenure (i.e., length of employment in the facility) was measured in days (at the individual level). Staff characteristics included age (at the time of hire), race, foreign-born status, job type, employment type, and prior experience working in the facility. Organizational factors included facility size, ownership, average wage, level of care, and the quality of management (i.e., administrator's education and organizational justice). The results of multilevel analysis indicated that 27% of the variance in organizational tenure was due to between-facility variation. Staff members, who worked full-time, were rehired, foreign-born, skilled, and white tended to have longer organizational tenure. Controlling for staff characteristics, longer organizational tenure was predicted by smaller facility size, nonprofit ownership, lower level of care, and better quality of management. In particular, policies that foster organizational justice had the strongest effect on organizational tenure. Together, organizational factors explained 52% of the between-facility variance in organizational tenure. These findings point to the importance of organizational factors in predicting staff retention and have practical implications for administrators who want to increase staff stability.

## SESSION 1725 (POSTER)

## INTERGENERATIONAL RELATIONSHIPS, SOCIAL ROLES & SUPPORT

### PREDICTORS TO THE PERCEPTIONS OF CHILDREN'S FILIAL PIETY AMONG OLDER ADULTS IN CHINA

W. Mao, I. Chi, *School of social work, University of Southern California, Los Angeles, California*

Filial piety, a value rooted in Confucianism, has traditionally served as a guide for children's behavior and attitude toward their parents, and still exerts influence in Chinese families. In a few existing studies regarding perceptions of filial piety from the perspective of older parents, perceived filial piety is consistently found to be a pivotal indicator of older adults' well-being. However, no study has addressed probable predicting factors related to perceived filial piety. This study aims to fill that gap by exploring factors that predict perceptions of children's filial piety among older adults in China. Data used in this study is from the national representative study Sample Survey on Aged Population in Urban and Rural China in 2000, conducted by the China Research Center on Aging. A subsample (N=19,430) of adults age 60 and above with offspring was included in the analysis. Results from multiple regression show that adults age 70 and above who are female, married and living with a spouse in an urban area, literate, and non-religious are more likely to consider their children observant of filial piety. In addition, economic security, fair monetary exchange with children, better health status, and co-residence with sons and daughters-in-law are significant in predicting a higher level of perceived filial piety. The results suggest that identifying potential predictors of filial piety and deploying them as protective factors could play a vital role in interventions targeting older Chinese adults and their families.

### FAMILY STRUCTURE AND CUSTODIAL GRANDPARENT HEALTH STATUS IN CHINA

S. Deng, S. Kolomer, *University of Georgia School of Social Work, Athens, GA*

Background: In the U.S. custodial grandparents in skipped generation households have been identified as having poorer physical health as compared to their noncustodial counterparts. In China, where intergenerational households are considered part of the fabric of society, little attention has been paid to grandparents residing in homes with their grandchildren without a parent present. Therefore, little is known about their physical health. This study examines health differences in China among grandparents living in three generation families with the presence of at least one parent, grandparents living alone, and grandparents residing with grandchildren without a parent present. Method: Utilizing secondary data from The China Health and Nutrition Survey (CHNS) collected by the Carolina Population Center at UNC at Chapel Hill and the National Institute of Nutrition & Food Safety at the Chinese CDC, comparisons of 212 grandparents across household structures were made. Logistic regression was used to examine predictors of health status of grandparents in the three different household structures. Results: Grandparents residing with grandchildren without a parent present (n= 40) were found to be in significantly better health that either grandparents living in three generational households (n=129) or grandparents living alone (n=43) ($\beta$=1.37, p< .05). Age, gender, and living environment were also found to be significant predictors of health status. Discussion: The physical health status of grandparents living in skipped generation households in China is remarkably different than what is known about custodial grandparents in the U.S. Plans for future cross cultural research and implications for practice will be discussed.

### ALTRUISM AND SELF-INTEREST IN INTERGENERATIONAL RELATIONSHIPS

S. Daatland, K. Herlofson, I.A. Lima, M. Veenstra, *NOVA, Oslo, Norway*

Population ageing may create conflicts between older and younger generations if the growing number of elders will in self-interest support benefits to seniors over benefits to children and families. Earlier findings are mixed. Esping-Andersen (1997) support the conflict argument from a European perspective, while Logan and Spitze (1995) rejects the claim based on a US study, and finds older people to be motivated by altruism more than self-interest in intergenerational relationships. This paper analyses the issue for the Norwegian case, with data from the Norwegian Life-course Ageing and Generations Study (NorLAG). The findings give mixed support for either position. Older people tend to expect less from younger family members than the younger themselves feel obliged to provide. Attitudes to the welfare state are, however, slightly balanced towards self-interest, inasmuch as the support for elder services increases moderately with age, whereas the support for families and child care decreases. The paper explores the strength of altruism and self-interest in intergenerational relationships in the family and societal domains, and the extent to which the two work in conflict or in support for each other.

### RELATIONSHIP OF ORIENTATION TO TRADITIONAL NORMS WITH NEGATIVE INTERACTION OF OLDER ADULTS WITH THEIR SON IN NEPAL

R. Gautam[1], T. Saito[2], S. Houde[1], I. Kai[2], *1. Department of Nursing, University of Massachusetts Lowell, Lowell, Massachusetts, 2. University of Tokyo, Tokyo, Japan*

Intergenerational relationships are important elements affecting health and psychological well-being in late life. The norm in Asian traditional culture has been to co-reside in multigenerational families. However, Nepalese society is rapidly changing which may cause conflicts among generations. The aim of this study was to examine the relationship of orientation to traditional norms (gender roles, caste system, child gender preference) with negative interaction of older adults co-residing with their married son. A cross-sectional quantitative study of 489 older adults aged 60 and older in Nepal was conducted with face-to-face interviews using structured instruments. The dependent variable, negative interaction, was measured by a pool of 4 widely used items in the literature: make too many demands, criticize, argue more than usual, give more than usual problems (Cronbach's $\alpha = 0.93$). Age, gender, marital status, religion, education, financial satisfaction, work status, health, number of sons, age, education of son, inter/intra caste marriage of son were used as control variables in the study. The multiple regression analyses illustrated that those older adults with higher orientation to traditional norms were significantly more likely to report higher levels of negative interaction with their son ($b = .201$, $\beta = .167$, $p < .001$). Health and policy implications are discussed in the context of an Asian developing country. The study results will contribute to the knowledge of aging in Nepal by exploring family relationships of older adults, which are important considerations when developing policy to meet the needs of both older adults and their family members.

### GENERATIONAL DIFFERENCE IN ATTITUDE TOWARD FILIAL PIETY IN HONG KONG

T. Lum[1], E. Yan[2], A. Ng[2], G. Leung[2], D. Lam[2], M. Chow[1], *1. University of Minnesota, St. Paul, Minnesota, 2. University of Hong Kong, Hong Kong, Hong Kong*

Objective: Although filial piety is a key Confucian virtue in Chinese society and is the key social value supporting Chinese system of family care for frail elderly, very little is known about how the support of filial piety changed across different generations of Chinese people. The objective of this study was to understand intergenerational difference in support of filial piety and its implication for family care for frail elderly among Chinese people. Methods: We used a mixed methods approach in this study. First, we conducted a telephone survey in Hong Kong in 2008. Respondents were selected by simple random sampling. We successfully interviewed 1,014 people and the successful rate was 61 percent. Second we conducted five focus groups in Hong Kong with people from different age groups to understand their view on filial piety. All focus group discussions were taped and transcribed by the research team. A grounded theory approach was used to analyze the focus group data while multivariate regression analysis was used to analyze the survey data. Findings: Support for filial piety was stronger among the elderly and younger adult populations, but lowest among middle age people. Older people were very willing to live with their adults children. However, most non-elderly adults were reluctant to live with their aging parents. Among non-elderly adults, the willingness to live with aging parents was highest among younger adults than middle age adults. Implications of these findings to the future of family care in Chinese society will be discussed.

## THE IMPACT OF THE INFORMAL CAREGIVING NETWORK ON ADULT CHILD'S CAREGIVER BURDEN

N. Tolkacheva[1], M. Broese Van Groenou[1], A.D. Boer[2], T. Van Tilburg[1], *1. VU University, Amsterdam, Netherlands, 2. The Netherlands Institute for Social Research, The Hague, Netherlands*

Previous research has typically relied on the adult child – parent dyad in understanding the caregiver burden experienced by adult children. This study uses information on multiple informal caregivers and examines how characteristics of the informal caregiving network affect the adult child's caregiver burden. In 2007, Dutch caregivers (N = 602) assisting their older parents reported on parental and personal characteristics, care activities, experienced burden and characteristics of other informal caregivers. A path model was applied to assess the relative impact of the informal caregiving network characteristics on the caregiver burden. An adult child experienced lower caregiver burden when the informal caregiving network size was larger, when more types of tasks were shared within the network, when care was shared for a longer period of time and when the adult child had no disagreements with the members of caregiving network. Considering growing needs in care for older parents, the informal caregiving network becomes a significant benefit for adult children involved in long-term care activities. More caregivers will turn into managers of care, as they increasingly have to organize the sharing of care among informal helpers and cope with disagreements in the informal caregiving network.

## GRANDPARENTS RAISING THEIR GRANDCHILDREN: NEGOTIATED RELATIONSHIPS WITH CHILD WELFARE WORKERS

J. Gladstone, R.A. Brown, *School of Social Work, McMaster University, Hamilton, Ontario, Canada*

Increasing attention is being paid to caregiving grandparents whose grandchild is involved with the child welfare system. The interaction that grandparents have with child welfare workers can be framed as a negotiated process. Nevertheless, little is known about the nature of these negotiations. Our qualitative study addressed 3 research questions: (1) What issues are perceived by social workers to be negotiable (or non-negotiable) with grandparents? (2) What strategies do social workers perceive themselves to use in these negotiations with grandparents? (3) What contextual factors influence the way that negotiations take place? Data were gathered through in-depth, active interviews with 42 social workers involved with grandparents in a child welfare setting. Data were analyzed using a constant comparison grounded theory approach. Findings showed that negotiations take place around issues that are not perceived by social workers to be protection concerns. Social workers offer resources and may support grandparents' efforts to gain custody of their grandchildren. Social workers, in return, expect grandparents to be compliant and dutiful. Strategies used by social workers in these negotiations include clarifying role and purpose, utilising basic helping skills, and depersonalising power. Several factors influence the way that negotiations take place, including structural factors (eg. legislation), grandparent investment (eg. their reaction to child welfare involvement),and competing negotiations (eg. grandparents' relationships with the grandchild's parent). Our conclusion is that grandparents who understand the position taken by social workers will be more empowered in these negotiations.

## FACTORS ASSOCIATED WITH PSYCHOLOGICAL WELL-BEING OF GRANDPARENTS RAISING GRANDCHILDREN IN KOREA

H. Yoon[1], K. Choi[2], *1. Hallym University, Chuncheon, Gangwon-do, Republic of Korea, 2. Hallym University, Chuncheon, Gangwon-do, Republic of Korea*

In spite of the increased number of grandparents raising grandchildren, little attention has been given to the impact of caregiving on psychological well-being of grandparents in Korea. This study examines factors associated with psychological well-being of grandparents raising their grandchildren as primary caregivers. The data for this study came from the Hallym Aging Study conducted by the Hallym University Aging Research Institute in 2003. 96 grandparents raising grandchildren as primary caregivers ("skipped generation" household) were compared with 484 older persons living with grandchildren and grandchildren's parents ("three generation" household). PGCMS constructed by Lawton was administered to assess psychological well-being. Grandparents raising grandchildren as primary caregivers showed significantly lower psychological well-being than grandparents living with grandchildren and grandchildren's parents. Multiple regression analysis was used to determine factors associated with psychological well-being of grandparents raising grandchildren as primary caregivers. Grandmothers reported lower level of psychological well-being than grandfathers. Poor health status was associated with lower level of psychological well-being. Grandparents who were responsible for living showed lower psychological well-being. Spirituality was associated with higher level psychological well-being. The findings suggest more attention to grandparents raising grandchildren as primary caregivers. The policy and practice implications to increase psychological well-being of grandparents raising children as primary caregivers are discussed in a Korean context.

## THE PRIMACY OF RELATIONAL CONCERNS AMONG OLDER ADULTS: RESULTS FROM AN IMAGE-BASED NEEDS ASSESSMENT

D. Scott, *Planning and Development, Greater Lynn Senior Services, Lynn, Massachusetts*

In 2008-2009, Greater Lynn Senior Services conducted a needs assessment of the seniors in its service area. This needs assessment employed an innovative methodology, image-based focus groups, a significant departure from its previous needs assessments which were primarily conducted through surveys of registered voters. In this recent needs assessment, relational and social issues stood out clearly as one of the most important life concerns for seniors. This finding contrasted sharply with results from previous survey-based need assessments. In 2001, relational concerns were largely absent from the design of the survey instrument. In 2005, the survey instrument included questions about loneliness and other relational concerns, but the results were difficult to interpret, and relational concerns were not identified as a primary finding. In 2008-2009, relational concerns were one of the top three categories of concern, along with health and resources such as money and housing. Hence, image-based focus groups opened up new investigative possibilities. Focus groups provide a narrative space in which participants may express relational concerns not easily captured in check boxes. The less-structured format also allows seniors to speak about relationships in positive as well as negative terms, thereby providing a fuller picture of their significance. Finally, images allow participants to project personal concerns in a way that may be less intimidating. These findings raise thorny policy questions and associated research implications. Should social service agencies take as a significant portion of their mission promoting social connections among older adults? If so, how can this be done?

### CONFIRMATORY FACTOR ANALYSIS OF THE KOREAN VERSION OF THE REVISED LUBBEN SOCIAL NETWORK SCALE

M. Hong, B.L. Casado, D. Harrington, *School of Social Work, University of Maryland Baltimore, Baltimore, Maryland*

The Lubben Social Network Scale (LSNS) was designed to measure perceived social support received from family and friends. Several versions of the LSNS were developed by modifying the original 10-item LSNS, and have been translated in several different languages. This study tests the structural validity of a Korean version of the 12-item revised LSNS (K-LSNS-R) and the 6-item LSNS (K-LSNS-6). The data were drawn from a survey interview of 130 Korean American caregivers in the Washington D.C. metropolitan area. The average age of the respondents was 57.8 (SD=12.9) and 77.3% of them were female. Confirmatory factor analysis (CFA) was performed to confirm the factor structure and internal consistent reliability was examined using Cronbach's alpha and corrected item-total correlations. The K-LSNS-R demonstrated a good internal consistency ($\alpha$=.84) and the items of the scale were sufficiently homogeneous without redundancy (item-total correlation coefficients ranged from .36 to .66). However, the CFA with two factors (family and friendship) revealed an overall poor fit ($\chi 2$=209.018, df =53, CFI = .764, TLI= .707, RMSEA = .151). In comparison, the CFA of the K-LSNS-6 yielded a good model fit ($\chi 2$=15.965, df =8, CFI = .977, TLI= .957, RMSEA = .084). The 6-item model also had a good internal consistency ($\alpha$= .81). Findings suggest that the K-LSNS-6 may be better for assessing social network, at least in Korean samples, because of its better model fit and parsimoniousness.

### FAMILY BENEFITS FROM OLDER ADULTS' VOLUNTEERING

S. Hong, *Social Work, National University of Singapore, Singapore, Singapore*

Although the theoretical assumption that benefits from older adults' volunteering can expand to their family has been postulated, it has been rarely tested. This study examines the relationship between older adults' volunteering and their family functioning. From 72 social service agencies in Singapore, individual and family information was collected from 361 older volunteers aged 50 and above. As the study outcomes, family functioning was measured by Family Adaptability and Cohesion Scale. Older volunteers' psychological benefits and well-being, volunteering experience, and socio-demographics were also measured. The study volunteers reported that spouses were the closest family member who got along with and the next one was their siblings. The family members to who they turned for help most frequently were their adult children and siblings. Since joining their volunteering, a majority of volunteers were better satisfied that their families accept and support their wish to take on new activities or directions (72%). They were better satisfied with the way their families shared time together (68%) and the way their families expressed affection and responded to their emotions (62%). While controlling for socio-demographics and health status, higher level of volunteering intensity was associated with higher level of family functioning. This study documented a wide range of family and individual benefits from older adults' volunteering. Furthermore, it contributes to the knowledge base to improve well-being for older adults and their families: the study findings highlight positive potentials of volunteering as an applicable intervention strategy for more conducive family support system in later life.

### DOES INTERGENERATIONAL DAY CARE AFFECT CHILDREN'S VIEWS OF OLDER ADULTS?

J.C. Heyman, I.A. Gutheil, L. White-Ryan, *Graduate Social Service, Fordham University, West Harrison, New York*

Intergenerational efforts help build relationships between generations (Generations United, 2010). There is a growing body of research on the benefits of intergenerational programs, but limited research on preschoolers' experiences. This purpose of this research was to understand preschoolers' attitudes toward older adults. The study's aim was to determine whether there is a difference in how preschool age children who participate in an intergenerational day care program and those in day care that is not intergenerational view older adults. Using a static group comparison design, face-to-face interviews were conducted with 32 preschoolers in the experimental group and 18 in the comparison group. As part of the interview, children's reactions to a sketch of an older man and one of an older woman were gathered to assess their views of older adults. Two group discriminate analysis was used to understand the differences in attitudes between those children who participate in an intergenerational program and those who did not. The Wilkes lamba indicated that the two groups were significantly different on the measures overall. Based on these measures, 82% of children were classified correctly with respect to program participation. Preschoolers in the intergenerational program viewed older adults as healthier compared to preschoolers who did not participate in the intergenerational program. The implications of the findings for future research and program development will be discussed.

### EFFECTS OF THE CHRONIC DISEASE SELF-MANAGEMENT PROGRAM ON HEALTH BEHAVIORS AND WELL-BEING OF GRANDPARENT CAREGIVERS

J. Kim, L. Ferretti, E. Kintner, P. McCallion, *Social Welfare, University at Albany, State University of New York, Albany, New York*

[Purpose]: Stressors related to demands of caregiving have been reported to negatively affect grandparents' health and many grandparent caregivers report multiple chronic health conditions. As they balance their caregiving responsibilities it is important find ways to manage those conditions and reduce stress. The Chronic Disease Self-Management Program (CDSMP) a 6 week series of skill building workshops (Lorig, et al., 2005) offers a potential mechanism. This study examines how this evidence-based intervention affected the health behaviors and well-being of a group of grandparent caregivers as compared to non-grandparent caregiver peers. [Method]: In a matched (age, gender, and ethnicity) group design, CDSMP was delivered to 62 completers and pre and post-test scores compared. [Result]: Baseline health status was lower for grandparent caregivers than for non-grandparent caregivers. The comparison of pre and post-test scores found improvement in both groups in health status and physician visits and fatigue, in shortness of breath for the grandparent caregiver group only and in pain for the non-grandparent caregiver group only. [Implications]: Findings confirmed a beneficial impact of CDSMP in both groups and in particular for grandparent caregivers with a compromised health status. More work is needed to increase access to evidence-based health promotion programs for grandparent caregivers.

## SESSION 1730 (PAPER)

## INTERVENTIONS AND SERVICES ACROSS CONTEXTS I

### FACILITATING THE ADOPTION OF INNOVATIONS FOR OLDER ADULTS: AN ORGANIZATIONAL FIELD ANALYSIS

B.J. Bedney, R.B. Goldberg, K. Josephson, L. Kotler-Berkowitz, W.C. Daroff, *The Jewish Federations of North America, Washington, District of Columbia*

The health and well-being of older adults is a national priority for gerontologists, aging services providers, and policy makers, all of whom understand the profound impact the aging of the baby boomers will have on the nation's social and economic fabric. Within this context, it is social service providers who are, and will be, called upon to serve and support older adults, both through the expansion of existing services and the adoption of new ones. In this study, we examined the factors that were most helpful to agencies adopting 'NORC-supportive service programs,' community-based interventions designed to help older adults age in place in 'naturally occurring retirement communities.' Preliminary data analysis of 17 surveys returned to date from 26 agencies in a National NORCs Initiative suggests that relationships and resources the agencies were able to garner from the network of external institutions, interactions, and norms that together constitute their 'organizational fields' (DiMaggio and Powell, 1983) were among the most helpful facilitating factors. The data also revealed distinctions between resources in their 'local' organizational fields and resources in their more distant or 'supra' organizational fields. In this session, we will use the results to show how the concept of organizational fields can be used to study program adoption, and discuss implications of the framework for researchers, policy makers, and aging services providers. Participants will leave the session with an increased understanding of the organizational field framework, and the ability to use the framework to both implement and study the program adoption process.

### THE EXPANDING ROLE OF AREA AGENCIES ON AGING IN PROVIDING HOME AND COMMUNITY BASED SERVICES AND SUPPORTS

A. Lackmeyer, S. Kunkel, J. Straker, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

Area Agencies on Aging (AAAs) across the nation are an integral part of the Aging Services Network which supports older adults so they may continue to live as independently as possible in their homes and communities. In addition to providing core services such as home delivered meals and transportation, AAAs have expanded their role to be more responsive to consumer needs and preferences by providing better access to services through single entry points and Aging and Disability Resource Centers, offering consumer directed services and evidence based disease prevention programs, assisting with the transition of older adults from institutional care back into the community and targeting and serving diverse populations. Surveys were conducted in 2007, 2008 and most recently in 2010 to explore the capacity of AAAs to provide services to the older adults in their community and to track innovative programming used to enhance these services for the future. Results show that AAAs have made progress in expanding the populations they serve (in 2008, 63.4% of AAAs were the single point of entry for at least some services for adults ages 18-59 compared to 49.4% in 2007), offering consumer directed services (48.4% in 2008), and facilitating the transition of consumers from institutional placement back into their communities (60.5% in 2008). As the population of older adults grows, so will the importance of AAAs, their role in livable communities for people of all ages, and their ability to meet the needs of consumers in a streamlined and consumer oriented way.

### COST EFFECTIVENESS OF A PILOT OCCUPATIONAL THERAPY INTERVENTION IN A PUBLIC AGENCY SETTING

C.A. Smith[1,2], M. Becker-Omvig[3], *1. University of Maryland School of Social Work, Baltimore, Maryland, 2. Montgomery County Health and Human Services, Rockville, Maryland, 3. Howard County Office on Aging, Columbia, Maryland*

Public agencies are confronted with greater demand for services to assist older adults with functional limitations to "age in place" and decreasing availability of informal caregivers and declining budgets to support public interventions. Public agencies need to identify cost-effective strategies to promote independence, safety, and quality of life, for the large number of older adults that wish to remain in the community within the reality of constrained budgets. A randomized controlled study was conducted within a large public agency to examine the cost-effectiveness of a occupational therapy (OT) intervention as a supplement or adjunct to a standard social work intervention. The theoretical approach of the study was that the person-environment gap (i.e., degree to which a person's needs exceed the ability of the environment to support them) can be narrowed through the introduction of assistive devices, home modifications, and individualized trainings. The goal of this approach is to help people maximize what they can do for themselves, rather than becoming dependent on others for supportive services. Preliminary data indicated that the intervention produced statistically significant changes ($p < .0005$) in both dosage of service requires [48% reduction from 3.38 hours (SD = 1.68) to 1.76 hours (SD = 2.06)] and functional independence [14.0 vs. 8.9 for intervention group on SAFER instrument]. Participants in this session will be exposed to findings that indicate that an OT intervention can produce similar or better outcomes for vulnerable older adults at a marked reduced expenditure rate with implications for direction of scarce public dollars.

### DEVELOPING A WEB-BASED CONSUMER DIRECTORY FOR RESIDENTIAL CARE FACILITIES FOR THE ELDERLY

C. Flores[1], R. Newcomer[1], T. Donnelly[1], G. Levenson-Palmer[3], T. Boughton[2], M. Weigand[1], *1. Social and Behavioral Sciences, University of California, San Francisco, San Francisco, California, 2. California Healthcare Foundation, Sacramento, California, 3. Department of Social Services, Sacramento, California*

This study was designed to develop a web-based consumer directory for Residential Care Facilities for the Elderly (RCFE) in California. This presentation is a case study of a collaborative effort between researchers, the California Healthcare Foundation (CHCF) and California Department of Social Services, Community Care Licensing Division (CCLD). A multidisciplinary workgroup, including state licensing managers and staff, RCFE providers, advocates, consumers, and researchers was organized. The workgroup participated in the recognition and formulation of necessary and optional elements of information to be provided via an electronic questionnaire completed by RCFE providers. This information, combined with available state licensing data, led to the collection of the data elements to be provided to consumers. Information related to facility characteristics, staff, safety, resident care and services provided, health and behavioral conditions allowed, food, activities, comfort and amenities, and cost and pricing structure is included. Web and electronic data system consultants aided in the development of the reporting formats, web site presentation formats, and planning for pilot testing the electronic web service system. A pilot test was conducted among RCFE providers and further refinements were made. A consumer directory utilizing the RCFE data will be established on the CHCF website, www.CalqualityCare.org. This product is designed to use health information technology to make information available to consumers, to increase access to care, and provide information for facility management, industry and regulatory planning and policy purposes. This study was funded by the California Healthcare Foundation (grant #08-1915).

## SESSION 1735 (SYMPOSIUM)

### LESSONS FROM THE CALIFORNIA FALL PREVENTION CENTER OF EXCELLENCE (FPCE)

Chair: *J. Pynoos, Andrus Gerontolgy Center, Univ. of Southern Calif., Los Angeles, California*

Discussant: *M. Kullman, The Archstone Foundation, Long Beach, California*

This symposium will describe the Fall Prevention Center of Excellence's (FPCE) efforts to better understand and identify causes of falls and develop effective interventions at individual, program and systems levels. The first three presentations will provide an overview of the development and implementation of the InSTEP model programs as well as preliminary results from the outcome and process evaluations conducted with English and non-English speaking older adult groups. Topics will include the relative effectiveness of the models; how senior centers with different levels of resources can organize and operate effective and sustainable, multifactorial fall prevention programs; and lessons learned. The creation and validation process of a self-assessment tool funded by the Centers for Disease Control will be presented, as well as next steps for the Center. FPCE is a consortium of the University of Southern California's Andrus Gerontology Center (Andrus); the Center for Successful Aging (CSA) at California State University, Fullerton; the VA Greater Los Angeles Healthcare System Geriatric Research, Education and Clinical Center (GRECC); and the California Department of Public Health, State and Local Injury Control Section (SLIC). Its mission is to provide leadership, create new knowledge, improve practice, and develop sustainable fall prevention programs for seniors and their families, professionals, program administrators, and policymakers.

### INSTEP (INCREASING STABILITY THROUGH EVALUATION AND PRACTICE): PROCESS EVALUATION

B. Kramer, *VA Greater Los Angeles Healthcare System, Geriatric Research Education Clinical Center (GRECC), Los Angeles, California*

Josea Kramer, PhD will discuss the process evaluation of how senior centers adapted, integrate and sustained InSTEP within their operations and the impact of InSTEP at the center level. Methods included individual and group interviews, failure analysis and LOGIC modeling. Findings include pitfalls in implementation and issues that will affect sustainability for fall prevention programming as well as strategies recommended by center directors to successfully disseminate InSTEP as a modular program which can be enhanced until a fully comprehensive fall prevention program can be sustained with existing funding at the center level.

### INSTEP (INCREASING STABILITY THROUGH EVALUATION AND PRACTICE): OUTCOME ANALYSIS

L. Rubenstein, *VA Greater Los Angeles Healthcare System, Geriatric Research Education Clinical Center (GRECC), Los Angeles, California*

We present preliminary outcome data from InSTEP- a multifactorial program aimed at reducing seniors' fall risk. We analyzed the relative effectiveness of six InSTEP models, which differ by intensity of professional involvement (high, medium and low) and by presence or absence of a formal discussion group. We investigated whether InSTEP models of higher intensity can more effectively reduce fall risks and whether a discussion group improves protocol adherence and long-term involvement in fall prevention activities. We used several validated instruments to measure fall risk behaviors, concerns about falling, fall history, and current physical activities and conducted balance and fitness tests. Preliminary results show improved agility from baseline to 3-months and significant reductions in self-reported balance problems ($p<.000$), walking problems ($p=.008$), and fear of falling ($p<.000$). Effects were generally greater in the higher intensity programs. The discussion groups did not seem to provide additional benefit, although they were well received.

### STAYING INDEPENDENT: VALIDATING A FALL RISK SCREENER

L. Rubenstein, B. Kramer, R. Vivrette, *VA Greater Los Angeles Healthcare System, Geriatric Research Education Clinical Center (GRECC), Los Angeles, California*

The FPCE was commissioned by the Centers for Disease Control (CDC) to develop and validate a fall risk informational brochure that includes a self-scored fall risk assessment instrument. The brochure, Stay Independent, was developed with input from seven focus groups at four senior centers and uses community dwelling seniors' natural language in discussing falls, perceptions about fall risks and activities to reduce risk. Since seniors identified factors that were not part of the standard medical evidence-based screening for fall risks, the self-administered risk screening instrument was validated in a population of community-dwelling seniors, which demonstrated excellent correlation between self-rated scores on the instrument and an independent fall risk assessment by a geriatrician. We will present data on the development and validation of this consumer-driven product, which facilitates both identification and quantification of fall risk.

### THE FALL PREVENTION CENTER OF EXCELLENCE: NEXT STEPS

J. Pynoos, *Andrus Gerontolgy Center, Univ. of Southern Calif., Los Angeles, California*

Co-Director of the Fall Prevention Center of Excellence, Dr. Jon Pynoos, will describe future objectives for the Center. In addition to enhancing the Center's core functions, priority objectives include expanding education and training for existing and future professionals and providers; strengthening collaboration with national, state and local agencies; testing the InSTEP model in other settings (e.g., assisted living and retirement communities) and with other population groups; and assisting the California Department of Public Health with falls data analysis. Improving the capacity of existing organizations to play a more effective role in fall prevention (e.g., local fire department's establishment of a protocol to refer older adults who have fallen to services that reduce fall risk) will also be discussed.

### INSTEP (INCREASING STABILITY THROUGH EVALUATION AND PRACTICE): TESTING PROGRAM EFFICACY IN TWO ETHNICALLY DIVERSE GROUPS

D. Rose, *California State University, Fullerton, Fullerton, California*

Following its successful implementation with English-speaking older adult groups, the efficacy of the moderate intensity InSTEP model was tested with a group of older adults whose primary language was Korean ($N = 60$) and a second group whose primary language was Spanish ($N = 60$). With the exception of the exercise component, all other components of the program were delivered in the primary language spoken by each group. An interpreter was present in the exercise class to clarify instructions or translate feedback provided by the English-speaking instructor. Post-program functional outcomes were similar to those obtained for the same model implemented with English-speaking older adults. Program adherence and satisfaction was also high for both groups. A process evaluation conducted with program participants, staff, and center administrators raised issues of sustainability and the need for additional program modifications aimed at improving its reach among ethnically diverse older adult groups.

## SESSION 1740 (SYMPOSIUM)

### THE BOOMERS' CHALLENGE: LEAVING A LEGACY

Chair: *W. Achenbaum, University of Houston, Houston, Texas*
Co-Chair: *H.R. Moody, AARP, Washington, DC, District of Columbia*
Discussant: *K.E. Sykes, EPA, Washington, DC, District of Columbia*

Boomers understandably have been preoccupied with their jobs and finances in recent years. They want sufficient resources to sustain their well-being and to give money to others. But our individual and collective legacies also entail leaving the world in better shape than we received it. This symposium focuses on two areas: (1) how to promote the notion of "social insurance" (a responsibility as citizens to protect ourselves against common risks, ably enunciated by FDR in the 1935 Social Security Act) and (2) our responsibility as world citizens to address global issues.

### WHAT LEGACIES SHOULD BOOMERS LEAVE?

W. Achenbaum[1], H. Moody[2], K.E. Sykes[3], E. Kingson[4], *1. University of Houston, Houston, Texas, 2. AARP, Washington, DC, Florida, 3. EPA, Washington, DC, District of Columbia, 4. Syracuse University, Syracue, New York*

Usually people think in terms of bequests to family members, friends, and charitiable/religious institutions when they consider leaving a legacy. Here, we invite professionals in aging to think about the values and calls for civic engagement embodied in the concepts of "social insurance" and the "environment." These concepts engage us in future-oriented collective action that affects all age groups. Unfortunately, these terms need to be refurbished to be sustainable.

## SESSION 1745 (SYMPOSIUM)

### IPSEN FOUNDATION LONGEVITY PRIZE LECTURE ON CELLULAR SENESCENCE AND CANCER

Chair: *Y. Christen, Fondation Ipsen, Boulogne-Billancourt, France*

This symposium is the traditionnal Ipsen Foundation Awarding ceremony of the Longevity Prize (usually organized during a Symposium of the GSA meeting). The 2010 laureate is Judit Campisi (UC Berkeley, Buck Inst.)fro her pionneer work on the relationships between cellular senescence and cancer. She will give a talk. G. Martin (Seattle) will give a shorter talk in order to introduce the laureate and the topic. Leonard Poon (Athens), president of the Ipsen Foundation Jury, and Yves Christen (Paris), President of the Ipsen Foundation, will chair the session

## SESSION 1750 (SYMPOSIUM)

### ESPO/BS SYMPOSIUM: HUMAN BIOGERONTOLOGICAL RESEARCH: RESULTS FROM ESPO RESEARCHERS

Chair: *M.E. Matzko, Biobehavioral Health, Penn State, University Park, Pennsylvania, Geisinger Medical Center, Danville, Pennsylvania*

Co-Chair: *D.A. Rivas, Tufts University, Boston, Massachusetts*

This symposium will highlight the research of young and emerging scientists in the field of biogerontology. The biology of aging is multifaceted and well-informed by invertebrate and rodent models. These models provide a unique approach to investigating molecular mechanisms of the aging process. Additionally, biogerontological research in humans is challenging, highly valuable, and can yield great insight for complex etiologies like age-related disease. This symposium will provide the forum for young investigators to present work on diverse topics such as human caloric restriction models, human diseases relevant to aging, nutrition, metabolism, and exercise. Diverse research methods will be applied including genetic, physiological, biostatistical, and molecular techniques. All work will attempt to convey the importance of multidisciplinary biogerontological research to the understanding of the human aging process.

### GHRELIN IN HUMAN CALORIC RESTRICTION: GASTRIC BYPASS SURGERY

M.E. Matzko[1,2], R. McCarter[1], G. Gerhard[2], C. Still[2], *1. Biobehavioral Health, Penn State, University Park, Pennsylvania, 2. Geisinger Medical Center, Danville, Pennsylvania*

This study investigated the actions of ghrelin, a hunger hormone known to affect many physiological systems, in human gastric bypass patients. Ghrelin responds to changes in energy intake and modulates processes involved in aging: immune function, growth hormone secretion, and appetite. Total plasma ghrelin was measured in 40 middle-aged obese women one month before and six to twelve months after Roux-en-Y gastric bypass surgery. Liver tissue ghrelin protein levels were measured in 40 obese middle-aged women with fatty liver disease and Type II Diabetes and those without either condition. Finally, 700 patients were genotyped for two ghrelin receptor gene SNPs previously demonstrated to be related to BMI and dietary weight loss success. Relationships with aspects of ghrelin and BMI, weight loss success, and metabolic disease burden will be discussed.

### DECREASED MUSCLE PROTEIN CONTENT IS ASSOCIATED WITH INCREASED AMPKα1 AND CLEAVED SREBP1 IN AGED SKELETAL MUSCLE

D.A. Rivas, E. Morris, R. Fielding, *Nutrition, Exercise Physiology and Sarcopenia Laboratory, Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts*

Increased intramuscular lipid content has been noted in lean and obese elderly persons and is thought to be associated with insulin resistance and decreased muscle quality. Furthermore, the impaired anabolic response of aged skeletal muscle to muscle contraction may also be related to excess lipid infiltration. However, it is still unknown if dysfunctional lipid metabolism has a mechanistic role in the age-associated loss of muscle mass. We have determined the effect of 28 days of overload via bilateral surgical ablation (SA) on markers of hypertrophy (total protein content) and aerobic capacity (citrate synthase) in young and old rats. Furthermore, data will be presented showing impairments in the expression of lipid metabolism regulators (SREBP1, AMPK) and their gene targets and that they do not change in response to mechanical overload in aged skeletal muscle.

## SESSION 1755 (POSTER)

### CROSS-NATIONAL GERONTOLOGY

### FACTORIAL INVARIANCE OF THE GDS-15 IN HAVANA, CUBA: THE GERIATRIC DEPRESSION SCALE SHORT FORM

O.S. Rostant, *Office of Medical Education Research and Development, Michigan State University, East Lansing, Michigan*

The Geriatric Depression Scale Short Form (GDS-15) has been widely used internationally; however rigorous invariance testing has not always been conducted when using this instrument cross-culturally, specifically in the Caribbean. Previous confirmatory factor analyses (Rostant, 2009) on the factor structure of the GDS-15 among older adults in Cuba, revealed a two factor structure which reflected a life satisfaction factor and a general depressive affect factor. The purpose of this study was to investigate the factorial invariance of the GDS-15 across gender. Participants included 1905 community dwelling cognitively intact older adults (Women n=1197) (Men n=708) from Havana, Cuba, adults aged 60-102 years (M=72, SD=8.916). Results: Invariance testing involved a hierarchical sequence of successively stringent models (Vandenberg & Lance, 2000). A comparison of the configural invariance model to the metric invariance model was non-significant, with a change in Chi-Square of (11, N=1905) = 10.735, p=.4657, CFI=.986, TLI=.991, RMSEA=.035, which indicates that factor loadings for the GDS-15 were equal across gender. Scalar invariance and residual error invariance were both non-significant indicating equal intercepts and errors across gender, with Chi-Square results of (12, N=1905) =20.115 p=.0649 CFI=.986, TLI=.991, RMSEA=.035 and (2, N=1905) = .127, p=.9385 CFI = .981, TLI = .989 RMSEA = .038 respectively. With all levels of invariance obtained, valid comparisons of scores on the GDS-15 can be made across men and women.

### PERSONALITY, MENTAL AND PHYSICAL HEALTH DIFFERENCES IN GERMAN AND NORTH AMERICAN CENTENARIANS

W. Hsieh[1], P. Martin[1], M. MacDonald[2], L. Poon[3], *1. Wen-Hua Hsieh, Iowa State University, Ames, Iowa, 2. Kansas State University, Manhattan, Kansas, 3. University of Georgia, Athens, Georgia*

The purpose of this study was to assess similarities and differences between North American and German centenarians with the focus on personality, mental and physical health. The sample included 239 centenarians from the Georgia Centenarian Study and 91 centenarians from the Heidelberg Centenarian Study with the mean age of 100.15 and 100.20, respectively. Personality was assessed by the Extraversion and Neuroticism dimensions from NEO Five-Factor Inventory, mental health was assessed by the Life Satisfaction Index and the short form of Geriatric Depression Scale, and subjective health was assessed by a single item of self-rated overall health. Independent samples $t$-test were used to examine the differences between the two groups. No significant differences were reported in subjective health, $t(265) = 1.52$, $p > .05$, and life satisfaction, $t(204) = 1.14$, $p > .05$. Significant differences in activities of daily living (ADLs), $t(266) = 3.92$, $p < .01$, Extraversion, $t(202) = -3.66$, $p < .01$, Neuroticism, $t(201) = -2.76$, $p < .01$, and depression, $t(265) = -3.68$, $p < .01$, were found. North American centenarians reported higher ability on performing ADLs, were less extraverted, less neurotic and less depressed than their German counterparts. Possible factors for the differences and commonalities between the two centenarian groups will be discussed.

### PREDICTORS OF COGNITIVE IMPAIRMENT IN OLDER VIETNAMESE ADULTS

A.N. Leggett[1], S.H. Zarit[1], N. Ngoc[2], H. Chuong[2], H. Nguyen[3], *1. Human Development and Family Studies, The Pennsylvania State University, State College, Pennsylvania, 2. National Technical College of Medicine No.II, Da Nang, Viet Nam, 3. Wake Forest University, Winston-Salem, North Carolina*

Vietnam has a growing older adult population, many of whom have experienced war and social turmoil, and care has been left to that traditionally provided by the nuclear family. As a developing country, Vietnamese health authorities are just now striving to provide services that supplement family care. To be successful, they need information on the functional status and difficulties faced by the older population. The current study focuses on predictors of cognitive impairment among older adults living in Da Nang and surrounding rural areas. The representative sample consists of 600 adults 55 and older stratified by gender, age, and rural/urban. The sample was 50% rural, 50% women, with a mean age of 70.33. Interviews were conducted in individuals' homes by trained interviewers. The dependent variable was a Vietnamese version of the MMSE. 34% of the sample scored 23 or below. Multiple linear regressions were run with age, gender, education, and rural/urban as controls and measures of material hardship, depression (CES-D), health behavior, and physical measurements as predictors. More cognitive impairment was significantly associated with being a woman, older, and completing less years of education, but not with rural/urban status. Material hardship, higher depression scores, and lower blood oxygen levels were also significant predictors of cognitive impairment above the significant demographic controls. These results show that demographic indicators, but also current functioning, are highly associated with cognitive impairment. New services implemented for older adults in Vietnam need to consider the high rates of cognitive impairment and those factors that exacerbate it.

### PREDICTORS OF DISABILITY IN OLDER HISPANIC AMERICANS AND ADULTS IN VIETNAM: A CROSS-CULTURAL STUDY

H. Nguyen[1], J. Acuna[2], N. Ngoc[3], C. Hoang[3], S.H. Zarit[4], *1. Department of Family and Community Medicine, Wake Forest University School of Medicine, Winston-Salem, North Carolina, 2. Tulane University, New Orleans, Louisiana, 3. Technical College of Medicine No. 2, Da Nang, Viet Nam, 4. Pennsylvania State University, University Park, Pennsylvania*

As life expectancy across countries continues to rise, disability has become a major health and social issue. While our knowledge about the disability process has grown markedly, what we know about disability and racial/ethnic groups has not kept pace. The goal of this study is to identify risk factors of disability that are similar or different across cultures and racial/ethnic groups. This study includes 300 individuals from the Hispanic Aging Survey (HAS) and 600 participants from the Vietnam Aging Survey (VAS). The two studies were designed to overlap to identify factors that affect health and disability across cultures. The mean age for the HAS sample was 67.6, and 70.3 for VAS. Disability was assessed using participants' self-reported ability to perform 7 common activities of daily living (ADL). ADL items were summed to create weighted disability scores, with higher scores indicating poorer function. Separate multiple linear regressions were run for HAS and VAS samples to confirm results. Predictors included age, gender, education, marital status, depressive symptoms, cognitive function (MMSE), grip strength, lower-extremity performance, and self-reported diabetes, heart disease, stroke, bone fracture, lung disease, cancer, hypertension, and arthritis. Results of both analyses showed that increased age, lower education, higher depressive symptoms, lower cognitive function, poorer lower-extremity performance, diabetes, stroke, and hypertension were risk factors of disability. These findings are similar to previous general population studies in the U.S. Our study suggests several risk factors of disability that are generally consistent across geographic regions and in different racial/ethnic groups.

### THE LIVING ARRANGEMENTS OF OLDER RUSSIAN IMMIGRANTS: COMPARING ISRAEL AND THE UNITED STATES

J.A. Burr[1], A. Lowenstein[2], J. Tavaras[1], C. Coyle[1], J. Mutchler[1], *1. Gerontology, University of Massachusetts Boston, Boston, Massachusetts, 2. University of Haifa, Haifa, Israel*

The late 20th century witnessed significant out-migration streams from Russia and other former Soviet Union (FSU) countries into Israel and the US. These immigrants were welcomed in both countries. However, each country's policies regarding absorption and settlement were different throughout this period. We assume the cultural, political, economic, and social systems of each country along with individual and family characteristics played a role in the selectivity of migration. We argue that decisions about living arrangements represent one strategy for coping with the migration process. We use census data to compare the living arrangements of older immigrants, demonstrating how duration of residence and other factors influence household composition decisions. After controlling age, gender, education, home ownership, automobile ownership, work behavior and geographic residential location, we find that married FSU immigrants to Israel are more likely than their native-born counterparts to be head of household living with others versus living in a couple only household. The results for US FSU immigrants show no such difference. In both countries, married FSU immigrants are less likely than their native-born counterparts to live in a couple only household than to live with others without household headship. Unmarried immigrants to each country are more likely to live alone than to live with others without headship. Finally, duration of residence in each country has unique, but different impacts on living arrangements among older FSU immigrants. We posit that immigrant policy differences in Israel and the US impacted to some extent the living arrangement options of these immigrants.

### SOCIAL SUPPORT AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS IN TAIWAN: A LONGITUDINAL STUDY

Z. Zimmer, F. Chen, M. Caserta, S. Wright, *University of Utah, Salt Lake City, Utah*

Changing demographics in Taiwan, including low fertility and population aging, is leading to dramatic decreases in availability of children who are traditional providers of social support. This is generating concern regarding the potential impact of declining support on psychological health. While there are ample prior studies that have shown that social support is associated with many facets of well-being, studies able to observe causal impacts between support and depression in

Taiwan are sorely lacking. The current study seeks to fill this void by investigating the relationship of social support on depression. Data come from the 1996 and 1999 waves of "The Health and Living Status of the Elderly in Taiwan." A sample of 3686 individuals is divided into those that do and do not exhibit depressive symptoms at baseline based on a Taiwanese version of the CES-D scale. Two support indicators, received instrumental and perceived emotional, and a series of demographic and social control variables, are measured at baseline. Logistic regression equations determine whether support predicts changes in depression, which of the two support indicators are most predictive of changes in depression, and whether support is a stronger predictor of change among those with or without depressive symptoms at baseline. The evidence will indicate robust associations, particularly between emotional support and change in depression and among those not depressed at baseline. This suggests that support in Taiwan is more likely to act as a preventive measure, maintaining psychological health, as opposed to a treatment for those already depressed.

## MEASURING DISABILITY IN DEVELOPING CONTEXT: THE CASE OF NEPAL

J. Subedi[1], J. Brown[1], K. Basnyat[1], S. Subedi[1], M. Tausig[2], *1. Sociology &Gerontology, Miami University, Oxford, Ohio, 2. The University of Akron, Akron, Ohio*

Activities of daily living (ADL) have been standard measures of disability in developed nations for more than four decades, but considerable literature has demonstrated that these measures do not translate well to the developing world. This finding has led to a great deal of work adapting culturally appropriate disability measures to substitute for ADL in several developing nations. However, this research generally ignores one aspect of ADL measures used in developed countries—that ADL measures are a scale. In this study, we examine the question of whether culturally adapted disability measures scale comparably to ADL measures using data from a sample of 3,014 randomly selected individuals aged 18 to 97 years old from Kathmandu, Nepal. Specifically, we examine the scalability of seven culturally adapted disability items including measures of mobility, endurance, self care, and the ability to complete household chores using exploratory factor analysis and reliability tests. We find that all seven items scale well with each having a factor loading of 0.5 or higher in the EFA and with a Cronbach's Alpha reliability coefficient of 0.88. We discuss implications of our findings both for Nepal and for research on disability across developing contexts.

## MULTICULTURAL LIFELONG EDUCATIONAL INTERVENTION FOR JAPANESE OLDER ADULTS

K. Hoshino[1], M. Nakayama[2], H. Iwasa[3], S.H. Zarit[4], *1. Sociology, Shizuoka University, Shizuoka, Japan, 2. Nagoya University, Nagoya, Japan, 3. University of Tokyo, Tokyo, Japan, 4. Pennsylvania State University, State College, Pennsylvania*

1. Puposes: We examined the effects of a lifelong educational intervention, in which community dwelling Japanese older adults could promote psychosocial development by examining their cultural identity and improving thier itergeneraional relationships. 2. Methods: The intervention consisted of three international lectures regarding successful aging in the U.S., Sweden, and Japan. The intervention group inculded 32 community dwelling older adults who participated in the lectures more than two times, and completed the questionnaire for the pretest and posttest(Male=17, Female=15, Mean Age=69.59 years old,SD=4.47). The control group had 87 older adults who participated in the questionnaire survey only(Male=47, Female=40, Mean Age=69.45, SD=4.63). The Japanese questionnaire included the Gerotranscendence Scale Type2(GST2), the Scale to Measure Banks's Stages of Cultural Identity(SBCI), the Multi-group Ethnic Identity Measure-Revised(MEIM-R), Erikson's Psychological Stage Inventory(EPSI), Social Support Scale, and so on. 3. Results and Discussion: The intervention group showed a significant increase of the total scale of the GST2 between the pretest and posttest. However, the Coherence Dimension, Identity, Generativity, Integrity, the Commitment of the MEIM-R, and social support significantly decreased. The control group significantly increased the Cosmic Dimension and Integrity, although it showed a siginificant decrease of social support. We found the intervention group could promote their psychosocial development of gerotranscendence. The decreases of cultural identity scores meant that older adults had started to explore their cultural identity in Japan, which is an ethnocentric country.

## THREE METHODS OF MEASURING CROSS-CULTURAL VARIATION IN MINORITY GROUPS' BELIEFS ABOUT DEMENTIA

R.W. Schrauf[1], M. Iris[2], *1. Applied Linguistics, Pennsylvania State University, University Park, Pennsylvania, 2. Leonard Schanfield Research Institute, Chicago, Illinois*

In cross-cultural gerontology and in multiethnic studies of aging, researchers make comparisons on some variable of interest (e.g. beliefs about aging, symptom sets for particular illnesses, dietary practices, and so on) with the aim of characterizing how much is shared between-groups and how much is unique to each group. For example, groups may wholly overlap or share some core set of beliefs while differing significantly on others. Documenting and measuring this variation is a first step in rigorous cross-cultural research. This poster presents compares three methods of measuring between-group and within-group agreement (Weller & Baer, 2002). These are: free-marginal kappa, average within- and between-group agreement, and Spearman's method. These measures are applied to beliefs about Alzheimer's disease among three minority groups in the U.S.: African Americans, Mexican Americans, and refugees/immigrants from the former Soviet Union (FSU). (1) Kappa coefficients function like correlation coefficients. In these data, the pairwise agreement on statements about Alzheimer's disease was: African-Americans & Mexican Americans (.521), African Americans & FSU (.581), Mexican-Americans and FSU (.685). (2) A more complex calculation involves finding the average proportion of within-group agreement across all three groups (.484) and the average between-group (shared) shared agreement (.478). (3) Finally, Spearman's method estimates the shared knowledge across groups at .48 as well. Each method accents different values. Kappa correlations emphasize shared beliefs across pairs of groups, while the 'Average' and Spearman's methods emphasize the overlap across groups. The presentation demonstrates the comparison of critical shared and unique beliefs about the etiology of AD.

## WITHIN-GROUP DIFFERENCES IN HEALTH STATUS AMONG ASIAN AMERICAN ELDERS

G. Kim[1], D.A. Chiriboga[2], Y. Jang[2], S. Lee[3], C. Huang[1], P. Parmelee[1], *1. The University of Alabama, Tuscaloosa, Alabama, 2. University of South Florida, Tampa, Florida, 3. University of Massachusetts Boston, Boston, Massachusetts*

Given the paucity of research on differences between older adults representing the many Asian American subgroups, the present study explored physical and mental health status in five groups of Asian American elders: Chinese, Japanese, Koreans, Vietnamese, and Filipinos. Data, drawn from the 2007 California Health Interview Survey (CHIS, N = 51,048), included 1,244 Asian Americans aged 60 or older. Background characteristics and physical and mental health conditions were compared, with results showing apparent within-group differences among Asian elders. Aside from the prevalence of diabetes, the five Asian groups differed significantly on all background characteristics and physical and mental health conditions. Specific patterns were identified in chronic diseases, disease comorbidity, and disability rates. Vietnamese and Filipinos tended to have poorer physical health than did Chinese, Japanese, and Koreans. The Korean elders had the fewest self-reported chronic diseases and least evidence of disease comorbidity. On the other hand, they had the poorest mental health status of any group;

the best mental health status was found among Japanese elders. Findings suggest that generalizing findings from one particular Asian group or from an aggregate Asian group may be problematic and may not reflect an accurate picture of the burden of health in specific Asian groups. Being aware of these differences in background and health characteristics may help providers to better serve Asian elderly clients.

# SESSION 1760 (SYMPOSIUM)

## CURRENT DEVELOPMENTS IN LONELINESS RESEARCH: CULTURE, ONSET AND TRAJECTORIES

Chair: *M. Aartsen, Faculty of Social Sciences, VU-University Amsterdam, Amsterdam, Netherlands*
Co-Chair: *T. Van Tilburg, Faculty of Social Sciences, VU-University Amsterdam, Amsterdam, Netherlands*

Loneliness is experienced in many cultures. Due to the adverse health consequences such as increased depression and increased likelihood of nursing home admissions, loneliness is a relevant public health issue. Insight into factors that lead to an increased risk of loneliness may reveal important information to our understanding of loneliness and to the design of interventions to prevent or reduce loneliness. In aiming to expand upon previous efforts in loneliness research among older adults, this symposium brings together recent findings of two large prospective studies, the TamELSA study in Finland and the Longitudinal Aging Study Amsterdam, with long follow up. The first presentation shows first evidence of the causal effect on loneliness of factors that are known to be associated with loneliness. The second presentation however shows distinctive clusters of individual trajectories within the population can be indentified, suggesting that covariates shaping the trajectories may have differential effect across the sub groups of people. The final presentation seeks to explain differences in loneliness from a cultural perspective and hypothesizes that loneliness may be lower in more individualized countries where people have lower standards for their social contacts and consequently have a lower likelihood of being lonely than people in less individualized countries. By utilizing the richness of the longitudinal datasets new conclusions can be drawn and new steps towards a better understanding of loneliness can be taken.

## LATENT TRAJECTORIES IN LONELINESS

M. Aartsen[1,2], M. Jylha[2], T. Van Tilburg[1], *1. Faculty of Social Sciences, VU-University Amsterdam, Amsterdam, Netherlands, 2. Tampere School of Public Health, University of Tampere, Tampere, Finland*

This study aims to contribute to discussions about longitudinal trajectories of loneliness and factors that may shape these trajectories. The acknowledgement of different trajectories of loneliness is important for the theoretical and conceptual understanding of loneliness as well as for the development of intervention strategies. Data came from the Longitudinal Aging Study Amsterdam, with observations between 1992 and 2009 among 3946 respondents. With a Latent Class Growth Analysis (LCGA) that was analyzed with Mplus we were able to identify four different trajectories in loneliness, suggesting the existence of four different subgroups. 65% of the respondents did not develop loneliness during the 18 years of follow-up, and 7% stayed at a constant high level of loneliness, 11% developed loneliness and 16% of the cases recovered from loneliness. Factors that are related to differences in loneliness trajectories will be discussed.

## LONELINESS CONSIDERED FROM A CULTURAL PERSPECTIVE

T. Van Tilburg[1], M. Aartsen[1,2], M. Jylha[2], *1. Faculty of Social Sciences, VU-University Amsterdam, Amsterdam, Netherlands, 2. Tampere School of Public Health, University of Tampere, Tampere, Finland*

Due to the relatively strong emphasis on individualism in the Netherlands, Dutch older adults might have lower standards for social contacts and consequently have lower changes of being lonely than adults in Finland. However, with aging the need for support will increase and the likelihood of fulfillment of this need is relatively low within a culture emphasizing individualism. We expect that among the oldest loneliness will be high in the Netherlands compared to Finland. This hypothesis is tested with data from the Longitudinal Aging Study Amsterdam and data from the TamELSA study. Results show an increase of loneliness prevalence with increasing age among Dutch older adults. After controlling for gender and partner status the prevalence increases from 16% among young old adults to 27% among the oldest. For Finnish older people there was no age-related increase in loneliness. The stronger individualism in the Netherlands might explain these country differences.

## ONSET OF LONELINESS IN OLDER ADULTS: RESULTS OF A 28 YEAR PROSPECTIVE STUDY

M. Jylha[1], M. Aartsen[2,1], *1. Tampere School of Public Health, University of Tampere, Tampere, Finland, 2. Faculty of Social Sciences, VU-University Amsterdam, Amsterdam, Netherlands*

The goal of this paper is to test whether often observed correlates of loneliness in older age also predict onset of loneliness longitudinally. So far, rigid tests of the causal sequence between correlates of loneliness and loneliness itself are very limited despite the increasing number of longitudinal studies. Analyses are based on data of the TamELSA study, which is a population-based prospective study in Tampere, Finland. For the present study 480 older adults aged between 60 and 86 years at baseline, who were not lonely at baseline, were selected and followed-up in 1989, 1999 and 2006. During the 28 years of follow-up approximately one third (N=178) of the study population developed feelings of loneliness. Logistic regression analyses indicated that losing a partner, reduced social activities, increased physical disabilities, increased feelings of low mood, uselessness and nervousness, rather than baseline characteristics, lead to enhanced feelings of loneliness.

# SESSION 1765 (POSTER)

## DEATH AND GRIEF

### PRE-DEATH DUAL PROCESS COPING IN HOSPICE NURSE-CAREGIVER COMMUNICATION – A CASE STUDY

K. Wright[1,2], L. Ellington[1], M.F. Clayton[1], P.H. Berry[1], M. Caserta[1], *1. The University of Utah College of Nursing, Salt Lake City, Utah, 2. Summa Health System, Akron, Ohio*

The dual process model (DPM) of coping with bereavement (Stroebe & Schut, 1999) posits that adaptation is an outcome of the dynamic oscillation between loss- and restoration-oriented (LO/RO) coping processes. In an anticipated death, such as for those in-home hospice, it is assumed that caregivers engage in both LO and RO processes prior to their partners' death. It has not been explored in what ways, if any, a hospice nurse case manager (HNCM) facilitates caregiver pre-death DPM coping. The purpose of this case study is to identify components of pre-death DPM coping processes in caregiver-HNCM communication during home visits. Five HNCM visits between an 80 year old cancer patient and spouse were audio recorded. These visits were transcribed and a directed content analysis of 116 pages (38,443 words) was completed. Codes/categories originated from the constructs of the DPM and frame the analysis. The caregiver displayed RO strategies incorporating humor and LO tasks in the form of reminiscence. The HNCM facilitated both humor and reminiscence through reflective questioning and opened ended questioning. This nurse also facilitated communication surrounding LO and RO processes between the couple. However, the dynamic nature of oscillation was difficult to capture in this case study. Future studies in hospice are needed to understand the potential role of the DPM pre-death and how HNCMs can better facilitate caregiver coping with imminent loss.

### LONGITUDINAL ANALYSIS OF BEREAVEMENT OUTCOMES: EXAMINING AGE-RELATED DYNAMICS OF DEPRESSION AND ANXIETY

J. Kellough[1], B.G. Knight[2], S. Nolen-Hoeksema[3], *1. Department of Psychology, University of Southern California, Los Angeles, California, 2. University of Southern California, Los Angeles, California, 3. Yale University, New Haven, Connecticut*

We examined the influence of age on change in symptoms of depression and anxiety over the course of the bereavement process by fitting a series of dynamic latent change score models with coupling to a longitudinal data set 313 bereaved individuals. These models revealed a coupling effect such that higher anxiety scores were associated with less increase in depression scores at the next occasion of measurement. However, there was no effect of depression scores on change in anxiety scores over time. Adding age significantly improved the fit of the model to the data and demonstrated that older individuals have lower initial levels of depression and anxiety than younger individuals in this sample. Furthermore, older age is associated with greater decreases in anxiety over time, whereas age had no significant effect on the slope of depression over time. These results suggest that in the absence of symptoms of anxiety, symptoms of depression will increase from the time period of approximately 3 months prior to the loss of a loved one to 13-months post-loss. However, anxiety symptoms appear to attenuate the change in depression over this bereavement period. The inclusion of age in these models revealed a protective effect on negative mental health outcomes in bereavement, consistent with previous notions that older adults are better able to cope with bereavement.

### ATTITUDES TOWARDS DYING AND DEATH IN VERY OLD AGE: ACCEPTANCE RATHER THAN ANXIETY?

O. Reidick[1], O.K. Schilling[1], H. Wahl[1], F. Oswald[2], *1. Department of Psychological Aging Research, Institute of Psychology, University of Heidelberg, Heidelberg, Baden-Württemberg, Germany, 2. Interdisciplinary Aging Research, Goethe University Frankfurt, Frankfurt am Main, Hessen, Germany*

In empirical studies of very old age, attitudes towards dying and death have found rare attention so far, such that little is known about how approaching the end of life is perceived among the oldest-old. Our study aimed to narrow this research gap by applying standardized measurement of death anxiety as well as acceptance based on the project LateLine, which is the German longitudinal follow-up of the European ENABLE-AGE study. In 2009, the third measurement wave was completed with N=115 participants aged 87 to 97 years. Regarding death anxiety and acceptance, the Multidimensional Orientation Toward Dying and Death Inventory (MODDI-F, Wittkowski, 1996, 2001) was assessed. Our findings confirm the multidimensional nature of death anxiety in very old age. Further, we found anxiety of one's own dying being located in the medium range, while anxiety of one's own death and rejection of one's own death was low and acceptance of one's own dying and death was high. We observed, however, substantial inter-individual variation in anxiety of one's own dying. For the latter, significant positive relations with anxiety of one's own death, rejection of one's own death, depression, negative affect as well as the amount of reported symptoms and diseases were demonstrated. Religiosity, sex and age revealed no linkage with attitudes towards dying and death. Our findings support the notion that quantitative empirical research into the still tabooed area of dying and death in very old age is needed and should be considered a crucial aspect of well-being in very old age.

### DEATH WITH DIGNITY ACT: IMPLICATIONS FOR LONG TERM CARE AND ASSISTED LIVING STAFF

K.S. Feldt, G. Bond, A. Jablonski, *Seattle University, Seattle, Washington*

In 2008, citizens of Washington state voted in favor of Initiative 1000, the Death with Dignity Act (WDDA). This study explored the level of knowledge of the new law and decisions made by directors of nursing in long term care (LTCF) and assisted living (ALF) facilities. Preliminary results from almost 200 DONs or Administrators contacted yielded 24 returned surveys (12%). Subjects were predominantly white (88.2%), female (94.1%), DONs (86.6% were RN's) who had worked in a LTCF approximately 22 years. Two thirds of respondents represented skilled facilities and 94% were employed full time. Fifty two percent favored the new law. A majority of respondents (64%) indicated their facility had opted out of participation in the WDDA and 83% had no input regarding that decision. Almost half had provided no education to their nursing staff regarding the new law, although two thirds had developed or had plans to develop policies/procedures regarding how staff should handle resident requests. Over half the respondents believed the WDDA required patients to be evaluated by an interdisciplinary team, even though it does not mention any interdisciplinary approaches. Most respondents understood that the patient needed to be competent, terminal and able to self-administer medications. One quarter of respondents indicated that residents in their facility had asked questions about the WDDA. Some respondents indicated they would refer resident inquires to a physician, provide further information, or help the resident find a facility that had chosen to participate in WDDA. Implications of our findings will be discussed.

### THE EFFECT OF LATE-LIFE WIDOWHOOD ON CHANGES IN SOCIAL SUPPORT: DO PERSONALITY TRAITS MATTER?

M. Pai, J. Ha, *Sociology, Kent State University, Kent, Ohio*

The purpose of this study was twofold: (1) to examine whether the effect of late-life widowhood on social support is moderated by five different personality traits: agreeableness, conscientiousness, emotional stability, extraversion, and openness to experience; and (2) to evaluate whether the distinguishing aspects of personality moderate the link between widowhood and social support differently for widows versus widowers. These questions were examined using data from the Changing Lives of Older Couples (CLOC) study, a multiwave prospective study of widowhood in later life. Results indicate that individuals scoring higher on openness and agreeableness experienced greater social support from children upon spousal loss relative to their peers scoring lower on these traits. Agreeableness also was found to moderate the link between widowhood and support from friends and relatives yet the effect was in the opposite direction. Individuals scoring higher on agreeableness experienced less support from friends and relatives compared to their peers scoring lower on this trait. Further, findings reveal gender differences with higher levels of extraversion predicting greater support from children for widows yet not for widowers. Finally, while being more conscientious predicts less support from children for widowers, results reveal no effect of this trait for widows. Overall findings highlight the importance of assessing in addition to structural contexts, individual-level factors conditioning the effects of late-life widowhood on social support.

### MENTAL HEALTH, PERSONALITY, AND DEATH ATTITUDES AND ANXIETY PROFILE

E.J. Bergman, *Gerontology Institute, Ithaca College, Ithaca, New York*

Purpose: This study examines the death attitude profile and relationship between mental health, personality, and death anxiety among young adults. Design and Methods: Surveys were administered to a sample of 391 students at a northeastern comprehensive college. Using grounded theory, major themes were identified and thematic analysis organized content regarding death attitudes. Descriptive and univariate analyses were used to assess the relationships between depressive symptoms, mastery, optimism, and death anxiety. Results: Death attitudes frequently cited by participants in this study included fear; concern over separation from loved ones; curiosity regarding noncorporeal continuity; and an appreciation for the need to live life to the fullest. Higher levels of depressive symptoms and lower mastery and optimism were associated with higher death anxiety and expressions of fear and other negative death attitudes. Implications: Mental health and personality characteristics may place some young adults at risk for disruptions associated with death anxieties. Results of this study suggest the importance of considering both mental health and personality influences in predicting death attitudes and reveal the potential for death educators to provide opportunities for the discussion and examination of personal death attitudes and beliefs.

### THE RELATIONSHIP BETWEEN LONELINESS AND DEATH ANXIETY IN LATER LIFE: ONE-YEAR LONGITUDINAL FINDINGS

B. Hayslip, M. Ward Pinson, C. Neumann, *Psychology, University of North Texas, Denton, Texas*

Previous cross sectional research, as well data derived from both Terror Management Theory and Socioemotional Selectivity Theory suggests that there might be a relationship between death anxiety and loneliness in older adults, taking into consideration the multidimensional nature of death anxiety and the distinction between social and emotional loneliness. Based upon a one-year longitudinal study of 173 community –residing older participants (M age = 72.00, SD = 7.2; 68% female), drawn from the original cross sectional sample of 355 older persons. A hypothesized longitudinal causal model was derived from the above theoretical perspectives, wherein it was predicted that both social and emotional loneliness, as assessed via the UCLA and SELSA-S measures at Time 1 would predict death anxiety (MDFODS, RDAS, CLFD measures) at Time 2, mediated by one's cultural world (depression, locus of control, social support, resiliency, spirituality, openness to experience, self-esteem). One-year longitudinal data was analyzed using Structural Equation Modeling (EQS). While results of a hypothesized structural model fitting the data supported a loneliness-death anxiety relationship over time as mediated by one's cultural world view were supported, the differential contribution of social versus emotional loneliness as a mediator was not supported. These findings that suggest older individuals who report being more lonely and are consequently more death anxious are buffered via the internalization of a cultural world view insulting them from their mortality. Thus, interventions to for example, lessen social isolation and/or providing more support from others can help alleviate older adults' fears about death and dying.

### THE SOCIAL SUPPORT FOR GRIEF IN HEALTHCARE (SSGH) SCALE: DEVELOPMENT AND TESTING

K.A. Anderson[1], H. Ewen[2], E.A. Miles[1], *1. College of Social Work, The Ohio State University, Columbus, Ohio, 2. Miami University, Oxford, Ohio*

Social support can be a critical mediating factor in grief. Unfortunately, current measures of social support fail to account for the special characteristics of grief in healthcare environments. The purpose of this study was to develop a social support scale for grief specific to healthcare workers. The 15-item Social Support for Grief in Healthcare Scale (SSGH) was developed based upon Doka's (1989, 2002) typology of disenfranchised grief. The SSGH was tested using exploratory factor analysis with a convenience sample of 380 nursing assistants (N = 380) working in the nursing home setting. Reflective of the supporting theory, all items of the SSGH loaded onto three distinct factors: recognition of the relationship between the healthcare professional and the resident/patient; acknowledgement of the loss; and inclusion of the griever in rituals and grief-related activities. Reliability was found to range from acceptable to high across these three factors. In sum, it appears that the SSGH may be a useful and reliable tool in understanding the role of social support for grief in healthcare workers. Additional testing is needed to determine whether the SSGH is a reliable tool for measure grief support for healthcare workers in other roles and settings.

### LONGITUDINAL STUDY OF AGE DIFFERENCES IN THE EFFECTS OF LENGTH OF ILLNESS BEFORE DEATH ON ADJUSTMENT TO LOSS

N.E. Pisca[1], B.G. Knight[1], S. Nolen-Hoeksema[2], *1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Yale University, New Haven, Connecticut*

Theoretical models of coping with bereavement along with empirical evidence suggest that individuals who deal with the loss of a loved one experience a variety of negative outcomes (e.g., depression, anxiety, etc.). However, there is a dearth of research investigating the effects of age and length of illness before death on adaptation to such stressful life events as losing a loved one. The current study explores the role age and length of illness plays on adaptation to loss. Regression analysis was performed on 154 participants from the Stanford Bereavement Project, a longitudinal prospective study that included 5 waves of data from 1989 to 1992. Participants were assessed before the death of their loved one and then at 1, 6, 13, and 18 months post-loss. Compared to older participants (over age 50), younger individuals experienced a higher level of anxiety and a lower level of calmness across the 4 time points post-loss. Furthermore, findings indicate that older adults do the same regardless of length of illness, whereas younger adults do worse with more time prior to death. The results may provide evidence of older individuals' resiliency when it comes to bereavement.

## SESSION 1770 (POSTER)

## DRIVING, TRANSPORTATION, MOBILITY

### THE EFFECT OF PASSENGERS ON OLDER DRIVER SAFETY

L. Morrison[1], S. Dubois[2], O. Marks[1], N.W. Mullen[1], M. Bedard[1,2], *1. Lakehead University, Thunder Bay, Ontario, Canada, 2. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

We examined the effect of passenger-types on older driver safety (drivers aged >65) using data from the Fatality Analysis Reporting System (1975-2008). Using a case control design, we calculated adjusted odds ratios (OR) of commonly committed unsafe driver actions (UDAs) based on passenger-type. Cases had an UDA recorded, controls did not. We controlled for driver age, sex, driving record, crash time-of-day, and passenger-type. Passenger-type was coded as follows: single adult passenger (age >18) in the front seat (adult passenger condition); at least one child (age <13) passenger with no adult passengers (child/children passenger condition); or no passenger present (reference condition). Two-thirds (63.5%) of older drivers committed at least one UDA. The top five UDAs committed were: Failure to yield right-of-way (28%); failure to keep in proper lane (17%); failure to obey traffic control devices (10.5%); driving too fast for the conditions (6.2%); and operating the vehicle in an erratic manner (4.7%). Overall, an adult passenger decreased odds of any UDA (OR: 0.91;99%CI:0.88;0.94) whereas a child passenger was equivalent to driving alone (OR: 1.03;99%CI:0.81;1.30). However, older drivers had increased odds of failing to keep in the proper lane when either an adult (OR:1.31;99% CI: 1.26;1.36) or child (OR:1.35;99% CI: 1.05;1.73) passenger was present. The general benefit of adult passengers may result from their ability to detect hazardous situations and bring them to the attention of drivers. Employing passengers to reduce risky behaviours and alert of possible danger may be useful in crash prevention for older drivers.

### A TRANSPORTATION RESOURCE GUIDE: DESCRIPTION, PROCESS, AND EVALUATION OF USE

A. Dickerson, L.N. Evans, L. Webster, S. Faircloth, M. Colcord, J. Wilkerson, *Occupational Therapy, East Carolina University, Greenville, North Carolina*

The 2005 White House Conference on Aging identified transportation as a top issues for elders. Driving is not only viewed as a source of independence, but in most areas, as the only means of maintaining participation in the community. Unfortunately, there comes a time when the elder must give up the keys. Although there may be information in one's community, it is often not easily accessible for the elder or caregiver or coordinated through one source. This poster will explain the process of developing a Transportation Resource Guide that will be used by therapists with their clients. The purpose of the Guide is to provide practitioners with a clear algorithm that will help their clients understand why it is unsafe for them to continue driving and to provide them with alternative modes of transportation that will be specific for that client based on their needs. The guide has been drafted, based on multiple interviews with clients, therapists, and transportation experts. The methods of development will be highlighted. The guide has been reviewed with occupational therapists and clients. Results indicate the guide is not readily used by occupational therapists. It appeared that some therapists feel transportation should be addressed by other professionals. The implications of this evaluation are discussed.

## EVALUATING DISPLAY CONFIGURATIONS OF A DRIVING SIMULATOR DESIGNED FOR AGING PATIENTS IN CLINICAL SETTINGS

R. Goodenough[1], J.O. Brooks[1], D. Evans[2], K. Duckworth[1], *1. Clemson University, Clemson, South Carolina, 2. DriveSafety, Inc., Salt Lake City, Utah*

Although large high-fidelity driving simulators are optimal for reproducing realistic driving experiences, they are often too expensive and require too much space to be practical outside of research environments. In response, DriveSafety has developed the CDS-250 specifically designed to be a small footprint simulator for clinical applications. However, there are limitations inherent to such smaller simulators, such as reduced display size. In order for driving situations involving maneuvers such as merging, intersection negotiation, and sharp turns, a field-of-view larger than that afforded by the display size is often necessary. A technique known as scene minification can be employed to fit large field-of-views onto a smaller display. A usability study was conducted investigating older driver comfort and performance while using different display configurations. Twenty-four licensed drivers drove through several different environments such as neighborhoods, rural roads, commercial areas, and freeways. Drivers were presented with two different display configurations consisting of either a single 47" screen or three 19" screens. Each drove through the driving environments using four different field-of-views: 65o, 80o, 95o, and 110o. Nearly all drivers tested preferred the three-screen configuration, mainly for its larger horizontal extent. For a majority of the drivers 110o was the preferred field of view of the four tested. This finding was surprising because it was hypothesized that few drivers would be comfortable with a 110o field-of-view compressed to fit a screen subtending a much smaller visual angle (65 o). This will allow therapists to work with patients on tasks including intersections.

## STEREOTYPES OF THE OLDER DRIVER: A FIRST PROMISING STEP

M. Joanisse, S. Gagnon, M. Voloaca, *School of Psychology, University of Ottawa, Ottawa, Ontario, Canada*

Historically the driving literature on older adults has been mainly focused on their higher involvement in on-road crashes. Furthermore, in the general population, negative comments in regards to the competency of older drivers are frequently heard. However, recent studies have shown that older drivers are safe drivers. While negative stereotypes in regards to older drivers seem to be present, their existence has yet to be empirically validated. We conducted an experiment to determine the presence of older driver stereotypes. Fifty-six young adults viewed 12 simulated clips of three categories of driving behaviours (i.e., risky younger drivers' behaviours, risky older drivers' behaviours and neutral driving behaviours). Results showed that risky older drivers' behaviours were rated as significantly more representative of older drivers in general, than young and middle-aged drivers. Risky young drivers' behaviours were evaluated as significantly more representative of young drivers than older drivers and middle-aged drivers. The neutral safe driving behaviours were rated as more representative of middle-aged drivers compared to the older and younger groups. The implication of these results on the decision-making process of older adults in regards to driving cessation is discussed as well as the potential consequences of these perceptions on driving performance.

## COGNITIVE SPEED OF PROCESSING AND VISION ARE ASSOCIATED WITH MOBILITY ACROSS THREE YEARS

M. O'Connor, J. Edwards, *University of South Florida, Tampa, Florida*

Mobility, or the ability to move through the environment, is critical for older adults' quality of life (e.g., Webber, Porter, & Menec, in press). Sensory, physical, and cognitive declines are associated with mobility limitations. However, cognition may be an especially salient predictor of mobility (e.g., Edwards, Bart, O'Connor, & Cissell, in press). Further research is needed to examine predictors of different mobility indicators in a longitudinal context. The current project utilized data from the Staying Keen in Later Life (SKILL) study (N=370; mean age=72.75) to longitudinally investigate mobility as defined by life space and driving behaviors (frequency and avoidance) across three years. First, hierarchical regression analyses were used to examine baseline relationships between the mobility variables and age, vision (acuity and contrast sensitivity), physical performance (Turn 360 Test), speed of processing (Useful Field of View Test [UFOV]), and mental status. UFOV emerged as a significant and independent indicator of baseline driving avoidance ($ps<0.05$). Additionally, vision was a significant indicator of driving avoidance and frequency. Next, latent change models were used to examine changes in driving and life space between baseline and follow-up. There were significant decreases in life space and driving frequency, and significant increases in driving avoidance across three years ($ps<0.05$). Vision was significantly correlated with changes in all outcomes ($ps<0.05$), while UFOV was correlated with changes in driving avoidance ($r=-0.17$, $p<0.01$), and frequency ($r=0.15$, $p<0.01$). The current study illustrates the importance of speed of processing for maintenance of driving and vision for both driving and life space.

## SELECTION, OPTIMIZATION, AND COMPENSATION IN THE SELF-REGULATORY DRIVING BEHAVIORS OF OLDER ADULTS

E. Lea, T. McCallum, *Psychology, Case Western Reserve University, Cleveland, Ohio*

To combat declines in functioning, older drivers engage in selection, optimization, and compensation (SOC). Previous research has investigated the use of the SOC model as a means of understanding how older adults balance and optimize resources to maintain mobility. Often, behaviors associated with selection and optimization are either ineffective at reducing accidents or associated with negative outcomes, such as depressed mood. This study examined older drivers' qualitative descriptions of their safety-oriented behaviors and the impetuses for those behaviors. Participants for the study ranged in age from 60-97(M=73.09, SD=8.92). Older drivers reported a number of self-regulatory driving behaviors including avoidance of challenging situations (34.0%), increased attention and caution (21.6%), and increased adherence to the laws (17.5%). The most frequently cited reasons for altering driving behavior were changes in the body (17.9%), safety (16.7%), age (14.3%), and changes in attitude or perception (14.3%). The majority of driving research has focused on avoidant driving behaviors as methods of self-regulation in elders' driving; however, only 34.0% of responses indicated avoidance was a method of increasing safety. Therefore, this study expands on research of self-regulatory behaviors by describing additional methods older drivers employ to increase perceived safety. This is notable as 53.6% of the sample reported that the self-regulatory driving behaviors they employ are effective to extremely effective at improving driving safety. A re-conceptualization of the SOC model, focused on independence through driving rather than mobility, follows.

### RACIAL AND ETHNIC DIFFERENCES IN DRIVING TRANSITIONS: DATA FROM THE HEALTH AND RETIREMENT STUDY

C. Lee, F. Porell, E. Dugan, *University of Massachusetts Boston, Boston, Massachusetts*

We explored racial and ethnic differences in biomedical, social, and psychological risk factors for driving cessation. This research identifies and compares risk factors in older (age>65) African American (N=5,872), Caucasian (N=36,866), Hispanic (N=3,386), and Other (N=661)race adults. We analyzed pooled data from waves 1998-2008 of the Health and Retirement Study. Variables included age, gender, education, marital status, income, functional status, ADL, IADL, vision, and health conditions (hypertension, diabetes, cancer, cardiovascular disease, stroke, lung disease, arthritis, falls, hip fracture, depression, and psychiatric illness). We utilized multivariate logistic regression to estimate consequences between reported future driving cessation and risk factors. Results of logistic regression analysis showed that overall, older age and low income adults had a greater risk of driving cessation in all of the race groups. However, for African American adults risk factors for driving cessation were IADL limitation, stroke, fall, hip fracture, fair/poor vision, while male gender, more education, and higher income were protective (pseudo R2=.31). For Hispanic adults never married, IADL, stroke, fall, fair/poor vision were risk factors for driving cessation, while male gender and more education were protective (pseudo R2=.33). Adults categorized as "other" race were at risk if they were functional limitation, and more likely to keep driving if they were male, had more education, had cancer, heart conditions or falls (pseudo R2=.48). Given the small size of the "other" category we report this with caution. Nonetheless, this information may guide tailored interventions to promote mobility in at-risk adults. *Research supported by a National Center for Senior Transportation student scholar award.

### WHY WOULD THEY STOP? REPORTS OF CONDITIONS THAT WOULD LEAD TO DRIVING CESSATION AMONG VISUALLY IMPAIRED OLDER ADULTS

M.T. Guzzardo, B.E. Gibson, A. Horowitz, J.P. Reinhardt, K. Boerner, *Research Institute on Aging, Jewish Home Lifecare, New York, New York*

Empirical evidence is limited with respect to how older adults make decisions about driving cessation as their driving abilities change. An important component of this process is the indicators older adults use to determine when driving cessation is warranted. Data from a larger NIA-funded study were used to describe older adults' reports of the conditions that would lead them to stop driving and compare them to the reports of a family member or friend (Contact). The sample includes 214 Participants age 55+ who were visually impaired drivers, as well as 214 of their Contacts. Approximately half of the Participants (51%) and Contacts (46%) reported Participants' vision getting worse as a condition that would lead them to stop driving. However, relatively few provided specific indicators of worsening vision (13% of Participants and 11% of Contacts said the Participant would stop if he/she couldn't see objects, people, or signs on the road). In addition, more Contacts (21%) than Participants (11%) believed that an accident would lead the Participant to stop driving. For Participants, 42% reported that being a danger to themselves or others would cause them to stop, and 23% of Contacts reported this. Less than one-fifth of each group reported that driving cessation was inevitable (15%; 13%). Findings underscore the need for older drivers with vision impairment to work together with their families, friends, and doctors to plan for future driving cessation, including the identification of specific indicators of increased risk in order to make safe decisions before an accident.

### RISK FACTORS FOR DRIVING TRANSITIONS: DATA FROM THE HEALTH AND RETIREMENT STUDY

E. Dugan, C. Lee, F. Porell, *Gerontology Dept, University of Massachusetts Boston, Boston, Massachusetts*

Driving a personal vehicle is the preferred means of mobility for most Americans, especially older adults. Transitioning from driver to passenger may lead to social isolation, less access to health care, loss of independence, and diminished quality of life. With increasing age threats to medical fitness to drive increase. This research identifies social, psychological, and biomedical risk factors for self-reported driving cessation in older (age>65) adults. We analyzed pooled data from waves 1998-2008 of the Health and Retirement Study (African American N=5,872; Caucasian N=36,866; Hispanic N=3,386; Other N=661). Variables included age, gender, education, race, marital status, income, functional status, ADL, IADL, vision, and health conditions (hypertension, diabetes, cancer, cardiovascular disease, stroke, lung disease, arthritis, falls, hip fracture, depression, and psychiatric illness). We utilized multivariate logistic regression to estimate consequences between reported future driving cessation and risk factors. Results of logistic regression analysis showed that drivers who were male, highly educated, married, wealthier, and had excellent vision and arthritis were more likely to continue driving. Minority race, never married, lowest income, functional limitation, ADL, IADL, diabetes, stroke, falls, hip fracture, fair/poor vision, and psychiatric problems were all risk factors for driving cessation (pseudo R2=.39, SE adjusted for 15,256 clusters). Identifying potential threats to future driving fitness should benefit older drivers, their families, health care providers, and licensing authorities. Knowing that a sometimes symptomless chronic disease (diabetes) can pose a threat to driving fitness may help motivate some older patients to more actively manage their condition to prolong their driving fitness.

### PAIN KILLERS AND SAFE DRIVING: AN EXAMINATION OF THE ASSOCIATION BETWEEN OPIOID ANALGESICS AND UNSAFE DRIVING ACTIONS PRECEDING FATAL CRASHES

S. Dubois[1,2], M. Bedard[1,2,3], B. Weaver[2,3], *1. Research Department, St Joseph's Care Group, Thunder Bay, Ontario, Canada, 2. Centre for Research on Safe Driving, Lakehead University, Thunder Bay, Ontario, Canada, 3. Northern Ontario School of Medicine, Lakehead University, Thunder Bay, Ontario, Canada*

In the USA, opioid analgesic (pain killer) consumption is increasing. Common side effects such as sedation, dizziness, and memory impairment have the potential to influence the central nervous system impairing a person's ability to drive safely. Most epidemiological research into the impact of opioid analgesics on road safety has focused on the association between opioid use and traffic crash occurrence. Yet, the role of opioid analgesics on crash responsibility is still not properly understood. We examined the impact of opioid analgesics on drivers (with a confirmed BAC=0) involved in fatal crashes (1993-2008) using a case-control design based on data from the National Highway Traffic Safety Administration Fatality Analysis Reporting System. Cases had one or more crash-related unsafe driving actions (UDA) recorded; controls had none. We calculated adjusted odds ratios (ORs) of any UDA by medication exposure after controlling for age, sex, other medications, and driving record. Compared to drivers who tested negative for opioid analgesics, drivers who tested positive demonstrated increased odds of performing an UDA from ages 25 (Female OR: 1.44; 95%: 1.15, 1.78; Male OR: 1.64; 95% CI: 1.34; 2.00) thru 65 (Female OR: 1.24; 95% CI: 1.04; 1.48; Male OR: 1.41; 95% CI: 1.20;1.65). The detection of opioid analgesics was not associated with greater risk of an UDA for drivers aged 75. Research is necessary to examine why these age differences exist, and if possible, to ensure that opioid analgesics do no contribute to crashes.

### WHAT ARE THEY TALKING ABOUT? CONVERSATIONS ABOUT DRIVING REPORTED BY VISUALLY IMPAIRED OLDER ADULTS

B.E. Gibson[1], A. Horowitz[1,2], J.P. Reinhardt[1,2], K. Boerner[1,2], *1. Research Institute on Aging, Jewish Home Lifecare, New York, New York, 2. Mount Sinai School of Medicine, New York, New York*

To understand how older adults with vision problems make decisions about driving and driving cessation, it is important to consider the influences of other significant persons. In particular, are suggestions by others to stop driving related to subsequent driving cessation? This study examines those influences by using baseline and year 1 follow-up data from a larger NIA-funded study of driving transitions and mental health. The baseline sample included 381 adults age 55+ with vision impairments who reported driving at baseline. Participants were asked to report the content of conversations they had with family, friends, doctors, and others. The content of each conversation was coded and data were entered using qualitative data management software. In total, 299 participants reported at least one conversation about driving. The three most common topics brought up by participants in the conversations were 1) discussing a driving difficulty (24%), 2) accepting the other's help or advice (23%), and 3) mentioning self-regulation of driving behaviors (21%). The three most common topics brought up by others in the conversations were: 1) offering rides (28%), 2) suggesting the participant regulate driving behaviors (26%), and 3) suggesting the participant stop driving (26%). At year 1, the sample consisted of 251 participants, including 45 ex-drivers. Driving cessation at year 1 was significantly related to having been told to stop by at least one person (family, friend, and/or doctor) at baseline ($r = .20$, $p < .01$). Implications for practice with visually impaired drivers and their families will be discussed.

## SESSION 1775 (SYMPOSIUM)

### SURVIVING THE CLINICAL GEROPSYCHOLOGY PREDOCTORAL INTERNSHIP PROCESS

Chair: *A. Shah, University of Alabama, Tuscaloosa, Alabama*

This section of the symposium focuses on the process of obtaining a clinical geropsychology internship, the first transitional step towards a career in geropsychology. Over time, obtaining a predoctoral internship in clinical psychology has become more challenging and enigmatic. An effort will made to demystify this process through a brief presentation on applying to, interviewing for, securing, and completing an internship in geropsychology. An overview will be provided on the available clinical geropsychology internship sites and how to choose the best fitting program.

### TIPS, TRICKS, AND ADVICE FOR LANDING A POSTDOCTORAL FELLOWSHIP IN GEROPSYCHOLOGY

K.L. Payne, *1. Milwaukee VA, Milwaukee, Wisconsin, 2. Portland VAMC, Portland, Oregon, 3. The University of Alabama, Tuscaloosa, Alabama*

This presentation will give audience members a chance to learn about the process of applying to geropsychology postdoctoral fellowships in a variety of settings including VAs, medical hospitals, academic settings, and private practice. The benefits and drawbacks for completing a fellowship in each of these settings will be explored. Differentiation of the process for applying to internships and fellowships will be discussed with a focus on tips and tricks for locating open fellowship positions, putting together a successful application, interviewing, and navigation of acceptance procedures. Examples from the presenter's recent experience with this process will be used to highlight possible challenges and successes. Audience members will have the opportunity to ask questions and to discuss particular issues or challenges they may be facing.

### HOW TO FIND THE RIGHT CLINCAL JOB FOR YOU IN GERONTOLOGY: APPLYING, INTERVIEWING, AND NEGOTIATING

M. Snarski, *Bath VA Medical Center, Painted Post, New York*

This presentation will discuss the process of obtaining a clinical position in geropsychology, starting with where to look for such position openings. Examples will be provided from presenter's recent personal experience in applying for VA hospital jobs. This session will address the processes of applying, interviewing, negotiating, and balancing personal and professional needs when choosing an appropriate geropsychology clinical position. More specifically, this session will discuss how to better equip your application package for success and guide the applicant to appropriate interview questions to raise with potential employers. The successes and challenges of this process will be presented, with time for questions and discussion to follow.

### NAVIGATING THE ACADEMIC GEROPSYCHOLOGY JOB SEARCH PROCESS: ANTICIPATION, CONSIDERATION, PERSPIRATION, AND NEGOTIATION

A. Snow, *Cntr for Mental Health & Aging/Psychology, University of Alabama/Tuscaloosa VAMC, Tuscaloosa, Alabama*

Academic geropsychology can be a high-reward career choice; even in recession, current demographic trends ensure that this area of specialization will continue to yield job opportunities. However, success in the academic geropsychology job market requires long-range planning, honest self-reflection, some hard work, and savvy negotiation. This presentation will review planning for the academic career that should begin in graduate school and continue through internship and particularly through a geropsychology research post-doctoral fellowship; this is the best way to ensure that the requisite research products and skills are in place. The successful applicant should engage in careful reflection with self, family, and friends so that one's personal and professional values are clear and can serve as guidance in reviewing potential job opportunities and offers. Careful preparation for job applications, job talks, and offer negotiations will lead to success and the beginning of the next step in an exciting career.

## SESSION 1780 (POSTER)

### HOUSING AND NURSING HOMES

### LONGITUDINAL SELF-RATED NURSING HOME USE EXPECTATIONS AMONG OLDER ADULTS IN THE HEALTH AND RETIREMENT STUDY

P.P. Haley, M. Beidleman, J. DeCoster, R.S. Allen, *Department of Psychology/Center for Mental Health and Aging, The University of Alabama, Tuscaloosa, Alabama*

Few studies have investigated the influence of cognitive status on self-rated nursing home use expectations. We examined the relation of cognitive status (i.e., a diagnosis of dementia, cognitive impairment without dementia, or no cognitive impairment) to subjective memory performance, objective cognitive performance, demographics (e.g., gender, race, Hispanicity), and self-rated nursing home use expectation using data from the 2002-2008 waves of the Health and Retirement Study (HRS) and waves A-C of the Aging, Demographics and Memory Study (ADAMS) ($N = 1770$). Respondents were asked, "What is the percent chance that you will ever have to move to a nursing home?" Repeated measures analysis of variance revealed significant individual change in nursing home use expectation, $F(3, 279) = 3.17$, $p = .025$, with expectation of nursing home use increasing from 12.9% to 19.8% from 2002 to 2008. Respondents with cognitive impairment without dementia reported poorer subjective cognitive performance, $F(18,1401) = 1.81$, $p = .02$. Hierarchical linear modeling revealed a significant level one random effect for objective cognitive performance and significant level two effects of Hispanicity and age. For some individuals, cognitive performance predicted nursing home use expectation. Older individuals and White-non-Hispanics had greater expectations of using nursing home care in the future. Future research should explore the impact of emotional health and other variables on self-rated nursing home use expectations.

### TRANSITIONS TO ASSISTED LIVING: THE ROLE OF SOCIAL WORKERS

N. Fields, H. Dabelko-Schoeny, *The Ohio State University, Columbus, Ohio*

Successful transition and adjustment to assisted living is of growing interest as policy makers search for cost effective ways of providing long-term care, and consumers demand care options which maximize choice and autonomy. Past research has suggested a growing need for social workers in assisted living, yet social workers currently have little presence in these settings and their potential role in supporting consumer transitions has not been clearly defined. This pilot study explored the factors related to the successful transition to assisted living by consumers enrolled in a Medicaid waiver program, including the role of a social worker. A written survey was administered to a state wide, purposive sample of Medicaid Assistant Living Waiver providers in facilities with the highest census of Medicaid Waiver consumers in each designated aging service area (N = 28). The importance of the availability of a licensed social worker within the assisted living facility was the one indicator that providers perceived as having little importance for transition success. However, the data also suggested a positive relationship between the availability of a social worker and the frequency and importance of education around service tier assignment and the importance of education around the resident care plan. Finally, providers suggested consumers transitioning to assisted living may benefit from the psychosocial support, a service social workers can provide. Future studies should examine the role of social workers in addressing the needs of residents relocating to residential care settings including assisted living.

### ANTIDEPRESSANT PRESCRIBING PATTERNS IN THE NURSING HOME: SECOND-GENERATION ISSUES REVISITED

S. Shah[1], B. Schoenbachler[2], S. Meeks[1], *1. University of Louisville, Department of Psychological & Brain Sciences, Louisville, Kentucky, 2. University of Louisvlle, Department of Psychiatry & Behavioral Sciences, Louisville, Kentucky*

Since implementation of the Omnibus Reconciliation Act of 1987 (OBRA), nursing homes are required to provide detailed records and regular assessments regarding the use of psychoactive drugs. Once considered an under-diagnosed and under-treated phenomenon ("first generation concerns"), depression diagnosis and antidepressant use in the nursing home have become increasingly common since OBRA. Now, second-generation issues regarding the monitoring and management of psychotropic drugs may be more critical than lack of diagnosis or treatment. The aim of this study was to assess the quality of documentation regarding the antidepressant prescribing patterns in the nursing home. We randomly selected 119 medical records from 6 nursing homes and used a standardized rating scale to review them. Results showed that 57.1% of the sample was taking antidepressants during the 6-month review period, and that 59.1% had a documented depression diagnosis. However, frequency statistics revealed that the documentation related to changes in dosing, side effects, and reason(s) for continuation was suboptimal. Differences in prescribing patterns were examined across nursing homes, and results showed relative consistency with regard to proportions of residents taking antidepressants and frequencies of dosage changes, but differences among facilities with regard to which antidepressants were prescribed, and documentation for side effects, depressive symptoms, and reasons for continuation were found. Overall, the quality of antidepressant documentation in nursing home charts appears to be inadequate. Future research should explore possible solutions to these second-generation issues.

### RACE, POWER, & WORKFORCE DIVERSITY: AWARENESS, PERCEPTIONS, & EXPERIENCES AMONG NURSING HOME LEADERS

L.D. Vinson[1,2], A. Snow[2,1], M.R. Crowther[1], A. James[1], J. Wong[1], *1. Department of Psychology, The University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health & Aging, The University of Alabama, Tuscaloosa, Alabama*

In response to the changing demographic profile of the US, there is an increasing presence of minorities in the workforce. Nursing homes, in particular, are facing issues on how to manage such a diverse workforce. Furthermore, nursing homes have a hierarchal environment with limited diversity at the administrative level, yet significant diversity at the direct care levels. The present study is an ongoing project exploring nursing home leaders' understanding of workforce diversity (WD), race, power, and how diversity is managed in the nursing home. Semi-structured interviews were conducted with 10 administrators at a community nursing home using guiding questions to explore the leaders' own experiences. Interviews explored the following concepts: diversity and leadership experiences, perceptions of WD and diversity management, and influences of WD on work process. Using the grounded theory approach to qualitative data analysis, preliminary results reveal several common themes. First, the leaders explained how they thought others perceived them. One administrator stated that the staff would "perceive me very differently from the way I perceive myself… they will probably perceive me as being distant." They also discussed their role in "doing the right thing" as a leader. Finally, the leaders described their personal experiences with racial discrimination and how these experiences affect their current situations. A theory of WD will be discussed based on the leaders' values, experiences and perceptions of race, power, and WD. Such a theory will aid in developing diversity promotion strategies and improve work-life in nursing homes.

### AGING INDIVIDUALS' PREFERENCES FOR AN AUTOMATED NIGHTSTAND

L. Smolentzov[1], J.O. Brooks[1,2], L. Mayweather[1], R. Beeco[1], J. Manganelli[1], K.E. Green[1], I. Walker[1], *1. Clemson University, Clemson, South Carolina, 2. Greenville Hospital System University Medical Center, Greenville, South Carolina*

'Smart' furniture is furniture that employs user-centered design principles and computer-aided assistive technologies. 'Smart' furniture might help older adults with self-care tasks and encourage aging-in-place. While our previous research has shown that seniors are accepting of the concept of 'smart' furniture, the current study assessed the desired characteristics, specifically the wants and needs, of 32 community dwelling older adults (M = 68.9 years) in terms of a 'smart' nightstand to help propel future designs. The volunteers were shown 'smart' nightstand prototypes through the use of 3D models using Google Sketch Up© prior to completing a survey including 36 potential items to be located in or on the nightstand as well as 21 functions the nightstand may perform (such as moving up and down). The participants ranked their like and need for each item and function. Results indicate that having a telephone, lamp, and glasses were three of the five highest rated like and need items while light control, communication regarding safety, the ability to move up / down, and medicine storage were four of the five highest rated like and need functions. Overall, participants' scores reflected a need and liking of incorporating a variety of items and automated functions into a nightstand. Creating a user-centered nightstand could potentially aid aging in place individuals by fulfilling not only what the user needs, but also what they want. This is valuable for potentially creating a nightstand that can aid future generations to age in place.

### ASSOCIATION BETWEEN MEDICAID-FUNDED HCBS WAIVERS AND THE PROPORTION OF LOW-CARE NURSING HOME RESIDENTS IN FLORIDA

E. Hahn, K.S. Thomas, K. Hyer, R. Andel, *University of South Florida, Tampa, Florida*

Up to 12% of nursing home (NH) residents are considered to have light care needs (i.e., low-care residents). We reported the county-level prevalence of low-care NH residents in Florida and examined whether the availability of Medicaid-funded home- and community-based service (HCBS) waivers may be associated with the proportion of low-care NH residents. This study utilized facility- and county-level data from the national registry of NH resident assessments from the Minimum Data Set, the Online, Survey, Certification and Reporting Data Set, the Area Resource File, and the Department of Elder Affairs to examine the association between the availability of Medicaid HCBS waivers and the proportion of low-care residents in 57 counties in Florida. We used Hierarchical linear models (HLM) with facility-specific information (age, gender, percent Medicaid/Medicare, occupancy, chain membership, profit status, and facility size) as level 1 variables and county-level information (market competition, hospital beds per 1000 adults aged 65+ and number of waivers) as level 2. Between 3.4%-23.1% of residents residing in 264 NHs were low-care (mean=12.3%, SD=7.23). In addition to the 2 statewide waivers, counties, on average, offer 1 waiver and range from 0-3 additional waivers. In a fully adjusted model, each additional waiver in the county was associated with a 1% decrease in the proportion of low-care residents (Est.=-1.04, SE=.45, p<.05). Smaller, for-profit facilities with a higher percent Medicaid residents had a higher proportion of low-care residents. NH-eligible Medicaid recipients may be sustained in the community when there is a greater availability of Medicaid-funded HCBS waivers.

### PATTERNS WITHIN CULTURE CHANGE HOUSEHOLDS: OUTCOMES FROM A PILOT STUDY

M.L. Kaup, *ATID, Kansas State University, Manhattan, Kansas*

Many skilled care facilities are investing in remodeling and new construction, testing new organizational models; adopting some of the principles from the culture change while still holding onto their previous institutional frameworks. Central to culture change in long-term care is the expression of desired patterns of behavior through features of the built environment. The implications for the setting, and the spatial composition of the household, are beginning to be addressed as an important factor in supporting these new behavioral expectations. Outcomes from a pilot study demonstrate emerging patterns in culture change households based on both the spatial arrangement of the setting as well as organizational structures that implicate how staffing is assigned to the households and what roles they assume. A qualitative research design using a mixed-method, multi-site strategy was employed that included ethnographic tactics to document the composition of the household features that are integral to four targeted routines. This presentation will demonstrate how each location was documented to reveal the staffing configuration as well as the architectural/ spatial parameters that define identifiable boundaries. Data will be presented graphically (plans and diagrams) as well as tabular and narrative form to demonstrate the organizational and environmental characteristics of each facility. After reviewing this analysis, participants will be able to identify the emerging patterns of the physical environment and the organizational structures that result in a multi-household context versus a "stand-alone" household and be able to discuss the implications for staffing roles that may have relevance to resident quality of life.

### POSITIVE EXPERIENCES FROM CARE-WORK AND THEIR EFFECTS ON BURNOUT SYNDROMES: RESULTS FROM A NATIONAL CROSS-SECTIONAL SURVEY IN JAPAN

K. Abe, *National Center for Geriatrics and Gerontology, Aichi, Japan*

Objectives: Positive experiences from daily care-work are important factors for stress reductions and retention rates. However, there is little study about the positive experiences and their effects on the stress of care-worker. The aim of this study is to examine the effects of the positive experiences on the burnout syndromes in Japan. Methods: The data analyzed in this study is from the 2007 Working Conditions Survey in Long-term Care, a nationally representative cross-sectional survey in Japan. Results: Results of the multiple regression analysis examined significant effects of the positive experiences from daily care-work on the burnout syndrome. In particular, personal accomplishments; a sub-scale of the Maslach burnout inventory, were strongly influenced by the positive experiences. Discussion: Positive experiences from daily care-work had a reductive effect on the stress of care-worker in Japan. This study highlights the importance of positive experiences and positive feelings of care-workers as well as their stressful working environment.

### LONGEVITY RULES: TENURE STATUS AS A STRUCTURAL INFLUENCE ON WELL-BEING IN A RETIREMENT COMMUNITY

S.A. Eisenhandler, *Sociology, University of Connecticut, Waterbury, Connecticut*

2010 is the five year benchmark for qualitative research on the cultural milieu and daily life of older adults and staff in a Connecticut retirement community called Kahehtiyo. This presentation delineates a clear pattern of longevity or tenure status for residents and staff alike that eases many transitions associated with aging in place. Regular interaction between residents and staff affects well-being reported by both groups: Longevity or tenure status makes this possible. Interviews and systematic participant observation of interaction between residents and staff disclose three significant structural factors associated with well-being. A key sociological element is stability in the population of residents and staff. A second factor is the size of the group; and, a third is the limited disruption of community when residents or staff have been replaced. Joint participation has been sustained here. This does not mean that Kahehtiyo is a utopia. It does mean that the resulting social cohesion reinforces a commitment to work through difficulties rather than to move to another retirement complex or to work for another community. Organizational research typically finds multiple benefits from low staff turnover. Yet that is only part of what makes for well-being among older adults—the longevity or tenure of residents themselves is equally important. Small retirement communities demonstrate that size, scale, and stability (even with replacement of members) build a social foundation for well-being. Disadvantages are also noted particularly the function of stability as social inertia.

### HOUSING QUALITY AMONG OLDER ASIANS: COMPARING IMMIGRANTS AND NON-IMMIGRANTS

J.A. Burr, J. Mutchler, *Gerontology, University of Massachusetts Boston, Boston, Massachusetts*

Housing quality has been demonstrated to impact a person's well-being. While some research exists on the quality of older persons' housing for the general population, our knowledge of the housing characteristics of older Asians is scarce. We develop a conceptual framework for analyzing housing outcomes among older Asians derived from stratification and assimilation theories. We analyze samples from the 2000 US Census PUMS (5%) for non-Hispanic Whites, Chinese, Japanese, Korean, Asian Indian, Filipino, and Vietnamese elders. Three dimensions of housing are examined: (1) home ownership, (2) residential crowding, and (3) home values and rents. Our models include both individual level and housing market characteristics. After controlling for demographic and economic characteristics, as well as housing market characteristics, including Asian-White residential segregation and size of the Asian population, we find older Asians from all six groups are more likely to live in crowded households and all but the Japanese elders are less likely to live in an owned home than their non-Hispanic White counterparts. We find that older Asian immigrants live in homes where the rents and value of owned homes is lower compared to non-immigrants. These results show that conceptual frameworks applied to younger minority populations and to other ethnic groups, such as Hispanics, apply to older Asians as well. The results also show a hierarchy of advantage whereby Japanese elders' housing quality is among the highest and Vietnamese elder's housing quality is among the lowest for the Asian groups examined here.

### WHAT ARE THE BARRIERS TO PROVIDING NON-PHARMACOLOGICAL INTERVENTIONS FOR AGITATION IN NURSING HOMES?

J. Cohen-Mansfield, K. Thein, M. Dakheel-Ali, M.S. Marx, *Research Institute on Aging, Rockville, Maryland*

Agitated behaviors are common in nursing home residents with dementia and often reflect unmet needs. While the most common treatment approach is pharmacological, in recent years there has been a growing movement to use non-pharmacological approaches that address the unmet needs. In our research of agitated nursing home residents with dementia, we use a systematic methodology for individualizing non-pharmacological interventions (TREA – 'Treatment Routes for Exploring Agitation'). Trained research assistants deliver the interventions, bypassing barriers related to staff noncompliance. Still, we encounter barriers to intervention delivery. Using the Barriers to Intervention Delivery Assessment (BIDA), which we developed after multiple group discussions of our experiences on the units and literature review, research assistants documented reasons for failure to deliver interventions in a group of 89 agitated residents from 9 different nursing homes. Barrier categories included: staff-related barriers (e.g., staff refusal to remove restraints); resident barriers (e.g., unresponsive, combative); environmental barriers (e.g., too much noise); resident not available (e.g., eating); and, family-related barriers (e.g., family photos were not provided for the intervention). Barriers were encountered for almost all participants. The most frequently occurring barrier was that of the resident being asleep (category: resident not available), followed by resident refusal (resident barriers), resident visiting with family, and resident showering (in both cases, resident not available). Data from all barrier categories will be presented. Knowledge of potential barriers gives us a tool by which to tailor interventions so as to anticipate or circumvent barriers, thereby maximizing intervention delivery. This study was supported by grant #5R01AG010172-14

### SERVICE STRUCTURE OF SHARED-HOUSING ARRANGEMENTS COMPARED TO SCU FOR PERSONS WITH DEMENTIA

I. Wulff[1], J. Gräske[1,2], A. Worch[2,3], T.W. Fischer[4], J. Nordheim[3], S. Meye[2], A. Pannasch[2], K. Wolf-Ostermann[2], *1. Graduate School "Multimobidity in Old Age", Charité-Universitätsmedizin Berlin, Inst. of Med. Sociology, Berlin, Germany, 2. Alice Salomon Hochschule Berlin, Berlin, Germany, 3. Charité-Universitätsmedizin, Inst.Med. Sociology, Berlin, Germany, 4. Technopolis Group, Berlin, Germany*

Objectives Shared-Housing Arrangements (SHA) Are a Specific German Kind of Small-Scale Living Facility for Care-dependent Persons, Being Served by Community Care Services and Detached from Special Care Units (SCU) for People with Dementia. Methods In a Cross-sectional Study 163 Community Care Services Responsible for 331 SHA Were Asked among Others to Provide Information on Their Service Structure, Involvement of Relatives and Volunteers, Consultation of General Practitioners, Medical Specialists and Therapists, and Resident Characteristics. Results Were Compared with Data of 32 SCU. Measures Include Demographical Attributes, Diagnoses, Type of Services According to Social Security Statutes, Staffing Conditions, and Collaboration with Therapists. Results There Is No Proportional Distribution in Terms of Gender. Residents in SCU (82.7 Years) Are Significantly Older than Residents of SHA (79.4 Years). Relatives of SCU Residents and Volunteers Are More Often Present and Involved in the Care in Comparison to SHA. Need-driven Behaviours Occurred More Times in Residents of SCU. While Approximately 85% of Residents in Both Groups Alike Had an Appointment with Their General Practitioner, Medical Specialist Care Varies. Residents of SHA (53.3%) Attend Significantly More Often to Therapies like Physiotherapy, Occupational Therapy or Logopedics than Residents of SCU (37.9%). Conclusion Data Indicate that Both Types of Facility Provide Slightly Different Services Due to the Attracted Population. The Study Results Contribute to Elucidation of Appropriateness and Quality of Service Structure in SHA.

### RESIDENTIAL TRANSITIONS OF ADULTS WITH DEMENTIA: COMPARING VIEWS OF ADMINISTRATORS AND FAMILIES

S.G. Kelsey, S.B. Laditka, J.N. Laditka, *University of North Carolina at Charlotte, Charlotte, North Carolina*

Transitioning family members with dementia to an assisted living facility (ALF) from the community challenges family caregivers. Families are also typically unprepared for the later transition from the ALF to a memory care unit (MCU), often required by behavioral problems that can accompany advancing dementia. We studied transitioning from ALFs to MCUs from the perspectives of ALF administrators and family caregivers who had experienced both the transition from home to the ALF and the later transition from the ALF to the MCU. We conducted in-depth telephone surveys with 37 ALF administrators and 15 family caregivers. Grounded theory identified themes. Thematic analysis organized content. Constant comparison methods compared themes among administrators and caregivers. Both groups said there was a need to help caregivers learn about dementia, discuss transfer policies on admission, show respect and maintain on-going dialog, and address financial concerns about greater MCU costs. Caregivers described ways to improve transitions, including mentoring programs for caregivers, support groups at the ALF, allowing caregivers to observe the MCU for a day, and having ALF staff help with the physical move to the MCU when it is at the same location. Administrators suggested increasing awareness of MCU benefits to reduce stigma, and employing social workers. Administrators can reduce the stress of transitioning by being more understanding of family caregiver emotions, supporting caregivers by helping organize the move, and encouraging guidance from a neutral third party such as a social worker or geriatric care manager.

### RECOGNITION AND TREATMENT OF DEMENTIA AMONG TWO COHORTS OF ASSISTED LIVING RESIDENTS IN MARYLAND

A.R. Vavilikolanu, Q. Samus, C.U. Onyike, M. McNabney, P. Rabins, C. Lyketsos, A. Rosenblatt, *Psychiatry, The Johns Hopkins University, Baltimore, Maryland*

BACKGROUND: Treatment of dementia in AL has been associated with increased length of stay and other important outcomes. In 2003, Maryland passed regulations that required direct care staff to undergo increased dementia care training. The effect of this policy on dementia care in AL has not been empirically examined. OBJECTIVE: To compare differences in dementia recognition and treatment, prior to and following the 2003 dementia-care policies, between two cohorts of AL residents with dementia using secondary data from the Maryland Assisted Living study. METHODS: Demographic and clinical variables of 248 residents with dementia, enrolled in either Phase I (2001-2003) or Phase II (2004-2006) of the MDAL study were compared. Dementia treatment was rated by a multidisciplinary consensus panel of experts. RESULTS: Cohort I residents had been in AL longer ($p<0.001$), were more cognitively impaired ($p=0.045$), and had greater neuropsychiatric symptomatology ($p<0.001$). Staff- recognition of dementia was better in Cohort I (77% vs. 63%, $p=0.011$), with no significant differences in family-recognition (86% vs. 85%, $p=0.680$), or complete treatment ratings (52% vs. 64%, $p=0.060$). In multiple logistic regression, cognitive impairment and neuropsychiatric symptomatology were associated with higher odds of staff-recognition, after controlling for covariates.

Increased age and neuropsychiatric symptoms contributed to incomplete treatment ratings. Cohort did not interact with other significant variables. CONCLUSION: This secondary analysis did not provide evidence that Cohort II had higher dementia recognition or treatment rates than Cohort I, as hypothesized. The effect of dementia training regulations and facility adherence to regulations bear more direct and comprehensive investigation.

### NURSING AIDE REPORTS OF PHYSICAL ASSAULT BY LONG-TERM CARE RESIDENTS WITH DEMENTIA: THEORETICAL AND METHODOLOGICAL IMPLICATIONS

D.G. Morgan[1], N.J. Stewart[2], M. Crossley[3], C. D'Arcy[4], D.A. Forbes[5], A. Cammer[1], *1. University of Saskatchewan, Canadian Centre for Health & Safety in Agriculture, Saskatoon, Saskatchewan, Canada, 2. University of Saskatchewan, College of Nursing, Saskatoon, Saskatchewan, Canada, 3. University of Saskatchewan, Psychology, Saskatoon, Saskatchewan, Canada, 4. University of Saskatchewan, Applied Research/Psychiatry, Saskatoon, Saskatchewan, Canada, 5. University of Western Ontario, School of Nursing, Saskatoon, Saskatchewan, Canada*

Physically aggressive behaviors are common among long-term care residents with dementia. This paper describes nursing aide (NA) reports of assault from residents, and methodological and theoretical implications. The conceptual framework, attribution theory, proposes that beliefs about the causes of events influence emotional reactions, distress, expectations for the future, and behavioural responses. NAs used a structured prospective event-reporting "log" or diary to document incidents over 144 consecutive work hours, noting time of occurrence, place, activity, emotional and behavioural responses, perceptions of cause(s), ability to control or change the cause and to prevent similar behaviour in the future, and residents' ability to control their behaviours. Eight-three NAs in 11 rural long-term care facilities in Saskatchewan, Canada, reported a total of 411 incidents. Most occurred in residents' rooms during dressing, transferring, and toileting, and were attributed to resident-level factors (not wanting care, cognitive impairment). A serendipitous finding was that NAs were reluctant to document incidents for fear of being blamed. In subsequent focus groups NAs reported many organizational level factors (e.g., lack of staff, work routines) that influenced their care practices (e.g., rushing residents despite knowing that this often leads to aggression). Organizational-level factors, and NAs' beliefs about their professional role (e.g., to help residents and protect their safety and dignity), had more impact on their behaviour than their causal attributions. Knowledge translation theory, which examines the impact of broader contextual factors on use of best practices, better describes these events than attribution theory, which focuses on the staff-resident dyad.

## SESSION 1785 (PAPER)

### INNOVATIVE INTERVENTIONS FOR PERSONS WITH DEMENTIA

### I'LL SHOW YOU THE WAY: RESIDENTS HELPING OTHERS WITH DEMENTIA

A.D. Peeples[1,2], A. Frankowski[2], E. Roth[2], *1. Doctoral Program in Gerontology, UMBC/UMB, Baltimore, Maryland, 2. Center for Aging Studies, UMBC, Baltimore, Maryland*

In many residential settings for older adults there is a mix of residents with and without dementia or other cognitive declines. This paper examines the ways in which residents free of cognitive decline guide, assist, advocate for, and otherwise help residents living with dementia. Data for our analysis was drawn from over 450 reflexive interviews and fieldnotes compiled during 30 months of conducting ethnography at five multi-level senior housing settings (comprised of an active adult neighborhood, a continuing care retirement community, independent living apartments, assisted living suites including dementia specific units, and/or nursing homes). Our findings suggest that the stigma associated with dementia is often mediated by the desire to help those who are in need, which in some cases results in friendships. Although the examples and case studies focus primarily on residents, data is also drawn from narratives of family members, managers, support staff, and direct care aides. In this presentation the interpersonal and social dynamics of these relationships are discussed, as are the environmental influences of each discrete setting on the potentially stigmatizing aspects of dementia. We also explore the ways in which people with dementia are stigmatized, offering some insight into the varying responses of residents. Support for this paper comes from a multi-year, qualitative NIA-funded study, Stigma and the Cultural Context of Residential Settings for the Elderly (P.I., J. Kevin Eckert).

### A RESTRAINT FREE TRAINING PROGRAM: DEVELOPMENT, OBJECTIVES AND PRELIMINARY DATA

C. Rummel, C. Garrison-Diehn, J. Fisher, C. Drossel, C. Catlin, *University of Nevada - Reno, Reno, Nevada*

Dementia currently affects over 50% of residents in long-term care facilities. Prevalence rates of behavioral challenges (e.g. agitation, delusional speech) in individuals with dementia have been reported at over 60%. A growing body of research indicates that conceptualizing behavioral challenges as "non-cognitive psychiatric symptoms of the dementia" leads to under-treatment of reversible causes of behavior change (e.g., pain, medication side effects, infection, delirium, fear). The practice of administering psychotropic medications as the first line of treatment for behavior challenges is one of the most serious consequences of misattributing challenging behaviors to dementia. Psychotropic medications used for behavioral management in persons with dementia have been found to increase excess disability and mortality. This paper will describe a state-wide restraint-free training program based on the functional analytic model of dementia that is being implemented within facilities across Nevada. The goal of this program is to reduce chemical restraint and increase effective care for residents with dementia. The development, aims and preliminary data of the training program will be discussed.

### TRANSITIONING RESEARCH INTO THE COMMUNITY: MAINTAINING FIDELITY, IMPLEMENTATION STRATEGIES, AND EVALUATION OF PARTICIPANT RESPONSE

S. Bollin[1], C. Conley[1], H. Menne[2], *1. Alzheimer's Association, Northwest Ohio Chapter, Toledo, Ohio, 2. Benjamin Rose Institute Margaret Blenkner Research Institute, Cleveland, Ohio*

The transition of an evidenced-based research program into the community can be a challenging yet rewarding benefit to a service organization. Research and evidenced-based programs enhance organizations and provide viable methods for measuring program impact. Organizations struggle with implementing evidence-based programs, in particular, in relationship to determining methods for maintaining fidelity, evaluating participant response to the program, and managing program implementation that is relevant and impacts the organizational mission. As evidenced-based programs are integrated into organizations, trends for adoption, integration and evaluation must be identified and explored. The evidenced-based program Reducing Disabilities in Alzheimer's Disease (RDAD), is being implemented in a community-based setting in the state of Ohio with support from the Administration on Aging. As the program transitions from an evidenced-based research project to a replication site, it is important to retain integrity while measuring ability to replicate and program impact. This presentation will a) identify strategies utilized in the replication of an evidenced-based research program, and b) present evaluation data demonstrating the broader impact of the program implementation, effectiveness, and adoption. For example, thirty families have completed the first 3 months of the evidence-based program, and average satisfaction scores (which were asked on a scale of 1=very dissatisfied to 4=very satisfied) range from 3.80-3.97, suggesting that participating families are responding well to the program. The solutions achieved in order to address evaluator and organizational struggles demonstrate the importance of a collaborative approach to the replication of evidence-based programs which may be applicable in various community settings.

## SESSION 1790 (PAPER)

## INTERVENTION STRATEGIES FOR IMPROVING COGNITION

### GIST-BASED REASONING TRAINING IN COGNITIVELY NORMAL SENIORS

R. Anand, S.B. Chapman, A. Rackley, M.W. Keebler, J.E. Zientz, J. Hart, *The University of Texas at Dallas, Dallas, Texas*

Cognitive impairment is a key factor that threatens functionality and quality of life in seniors. Given the projection that the population of individuals 65 years of age and older will double within the next 25 years, there is a critical need to examine the benefits of cognitive training programs that target higher order cognitive skills such as gist-based reasoning to maximize cognitive capacity in later life. This study examined the effects of eight hours of gist-based reasoning training in 26 cognitively normal seniors between the ages of 64-85 years (M = 74.23, SD = 6.67). Participants received cognitive training in groups of no more than five individuals. The focus of the training was to teach cognitive strategies including inhibition, organization, inference, and generalization to construct gist-based abstract meanings from the details using a wide variety of information sources such as articles, short stories, and audio clips. Findings suggest that top-down strategy-based gist reasoning training significantly improved abstraction ability (p = .02) as well as generalized to untrained measures of executive function including cognitive switching (p = .03) and verbal fluency (p = .005). Individuals with lower baseline ability to abstract gist showed the greatest gain in the target domain trained. These findings highlight the potential value of engaging in cognitively challenging activities that target gist-based reasoning to strengthen cognitive potential with aging.

### THE EFFECT OF VISUAL SPEED OF PROCESSING TRAINING ON MIDDLE-AGED AND OLDER ADULTS WITH HIV

D. Vance, P.L. Fazeli, L.A. Ross, M.L. Ackerman, *School of Nursing, University of Alabama at Birmingham, Birmingham, Alabama*

By 2015, half of the U.S. HIV population will be 50 and older. Unfortunately, those aging with HIV are more vulnerable to cognitive and functional deficits. In this study, 52 middle-aged and older adults (Mage = 51.5 years; range 40.7 – 70.6 years) with HIV were randomly assigned to a visual speed of processing training condition or a no-contact control condition. In the visual speed of processing training condition, participants received 10 hours of computerized visuo-cognitive exercises. At baseline and posttest, the following measures were administered: Useful Field of View (UFOV®) Test, Wisconsin Card Sorting Test, Finger Tapping Test, and the Timed Instrumental Activities of Daily Living (TIADL) Test. Controlling for baseline performance, ANCOVAs were used to examine treatment effects on these measures between the two groups at posttest. Treatment effects were detected on UFOV®, F(2,40) = 5.61, p = .022; the visual speed of processing training group improved on their UFOV® performance. Furthermore, transfer of training was observed on the TIADL Test, F(2, 37) = 4.104, p = .05; the visual speed of processing group improved their speed and accuracy in performing these laboratory instrumental activities of daily living. Next, we examined the relationship between the cognitive measures and performance on the TIADL Test; only baseline (r = .52, p = .001) and posttest (r = .48, p = .001) UFOV® scores were significantly related to baseline and posttest TIADL performance, respectively. This study emphasizes that computerized cognitive remediation therapy may benefit cognitive and everyday functioning in this growing population.

### CUE COLOR AND FAMILIARITY AS ENVIRONMENTAL AIDS IN WAYFINDING FOR OLDER ADULTS

R. Davis, *Kirkhof College of Nursing, Grand Valley State University, Grand Rapids, Michigan*

Older adults often have problems wayfinding in unfamiliar environments. We examined the contributions of specific properties of cues (landmarks) – color, familiarly, and the number of cues - in wayfinding in community dwelling older adults. Using a virtual reality program, 133 subjects in 3 age groups (55-64, 65-74, and > 75) were asked to find a hidden target. The test required the subjects to learn and remember the location of the hidden target only using environmental cues. Subjects were tested in four cue conditions repeatedly over three days. Each cue condition varied with respect to the color and familiarity of the cues. Place learning performance included latency (time it took to find the target) and distance traveled to the target. Other measures were included in the analysis, including age group, cognitive ability, and computer experience. Subjects found the hidden target the fastest (F(3,2922)=13.16, p<.0001) and with the shortest distance traveled (F(3, 3100)=5.173, p=.002) when cues were both colorful and familiar. The youngest age group outperformed the oldest age group overall. There was a group by day interaction for latency (F(4, 2950)=3.61, p=.006) and distance traveled (F(4,3111)=2.70, p=.030) with the older adults showing worse performance than the younger and not showing learning until day 3 of testing. MMSE also interacted with day of testing for latency (F(2, 2925)=5.86 p=.003) and distance traveled (F(2, 3111)=6.45, p=.002) showing that those with higher MMSE scores (better cognition) performed better than those with lower MMSE scores.

### SUBJECTIVELY APPRECIATED BENEFITS FROM COGNITIVE FITNESS INTERVENTIONS IN OLDER WOMEN

V. Klusmann[1,2], A. Evers[1], R. Schwarzer[2], I. Heuser[1], *1. Psychiatry and Psychotherapy, Charité Universitätsmedizin Berlin CBF, Berlin, Berlin, Germany, 2. Freie Universität Berlin, Berlin, Berlin, Germany*

In a recent randomized controlled trial we showed that a mental and a physical activity program were effective to enhance or maintain cognitive fitness. A positive perception of one's own cognitive fitness is an important condition for high self-efficacy beliefs and, thus, can sustain independence in old age. Here, we pose the question whether objective cognitive benefits are reflected in subjective perceptions of memory and concentration. Healthy women (*N* = 259), aged 70 to 93 years, were randomized to participate for six months in either computer lessons or physical exercises or as controls. In addition to pre-post-tests of memory and executive function, perceived changes in memory and concentration were captured at baseline, at four and at six months and at a ten-month follow-up. Multilevel linear modelling was used to compare trends over time. Despite comparable objective cognitive benefits from the mental and the physical interventions (in contrast to the control group), only the women in the computer course perceived benefits in memory, *F*(2, 707.9) = 4.31, *p* = .01, and concentration, *F*(2, 714.2) = 4.75, *p* = .009. The exercise group, in contrast, rated only physical health as having improved, *F*(2, 562.0) = 4.63, *p*= .01. The perception of cognitive benefits seems to be biased towards the obvious type of interventions, i.e., gains are perceived in the corresponding activity domain only. A sensitization for transfer effects could enhance motivation and satisfaction with the outcomes in participants of intervention programs and may also be beneficial in terms of practical relevance.

## SESSION 1795 (SYMPOSIUM)

### LESBIAN, GAY, BISEXUAL, AND TRANSGENDER AGING: RELATIONSHIPS, REPRESENTATIONS, AND RESILIENCY

Chair: *B.R. Grossman, Health Science, San Jose State University, San José, CA, California*

The trajectories of lesbian, gay, bisexual, and trans (LGBT) people are unique from those of their heterosexual counterparts. Heterosexism and homohpobia (as well as bi- and trans- phobia) shape the lives and experiences of LGBT people, not only in young adulthood but also in middle and old age. Across the lifecourse, LGBT people (re)negotiate their relationships, especially intergenerational familial relationships, and identities in the context of these institutionally supported forms of discrimination. LGBT people also demonstrate resiliency in the new forms of community, civic engagement, and family they create as means of survival. This symposium brings together members from the Rainbow Research Group, an informal Interest Group of GSA, to explore the role of relationships, representations, and resiliency for LGBT older people. The papers in the symposium highlight the ways in which LGBT identity can: influence relationships with biological family members, be (re)presented through digital media in ways that both fight and reproduce stereotypes for older adults, and serve as an important starting point for theorizing strategies to promote resilience and visibility.

### DECREASING VULNERABILITY AMONG LESBIAN, GAY, BISEXUAL, AND TRANSGENDER ELDERS: A CRITICAL INTERACTIONIST APPROACH

P. Burbank, D. Martins, *Nursing, University of Rhode Island, Kingston, Rhode Island*

Lesbian, gay, bisexual, and transgender (LGBT) elders are an invisible, vulnerable minority with unique needs. They face marginalization and reduced social power on several fronts – because of their age, sexual orientation, and gender as most are women. This paper describes a new theoretical perspective, critical interactionism, and its application to research and practice to help decrease vulnerability and improve health of LGBT elders. Critical interactionism combines symbolic interactionism and critical theory, typically viewed as divergent theoretical perspectives, so that both micro and macro levels of issues facing LGBT elders come into focus and strategies for change across individual and societal levels can be developed and applied. New research questions emerge from this perspective with expanded possibilities for theory development and the potential for innovative practice strategies that can address individual client and larger system problems through empowerment of LGBT clients and health care professionals who care for them.

### HOW THE DISCOVERY OF A GRANDCHILD'S GLBQ SEXUALITY IMPACTS GRANDPARENT-GRANDCHILD RELATIONSHIPS

K. Scherrer, *University of Michigan, Ann Arbor, Michigan*

Sexual orientation is an under-examined aspect of U.S. families that has emerging relevance to contemporary family life as younger adults are increasingly likely to "come out" as gay, lesbian, bisexual and queer (GLBQ) and insist on inclusion in their families of origin. Extant research on GLBQ family relationships has been largely myopic in its focus on parent-GLBQ child relationships, leaving a noticeable absence in the literature of the perspectives and experiences of grandparents themselves, and to a lesser extent of GLBQ grandchildren. This research project examines: How does the discovery of a GLBQ grandchild's sexual identity shape the relationship between grandparents and their adult grandchild? To respond to this question, I utilize 24 in depth qualitative interviews with 13 grandparents and 11 GLBQ adult grandchildren from the same family to better understand their changing relationship after a grandchild has "come out." I attend particularly to how these relationships have changed over time within in a family context. Findings indicate that "coming out" may have less salience for grandparent-grandchild relationships than other family relationships. Findings also indicate that "coming out" may facilitate closeness in grandparent-grandchild relationships, while at the same time may also reveal sexuality specific intergenerational differences in family expectations, such as with marriage or geographical proximity. After attending this session, participants will be able to describe how sexual orientation may impact grandparent- GLBQ adult grandchild relationships.

### IN THE SHADOW OF SEXUALITY: OLDER AFRICAN AMERICAN SEXUAL MINORITIES, HEALTH AND SOCIAL SUPPORT

M.R. Moore, *1. Sociology and Resource Centers for Minority Aging Research, University of California, Los Angeles, Los Angeles, California, 2. UCLA Resource Centers for Minority Aging Research, Los Angeles, California*

This work examines the interaction of racial group membership and sexual orientation as it relates to dimensions of social support. It analyzes participant-observation, focus group and interview data from a pilot study of 25 African-Americans born before 1955 who self-identify as lesbian, gay, bisexual or same-gender-loving. Despite sexual minority status, many older gay racial minorities report close relationships with family members but remain distant in the types of information they are willing to share about their lives. They provide substantial instrumental support to kin but may not receive sufficient emotional support to mitigate experiences of loneliness and social isolation that increase with age. These findings have implications for how we conceptualize "open" and "hidden" expressions of gay sexuality in older cohorts, the relationships aging sexual minorities have with others in their families and racial communities, and the development of interventions to address health inequities for this population.

### METHODOLOGICAL CHALLENGES IN STUDYING RARE, INVISIBLE AND MARGINALLY VISIBLE GERIATRIC POPULATIONS: EXAMPLES FROM TRANSGENDER AGING RESEARCH

T.M. Witten, *Center for the Study of Biological Complexity, Virginia Commonwealth University, Richmond, Virginia*

With the increasing interest in studying the GLBTI-identified populations, there is a concurrently growing interest in exploring the aging experience of GLBTI elders. While the literature in this area has been growing over the past few decades, little has been written about methodological challenges surrounding research with these populations and in particular methodological issues around aging-related studies. In this presentation we discuss some of the important methodological challenges that arise when studying rare, invisible or marginally visible geriatric populations with a special focus on how to work with transgender-identified populations.

### "WELL-EXPERIENCED DADDIES" AND "MATURE WOMEN" - REPRESENTATIONS OF OLD AGE AND AGEING BODIES IN WEB-BASED GLBTQ COMMUNITIES

A. Siverskog, *National Institute for the Study of Ageing and Later Life, Linköping University, Norrköping, Sweden*

Old persons are often considered asexual while simultaneously the concept of successful aging includes ideal of an active sex life in old age. These contradictory discourses surrounding old age and sexuality raise questions of old people's possibilities to express desires and wishes for intimacy, sexuality and sex. These questions are even more relevant considering sexual minorities whose sexuality often caused feelings of shame and stigma during their life course. This paper explores how persons aged 60 and over, who are identifying as homo-, bi-, transsexual or queer, present themselves and their ageing bodies through personal profiles in two different web-based GLBTQ communities. The paper focuses the self presentations and how what is sought – friends, partners, and sexual contacts – is described. It also explores how social positions as class, gender, ableness and age are interconnected and accentuated when presenting the self.

# SESSION 1800 (PAPER)

## LIVING WITH CHRONIC ILLNESS

### GENDER VARIABILITY OF PSYCHOLOGICAL DISTRESS AND PAIN: EXAMINING THEIR INFLUENCE ON SEXUAL ACTIVITY AND BODY IMAGE IN OLDER CANCER PATIENTS

J. Krok[1], T. Baker[1], S. McMillan[2], *1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. Moffitt Cancer Center, Tampa, Florida*

Psychological distress is common symptom often reported by patients experiencing a chronic medical illness. This is relevant particularly among older adults reporting cancer-related pain. This prospective study examined the impact of cancer pain and psychological distress (i.e., worry, body image) in a sample of older adults (N=232) receiving outpatient services from a large comprehensive cancer center. Preliminary data indicated that 79% of the participants reported pain (83% of the women), and that women were also more likely to report their pain as cancer-related (61%). In examining psychological distress, we found that sexual inactivity, sleep problems, and body image were the most severe and distressing symptoms related to cancer treatment for men and women. Analyses further indicated that severity and distress of sexual problems and body image issues were moderately correlated with reports of sadness (r=.50, p<.001), worry (r=.54, p<.001) and nervousness (r=.51, p<.001) Being older (b=.046, p<.01) and white (b=1.17, p<.01) were found to be associated with the severity of sexual problems among this sample of adults (F6,43 =2.84, p<0.05). Pain severity, however was not a significant indicator (p = .071). This finding warrants further study. Our results emphasize the need for further studies examining psychological indicators, and the impact they have on body image perceptions and sexual activity in older cancer patients.

### WATCHFUL WAITING OR ACTIVE SURVEILLANCE: LABEL AFFECTS ON ACCEPTANCE OF MONITORING PROSTATE CANCER

D. Bailey[1], A. Cooper[2], M. Luce[3], K. Weinfurt[4], M. Wallace[5], *1. Duke University School of Nursing, Durham, North Carolina, 2. Duke University Social Science Research Institute, Durham, North Carolina, 3. Duke University The Fuqua School of Business, Durham, North Carolina, 4. Duke University Department of Psychiatry and Behavioral Sciences, Durham, North Carolina, 5. Fairfield University School of Nursing, Fairfield, Connecticut*

The value of prostate-cancer screening remains an open question and has recently been called a public health disaster. Many men diagnosed with disease as a result of such screening pursue aggressive treatments that have significant, deleterious effects on their quality of life (QoL) but do not necessarily prevent problems or prolong life. Close observation for appropriately selected patients may maintain QoL without increasing the chance of the cancer spreading. Yet few men who are eligible for this non-invasive approach to early-stage, localized prostate cancer pursue monitoring instead of invasive treatment. We used a randomized experimental exposure administered via an online questionnaire to examine the way in which a variety of labels made monitoring (rather than invasive treatments) more appealing to 600 men at risk for prostate cancer. In this paper we present our findings, which include a relatively high level of acceptance for monitoring among our subject population, and relatively little variation across the different labels whose impact we explore. We will discuss the implications of these findings for further research and clinical practice.

### THE BENEFITS OF AGE ON DEPRESSION AND ANXIETY SYMPTOMS AMONG END-STAGE LIVER DISEASE PATIENTS

A. Eshelman[2], M. Abouljoud[2], T. Meyer[2], D. Fischer[2], D. Moonka[2], D. Paulson[1,2], K. Brown[2], *1. Institute of Gerontology/Dept. of Psychology, Wayne State University, Detroit, Michigan, 2. Henry Ford Hospital, Detroit, Michigan*

Declines in frequency of depression through age 75 have been reported by Teachman and others. Evaluating this trend among patients with end-stage liver disease (ESLD), this longitudinal study compares older and younger, men and women anticipating liver transplant on the Hospital Anxiety and Depression Scale depression and anxiety indices (HADS-D and HADS-A, respectively) and the SF-36 mental health component summary measure (MHCS). The sample included 257 liver transplant surgery candidates ranging in age (18-74 years), with available post-transplant data for 74 participants. In cross-sectional analysis of baseline data, the sample was grouped into tertiles by age. Results of a two-way MANOVA indicated that older participants reported fewer anxiety symptoms than those in either the first (p<.01) or second (p=.01) tertiles, and fewer depression symptoms (p=.05) and better MHCS scores (p=.01) than those in the youngest tertile. Female participants endorsed more symptoms on the HADS-A (F=6.06, p=.02), but not on other measures. Differences between patients based on median split by age, and gender before and after liver transplant on mood, anxiety and global health were evaluated using repeated-measures two-way ANOVAs. Results indicate improvements across all measures following transplant (p<.01) and no significant interaction by age. Between-subjects, older participants reported fewer symptoms on the HAD-A (F=7.03, p=.01) and HAD-D (F=3.87, p=.05), and better functioning on the MHCS (F=4.77, p=.03). These results suggest that the normative decline of depression and anxiety symptoms throughout adulthood is robust despite ESLD and liver transplant. These findings contribute to the literature regarding emotional development in late adulthood.

### JUST TRYING TO FIND MY WAY: A LONGITUDINAL STUDY OF AGING WITH HIV AMONG OLDER AFRICAN AMERICANS IN DETROIT

A.L. Nevedal, *Wayne State University, Detroit, Michigan*

Older adults represent approximately 25% of all HIV/AIDS cases, but research estimates that the percentage will increase to 50% by the end of 2015. This increase is due to advancements in Highly Active Anti-retroviral Therapy (HAART) allowing people to live longer with HIV and improved awareness and HIV testing of older adults. People with HIV are living longer and into old age, yet little is known about the long-term socio-cultural consequences of aging with a stigmatizing and chronic illness or how HIV alters the aging experience. Findings are reported from dissertation research building on a longitudinal study of African Americans with HIV [RO1AI49113-01]. Semi-structured, in-depth, interviews were conducted among older African Americans with HIV (N=14). Drawing from a longitudinal data-set, the experience of living with HIV is analyzed at three time points (project beginning/end, dissertation follow-up), providing up to seven years of information on HIV experience for each participant. Becker's framework of life course disruption and reorganization were utilized to discover and describe the socio-cultural consequences of aging with HIV. Qualitative analyses reveal how HIV disrupts the life course and the ways older adults learn to live with HIV despite major disruptions to intimate and sexual relationships. Anthropological inquiry into this population can provide insight into the influence of stigma on normative life course transitions, possible sources of resilience, and insights into aging provided by HIV experience.

## SESSION 1805 (SYMPOSIUM)

### QUALITATIVE DATA: UNCOVERING MEANINGS AND SUBJECTIVE EXPERIENCES IN AGING RESEARCH

Chair: *A. Kydd, Health Nursing and Midwifery, university of the west of scotland, Hamilton, Lanarkshire, United Kingdom*
Discussant: *C. Brown, Seasons of Life LLC, Parker, Colorado*

Qualitative researchers observe people in their natural settings and attempt to interpret or make sense of phenomena in terms of the meanings people bring to them (Denzin and Lincoln, 2003). Qualitative data embraces the uniqueness of the individual and seeks to explore and uncover meanings and subjective experiences as perceived by the individuals participating in the research. Brett Davies(2007) states that qualitative research is a situated activity that locates the observer in the world. The debate between quantitative research and qualitative research continues, with advocates of the two methodologies entrenched in arguments on scientific rigour and the search for 'truth'. This symposium is not concerned with arguing which methodology is best; it acknowledges that the best method is that which serves to address the answer to the research question (Robson, 2002). It is however concerned with illustrating how each author has used a qualitative methodology in a rigorous manner in order to look at meanings and subjective experiences from the participants involved in studies on aging research. Each paper will address the qualitative methods used and outline the strengths and limitations of the approach. The symposium hopes to attract both qualitative and quantitative researchers, plus new researchers and experienced researchers, to listen to the papers presented and participate in the discussion on the research approaches used by each author.

### SOCIAL NETWORKING FOR THE ELDERLY: SUSTAINING COMMUNICATIONS IN TRANSITIONS

M.D. Williams, *CaringFamily, LLC, Boulder, Colorado*

Elders transitioning to assisted living and skilled nursing environments often lose connection to their social networks. CaringFamily has created an Internet service (the Family Connections Service) that re-establishes, enhances and influences the communications of an elder and their Social Support Network. Each member of the network uses mechanisms already tuned to their personal skills, knowledge and inclinations. Most elders use pen & paper. Family members use common digital tools (e.g. email, Internet, camera-phones). Staff use computers, pen & paper and artifacts made available at the facilities (e.g. binders, kiosks filled with colorful cards, instant cameras). The volume of data automatically collected is huge. We are observing an explosion of communications phenomena. A research workbench has been created to support online consenting and collection of survey data. The survey response rate has been, surprisingly, running about 90% across different studies. The phenomena we are observing demand a wide array of mix methods study.

### USING ETHNOGRAPHIC ANALYSIS TO IDENTIFY CONFLICT BETWEEN QUALITY OF LIFE AND QUALITY OF CARE IN THE NURSING HOME

T.A. Allison, *Medicine, UCSF/Jewish Home, San Francisco, California*

This research utilizes participant-observation methodology and ethnographic analysis in order to examine the tension between social and medical models of care in the nursing home. Ethnomusicology research methods provide insight into larger quality of life (QOL) and quality of care (QOC) issues in institutional care. The data includes two years' worth of observations of and participation in songwriting and sing-along groups. Ethnographic analysis reveals disruptions in nursing home residents' attempts to learn and to create a sense of community within the institution. Nursing home residents encounter routine, often painful, interruptions to scheduled activities programs because of medical orders for medications and blood sugar checks. If we are to develop humane models of institutional care for our elders, we can utilize ethnographic methods in order to better understand the human desires of elders (QOL), and the disruptions that arise in the process of providing quality medical and nursing care (QOC).

### HOW COUPLES COPE WITH HEARING LOSS IN LATER LIFE: LESSONS LEARNED FROM A QUALITATIVE PILOT STUDY

T.A. LaPierre[1], M.C. Jiregna[2], S.H. Ferguson[2], *1. The Gerontology Center, University of Kansas, Lawrence, Kansas, 2. University of Kansas, Lawrence, Kansas*

Research suggests that hearing loss in one or both partners can have a significant impact on marriage. This pilot study used semi-structured interviews with questions targeting problems couples might face in their marital relationship due to hearing loss. Participants were seven couples aged 69-85, interviewed separately. Prior to the interview, each spouse completed a questionnaire in which they reported their hearing status, their assessment of their spouses hearing status, length of marriage, and marital satisfaction. Participants' hearing assessment results were also examined. Although participants reported that hearing loss did not have a direct impact on their marital relationship a number of communication challenges were reported. The meaning attributed to the experience of hearing loss emerged as a potential link between hearing loss and marital satisfaction. Lessons learned during the course of the pilot study will be discussed in light of their personal application to future qualitative and quantitative research projects.

## SESSION 1810 (POSTER)

## RESEARCH METHODS

### DEVELOPING A PREDICTIVE MODEL FOR ELDERLY DEPRESSION: DOES NEIGHBORHOOD MATTER: RESULTS FROM A REGRESSION ANALYSIS USING THE NYC HEALTHY INDICATORS PROJECT

W.D. Cabin, *Stockton College, Glen Rock, New Jersey*

Depression occurs at significant rates in the United States and New York City among the general population, adult population, and elderly population. Depression has negative physical and mental health, psychological, and financial consequences for the person experiencing depression, as well as their friends, family, and caregivers. 90% of American and New York City elderly are community-dwelling, non-institutionalized, living in neighborhoods. An extensive literature review indicates there is some consensus on individual-level characteristics which are risks for depression. However, there is limited research, with mixed results, on the influence of neighborhood characteristics on depression in the general population and the adult population. The research indicates some limited, mixed support for the influence of neighborhood characteristics, with study limitations. There are only a few studies which address the inter-relationship of multiple individual and neighborhood level characteristics on a path to depression. The literature is even more limited, in fact understudied, on the influence of neighborhood-level characteristics on elderly depression and the inter-relationship of individual and neighborhood-level characteristics on the path to depression among the elderly. This paper explores the ability of data analysis of the Healthy Indicators Project (HIP) to better inform knowledge on the issue, resulting in a predictive model of eight variables which are statistically significant predictors of elderly depression. The model finds depression is highest with: visual impairment, frequent falling, lower income, little leisure-time physical activity, low neighborhood satisfaction, trouble hearing, arthritis/rheumatoid arthritis, and being disabled. Limitations and implications for future research, policy and practice are discussed.

### TRANSDISCIPLINARY TRANSLATIONAL RESEARCH ON AGING: THE CORNELL-COLUMBIA EDWARD R. ROYBAL CENTER

E. Wethington[1], C. Reid[2], R. Meador[1], K. Pillemer[1,2], *1. Human Development, Cornell University, Ithaca, New York, 2. Weill Cornell Medical College, New York, New York*

Transdisciplinary research has emerged as a national priority in health research. The aims of the Cornell-Columbia Edward R. Roybal Center, the Translational Research Institute on Pain in Later Life (TRIPLL, 2009-2014), are to foster transdisciplinary translational scientific research on pain in older people through an innovative pilot studies program and investigator development infrastructure and to evaluate the impacts of Roybal Center programs on investigator development, institutional change, and community capacity for supporting research. Community translation is a particular focus, and community partnerships are encouraged. This presentation reports on an ongoing evaluation of outcomes produced by the Cornell Roybal Center (1993-present) as it has transformed in response to the federal mandate for translational research. Evaluated outcomes included: 1) implementation of trans- or multi-disciplinary perspectives in research; 2) investigator productivity and other indicators of strategic career development; 3) investigator adoption of methods outside of their disciplinary base; 4) participation in Roybal investigator development events; 5) institutionalization of Roybal seminars in university programs; 6) reports produced and disseminated for practice audiences; 7) incorporation of community stakeholders in research proposals and publications; and 8) adoption of research-based policy and practice change in services for older people. Outcomes were analyzed in relationship to Roybal program development, investigator characteristics, and institutional changes. Investigator productivity increased after the adoption of formal transdisciplinary mentoring. Institutional support for translational research increased in response to federal initiatives, with the Roybal Center serving as a base for translation to the community. A state-wide translational research infrastructure is in the planning stages.

### USE OF THE CALIFORNIA OLDER ADULT STROOP TEST IN A LONGITUDINAL STUDY

M. Currell[1], K. Thompson[1], G. Byrne[1,2], N.A. Pachana[1], *1. University of Queensland, Psychology, Brisbane, Queensland, Australia, 2. University of Queensland, Psychiatry, Brisbane, Queensland, Australia*

Background: The California Older Adult Stroop Test (COAST) is a version of the Golden Stroop designed specifically for older adults, with a number of features that make it more suitable for an aging population. These include a reduced number of items to limit the effects of fatigue on performance scores and larger type to take account of normal loss of visual acuity. Additionally, the COAST utilizes red, yellow and green colors to limit reduced performance due to blue green color confusion that frequently occurs with advancing age. The COAST has demonstrated excellent psychometric properties in a wide range of healthy and clinical populations, including individuals with mild to moderate dementia. Method: The COAST has recently been used as part of the well-characterized Longitudinal study of Aging in Women (LAW). The LAW study was established to investigate physical and cognitive changes of women aged 40 to 80 years. A broad neuropsychological test battery, including the COAST, has been administered at 2 year intervals. Results: COAST has shown good convergent validity with the DKEFS Trial Making Test Number Letter Sequencing (completion time), $r = .560$, $n = 352$, $p < .01$ and the DKEFS Tower of London total achievement score, $r = -.356$, $n = 374$, $p < .01$. Divergent validity and reliability are also excellent. Conclusions: The COAST offers a design and psychometric advantage over more traditional versions of the Stroop not designed for older adults. These results support the use of the COAST for assessing executive dysfunction in later life.

### A FACTOR ANALYSIS OF THE EXECUTIVE INTERVIEW (EXIT) UTILIZING A NURSING HOME SAMPLE

L.A. Gerolimatos, M.R. Nadorff, M. Smith, B. Edelstein, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

The current study examined the reliability and factor structure of The Executive Interview (EXIT), a 25-item measure that tests executive functioning (Royall, Mahurin, & Gray, 1992). The EXIT can be used in a variety of settings, and has been validated on individuals with mild cognitive impairment (Stockholm, Vogel, Gade, & Waldemar, 2005). Scores on the EXIT are significantly related to scores on other measures of executive functioning, including the Stroop test (Stockholm et al., 2005), and the Frontal Assessment Battery (Moorhouse, Gorman, & Rockwood, 2009). It has also been shown to predict behavioral and functional impairment (Royall, Palmer, Chiodo, & Polk, 2005). To date, there has been no research examining the factor structure of the EXIT. The EXIT was examined in a sample of 79 residents ($M = 67$ years old, 53% female) of a state-operated nursing home in West Virginia. Little's MCAR test was not significant, $\chi2 (334, N = 79) = 324.6$, $p = .634$, indicating that the data may be assumed to be missing at random. Missing data were imputed using expectation maximization, which is an appropriate method for exploratory factor analysis (Tabachnick & Fidell, 2007, p. 68). The cronbach's alpha for the EXIT was 0.77, demonstrating acceptable internal consistency. An exploratory factor analysis using maximum likelihood extraction and promax rotation found a nine factor solution that explained 67% of the variance in the measure. The utility of this nine factor solution, as well as their conceptual relation with executive functioning, will be discussed.

### RELIABILITY AND CONSTRUCT VALIDITY OF THE PERCEIVED ENACTMENT OF AUTONOMY IN JAPANESE OLDER ADULTS

M. Matsui, *Nagasaki University, Nagasaki, Japan*

Background:Perceived Enactment of Autonomy (PEA) recognizes that people can sense their own ability act autonomously in meeting needs for both dependence and independence. Little is known about PEA among Japanese people, who are experiencing rapid aging society. The aim of this study was to assess psychometric properties of PEA among community-dwelling older adults in Japan. Method:PEA developed by Hertz (1991) contains 31 positively and negatively worded statements and total scores can range from 31 to 124, with higher scores indicating a higher level of PEA. There are 3 subscales: Voluntariness, Individuality and Self-Direction. Analyzed was internal reliability among 220 older adults. Construct validity was obtained by testing theoretical relationship between PEA and Locus of Control which has two subscales of Internal and External Control. Higher point of External Control indicates less controlled by external factors. The researchers obtained institutional review board approval from Nagasaki University. Results:Cronbach's alpha of PEA was .933 and for subscales were .745 for Voluntariness, .864 for Individuality, and .780 for Self-Direction. Construct validity was shown that PEA and Locus of Control was significant related ($r=.255$, $p=0.003$), especially PEA and External Control ($r=.408$, $p=0.003$), and Individuality and External Control ($r=.415$, $p<0.001$). Conclusions:PEA had satisfactory psychometric properties. It can be used to measure autonomy in the Japanese older adults.

### STORIES FROM OLDER PERSONS EXPERIENCING HOMELESSNESS IN A MODERN SKID ROW NEIGHBORHOOD

P. Carder, J. Mandle, *Institute on Aging, Portland State University, Portland, Oregon*

This poster presents analysis from a qualitative study of individuals who were experiencing homelessness or residing in transitional housing in Portland, Oregon. The project, conducted by a non-profit service organization, was designed to learn how homeless individuals accessed housing and social service programs. The data, based on over 500 interviews, are available for secondary analysis through a public-access website. Secondary analysis is relatively uncommon in qualitative research, and so this paper describes some of the pros and cons of using such a data source. For example, the data had been coded and themes developed by the individuals who conducted interviews, but applied by a set of volunteers who lacked qualitative data training. Thus, we largely ignored the existing code categories and instead started from un-coded data, using grounded theory methods to analyze the 26 interviews that were conducted with individuals who were between the ages 55 and 74 at the time of their interview. Findings indicate that older persons experience problems specific to their age as well as those common to younger adults. Age-specific themes include: being old but not "old enough" for housing and services, work-based job discrimination, and age-related health decline. Themes common to younger individuals included negative societal responses, feelings of stigma, and substance abuse. The poster provides suggestions for addressing the particular concerns of individuals who are not traditionally viewed as "old" but are old for street life. It also offers insights on how to access and use a secondary source of qualitative data.

## DYNAMIC ANALYSES OF THE INTERRELATIONSHIP BETWEEN MOTHERS AND DAUGHTERS ON A MEASURE OF DEPRESSIVE SYMPTOMS

R. Reyes, *University of Southern California, Los Angeles, California*

Much prior research has attempted to analyze a reciprocal dynamic relationship between older parents and their adult children. Mothers are generally more invested in their children's lives and the relationship between mother and adult daughter has been shown to have more emotional ties than that between a mother and her adult son. The goals of this study are to explore the dynamic interrelationship between mother and daughter on depressive symptomatology using longitudinal data. The focal data are based on mothers (mean age = 56) and their biological daughters (mean age = 32) from the University of Southern California's Longitudinal Study of Generations (LSOG). Four kinds of structural equation model (SEM) analyses are presented in order of complexity and each are designed to develop and test specific dynamic structural equation model hypotheses. The model fits of varying dynamic cross-lagged SEMs are compared for goodness-of-fit to various forms of the LSOG data. An initial two-time point regression based model suggests an adult daughter's depressive affect to be a leading indicator of her older mother's depressive symptoms. However, more complex models using more of the available data and advances in measurement models suggest the directionality of such developmental processes are not so simple or uniform. Substantive results are discussed as they pertain to all the models.

## PREDICTORS OF ATTRITION IN A LONGITUDINAL STUDY OF OLDER ADULTS

J. Socha, J.E. Calamari, *Rosalind Franklin University of Medicine and Science, North Chicago, Illinois*

Selective attrition in longitudinal studies poses a serious threat to the validity of conclusions. Relatively little is known about predictors of non-participation in surveys of older adults. The current study examined demographic and functional predictors of attrition in a 2-year longitudinal study of late-life anxiety (N=204). Emotional, cognitive, and physical functioning were assessed via self-report and clinical interview at four six-month intervals. The percent of remaining baseline participants were as follows: 75% (Time 2); 56% (Time 3), and 49% (Time 4). Attrition was classified as loss to follow up, refusal, and mortality/morbidity. Reasons for non-participation could not be ascertained for 28 subjects, who were subsequently excluded from analyses. Multinomial logistic regression revealed age, education, and gender did not significantly influence attrition status. Race (non-white) increased odds of mortality/morbidity attrition (OR= 1.86; p<.043). Unadjusted analyses revealed problematic emotional, cognitive, and physical functioning significantly increased the odds of mortality/morbidity attrition, as reflected by scores on the following self-report measures: Positive Affect Negative Affect Scale (PANAS), State Trait Anxiety Inventory (STAI), Anxiety Sensitivity Inventory (ASI), Short Form Health Survey – 36 (SF-36), and the Memory Functioning Questionnaire. Problematic mental health functioning, as measured by the SF-36, significantly increased the odds of attrition due to refusal. After adjusting for the significant influence of race, only the MFQ, SF-36, and ASI remained significant predictors of mortality/morbidity. Findings suggest emotional, cognitive, and physical functioning are important predictors of mortality/morbidity attrition. Furthermore, self-reports may be more informative in predicting nonresponse among older adults compared to clinical interviews.

## RELIABILITY OF THE QUALITY OF CARE MEASURE FOR DEMENTIA CAREGIVERS

M. Stephens, K. Vo, F. Moise, V. Samarina, E. Rogers, R. Gomez, *Palo Alto University, Palo Alto, California*

This study proposes to examine one of the self-report survey's that has been distributed to caregivers in the Resources for Enhancing Alzheimer's Caregiver Health II (Schulz et al., 2001), a nationwide initiative to help understand the impact of Alzheimer's Disease on caregivers. As part of a larger study, the caregivers were given the 42-item Quality of Care Measure created by the principle investigators of the REACH II initiative (Schulz et al., 2001). In order to examine the internal consistency of the Quality of Care Measure, Chronbach's alpha was calculated for the total sum and four subscales, which include: positive aspects of environment (five questions), hazards in environment (eleven questions), frustrations of caregiving (eight questions), and exemplary caregiving (eighteen questions). Reliability analyses indicated that the total score consisting of 42 items had a moderate reliability of 72.5%. The Positive aspects of environment had relatively poor reliability of 44.8%. The Hazards in Environment had the worst reliability 39.6%. The Frustrations of Caregiving had moderate reliability of 73.5%. The exemplary Caregiving had the best reliability 82.7%.The findings of this study suggests that only the Quality of Care total score and 2 of the 4 subscales (Frustrations of Caregiving and Exemplary Caregiving) are appropriate to measure the quality of care. Positive Aspects of Environment and Hazards in the Environment were unreliable subscales and should not be used in data analyses. This study indicated that researchers should take care in selecting measures with reliable psychometric properties to maintain internal consistency.

## COGNITION IN OLDER ADULTS: A COMPARISON OF RAW AND NORMATIVE DATA

C. Flynn Longmire, J. Mintzer, *Medical University of South Carolina, Charleston, South Carolina*

Cognition in older adults can be characterized by normal age-related changes, mild impairment or dementia. Knowledge is increasing, yet much is unknown about cognitive changes in older adults especially as it relates to Alzheimer's disease, the most common type of dementia. Understanding of changes within various cognitive domains, related risk factors, and possible differences depending on group membership is incomplete. Analysis of such questions often includes many background and medical history variables. Normative data, pre-adjusted for demographics, may be useful in these kinds of analysis. Purpose: This project considered the effectiveness of using demographically-adjusted normative data as compared to analytically adjusting raw data for demographic variables. Methods: 102 older adults from 5 study sites across South Carolina were tested on attention and executive functioning. Linear regressions using raw scores or normative scores were compared to see if the normative scores effectively controlled for the effects of age, education, gender and race. Results: The normative scores controlled for race in all analyses and for the other variables at least once in the sets of models. Variables not completely adjusted for showed inconsistent significance and seemed to interact with other variables, both signs that these effects may be due to sample traits not ineffectiveness of the normative data. Conclusion: Sample effects notwithstanding, normative data can control for the demographic variables for which they are pre-adjusted in older samples, and may serve as analytic tools in the effort to understand the effects of various factors on the cognition of older adults.

### RETROSPECTIVE PILOT STUDY TO VALIDATE A HIGH RISK DISCHARGE SCREENING TOOL

A. Lathia[1], M. Costigan[2], A. Powers[2], L. Benedict[2], S. Fosnight[2], S. Hazelett[2], E. Baum[2], *1. Cleveland Clinic, Cleveland, Ohio, 2. Summa Health System, Akron, Ohio*

The purpose of this study was to test a screening tool designed to identify elderly patients at high risk for hospital readmission and determine its sensitivity. We tested the tool on 20 patients admitted to our Acute Care for the Elderly (ACE) unit who were hospitalized within the last 30 days. A quality improvement committee developed the screening tool to identify patients at high risk for readmission. To test this tool, we reviewed the charts of the current and previous admissions of 20 patients who had been re-hospitalized within 30 days. A score of ≥ 7 was considered positive for identifying a patient at moderate risk for readmission and a score ≥ 15 was considered high risk for readmission. The sensitivity of the screening tool was 80%. Of the 20 readmissions screened, 16 (80%) patients had a positive screen, with 8 (40%) at moderate risk and 8 (40%) at high risk for readmission. Only 4 (20%) patients screened negative. The majority of the patients were readmitted from home (independent living or assisting living). Early identification of high risk patients can facilitate more efficient direction of extra resources for discharge planning. This readmission screening tool appears to be sensitive for identifying patients at high risk for readmission. We are planning to trial this screening tool on patients who were discharged from the hospital and not readmitted, to determine its specificity.

## SESSION 1815 (SYMPOSIUM)

### POSITIVE AND NEGATIVE RELIGIOUS COPING AND MENTAL HEALTH IN VETERAN CANCER SURVIVORS

Chair: *K. Trevino, VA Boston Healthcare System, Brockton, Massachusetts, Harvard Medical School, Department of Psychiatry, Boston, Massachusetts*

Religious/spiritual beliefs are important to the process of coping with cancer. However, researchers have not explored positive and negative religious coping in cancer survivors. Interviews were completed with 48 veterans treated for cancer. The interview assessed experiences with cancer diagnosis and treatment, PTSD, depression, and patterns of positive (PRC) and negative (NRC) religious coping. 27% of participants reported using NRC to deal with their cancer. NRC was associated with lower levels of emotional support, higher levels of PTSD and depression, and greater likelihood of meeting DSM criteria A for PTSD. NRC was also associated with higher levels of posttraumatic growth. 69% of participants reported using PRC to deal with their cancer. No significant relationships emerged for PTSD or depression. However, PRC was associated with higher levels of posttraumatic growth. Certain religious coping strategies are associated with greater psychological distress. Cancer survivors using these strategies may benefit from mental health treatment.

### IS NON-DISCLOSURE TO RELIGIOUS CONGREGATIONS A BARRIER TO SUPPORT FOR OLDER ADULTS WITH HIV?

M. Brennan[1,2], S.M. Strauss[2], S.E. Karpiak[1,2], *1. Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York, 2. New York University College of Nursing, New York, New York*

By 2015, half of those in the US with HIV will be over age 50. This group has a high level of unmet needs and lacks effective social support. As they age, they will need to access community services, perhaps including those provided by religious congregations. However, HIV stigma inhibits many older people with HIV/AIDS (OPLWHA) from disclosing their status. We examined whether disclosure to the congregation would prevent OPLWHA (n=819) from accessing congregational services. Of those who attended religious services (54% attended at least monthly), 47% had not disclosed their HIV status. No significant differences in religious service attendance patterns following HIV diagnosis emerged between those who did and did not disclose. While non-disclosers were somewhat less likely to report congregational support, findings suggest that congregations, despite some inherent stigma, can be a feasible source of community support for older adults with HIV.

### PASTORAL CARE: TALKING ABOUT DEATH AND DYING

E. MacKinlay, *1. School of Theology, Charles Sturt University, Barton, ACT, Australian Capital Territory, Australia, 2. Centre for Ageing and Pastoral Studies, Canberra, Australian Capital Territory, Australia*

This paper reports on one component, (pastoral care), in a mixed study using weekly sessions over 18 weeks for people with dementia who were also depressed. The overall study aimed to evaluate effectiveness of four different programs in lowering depression levels among participants. The twenty-four participants in the pastoral care program were all in residential aged care. Sessions were led by a trained facilitator in five groups, were audio recorded and transcribed and a journal of non-verbal behaviours recorded by a research assistant. Qualitative analysis was conducted using NVivo8 with themes being compared with the format of spirituality in ageing based on a model developed by MacKinlay (2001). One important theme was attitudes to death and dying. The people with dementia freely shared both recent and older loss and grief experiences. The ability of the group facilitator to explore and support the participants was important in supporting the discussion.

## SESSION 1820 (SYMPOSIUM)

### THE INFLUENCE OF PLACE, SPACE AND SOCIAL SUPPORT ON THE HEALTH OF OLDER ADULTS

Chair: *B. Sellars, University of Pittsburgh, Pittsburgh, Pennsylvania*
Discussant: *T.C. Antonucci, University of Michigan, Ann Arbor, Michigan*

Among older adults, health and well-being is not simply influenced by one single context, but rather by the interaction between individual, and the personal and environmental resources that are available. The panel provides four research studies that all underscore the importance of recognizing social support as a factor in the aging process. First, a paper discussing how social support and geographic region (Pittsburgh vs. Memphis) are associated with mortality outcomes among adults will be presented. This study highlights the need to understand both the distal and proximal contexts in which aging occurs. The next presentation will address the role of social support in the diffusion of information among older adults residing in La Crosse, WI who had received knowledge about advanced care programs, as compared to older adults in surrounding areas who had not. This study underscores the need to understand how informational social support is spread within communities of older adults. The next paper addresses the role of social support in the disease specific context of the diabetes illness experience. This study discusses how social support positively impacts disease management in a proximal setting, with implications for future disease-related health problems. In the same vein, the final presentation will address how social capital (e.g., perception that neighbors are willing to help) is associated with self-rated health and ADL performance. This study is an example of how perceptions of social support may aid older adults functioning on daily tasks. A discussant will provide perspectives from psychology.

### EVALUATING THE RESPECTING CHOICES® ADVANCE CARE PLANNING PROGRAM

S.M. Moorman[1], D. Carr[2], K.T. Kirchhoff[3], B.J. Hammes[4], *1. Sociology, Boston College, Chestnut Hill, Massachusetts, 2. Rutgers University, New Brunswick, New Jersey, 3. University of Wisconsin, Madison, Wisconsin, 4. Gundersen Lutheran Medical Foundation, La Crosse, Wisconsin*

Diffusion of information through a social network is an important mechanism by which social support affects health, illness, and mortality (Smith and Christakis 2008). This study examines the potential diffusion effects of the Respecting Choices® advance care planning program that has been administered in La Crosse, WI since 1991. Participants in Respecting Choices® receive help from trained facilitators in discussing and documenting their end-of-life medical care preferences. We use data from a survey of over 5,000 white Wisconsin high school graduates in their mid-60s to assess whether survey respondents who reported having social ties in the greater La Crosse area were more likely than those reporting no ties to the region to have engaged in advance care planning. We find no evidence that the effects of the intervention have extended beyond its direct recipients to persons socially connected to La Crosse. We discuss implications for policy and practice.

### THE RELATIONSHIP BETWEEN SOCIAL CAPITAL AND HEALTH: DOES GENDER PLAY A ROLE?

J. Norstrand[1], S.M. Moorman[2], *1. Philadelphia Corporation for Aging, Philadelphia, Pennsylvania, 2. Boston College, Newton, Massachusetts*

Social capital (SC), including trust, networks and civic engagement, has been linked to better health and lower mortality among older adults. This study examined whether 6 indicators of individual level SC were associated with self-rated health and activities of daily living (ADLs) for men and for women. A sample of 2,329 adults aged 65 and older from Southeastern Pennsylvania were obtained from the Public Health Management Corporation 2008 dataset. Multiple regression analyses revealed that several SC indicators (trust neighbors, sense of belonging, perception that neighbors are willing to help, participation in community groups) were significantly associated with better self-rated health. Only participation in community groups was associated with better ADL performance. These relationships were stronger for women than for men. This differential impact of SC on health has important implications for community based interventions.

### THE INFLUENCE OF SOCIAL SUPPORT AND REGION ON CO-MORBIDITY AND MORTALITY: AN EXAMPLE OF THE BIOECOLOGICAL MODEL OF HUMAN DEVELOPMENT

B. Sellars[1], N.L. Watson[1], S. Spencer[2], R.N. Rooks[3], S. Rubin[4], S. Satterfield[5], T.B. Harris[6], A.B. Newman[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of South Carolina, Columbia, South Carolina, 3. University of Colorado-Denver, Denver, Colorado, 4. University of California-San Francisco, San Francisco, California, 5. University of Tennessee, Memphis, Tennessee, 6. National Institute on Aging, Bethesda, Maryland*

Using the bioecological model of human development as a framework, this study investigates the influences of the microsystem (social support) and macrosystem (Northern vs. Southern U.S. region) on mortality among older adults. The population consisted of 3,075 older adults from the Health, Aging, and Body Composition Study, living in Memphis, TN and Pittsburgh, PA (M= 73.6, SD= 2.9 years; 52% women; 42% Black. Nine hundred and seventy-five deaths (38.8/1,000 p-yr) occurred over approximately 8 years. In a Cox proportional hazards model of all-cause mortality, U.S. region and social support scores were each associated with mortality after adjustment for risk factors and chronic conditions: HR (95% CI) = 1.24 (1.09 - 1.41) for Memphis; 0.82 (0.76 - 0.86) per 10-point higher LSNS score. The association between social support and mortality did not vary by region. These data suggest independent contributions of microsystem and macrosystem environments to mortality risk in older adulthood.

### THE MULTIFACETED ROLE OF SOCIAL SUPPORT IN SHAPING THE DIABETES ILLNESS EXPERIENCE

N.J. Webster, *Case Western Reserve University, Cleveland, Ohio*

Poorly managed diabetes can lead to disease-related complications (i.e, amputations, blindness, and heart disease) and subsequent rapid declines in health. Using a U.S. national sample of adults aged 40-99 with type-II diabetes (N=26,002) this paper examines how social support influences the diabetes illness experience (complications, general health, activity limitations, and self-management). Controlling for demographic characteristics and duration of diabetes, respondents with more social support reported fewer diabetes-related complications. Also, independent of the number of complications, receiving more support was significantly related to better reports of health, fewer health-related activity limitations, and increased self-management (i.e., physical activity, daily servings of fruits and vegetables, and monitoring of blood sugar levels). Findings suggest social support can play a vital role in improving the health of older adults living with type-II diabetes and can foster better management of the condition and therefore has potential to prevent or delay future disease-related health problems.

## SESSION 1825 (PAPER)

## THE QUALITY OF SLEEP

### SOCIO-ECONOMIC PATTERNING OF SLEEP PROBLEMS IN MIDLIFE AND LATER LIFE: THE CONTRIBUTION OF SOCIODEMOGRAPHIC AND HEALTH-RELATED CHARACTERISTICS

S. Arber[1], T. Lallukka[2,1], R. Meadows[1], *1. University of Surrey, Guildford, United Kingdom, 2. University of Helsinki, Helsinki, Finland*

Sleep has been little researched within social gerontology, especially the social patterning of sleep. This paper aims to compare people in midlife (45-64) and later life (65+) in terms of (i) sociodemographic and socio-economic patterning of reported sleep problems; and (ii) health-related explanations for observed socio-economic differences. Methods: Over 4000 people (age 45-64, men=1068, women=1341; age 65+, men=831, women=1047) from the nationally representative UK Psychiatric Morbidity Survey, 2007 were analysed. The interviews included self-reported sleep problems on four or more nights per week. Separate nested logistic regression models for age 45-64 and age 65+ were fitted to examine how sleep problems varied with gender, marital status, worries, smoking, physical/mental health and measures of socio-economic circumstances. Results: In midlife and later life, strong links were found between socio-economic circumstances and sleep problems, particularly low household income, living in public housing, and low educational qualifications. Women reported significantly more sleep problems than men, as did the divorced and widowed compared with married respondents, particularly in midlife. Sleep problems of the divorced/widowed, especially among men, were linked to their more disadvantaged socio-economic circumstances. Reported worries, smoking, and measures of health did not explain the identified associations of disadvantaged material circumstances with sleep problems. Conclusions: Efforts to improve the socio-economic circumstances of older people might help reduce sleep problems, especially among the widowed and divorced. This research is part of 'SOMNIA, Sleep in Ageing', New Dynamics of Ageing initiative, supported by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009).

### MARITAL QUALITY, SLEEP BEHAVIOR, AND OLDER ADULTS' PSYCHOLOGICAL WELLBEING

J. Bookwala, *Psychology, Lafayette College, Easton, Pennsylvania*

Data from 1,485 older adults (mean age=67.8) who participated in the National Social Life, Health, and Aging Project were used to test the indirect effects of marital quality via sleep behaviors on older adults' psychological wellbeing. Measures included marital quality (positive spousal exchanges, negative spousal exchanges, and marital happiness), sleep behaviors (frequency of sharing the same bed with one's spouse, typical number of hours of sleep per night, and restlessness of sleep in the previous week), and psychological wellbeing (depressive symptoms, loneliness, and anxiety). Path analysis testing the mediating role of sleep behaviors in the link between marital quality and psychological wellbeing indicated an excellent fit of the model to the data ($\chi 2[11, N=1485]=12.6, p>.32$; NNFI=.996; CFI=.999; RMSEA=.01). The model explained 26.3%, 21.3%, and 17.1% of the variability in depressive symptoms, loneliness, and anxiety, respectively. Overall, better marital quality was associated with a higher frequency of a shared bed, more hours of sleep at night, and less restless sleep. In addition, more frequently sharing a bed with one's spouse, more hours of sleep, and less restless sleep generally were linked with better psychological wellbeing. The indirect effects of the marital quality indicators on psychological wellbeing via sleep behaviors were statistically significant; the link between marital quality and psychological wellbeing was partially mediated by less frequently sharing a bed with one's spouse and greater sleep restlessness. These results show that among married older adults, sleep behaviors may serve as a mechanism by which poor marital quality explains lower psychological wellbeing.

### SOCIAL AND HEALTH INFLUENCES ON THE SLEEP QUALITY OF OLDER ADULTS LIVING IN THE UK

R. Luff, S. Venn, S. Arber, *Sociology, University of Surrey, Guildford, Surrey, United Kingdom*

The Pittsburgh Sleep Quality Index (PSQI) was designed to measure subjective sleep quality over the previous month and to discriminate between poor and good sleepers. The PSQI includes indicators of sleep latency, sleep duration, sleep disturbances, use of sleep medication, subjective sleep quality and daytime dysfunction. This paper examines how health and social factors influence the quality of sleep of older adults. A self-completion questionnaire which included the PSQI was completed by 1085 older people (575 males and 583 females), from South East England, aged over 65 who were living in their own homes. It was found that about half of older adults scored 6 and above on the PSQI, indicating they experience poor quality sleep. Logistic regression using a range of socio-demographic and health predictor variables was undertaken. Gender, social economic status (SES) and health problems were all significant predictors of poor sleep. In particular, older women reported poorer sleep than men, and those who had been in professional occupations reported better sleep than those in most other SES groups. Greater numbers of health problems were associated with poorer sleep, with cancer and muscular/skeletal conditions specifically relating to higher PSQI scores. There was no effect of age once health problems were entered into the model, suggesting poor sleep amongst older people is not purely age related, but is influenced by more specific health and social factors. We acknowledge support from the New Dynamics of Ageing initiative, a programme supported by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009).

### SLEEP DISTURBANCE IN LATER LIFE: THE IMPACT OF WORRIES AND ANXIETY

S. Venn, S. Arber, *Department of Sociology, University of Surrey, Guildford, United Kingdom*

Background It is widely reported by older people that their sleep patterns have changed with increasing age. Older people report difficulty getting to sleep, problems maintaining sleep, and waking early. Factors that impinge on sleep in later life include poor health, medications, and worries and anxiety. Aims and Methods This paper focuses on the impact of worrying and anxiety on quality of sleep through qualitative interviews (n=62) with men and women aged 65-95, with poor sleep, living in SE England. Results Results indicate a gender difference in the types of worries that disturb older people at night. Women most often reported worrying about family members, whilst men's sleep was disturbed by concerns for their own health, or by general non-specific anxiety. Both men and women also reported worrying at night about the future in terms of financial security and health. Disturbed sleep and reduced sleep quantity were also a cause of anxiety. Strategies to cope with sleep disturbance because of worrying ranged from practical approaches, such as making lists of problems and using relaxation and meditation techniques, to distraction techniques, such as doing household chores or watching television. Conclusions Sleep disturbance caused by worrying is commonly reported by older people and a variety of coping mechanisms are employed to deal with worries, some of which facilitate sleep, such as relaxation techniques, but some delay sleep, such as watching television. Research supported by the New Dynamics of Ageing initiative, a multidisciplinary research programme supported by AHRC, BBSRC, EPSRC, ESRC, MRC (RES-339-25-0009).

### THE CONTRIBUTION OF SLEEP QUALITY TO SELF-RATED HEALTH IN OLDER ADULTS

K.A. Marx[1,2], J. Gaines[1], K.L. Burke[1], J.M. Parrish[1], *1. Erickson Foundation, Catonsville, Maryland, 2. University of Maryland, Baltimore Co., Baltimore, Maryland*

Sleep complaints are common in older adults. Prior research has found poor sleep to be associated with problems in physical, social and mental health domains. The purpose of this study is to examine the contribution of sleep quality on overall self-rated health status in older adults. A cross sectional analysis of 171 older adults participating in the VIVA! study was done (mean age 84.1 years, 76% female). The mean score on the Pittsburgh Sleep Quality Index (PSQI) was 6.3 (sd = 4.0) with a score of five or above indicating poor sleep quality. The PSQI score was significantly correlated with depression (r=.319, p<.001), self-rated health (r=.297, p<.001), life satisfaction (r=.250, p=.001), physical functioning (r=.176, p=.021), and mastery (r=.173, p=.024). A stepwise multiple regression was done to find the contribution of sleep quality, physical functioning, depression, life satisfaction and mastery to self-rated health. The final model found that depression, physical functioning and sleep quality contributed significantly to the individual's self-rating of health (adj. $R2 = .312$, $F(3,159) = 25.44$, $p=.036$). The individual contribution of sleep quality to the final model was 2.7%. An older adult's sleep quality is an area that researchers and clinicians need to be aware of when assessing the older adult for health related issues.

## SESSION 1830 (PAPER)

## TRAINING FACULTY AND PROVIDERS IN GERIATRIC CARE

### EVALUATING EFFECTIVENESS OF THE FACULTY LEARNING ABOUT GERIATRICS (FLAG) PROGRAM

K. Krichbaum, M.J. Kaas, J.F. Wyman, C. Mueller, *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

A primary goal of the Minnesota Hartford Center for Geriatric Nursing Excellence is to increase the number of faculty who are able to provide effective education to nursing students at associate and higher degree programs in the Upper Midwest region, including Tribal Colleges, that develops knowledge and abilities to care for older adults. The FLAG program is designed to achieve that goal by developing FLAG Fellows' knowledge of geriatrics, teaching effectiveness, and leadership in implementing curricular change in their home institutions. The programs' components include an intensive Summer Institute (SI), mentorship of Fellows throughout the year to support education project development and implementation, and participation in an online learning network. FLAG's content areas include: geriatrics and nursing care of older adults; teaching-learning theory and methods to improve learning outcomes; health care informatics; and leadership for curriculum change. Fellows apply learnings from FLAG to design and implement an education project that enhances student learning in geriatrics. Evaluation of effectiveness of the program to achieve its goals is based on Fellows' assessment of goal achievement, their self-evaluations of teaching effectiveness before and after the SI, assessment of the impact of the Fellows' education projects by the Fellow and his/her dean, and satisfaction with the FLAG experience. Data from these assessments for two years have been analyzed; findings include high levels of satisfaction, and effectiveness of the program in meeting stated objectives. Presentation and discussion of findings will include strengths of the program and methods used for continuous quality improvement.

### HEALTH CARE OF OLDER ADULTS: ADAPTING A FACULTY DEVELOPMENT CURRICULUM INTO A GRADUATE ACADEMIC COURSE

C. Ford[1], P. Sawyer[1], A.G. Rothrock[1], C. Ritchie[1,2], *1. Gerontology, Geriatrics & Palliative Care, University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta GRECC, Birmingham, Alabama*

The University of Alabama at Birmingham (UAB) Geriatric Education Center (GEC) focuses on improving the health care quality of older adults through the development of interdisciplinary training for health care professionals. In 2008, the UAB GEC Faculty Scholars Program (FSP) was developed to train faculty from seven disciplines (dentistry, medicine, nursing, occupational therapy, physical therapy, psychology, and social work). The 36-hour program focuses on Institute of Medicine priority areas (advanced illness, care coordination, frailty, symptom and medication management, ethnogeriatrics and health literacy). Classroom contact was supplemented by educational modules delivered through an online platform. These modules were adapted by GEC leadership and combined with supplementary material to create an online graduate-level academic course. This presentation will describe the development and implementation of Health Care of Older Adults, the online course for graduate students adapted from the GEC FSP. Planned as a bi-annual course offering, the course was first offered in 2009 for a nine-week summer session. Ten graduate students from nursing, psychology, and sociology participated. The course was divided into three segments: introduction, health, and health care delivery. A course-master coordinated the material and was the main contact for students. The faculty who developed the original modules were available for consultation. Following completion of each component, students provided feedback regarding the module content. This presentation will discuss the similarities and differences of using the modules to train graduate students versus faculty. After this presentation, attendees will be able to discuss the advantages/challenges of adapting educational products for various learning levels.

### TRAINING INTERDISCIPLINARY TEAMS OF HEALTH PROFESSIONALS ON CARING FOR VULNERABLE OLDER ADULTS

C. Luz[1,2], M. Ensberg[1,2], J. Ilardo[1,2], J. Yonker[1,2], *1. Michigan State University, East Lansing, Michigan, 2. Geriatric Education Center of Michigan, East Lansing, Michigan*

The session will describe the process used to develop and implement a train-the-trainer program for regional interdisciplinary teams of health professionals by the Geriatric Education Center of Michigan (GECM). The purpose of the regional teams is to train health care workers in their own communities on a wide range of topics related to functional health and the importance of early assessment, interdisciplinary care planning, and use of community resources. The train-the-trainer curriculum focuses on these topics as well as how to teach team members about an incremental, interdisciplinary approach to functional assessment that facilitates optimal aging in the home environment. Methods used by GECM faculty to develop the curriculum, train teams, and provide them with support as they organized trainings in their own communities will be discussed. In addition, valuable lessons learned that can inform others interested in replicating this model will be presented including challenges encountered, how these were addressed, and the current status of the teams, types of training models used by teams, their recruiting methods, target audiences, and accomplishments. Modifications to the train-the-trainer program based on these initial experiences will be described.

### A FACULTY SCHOLARS PROGRAM: EXPANSION TO A STATE-WIDE INITIATIVE

A.G. Rothrock[1], C. Ford[1], P. Sawyer[1], E. Kvale[1,2], P. Bosworth[1], C. Ritchie[1,2], *1. University of Alabama at Birmingham, Birmingham, Alabama, 2. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

The UAB Geriatric Education Center Faculty Scholars Program (FSP) is an interdisciplinary training program aimed at improving health care quality for older adults by providing geriatric training in priority areas identified by the Institute of Medicine (advanced illness, care coordination, frailty, symptom management, medication management, ethnogeriatrics, health literacy). Faculty scholars learn to 1) Recognize and manage geriatric syndromes associated with advanced illness, 2) Utilize behavioral interventions and pharmacological treatments to minimize disabling symptoms, 3) Provide culturally and linguistically appropriate geriatric care, 4) Arrange care so that those facing advanced illness can participate in treatment preferences and experience optimal quality of life, and 5) Develop a patient-centered plan of care in an integrated clinical environment with proactive delivery of evidence-based care and follow-up. The 36-hour training program includes an orientation session (2 hours), 10 web-based modules (1 hour each), and 3 in-person sessions (8 hours each). This presentation will focus on Year 3 of the FSP, which expanded from UAB faculty only to a state-wide initiative including 21 faculty representing eight universities and one college. Disciplines represented include Communications, Gross Anatomy, Medicine (Emergency, Family, and Internal), Nutrition Sciences, Pharmacy, Physical Therapy, Psychology, and Social Work. We will share lessons learned from the first two years of the FSP that resulted in significant changes to the structure of Year 3 curriculum. After attending this presentation, participants will be able to discuss the opportunities and challenges associated with recruitment, curriculum, implementation and evaluation of interdisciplinary professional training programs.

## SESSION 1835 (SYMPOSIUM)

### TRANSITIONS IN OLDER MEN'S SOCIAL AND FAMILIAL RELATIONSHIPS: THE INFLUENCE OF LIFE EVENTS

Chair: *K.M. Bennett, Psychology, University of Liverpool, Liverpool, United Kingdom*
Discussant: *L. Kaye, UMaine School of Social Work, Bangor, Maine*

Men face a number of important life events as they age. Sometimes these events involve gaining a new role, such as becoming a grandparent or a carer. Others concern the loss of a role whether it be as an offspring, a spouse, or as a partner in an established marital relationship. When these transitions in role occur, men are faced with challenges to their social and familial relationships. In this symposium we bring together papers on four major role changes that address the changing nature of their social and familial relationships. Stelle examines the roles of grandfathers in older families, and the varied ways in which familial relationships influence that role. Moss and Moss examine the changes in personal identity of middle-aged sons that occur as a result of the deaths of their fathers, and the ways in which their relationships with the deceased influence their post-bereavement identities. Soulsby and Bennett examine transitions to both widowhood and divorce of older men, and the influences that these have on social and familial relationships. Finally, Russell addresses one of the most challenging transitions faced by older men: that of becoming a caregiver to wives with dementia, and the potential loss of a previously established marital relationship. This loss too influences the surrounding familial and social relationships. This exciting presentation will be discussed by Kaye, who will pull together the common themes and highlight the challenges faced by older men in the context of familial and social relationships.

### SUPPORT NETWORKS AND SOCIAL INTERACTION: CHANGES IN THE FACE OF WIDOWHOOD AND DIVORCE

L.K. Soulsby, K.M. Bennett, *University of Liverpool, Liverpool, Merseyside, United Kingdom*

Research recognises that both widowhood and divorce removes the primary source of health and support, the spouse (Glaser et al. 2006). Through qualitative interviewing, this research aimed to uncover the specific impact of widowhood and divorce on men's social relationships and social interaction. While women tended to engage in new social activities and form fresh social contacts following widowhood and divorce, men noted that they would intentionally avoid group social interaction. Men reported a loss of both social and kin ties, and often felt isolated by their social network and by married couples in particular. Divorce appeared to have a more negative effect on social network size and availability of social support compared to widowhood. Finding a new female companion following widowhood and divorce provided a platform for developing new relationships and increase the men's social interaction. Support services should work with the aim of minimising the negative social outcomes of transitions out of marriage, including separation, divorce and widowhood.

### PERSONAL IDENTITY OF MIDDLE AGED SONS AS INFLUENCED BY THE DEATH OF THEIR ELDERLY FATHER

S. Moss, M.S. Moss, *Arcadia University, Glenside, Pennsylvania*

This paper explores shifts in the personal identity of middle aged sons as they are affected by the death of their elderly father. As part of a study of family bereavement, ten bereaved adult sons participated in lengthy qualitative interviews, 6 to 10 months after their father's death. Four themes associated with the son's personal identity emerged: (1) Shift in son's relationship with and caregiving responsibilities toward his widowed mother. (2) Re-evaluation of similarities and differences in personal characteristics of the son and of the father. (3) Renewed awareness of the meaning of work in the son's life. (4) Revision of the son's calculus of personal life expectancy. Discussion explores the implications of these themes for understanding the meaning of the father's death for the adult son. (Funded by NIH Grant 1R01AG031806 –ARRA)

### A LIFE COURSE PERSPECTIVE ON GRANDFATHERHOOD: THE EXPERIENCES OF MEN AS GRANDFATHERS IN AGING FAMILIES

C. Stelle, *Bowling Green State University, Bowling Green, Ohio*

While research on grandparenting highlights that grandparenthood is a gendered familial role, there is an inconsistency between the recognition of the salience of gender and the lack of attention to grandfathers and their experiences within the family. This paper describes a life course perspective and the examination of the experience and meaning of grandfatherhood. The life course themes explored include issues of temporality, social context and men's development, heterogeneity, dialectics of continuity and change, and the possibility for dynamic and multidirectional change. Findings on the experience of grandfathers in aging families suggest considerable variability in role expectations, enactment, satisfaction, and challenges. Conclusions suggest a need for a closer examination of the gendered nature of grandparenthood, the lived experiences of older men as grandfathers, and an understanding of how this role builds on previous roles and meanings of being an older man and issues of masculinity across the life course.

### THE SOCIAL NETWORKS OF ELDERLY MEN CAREGIVERS

R. Russell, *GRCMSW Program, SUNY Brockport, Rochester, New York*

More than one elderly million men care for spouses with cognitive impairment, and the number is projected to increase well into the future. In their roles as caregivers, their social networks change radically as their work shifts from the world of market economy to the domestic world of spousal care. How do their social networks change and what roles do social networks play in their lives as caregivers? Data for this presentation are taken from a 12 year ongoing qualitative study of elderly men caregivers in Rochester, New York. From the study, two overarching themes have consistently emerged: 1) pre-retirement social relationships were more beneficial than previously thought, and 2) multiple and varied social networks, especially with other men, are beneficial in mitigating caregiver burden. Implications for future research and provision of services are also discussed.

# SESSION 1840 (PAPER)

## TRENDS AND POLICY IN HEALTH CARE

### UNDERSTANDING COHORT DIFFERENCES IN APPRAISALS OF RECONSTRUCTION PRIORITIES OF MENTAL HEALTH SYSTEMS IN POST-CONFLICT LIBERIA

D.A. Gray[1,2], D.C. Henderson[2], B.L. Harris[3], R. Boxill[2], J.R. Carney[2], C. Borba[2], *1. University of Massachusetts Boston, Boston, Massachusetts, 2. Massachusetts General Hospital, Boston, Massachusetts, 3. University of Liberia, Monrovia, Liberia*

The traumatic events and stress of societal conflict on individuals can be quite severe. The United Nations, The World Bank, and other agencies have focused efforts on peace building. However, attempts by the international community to end war and establish peace frequently fail on two fronts; low prioritization of rebuilding local institutions and a lack of understanding of local and regional conditions (Brahimi, 2007). An integral part of rebuilding societies is the establishment of reconstruction priorities. Needs Assessment Surveys are often used to prioritize the many tasks required to rebuild a society after devastating conflict (Saxena, et al., 2007). These tools have been criticized for failing to call for inclusion of elders as respondents (WHO-AIMS, 2005; Kievelitz et al., 2004; DfID, 2002), not collecting relevant data, failure to adequately sample key informants, and lack of evidence based responses (Darcy & Hoffman, 2003). The study design is cross sectional and used individuals as the unit of analysis. The data was collected during a 2 week period in March 2009 in Liberia by a team from Massachusetts General Hospital Division of International Psychiatry, Harvard Medical School and the Harvard Program for Refugee Trauma. It was restricted to Native Liberian respondents, leaving 162 individuals eligible for analysis. Using a series of one-way and two-way ANOVAs, results suggest there is a relationship between informants' age and their assessment of mental health needs in post-conflict society.

### TRENDS IN USE OF INPATIENT PROCEDURES AMONG THE ELDERLY BY RACE AND POVERTY

Y. Gorina, J.D. Weeks, M.F. Owings, *Aging and Chronic Disease Statistics, National Center for Health Statistics, Hyattsville, Maryland*

The rates of the medical procedures among Americans aged 65 and over have changed from 4,934 per 100,000 population in 1999 to 5,300 per 100,000 i 2007. The trends are evident in increasing rates of knee and hip replacements performed, and in expanded use for the very old

(85+). The rates for other procedures, such as mastectomy, amputation of lower limb, and some heart procedures decreased. We will review the disparities in the procedures by race of the patient available from the Medicare records. The data from the HRSA' Area Resource File linked to Medicare claims data allowed us to present the trends in procedures by the characteristics of patient's residential area, such as level of poverty. In 2007, the rates of procedures among patients living in the areas with the lowest level of poverty among older white and black patients were 5,069 and 6,688 per 100,000 respectively. The rates of procedures among patients living in the areas with the highest level of poverty among older white and black patients were 5,726 and 7,007 per 100,000. Because Medicare claims represent multiple services provided to beneficiaries and can be considered as a longitudinal database, it is possible to obtain a more complete characteristics of the patients' health status. We will present the trends in the rates of procedures among patients with selected chronic condition using indicators available from the CMS' Chronic Conditions Warehouse. The benefits and drawbacks of the methodology used will be discussed.

### RETHINKING INFLUENZA VACCINATION POLICY: THE POTENTIAL TO INDUCE HERD IMMUNITY AGAINST INFLUENZA IN OLDER ADULTS BY VACCINATING CHILDREN—EVIDENCE FROM THE STATE AND COUNTY LEVELS

S.A. Cohen, K.K. Chui, E.N. Naumova, *Public Health and Community Medicine, Tufts School of Medicine, Boston, Massachusetts*

Growing evidence suggests that children play an important role in the transmission of influenza to other children, adults, and seniors, who are particularly vulnerable to influenza-associated morbidity. Building upon prior research, we hypothesized that vaccinating children against influenza may have indirect benefits for seniors (age 65+) to reduce influenza-associated morbidity. We conducted an analysis on two geographic levels—state and county. For the state-level analysis, we abstracted all US influenza-associated (ICD-9CM codes 480-487) Medicare hospitalization records for four "influenza years" (2002-06), defined as July-June. We abstracted all influenza-associated hospitalizations for Florida counties for two influenza years in which complementary exposure data were available, 2002-03 and 2006-07, for the county-level analysis. Influenza-associated hospitalization rates increased exponentially with age in seniors, and this acceleration rate was used as the outcome variable. One exposure variable, influenza vaccination in children, was obtained from the National Immunization Survey, while influenza vaccination coverage in seniors was obtained from the Behavioral Risk Factor Surveillance System. Season-specific acceleration rates were regressed against the percentage of vaccinated children or seniors, or both. Child influenza vaccination coverage was negatively associated with influenza-associated hospitalizations in seniors, and was most pronounced in the 2003-04 season (beta = -0.096, p = 0.027). Influenza vaccination of seniors was not significantly associated with influenza-associated hospitalization rates in any of the models on either geographic level. These results suggest that the prevailing strategy to vaccinate seniors may be less effective than inducing herd immunity through vaccinating children against influenza to reduce influenza-associated diseases in seniors.

### MEDICAID LONG TERM CARE HOME AND COMMUNITY BASED SERVICES FOR THE ELDERLY: TRENDS IN PROGRAMS AND POLICIES, 1999-2007

C. Harrington, T. Ng, *University of California, San Francisco, California*

In response to consumer demand, the Supreme Court decision in the Olmstead case and the New Freedom Initiative of 2001, states have unevenly expanded combinations of three Medicaid home and community based services (HCBS) : home health, state plan personal care services (PCS), and 1915(c) waivers. By 2007, the federal-state Medicaid program paid for 42 percent of the nation's estimated $190 billion total long-term care (LTC) expenditures while institutional care (e.g., nursing homes) consumed 58 percent of those expenditures. As states struggle with budget deficits in FY 2010 and beyond, the Deficit Reduction Act (2005) and the debate around health insurance reform reflects growing concerns about the need to preserve and expand Medicaid HCBS and the need for information on program and policy trends. This paper draws from a unique national dataset to present the latest trends in participants, expenditures and policies for the three Medicaid HCBS programs serving the elderly. While data for 2007 show a steady increase in participants and expenditures, these growth rates have slowed since 2001. Inequities in access to services and limited funds have also resulted in unmet needs for HCBS among the elderly. Findings from the survey of policies used in the programs in 2009 show that states are increasing the number of waiting lists for elderly waiver services even as the number of available "slots" increases. Cost caps such as service and cost limits are also used in almost half the state plan personal care programs and almost a third of home health programs.

## SESSION 1845 (PAPER)

## WOMEN AND AGING

### BECOMING THE OLD ONES: IDENTITY AND FAMILY TRANSITIONS IN A RURAL CONTEXT

B. McCann, K. Allen, K.A. Roberto, *Human Development, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Social theorists posit that how people experience aging depends on their social location. Using an integrative feminist, life course, and symbolic interactionist frame we asked how single, baby boomer women in rural Appalachia (n=14) experienced aging in a relational context. During in-depth qualitative interviews we asked participants to describe their closest relationships over their life course and how their beliefs and ideas about relationships have changed over time. We also asked them to describe how they coped with losing loved ones. We found that the women who were lifelong residents of their community thought of themselves as becoming the community "old ones" as the elders in their extended kin networks died. These women had an awareness that they were the keepers of family knowledge and traditions, as well as community history. They passed their knowledge to the younger generation (specifically children, nieces, and nephews) to keep family traditions alive. Women who were not reared in the community in which they currently lived, but entered the community via a former partner, did not describe experiencing this family transition. We conclude that marital status, i.e., being single, was less salient to how the women experienced aging; rather losing family and community members, and family-of-origin history intersected to shape the rural baby boomer women's sense of self.

### AGING AT ARM'S LENGTH: A QUALITATIVE EXAMINATION OF MIDDLE-AGED AND OLDER WOMEN'S DISTANCING FROM OLD AGE

A. Barrett, *Florida State University, Tallahassee, Florida*

Given the cultural devaluation of the elderly, particularly older women, few in midlife relish the thought of growing older. However, we have a limited understanding of specific social psychological strategies of managing the aging self. The present study addresses this issue by drawing on semi-structured interviews with middle and older aged women (n=52). Analyses reveal a focus on distancing oneself from old age. This paper explores six distancing strategies: engaging in activities associated with youth, including childhood; maintaining youthful identities and appearances; postponing perceived markers of old age; making self-enhancing comparisons with women from current as well as earlier cohorts; maintaining a belief in personal controllability of aging; and downplaying the salience of age and aging. Although less common than distancing, two other strategies were observed: active resistance of negative stereotypes of older women and an embrace of positive aspects of aging, including liberation from demanding caring roles occupied in earlier life. The paper concludes with a discussion of the possible implications of the various strategies for cultural change in images of older women, as well as consequences for self-conceptions and well-being in middle and later life.

### FEMALE VOICES: OLDER WOMEN IN APPALACHIA

M. Diderich*, Social Sciences, Shawnee State University, Portsmouth, Ohio*

Female Voices: Older Women in Appalachia The author lives in a unique area which is also a rich sociological laboratory that stands apart from mainstream American society. My findings are the result of an ethnography of the regional culture, spanning four years (2006-2010), and they are embedded in the oral life histories (in-depth face-to-face interviews) of Appalachian females who are 65 years or older. They have come of age in the 1920s, 1930s and 1940s, and, as the matriarchs of their families, have transmitted intergenerational values to their children and (great) grand children. Many contemporary female students in this Appalachian region are discouraged from going to college. Instead, in some cases, the adagio is to be a teenage mother or to at least find a man in which any man is considered “good enough” because he is of the male gender and can provide her with a socially acceptable status. Thus, females are raised and socialized in an atmosphere where it is imperative to find a man, and to view a male as a prize to be won, even if that male cannot provide a stable family life. Older Appalachian females advocate traditional and transitional gender roles for their daughters and grand daughters, including a traditional or transitional division of labor within the household. Their feelings about attitudes that have arisen in the second and third wave of feminism, as well as their current role in their respective families are discussed.

# SESSION 1850 (PAPER)

## ASSESSMENT IN HIGH RISK POPULATIONS

### PAIN ASSESSMENT IN NURSING HOME RESIDENTS WITH DEMENTIA

F.A. Cervo[1,2], P. Bruckenthal[3], J.J. Chen[2], L. Bright-Long[4,2], S. Fields[5,2], G. Zhang[2], I. Strongwater[1], *1. Long Island State Veterans Home, Stony Brook, New York, 2. Stony Brook University Medical Center, Stony Brook, New York, 3. Stony Brook University School of Nursing, Stony Brook, New York, 4. Maria Regina Residence, Brentwood, New York, 5. Gurwin Jewish Geriatric Nursing and Rehabilitation Center, Commack, New York*

Background: The effective management and treatment of pain in nursing home residents with dementia requires the use of a reliable, valid, and clinically feasible pain assessment tool. Our study examined the application of the CNA Pain Assessment Tool (CPAT) in long term care settings. Methods: 186 residents of three regional skilled nursing facilities participated in the study. The reliability, validity, and clinical feasibility of the CPAT were determined in Phase I of the project. In Phase II, the implementation of the CPAT was combined with the American Medical Directors Association pain management guideline to determine if short term improvements in pain management could be achieved. Results: The CPAT was found to have statistically significant levels of interrater and test-retest reliability as well as acceptable levels of internal consistency. Construct and criterion validity were also found to be statistically significant. As determined by a practicality survey, the CPAT was found to be a clinically useful and feasible instrument. Phase II analysis revealed a statistically significant reduction in CPAT pain scores in both control and intervention arms of the study. When reductions in pain scores were compared for control and intervention periods, no significant change was found. Conclusion: This study provides evidence that the CPAT is a reliable and valid pain assessment instrument as well as a clinically utile and feasible tool when used in nursing home residents with dementia. Significant reductions in pain scores have shown that the CPAT is a useful tool in short term pain management.

### DIAGNOSIS COST GROUPS, SELF REPORTED FUNCTION, AND COGNITION PREDICT DEATH IN A HIGH RISK POPULATION

J.E. Agens[1], J. Lin[2], *1. Geriatrics, Florida State University College of Medicine, Tallahassee, Florida, 2. Florida State University Department of Statistics, Tallahassee, Florida*

Purpose: For the attendee, this session will provide empiric knowledge of how diagnostic and functional data obtained longitudinally predicts mortality in a group already at risk for death. Methods: This was a retrospective look at data collected prospectively in a group of 261 HMO patients, mean age 73, selected on the basis of high Diagnosis Cost Group (DCG ) scores. These yield a relative risk score based on an ICD9 coding algorithm. A baseline DCG relative risk score of 7 served as a cutoff for initial inclusion this primary care program utilizing a geriatrician and two nurses. Improvement in self-reported function has been previously reported after 12 months in the program. Independent variables included DCG score in year 2 of the program, Short Form 36 Physical Function and General Health Scores at baseline, and Folstein score at baseline. Dependent variable was death as a categorical variable. Deaths were counted in years two through five of the program to limit the effect of patients who were dying on program entry. DCG was obtained again at year two as an independent variable. Other variables were obtained at program entry. Results: 20 deaths occurred over 3 years of observation following year two of the program. Both univariate and multivariate logistic regression models predicting death were used. All independent variables noted above predicted death in the univariate model ($p<.05$). Only DCG and Folstein score predicted death independently in the multivariate model ($p <.05$). When predicting death, cognition may add more to diagnoses than function.

### AN INVESTIGATION OF THE DISCRIMINATIVE VALIDITY OF THE FULLERTON ADVANCED BALANCE SCALE AS A FUNCTION OF AGE AND FUNCTIONAL STATUS

D. Rose, D. Hernandez*, Kinesiology, California State University, Fullerton, Fullerton, California*

The Fullerton Advanced Balance (FAB) Scale is a reliable and valid tool for assessing balance in community-residing older adults. Purpose: To investigate the discriminative validity of the scale as a function of age and functional status in a group of moderate to high functioning older adults. Methods: A total of 407 independently functioning male and female adults (76.7 ± 6.3 years) performed the FAB scale as part of a comprehensive fall-risk screening. Participants were divided into five age groups (65-69; 70-74; 75-79; 80-84; 85-89). Inclusion criteria included residing independently in the community, being relatively healthy, and scoring above 12 out of 24 on the Composite Physical Function (CPF) scale. Three levels of functional status (high functioning, high moderate functioning and low moderate functioning) were created using the CPF scale. Results: A 5 (Age) X 3 (Functional Status) ANOVA (SPSS, V17.0) produced significant univariate effects for age and functional status only. Significant age associated changes were evident between all five age groups for mean FAB scores. Mean FAB score was highest for the 65-69 age group (29.2/40) and gradually decreased across age groups with the 85-89 age group demonstrating the lowest mean FAB score (18.7/40). Significant changes were also evident between all three levels of functional status identified. As expected, the mean FAB score was highest in the high functioning group (28.3/40) and lowest in the low moderate functioning group (19.3/40). Conclusions: The FAB scale can effectively discriminate between age groups and on the basis of self-reported functional status.

### INSIGHT INTO HOSPITALIZATION OF CENTENARIANS

A. Balstad[2], S. Patil[1], R.S. Chamberlain[1,2], *1. Department of Surgery, Suite # 1172, Saint Barnabas Medical Center, Livingston, New Jersey, 2. St. George's University, School of Medicine, Grenada, Grenada, Grenada*

Background: Advances in medicine has led to a growth in the centenarian population (> 100 years old). Centenarians are generally unstudied, but as longevity increases, so does the need to better understand the medical and surgical needs of this population. Methods: 195 hospital admissions corresponding to 110 patients were analyzed (2000 – 2009). Age, gender, ethnicity, diagnosis, co-morbidities, advance directives (ADRs), functional status, LOS and cause of death were abstracted. Results: Mean age was 101.3 years (100- to 111- years) with an M:F ratio of 86:24. The most common co-morbidities were hypertension (60%), congestive heart failure (CHF) (37%) and coronary artery disease (34%). CHF (13%), pneumonia (7%), and dehydration (4%) were the primary reasons for hospitalization. Mean LOS was 6.7 days (1 to 33 days). Mean ECOG performance score was 3.6 on admission (2 to 4) and 3.7 on discharge (2 to 5). Most centenarians were admitted from home (95%) but only 28% were discharged to home. ADRs were unavailable for 51% of patients, and only 2% established new ADRs during hospitalization. 31 procedures/surgeries were performed. Twenty two patients (20%) died in hospital. Conclusions: Most centenarians are hospitalized and treated without change in their functional status. Medical causes of admissions (84%) outnumber surgical causes (16%). Orthopedic procedures (29%) were the most common operations in this group, and restoration to pre-operative ambulatory status is normal. Mortality is primarily due to exacerbation of medical illness and not hospital related. Advanced directives are seriously lacking for this group.

## SESSION 1855 (PAPER)

## FALLS AND FALL PREVENTION ACROSS SETTINGS

### EXAMINING THE RURAL/URBAN GAPS IN FALLS PREVENTION STRATEGIES ADOPTED IN LONG TERM CARE FACILITIES

S. Johnson, *Faculty of Kinesiology and Health Studies, University of Regina, Regina, Saskatchewan, Canada*

Falls are a major threat to the health of older adults. Compared to older adults who live in the community, residents of long-term care (LTC) facilities fall two to four times more often, and are twice as likely to injure themselves. Given the high incidence of falls among LTC residents, several promising and effective falls prevention strategies are available for implementation in these facilities. However, rural-urban differences in the adoption of various falls prevention strategies in LTC facilities have not been examined. The present project examined this issue involving 70 LTC facilities and using a telephone survey. The survey instrument encompassed facility information, profiles of interviewees, and fall- intervention strategies currently in place in the facilities. Three falls prevention strategies, exercise, clinical assessment and nutritional review, showed the greatest rural-urban differences. Only 64% of rural nursing homes employed an exercise based intervention strategy compared with 79% of urban nursing home. Clinical assessment fall prevention strategy was utilized in 64% of rural respondents while 71% of urban nursing homes used clinical assessment as a intervention/prevention strategy. A clinical assessment may include the following components: sensory impairment, leg strength, ROM, balance/gait, footwear/clothing, acute or chronic conditions and mobility aids. Significant rural-urban difference was also observed for nutrition review with 43% of rural nursing homes and 50% of urban nursing homes utilizing this strategy for prevention. The study highlights the need to promote promising and effective falls prevention strategies in rural as well as urban contexts.

### TASK-SPECIFIC TRAINING DECREASES FALLS BY OLDER WOMEN IN THE COMMUNITY: 6 MONTH PROSPECTIVE DATA

N. Rosenblatt, J. Marone, M.D. Grabiner, *Kinesiology and Nutrition, University of Illinois at Chicago, Chicago, Illinois*

We have shown that training the execution of compensatory steps in response to large, anteriorly-directed postural disturbances reduces falls after laboratory-induced trips. The present work is extended by comparing all-cause falls by community-dwelling women following their having participated in a two week, four session protocol of task-specific training compared to age-matched controls. Data from 60 women age 55 years and older were monitored every two weeks for at least six months. The results revealed that 55% of control subjects fell compared to 38% of trained subjects. Of the 44 reported falls, 8 were considered not trainable (e.g. syncope) and eliminated from further analysis. Of the remaining 36 falls, 8 were considered "preventable trip-related falls", i.e., kind that was specifically targeted by the training protocol. Of these eight preventable trip-related falls, seven occurred in the control group and only one occurred in the trained group. In the age group 55-64 year old age group, four untrained women reported a preventable trip-related fall whereas there were none on the trained group. In the age group of 65 years and older, three and one preventable trip-related falls were reported by the control and trained group, respectively. Overall, these preliminary results suggest that during the six month period following completion of the task-specific training protocol, both the number of preventable trip-related falls and all-cause preventable falls was reduced. Thus, the data suggest that task-specific training protocols may amplify the efficacy of currently used multifactorial fall and exercise-based fall prevention programs.

### IDENTIFICATION OF SYSTEMIC CAUSES OF FALLING ACROSS THE AGING CONTINUUM

A.A. Zecevic, M. Halligan, P. van Wyk, *University of Western Ontario, London, Ontario, Canada*

The Systemic Falls Investigative Method (SFIM) emerged as a powerful and comprehensive analytical tool for identifying systemic causes and contributing factors of falls. The purpose of this study was to use SFIM to explore similarities and differences in causes of falling across the continuum of care in later life. Prospective, multiple case study design was employed to investigate falls in five diverse healthcare settings, including a community public health unit, an acute care hospital, a rehabilitation hospital, an assisted-living facility for individuals with acquired brain injury, and a long-term care home. From each setting, one to three staff members were trained in SFIM and mentored while investigating falls within their organization. Content analysis of 21 detailed reports from the falls investigations was employed to identify patterns of safety deficiencies within four levels of the Swiss Cheese Model of Accident Causation. Results indicate that SFIM helped identify several systemic issues contributing to falls in most participating organizations. For example, inadequate patient/resident supervision (i.e., staff`s unawareness of patient activity related to urgent voiding) was influenced by deficiencies in teamwork, poor communication between shifts, inadequate staffing levels, lack of training, budgetary restrictions and limited organizational learning. Falls in the community feature unsafe conditions of different origins, rooted in the lack of accountability for environmental hazards, poor employee safety training, inadequate policies and family supervision. The SFIM is an unique method for risk identification and analysis across healthcare settings, and can provide specific guidance for targeted injury prevention interventions.

### POSTURAL STIFFNESS, DAMPING, DISTRACTIONS, AND PROSPECTIVE FALLS IN OLDER ADULTS: THE MOBILIZE BOSTON STUDY

H. Kang[1], L. Quach[2], W. Li[3], L. Lipsitz[2,4,5], *1. Kinesiology and Health Promotion, Cal Poly Pomona, Pomona, California, 2. Institute for Aging Research, Boston, Massachusetts, 3. University of Massachusetts Medical School, Worcester, Massachusetts, 4. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 5. Harvard Medical School, Boston, Massachusetts*

Outdoor falls have been recognized as a distinct problem that occur even in healthy older adults. Because the outdoors pose greater opportunities for mechanical perturbations to the postural system, the capacity to absorb these perturbations, quantified as mechanical stiffness and damping, may indicate reduced fall risk. Cognitive distractions may further increase fall risk. We tested whether biomechanical parameters of postural control, during quiet standing and dual task conditions, are associated with the risk of falls in a representative sample of community-dwelling older adults, the MOBILIZE Boston Study cohort. Static posturography data was captured for 30 seconds from 725 participants aged 78±5 years, with and without dual task (serial subtractions). Postural control was modeled as a damped oscillator inverted pendulum, from which stiffness, damping, and sway amplitudes were determined. Prospective falls were assessed through a mail-back monthly calendar (6-36 mo. follow-up). The association of biomechanical parameters and fall rates was estimated using negative binomial regression. Greater postural stiffness (adjusted RR=0.70 (0.50-0.96) p=0.03) and damping (RR=0.49 (0.29-0.82) p=0.007) were associated with lower outside fall rates. Results were similar for those measured during dual task. Decline in stiffness and damping may be an early marker of fall risk in healthy older adults. Causes of this decline require further study. Biomechanical parameters during dual task were no better at predicting falls than during quiet stance. A more sophisticated model of postural control that incorporate cognitive function may better explain the role of cognitive distractions on falls.

## SESSION 1860 (SYMPOSIUM)

### HEALTHY AGING WITHIN AND ACROSS SYSTEMS

Chair: *A.B. Newman, Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania*

Discussant: *J. Magaziner, University of Maryland, Baltimore, Maryland*

Healthy aging is a desirable goal for individuals and for public health. Longitudinal data can identify individuals who remain healthy for long periods of time and can assess trajectories of change that can better define healthy aging. Increasingly, health in late life is recognized to be far more than the absence of disease. For many age-related chronic diseases, there is a large reservoir of physiologic change that precedes clinical disease. Little is known about the relationship between changes across systems in their trajectories of age-related decline. Age-related change in one system could be a sentinel indicator for the overall rate of aging or mortality risk; alternatively combinations of factors might be more informative. In this symposium we will evaluate individual systems and combinations of age-related changes to define healthy aging. The first presentation will evaluate the potential for fracture-free survival to capture overall healthy aging in older women who have been followed for many years. The second will examine trajectories of IGF-1 and DHEAS to determine their individual and joint contributions to health risk. The third will focus again on bone, evaluating biologic age based on bone density compared to chronological age as a novel approach to defining healthy aging. The fourth will discuss novel immunological parameters related to healthy aging. The final presentation will illustrate the rates of healthy aging in multiple systems and the correlations between systems over time. By quantifying the risks related to these various approaches, insight will be gained into the processes underlying healthy aging.

### IS FRACTURE FREE SURVIVAL AN INDICATOR OF HEALTHY AGING: STUDY OF OSTEOPOROTIC FRACTURES (SOF)

J.A. Cauley[1], S.K. Ewing[2], L. Lui[3], T.A. Hillier[4], S.R. Cummings[5], K. Ensrud[6], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of California at San Francisco, San Francisco,, California, 3. San Francisco Coordinating Center, California Pacific Medical Center, San Francisco, California, 4. Permanente Center for Health Research, Portland, Oregon, 5. California Pacific Medical Center, San Francisco,, California, 6. University of Minnesota, Minneapolis, Minnesota*

To test the hypothesis that fracture free survival is a marker of healthy aging, we examined women enrolled in SOF. We limited our analysis to women who had at least 10 years of follow-up and compared women who remained fracture free (n=2407) with women who experienced at least one fracture (n=3604). Women who remained fracture free compared to women with a fracture, respectively, were younger at baseline (70.1 vs 71.2 yrs), heavier (68.5 vs 67.0 kg), experienced less weight loss (-0.34 vs -0.45%/yr), less height loss (2.7 vs 3.3 cm) and were less likely to report a stroke or pulmonary disease. Fracture free women reported higher total energy expenditure (1756 vs 1666 kcal/wk). All of the physical function measures at baseline e.g., gait speed showed higher function in women who remained fracture free. Fewer of the fracture-free women have died than women with a fracture (46% vs 54%), p<0.001.

### STABLE TRAJECTORIES OF IGF-1 AND DHEAS LOWER HOSPITALIZATION RISK

A.R. Cappola[1], N.D. Yanez[2], W. Guo[1], R.C. Kaplan[3], M. Pollak[4], A.B. Newman[5], L.P. Fried[6], *1. Division of Endocrinology, Diabetes, and Metabolism, UNIVERSITY OF PENNSYLVANIA - SCHOOL OF MEDICINE, Philadelphia, Pennsylvania, 2. University of Washington, Seattle, Washington, 3. Albert Einstein College of Medicine, Bronx, New York, 4. McGill University, Montreal, Quebec, Canada, 5. University of Pittsburgh, Pittsburgh, Pennsylvania, 6. Columbia University Mailman School of Public Health, New York, New York*

We have previously shown that the slope and variability of two hormones produced via distinct pathways, IGF-1and DHEAS, each predict mortality, whereas the absolute hormone level does not. In this analysis, we examined the relationship of IGF-1 and DHEAS trajectory patterns with hospitalization in 945 participants aged 65+ enrolled in the Cardiovascular Health Study who had hormone levels measured at 3-6 timepoints over an eight year period. Declining slope of IGF-1 (p=0.02) and increasing variability of IGF-1 (p=0.02) or DHEAS (p<0.001) were each associated with increased risk of hospitalization during the following six months. In models examining the impact of hospitalization on each hormone, we found no evidence that hospitalization in the prior six months affected the trajectory pattern or hormone level. Irrespective of the actual level, older individuals with stability of hormone levels are less likely to be hospitalized than those whose levels fluctuate.

### BONE AGE-A NOVEL INDEX OF AGE BASED ON BONE MINERAL DENSITY

Y. Sheu[1], A.B. Newman[1], P. Cawthon[2], T. Harris[3], F.A. Tylavsky[4], J.A. Cauley[1], *1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. California Pacific Medical Center, San Francisco, California, 3. National Institutes of Health, Bethesda, Maryland, 4. University of Tennessee, Memphis, Tennessee*

Bone mineral density (BMD) and chronological age (CA) are strong risk factors for osteoporotic fractures. We investigated “bone age” (BA) as an alternative means to understand an individual’s biologic age. We used data from 3,043 Health Aging and Body Composition Study participants (68-80 yrs) to calculate non-vertebral fracture risk as a function of CA and femoral neck BMD separately, then equating them to define BA. During 7.7 yrs of follow-up, fracture occurred in 308 participants. Results from the Cox regression model showed that individuals with BA greater than their CA were more likely to experience an incident fracture. Compared to those with BA and CA difference within +/- 5 yrs, individuals with BA 5 yrs older and younger than their CA had 37% ($p<.02$) higher and 61% ($p<.0001$) lower risk of fracture, respectively. The concept of BA may provide an easily understandable translation of fracture risk to tailor preventive treatments.

### IMMUNOLOGICAL CORRELATES OF HEALTHY AGING

A.N. de Vallejo[1], D.L. Hamel[1], R.G. Mueller[1], J.J. Michel[1], R. Boudreau[2], A.B. Newman[1,2], *1. University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, 2. University of Pittsburgh Graduate School of Public Health, Pittsburgh, Pennsylvania*

Immunity is vital to individual fitness and survival. Hence, we sought to define immunologic criteria for preserved function or ill-health among survivors of the Cardiovascular Health Study (n=140, aged >85 years). From clinical performance testing, 41% of subjects were categorized as impaired, and 59% were unimpaired. The impaired group has an immune signature dominated by interleukin (IL)-6, tumor necrosis factor (TNF)-$\alpha$, and T cells expressing the inhibitory natural killer receptors (NKR). In contrast, the unimpaired group had a signature dominated by interferon (IFN) $\gamma$, IL-5, IL-13, and IL-17, and T cells expressing activating NKRs. Cellular bioassays showed that activating NKRs were signaling competent receptors that trigger T cell activation without the need of the T cell receptor (TCR), suggesting a beneficial role of these unusual lymphocytes in immunity of older adults. These data highlight the value of immunological parameters as prognosticators of health outcomes of aging.

### RATES OF AGING–CROSS-SYSTEM CORRELATIONS AND MORTALITY RISK

A.B. Newman[1], R. Boudreau[2], A. Arnold[3], L.F. Fried[2], J.A. Cauley[2], T. Harris[4], *1. Epidemiology and Division of Geriatric Medicine, University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania, 2. University of Pittsburgh, Pittsburgh, Pennsylvania, 3. University of Washington, Seattle, Washington, 4. National Institute on Aging, Bethesda, Maryland*

A question fundamental to aging biology whether there is any correspondence or synchrony in aging across systems. It is not known whether individuals who are doing well in one system as more likely to maintain function in other systems. We examined 3727 older adults in the Cardiovascular Health Study (CHS) with at least two assessments 5 years apart in the CHS. The systems included 1) vascular (carotid wall thickness)2) brain (minimental state exam) 3) kidney (creatinine) 4) lung (forced vital capacity) 5) metabolic (fasting glucose) and 6) musculoskeletal system (grip strength). We defined "minimal aging" in each of the systems based on maintaining stable values over at least 5 years. About 50% remained healthy in 2 or more systems, while only about 10% remained healthy in 3 or more. Agreement for stability varied between systems, but individuals with minimal aging in all systems had remarkably low risk of mortality.

## SESSION 1865 (SYMPOSIUM)

### IS IT MY CANCER OR AM I JUST GETTING OLDER? HEALTH AND FUNCTION IN OLDER CANCER SURVIVORS

Chair: *K. Bellizzi, HDFS, UConn, Storrs, Connecticut*
Discussant: *C.W. Given, Michigan State University, East Lansing, Michigan*

The profile of cancer survivors is expected to change in parallel to the major shifts taking place in the age distribution of the US population. Moreover, cancer is often superimposed on other age-related health conditions making it difficult to disentangle the effects of cancer versus other age-related health problems. This symposium will present data from three studies that have examined health and function in older cancer survivors. The first presentation will focus on the influence of cancer and its treatment on falls, fall consequences, and use of healthcare in 865 elderly with cancer compared with 8,617 with no history of cancer. Findings suggest certain segments of those with cancer had an increased rate of falls ($p=0.01$) and more frequent services use ($p<.001$), compared to those without cancer. The second study examined measures of frailty, ADLs, IADLs, and functional limitations in 112 newly diagnosed older cancer patients at baseline, 3 and 6 months post diagnosis. At six months follow up, 58% remained stable, 19% improved in functioning and 23% declined in functioning. The third presentation will focus on data from a prospective study examining the impact of cancer on pre-existing health conditions and new health problems of older cancer survivors (n=1108) compared to matched controls (n=5540). Patients reported statistically significant declines in physical function and ADLs and an increase in arthritic pain and depression compared with controls. The discussant will discuss these findings in relation to potential interventions to attenuate these effects in the growing population of older cancer survivors.

### CHANGES IN FUNCTIONAL STATUS DURING A SIX-MONTH PERIOD IN OLDER NEWLY-DIAGNOSED CANCER PATIENTS

M.T. Puts[1,2], J. Monette[2,3,6], V. Girre[2,4], C. Wolfson[5], M. Monette[2], G. Batist[6], H. Bergman[2,6], *1. Lawrence S. Bloomberg Faculty of Nursing, University of Toronto, Toronto, Ontario, Canada, 2. Solidage Research Group on Frailty and Aging, Jewish General Hospital, McGill University, Montreal, Quebec, Canada, 3. Division of Geriatric Medicine, Jewish General Hospital, McGill University, Montreal, Quebec, Canada, 4. Department of Medical Oncology, Paris, France, 5. Division of Clinical Epidemiology, McGill University Health Centre, Montreal, Quebec, Canada, 6. Department of Oncology, Segal Cancer Centre, Jewish General Hospital, McGill University, Montreal, Quebec, Canada*

While the number of older cancer patients is expected to increase, little is known about their functional trajectories over time. One-hundred twelve newly-diagnosed cancer patients aged 65+ were recruited at the Jewish General Hospital, Montreal, Canada. Participants were interviewed at baseline, 3 and 6 months. Seven frailty markers (FM), functional limitations (FL), instrumental activities of daily living (IADL), basic activities of daily living (ADL) were assessed. Participants were grouped: independent, only FM and/or FL, IADL disability, ADL disability and death. Logistic regression analyses were conducted to examine if deterioration in functioning was associated with age, sex, diagnosis, extent of disease, and treatment received. At baseline, 12 (10.7%) were independent, 54 (48.2%) had FM/or FL, 34 (30.4%) IADL and 12 (10.7%) ADL disability. Among participants who completed the follow-up, 61 (58.1%) remained stable, 20 (19.0%) improved and 24 (22.9%) deteriorated in functioning. No variable was associated with deterioration in functioning.

### FALLS, FALL SEQUELAE, AND HEALTHCARE IN AGING COMMUNITY DWELLING ELDERLY CANCER SURVIVORS

S.L. Spoelstra[1], B.A. Given[1], D. Schutte[1], A. Sikorskii[3], M. You[1], C.W. Given[2], *1. Michigan State University College of Nursing, East Lansing, Michigan, 2. Michigan State University College of Human Medicine, East Lansing, Michigan, 3. Michigan State University Department of Statistics, East Lansing, Michigan*

The influence of cancer on elderly is examined in a Home and Community Based Waiver program during 2002-2007. A comparison of with cancer (865) to without cancer (8617) on falls, fractures and healthcare use occurred. Data were obtained from Minimum Data Set assessments, vital records, and claims. Mean age was 77.1 years, 67.8% female, 74.0% Caucasian. Cancers was 92.7% > stage 2. Falls were 35.9% (304) with cancer and 25.3% (2,174) with non-cancer, a significant difference (p-value 0.01); hip fractures were 4.6% (38) and 5.3% (449) p-value 0.38; service use: ER 35.4% (295) to 22.2% (1904) and hospitalization 13.1% (109) to 10.6% (911), p-values <.001 respectively. A cancer diagnosis increased falls and service use; no difference was found in fractures. As elderly cancer survivor's transition through life, clinicians need to be aware that these patients are prone to increased falls, assess risk, and implement interventions to prevent falls.

### A PROSPECTIVE STUDY OF THE IMPACT OF CANCER ON HEALTH AND FUNCTION OF OLDER CANCER SURVIVORS

K. Bellizzi[1], B. Reeve[2], *1. HDFS, UConn, Storrs, Connecticut, 2. National Cancer Institute, Bethesda, Maryland*

The impact of cancer and its treatment on preexisting health conditions and new age-related health problems of older persons is unknown. We prospectively examined the relative impact of cancer (prostate, breast, colorectal, or lung) on pre-existing health conditions (ADLs, neuropathy, arthritis, and physical function ) and new health problems (sensory impairment, depression) of older cancer survivors (n=1108) compared to matched controls (n=5540). Cancer patients whose first cancer occurred between their baseline and follow up assessment were identified for analyses. Patients with all cancer types reported statistically significant declines in physical function compared with controls. Prostate, colorectal and lung cancer patients reported significantly more difficulties performing certain ADLs compared with controls. There was a significant increase between baseline and follow-up for breast and prostate with respect to arthritis. Colorectal and prostate patients reported a significant increase in depression compared with controls. There was no increase in arthritis or neuropathic conditions or decline in visual and hearing impairment for cancer groups compared to controls.

## SESSION 1870 (SYMPOSIUM)

### RESEARCH DESIGNS FOR CLINICAL AGING RESEARCH

Chair: *H. Allore, Internal Medicine, Yale University, New Haven, Connecticut*

Good research designs promote sound statistical inference. Bad research designs cannot always be remedied by sophisticated techniques of statistical analysis. So careful attention to issues of research design is always warranted; however, it is especially valuable when dealing with older study participants who present distinctive challenges to clinical researchers. This symposium proposal outlines several proposed talks very pertinent to clinical aging research. Both experimental and observation designs will be addressed in them. A crucial aspect of a research design is a specification of when and how key variables are measured; a crucial consequence of any research design is the array of statistical techniques that are most appropriate for analyzing the data it yields. Thus, this symposium will touch upon all three of the components of our interest group title and will present an integrated account of how some distinctive challenges of dealing with older study participants might be met. Among these distinctive challenges are the identification of suitably measured outcomes and appropriately chosen eligibility criteria, the acknowledgment of multiple morbidities by multicomponent interventions, and the threat of biased inference introduced by missing data.

### DESIGNING MULTICOMPONENT INTERVENTIONS AND ESTIMATING TREATMENT EFFECTS

H. Allore, *Internal Medicine, Yale University, New Haven, Connecticut*

The full factorial design is a common multicomponent design in which intervention components and their levels are randomly assigned to study participants. This may result in an unwieldy number of treatment arms. However, in trials addressing multifactorial geriatric health participants typically have ≥ 1 modifiable risk factors, but rarely all risk factors. Consequently, participants are not eligible for all combinations of intervention components. Rather, the option for those randomized to the intervention arms is to apply each intervention component to each modifiable risk factor present. This type of multicomponent intervention is called "standardly-tailored". There are several methods for analyzing data from a full factorial design to estimate overall effects and component effects. For standardly-tailored designs the overall effect can be estimated; however, the appropriate comparison group to estimate a component effect includes only participants in the control arm that would have been eligible for that particular intervention component.

### TRIGGERED SAMPLING DESIGNS FOR OBSERVATIONAL COHORT STUDIES WITH OLDER STUDY PARTICIPANTS

P.H. Van Ness, *Internal Medicine, Yale University, New Haven, Connecticut*

A characteristic of observational cohort studies involving older study participants is the loss to follow-up that occurs when they die or become too ill to participate in the study. Various analytical techniques handle such missing data when it is missing at random, e.g., multiple imputation, joint modeling of death and a longitudinal outcome. A design approach that anticipates this difficulty specifies that additional information be gathered from study participants who experience a marked decline in health status, such as hospitalizations or referrals to hospice. This new sampling "triggered" by a decline in health status will most often occur at times when data was not scheduled to be gathered and is intended to detect changes in key variables occurring prior to drop-out. This presentation will describe the advantages and disadvantages of this type of study design and will illustrate several analytical and interpretive issues.

### DESIGNING CLINICAL TRIALS TO ASSESS THE EFFECTS OF BEHAVIORAL INTERVENTIONS ON COGNITIVE OUTCOMES IN SENIORS

M.A. Espeland, *Wake Forest University Health Sciences, Winston-Salem, North Carolina*

Clinical trials of promising non-pharmacological strategies to prevent cognitive impairment are needed. Features of these trials (choice of behavior, required sample sizes, and expected rates of adherence and retention) are dependent on the targeted baseline levels of cognitive and physical function for the cohort. The required sample size and duration of follow-up are also sensitive to the choice of the trial's primary outcome. Data from several trials will be reviewed to provide empirically-based projections for these design benchmarks that are critical for the design of efficient trials of behavioral interventions. These demonstrate the feasibility of such trials. Attendees will learn how the choice of outcomes — ranging from changes in global and domain-specific cognitive function to incident dementia — influence the required sample sizes of trials of promising behavioral interventions. They will learn how eligibility criteria defining baseline cognitive and physical function influence recruitment, retention, adherence, and sample size requirements

### USING AUXILIARY INFORMATION TO CORRECT FOR INFORMATIVE LOSS TO FOLLOW UP

C.B. Hall, *Albert Einstein College of Medicine, Bronx, Connecticut*

Loss to follow-up among participants in longitudinal aging studies introduces a bias in the estimation of functional and cognitive changes as well as of disease incidence. Joint modeling of auxiliary information collected on those lost to follow-up, and multiple imputation using such information, have the potential to allow investigators to estimate the magnitude of this bias and possibly to correct for it. This presentation will outline statistical methods needed to use this auxiliary information. It will further show examples of the use of existing primary care medical records, and of cognitive and mobility data collected via telephone, to correct for the informative dropout. Finally, it will discuss barriers to implementing these and similar approaches and suggest directions for future methodologic improvements.

## SESSION 1875 (SYMPOSIUM)

### VA GRECC SYMPOSIUM: VITAMIN D AND GOOD HEALTH ACROSS THE AGING CONTINUUM

Chair: *G.A. Howard, GRECC, Miami VA Medical Center, Miami, Florida, University of Miami Miller School of Medicine, Miami, Florida*

Co-Chair: *S. Levis, GRECC, Miami VA Medical Center, Miami, Florida*

For years 400 IU/d of vitamin D (RDA) was thought to be sufficient to maintain a healthy lifestyle. Hence, health care practitioners are surprised when presented with data showing a prevalence of vitamin D deficiency over 50% in certain populations. In spite of a number of publications, there is widespread naiveté concerning the worldwide prevalence of vitamin D deficiency and insufficiency, particularly in the elderly. A number of reports have shown the beneficial effects of increased vitamin D intake not only on the skeleton, but on the heart and virtually all major organ systems. Not without controversy, the question of how much is enough is being investigated in several on-going studies to provide a definitive answer. Vitamin D plays a major role, not only in bone health, but also in neuromuscular function. In the elderly, vitamin D deficiency is associated with decreased lower extremity neuromuscular function and increased risk for falls and fractures. This symposium will provide a glimpse into several beneficial aspects of increased vitamin D intake among the elderly. The benefits are not only physiological, i.e., raising the serum level of circulating vitamin D and its biologically active derivatives, but physical in terms of improving physical and functional performance in the elderly. After attending this session, participants will be able to appreciate the benefits that vitamin D supplementation at the appropriate dose could afford in ameliorating functional decline in elderly adults, as well as understanding the potential benefits of supplementation as an important intervention in type 2 diabetes.

### SAFETY AND PHYSICAL PERFORMANCE BENEFIT OF DAILY SUPPLEMENTATION WITH 2000 IU OF VITAMIN D3 IN OLDER AMBULATORY PERSONS

S. Levis[1,2], H. Florez[1,2], B.R. Troen[1,2], E. Cherniack[1,2], O. Gomez[1,2], B.A. Roos[1,2,3], *1. Miami VA Medical Center, Miami, Florida, 2. University of Miami Miller School of Medicine, Miami, Florida, 3. Miami Jewish Health Systems, Miami, Florida*

Since we previously observed a high prevalence of vitamin D (vitD) insufficiency in older south Floridians, we conducted a pilot study of vitD supplementation in 49 ambulatory persons age 73.1 ± 6.5 years, range 64 to 92 (83% women, 45% Hispanic white). Serum 25-OH vitD at baseline was 26.92 + 8.82 ng/ml and vitD intake 275 ± 220 IU/d; the majority (50% men; 61% women) had low weekly caloric expenditure consistent with sedentary lifestyle. Regardless of baseline level of serum 25-OH vitD (25-vitD) or physical activity, all persons received vitD3 2000 IU/d. Serum and urine calcium remained unchanged throughout the trial. After 6 months, participants had a mean increase of 0.09 ± 0.2 m/sec from baseline in the 4-meter walking speed test ($p<0.05$, CI 0.035, 0.15). These results suggest that supplementation with vitD3 2000 IU/d safely and effectively improves physical performance in older individuals.

### ASSOCIATIONS BETWEEN VITAMIN D INTAKE AND PHYSICAL FUNCTION: THE RENEW (REACH-OUT TO ENHANCE WELLNESS) TRIAL

M.C. Morey[1,2], P.E. Miller[3], D. Snyder[2], B. Peterson[2], H. Cohen[2,1], W. Demark-Wahnefried[4], *1. VA GRECC, Durham, North Carolina, 2. Duke University OAIC/ Aging Center/ and/or School of Nursing, Durham, North Carolina, 3. Pennsylvania State University, College Park, Pennsylvania, 4. University of Alabama at Birmingham, Birmingham, Alabama*

Recent evidence suggests that vitamin D status is positively associated with physical function. At baseline (n=641) and 1-year (n=558), cross-sectional associations between vitamin D intake and self-reports of physical function were examined in older, long-term cancer survivors in the Reach-Out to ENhancE Wellness (RENEW) trial, a 1-year-home-based intervention designed to promote exercise and diet quality. We also investigated whether change in vitamin D intake was associated with change in physical function post-intervention. Dietary vitamin D intake, but not supplemental intake, was modestly associated with physical function at both baseline and 1-year ($P<0.05$ both assessments). However, no significant associations were observed between change in vitamin D intake (through diet or supplements), and change in functional status. Our findings suggest that long-term dietary intake may play a role in physical functioning and that additional research is needed to elucidate the role of dietary vitamin D intake on physical function in older adults.

### RACIAL DISPARITY AND EFFICACY OF VITAMIN D SUPPLEMENTATION IN INCREASING 25(OH)D SERUM LEVELS

D.M. Kresevic[1,2], M. Pallaki[1], C. Burant[3,1], J.E. Denton[1], A.E. Higgins[1], *1. GRECC, VA, Cleveland, Ohio, 2. University Hospitals Case Medical Center, Cleveland, Ohio, 3. Case Western Reserve University Frances Payne Bolton School of Nursing, Cleveland, Ohio*

This pilot study, a retrospective chart review, was conducted on community-dwelling veterans (≥65 years) who were cared for in VA geriatric clinics and had one or more recorded 25(OH)D levels. At baseline, 206 of 234 (88.0%) patients had a serum level below normal (32 ng/ml). In a subsample of patients (n=62) who had complete data over three time periods (supplementation for at least 90 days), type of supplementation as compared to 25(OH)D serum levels was analyzed. Of these patients, 95% were prescribed calcitriol at least one time, 72% of whom increased their 25(OH)D levels. Fifty-two percent were prescribed calcitriol at all three time periods, 63% of whom increased their 25(OH)D levels. It should be noted that while not significant due to small sample size, in veterans who took calcitriol for at least 90 days, Caucasians were 3.5 times more likely to increase their 25(OH)D levels as compared to African Americans.

### THE ROLE OF VITAMIN D IN DIABETES PREVENTION AND MANAGEMENT

H. Florez[1,2], L. Oropesa[2], W.M. Valencia Rodrigo[3,2], F.A. Andrade[2], S. Levis[1,2,3], B.A. Roos[1,2,3], *1. University of Miami Miller School of Medicine, Miami, Florida, 2. Bruce W. Carter Miami VA, Miami, Florida, 3. Jackson Memorial Hospital, Miami, Florida*

Altered calcium and vitamin D homeostasis plays a role in the development of diabetes. The mechanisms responsible include effects on insulin resistance, beta-cell dysfunction, and the degree of inflammation. Studies have shown an inverse association between dietary vitamin D and diabetes risk. We have found that hypovitaminosis D (HVD) and daily calcium intake are associated with elevated fasting plasma glucose (FPG). In a post-hoc analysis of 3-year clinical trial data, Pitas et al. (2007) showed a modest but significant difference in FPG (~6 mg/dl) in subjects with prediabetes treated with cholecalciferol (D3) versus those that received placebo. HVD is associated with obesity, sarcopenia, and functional decline while D3 supplementation may enhance muscle function and provide added benefits to lifestyle intervention in older adults at high-risk for diabetes and cardiovascular disease (CVD). Well-designed studies investigating the effect of vitamin D supplementation on glycemic status, diabetes and CVD risk are needed.

## SESSION 1880 (SYMPOSIUM)

### CARE TRANSITIONS: LESSONS THE U.S. CAN LEARN FROM LONG-TERM CARE IN OTHER INDUSTRIALIZED NATIONS

Chair: *H. Gleckman, The Urban Institute, Washington, District of Columbia*
Discussant: *H. Gleckman, The Urban Institute, Washington, District of Columbia*

The U.S. is not alone in its efforts to improve delivery and finance of care transitions across the aging continuum. In contrast to the U.S. system—-built principally on informal care and Medicaid-funded paid assistance—most other developed nations have dramatically reformed their long-term care structures in recent decades. Over the past year, the U.S. has struggled to do the same, especially through debate over the CLASS Act. While the designs of other nations differ from one another, each has important lessons for the U.S. In this symposium, participants will learn about successful models of long-term care developed in recent years by Japan, Germany, and Sweden. In addition, they will learn how the U.S. can adopt the experiences of those nations as it reforms its long-term care model. In this symposium, John Creighton Campbell will argue that Japan's experience with its mandatory long-term care insurance system demonstrates that comprehensive LTC is workable and controllable at moderate cost. Mary Jo Gibson will present on the German model and discuss the early experience of important 2008 reforms that attempted to improve care coordination and quality, expand some benefits, and help ensure long-term financial sustainability of its long-term care insurance design. Gerdt Sundström will review Sweden's efforts to control costs by refocusing its taxpayer-funded system on ancillary home-based services rather than aides and nursing facility care. Howard Gleckman will moderate and discuss how the U.S. can adopt elements of each of these systems to fit its preference for private market solutions.

### PUBLIC AND PRIVATE LONG-TERM CARE FINANCING IN THE U.S: EXPERIENCE WITH RECENT REFORMS

H. Gleckman, *The Urban Institute, Washington, District of Columbia*

In contrast to Japan, Germany, Sweden, and most other developed nations, the U.S. continues to struggle in its efforts to expand benefits for long-term care supports and services. Increasingly resource-constrained, many states are cutting back on Medicaid benefits for the elderly and disabled. Yet, private long-term care insurance finances less than 10 percent of long-term care costs in the U.S. To ease growing burdens on family caregivers, the CLASS Act is an effort to create a public long-term care insurance system. However, unlike Germany and Japan, this is a voluntary model. Participants will better understand what lessons the U.S. can learn from the successful implementation of public insurance in Germany and Japan, and from the taxpayer-funded system in Sweden? They will also learn whether elements of those models can be tailored to the U.S. preference for private-market solutions to social problems?

### THE SWEDISH EXPERIENCE: DIVERSIFICATION OF SERVICES AND CONTAINING COSTS

G. Sundström, *Institute of Gerontology, School of Health Sciences, Jönköping, Sweden*

Public services for older people are often limited to institutional care or home care, usually assistance provided by aides. In many countries these major services are supplemented – or substituted – by "minor" services such as transportation, meals-on-wheels, electronic monitoring, and day care. Sweden's taxpayer funded system provided comprehensive, but costly, care until the 1980s. To contain rapidly rising costs, Sweden – largely successfully – substituted these less intensive, "minor" services for more "heavy" ones. Home Help is rationed to support only the neediest, before ever-shorter institutional care. While everyone in need receives benefits, these are often provided later than prior to the reforms. However, care across the continuum continues to be reasonably well targeted. Participants will learn that older people and their families appear to be well served by this broad range of services, particularly in contrast to the alternatives: Home Help, institutional care, or nothing.

### GERMANY'S PUBLIC, MANDATORY LONG-TERM CARE SYSTEM: FIFTEEN YEARS OF EXPERIENCE AND RECENT REFORMS

M. Gibson, *Independent Health Policy Analyst, Santa Barbara, California*

Germany's Public, Mandatory Long-Term Care System: Fifteen Years of Experience and Recent Reforms Based on a social insurance model, the German system provides long-term services and supports with no means test, yet its public expenditures on long-term care (per capita age 65 +) are less than those in the U.S. Benefits include a cash allowance for home care, formal home care services, and institutional care. Important reforms were enacted in Germany in 2008 to improve care coordination and quality, expand some benefits, and help ensure long-term financial sustainability. The German experience is salient to policy discussion in the U.S. in light of its efforts to expand coverage for long-term care, support family caregivers, improve quality, and contain the costs to states and the federal government of Medicaid's long-term care safety net. Participants will be able to compare and contrast the U.S. and German experiences, focusing on what seems to work and what does not.

### JAPAN'S PUBLIC, MANDATORY LONG-TERM CARE INSURANCE: TEN YEARS OF EXPERIENCE AND RECENT REFORMS

J.C. Campbell, *1. University of Michigan, Ann Arbor, Michigan, 2. Institute of Gerontology, Tokyo University, Tokyo, Japan*

After its first ten years, Japan's LTC insurance program is operating successfully and providing services to some 4 million people (about 14 percent of the 65+ population), without respect to income or family situation. Financing is ½ social insurance premiums, ½ taxes. More than 3 million get home and community based services, the majority using adult day care. Government covers 90 percent of the cost, but public spending (per older person) is only slightly higher than in the U.S. despite such high service levels. Expenditures ran more than expected due to high enrollment by people with light needs, so a reorganization in 2006 moved this group into a lower-cost program. These and other reforms brought enrollment and spending growth roughly in line with growth in the target population. Participants will learn that Japan demonstrates comprehensive LTC is workable and controllable at moderate cost.

## SESSION 1885 (SYMPOSIUM)

### POLICY SERIES SYMPOSIUM: CIVIC ENGAGEMENT IN LATER LIFE: TRANSLATING PROMISING IDEAS INTO REALITY WITHIN DIVERSE COMMUNITIES

Chair: *J. Hinterlong, College of Social Work, Florida State University, Tallahassee, Florida*

The promise of civic engagement among older adults to address community needs has sparked the creation of program models, planning efforts, and public policy in diverse communities throughout the United States. While interest in these efforts continues to grow, differences in the definition of civic engagement raise challenges to identifying key features of successful initiatives. One strategy for addressing this barrier is to understand how older adults and others involved in these programs have translated the goal of engagement into community-specific action. This symposium first will explore how the concept of civic engagement has emerged and evolved. An inclusive framework to guide scholarship and practice is presented. Next, an overview of recent efforts to promote engagement at the national, regional, and local level will illustrate the diversity of activities in the field. Three related papers will consider how communities have responded to call for increased support of older adults' engagement. Examples are drawn from ethnically and geographically diverse settings. Emphasis is placed upon evidence provided from the participants and local leaders about the implementation of these programs and policies. We highlight the roles and voices of older adults themselves in translating the promise of civic engagement into real opportunities for individuals and communities. Recommendations for scholarship, community practice, and public policy are offered.

### IDENTIFYING THE BOUNDARIES AND HORIZONS OF CIVIC ENGAGEMENT AS A CONCEPT FOR THE FIELD OF AGING

E.A. Greenfield, *School of Social Work, Rutgers, The State University of New Jersey, New Brunswick, NJ*

Despite increasing attention to older adults' civic engagement across the field of aging, there nevertheless remains a plurality of approaches to defining what civic engagement means. Based on a review of extant research, this paper identifies points of convergence and divergence among gerontological definitions of civic engagement. While there is agreement regarding organizational volunteering, voluntary group participation, political participation, and community leadership as types of civic engagement, there is less agreement on employment, caregiving, and lifelong learning. This reflects the fact that, until recently, the concept of civic engagement has developed largely within fields outside of gerontology, such as political science and youth development. Regarding implications for research, practice, and policy, the paper concludes by discussing the importance of broad and inclusive definitions of civic engagement for the field of aging, as well as the use of theory to systematically distinguish among varied manifestations of civic engagement in later life.

### OLDER ADULTS' CIVIC ENGAGEMENT: FOSTERING FIELD-BUILDING IN THE UNITED STATES

J. Hinterlong, *College of Social Work, Florida State University, Tallahassee, Florida*

Propelled by private philanthropic investments, public sector activity, and emerging preferences among aging individuals, program and policy initiatives aimed at promoting civic engagement among older adults have proliferated. The growth of the field has faced challenges in the replication of models across communities and the threats to economic security. Nevertheless, sustained efforts by advocates and prominent organizations coupled with growing evidence of the positive impacts of engagement to older adults and others have produced a corps of national, regional, and local leaders to support this work. This paper uses lessons learned from an evaluation of a national philanthropic program to build the field of aging and civic engagement. It highlights the evolution and structure of the field, suggests reasons for its success, and proposes directions for future growth.

### DEVELOPING AND SUSTAINING SUCCESSFUL COMMUNITY PARTNERSHIPS: THE DIVERSE ROLES OF OLDER ADULTS

N. Giunta, *School of Social Work, Hunter College, New York, New York*

Through the Community Partnerships for Older Adults (CPFOA) Program of the Robert Wood Johnson Foundation, fifteen Community Partnerships (CPs) received development and implementation funding to improve the lives of older adults. Assuming no one-size-fits-all approach to meet older adults' complex needs in a diverse society, each CP developed an individualized plan to address its community's unique needs. Surveys, national program office documentation, and other communications with CP participants were examined to identify common "keys to success" across partnerships (N = 15). Among others, two particularly relevant themes emerged across successful partnerships: direct involvement of older adults in leadership, planning, and implementation of partnership initiatives; and consensus from a broad spectrum of stakeholders on community-specific plan implementation. This paper supports evidence that participation in community development initiatives such as CPFOA is related to positive outcomes for older adults and their communities. Community practice, policy, and research implications will be discussed.

### INCREASING ETHNIC COMMUNITY CAPACITY THROUGH TRAINING VOLUNTEERS FOR LEADERSHIP ROLES

S. Diwan[1], T. Blair[2], A. Chandra[3], K. Grimsich[3], R. Grimm[3], S. Shenfil[3], *1. San Jose State University, San Jose, California, 2. UC Berkeley, Berkeley, California, 3. City Of Fremont Dept of Human Services, Fremont, California*

Older immigrants face numerous challenges such as cultural and linguistic barriers to accessing health and social services. Designed to increase community capacity, the Community Ambassador Program for Seniors (CAPS) trained volunteers from ethnic and faith organizations to create a network of bicultural, multi-lingual advocates for seniors in northern California. Since 2007, CAPS trained 85 volunteer "ambassadors," who have assisted more than 600 seniors with health and mental health care, transportation, and other essential services. Training increased volunteers': 1) effectiveness in noting particular areas of individual needs; 2) responsiveness through enabling a wider range of responses to be addressed by volunteers; and 3) considerable satisfaction with their leadership roles. Ambassadors frequently grapple with boundary and role issues that are unique to working within ethnic communities. Lessons learned include the need for understanding key features of particular communities, and supporting volunteers to better understand their roles and boundaries within their communities.

### REMOVING BARRIERS TO CIVIC ENGAGEMENT: LOCAL GOVERNMENT ZONING, HOUSING, AND TRANSPORTATION POLICIES AND PROGRAMS

A.J. Lehning, *School of Social Welfare, UC Berkeley, Berkeley, California*

The physical environment in a majority of this nation's communities presents a significant barrier to the civic and social engagement of older adults. This mixed methods study examines the factors that influence local government adoption of community design, housing, and transportation policies and programs that previous research suggests are important to helping older adults age in place and remain connected to their communities. Survey responses from 62 city planners provide partial support for facilitating factors identified from policy adoption literature, particularly in terms of the importance of advocacy by individuals working within local government and residents. Contrary to hypotheses, however, cities with a higher socioeconomic status and percentage of the population age 65 and older are less likely to have these innovations in place. Qualitative interviews with 18 local government employees suggest explanations for these results and offer some additional factors that should be considered in future research.

## SESSION 1890 (PAPER)

## INFORMAL CAREGIVING

### INFORMAL CAREGIVING BY AND FOR THE OLDEST OLD: POLICIES FOR THE FUTURE

D. Wagner, E. Takagi, *Gerontology, Towson University, Towson, Maryland*

Informal caregiving for an older adult is a normative activity today. The age of the care recipient and the caregiver has increased during the past decade as population aging has occurred in the US. We analyzed data from the 1997, 2004 and 2009 National Alliance for Caregiving (NAC)/AARP national surveys of caregivers and noted that the percentage of caregiving providing help to someone 85+ years of age increased from 24% in 1997 to 30% in 2009. Older adults are not only care recipients but caregivers and many of these older caregivers are often caregiving alone and are more likely than younger caregivers to have higher burden levels associated with this care. The oldest-old caregivers(75+)in the 2009 survey report spousal care as the most common care situation. However, significant numbers are also caring for a friend, a parent or a sibling. Much of the policy change being proposed to support family caregivers on a national level is targeted at the younger (50 years on average) adult child caregiver with less focus on the oldest old. This paper describes the caregiving trends observed in the 2009 NAC/AARP study and discusses policy implications with a focus on the older caregiver. Existing policy proposals such as tax credits for family caregivers and assessment of caregivers are critically reviewed in the context of the growing number of older caregivers and care recipients and a policy paradigm for addressing the needs of this sub-population of informal caregivers is described.

### GENERATIONAL BALANCING ACTS: SOCIO-CULTURAL CONTEXTS OF MID-LIFE FAMILY CAREGIVING

B.A. Mitchell, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

It is well established that a significant number of aging parents are caught between the demands of caring for both younger and older generations. Past studies also indicate that only a minority of these "sandwiched generation" adults experience intense stress and strain with these competing responsibilities, despite the popularity of "apocalyptic" perspectives of aging families. However, gaps remain in the literature on how generational balancing acts are experienced within diverse cultural settings in a rapidly changing urban environment characterized by high rates of immigration. In recognition of these emergent trends and issues, the purpose of this paper is to explore predictors and subjective perceptions of middle-generational family demands using a mixed-methods approach. Building upon life course and role identity theory, both quantitative and qualitative data are drawn from in-depth interviews with a random sample of 490 parents (mothers and fathers) living in Metro Vancouver, British Columbia. Respondents have a mean age of 58 and self-identify as primarily belonging to one of four cultural groups: British-, Southern-European-, South Asian-, and Chinese-Canadian. Results reveal diversity in perceptions of "juggling acts" (e.g., by cultural and immigration background, age, gender, distance/proximity, health statuses, and relationship quality) and at various stages of child launching (e.g., "full nest" versus "empty nest" living arrangements).

### CHARACTERISTICS OF INFORMAL CAREGIVERS IN EUROPEAN COUNTRIES AND KOREA

S. Jang, I. Kawachi, S. Cho, M. Avendano, *Department of Society Human Development and Health, Harvard School of Public Health, Boston, Massachusetts*

Informal caregivers adopt their role for many different reasons, including cultural tradition, and/or dearth of formal long-term care resources. Informal caregivers in most societies are female family members, however, precise figures about the characteristics of caregivers in various societies remain scarce. This study sought to examine macro-level societal characteristics associated with a higher reliance on female family member's informal caregiving. The sample consisted of weighted populations of informal caregivers aged 50 years old or older who had responded to the Survey of Health, Ageing and Retirement in Europe (SHARE) in 2004 and to the Korean Longitudinal Study of Ageing (KLoSA) in 2006. We also used macro data obtained from OECD statistics for the GDP, total fertility rates, labour force participation rates, level of women's empowerment, long-term care resources, population statistics, and life expectancy to examine correlations with the proportions of women and older caregivers. We observed similarities and differences in the distributions of informal caregivers among 11 countries. Korea, Spain, and Italy exhibited similarly high percentages of women, homemakers, co-residents, and spouses in informal care giving roles. Denmark and Sweden showed high proportions of employed informal caregivers. Lower female labour force participation is associated with higher proportions of women caregivers. A higher proportion of women caregivers in the population correlate with lower national GDP per capita. Our findings suggested that relieving women of their caregiving roles and enabling them to share these roles with formal care providers and other resources might increase the participation of women in the labour force and thereby improve the economic status of country.

## SESSION 1895 (PAPER)

## INTERVENTIONS AND SERVICES ACROSS CONTEXTS II

### TO THE HOSPITAL AND BACK HOME AGAIN: A NOVEL NURSE PRACTITIONER-BASED TRANSITIONAL CARE PROGRAM FOR THE HOSPITALIZED HOMEBOUND

K. Ornstein[1,2], K. Smith[1], D. Foer[3], T. Lopez-Cantor[1], T. Soriano[1], *1. visiting doctors program, mount sinai, New York, New York, 2. columbia university, new york, New York, 3. Yale University, New Haven, Connecticut*

Seamless transitions between care settings are a critical component of high quality care for frail older persons and may be a particularly salient issue for the growing number of elderly homebound patients. With high prevalence of chronic and end-stage disease, homebound patients have particularly high rates of hospitalizations and emergency room visits resulting in frequent changes in care settings and increased vulnerability to poor outcomes. Increasingly, homebound patients are being cared for by primary care physicians who are part of multidisciplinary outpatient care teams within home-based primary care (HBPC) programs. At the Mount Sinai Visiting Doctors Program(MSVD), the largest academic HBPC program in the U.S., we developed a novel, nurse-practitioner led transition of care program to improve coordination of care and communication between patients, caregivers and physicians on the inpatient and outpatient setting. We report on the details of the intervention model, including the communication tools developed and utilized for the project. Over a 27 month period the team followed 532 homebound patients through 1088 hospital discharges across 11 services within Mount Sinai Hospital. 663 post-discharge visits were made by nurse practitioners within 3 weeks of discharge representing more than 90% of all patients discharged home. We conducted a detailed evaluation of program effectiveness and costs. While we did not find significant reductions in length of stay during the intervention period, the 30-day rehospitalization rate decreased from 16.6% to 15.8% for this population. We also report results from focus groups conducted among inpatient and primary care providers on program satisfaction.

### ENGAGING LONG TERM CARE HOMES TO PROMOTE SUCCESSFUL RESEARCH IMPLEMENTATION

S. Kaasalainen[1], J. Williams[4], T. Hadjistavropoulos[2], L. Thorpe[3], S. Whiting[3], J. Tremeer[5], S. Neville[6], *1. McMaster University, Hamilton, Ontario, Canada, 2. University of Regina, Regina, Saskatchewan, Canada, 3. University of Saskatchewan, Saskatoon, Saskatchewan, Canada, 4. QEII Health Services Centre, Halifax, Nova Scotia, Canada, 5. Regina Qu'Appelle Health Region, Regina, Saskatchewan, Canada, 6. Saskatoon Health Region, Saskatoon, Saskatchewan, Canada*

BACKGROUND: Quality improvement initiatives can benefit from both the conduct and utilization of research. Researchers need to involve LTC staff in planning and implementing interventions to maximise the likelihood of success. The purposes of this study were to: (a) identify barriers and facilitators of LTC homes' readiness to implement research interventions; and (b) develop strategies to facilitate their implementation. METHODS: A mixed method design was used, primarily driven by the qualitative method and supplemented by a smaller, embedded quantitative component. Data were collected at seven LTC homes from health care providers and administration using 13 focus groups, 26 interviews and two surveys. RESULTS: Findings revealed that participants appreciated being involved at early stages of the project. We developed a model to help conceptualize the study findings. The core of the model represents the innovation which will be implemented within the practice environment. In order to implement the innovation successfully, all of the participants described the importance of working within the structures and processes of the existing practice environment. As such, a number of strategies were highlighted for researchers to help facilitate a positive engagement with LTC homes. All of the themes within the model were well-supported by data from each of the participating LTC homes. CONCLUSIONS: Engaging staff at the planning stage facilitated effective communication and helped strategize implementation within the constraints of the system.

### SUCCESSFUL STRATEGIES FOR STRENGTHENING THE DIRECT SERVICE WORKFORCE: FINDINGS FROM CMS ASSISTANCE TO STATES

B. Wright[1], C. Blakeway[1], J. Engberg[2], S. Hunter[2], L. Steighner[3], *1. The Lewin Group, Falls Church, Virginia, 2. RAND Corporation, Santa Monica, California, 3. American Institutes for Research (AIR), Washington, District of Columbia*

As the older population increases, many states are struggling to recruit and retain qualified direct service workers (DSWs) to meet the growing need for long-term services and supports. In this session, participants will hear findings from two CMS projects to help states improve recruitment and retention of DSWs: 1) the CMS Direct Service Workforce Demonstration grants awarded to 10 states in 2003 and 2004, and 2) intensive technical assistance (TA) provided by CMS through the DSW Resource Center to 16 Money Follows the Person states in 2009-2010. In the Demonstration, each grantee undertook one or more activities. The evaluation used a cluster design, which clustered states by type of initiative (e.g., health care, training, mentoring, marketing campaigns) to permit a comparison of outcomes among grantees with similar initiatives. The study found that stakeholders identified low pay and difficult work as the main challenges. In many cases, implementation struggled because of an incomplete understanding of workers' needs. The implementation evaluation suggests that much of the worth of the initiatives is demonstrating to workers that they are valued and that realistic job previews can help reduce turnover due to unrealistic expectations. In providing TA to states through the DSW Resource Center, interviews with state officials indicated that major challenges were developing core competencies, collecting data needed to understand the problem and design/evaluate initiatives, and strengthening the workforce in rural areas. Through consultation with workforce experts across disciplines/sectors and review of existing literature/resources, promising solutions to these problems were developed.

### LESSONS LEARNED USING INCLUSIVE STRATEGIES FOR AGE-WAVE COMMUNITY PLANNING

P. Dressel[1], G. Walker[2], *1. JustPartners, Inc., Baltimore, Maryland, 2. Jefferson Area Board for Aging, Charlottesville, Virginia*

Given both the aging demographics and financial constraints affecting communities across the nation, interventions that do more for more constituents more efficiently are especially appealing and necessary. This paper shares twelve lessons from three communities in three states utilizing strategies from the Viable Futures Toolkit to address issues of aging by employing a new math that offers results far beyond this one constituency. Lessons focus on using existing resources, opportunities, and challenges to forge common ground practical solutions; making families a key building block for cross-constituency interventions; avoiding conflict across constituencies through shared guiding values; advancing policy change to sustain changed inter-organizational practice; and paying particular attention to internal organizational needs as cross-organizational collaboration gets underway. Aging services organizations and local governments implementing this multi-constituent approach to address elders' concerns report win-win outcomes of expanded policy allies, additional funding sources, and greater media attention for positive change and public acceptance.

## SESSION 1900 (SYMPOSIUM)

### PROMOTING PARTNERSHIPS TO SUPPORT PARTICIPANT-DIRECTED COMMUNITY LIVING FOR SENIORS AND VETERANS

Chair: *A.B. Stevens, Scott & White Healthcare, Temple, Texas*
Discussant: *N. Whitelaw, National Council on Aging, Washington DC, District of Columbia*

The Administration on Aging (AoA) and the Veterans Health Administration (VA) are promoting community living for Seniors and Veterans with disabilities by partnering on two new programs. The Community Living Program targets adults age 60 and over who are at risk of nursing home placement and spend down to Medicaid. In the Veterans Directed Home and Community-Based Services (VDHCBS) Program, the VA purchases community-based services on behalf of eligible Veterans from the AoA Aging Services Network. This symposium will describe the AoA/VA partnership, including the shared goal of providing participant-directed services, and will provide an example on how this national partnership can lead to community-based care options in local communities. Lori Gerhard, Director of AoA's Office of Planning and Policy Development, will describe the AoA/VA partnership and the unique value that academic health scientists can bring to programs that result from this partnership. Dan Schoeps, Director of VA Purchased Long-term Care Group, will describe the VA's evolving approach to consumer directed long term care. Alan Stevens and Richard McGhee, Co-Directors of the Central Texas Community Living Program and VDHCBS will present an overview of the project, which includes Coleman's Care Transitions Intervention. Angie Hochhalter, evaluation specialist, will present the logic model used to guide the implementation and evaluation of the Central Texas program. Baseline data from the initial cohort of 232 participants will be described as well as preliminary data from a 6 month follow up assessment. Dr. Nancy Whitelaw of NCOA will serve as the symposium's discussant.

### THE U.S. ADMINISTRATION ON AGING (AOA) AND THE U.S. DEPARTMENT OF VETERAN AFFAIRS (VA) WORKING TOGETHER TO FACILITATE COMMUNITY LIVING OPTIONS

L. Gerhard[1], D. Schoeps[2], *1. Administration on Aging, Washington DC, District of Columbia, 2. Veterans Health Administration, Washington DC, District of Columbia*

Flexible community-based long term care services result from a unique AoA/VA partnership. Lori Gerhard, Director of AoA's Office of Planning and Policy Development, will describe the partnership and the unique value that academic health scientists can bring to AoA's goal of providing evidence based interventions. Dan Schoeps, Director of VA Purchased Long-term Care Group, will describe the VA's dedication to participant-directed long term care. Programs resulting from the AoA/VA partnership share a common goal of engaging individuals during transitions in care to ensure access to the full range of service options to promote health and independence. Presenters will describe how AoA and the VA are collaborating to implement care transitions models, build community capacity to implement transitional care, achieve hospital buy-in, and evaluate care transitions activities. Training materials, strategies, and tools from ongoing projects funded by AoA and the VA will be showcased.

### THE CENTRAL TEXAS COMMUNITY LIVING PROGRAM

A.B. Stevens[1], T.D. Butler[1], J. Jones[1], R. McGhee[2], *1. Scott & White Healthcare, Temple, Texas, 2. Central Texas Aging and Disability Resource Center, Belton, Texas*

Partnering with Scott & White Healthcare and interfacing with the Central Texas Veteran Directed Home and Community-Based Services Program, the Central Texas Aging and Disability Resource Center (ADRC) is implementing and evaluating a multi-component education and support program which supports community-based living for older individuals at risk of nursing home placement. Participants are identified in the hospital setting and through community referrals. All services are delivered according to a customized, ten-month plan of care developed in partnership with the person at risk of nursing home placement and the responsible family caregiver. Core services include the Coleman Care Transitions Intervention and the REACH II Intervention, both evidence-based. Formal support services such as respite and home modifications are provided at no charge to the participant. Implementation of the program, including the importance of developing strong community/healthcare provider partnerships, will be highlighted in this presentation.

### PRELIMINARY FINDINGS FROM THE CENTRAL TEXAS COMMUNITY LIVING PROGRAM

A. Hochhalter[1], E. Smith[1], A.B. Stevens[1], R. McGhee[2], *1. Scott & White Healthcare, Temple, Texas, 2. Central Texas Aging and Disability Resource Center, Belton, Texas*

The Central Texas Community Living Program is designed to delay or prevent nursing facility placement for individuals who prefer living at home. The program targets those at risk for placement and Medicaid spend-down. To date, 504 persons have been referred through Scott & White Memorial Hospital or the Central Texas Aging and Disability Resource Center. Of these persons, 232 have enrolled. A comprehensive evaluation of program implementation and effectiveness on both the individual consumer and organizational levels is underway. Among enrolled participants, 18 have cancelled services, 10 have been transferred to the Central Texas Veteran Directed Home and Community-Based Services Program, 10 have died at home, and 3 have entered a nursing facility. The presentation will describe the evaluation logic model and six-month follow-up data for enrolled consumers, including clinical status, functional status, and quality of life of the consumer and family caregiver, and nursing home placement of the consumers.

## SESSION 1905 (SYMPOSIUM)

### SUSTAINABLE COMMUNITIES: GOOD FOR THE ENVIRONMENT AND OUR HEALTH

Chair: *K.E. Sykes, Aging Initiative, US EPA, Washington, District of Columbia*

Discussant: *K.E. Sykes, Aging Initiative, US EPA, Washington, District of Columbia*

Taking action against global warming creates immediate “win-win” situations for our health and environment. Older adults can be part of the solution to this problem through civic engagement to address better transportation options and community designs that lead to more active and less stressful lifestyles and ultimately healthy people. The EPA Aging Initiative has funded and inspired 3 projects focusing on smart growth, civic engagement and active aging. Results and progress from these exemplary pilots will be discussed. ENCorps, a training program for Mainers 50 years and older, contained program components attractive to baby boomers: 1) flexibility in defining smart growth projects that address community projects that promote environment integrity; 2) educational opportunities that build skills and foster leadership capacity and 3) provide opportunities for social networking. A case control study conducted in Portland, OR examined whether green streets contribute to community well-being, (physical and mental health of older and younger adults). The findings will inform changes to the urban environment that are both ecologically sensitive and socially beneficial for people of all ages. Philadelphia Corporation for Aging developed an agenda to promote a built environment that encourages social connectedness, and government policies that encourage a high quality of life for persons of all ages. A broad coalition was created designed to achieve the goals set by the EPA by examining the impact of the built environment on health outcomes through interventions that impact the urban environment such as the rewriting to the City’s zoning code.

### THE EFFECTS OF GREEN STREETS ON OLDER ADULTS’ PHYSICAL AND MENTAL HEALTH

M.B. Neal, J. Dill, G. Luhr, A. Adkins, V. Shandas, D.A. Lund, *Portland State University, Portland, Oregon*

Sustainable, or “green,” streets incorporate natural, landscape-based features that manage stormwater, accommodate walking and bicycling, mitigate urban heat island effects, and reduce greenhouse gas emissions and air pollution. Although the environmental benefits (e.g., improved water and air quality) of natural greenery in urban areas are well known, potential secondary benefits of green streets could include higher levels of physical activity, increased social interaction and social capital, and improved health, yet no published research has directly demonstrated these benefits. This paper reports the results of a study designed to determine whether green streets contribute to community well-being, including the physical and mental health of older and younger adults. A mailed survey of residents of four Portland, Oregon neighborhoods, two with green streets and two without, was conducted. The study findings will help inform changes to the urban environment that are both ecologically sensitive and socially beneficial for people of all ages.

### BRINGING ACTIVE AGING TOGETHER WITH SMART GROWTH: THE PHILADELPHIA EXPERIENCE

K. Clark, A. Glicksman, D. Nevison, *Planning, Phila Corporation for Aging, Philadelphia, Pennsylvania*

Integrating active aging and smart growth into the fabric of a large city requires long-term commitment, from a variety of diverse stakeholders, based on careful planning and coalition building. Philadelphia Corporation for Aging (PCA), the Area Agency on Aging for the city of Philadelphia, has developed an agenda to promote a built environment that encourages social connectedness, and government policies that encourage a high quality of life for persons of all ages. PCA is building a broad coalition of private, not-for-profit, and municipal agencies committed to this agenda and is attempting to achieve the goals set by the EPA on a city-wide scale through: sharing the results of research designed to examine the impact of the built environment on health outcomes, identifying common interests and developing partnership for various projects, and by participating in activities that will impact the urban environment such as the rewriting to the City’s zoning code.

### DESIGN AND IMPLEMENTATION STRATEGIES FOR ENGAGING OLDER ADULT VOLUNTEERS AS ENVIRONMENTAL STEWARDS

L.W. Kaye, J. Crittenden, A. Chamberlain, *Center on Aging, University of Maine, Bangor, Maine*

Encore Leadership Corps (ENCorps) is a state-wide training and civic engagement program for Mainers 50 years and older who wish to participate in smart growth, community revitalization, and environmental stewardship initiatives. In four months, 110 older adults have enrolled ranging in age from 50 to 85 years (mean = 63.2 years). Sixty two percent are women. Male enrollees are significantly older (65.4 years) than their female counterparts (61.8 years) ($p<.05$). Programmatic components that were particularly influential in attracting baby boomers to ENCorps include: 1) flexibility in defining volunteer smart growth projects; 2) opportunities to address real community issues that promote environment integrity; 3) an emphasis on continuous education and skills building; 4) opportunities for social networking/collaboration; and 5) the fostering of leadership capacity. Supported by grants from the U.S. EPA's Aging Initiative, Maine Community Foundation, the Atlantic Philanthropies, Jane's Trust, Margaret E. Burnham Charitable Trust, and the Davis Conservation Foundation.

## SESSION 1910 (SYMPOSIUM)

### THE POLITICAL ECONOMY OF RETIREMENT SECURITY: RECESSION, BUDGET DEFICITS AND THE ENTITLEMENTS PROGRAM

Chair: *L. Polivka, The Claude Pepper Foundation, Inc., Tallahassee, Florida*

Initiatives to reduce the costs of the entitlements programs, which were created to ensure the economic well-being of the elderly, have emerged at regular intervals since the 1980 election of Ronald Reagan. The most recent initiative is now underway with President Obama's creation of a commission to address the projected growth of large budget deficits over the next 10 years. Proponents of reduced entitlements spending anticipate that budget deficit anxiety among the political elite and in the media will finally make it possible to make major reductions in these programs. The President's Deficit Commission will consider potential cuts in the entitlements programs after a decade's long period of decline in private defined benefit pension plans, wages and family savings. Baby boomers have less total retirement wealth than those in the same age cohort 25 years ago, and are facing substantially higher out of pocket health and long-term care (LTC) expenses (200 thousand plus). These trends raise serious questions about the capacity of many future retirees to have an adequate standard of living in retirement without maintaining or even increasing benefits in the Social Security and Medicare programs. Presenters in this session will address each of these issues and offer alternative strategies for ensuring the future of retirement security.

### ECONOMIC RESOURCES OF FUTURE RETIREES

L. Polivka, *The Claude Pepper Foundation, Inc., Tallahassee, Florida*

The retirement prospects of successive generations of retirees have improved steadily between 1945 and 1990 with the development of Social Security, Medicare and Medicaid (LTC coverage for some), the growth of private pensions and retiree health benefits, and the increase in wages and savings. Over the past 20 to 30 years, however, private pensions have become a less reliable source of retirement income and wages and savings have declined. This presentation will discuss the impact of these changes and their sources (globalization, deregulation, privatization, declining union power, revenue reductions and cuts in social programs) on the generation of retirement wealth since 1980, and the relative capacity of future generations of retirees to maintain an adequate living standard in retirement. The paper will address the kinds of changes in income support and health care policies that will be needed to ensure retirement security for most workers in the future.

### CRISES AND OLD AGE POLITICS: THE DEBT-REDUCTION COMMISSION

C.L. Estes, *Institute for Health & Aging, University of California, San Francisco, San Francisco, California*

This paper examines President Obama's National Commission on Fiscal Responsibility and Reform and its implications for the politics and economic security of the aging. Research methods include discourse and network analyses of commission members, their statements, invited testimonies, and commission products, as well as public opinion polling and media accounts. The paper offers (1) a chronology of "crisis" claims; and (2) identification of (a) the dominant narratives (e.g., "Catastrophic Deficits, Demography and the Nation's Downfall" versus "Social Security does not contribute to The Debt, and its Guarantee ensures the Common Good,") and (b) the major "solutions" (e.g., entitlement cuts (Social Security, Medicare, Medicaid) versus revenue/tax increases, or variations and combinations of each. Theories of Legitimation Crisis (Jurgen Habermas), The Fiscal Crisis of the State (James O'Connor), and Antonio Gramsci inform this examination of the: (1) objective and subjective dimensions of crisis, and (2) symbolic and material consequences of deficit crisis for the aging and future generations.

### THE TWO LEGGED STOOL: INDIVIDUALIZING INCOME RISK IN RETIREMENT

P. Herd, *University of Wisconsin-Madison, Madison, Wisconsin*

The composition of retirement income has shifted from a mixed portfolio of individual and collectivized risk, to one dominated by individual responsibility. The three legs of the retirement stool traditionally had varying levels of risk. Both Social Security and employer provided defined benefit plans pooled risk across all beneficiaries. The riskiest part of the leg, the individualized part, was private savings. But over the past 30 years, employer provided pensions and private savings have merged into a seamless leg of risk. Both are individualized and their values are linked to the ups and downs of the stock market and the individual's ability to invest those resources wisely. The consequence of these changes is that the retirement income stool is now just two legs. One leg, which collectivizes risk, is comprised of Social Security. The other leg, which individualizes risk, is comprised of private savings, employer provided defined contribution plans, and earnings.

## SESSION 1915 (SYMPOSIUM)

### AGING AND THE BATTLE OF THE BULGE

Chair: *D. Ingram, Pennington Biomedical Res Center, Baton Rouge, Louisiana*

Current estimates of the number of obese persons over 65 years of age are close to 30%. For those aged 45-64, the estimate is about 40% with incidence having more than doubled over the last 35 years. This obesity epidemic will have major negative impact upon the health and quality of lives of older persons as well as create incredible challenges to the health care system and its financing. To bring these challenges into perspective for the audience, this symposium will cover several aspects of the "Battle of the Bulge." First, Vishwa Deep Dixit will describe the impact of obesity on the aging thymus and the resulting negative consequences for immune function. Annadora Bruce-Keller will discuss effects of obesity on brain aging as it relates to inflammation and oxidative stress and their impact upon cognitive function. Roy Martin will describe the role of fermentable dietary fiber on preventing obesity and diabetes and attenuating aging processes including effects on appetite control. Finally, Eric Ravussin will describe on-going studies of calorie restriction in humans as an approach for controlling the risks of obesity in later years and attenuating other age-related diseases of aging and functional declines.

### GEROBESITY AND IMMUNE FUNCTION

V.D. Dixit, *Pennington Biomedical Res Ctr, Baton Rouge, Louisiana*

Nearly 40% of Americans age 50 years or older are overweight. Both aging and obesity are known to compromise immunity which is reflected in greater incidence and severity of infections and certain cancers. However, it remains unclear how obesity impacts the aging of immune system and mechanisms regulating generation of T cells from thymus. Intriguingly, by 5th decade of life, 80% of human thymus is replaced by adipocytes and dramatically looses its capacity to produce naïve T cells and maintain T cell repertoire diversity. Using genetic fate-mapping approaches, our recent studies show that process of epithelial-mesenchymal transition (EMT) contributes towards generation of fibroadipogenic precursors in thymus and loss of organ function. Diet-induced obesity accelerates the aging of thymus by inducing defects in thymic stromal cells as well as hematopoietic stem cells. Our data suggest that obesity accelerates immunosenescence mechanisms which may lower the health-span of a growing "gerobese" population.

### THE IMPACT OF HIGH FAT DIETS ON BRAIN AGING

A. Bruce-Keller, *Pennington Biomedical Res Ctr, Baton Rouge, Louisiana*

The obesity epidemic will likely pose major impact upon the incidence of neurodegenerative disease. Using rodent models, we are examining the degree to which, and the mechanisms by which, high dietary fat intake affects brain function. Mice of different ages are administered diets with differing fat composition and evaluated for cognitive ability and biochemical markers of redox signaling. Consumption of high fat diet increases body weight and fat accumulation in mice of all ages, but only the oldest mice became cognitively impaired following high fat diet consumption. Furthermore, biochemical analyses of brain redox signaling and oxidative injury revealed that aged mice respond to high fat diet with significantly enhanced oxidative stress, which histological analyses localized primarily to neurons. Collectively, these data suggest that aged mice are particularly susceptible to the detrimental neurologic effects of high fat diet, which may disrupt cognition through increased neuronal redox signaling and oxidative injury.

# SESSION 1920 (PAPER)

## DEPRESSION: PREVALENCE AND TREATMENT

### A RCT FOR FOLIC ACID AND VITAMIN $B_{12}$, AND PHYSICAL ACTIVITY IN THE PREVENTION OF COGNITIVE DECLINE IN OLDER ADULTS WITH ELEVATED DEPRESSIVE SYMPTOMS

J.G. Walker[1], P. Batterham[1], A. Mackinnon[2], A. Jorm[2], I. Hickie[3], M. Fenech[4], D. Crisp[1], H. Christensen[1], *1. Centre for Mental Health Research, Australian National University, Canberra, Australian Capital Territory, Australia, 2. The University of Melbourne, Melbourne, Victoria, Australia, 3. The University of Sydney, Sydney, New South Wales, Australia, 4. Commonwealth Scientific and Industrial Research Organisation, Adelaide, South Australia, Australia*

Objective: The present randomized controlled trial (RCT) investigated whether folic acid + vitamin $B_{12}$ intake or physical activity prevented cognitive decline in elderly with elevated depressive symptoms. Method: A community-based of a two-year intervention with a completely crossed 2 x 2 x 2 factorial design: (400 mcg/d folic acid + 100 mcg/d $B_{12}$ vs placebo) by (physical activity promotion vs nutrition control) by (MHL vs pain information control). 909 adults aged 60-74 years with elevated psychological distress (Kessler - 10). The interventions were delivered via post in 10 modules with concurrent telephone tracking calls. The main outcome was change in cognitive function at 12 and 24 months using the Telephone Interview for Cognitive Status – M (TICS-M) and the Test of Adult Cognition by Telephone (BTACT), the Informant Questionnaire on Cognitive Decline in the Elderly (IQCODE) was administered at 24 months. Results: Folic acid + $B_{12}$ compared to placebo improved TICS-M total score ($p = .032$; $d = .17$), TICS-M immediate ($p = .046$; $d = .15$) and delayed recall ($p = .013$; $d = .18$) at 24 months. There were no significant changes for TICS-M orientation, TICS-M attention/calculation, TICS-M semantic memory, the BTACT or the IQCODE. Physical activity compared to nutrition promotion was associated with improved recall memory (TICS-M) from baseline to 12-month follow up ($p = .036$; $d = .14$). Conclusion: Long-term daily folic acid 400 mcg + $B_{12}$ 100 mcg promotes improvements in cognitive functioning, particularly in immediate and delayed memory performance, in elderly with depressive symptoms.

### DEPRESSION, COGNITIVE FUNCTIONING AND MORTALITY IN AN OLDER-OLD SAMPLE

D. Paulson[1,3], M.E. Bowen[2], P.A. Lichtenberg[1], *1. Wayne State University, Institute of Gerontology, Detroit, Michigan, 2. Veterans Health Administration, HSR&D/RR&D Center of Excellence, Tampa, Florida, 3. Henry Ford Health System, C/L Psychiatry, Detroit, Michigan*

The relationship between mood and longevity in late life has been found to be robust, but highly influenced by contextual factors such as catastrophic cognitive decline and functional independence. Given that the fastest-growing population segment include older-old women, it is important to better understand factors associated with longevity and decline. Using the Health and Retirement Survey (years 1998-2006), the current longitudinal study examined the relationship between longevity, cognitive functioning and mood among stroke-free women over the age of 80 across 8 years. Depression symptoms were assessed using the 8-item Center for Epidemiological Studies Depression Scale (CESD) and cognitive functioning was assessed using the 35-point Telephone Interview for Cognitive Status. Cerebrovascular risk factors (CVRFs) included diabetes, hypertension, heart disease and lifetime history of smoking. Respondents who endorsed multiple CVRFs were identified as having high cerebrovascular burden. Using logistic regression, depression symptoms (CESD; $\beta$=.077, ExpB=1.080, p=.018) and cognitive functioning (TICS; $\beta$=-.068, ExpB=.934, p<.001) predicted incidence of death over 6 years after controlling for age, years of education, BMI, cerebrovascular burden, and IADL functioning. Model sensitivity was .76. Using cox regression, time to death was significantly predicted by age ($\beta$=.021, p=.013) and cognitive functioning ($\beta$=-.018, p=.009), with cerebrovascular burden showing a strong trend toward significance (-.141, p=.058). Time to death was not predicted by years of education ($\beta$=.012, p=.284), BMI ($\beta$=-.012, p=.168), or CESD ($\beta$=-.003, p=.886). These findings suggest catastrophic decline for both mood and cognitive functioning preceding death, and underscore the importance of these variables for elders.

### EVALUATION OF A BEHAVIORAL ACTIVATION GROUP THERAPY PROTOCOL IN A GERIATRIC PSYCHIATRY FACILITY

M.J. Norton[1], M.R. Crowther[1], F. Scogin[1], L. Ward[2], A. Snow[1,2], D. Boles[1], *1. Psychology, The University of Alabama, Tuscaloosa, Alabama, 2. Tuscaloosa VAMC, Tuscaloosa, Alabama*

The purpose of this study was to evaluate the effect of a Brief Behavioral Activation Therapy for Depression (BATD) group protocol added to hospital treatment as usual (TAU) on patient depression (measured by the Geriatric Depression Scale-GDS). BATD strives to bring individuals into contact with positive reinforcement in their environment through increasing participation in pleasant, personally rewarding activities. Few studies to date have examined behavioral activation therapies in state psychiatric facilities. Participants were patients at a state-run inpatient geriatric psychiatry facility (mean age=72.2). A 2-group comparison design was used. 25 patients were randomized to BATD + TAU, and 25 were randomized to a TAU only control group. The BATD intervention consisted of 8 group sessions. Measures of treatment delivery, receipt, and enactment were utilized to assess treatment implementation. A one-way between-subjects analysis of variance (ANOVA) was used to test the effect of the intervention on depressive symptoms. The results showed no significant effect of group assignment on depression change scores (F [1, 47]= .46, p=.501). Assessment of treatment implementation revealed good treatment delivery, as measured by ratings of therapist competence (87%) and adherence (89%). However, measures of treatment receipt (group attendance, scores on a BATD Knowledge Quiz) and enactment (homework completion) were below expectation. Patient attendance at group sessions averaged 3 out of 8 sessions. Patient scores on a BATD Knowledge Quiz averaged 12.3%. Treatment enactment scores averaged 48%.

We will discuss modifications to group BATD for future interventions and site willingness to implement interventions regardless of modest results.

### LONGITUDINAL PATTERNS OF DEPRESSIVE SYMPTOMS IN THE HEALTH AND RETIREMENT STUDY

A.T. Perzynski[1,2], J. Sudano[1,2], *1. Case Western Reserve University, Cleveland, Ohio, 2. MetroHealth, Cleveland, Ohio*

Most prior population-level studies of depressive symptoms in older adults have only compared the change in mean symptom scores over time or modeled development of depressive symptoms as a single growth trajectory. We use latent class growth analysis (LCGA) to investigate multiple patterns of depressive symptoms in the Health and Retirement Study (HRS). We analyze 5,195 age-eligible respondents from the 1992 HRS cohort, who completed interviews in all seven waves through 2004. Demographic characteristics are: 60.3% female, 76.4% non-Hispanic White, 14.4% Black, 7.4% Hispanic, 1.8% other racial/ethnic groups; median age=55; and mean education=12.4 years (SD=3.0). Depressive symptoms are measured using a dichotomous, 8-item version of the CES-D. Using MPlus, we compared the fit of LCGA models of two to eight classes while also accounting for the HRS complex sampling design. The best fitting model has four distinct patterns of depressive symptoms: (1) Almost no symptoms throughout=73.5%, (2) Decreasing symptoms=9.6%, (3) Increasing symptoms=11.5% and (4) Many persistent symptoms=5.4%. Further analysis including covariates shows a greater likelihood of being in the "many persistent symptoms" class as opposed to the "almost no symptoms" class for women (OR=2.16, p<.001) Blacks (OR=1.95, p<.001), Hispanics (OR=1.32, p<.05) and those with lower education (OR=1.32, p<.001). Our results support a four-pattern typology that can serve as a framework for better understanding depressive symptoms and underscore the importance of gender, race/ethnicity and socioeconomic status for mental health among older adults. Future work will examine how patterns of depressive symptoms are associated with specific life events, health conditions and mortality.

### DEPRESSION, MASCULINITY, AND AGING: FINDINGS FROM THE MEN'S HEALTH AND AGING STUDY

E. Apesoa-Varano[1], J. Barker[2], J. Unutzer[3], L. Hinton[1], *1. Psychiatry, Univ. of California, Davis, Sacramento, California, 2. University of California, San Francisco, San Francisco, California, 3. University of Washington, Seattle, Seattle, Washington*

Depression in older men has been associated with functional disability, poor quality of life, and identified as a major risk factor for suicide. A gap remains in our understanding of the social processes and factors involved in older men's help-seeking that may hinder or facilitate depression care. This paper addresses this gap by exploring how Mexican and white non-Hispanic (WNH) older men experience and express their depression. The data are drawn from an NIMH funded (R01 MH080067) mixed method study of barriers and facilitator of care in white non-Hispanic and Mexican-American men. Findings are based on in-depth, semi-structure interviews with 50 men over the age of 60 screened for clinical depression in primary care settings, including treated and untreated. We identify specific idioms of distress that are linked to men's conceptions of masculinity and aging across both ethnic groups. We found that older men across groups do not use "red flag" terms commonly associated with depression (e.g. feeling sad or lacking interest) and instead communicate their depression as a sense of worthlessness and lost productivity. WNH men are more likely to perceive their depression as a reflection of individual failure while Mexican men ground them in their socio-economic life and consider their impact on the family. We explore further implications of these findings.

## SESSION 1925 (PAPER)

## EARLY IN THE LIFE COURSE

### THE IMPACT ON YOUNG PEOPLE OF HAVING A FATHER WITH YOUNG ONSET DEMENTIA: A FOLLOW-UP STUDY OF TRANSITION TO ADULTHOOD

J.R. Oyebode[1,2], N. Lord[1], J. Allen[2], *1. School of Psychology, University of Birmingham, Birmingham, United Kingdom, 2. Birmingham and Solihull Mental Health Foundation Trust, Birmingham, United Kingdom*

Background: An earlier study by our group found that having a father with dementia had a profound impact on children/young people aged 13-24 years. Aim: This study follows up the original participants four years after their first interview to explore the continuing influence on their lives of living/having lived with a father with dementia. Method: A Grounded Theory approach was taken. Seven young people were interviewed, with all being recorded and transcribed. Results: Analysis highlights the powerful narratives of these young people as they witnessed and lived with their father's deterioration, and in some cases death. They spoke of a succession of turning points, each taking them on to further challenges. Most retained huge sympathy for their fathers, and their caregiving mothers, whilst also being very distressed on their behalf. They spoke of their adolescence being different from their peers, leaving them with some feeling of distance and isolation, though their bonds with their well parent and siblings were often strengthened. Some were still waiting for their father's (and their own) ordeal to end. Others, whose father had died, were very conscious that they were missing a father but were working to try and re-establish their lives. Meaning-making was a strong theme throughout. Conclusions: Young people who have a father with early onset dementia see things and take on responsibilities that are rare in their age group in the developed world. The meaning they are able to take from this seems to play a key part in determining personal outcomes.

### INTERGENERATIONAL LEARNING THROUGH COMPUTER AND INTERNET

E. Chang, *Gerontology Academic Program, California State University Fullerton, Fullerton, California*

The stereotype that "you cannot teach an old dog new tricks" persists despite scientific evidences that human brain has plasticity and human development continues through lifetime. This stereotype is perpetuated in technology-related learning; the misconception is commonly embraced by both the young and the old. Computer and Internet has created a digital gap between age groups. Contrary to conventional belief that older people cannot handle technology, computer and Internet can be a tool to dispel this stereotype. A class assignment requiring students to teach older adults who never used Internet to learn how to surf Internet or send an e-mail or learn new computer software provides encouraging evidences. Different from most older-adult computer classes, whose focus is on the benefits for the older learners, this assignment aims for students to advance their understanding of aging through teaching older computer novices. 21 students in the Successful Aging and Gerotechnology class completed the assignment. Students are asked to document their teaching experiences and write a reflection essay. The age of participants ranged from 50 to 93; the teaching sessions lasted from four hours to five days. Students identified barriers for older adults to embrace computer and Internet and tested different ways to motivate their older students. In general, students reported a positive experience for both parties. Some students also reported becoming less trusting of Internet security, echoing concerns of their students with age-old wisdom. All of them affirmed that older people can learn new things if motivated and taught well.

### THE EDUCATIONAL SUPPORT PROGRAM IN A JAPANESE ELEMENTARY SCHOOL OFFERED BY THE SENIOR VOLUNTEERS AND ITS INFLUENCE ON CHILDREN'S SCHOOL LIFE -THE RESULTS OF TWO-YEAR FOLLOW-UP SURVEYS-

H. Uchida[1], Y. Fujiwara[2], S. Shinkai[2], T. Nishigaki[1], S. Matsuura[3], H. Sakuda[1], *1. University of Hyogo, Himeji, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Itabashi, Japan, 3. Matsuura Clinic, Himeji, Japan*

This study was to clarify the educational support program in an elementary school given by the senior volunteers and its influence on children's school life, based on the results of two-year follow-up surveys. The program served children in grades 2-4 (age 7 to 9) during the school day, and a volunteer was assigned to a classroom. The volunteers attended homeroom, and played with children in rest times. They also worked under the direction of the teachers to support children literacy, mathematic, physical education, moral education, arts and crafts, etc. The participants were six seniors (age 66.8+/-5.8) and 15 children, who lived in Himeji, Japan. As the control groups, we selected 25 children who lived in a neighboring district. We carried out a baseline survey in the beginning of February 2007, and the follow-up surveys were done in Januarys 2008 and 2009. We questioned for the children several items such as health status, mental and emotional support from family, and school life and its rules. There was no significant difference in baseline characteristics between the two groups in children. After two years, average scores of "enjoying the activities with the class mates", "having an adult who cares about me" and "having an adult whom I can rely on" in educationally supported children significantly increased. A score of health status also increased in children. The educational support program for two years clearly promoted mental satisfaction and social networks of the school children. It is suggested that the program had the positive influence on the children and senior volunteers.

### THE INCREASING IRRELEVANCE OF AGE: ITS IMPACT ON THE CHARACTER OF CHILDHOOD

J. Levin, *Sociology, Northeastern University, Boston, Massachusetts*

Although ageism continues to characterize the attitudes and behavior of many Americans, there has also been a decline in the relevance of age for many of the important decisions made by adults—e.g., first marriage, childbirth, and retirement. As the barriers between age groups become more and more permeable, the variability of age as a decision-making marker continues to broaden. The result for middle-aged and older adults has been ameliorative. Americans now enjoy a wider range of ages within which they can legitimately decide to marry, give birth, and retire. For children, however, the blurring of age boundaries has had a deleterious effect. At earlier and earlier ages, children now engage in activities formerly associated with teenagers or young adults. Bullying peaks in the 6th, rather than the 11th, grade; oral sex has become a socially acceptable practice in middle-school restrooms and corridors. At the same time, teenagers are being treated like young adults. More and more 14 and 15 year old defendants are being tried as though they were 24 or 25. Middle school boys have opened fire on their schoolmates after being rejected by a girlfriend. And growing numbers of young adults are being regarded as adolescents who remain in school and in their parents' homes until they are in their late twenties and thirties.

## SESSION 1930 (SYMPOSIUM)

### HIV/AIDS IN LATER ADULTHOOD: CURRENT FINDINGS AND FUTURE DIRECTIONS

Chair: *N. Orel, Gerontology, Bowling Green State University, Bowling Green, Ohio*

Current data from the 2008 Department of Health Study indicate that between 1990 and 2005 the number of AIDS cases in people over the age of 50 increased by more than 700%. While many individuals assume that older adults are not involved in activities that would place them at risk for HIV, current research has found that the vast majority of older adults (92%) consider sex an important part of life and 75% of those between 65 and 74 report being sexually active (National Bulletin of the National Advisory Council on Aging, 2002). However, current research also indicates that one out of three sexually active older adults with HIV/AIDS has unprotected sex and often with multiple sexual partners (Lovejoy et al., 2008). Generally, older adults have been found to be the least knowledgeable about HIV and its transmission (Hillman, 2007) and fail to recognize the relevancy of HIV/AIDS education and prevention to their lives (Altschuler et al., 2004). Additionally, older adults who are diagnosed with HIV often find a scarcity of programs and services that would meet their specific needs and concerns. This symposium will highlight the most current and up to date research on a) myths and misconceptions about HIV/AIDS among ethnic elders, b) efficacious HIV/AIDS prevention education programs, c) training resources that emphasize the relevancy of HIV/AIDS education for an older adult population, and d) the importance of social networks for older adults living with HIV. This symposium highlights relevant issues in HIV/AIDS and the older adult population.

### MYTHS & MISCONCEPTIONS ABOUT HIV/AIDS IN OLDER COMMITTED ETHNIC MINORITIES

O. Macklin, *1. Los Angeles County Community & Senior Services, Los Angeles, California, 2. Veterans Healthcare Administration, Los Angeles, California*

This study examined Older Adults' (OA) perception of HIV/AIDS and their susceptibility. It further examined discrepancies in HIV/AIDS prevention services that may be exacerbating the pandemic. A qualitative study of diverse older adults in Los Angeles, who reported being in committed relationships, was conducted. Results indicate that OAs are aware of what HIV/AIDS is and how it is transmitted. Participants overwhelmingly identified high-risk groups as LGBTs, substance users, and younger people. OAs were not getting tested for HIV/AIDS, did not practice "safe sex", and felt being excluded from one of the high risk groups mentioned previously, reduced their risk of contracting it. Additionally, being religious and in a committed relationship, were also factors which influenced OAs' perceptions about their vulnerability. Results from this study demonstrate how the lack of HIV/AIDS resources designed to address the sociocultural needs of the aging community, correlates with the increase in newly-reported cases.

### TAKING INTO ACCOUNT OLDER WOMEN'S SEXUAL DECISION MAKING IN DEVELOPING HIV PREVENTION PROGRAMS

W. Watson, *Dept of Human Services, Bowling Green State University, Bowling Green, Ohio*

Most of what is known about sexual decision-making, condom use, and romantic relationships has been extrapolated from research with adolescents and college students. Older women are affected by sexually transmitted diseases, including HIV/AIDS, yet little is known about how they are processing information about their sexuality, romantic relationships, sexual decision-making, condom use, and information about HIV/AIDS. Through semi-structured, in-depth interviews, the narratives of fourteen women between the ages of sixty-five and eighty were examined. Analysis proceeded from an interpretive phenomenological approach, grounded within the author's developmental contextualist and feminist theoretical perspectives. Findings are organized around two overarching themes: a) most women feel knowledgeable about HIV and b) lack of HIV testing or condom use in this relationship. Trust in partner's honesty and faithfulness is seen as protection against disease. Findings are discussed in relation to understanding women's relationship and sexual decision making and the implications for HIV education and prevention.

### HOUSING AND OLDER ADULTS LIVING WITH HIV

L. Seidel, *AIDS Community Research Initiative of America, New York, New York*

Nearly half of individuals with HIV experience housing stressors, which have been linked to lower rates of medication adherence leading to poorer treatment outcomes and resistance, yet there is little research on housing and older adults with HIV. It was hypothesized that housing instability would have a direct effect on medication adherence and adherence self-efficacy with indirect effects through the mediating variables of loneliness, social support and depression among older adults with HIV (n=30). Results confirmed the higher rates of housing instability, loneliness and depression among those living with HIV. A multiple regression analysis found no significant effect of housing stability on medication adherence. However, social support emerged as a positive predictor of adherence, while loneliness negatively related to adherence self-efficacy accounting for 37% and 52% of the variance in these respective outcomes. Social networks are a crucial part of care that may result in greater self-efficacy and medication adherence.

### EVALUATING PROGRAMS ON HIV AND OLDER ADULTS: NOTES FROM THE FIELD

M. Brennan[1,2], L. Seidel[1], S.E. Karpiak[1,2], *1. Center on HIV and Aging, AIDS Community Research Initiative of America, New York, New York, 2. New York University College of Nursing, New York, New York*

Programs that address HIV and older adults are emerging. Funders increasingly require a strong evidence-base for program effectiveness. However, the newness of these programs and the constituencies involved require special considerations in program evaluation. The AIDS Community Research Initiative of America is in Year III of a $3,000,000 New York City Council contract for HIV and Older Adults education and prevention. Evaluating this program has highlighted some crucial issues, including bridging the cultural and organizational divide between AIDS Service Organizations (ASOs) and aging providers. For example, ASO staff is more accustomed to multi-day trainings and detailed outcome evaluations compared to many aging service provider staff. Also, funding mandates are often at odds with the methodology of many HIV prevention paradigms, leading to difficulty in program implementation and process evaluation. We will discuss these and other issues, and provide suggestions for conducting program evaluation for HIV and Aging prevention and education.

### "BE A LIVING EXAMPLE" – AN EVIDENCE-BASED HIV/AIDS PREVENTION EDUCATION PROGRAM FOR OLDER ADULTS

N. Orel, C. Stelle, W. Watson, *Gerontology, Bowling Green State University, Bowling Green, Ohio*

Although there are educational curriculum and programs available that address HIV/AIDS for individuals aged 50 and older (e.g., AIDS Community Research Initiative of America, National Association of HIV Over Fifty), it is apparent from current research that educational programs/resources that address HIV/AIDS with content on sexuality, sexual health, and medication are the most effective (Orel et al., 2009). Because a previously identified obstacle to educating older adults about HIV/AIDS was the "lack of perceived relevance," this presentation will specifically discuss an evidence–based prevention education program that emphasizes the relevancy of HIV/AIDS knowledge for an older adult population. The "Be a Living Example" program encouraged participants to become knowledgeable about HIV/AIDS and to be tested for HIV so that they could then share with the younger generation (i.e., grandchildren) information about how non-evasive, simple, and yet important HIV testing is. "Be a Living Example" campaign supported participants' desire for generativity.

## SESSION 1935 (PAPER)

## HOUSEHOLD AND PERSONAL FINANCES

### THE BURDEN OF ENERGY COSTS ON ELDERLY HOUSEHOLDS: EVIDENCE FROM THE 2006-2008 AMERICAN COUMMUNITY SURVEY

J. Deichert, S.P. DeViney, *Gerontology, University of Nebraska at Omaha, Omaha, Nevada*

This research measures the energy burden of households with at least one person aged 65 or older based on information from the US Census Bureau's 2006-08 American Community Survey. Energy burden is defined as the share of annual household income that is used to pay annual energy bills.. During 2006-08, the average energy cost for households with only one person 65 or older was $2,389 per year and represented 10.5 percent of their household income. For households with 2 or more persons 65 or older, the respective numbers were $2, 639 and 6.8 percent. The analysis also showed that energy costs were a sizeable component of housing costs. Renter households with only one person 65 or older paid 18.3 percent of housing to energy and owners paid 35.6 percent. The comparable numbers for households with two or more persons were 17.1 percent and 36.7 percent respectively. Energy burdens varied by state: the highest burdens generally in the Southeast and the lowest burdens in the West and Northwest. As a percent of income, energy burdens were highest for elderly households with low incomes, non-English speaking households, renter households, females living alone, and housing built prior to 1960. Since prior research have shown the elderly adjust other expenditures to pay for higher energy costs, other studies suggest that energy burden is linked to deferred health care, home maintenance, and food security. Quality of life for the elderly needs to include polices addressing energy burden.

### WHY DO PEOPLE LET THEIR LONG-TERM CARE INSURANCE POLICIES LAPSE? EVIDENCE FROM THE HEALTH AND RETIREMENT STUDY

Y. Li[1], G.A. Jensen[2], *1. School of Public & Environmental Affairs, Indiana University - IUPUI, Indianapolis, Indiana, 2. Wayne State University, Detroit, Michigan*

Objectives: To explore the patterns and determinants of long-term care insurance (LTCI) lapsing, using longitudinal data from the 1998-2006 Health and Retirement Study (HRS). Methods: We pool all two-wave intervals from the 1998-2006 HRS where the respondent reported holding private LTCI in the first sample wave. The final analytic sample consists of 6,920 two-wave intervals on 3,707 unique individuals. Multivariate logit models are estimated to uncover the effects of consumer learning-through-experience on LTCI lapsing that takes place in the second sample wave, while controlling for the policyholder's characteristics and the benefit provisions of the policy they hold. Results: The overall lapse rate in this sample is about 31%. Lapse rates vary considerably with policy characteristics, and substantially higher rates are observed for cheaper and less generous policies, e.g., policies that do not include inflation protection, or that limit coverage to in-home care only. Policyholders who are unknowledgeable about the specific features of their policies and who have actual encounters with the long-term care system are more likely to subsequently let their policy lapse. Conclusions: Many LTCI policyholders do not fully understand the limitations and benefit restrictions of their coverage. Some are learning about such limits "the hard way," after an encounter with the long-term care system, and then they drop coverage. These findings highlight the need for investment in consumer education and greater supply-side regulation in order to reduce LTCI lapsing.

### HEALTH, WEALTH, AND GENDER: LONG- VERSUS SHORT-RUN IMPACTS OF HUSBANDS' AND WIVES' HEALTH SHOCKS ON HOUSEHOLD WEALTH

J. Ward-Batts, *Economics; Institute of Gerontology, Wayne State University, Detroit, Michigan*

Health shocks to wives versus to husbands may have differential effects on household wealth. We expect that a health shock affecting a primary earner will affect household wealth less negatively than that to a homemaker, since the productivity of the former is often formally insured, whereas the household must insure itself against the latter. 1992-2008 longitudinal data from the Health and Retirement Study (HRS) data on married couples first observed near retirement age are used to estimate the effect of a new health condition on household wealth, in both the short-run and long-run. Effects are allowed to differ by type of health condition as well as by gender of the spouse affected. Labor supply of the affected individual and the spouse, out-of-pocket medical expenses, and other types of expenses are explored as mechanisms through which individual health shocks may affect household wealth. Potential mitigating factors are also explored. Estimates using only two waves of data indicate that the short-run impact of a health shock to the wife has a larger negative impact than a health shock to the husband. When adding additional waves of data, estimates in which health conditions are disaggregated provide better fit, but results are inconsistent with those when conditions are aggregated. This suggests that previous studies in which conditions are aggregated may be misleading when considering longer-term effects, and that "mild" conditions down-played in previous studies can eventually have significant impacts on household wealth.

### COUPLES MANAGING THE RISK OF FINANCING LONG TERM CARE

A.E. Matzek, M. Stum, *University of Minnesota, St. Paul, Minnesota*

Understanding the financing of long term care (LTC) from the perspective of couples is pertinent because couples are confronted with the challenge of financing LTC for not one, but both spouses. The purpose of this study was to examine how couples articulated consensus about financial LTC risk management strategies (i.e., purchasing LTC insurance, self-insuring, no strategy). The current study was a secondary analysis of a larger qualitative dataset examining couples from a population of state and university employees who had recently been making decisions about how to manage the risk of financing LTC. Sixteen heterosexual married couples (16 husbands and 16 wives) provided the units of analysis for the current study. Guided by decision making theory for families, triangulated qualitative data analysis was utilized to examine how couples articulated consensus about their financial LTC decision outcomes. Findings indicated that couples utilized a combination of risk management strategies and represented five consensus patterns of decision outcomes that ranged from convergent to divergent. Couples who articulated consensus with their decision outcomes seemed to be the couples who were being most proactive about planning for both spouses. Financial and family practitioners should work with both spouses to ensure that couples can reach consensus about responsibility for financing LTC.

## SESSION 1940 (PAPER)

## INTERGENERATIONAL RELATIONSHIPS IN CHINESE CULTURE

### GRANDPARENT–GRANDCHILD RELATIONSHIPS IN RURAL CHINA: THE MEDIATING ROLE OF THE MIDDLE GENERATION AND THE KINSHIP STATUS OF THE GRANDPARENT

L. Xu[1], I. Chi[2], *1. USC, Monterey Park, California, 2. USC, Los Angeles, California*

Background:The grandparent–grandchild relationship is important in Chinese society. Grandparent–grandchild relationships are linked with the middle generation and gender plays a central role in grandparent–grandchild relationships. Methods:Wave 4 of the Study of Older Adults in Anhui Province of China was drawn for this study (N=1,071). The dependent variable was the emotional closeness between the grandparent and each grandchild. And the independent variables were the grandparent-parent closeness and the gender of the parent which will reveal whether the grandparent is the paternal or maternal grandparent. Hierarchical regression model was conducted. Results:The results showed that the closeness between grandparent and their adult child medicated the grandparent-grandchild closeness (t=26.92, p=.000). Paternal grandparents had closer relationships with their grandchildren than maternal grandparents did (t=2.86, p=.004). The father's bond with his own parents had a greater effect than a mother's on the grandparent–grandchild closeness (t=24.57, p=.000). In addition, income and physical function of grandparents, the education of the grandchildren, and length of taking care of grandchild by grandparent were also significantly associated with grandparent-grandchild closeness. The final regression model explained 68.9% variance on grandparent-grandchild closeness. Conclusion:The role of the middle generation, especially the roles of the fathers, and the paternal family lineage should not be ignored when considering grandparent-grandchild relationships in rural China.

### YOU SHOW FILIAL PIETY TO YOUR CHILDREN: THE CHANGING MEANINGS OF FILIAL PIETY AMONG CHINESE ELDERLY IMMIGRANTS

E. Chang[1], M.A. Simon[2], E. Wong[3], K.A. Skarupski[1], B. Wong[3], X. Dong[1], *1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois*

Background: Despite prior research on older adults' shifting filial expectations for their younger children in contemporary Chinese society, few studies have examined how the Chinese elderly have adapted to the changing meanings of filial behaviors in the U.S. context. Methods: Based on focus group interview data (N=39) with community-dwelling Chinese elderly immigrants residing in Chicago Chinatown, this study explores how the cultural ideal of filial piety has been modified and reinforced on the foreign soil. The construct and practice of filial piety is analyzed from three dimensions— what is an ideal filial role, to what extent immigrant children fulfill filial care expectations, and how to respond to a challenging situation in which expectations were unmet. Results: Among these Chinese elderly immigrants, emotional support outweighs other forms of filial care. Qualitative data analysis demonstrates that fractions and contradictions exist between elders' conceptualizations of filial piety and the actual receipt of filial care. However, Chinese elders mitigate some of the potential intergenerational tension by prioritizing the whole family's socio-economic well-being over their own filial care needs. Discussions: These results show that elders opt for a more independent life by living in senior apartments and managing their own health problems without soliciting help from financially stressed, geographically distant adult children. By so doing, older Chinese immigrants describe their acts as "showing filial piety to their children," albeit genuine filial needs of emotional support may be left unattended. This study has implications for the provision of culturally-sensitive elder care.

### A VIGNETTE STUDY ON SONS' AND DAUGHTERS' OBLIGATIONS TO THEIR PARENTS IN RURAL CHINA

Z. Cong[1], M. Silverstein[2], *1. Human Development and Family Studies, Texas Tech University, Lubbock, Texas, 2. University of Southern California, Los Angeles, California*

This paper used a vignette to study under which circumstances daughters are regarded as more responsible for taking care of their elder parents in rural China. The vignette asked for elders' attitude about how a daughter and a son should share the responsibilities of taking care of a post-surgery widowed parent under different situations. The vignette study is a part of a four-wave longitudinal study in Anhui Province, China, with data collected between 2001 and 2009. Using a working sample of 1010 observations, we used ordinal logistic regression to predict how elders allocate the responsibility between the daughter and the son. We found that the daughter was regarded as more responsible when the son migrated to search for employment and when the daughter herself was living in proximity. Whether the son had minor kids to take care of did not influence elders' belief in the share of responsibilities. On the contrary, elders perceived the daughter as more obligated if the daughter did not have any kids. Rural to urban migration has increased distance between parents and their sons, and has forced elders to partially forgo traditional beliefs in gender differences concerning caregiving. At the same time, sons were still seen as more legitimate care providers, whose care responsibilities were less conditional to their family obligations than daughters, while daughters were more likely to be substitutes whose support would be called upon when sons failed to provide support and when situations allowed daughters to provide care.

### CULTURE, STRUCTURE, OR EMOTIONS? ADULT CHILDREN'S MARRIAGES AND INTERGENERATIONAL TIES IN THE UNITED STATES AND CHINA

N. Sarkisian[1], N. Gerstel[2], E. Calvo[3], *1. Sociology, Boston College, Chestnut Hill, Massachusetts, 2. University of Massachusetts, Amherst, Massachusetts, 3. Harvard University, Boston, Massachusetts*

Little research has examined the effects of adult children's marriages on intergenerational ties; even less examines cross-national variation in these effects. This paper fills that gap by comparing the effects of marriage on the relationship between adult children and their aging parents in the U.S. and China—two countries characterized by distinctive patterns of family ties, with the Chinese still emphasizing extended families (and incorporating the nuclear family into these larger groupings) and Americans emphasizing nuclear families (with a much less encompassing extended kinship structure). Using two datasets collected during the same time period—the Survey of Aging and Intergenerational Relations in Baoding City, China, and the second wave of the National Survey of Families and Households—this paper assesses the effects of marriage on various aspects of intergenerational ties, including three broad components: structural (coresidence and proximity), associational (frequency of contact), and functional (financial and practical assistance). It further evaluates the role of structural factors in explaining the effects of marriage. We find that in the United States, married individuals had significantly weaker ties to their parents than single individuals, and these differences cannot be explained by structural characteristics such as time demands, needs and resources, and extended family characteristics. In China, we also find that married individuals had less intense ties, but most of these differences are explained by structural characteristics. We conclude that persistent effects of marriage in the United States but not in China are consistent with cultural rather than universal theories of marriage and kinship.

## SESSION 1945 (SYMPOSIUM)

### LATER LIFE HEALTH IN SOCIAL CONTEXT

Chair: *R.M. Hauser, Center for Demography of Health and Aging, University of Wisconsin- Madison, Madison, Wisconsin*
Discussant: *J. Freese, Northwestern University, Evanston, Illinois*

This symposium presents a set of complementary papers on the health of older adults that address a combination of distal and proximate influences on those outcomes. Two of the papers focus on life-long influences. One explores the influence of the family of origin using a sibling-based design, while the other estimates the effects of life-long work and family trajectories. The other two papers address proximate sources of access to health care, size of place of residence in an upper-midwest state, and the complexity of individual health problems. These complementary perspectives on health outcomes in later life are each drawn from a common set of data, the 50+ year-long Wisconsin Longitudinal Study, which has followed the lives of Wisconsin's high school "class of '57."

### THE IMPACT OF WORK AND FAMILY TRAJECTORIES ACROSS THE LIFE COURSE ON HEALTH AT OLDER AGES

J. Raymo[1], J. Warren[2], A. Halpern-Manners[2], J. Goldberg[1], *1. Sociology, University of Wisconsin, Madison, Wisconsin, 2. University of Minnesota, Minneapolis, Minnesota*

We examine relationships between trajectories of work and family experiences across the life course and four measures of health at older ages: (a) self-rated health, (b) activity-limiting conditions, (c) SF-12, and (d) CES-D. We construct work and family trajectories using group-based trajectory modeling techniques (finite mixture models) to characterize the trajectories of family circumstances and transitions from birth through age 65 and trajectories of labor force experiences from age 36 through age 65. Preliminary estimates (conducted separately for men and women) indicate that latent work and family trajectories are significantly associated with multiple measures of health net of more temporally proximate correlates, including work and family circumstances. For men, trajectories characterized by employment interruptions in mid-life are negatively associated with later health whereas early retirement is associated with better health. For women, never marrying is negatively associated with emotional health and never having worked is negatively associated with physical health.

### PARENTAL AGES AT BIRTH, NUMBER OF SIBLINGS, AND HEALTH IN LATER ADULTHOOD: A SIBLING RESEMBLANCE MODEL FROM A PROSPECTIVE POPULATION STUDY

D. Kuo, *University of Wisconsin, Madison, Wisconsin*

In this paper, I use data of sibling pairs from Wisconsin Longitudinal Study to examine the relationships between parental age at birth and physical and mental health of the offspring in later adulthood. Parental ages were shown to be positively related to education, health and mortality. In the current study, I will observe health outcomes of sibling pairs. Using sibling resemblance model allows the (partial) control for unmeasured heterogeneity in the family environment and a better model specification on relative birth order and possible birth spacing which are both correlated to parental age at birth of the respondent. The main explanatory variables include number of siblings, parental ages at the birth of both siblings, and parental age at the birth of the first born. Parental socioeconomic status, childhood health, family environment and one's own socioeconomic status were controlled. I am interested in whether the positive relationship between parental ages at first birth may be explained by shared family environment.

### PERCEIVED AND REALIZED ACCESS TO HEALTH CARE: DOES RURAL RESIDENCE PUT THE NEAR ELDERLY AT RISK?

J.R. Schumacher, C. Everett, N. Pandhi, A. Wright, M.A. Smith, *University of Wisconsin-Madison, Madison, Wisconsin*

Rural versus urban residents are older, in poorer health, and have fewer health care resources. Whether individual-level (predisposing, enabling, need) or community-level (provider supply) factors account for rural/urban disparities in perceived access and utilization is unclear. We estimate rural-urban differences among Wisconsin Longitudinal Study respondents, aged 55-64. The primary predictor variable was participant residence area (urban (UA) or large, small, or isolated small rural (ISRA)). Linear/logistic regression models predicted perceived access and utilization sequentially including predisposing, enabling, and need factors. Results suggest the lower perceived access in ISRAs versus UAs is explained by physician supply. However, the lower odds of utilizing recommended services in ISRAs compared to UAs is explained by need factors. Rural residents are less likely to have dental check-ups, regardless of factors including dentist supply. Initiatives to reduce rural/urban disparities should emphasize provider supply, while considering need and cultural factors that impede receiving recommended care.

### COMPLEX PATIENTS AND CARE DISPERSION

C. Everett, J.R. Schumacher, C. Thorpe, M.A. Smith, *School of Medicine and Public Health, UW Madison, McFarland, Wisconsin*

Quality of chronic illness care in the US is suboptimal, in part due to disease-specific approaches utilized in our health care system. For complex patients with multiple chronic conditions, this approach leads to dispersion of care amongst multiple providers. Dispersion of care and strict adherence to disease-specific quality measures could result in poorer health outcomes due to exacerbations of comorbid diseases. Therefore, general health measures (e.g. Health Utilities Index) may be critical outcomes for complex patients. We identified Wisconsin Longitudinal Study participants with Medicare that responded to the 2004-2005 surveys and examined the relationship between patient complexity, care dispersion and general health outcomes. Preliminary results suggest patient complexity increases, the number of providers seen increases. After controlling for patient complexity, care dispersion appears to negatively impact general health. Results suggest that interventions to reduce care dispersion (i.e., medical home) may have beneficial impacts on the health of complex patients.

## SESSION 1950 (SYMPOSIUM)

### MEDICAL CARE IN ASSISTED LIVING

Chair: *J. Schumacher, Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland*

Discussant: *C. Cefalu, Louisiana State University School of Medicine, New Orleans, Louisiana*

This symposium addresses how medical care is provided in residential care/assisted living (RC/AL) from the perspectives of both primary care providers and the health care supervisors of RC/AL settings. Using data from an NIA funded study of 180 providers and health care supervisors from 80 RC/AL settings, the symposium examines providers' reported practice patterns with patients residing in RC/AL particularly the influence of providers' on-site visits. Results indicate over 80% of providers view their relationship with patients' RC/AL settings as a partnership, yet only 52% report understanding RC/AL offered health services. Confidence in RC/AL staff varied widely regarding the staff's ability to provide common health monitoring information (e.g., blood pressure) or problem management (e.g., fever assessment, agitation) with 4-41% reporting little or no confidence in RC/AL staff. In contrast, RC/AL healthcare supervisors report high levels of responsiveness to primary care providers as well as high confidence in their staffing and ability to provide requested information (80% agreement). In terms of nursing staffing and procedures, the data show 44% of RC/AL settings report RN coverage and most use their own staff for vital signs. Contractors are used to draw blood samples for 74% of settings. Overall, the RC/AL Health Care Supervisors who coordinate/oversee the medical care typically report frequent contact with residents' providers and over 70% are quite satisfied with the quality of their medical care. The implications of non-representative elements in the sample are discussed. The symposium provides a data based context for characterizing medical care provision in RC/AL settings.

### PRIMARY CARE PROVIDER PRACTICE PATTERNS WITH RESIDENTS OF ASSISTED LIVING

J. Schumacher[1], S. Zimmerman[2], P. Sloane[2], J.K. Eckert[1], B. Harris-Wallace[1], R. Perez[1], D.A. Reed[2], *1. Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of North Carolina, Chapel Hill, Chapel Hill, North Carolina*

Residents of residential care/assisted living (RC/AL) communities present providers with a range of opportunities and challenges for their care. This study of 180 primary care providers reveals a broad range of practice patterns and attitudes toward RC/AL. Overall, providers strongly endorse the view that caring for RC/AL patients differs from caring for patients living independently or in nursing homes. Results show 46% make on-site visits to RC/AL settings more than once a month. Also, over 80% view their relationship with RC/AL staff as a partnership. At the same time, only 52% of providers report a strong understanding of the health care services offered in the RC/AL setting and nearly 20% have stopped seeing RC/AL residents due to quality of care concerns. Results suggest an emerging care relationship between primary care providers and healthcare staff in RC/AL. Implications of the non-representative elements of the sample will be discussed.

### CARING FOR MEDICAL PROBLEMS IN ASSISTED LIVING: MEDICAL PROVIDER PERSPECTIVES

P. Sloane[1], A.S. Beeber[1], J. Schumacher[2], C. Mitchell[1], S. Zimmerman[1], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. University of Maryland, Baltimore County, Baltimore, Maryland*

As residential care/assisted living (RC/AL) has grown, so too has the number of medical providers who provide care to these residents. This session will present primary care provider perspectives regarding medical care in RC/AL. Data from 180 providers (92% physicians, 8% nurse practitioners/physician assistants) will be presented regarding matters such as confidence in RC/AL staff ability to monitor resident blood pressure (48%) and weight (37%); assess patients with fever (29%); assess agitation (50% day staff, 17% night staff); follow instructions for agitation care (58%); and provide quality end-of-life care (50%). Depending on the problem, 4-41% of respondents had no or a little confidence in staff ability to manage these common medical situations. Implications of these data for medical care provision will be discussed.

### CARING FOR MEDICAL PROBLEMS IN ASSISTED LIVING: HEALTH CARE SUPERVISOR PERSPECTIVES

S. Zimmerman[1], J. Schumacher[2], B. Harris-Wallace[2], R. Perez[2], J.K. Eckert[2], P. Sloane[1], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. Sociology and Anthropology, University of Maryland, Baltimore County, Baltimore, Maryland*

Staff of residential care/assisted living (RC/AL) communities must work with their residents' primary medical care providers to assure that their residents' healthcare needs are met. This session will present data from 80 health care supervisors regarding how often they provide residents' medication records to providers (84% most of the time) and contact providers when a resident falls (66% always); the credentials of day and evening staff who contact providers (30% RN, 30-38% LPN, 8-20% medication technicians, 8-16% certified nursing assistants); their confidence in day and evening shift ability to work with providers (64% extreme confidence day, 46% extreme confidence evening); and how satisfied they are with provider involvement in six areas (ranging from 36% extremely satisfied with medications to 6% extremely satisfied with incontinence care). (Note: Data in this abstract are preliminary.) The implications of these findings to inform staff-primary care provider relations for optimal resident care will be discussed.

### NURSING CARE IN ASSISTED LIVING

A.S. Beeber[1], S. Zimmerman[1], B. Harris-Wallace[2], J. Schumacher[2], R. Perez[2], P. Sloane[1], *1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. University of Maryland Baltimore County, Baltimore, Maryland*

Nursing care is important in residential care/assisted living (RC/AL) but little is known about service availability and the type of staff who perform these services. This session will present 80 health care supervisors' reports on nurse staffing, available services, and the type of staff providing care. Preliminary analyses revealed 44% of settings had at least 1 full-time LPN, and 38% had at least 1 full-time RN. Rates of diagnostic and therapeutic services will be presented (e.g., 60% of settings do not administer intravenous medications, 94% provide wound dressing changes) as well as whether staff or contractors perform tasks (e.g., 94-98% of settings use their own staff to perform vital signs, 74% use contractors to draw blood). The session will further address whether staffing and procedures vary according to setting characteristics and findings will be discussed in the context of resident's healthcare needs and how well nursing practices are addressing them.

### HEALTH CARE SUPERVISORS PERSPECTIVES OF MEDICAL CARE COORDINATION AND PROVISION IN ASSISTED LIVING

B. Harris-Wallace[1], R. Perez[1], J. Schumacher[1], P.J. Doyle[1], J.K. Eckert[1], S. Zimmerman[2], *1. University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of North Carolina, Chapel Hill, Chapel Hill, North Carolina*

Residential care/assisted living (RC/AL) communities are increasingly faced with a challenging array of medical-related responsibilities. The AL Health Care Supervisor (HCS) who coordinates/oversees medical care must therefore work closely with residents' providers to ensure care needs are met while maintaining AL's social model of care. This presentation focuses on health care coordination and provision in a sample of 80 HCSs and will address the relationship between RC/AL staff and primary care providers. Data reveal HCSs' have regular contact with providers (>8 times per month), are very satisfied with the quality of care provided to residents by providers (70%), and are quite satisfied with the quality of communication (70% satisfaction). Notably, themes such as access to providers and providers' specialization in geriatrics emerge as critical related to the quality of relationships and care in the environment. Implications of these findings for healthcare organization will be discussed.

## SESSION 1955 (SYMPOSIUM)

### MIDRANGE CHANGE OF PSYCHOSOCIAL AND HEALTH INDICATORS IN VERY OLD AGE: FINDINGS FROM EUROPEAN LONGITUDINAL STUDIES

Chair: *O.K. Schilling, Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*
Co-Chair: *S. Iwarsson, Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*
Discussant: *B. Johansson, Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*

This symposium presents longitudinal findings from European aging studies, focussing on psycho-social and health changes in very old age (80+) across midrange time periods (5-7 years). The very old age deserves consideration as a period of major changes accompanying the approach of death among those who survived until that age, but midrange longitudinal data from the oldest-old have rarely been gathered. This collection of papers investigates intra-individual change in crucial life domains among very old people, that is, in indicators of environmental, social, and physical conditions. The first longitudinal study addresses linkages of subjective time perspective, health behavior and functional status in very old age, underscoring that health behavior and functional status are more closely related with subjective time perspective than with chronological age. This study uses data from the Amsterdam Longitudinal Study of Aging, whereas all the following are based on six-year longitudinal data from the German and Swedish national samples of the ENABLE-AGE Project. The second study explores patterns of relocation across a six-year period and relocation as related to aspects of health and subjective well-being over time in very old individuals. The third paper analyzes the characteristics of mid-range changes in common indicators of health symptoms, functional status and subjective well-being in very old age, revealing general tendencies of deterioration, but also differences in terms of "plasticity" of change. The fourth study addresses very olds' mortality across a six-year observation period and suggests that social participation and housing aspects may buffer health-related mortality risks.

### LONGITUDINAL INTERPLAY OF SUBJECTIVE TIME PERSPECTIVE, HEALTH BEHAVIOR AND FUNCTIONAL STATUS

J.P. Ziegelmann[1], D.J. Deeg[2], *1. Freie Universitaet Berlin, Berlin, Germany, 2. Vrije Universiteit Amsterdam, Amsterdam, Netherlands*

Objectives: The perception of time (e.g., subjective position in the life cycle) has been shown to be associated with longevity as well as with the deterioration of health and is central for the motivation to engage in health behaviors such as physical activity. This study aims at investigating the longitudinal interplay of subjective time perspective, health behavior and functional status. Methods: We used 7 year longitudinal data of 1250 older adults (aged 65-90 years) from three waves of the Longitudinal Aging Study Amsterdam (LASA). Results: Cross-lagged panel analyses revealed that subjective time perspective was significantly related to physical activity after three years. Physical activity in turn was significantly related to better functional status after four years. Conclusions: Results indicate the importance of paying specific attention to motivating individuals with a shorter subjective time perspective for behavior change which in turn might improve functional status.

### RELOCATIONS, ASPECTS OF HEALTH AND WELLBEING IN VERY OLD AGE – A SIX-YEAR PERSPECTIVE

C. Löfqvist[1], M. Granbom[1], F. Oswald[2], H. Wahl[3], S. Iwarsson[1], *1. Health Sciences, Lund University, Lund, Sweden, 2. Goethe University, Frankfurt, Germany, 3. University of Heidelberg, Heidelberg, Germany*

Based on data from the ENABLE-AGE Project, the study aims were to explore patterns of relocation across a six-year period in very old age, compare participants relocating versus staying put, and to study relocation in relation to aspects of health and subjective wellbeing (N=268 single-living persons, in Sweden and Germany). Interview data were collected at home visits, at baseline (T1) and one (T2) and six (T3) years later. In Sweden 15% relocated during the study period. Among those relocating, the magnitude of housing accessibility problems was higher compared to those staying put; most of them were dependent on mobility devices. Already at T1, participants relocating were less independent in I-ADL in comparison with participants not relocating, with a more marked difference at T3. In terms of perceived health and wellbeing, there were no differences between the groups, indicating complex housing and health patterns in the face of relocation.

### LONG TERM CHANGE IN SUBJECTIVE WELL-BEING, FUNCTIONAL STATUS AND HEALTH SYMPTOMS IN VERY OLD AGE: PATTERNS OF DETERIORATION, PLASTICITY, AND STABILITY

O.K. Schilling[1], H. Wahl[1], O. Reidick[1], F. Oswald[2], *1. Department of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany, 2. Goethe University Frankfurt, Frankfurt, Germany*

This study analyzed change over seven years in commonly used indicators of subjective well-being (SWB) and of physical and functional status in a very old sample (German ENABLE-AGE/LateLine study, N=115, aged 80-89 at 2002 measurement, followed-up 2003 and 2009). As longitudinal findings on very old age are rare, we addressed general dynamics of intra-individual changes by means of growth curve modeling. Three distinct patterns appeared: Indicators of SWB (positive/negative affect, life satisfaction) and of health symptoms appeared with general deterioration, varying only slightly between individuals. Measures of functional status and depressive symptoms deteriorated on average, but with "plasticity", showing substantial inter-individual variation of changes. Perceived health appeared stable. These findings and further analyses, addressing adaptation in terms of stabilization under worsening health, contradict the notion of SWB stability in very old age, but evidence adaptive potentials of the very old to maintain functional abilities.

### CAN HOUSING INDICATORS HELP TO PREDICT MORTALITY IN VERY OLD AGE? DATA FROM THE GERMAN ENABLE-AGE / LATELINE STUDY

R. Kaspar[1], F. Oswald[1], H. Wahl[2], O.K. Schilling[2], *1. Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt am Main, Germany, 2. Institute of Psychology, Dept. of Psychological Ageing Research, University of Heidelberg, Heidelberg, Germany*

The aim of this presentation is to test if housing-related predictors, i.e. environmental barriers, place attachment, and social participation (frequent contact to relatives, friends and neighbors, religious activities and community involvement), in addition to well known health-related predictors (i.e. ADL, functional limitations), help to explain mortality rates. The sample includes 260 single-living and community-dwelling individuals aged 82 to 91 from the 2003 German part of the European project ENABLE-AGE survey study and its follow-up project LateLine, 106 of whom were deceased by March 2010 (mean survival time 3.5 years). Logistic regression analyses revealed social participation to systematically buffer the effects of health status on mortality. No long-term protective effects were found for lack of environmental barriers and place attachment. Further analyses elaborate on links between housing, health and survival time within the group of non-survivors. The findings exemplify the potential of housing to supplement the health focus in mortality-related analysis.

## SESSION 1960 (PAPER)

## NETWORKS OF CARE

### SOCIAL ROLES OF OLDER MEMBERS WITHIN THE SOCIAL NETWORK SYSTEMS OF FAMILIES AFFECTED BY A HEREDITARY CANCER SYNDROME

S. Ashida[1], D. Hadley[1], A. Giroux[1], K. Skapinsky[1], H. Devlin[1,2], L.M. Koehly[1], *1. NHGRI/NIH, Bethesda, Maryland, 2. The College of New Jersey, Ewing, New Jersey*

Evidence suggests that social networks provide contexts within which social resources are exchanged to help individuals cope with serious illnesses or disease risks that affect family systems. However, the importance of relationship characteristics such as age differences between members has not been well studied. This study evaluates whether social resources are exchanged more within relationships that involve older network members compared to relationships between younger network members. A total of 209 individuals from 35 families affected by Hereditary Nonpolyposis Colorectal Cancer (HNPCC) syndrome completed interviews about their social network systems (family and friends) and provided information regarding 2,085 relationship ties. Results of hierarchical logistic regression models showed that younger respondents (18 to 59 years) were more likely to receive social resources from older members (60 years or older) than from younger network members. When respondents were younger, older network members were more likely to: encourage colon screening (OR=2.49), tell the respondents about their family risk for HNPCC (OR=1.67), help in a crisis situation (OR=1.58), and be dependable when needed (OR=1.44). When respondents were older and network members were younger, respondents were more likely to share their genetic risk status (OR=1.94). Respondents were more likely to take advice from members within intergenerational relationships (younger-older: OR=2.74; older-younger: OR=2.11). Results suggest that older network members play important social roles by providing resources (e.g., social support, social influence) to the younger members in these families. Efforts to facilitate family adaptation should consider utilizing social relationships that involve older network members.

### THE ROLE OF FAMILY IN HELP-SEEKING AND DEPRESSION CARE AMONG OLDER MEN

L. Hinton[1], C. Apesoa-Varano[1], J. Unutzer[2], J.C. Barker[3], *1. Psychiatry and Behavioral Sciences, University of California, Davis, Sacramento, California, 2. University of Washington, Seattle, Washington, 3. University of California, San Francisco, San Francisco, California*

There is a gap in our knowledge of the social processes and factors shaping a family's role in depression care pathways for older adults. In particular, we know little about how family shapes help-seeking and depression care among older men of ethnically diverse backgrounds, who continue to be under-treated for depression and at a high risk for suicide. This paper addresses this gap by exploring data from an NIMH funded (R01-MH080067) mixed method study of barriers and facilitators of depression care among White non-Hispanic and Mexican older men. Findings are based on 50 in-depth, semi-structured interviews with men over the age of 60 screened for clinical depression in primary care settings, both treated and untreated. We found that family plays a dual role—as facilitator or barrier—as it "regulates" older men's help-seeking and depression care attitudes and behavior. Whether family is a barrier or facilitator depends on family dynamics, cultural and socioeconomic factors such as negative attitudes toward depression, access to general healthcare, and family involvement in illness management. A better understanding of these processes can provide clues to involving family in improving depression care for older men.

### JUST LIKE FAMILY: FICTIVE KIN TIES IN THE LIVES OF OLDER ADULTS

M. Voorpostel, *FORS, Lausanne, Switzerland*

In current society, older adults may have to rely increasingly on non-traditional forms of support. One adaptive strategy is expanding family boundaries to include non-kin ties (fictive kin). Creating fictive kin is a means to institutionalize relationships and create social capital. These ties develop from longstanding friendships or newer relationships, for example with (in)formal caregivers. A common explanation is that fictive kin substitutes for unavailable relatives. Yet, norms regarding the family may be important as well. Using a sub-sample of the Netherlands Kinship Panel Study (1'271 older adults aged 60-79), this study examines the prevalence of fictive kin ties, and looks at to whom they are most common. Specifically, the importance of family structure and family norms is assessed. Of the respondents, 41.5% mentioned fictive kin ties. Regressions showed that people with fictive kin ties were more likely to be never married, divorced or widowed than those without such ties. They had higher expectations from family, but relied more on friends. After controlling for partner status and family norms, no effect of gender, age and presence of children and siblings remained. Concluding, family structure and family norms are independently related to the creation of fictive kin. Older adults who have high expectations from family yet who rely more on friends are most likely to have fictive kin. This supports the idea that older adults create 'family-like' ties to compensate for expected but absent family support. Fictive kin ties should be included when assessing support networks of older adults.

### IMPROVING OUTCOMES OF FAMILY CAREGIVERS CARING FOR HOSPITALIZED ELDERS: THE CARE PROGRAM

B. Powers[1], H. Li[1], B. Melnyk[2], R. McCann[1], C. Koulouglioti[1], E. Anson[1], Y. Xia[1], S. Glose[1], *1. University of Rochester, Rochester, New York, 2. Arizona State University, Tempe, Arizona*

Older adults often experience functional decline and iatrogenic complications (e.g. confusion, incontinence, falls, nutrition problems, pressure ulcers) resulting from hospitalization. These can pose serious challenges for family caregivers (FCGs) responsible for managing transitions of hospitalized elders to post-acute care settings. Therefore, the purpose of this randomized controlled trial was to determine the effectiveness of the CARE Program in improving coping and role outcomes for 421 FCGs of older hospitalized adults. Intervention: Phase 1 involved information on what to expect regarding patients' potential responses along with a mutual agreement contract about how FCGs preferred to participate in their older relatives' hospital care; and Phase 2 involved information on how FCGs can smooth hospital-to-home transitions, participate in the discharge process, foster positive FCG-care receiver relationships, and prepare for follow-up care post hospital discharge. Outcomes were measured in the hospital, at 1-2 days post-admission and 1-3 days pre-discharge and post-hospital discharge, at 2 weeks and 2 months. Findings: Early findings suggest that the CARE Program may be especially effective at easing patient post-acute care transitions for non-spouse FCGs who, compared to spouses, reported statistically significant higher participation in the care of older relatives at hospital discharge, better preparedness for participation in care giving activities, feelings of less role strain, and less difficulty adapting to the caregiver role. Conclusions: Providing FCGs with information early in the hospitalization that helps them know what to expect and how they can participate in care is empowering and effective preparation for managing their older relatives' later post-hospital transitions.

## SESSION 1965 (SYMPOSIUM)

### REFLECTING ON THE PAST WHILE FORGING TOWARD THE FUTURE: HURRICANE KATRINA'S INFLUENCE ON OLDER ADULTS

Chair: *T.L. Henderson, Human Development & Family Science, Oklahoma State University, Stillwater, Oklahoma*

The impact of Hurricane Katrina on older adults provides an opportunity to enhance the scope of disaster research, preparedness efforts, and program modifications focused on the needs of older adults and their families. The current symposium provides an overview of the losses experienced by displaced older adults from the New Orleans area, perceptions of older adults who were long-term residents of Baton Rouge, and the impact of family and community demographic structure and characteristics on vulnerable elderly persons. To enhance the use of evidence-based practices, the New Orleans Council on Aging also provides lessons learned five years after Hurricane Katrina made landfall.

### SURVIVORS OF HURRICANE KATRINA: LOSSES, HOPES, AND DREAMS OF DISPLACED OLDER ADULTS

T.L. Henderson[1], Y. Kamo[2], K.A. Roberto[3], *1. Human Development & Family Science, Oklahoma State University, Stillwater, Oklahoma, 2. Louisiana State University, Baton Rouge, Louisiana, 3. Virginia Polytechnic and State University, Blacksburg, Virginia*

Hurricane Katrina brought financial and employment hardship, dislocation and housing challenges, and familial and social disruption to older citizens living in the Gulf Coast area. Based on interviews with 122 displaced adults, 60 years of age or older, we used Grounded Theory Methods to conceptualize their losses as well as their incredible resilience evident in their hopes and dreams in the aftermath of Hurricane Katrina. Losses faced by displaced older adults were explained by tangible domains of loss of lives, property, homes, and personal items; and community destruction. Another dimension of loss included the loss of contact and communication with family, friends, and neighbors, and family separation. Despite losing everything, most older adults hoped to return to the New Orleans area and find a new home. Others hoped for a better life for themselves and others. Findings suggest new directions for late life disaster-related research and implications for program development.

### THE IMPACT OF FAMILY AND COMMUNITY DEMOGRAPHICS ON THE VULNERABILITY OF THE ELDERLY TO NATURAL DISASTERS

T.J. Durant*, Sociology, Louisiana State University, Baton Rouge, Louisiana*

The purpose of this paper will be to examine the impact of family and community demographic structure and characteristics influence the vulnerable of elderly persons to natural disasters like Hurricane Katrina. The major premise examined is that older persons who live in families and communities with certain structure and characteristics, make them more vulnerable to the effects of a natural disaster. This vulnerability is indicated by family and community social capital, including family size, composition, and economic status, institutional living arrangements (nursing homes and assisted living homes) and community resources, contacts, and integration. These factors also interact with race, class, and gender to create different levels of vulnerability for the elderly and will be used to model families and communities in terms of level of vulnerability. Family and community Illustrations will be drawn from the Hurricane Katrina disaster in New Orleans in September 2005.

### HURRICANE KATRINA: PERCEPTIONS OF OLDER PEOPLE IN A COMMUNITY ACCEPTING DISPLACED VICTIMS

Y. Kamo, T.L. Henderson, K.A. Roberto*, Louisiana State University, Baton Rouge, Louisiana*

We examine perceptions about community changes and interpersonal relationships held by older residents in Baton Rouge, LA, following Hurricane Katrina. The perceived changes include increased traffic, congested businesses, higher housing costs, and tighter securities. Comparing the responses referring to weeks after Katrina and at the time of survey, we learn some changes were quickly modified (e.g., general congestion, cell phone connectivity, litter and trash), but others left a long time scar on the community and its residents (e.g., insurance premium, housing prices, and fear of crime, if not increased crime rates). While older Baton Rouge residents reported becoming friendlier, patient, and tolerant of others, they also became more suspicious and fearful of others. Suggestions are offered on policies to minimize negative effects of natural disasters on host cities.

### ISSUES FACING OLDER ADULTS IN NEW ORLEANS AFTER HURRICANE KATRINA: LESSONS LEARNED BY HOWARD RODGERS AND SONTRA CARMOUCHE

H.L. Rodgers[1], T.L. Henderson[2], *1. New Orleans Council on Aging, New Orleans, Louisiana, 2. Oklahoma State University, Stillwater, Oklahoma*

Older adults in New Orleans were affected adversely by Hurricane Katrina because many of them lacked the financial resources and transportation needed to evacuate. Those who were evacuated by the government found themselves in shelters operated by community groups, churches, and the American Red Cross with an array of service delivered by providers and volunteers with varying levels of expertise. Culturally appropriate service delivery for older adults residing in the New Orleans area was hindered by the relocation and temporary inoperable New Orleans Council on Aging (NOCOA); NOCOA lost its administrative office and all of the programs that operated directly and through subcontracts. Program participants will be given an overview of the journey of an aging agency (e.g., managing a temporary office 70 miles away in Baton Rouge and the return of NOCOA to New Orleans in January 2006), the state of aging service delivery five-years after Katrina, and program lessons learned for disaster preparedness

## SESSION 1970 (PAPER)

## SERIOUS MENTAL ILLNESS

### CHALLENGES FACING OLDER ADULTS WITH SCHIZOPHRENIA: THE PERSPECTIVE OF DIRECT SOCIAL SERVICE PROVIDERS

L.P. Ogden, *School of Social Work, Columbia University, New York, New York*

An estimated 1% of the U.S. population carries a diagnosis of schizophrenia. The majority of older adults with schizophrenia experience medical co-morbidities (Parks et al., 2006), social isolation (Jeste & Nasrallah, 2003), and enduring cognitive and psychiatric symptoms (Harvey, 2005), yet few social service programs address their needs, and even fewer have demonstrated effectiveness (Bartels & Pratt, 2009). Moreover, less than 2% of current research on schizophrenia focuses on older adults (Jeste & Nasrallah, 2003). Direct social service providers who work in housing programs witness the daily challenges, including barriers to service use, these older adults encounter. Thus providers in housing programs are particularly well positioned to inform the development and uptake of effective supportive and therapeutic services within such programs. This study used hermeneutic phenomenological methods to examine the experience of social service providers who work with older adults with schizophrenia in urban housing programs. I identified three core themes in the data: 1) Providers conceptualize older adults with schizophrenia as “survivors”. 2) Providers perceive these “survivors” as facing even more, albeit different, hardships as they age. 3) Providers and older adults with schizophrenia engage in a parallel process of coping with the severity of challenges for older adults with schizophrenia. The implications of the results for professional education and practice are discussed.

### DEPRESSED OLDER MEN’S PERSPECTIVES ON SUICIDE

J.C. Barker[1], E. Apesoa-Varano[2], J. Unutzer[3], L. Hinton[2], *1. Anthropology, History & Social Medicine, University of California San Francisco, San Francisco, California, 2. University of California Davis, Sacramento, California, 3. University of Washington, Seattle, Washington*

Rates of suicide are higher for older men than for any other age or gender group. Poor quality of life, functional disability and depression are risk factors for suicide. Relatively little is known, however, about what depressed older men think about suicide. This gap is addressed in this paper. Data come from 50 in-depth, semi-structured interviews with Mexican and white non-Hispanic clinically depressed men. Study participants were aged 60 or more, were either treated or untreated for depression, and were recruited from primary care settings. Men from both ethnic groups invoked the same basic images of masculinity as deterrents to actually attempting suicide, although at some time 48% of these men reported having had thoughts of committing suicide. “Being a man” meant being responsible or accountable for one’s actions; suicide violated this strongly held ideal. Depressed older men whose sense of loss includes loss of masculinity may be those who are more likely to attempt or complete suicide. (Men’s Health and Aging Study, grant # R01 MH 080067).

### THE IMPACT OF SERIOUS MENTAL ILLNESS ON THE DISCHARGE DISPOSITION OF OLDER ADULTS FOLLOWING A GENERAL MEDICAL HOSPITALIZATION

S. Bressi Nath[1], S.C. Marcus[2], J.E. Coulter[1], *1. Graduate School of Social Work and Social Research, Bryn Mawr College, Bryn Mawr, Pennsylvania, 2. University of Pennsylvania School of Social Policy and Practice, Philadelphia, Pennsylvania*

As compared to the general population, older adults with serious mental illness (SMI) face significant difficulties in psychological and social functioning and are also more likely to have chronic medical problems. Considering these vulnerabilities, these persons are likely to need significant medical and supportive services across the care continuum, including following an acute care episode for a general medical condition. Thus, the present analysis used a large nationally-representative data set, the 2007 Nationwide Inpatient Sample (NIS) of the Healthcare Cost and Utilization Project (HCUP), to examine the impact of SMI on the discharge status of adults 65+ following a general hospital stay. Method: The NIS is the largest all-payer database of hospital discharges in the US and contains over 100 patient-level variables. Among discharges for persons 65+ (N=13,229,946), a series of logistic regression models examined the impact of SMI on discharge to home care (HC), a skilled nursing facility (SNF), a nursing home (NH), or because of death. Results: Following hospitalization, persons 65+ with SMI were significantly more likely to be discharged to a NH [OR=2.1, p<.0001]], a SNF [OR=1.7, p<.0001], to HC [OR=1.8, p<.0001], or to die [OR=1.2, p<.0001] as compared to those without an SMI while controlling for demographic characteristics and clinical characteristics (e.g. severity of illness). Conclusion: In this analysis, SMI among those 65+ resulted in an increased need for higher-levels of care following hospitalization. Findings have implications for bolstering community-based services aimed at restoring the functioning of these persons across the care continuum.

## SESSION 1975 (PAPER)

## TECHNOLOGY AND ASSESSMENT

### DEVELOPMENT OF NURSING HOME - ELECTRONIC HEALTH RECORD SYSTEM

J. Lee[1], Y. Lee[2], *1. College of Nursing Science, Kyung Hee University, Seoul, Republic of Korea, 2. Kyung Hee Cyber University, Seoul, Republic of Korea*

Purpose: The purpose of the study was to develop and apply the Nursing Home – Electronic Health Record (NH-EHR) System in Korea. Methods: This study employed seven-phase methodological research design: 1) Literature review was done in 145 Korean articles, 279 foreign ones, 82 nursing home documentation forms from 58 Korean nursing homes and 146 American nursing home forms. 2) Center for Korean Nursing Facility (CKNF) and its home page (http://cknf.org) were established to build the national and international network. 3) Three times of interdisciplinary panel discussion were made. 4) Contents analysis of nursing home services were done in 6 nursing homes in Seoul and metropolitan area. 5) Contents were developed and validated in 9 nursing homes. 6) The NH-EHR program was developed by a software company. 7) The NH-EHR system was applied and modified in 9 nursing homes. Results: Nursing home documentation system included 6 main areas and total 540 items: 1) administration, 2) health assessment, 3) prescription and treatment, 4) diet and rehabilitation, 5) quality improvement, and 6) Statistics. Validity and reliability of the documentation system were tested in 152 nursing home residents from 9 nursing homes. The contents showed good validity and reliability in Korean nursing homes. The NH-EHR program was developed using application service provider (ASP) system. Conclusions: The NH-EHR system in this study was valid and reliable in Korean nursing homes. The system could be translated into other languages and provided for other countries.

### USING TECHNOLOGY FOR A HOLISTIC ASSESSMENT OF OLDER ADULTS' WELLNESS

G. Demiris, H.J. Thompson, *University of Washington, Seattle, Washington*

Numerous efforts have been developed to address a single aspect of older adults' well-being focusing on one or more specific functional, physiological, social or cognitive parameters. In order to capture and understand wellness, as defined by Halbert Dunn, namely "an integrated method for functioning which is oriented toward maximizing the potential of which the individual is capable," a holistic approach is required. Within the HEALTH-E (Home based Environmental and Assisted Living Technologies for Health Elders) Project we utilize an integrated monitoring system that consists of several existing telehealth technologies (incl. a telehealth kiosk, cognitive and gait assessment software and hardware) to assess the physiological, cognitive, functional, spiritual and social wellness of older adults. Our aim is to increase our understanding of older adults' wellness, allowing for identification of trends and patterns over time and ultimately support aging in place. Data collection takes place within a "living laboratory," namely a community room within an independent retirement community which residents visit multiple times a week. Synthesis methods applied on the resulting data sets include pattern discovery and sequence prediction. We use novel graphical and visual methods to ultimately represent older adults' wellness as part of their personal health record. We have to date recruited 30 subjects and our findings demonstrate that older adults appreciate a holistic assessment of their well-being, their active engagement in the decision making process and access to a personal health record that they control and share with both their formal and informal network.

### EVALUATION OF COMMUNITY-BASED COMPUTER/INTERNET TRAINING PROGRAM FOR SENIORS

C. Lee[1], J. Branham[2], M.H. Remis[2], S. Czaja[1], *1. Center on Aging, University of Miami Miller School of Medicine, Miami, Florida, 2. The OASIS Institute, St. Louis, Missouri*

The increased use of the Internet for information exchange, communication, and healthcare applications underscores the need for people of all ages to have computer/Internet skills. This paper describes the evaluation of a training program specifically developed to teach older adults basic computer and Internet skills. The program was developed and implemented by a non-profit community organization, the OASIS Institute, in four cities across the U.S. The program included 12 two hour sessions over six weeks. The sample included 194 ethnically diverse middle-income and lower SES adults age 40-90 yrs. who were randomly assigned to the training or a wait-list control condition. Knowledge of computers and the Internet, attitudes towards computers, and computer and Internet use were assessed at baseline, post training, and three months post training. Reasons for seeking training included communicating with family, accessing health information, learning something new and gaining job skills. The results provide evidence that the program helps students develop effective technology skills. There was a significant increase in computer and Internet knowledge among the participants who received the training program. The majority of participants found that the training was valuable and indicated that it met their learning goals. They also reported a significant increase in interest in computers and computer self-efficacy. We also found that some participants indicated a need for more training and practice. We discuss the key factors for successful implementation of the training in community settings.

### COMPLEX LIFE-CHANGES ILLUSTRATED IN THE COLLABORATIVE VIRTUAL REALITY ENVIRONMENT OF SECOND LIFE®

L.H. Rose, *Gerontology Interdisciplinary Program, University of Utah, Salt Lake City, Utah*

Life's transitions are complex, individualized, and interrelated with other aspects of people's lives. Scenario-based exploration is often the most effective means of individual and collective problem solving for complex cases. Virtual Reality is a relatively new tool for global collaboration and scenario-based training in gerontology and geriatrics. Gerontology Education Island is an immersive environment offering a visually/auditory, and socially-rich collaborative and educational environment. There, avatars interact synchronously and asynchronously with dynamic materials, interactive presentations, bots, holodecks, and other live people. The virtual environment of Second Life® allows for complex illustrations of life-altering situations through which professionals, caregivers, policy makers, and seniors can collaborate and learn. In this workshop, the presenter will introduce Gerontology Education Island in the virtual reality program of Second Life® which offers seniors, caregivers, educators, and professionals virtual "hands-on" experiences with purposefully-scripted objects, virtual avatars, other explorers, and a vast array of professionals.

## SESSION 1980 (SYMPOSIUM)

### TRAUMA, AGING AND TRANSITIONS OF CARE

Chair: *M. Aydin, Center for Health Policy Research, U.C.L.A, Los Angeles, California*

Co-Chair: *E.H. Davison, VA Boston HCS, Boston, Massachusetts*

Discussant: *M. Smyer, Bucknell University, Lewisburg, Pennsylvania*

The importance of psychological trauma in the aging survivor's experience of health care is often neglected by both clinicians and researchers. Trauma histories, including exposure to natural disasters or war events, may shape the experience of older adults living in a nursing home, living in the community, or receiving services for age-related deficiencies. This symposium brings together three complementary papers that address several important research questions: Are there differences in the mental health outcomes of aging trauma survivors who live in the community versus long-term care facilities? What are the cognitive risks associated with trauma-related distress in such settings? What interventions are available to clinicians in order to identify and treat aging natural disaster survivors? Glicksman and Mamberg describe the differences between Holocaust survivors who receive services in the community and those who receive care in a nursing facility, and explore the importance of social support in mitigating the psychological impact of trauma on the aging survivor. Brady and Spiro then provide an overview of the literature that examines whether deteriorating cognitive function is related to the development or exacerbation of posttraumatic stress symptoms. Finally, Brown and Hyer describe the evaluation of disaster mental health service training to Florida nursing home staff following residents' exposure to hurricanes, and describe how their findings can be used by those who work with the elderly following exposure to disasters.

### DEMENTIA AND POSTTRAUMATIC STRESS DISORDER IN OLDER ADULTS: NEUROPSYCHOLOGICAL PERSPECTIVES

C.B. Brady[1,2], A. Spiro[1,3], *1. VA Boston Healthcare System, Boston, Massachusetts, 2. Boston University School of Medicine, Boston, Massachusetts, 3. Boston University School of Public Health, Boston, Massachusetts*

Persons who experience trauma earlier in life may experience a waxing and waning of trauma-related psychological distress over their lifespan, with an exacerbation or new onset of symptoms in later life. This symptom exacerbation can range in severity from Post-Traumatic Stress Disorder (PTSD) to less severe "subclinical" stress-related symptomatology. In this paper, we provide an overview of the literature on the role of cognitive impairment and dementia in the development or exacerbation of PTSD symptoms in older adults. Specifically, we discuss whether there are patterns of neuropsychological deficits that are related to the onset and severity of trauma-related distress in older adults. Further, we discuss whether certain age-related disease risk profiles (e.g., vascular disease risk) are associated with late-life manifestation of cognitive impairment and PTSD. We conclude that consideration of the relations among stress-related symptomatology and cognition in older adults is underappreciated in both clinical and research settings.

### INTERVENTION WITH NURSING HOME RESIDENTS AFTER HURRICANES

L.M. Brown, K. Hyer, *Aging and Mental Health Disparities, University of South Florida, Tampa, Florida*

Two research studies evaluating use of disaster mental health services (DMHS) in nursing homes (NH) were conducted to understand staff perceived need for resident intervention after hurricanes (Study 1) and to evaluated the feasibility of using NH staff to provide psychological first aid (PFA) to residents (Study 2). Study 1: A 25-item questionnaire completed by 258 (40%) NHs in Florida revealed that DMHS were not routinely provided after hurricanes. Facilities that received evacuees were more likely to provide intervention than facilities that evacuated. The relationships between facility size, mental health, dementia, and type of clinician on willingness to use DMHS were not statistically significant. Study 2: Pilot study program evaluations indicated that staff felt that PFA training would improve overall care of residents, was worth recommending to colleagues, increased knowledge about DMHS, and enhanced confidence in using PFA with residents.

### ARE THERE MENTAL HEALTH DIFFERENCES OF TRAUMA SURVIVORS IN COMMUNITY VS. FACILITY LONG TERM CARE?

A. Glicksman[1], M.H. Mamberg[2], *1. Research, Phila Corporation for Aging, Philadelphia, Pennsylvania, 2. Bridgewater State College, Bridgewater, Massachusetts*

Serving older trauma survivors in Long-Term Care settings (LTC) raises the question of whether earlier experiences of trauma impact elders' later experience of LTC. Findings are presented from a study of Holocaust survivors in community-based and facility-based LTC. Holocaust survivors in both settings were compared with no-trauma groups in each type of LTC. No significant differences were found on measures of depression between elders residing in a nursing facility vs. those in non-facility communities. Significant differences were seen between the trauma and no-trauma groups in depression scores, with the trauma group displaying more depression ($p < 0.05$). However, when we controlled for the presence of a close family member the difference was no longer significant. We thus conclude that family support is critical for the mental health of older trauma survivors regardless of LTC setting.

## SESSION 1985 (SYMPOSIUM)

### EFFORTS TO SMOOTH TRANSITIONS FROM HOSPITAL TO HOME: PROGRAMS, RESOURCES AND LESSONS LEARNED

Chair: *P. Sprigg, Administration, Carol Woods Retirement Community, Chapel Hill, North Carolina*

In our fragmented health care system, patients face significant challenges when moving from one health care setting to another. The transition from hospital to home is perhaps one of the most complex transitions with the potential for patient and caregiver confusion about the patient's condition and appropriate care; lack of follow-through on referrals, medication errors, and inconsistent patient monitoring, all leading to a decrease in quality of care and quality of life and costly and avoidable emergency room use and re-hospitalization. This session is designed to introduce programs and resources at the national, state and local level to provide participants with tools and examples to improve transitions from hospital to home.

### REDUCING READMISSIONS THROUGH IMPROVING TRANSITIONS IN CARE

C. Lattimer, *Administration, Case Management Society of America, Little Rock, Arkansas*

Seniors face significant challenges when moving from one health care setting to another. Globally the healthcare systems are not structured to meet the needs of most patients or caregivers during transitions between health care settings. Discussion in this session will look at initiatives that are improving transitions of care in order to increase quality of care and patient safety. Tools and resources will be assessed along with the work currently being done by the National Transitions of Care Coalition to identify performance and outcome measures in support of improving quality transitions. Seniors and their caregivers are often the only consistent factor involved with transitions and how do we encourage them to play a more active role in their care during transitions. During this presentation issues and barriers related to Transitions of Care will be discussed along with an interactive review of several patient scenarios supporting the concerns. Several models of collaborative practice will be reviewed along with various tools and resources available that address improved communication and support to providers, patients and caregivers. Performance measures will be discussed that support improved quality of care and patient safety in addressing the needs of seniors and assisting seniors in remaining independent and active with their health care options. Participants will: 1) Identify the barriers and gaps with transitions of care and how they affect readmissions for seniors 2) Review tools and resources available for improving communication between providers and with seniors and their family caregivers

### TRANSITIONAL CARE PROCESS, FROM HOSPITAL TO HOME, STRIVES TO IMPROVE OUTCOMES FOR MEDICAID RECIPIENTS WITHIN COMMUNITY CARE OF NORTH CAROLINA

J. Cockerham, *Community Care of North Carolina, Raleigh, North Carolina*

Community Care of North Carolina, a state-wide program of community health networks, operated by community physicians, hospitals, health departments, and departments of social services, have established local systems that give primary care providers opportunities to work with Care Managers and community providers to develop capacity, tools, information and support needed to manage health care needs of the Medicaid population. Over 30% of 993,374 CCNC enrollees have 3 or more chronic conditions, incurring 4.5 times more cost. CCNC implements a Transitional Care Process to achieve long-term quality, cost, access and utilization objectives. Process begins on admission to facilitate interdisciplinary collaboration across transitions with focus on patient/caregiver playing central role in formation/execution of care plan. It promotes self-management and direct communication between patient/caregiver, primary care provider, etc. Care Managers ensure patients are linked back to medical homes, make home and PCP visits, collaborate with Network Pharmacists on medication management and reconciliation. .

### COMMUNITY CONNECTIONS: BUILDING COMMUNITY INFRASTRUCTURES TO SUPPORT TRANSITIONS FROM HOSPITAL TO HOME

H.K. Altman, *Administration, Carol Woods Retirement Community, Chapel Hill, North Carolina*

The Community Connections initiative is about building connections among organizations, programs and consumers at both the state and community levels, addressing the current fragmentation of the health and social service system and supporting the development of an infrastructure of services designed to successfully integrate individuals back into their communities following hospital discharges. Session participants will hear about this current 3-year project, funded by The Duke

Endowment that includes elements to coordinate community organizations to implement evidence-based hospital transitions and telehealth programs, expand PACE, Adult Day Health and Chronic Disease Self-Management programs, and partner with health care systems and state agencies to align efforts and enhance services, including participating in the AoA and CMS-supported Aging and Disability Resource Center initiative.

# SESSION 1990 (PAPER)

## FINDING THE RELATIONSHIP BETWEEN BIOLOGY, AGING AND DISEASE

### COVERT BRAIN CHARACTERISTICS OF PARKINSONIAN SIGNS: A DIFFUSION TENSOR IMAGING STUDY OF THE HEALTH AGING AND BODY COMPOSITION (HEALTH ABC) COHORT

C. Rosano[1], H. Aizenstein[1], V. Venkatraman[1], C. Taylor[1], K. Yaffe[2], T. Harris[3], S.B. Kritchevsky[4], A.B. Newman[1], *1. University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of California, San Francisco, San Francisco, California, 3. National Institutes of Health, Bethesda, Maryland, 4. Wake Forest University, Winston-Salem, North Carolina*

Parkinsonian signs occur commonly in older adults and predict greater risk of developing dementia and disability. While brain changes in Parkinson disease (PD) have been characterized, little is known about the brain abnormalities of Parkinsonian signs in community-dwelling older adults. Brain Imaging and a modified scale of the Unified Parkinson Disease Rating scale (UPDRS) were obtained in 274 Health ABC participants (80-89 years old, 56% women, 42% blacks) free from dementia and physical disability. Diffusion Tensor was used to quantify covert abnormalities as mean diffusivity of PD-related brain regions that are important for mobility/balance, memory and executive function (prefronto-temporal, subcortical and cerebellum). We found that parkinsonian signs were highly prevalent (45% with UPDRS>0). Greater UPDRS score (used as continuous) was associated with greater covert abnormalities localized to regions of mobility/balance (caudate, thalamus, posterior cerebellum), memory (hippocampus, parahippocampus, entorhinal cortex, amygdale) and executive function (middle frontal gyrus). In logistic regression models (outcome: UPDRS>0), there was a 30% greater probability of having Parkinsonian signs for each standard deviation of mean diffusivity obtained from the regions above (odds ratio [95% CI]: 1.31 ([1.07, 1.62], p=0.01). Adjustment for age, race, gender, intracranial and total brain volume did not change these associations. In this group of well functioning older adults, Parkinsonian signs were highly prevalent and were associated with focal bilateral covert abnormalities within PD-related networks. Future studies will need to assess whether these are true prodromal signs of PD or reflect other neuropathological findings such as Lewis bodies.

### COMMON HUMAN GENETIC VARIATION IN PATHWAYS TO SUCCESSFUL AGEING

D. Melzer, *Epidemiology and Public Health, University of Exeter, Exeter, United Kingdom*

Successful aging depends on delaying the onset of age-related disease (ARD) until late in life. Hundreds of genome wide association studies (GWAS) have identified common risk variants for ARDs and traits. Most GWAS are large-scale, with robust identification and replication of findings. This talk will present a review of GWAS results, addressing three basic questions: 1. Are the genetic variants identified involved in the key pathways prominent in aging research, especially oxidative stress, insulin, IGF-1 and other endocrine signalling, inflammation, or cell cycle control/cell senescence? 2. Are there variants or loci associated with more than one ARD – loci that might modulate overall aging? 3. How many variants are likely to influence human ARD? Dozens of variants have been identified as risk markers for key ARDs including cardiovascular disease, type 2 diabetes, osteoporosis, prostate cancer and Alzheimer's disease. Many more markers have emerged for other age related cancers and other conditions. Several markers are near or occasionally in genes linked to aging pathways. Cell cycle control is prominent. There are also many variants very specific to each disease process (e.g. for prostate cancer, variants only involved in prostate produced proteins). At least three loci associated with two or more ARDs have emerged, including a locus near TERT. These findings suggest that large numbers of cell type specific genetic variations are involved in human ageing, producing a 'mosaic' modulation of variation in the human aging process.

### CHRONIC PHYSICAL CONDITIONS AMONG THE ELDERLY PEOPLE WITH BEHAVIORAL HEALTH DISORDERS

W. Lin[1,2], R.E. Clark[1,2], J. Zhang[1], G. Leung[1], *1. Center for Health Policy and Research, University of Massachusetts Medical School, Shrewsbury, Massachusetts, 2. Department of Family Medicine and Community Health, University of Massachusetts Medical School, Worcester, Massachusetts*

Although studies have shown increased medical comorbidity among younger people with behavioral health disorders (BHDs), the information on elders is limited. Using merged claims data for elderly Massachusetts Medicare and Medicaid members (N=679,182, CY2005), we estimated logistic regression models to investigate whether mental illness and comorbid substance use disorders (SUD) were associated with a higher comorbidity of fifteen selected chronic physical conditions. The average number of chronic physical conditions was similar for elders with severe mental illness (SMI) and other mental illness (OMI) (4.5 and 4.2, respectively), but it was only 2.5 for those without mental illness. Compared with elders without mental illness and SUD, those with a BHD alone or co-occurring mental illness and SUD were more likely to have chronic physical conditions, except eye diseases. Furthermore, within each respective mental illness group (SMI and OMI), a comorbid SUD was associated with higher adjusted odds of having chronic physical conditions, except Parkinson's disease, diabetes, and eye diseases. The highly prevalent chronic physical conditions among elders with BHDs may introduce competing demands between physical and behavioral health treatment. This could have negative impact on access to these services and quality of care. Relying on either general medical or mental health sector alone may not be sufficient to manage physical and behavioral comorbidities concurrently and successfully. This underscores the need to coordinate physical and behavioral health services. The Special Needs Plan created by the Congress in the Medicare Modernization Act of 2003 is a possible venue to consider for care coordination.

### VALIDATING A NON-EXERCISE MEASURE OF CARDIORESPIRATORY FITNESS: ASSOCIATIONS WITH BRAIN STRUCTURE AND FUNCTION

A.N. Szabo[1], E.L. Mailey[1], S.M. White[1], T.R. Wojcicki[1], K. Erickson[2], M. Voss[1], A. Kramer[1], E. McAuley[1], *1. Department of Kinesiology and Community Health, University of Illinois, Urbana, Illinois, 2. Uiversity of Pittsburgh, Pittsburgh, Pennsylvania*

There is increasing evidence that cardiorespiratory fitness (CRF) is associated with brain structure and function, and improvements in CRF through exercise training have been implicated in the restoration of neural and cognitive functioning in older adults. Alternatives to graded exercise testing (GXT) such as submaximal field tests and equations used to calculate CRF in older adults have been demonstrated to be reliable, less costly, and less invasive measures of CRF in older adults (Mailey et al., 2010). However, their potential for assessing fitness relationships with brain structure and cognitive functioning has yet to be determined. Older adults (N = 70; M age = 65.03) completed a 3 Tesla sMRI, a spatial working memory task, a frequency of forgetting (FOF) questionnaire and three measures of CRF including a maximal graded exercise test (GXT), Rockport 1-mile walk test, and an equation derived measure of CRF (Jackson et al., 1990). Correlation analyses revealed all measures of CRF (GXT, Rockport, and Equation) were significantly correlated with hippocampus volume in both the right (rs = 0.57, 0.38, 0.39) and left (rs = 0.60, 0.41, 0.39) hemispheres. Additionally, all fitness measures were significantly correlated with spatial working memory reaction time (rs = -.39, -.29, -.35). Finally, all measures of CRF were significantly correlated with frequency of forgetting (rs = .33, .25, .30). No correlations were significantly different from each other. These findings suggest that a low-risk, low-cost, non-exercise estimate of CRF is significantly related to brain structure and cognitive function in older adults. Further validation is required, as is determination of whether such relationships hold over the course of exercise interventions.

## SESSION 1995 (PAPER)

## IMPROVING THE NURSING HOME EXPERIENCE

### DEVELOPMENT OF A NEW RESIDENT SAFETY CLIMATE SURVEY FOR VA COMMUNITY LIVING CENTERS (NURSING HOMES)

C.W. Hartmann[1,2], J.A. Palmer[1,2], D. Berlowitz[1,2], *1. CHQOER, Bedford VA Medical Center, Bedford, Massachusetts, 2. Boston University School of Public Health, Boston, Massachusetts*

VA Community Living Centers (CLCs—formerly Nursing Home Care Units) are undergoing “culture change,” designed to promote resident-centered care and create resident-centered environments. Important aspects of resident care and a facility safety’s environment can be improved through the development of a strong “safety climate” (staff attitudes and behaviors related to resident safety), which may or may not conflict with culture change. Our objective was to develop a nursing home safety climate instrument to provide measurable, actionable feedback to facilities about how to improve safety climate and about interactions between safety climate and culture change. Thirteen experts in survey design and methodology, nursing home care, and safety climate participated in the instrument development. We used existing instruments and the safety climate literature to create a pool of instrument domains and item objectives. Panel members ranked draft domains and objectives using a modified Delphi approach. After two rounds of rating, experts met to discuss the ratings. Items for which consensus was not reached were rated again a third time. The process resulted in an instrument with 9 domains, 43 safety climate items, and 5 demographic items. The domains were Safety priorities, Attitudes regarding resident safety, CLC senior management’s commitment to safety, Direct supervisor’s commitment to safety, Risk or hazards, Perception of shared importance of safety, Culture change and safety, Drivers of safety improvements, and Overall impressions. This is the first instrument designed to assess safety climate in VA nursing homes and to provide immediate, specific, and meaningful feedback to facilities.

### EXPERIENCE OF RESIDENTIAL TRANSITION AMONG FRAIL OLDER MINORITY PACE MEMBERS

S.L. Molony[1,2], L.K. Evans[2], *1. Nursing, Yale University, New Haven, Connecticut, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

Transitions within and between various long term care environments are common as individuals age and their health and personal needs change. An empirical base is needed that identifies predictors of wellbeing in the context of co-occurring health and residential transitions among home, adult day health centers, assisted living/supportive housing and/or nursing homes. This paper describes perceived changes in person-environment relationship (at-homeness) over time among frail older minority PACE members who experienced a residential move, one aim of a larger feasibility study that explored predictors of wellbeing in this population. Purposive sampling was used to achieve diversity among residential settings. The five phases of person-environment (P-E) integration identified in a metasynthesis of older adults’ ‘meanings of home’ formed the framework for analysis of qualitative data from three time points: baseline and 3 and 6 months post move. The 17 enrolled elders were 59% male and age 62 – 88 years; 59% had < 8th grade education. More than 2/3 had some cognitive impairment (M MOCA 20.2 +/-6.06), health was self-rated as fair to good, and 10% died during the 6-month study, underscoring frailty. Categories emerging from qualitative content analysis revealed consistency with literature-derived themes, e.g., empowering (‘do what I want’) place of relationship, and with phases of integration in the new home, e.g., ‘closing one door - opening another,’ ‘nesting,’ and ‘continuity.’ Complex patterns of P-E fit also emerged, illustrating the importance of ‘knowing the person.’ A significant increase in ‘at-homeness’ after moving from nursing home to community housing supported qualitative findings.

### THE DEVELOPMENT AND PROCESS EVALUATION OF A MUTUAL SUPPORT GROUP IN LONG-TERM CARE FACILITIES

K. Theurer, A.V. Wister, H. Chaudhury, L.D. Lovegreen, *Simon Fraser University, Vancouver, British Columbia, Canada*

Mutual support groups have the potential to offer a process that acts as a buffer to offset the passivity and dependence fostered in the culture of long-term care facilities (LTCF). The purpose of this paper is to present the development of a new intervention involving co-led mutual support groups in LTCF and to evaluate its process, structure and content. Tom Kitwood’s Model of Personhood was used as the basis for developing *The Little Java Music Club*, a weekly discussion group using themes chosen by participants and supportive materials such as related music and photographs. A mixed methods qualitative process evaluation was used, utilizing focus groups, systematic observation of six resident groups, individual resident interviews (N=65) and staff interviews (N=7) in three LTCF in British Columbia, Canada. A majority of the residents reported positive benefits and themes generated included spending time together (versus being alone in their rooms), getting to know one another better, gaining new respect and understanding for one another, giving and receiving support, unloading their burdens and learning new coping skills. Group observations showed increased active participation during and after the sessions. In their interviews, staff revealed an overall positive experience and described how the unique program structure fostered sharing on a deeper level and how it empowered residents with moderate to severe cognitive impairment. Implications for a future outcome evaluation of the program will be presented. Funded in part by the Social Sciences and Humanities Research Council of Canada and the Michael Smith Foundation for Health Research.

### EFFECT OF FEASIBLE MOBILITY INTERVENTION IN NURSING HOMES: MOBILITY OF VULNERABLE ELDERS (MOVE)

S. Slaughter, C. Estabrooks, *University of Alberta, Edmonton, Alberta, Canada*

Introduction: Almost 90% of long-term care (LTC) residents have some type of mobility limitation leading to a loss of ability in activities of daily living and an increased the risk of problems such as pressure ulcers, falls, and incontinence. Objective: The purpose of this research is to study the effect of repeating a simple functional activity (sit-to-stands) on resident mobility. Methods: In this quasi-experimental study the sit-to-stand activity and a reminder system were introduced to health care aides during short education sessions. We monitored the monthly uptake of the sit-to-stands using the health care aides’ documentation flowsheets and we measured resident mobility using the 30-second sit-to-stand test at baseline and four months later. Using logistic regression we assessed the influence of exercise occasions on change in mobility as a binary outcome (improved/maintained mobility versus reduced mobility). Results: 98 health care aides and 32 residents participated in the study between October 2009 and February 2010. In the month prior to measuring the residents' sit-to-stand performance residents completed a mean of 29.7 (SD = 20.79; range 2 to 76) occasions of sit-to-stand repetitions. For every 12 occasions of repeating the sit-to-stand exercise in a month, the odds of improving or maintaining performance with the 30-second sit-to-stand test doubled (OR = 1.05, p = 0.014). Conclusions: This study provides promising evidence that the sit-to-stand functional activity many delay the loss of mobility in nursing home residents with dementia. We plan to evaluate the effectiveness of this mobility intervention in a larger controlled study.

# SESSION 2000 (PAPER)

## INNOVATIVE EDUCATION FOR OLDER ADULTS AND HEALTHCARE PROFESSIONALS

### ATTITUDES OF BACCALAUREATE NURSING STUDENTS TOWARD OLDER ADULTS: IMPLICATIONS FOR EDUCATION IN GERONTOLOGY

S. Swanlund[1], A. Kujath[2], *1. Illinois Wesleyan University, Bloomington, Illinois, 2. University of Illinois at Chicago, Chicago, Illinois*

Chronic conditions contribute to the factors making older adults (65 and older) the largest consumers of health care resources, yet graduating nurses are choosing intensive care nursing, pediatrics, and obstetrics over work with the elderly. This mixed methods study examined the attitudes of baccalaureate nursing students toward older adults, students' preferred work areas after graduation, and reasons for nursing career choices. A convenience sample of 50 students from a private Midwestern baccalaureate nursing program completed a demographic data sheet, the Tuckman-Lorge Attitude Toward Old People questionnaire and ranked 10 nursing work areas. Qualitative data included reasons why students were choosing or not choosing specific work areas, and factors which might change their opinion of working with older adults. Quantitative results revealed there was a trend for students who were in the program longer to have more positive attitudes towards old people. Students who spent time with an older family friend or relative had better attitudes than those who did not (p=.007). There was no correlation between attitudes and choosing to work with older adults. One overriding theme with two subthemes emerged from the qualitative data collected. The responses from these 50 BSN students revealed that developing a value for gerontology is imperative. Valuing gerontology was seen as a precursor to developing a positive attitude. Developing relationships with older adults and appreciating the complexity in the care of the older adult emerged as two subthemes. These results are important to future gerontological curricular planning.

### EVALUATING COMMUNICATION STRATEGIES IN DEMENTIA: CONVERSATIONS BETWEEN AGED CARE STAFF AND RESIDENTS

E.R. Smith, M. Broughton, R. Baker, C. Gallois, A.J. Angwin, D. Copland, K. Havas, H.J. Chenery, *The University of Queensland, Brisbane, Queensland, Australia*

Background: Communication difficulties are prominent in dementia and are distressing both for people with dementia and their caregivers. Based on empirical and clinical data, a DVD-based program entitled MESSAGE was developed to provide caregivers with evidence-based strategies to facilitate communication in dementia. The effectiveness of this program was examined in a sample of professional caregivers in residential facilities. Method: As part of the evaluation of the MESSAGE program in aged care settings, 10-minute conversation samples were recorded between caregivers and residents with dementia. Twenty caregiver-resident dyads were recorded at baseline. Caregivers then either received MESSAGE training or served as controls. Within the eight dyads recorded at follow-up three months later, there were four trained caregivers and four controls. Conversations were transcribed and analysed using Leximancer, a text-mining tool designed to identify meaningful themes, concepts and relationships in discourse. Results: Leximancer analysis revealed that, at baseline, conversational content was generated predominantly by caregivers. Dominant concepts included 'favourite', 'children', 'today' and 'remember'. Residents appeared to contribute to conversations using content-poor responses, including agreement, laughter, and automatic language (e.g., swearing). At three months post-training, contribution of content appeared more evenly shared between conversational partners for dyads involving trained caregivers, but not control caregivers. Discussion: This study describes a novel method for evaluating the effects of caregiver training. The provision of MESSAGE strategies appears to have a positive impact on communication between caregivers and people with dementia. In particular, trained caregivers appear better able to facilitate contribution of content by the person with dementia.

### EVALUATION OF AN INTRODUCTORY GERIATRICS COURSE FOR PHARMACY STUDENTS

C.A. Sadowski, M. Gukert, *Faculty of Pharmacy, University of Alberta, Edmonton, Alberta, Canada*

Objective: To describe the implementation and evaluation of the first 5 years of an introductory geriatrics course for pharmacy students. Methods: The pediatrics/geriatrics module, a mandatory second year course for pharmacy students, first ran fall 2005. This course was assessed by professor evaluation, teaching assistant feedback, student performance on assignments and examinations, and course evaluations completed by students. Content was compared to required syllabus content suggested by professional organizations. Student marks were analyzed descriptively. Feedback from all sources was categorized into themes. Results: The geriatrics portion of the course matched very well with curriculum suggested by the professional organizations (AGS, CGS, ASCP). The students identified 4 areas of concern: the content was too complex for second year, the content emphasized the social sciences over the medical sciences, much of the content appeared subjective, and the course was overall too onerous, particularly in relation to the 5 writing assignments. Professor evaluation identified 3 areas of concern: lack of student engagement, an inability to address the complexity of geriatrics by teaching so early in the curriculum, and lack of critical thinking on writing assignments. Student marks overall were quite high for the course, with no students failing. Conclusion: The implementation of an early geriatrics course did not meet student or professor expectations. The course may be improved by teaching later in the curriculum, when there is a professional identity and knowledge foundation already laid for the students.

### WILL EDUCATION PROTECT MIDDLE-AGED (45-64) WHITE AMERICANS FROM DEVELOPING MENTAL DISORDER?

X. Pan, *Miami University, Oxford, Ohio*

The objective of this research is to examine the relationships among education, mental health history, and well being at midlife among white Americans. It is hypothesized that individuals with higher education will experience protective effects on their mental health during middle age (45-64), particularly depression and anxiety. The sample consists of 2,911 persons (1,391 males, 1,520 females) drawn from the National Survey of Midlife Development in the United States (MIDUS), which is a collaborative, interdisciplinary investigation of patterns, predictors, and consequences of midlife development in the areas of physical health, psychological well-being, and social responsibility on a nationally representative sample of non-institutionalized, English-speaking adults in the United States. Bivariate correlations were used to examine the relationships among demographic characteristics, education, mental health history, and midlife well-being (depression and anxiety). Variables with significant bivariate correlations were entered as predictors into two linear regressions predicting depression and anxiety. Findings reveal that education level and mental health are significantly associated r=.249, p<.01; middle-aged white Americans who are highly educated are more likely to report their mental health as "very good" or "excellent" than those who are less educated. Higher levels of education predict better mental health at midlife.

## SESSION 2005 (SYMPOSIUM)

### PHYSICAL ACTIVITY AMONG VULNERABLE OLDER ADULTS: AN EXPLORATION OF POTENTIAL BENEFITS AND BARRIERS

Chair: *M. Shardell, University of Maryland School of Medicine, Baltimore, Maryland*
Discussant: *E.M. Simonsick, National Institute on Aging, Baltimore, Maryland*

The role of physical activity in delaying disability among community-dwelling older adults is well-documented. However, less work has examined the effects of physical activity in vulnerable subgroups of older adults, such as hospitalized, sedentary, or nutritionally compromised older persons, in whom the barriers to and benefits of participating in physical activity may differ from the general population. The research presented in this symposium takes advantage of longitudinal data and state-of-the-art techniques from several unique cohorts, including nationally representative cohorts with up to 12 years of mortality follow-up (NHANES III) and physical activity measured via accelerometry (NHANES years 2003-2006), a randomized clinical trial of an exercise intervention (LIFE), and a cohort study of hip fracture recovery (Baltimore Hip Studies 4), to provide new insights on the heterogeneous benefits of physical activity on health in older persons. Presentations examine the differential preventive effects of physical activity on mortality depending on vitamin D levels, the "pre-habilitative" impact of pre-fracture physical activity on post-fracture inflammation among hip-fracture patients, and the rehabilitative effects of physical activity on functional recovery from hospitalization. Presentations also address the influence of nutritional status measured by serum carotenoid levels on physical activity after hip fracture and the association between metabolic syndrome and accelerometry-measured sedentariness in older persons. Attendees will gain a greater understanding of 1) factors that influence physical activity and 2) its health effects among vulnerable older persons, which will contribute to efforts to develop and evaluate appropriate activity-based interventions to improve health at older ages.

### JOINT EFFECTS OF PHYSICAL ACTIVITY AND VITAMIN D ON LONGEVITY: NHANES III

M. Shardell[1], D. Alley[1], R.R. Miller[1], G. Hicks[2], *1. University of Maryland School of Medicine, Baltimore, Maryland, 2. University of Delaware, Newark, Delaware*

High physical activity (PA) and high vitamin D [25(OH)D] both relate to improved longevity. Research has not examined the joint relationship of PA and 25(OH)D with longevity. Analysis included 3,377 adults aged≥55 years from the National Health and Examination Survey III. PA was categorized using metabolic equivalent tasks (METs) in the past month as low (≤3.5 METs), moderate (3.6-14.9 METs), or high (≥15 METs). Mean follow-up was 7.8 years. Survey-weighted Cox regression adjusting for covariates was used. Participants with both high 25(OH)D (≥50 nmol/L) and high PA had the lowest all-cause mortality, relative to participants with both low 25(OH)D (<50 nmol/L) and low PA (Hazard Ratio=0.57, 95% Confidence Interval 0.33-0.98). Mortality for participants with low 25(OH)D/high PA did not differ from those with low 25(OH)D/low PA. Higher 25(OH)D and PA were jointly associated with longevity. This work is an important step toward identifying optimal 25(OH)D/PA combinations among older adults.

### PRE-FRACTURE PHYSICAL ACTIVITY AND POST-FRACTURE INFLAMMATION: THE BALTIMORE HIP STUDIES

R.R. Miller[1], M. Shardell[1], D. Alley[1], G. Hicks[2], D. Andersen[1], D. Orwig[1], J. Yu-Yahiro[3], J. Magaziner[1], *1. University of Maryland School of Medicine, Baltimore, Maryland, 2. University of Delaware - Physical Therapy, Newark, Delaware, 3. Union Memorial Hospital - Orthopaedics, Baltimore, Maryland*

Physical activity (PA) may have anti-inflammatory effects. Whether pre-hip-fracture PA is associated with lower inflammatory marker levels post-fracture is unknown. Using generalized estimating equations, we examined the association of pre-fracture PA with serum levels of soluble TNF- alpha receptor 1 (sTNF- alphaR1) at baseline and at 2, 6 and 12-months post-fracture in 161 women from the fourth Baltimore Hip Studies cohort. Adjusting for covariates, higher levels of pre-fracture PA were associated with lower sTNF- alphaR1 levels during the year post-fracture (p=0.09 for longitudinal association). Relative to other study participants, those in the lowest quintile of pre-fracture PA had sTNF- alphaR1 levels that were 514.5 pg/ml (95%CI: -27.1, 1056.0) and 560 (95%CI: -10.6, 1132.2) higher at baseline and 2 months. Higher levels of pre-fracture physical activity were associated with lower levels of sTNF- $\alpha$R1 during the year post-fracture a mechanism by which physical activity may increase resilience in older adults.

### EFFECT OF PHYSICAL ACTIVITY ON HOSPITALIZATION-ASSOCIATED FUNCTIONAL DECLINE: THE LIFE PILOT STUDY

D. Alley[1], F. Hsu[2], M.P. Walkup[2], M. Shardell[1], M. Pahor[3], S. Studenski[4], J. Guralnik[5], T. Harris[5], *1. University of Maryland School of Medicine, Baltimore, Maryland, 2. Wake Forest University School of Medicine, Winston-Salem, North Carolina, 3. University of Florida, Gainesville, Florida, 4. University of Pittsburgh, Pittsburgh, Pennsylvania, 5. National Institute on Aging, Bethesda, Maryland*

Hospitalization often precipitates the development of disability in older persons, possibly due to hospitalization-associated deconditioning. Few studies have addressed whether physical activity (PA) can reduce functional decline associated with hospitalization. Using data from a randomized controlled trial comparing a 12-month PA intervention to a successful aging (SA) intervention in sedentary older persons (The Lifestyle Interventions and Independence for Elders Pilot study, N=424, aged 70-89), we compared changes in physical function in participants by hospitalization status and intervention arm. Among hospitalized participants, the PA intervention group showed an average 1-point improvement in Short Physical Performance Battery (SPPB) score and no change in 400m walking speed during the six months in which a hospitalization occurred, while the SA group experienced declines in both outcomes (N=69 for SPPB, N=63 for 400m walk, p for difference <.01). Results suggest that participating in PA may increase resilience and recovery from hospitalization in older persons.

### ASSOCIATION OF SERUM CAROTENOID LEVELS WITH RECOVERY OF PHYSICAL ACTIVITY AFTER HIP FRACTURE: THE BALTIMORE HIP STUDIES

G. Hicks[1], M. Shardell[2], D. Alley[2], R.R. Miller[2], C. D'Adamo[2], J. Magaziner[2], *1. University of Delaware, Newark, Delaware, 2. University of Maryland School of Medicine, Baltimore, Maryland*

In older adults, low serum carotenoid levels have been associated with sarcopenia and progression of disability. We examined the association of carotenoid status at the time of hip fracture with recovery of physical activity, as measured by the Yale Physical Activity Survey (YPAS) and Six-Minute Walk (6MW) Test. Analyses included 96 participants aged ≥ 65 years from the Baltimore Hip Studies 4th cohort. Generalized estimating equations, adjusting for covariates, were used. Women with high carotenoid levels at baseline had higher physical activity levels in the year post-fracture (p=.01) as measured by the YPAS.

Although they did not have greater 6MW distances overall throughout the year (p=.12), their 6MW distances were 34.79 meters (95%CI: 2.32, 67.25) and 41.91 meters (95%CI: 2.69, 81.13) greater at 6 and 12 months post-fracture, respectively. Overall, women with higher carotenoid status at the time of fracture had better recovery of physical activity in the year post-fracture.

### SEDENTARY PATTERNS ASSOCIATED WITH METABOLIC SYNDROME INDEPENDENT OF PHYSICAL ACTIVITY

A. Koster[1], A. Bankoski[1], J.J. McClain[2], R.J. Brychta[3], P. Caserotti[1], T. Harris[1], *1. National Institute on Aging, Bethesda, Maryland, 2. National Cancer Institute, Bethesda, Maryland, 3. National Institute of Diabetes and Digestive and Kidney Diseases, Bethesda, Maryland*

This study examined associations between objectively measured sedentary patterns and metabolic syndrome (MS) among older adults. Data were from 1367 men and women, aged ≥60 years in the 2003-2006 National Health and Nutrition Examination Survey. Sedentary time was assessed using an ActiGraph accelerometer and defined as <100 counts per minute. MS was defined according to the ATPIII criteria. Compared to people without MS, people with MS spent more hours and a greater percentage of time sedentary, had longer average sedentary bouts, lower intensity (average counts/min) during sedentary time, and fewer breaks in sedentary time (all p<0.01). A greater percentage of time sedentary, a lower intensity sedentary time, and fewer sedentary breaks were associated with a significantly greater likelihood of MS after adjustment for physical activity. Older people may benefit from reducing total sedentary time and avoiding prolonged periods of sedentary time by increasing the number of breaks during sedentary time.

## SESSION 2010 (PAPER)

## PREDICTING MORBIDITY: NEW FINDINGS FROM LONGITUDINAL DATABASES

### A NUANCED ANALYSIS OF CANCER SURVIVORS' HEALTH STATUS: A REPORT FROM THE HEALTH AND RETIREMENT STUDY

S. Koroukian[1], D.F. Warner[1], C. Owusu[1], C.W. Given[2], *1. Epidemiology and Biostatistics, Case Western Reserve University, Cleveland, Ohio, 2. Michigan State University, East Lansing, Michigan*

Introduction: Studies documenting lower health status and greater decline in older cancer survivors (CS) compared to cancer-free (CF) elders have not accounted for the frequent occurrence and co-occurrence of comorbidities (COM), functional limitations (FL), and geriatric syndromes (GS). Our study aims to fill this gap in the literature. Methods: We used self-reported data on a U.S. representative sample of 13,544 adults age 50 or older from the 2004-2006 waves of the Health and Retirement Study. CS (13%) were identified based on history of cancer. We relied on COM, FL, and GS to group respondents in the following clinical categories: (CC0) none of COM, FL, or GS; (CC1) occurrence of any one of COM, FL, or GS; (CC2) co-occurrence of any two of COM, FL, and GS; and (CC3): co-occurrence of all three of COM, FL, and GS. Using multivariable logistic regression, we evaluated the independent association between CS status and each of self-rated fair/poor health and 2-year decline from excellent, very good or good to fair/poor health, or from fair to poor health. Results: More CS than CF respondents presented with CC2 (37.4% vs. 33.4%) or CC3 (33.2% vs. 24.5%), p < 0.01. After adjusting for the clinical categories, CS status remained independently associated with fair/poor health status (adjusted odds ratio 1.34, 95% Confidence Interval: (1.19, 1.52) and decline (1.23 (1.06, 1.43)). Conclusions: With the refined characterization of clinical presentation, we report a significant association between CS status and health outcomes, albeit at a relatively modest magnitude.

### VITAMIN D STATUS AND PERFORMANCE ON THE TRAIL MAKING TEST PARTS A AND B: CROSS-SECTIONAL AND LONGITUDINAL ANALYSES OF WOMEN'S HEALTH AND AGING STUDY II DATA

J. Deal[1,2], M. Carlson[1,3], Q. Xue[1,4,2], L.P. Fried[5], P.H. Chaves[1,4,2], S. Yasar[1,4], *1. Center on Aging and Health, Johns Hopkins Medical Institutions, Baltimore, Maryland, 2. Department of Epidemiology, Johns Hopkins School of Public Health, Baltimore, Maryland, 3. Department of Mental Health, Johns Hopkins School of Public Health, Baltimore, Maryland, 4. Division of Geriatrics, Johns Hopkins School of Medicine, Baltimore, Maryland, 5. Mailman School of Public Health, Columbia University, New York, New York*

Trail Making Test (TMT) Parts A (TMT-A) and B (TMT-B) are traditionally used in cognitive assessment in older adults. TMT-A provides insight into psychomotor speed, and TMT-B into executive function. Whether vitamin D affects performance on these cognitive subdomains is not known. We assessed cross-sectional and longitudinal relationships of serum vitamin D with TMT-A and TMT-B performance. Observational data were from the Women's Health and Aging Study II (age range: 70-80 y.o.). There were 6 data collection rounds (up to 9 years of follow-up) for longitudinal analyses (sample size: 341). Linear, logistic, and longitudinal random effect models were used. Exposure of interest was baseline serum 25-hydroxyvitamin D (25-OH-D). Adjustment was done for major demographics and baseline comorbidity. Cross-sectionally, vitamin D and TMT-A performance were not associated in a statistically significant fashion. Longitudinally, vitamin D sufficiency (25-OH-D>30 ng/mL) was associated with less decline on TMT-A in a statistically significant fashion (p<.05) after the initial 3 years of the study. Regarding the TMT-B, those with vitamin D deficiency (serum 25-OH-D<15 ng/mL) performed worse than those without deficiency. Longitudinally, vitamin D was not associated with decline rates over time on TMT-B performance. We documented statistically significant associations of serum vitamin D with TMT-A and TMT-B performance, though results from cross-sectional and longitudinal analyses differed substantially. Findings are relevant for the design of subsequent clinical trials aimed at assessing the impact of vitamin D interventions on cognitive decline prevention in older populations.

### THE ASSOCIATION OF OLDER COUPLES' COGNITIVE STATUS WITH HOSPITALIZATION, DOCTOR VISITS, AND FALLS: THE HEALTH AND RETIREMENT STUDY

T. Okura[1], K. Langa[2], *1. Baji Park Clinic, Tokyo, Japan, 2. University of Michigan, Ann Arbor, Michigan*

(Objectives) We hypothesized that couples of older adults in which both spouses are cognitively impaired are highly susceptible to adverse clinical events such as hospitalizations, a greater number of doctor visits including urgent visits, and falls due to an impaired ability to ensure a healthy and safe living environment. (Methods) We identified 2,323 older married couples (both aged 65 or older) living in the community in the 2006 wave of the Health and Retirement Study (HRS). Level of cognitive impairment was characterized according to quartile of scores on the 35-point HRS cognitive scale (HRS-cog). We ascertained hospitalizations, falls, and the number of doctor visits for the last 2 years in the same wave of the HRS. (Results) Both spouses were in the lowest cognitive quartile in 6.6% of older couples, compared to the 33.1% of couples where only one spouse was in the lowest cognitive quartile. In older couples where both partners were in the lowest cognitive quartile, both partners were more likely to be hospitalized and to fall, compared to the older couples where both partners were in the highest cognitive quartile (odds ratio (OR), 5.67; 95% CI, 2.44-13.15 for hospitalization; OR, 2.75; 95% CI, 1.22-6.20 for fall). (Conclusions) Older couples where both partners are cognitively impaired may be substantially more vulnerable to negative clinical events. Cognitive assessment of both partners of an older couple may be important to identify those at especially high risk for negative clinical outcomes and to better target interventions to prevent these outcomes.

### THE ASSOCIATION BETWEEN MIDLIFE BODY MASS INDEX AND COGNITIVE FUNCTION IN LATE LIFE: AGE GENE/ENVIRONMENT SUSCEPTIBILITY - REYKJAVIK STUDY

M. Chang[1], J. Saczynski[2], T. Aspelund[3,4], V. Gudnason[3,4], T.B. Harris[5], L.J. Launer[5], P.V. Jonsson[1,3], *1. Landspitali University Hospital, Reykjavik, Iceland, 2. University of Massachusetts, Worcester, Massachusetts, 3. University of Iceland, Reykjavik, Iceland, 4. Icelandic Heart Association, Kopavogur, Iceland, 5. National Institute on Aging, Bethesda, Maryland*

Background: Little is known about the association between midlife BMI and cognitive functions among older adults. The objective of the study is to examine the long-term association of midlife BMI to late-life cognitive function and dementia. Methods: A population based cohort of men and women (born in 1907–1935) participated in the Age Gene/Environment Susceptibility - Reykjavik Study. The interval between midlife BMI and late-life cognitive function was 26 years. Midlife BMI category was defined as 1) normal (BMI 18.5 to 24.9), 2) overweight (BMI 25 to 29.9), and 3) obesity (BMI 30 or more). Composite scores of speed of processing (SP), memory (MEM) and executive function (EF) were created from a neuropsychological test battery. Dementia was diagnosed according to international guidelines by consensus. Results: Analyses are based on 4954 participants (women = 57%, dementia = 3.9%; midlife BMI level: normal = 51.4%, overweight = 39.8%, and obesity = 8.7%). Compared to normal BMI group (reference), both the overweight and obesity groups had significantly slower SP (overweight, $\beta = -0.09$; obesity, $\beta = -0.14$, trend $p < 0.0001$), lower MEM (overweight, $\beta = -0.06$; obesity, $\beta = -0.11$, trend $p < 0.004$) and EF (overweight, $\beta = -0.06$; obesity, $\beta = -0.10$, trend $p < 0.002$), after full adjustment, but no association was found with dementia. Conclusion: Being overweight or obese at midlife contributed to lower cognitive function 26 years later. However, we found no association between midlife BMI and dementia, and this contradictory results need to be examined further.

## SESSION 2015 (PAPER)

## PREDICTORS AND FACTORS ASSOCIATED WITH DEMENTIA

### DO MIDLIFE MOTIVATIONAL ABILITIES PREDICT COGNITIVE DECLINE AND ALZHEIMER'S DISEASE?

S. Forstmeier, M.E. Mortby, A. Maercker, *Dept. of Psychology, University of Zurich, Zurich, Switzerland*

Motivational reserve (MR) is a form of brain reserve and can be defined as a set of motivational abilities that provide the individual with resilience to neuropathological damage. In two studies, the hypothesis was tested that lower premorbid motivational abilities are associated with higher risk of cognitive impairment and Alzheimer's disease (AD). Premorbid motivational abilities of the participants were estimated on the basis of the individual occupational history using the Occupational Information Network (O*NET) database which provides detailed information on worker characteristics. A previous study has shown that O*NET-based premorbid motivational abilities correlate highly significant with established self-report measures of motivational abilities. Cross-sectional study: In a community sample of 147 non-demented participants aged 60-94 years, 10% were mildly cognitively impaired. Motivational abilities predicted odds of mild cognitive impairment, even when age, sex, education, and premorbid cognitive ability ("cognitive reserve") were controlled (OR 0.24; 95% CI 0.08-0.71). Longitudinal study: In the German Study on Ageing, Cognition and Dementia in Primary Care Patients (AgeCoDe), about 2500 non-demented participants aged 75-89 were followed up twice (after 1 ½ and 3 years). In a fully adjusted model, motivational abilities were associated with a reduced risk of MCI. The association of midlife motivational abilities with incidence of AD was less clear. Midlife motivational abilities were associated with reduced risk of AD in ApoE e4 carriers, but not in non-carriers. Revealing the mechanisms underlying this association of motivational abilities and cognitive decline may lead to novel strategies for delaying the onset of AD symptoms.

### FACTORS ASSOCIATED WITH TIME TO IDENTIFY PHYSICAL PROBLEMS OF NURSING HOME RESIDENTS WITH DEMENTIA

C.R. Kovach[1], M.R. Simpson[1], L.L. Joosse[2], *1. University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, 2. Aurora Healthcare, Milwaukee, Wisconsin*

The purposes of this study were to: a) examine factors associated with time to identify new physical problems of nursing home residents with dementia; and b) compare identification of dementia behaviors and physical assessment needs between staff nurses and an expert. A total of 155 residents and 38 nurses from eleven nursing homes participated. Physical problems emerging over six weeks were prospectively measured along with time, patient and nursing care variables. Staff and an expert nurse independently recorded behavior change and the need for further physical assessment. Analysis was done with mixed models, incorporating a random effect for nurse. Sensitivity and specificity indices were calculated. A one unit decrease in nurse assessment skill was associated with a 54% increase in the time to identify new physical problems ($p < .001$). A 10% reduction in the ratio of new to standard interventions was associated with a 14% increase in the time to identify new problems ($p = .002$). Patients without specific physical symptoms had 127% longer times to identify new problems ($p = .009$). Sensitivity was low for the staff nurses, ranging between 35-65% for identifying changes in the different types of resident behaviors, while specificity was quite high at over 95%. Additional assessment was felt to be needed for 51% of residents by the staff nurse and for 73% of residents by the expert. Staff nurses are under-identifying behavior changes and the need for additional physical assessment. Improved assessment may decrease the time to identify new problems.

### THE EMERGING ROLE OF ADIPOKINES IN COGNITIVE DECLINE AND DEMENTIA

D.J. Llewellyn[1], I. Lang[1], K. Kos[1], K. Langa[2], R. Clarke[3], D. Melzer[1], *1. Peninsula Medical School, University of Exeter, Exeter, United Kingdom, 2. University of Michigan, Ann Arbor, Michigan, 3. University of Oxford, Oxford, United Kingdom*

Obesity increases the relative risk of incident dementia over 10 years or more by around 75%, but the mechanisms involved are unclear. It is commonly overlooked that the effects of excess adipose tissue on the brain may be mediated by recently discovered adipokines that cross the blood brain barrier and whose functions in the brain have yet to be fully established. White adipose tissue is the largest endocrine organ in the body, and adipokines establish cross-talk between adipose tissue and the brain to communicate energy status. Adipokines may influence the risk of conditions related to dementia such as atherosclerosis and stroke through inflammatory mechanisms. However, recent large population-based studies suggest that the proinflammatory adipokine leptin may paradoxically be neuroprotective. Here we review recent adipokine research, with particular attention to the roles of leptin, adiponectin, TNFα, IL-6, and ZAG. Adipokines may provide early markers for those at higher risk and new insights into the complex pathogenesis of cognitive decline and dementia. Increased understanding of these mediators may also make it possible to prevent cases of dementia resulting from obesity by pharmacological manipulation of selected adipokines.

### MOTIVATIONAL RESERVE: A MODERATOR OF APATHY AND DEPRESSION IN DEMENTIA IN A US-REPRESENTATIVE SAMPLE

M.E. Mortby, A. Maercker, S. Forstmeier, *Psychopathology and Clinical Intervention, University of Zurich, Switzerland, Zurich, Zurich, Switzerland*

Motivational Reserve (MR; Forstmeier and Maercker, 2008), a complementary process to Cognitive Reserve (CR), is proposed to attenuate cognitive impairment in later life. Particularly, high MR is proposed to be associated with prolonged maintenance of cognitive function, delayed Alzheimer's disease (AD) onset, and subsequently a more rapid illness progression. Pre-morbid motivational abilities constituting MR, and the presence of neuropsychiatric symptoms of apathy and depression, have, independently, been associated with increased conversion rates from Mild Cognitive Impairment (MCI) to AD. Until this study, the moderating effects of pre-morbid motivational abilities on apathy and depression progression in dementia have not been established. Using the Aging, Demographics, and Memory Study subsample of the US-representative Health and Retirement Study, a longitudinal cohort comparison (N=80) of motivational abilities on apathy and depression progression was conducted. Participants were 70 years or older and categorized into normal, MCI and AD cohorts. MR was estimated using detailed occupational history (utilizing the Occupational Information Network (O*NET) database). Baseline and follow-up assessments were conducted 2 years apart. Using the Neuropsychiatric Inventory, Analysis of Variance and Covariance were conducted to determine the protective role of MR on apathy and depression within the cohorts. Analyses demonstrated significant cohort differences for MR when controlling for CR (p=.037), for apathy (p=.004) and depression (p=.001). Analyses including the covariables of MR, CR, and baseline apathy and depression further demonstrated significant differences. These findings suggest that over and above educational attainment, this index of MR has a protective function for apathy and depression in cognitive impairment.

## SESSION 2020 (PAPER)

### UNDERSTANDING CARE PREFERENCES AND QUALITY OF LIFE

### ADVANCE CARE PLANNING: THE IMPORTANCE OF SITUATIONAL FEATURES AND PERSONAL CHARACTERISTICS

K.R. Baughman[1], R.E. Ludwick[2], D.M. Merolla[2], S. Hazelett[3], B.R. Palmisano[1], J. Winchell[2], M. Hewit[1], *1. Behavioral & Community Health Sciences, NE Ohio U College of Medicine, Rootstown, Ohio, 2. Kent State University, Kent, Ohio, 3. Summa Health System, Akron, Ohio*

The purpose of this study was to examine factors contributing to Area Agencies on Aging (AAA) care managers' decisions to discuss advance care planning (ACP) with consumers. A factorial survey with three vignettes with randomly assigned situational features of a hypothetical consumer was administered to 182 AAA care managers (registered nurses and social workers) from three regional AAAs. Factorial surveys combine the strengths of the classic factorial design experiment with a sample survey allowing for analyses of how both situational features of the consumer and personal characteristics of the care manager are associated with ACP decisions. Hierarchical linear models indicated that most variability in ACP decisions is due to differences among care managers (64%) rather than situational features of the consumers (36%). A positive decision to discuss ACP was associated with consumers who needed assistance with legal issues as compared to those who were independent, and consumers who did not have a diagnosis of congestive heart failure, diabetes, Parkinson's disease or pulmonary hypertension as compared to cancer; these factors explained 7% of vignette level variance. Significant personal characteristics of the care manger included being white, having less direct contact with consumers, having personal experience with ACP, and having the skills, knowledge, confidence, and responsibility to initiate a conversation; these factors explained 23% of person-level variance. This study shows the lack of normative consensus about ACP and points to the need for consistent educational programs on ACP regarding the role of the care manager in the ACP process.

### THE UNIQUE IMPACT OF FRAILTY ON HEALTH RELATED QUALITY OF LIFE IN OLDER ADULTS WITH HEART FAILURE

H.G. Buck, B. Riegel, *University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

Background: Frailty increases morbidity and mortality during transitions of care in older adults with heart failure (HF). Health related quality of life (HRQOL) also predicts both morbidity and mortality in this same population. The magnitude of the impact of frailty on HRQOL versus known predictors is largely unexplored in this vulnerable population. Objective: To determine the impact of frailty on variance in HRQOL after adjusting for known predictors- gender, income, ethnicity, health perception, and functional status. Methods: Frailty was determined on the basis of age, number of comorbid conditions, and symptom severity. HRQOL was assessed using the Minnesota Living with Heart Failure Questionnaire (MLHFQ) physical and emotional subscales and summary score. Predictors of HRQOL, identified from the literature, were tested with frailty using hierarchical regression modeling. Results: In a sample of 119 hospitalized HF elders (age M 76, SD 6.23); known predictors explained 10% (p 0.03) of the variance in total HRQOL. Frailty accounted for an additional 13% ($p< 0.001$) of the variance. As expected, known predictors explained 13% (p 0.007) of the variance in physical HRQOL. Frailty increased this to 25% (p 0.000). Frailty also impacted emotional HRQOL- with known predictors explaining 8% (p 0.08) of the variance and frailty increasing that to 13% (p 0.01). Conclusion: A triad of factors associated with frailty explains significant unique variance in both physical, and specifically, emotional HRQOL. Assessing and treating indicators of frailty may improve HRQOL and decrease the risk of morbidity and mortality for older adults with HF.

## SESSION 2025 (SYMPOSIUM)

### A PILOT STUDY OF A NON-PHARMACOLOGICAL INTERVENTION FOR DELIRIUM SUPERIMPOSED ON DEMENTIA

Chair: *A.M. Kolanowski, Penn State University, University Park, Pennsylvania*

Delirium is common in older adults with dementia, and is referred to as delirium superimposed on dementia (DSD). Individuals with DSD are at high risk for poor health outcomes. Our broad objective in this pilot project was to demonstrate that implementation of cognitively stimulating activities has potential for reducing delirium severity and duration, and functional loss in post-acute care settings. For preliminary analyses we used a mixed-model ANOVA. The group by time interaction indicated that the control group (N= 5) had a significantly greater decrease in physical function and mental status over time compared to the intervention group (N= 11). Delirium, severity of delirium, and attention all approached significance and improvement favored intervention over time. Although not statistically significant (p= .1113), there was a difference in mean (7.0 vs. 3.27) and median (7.0 vs. 3.0) days with delirium: the control group having more days of delirium.

### EFFECTS OF ANIMAL-ASSISTED THERAPY FOR RESPONDING TO PASSIVE BEHAVIOR IN PERSONS WITH DEMENTIA

C.A. Soprano[1,2], A.M. Kolanowski[2], V.M. Chinchilli[2], K. Colling[3], D. Lago[2], J. Penrod[2], *1. Nursing, Wilkes University, Wilkes-Barre, Pennsylvania, 2. Penn State, State College, Pennsylvania, 3. University of Michigan, Ann Arbor, Michigan*

Approximately 90% of nursing home residents with dementia experience passive behavior (PB). PB occurs daily, is often resistant to interventions, causes caregiver distress, and leads to negative consequences such as, social isolation, loss of physical functioning, excess disability, and further cognitive decline. PB is poorly understood, in that it is often diagnosed as depression and inappropriately treated with antidepressants. While few non-pharmacological interventions exist for PB, animal-assisted therapy (AAT) is a promising intervention. A within-subject, repeated measurements quasi-experimental study, using an ABAB design, was conducted to determine if a functional relationship existed between AAT and PB. Eight subjects completed 32, daily, 20-minute videotaped sessions under two conditions: dog present and dog absent. Measures of PB were obtained from the video-recordings using the Observational Form of Passivity in Dementia scale. Findings from this study suggest that AAT can serve as a useful intervention for decreasing PB in persons with dementia.

### INTERVENTIONS NURSES DOCUMENT IN RELATION TO THEIR PATIENTS' CHANGING MENTAL STATUS

M.R. Steis[1], D.M. Fick[2], S.J. Loeb[2], J. Penrod[2], R. Schrauf[2], *1. Penn Nursing Science, University of Pennsylvania, Philadelphia, Pennsylvania, 2. The Pennsylvania State University, University Park, Pennsylvania*

Purpose: To explore hospital nurses' management of delirium in elders with dementia, a common accompaniment to transitions in health state and care environments. Methods: This was a retrospective electronic chart review of documented nursing interventions related to patients' mental status in two patient groups: dementia-only and delirium-superimposed-on-dementia (DSD). Content analysis was performed using the Nursing Intervention Lexicon and Taxonomy classification system. Results: Nurses primarily documented Care Vigilance and Care Environment Management interventions. Many interventions appeared rooted in efforts to keep the patients safe and to maintain control over the situation. Differences between groups were limited to quantity, not type of intervention documented. Conclusions and Implications: There is evidence that nurses intervene to protect delirious patients. Overall, nurses did not document care that was consistent with published delirium management guidelines. Specific educational interventions will be presented.

### HOW DO ACUTE CARE NURSES ASSESS AND MANAGE THE TRANSITION OF DELIRIUM IN HOSPITALIZED OLDER ADULTS?

T. Diehl[1], M. Steis[2], A. Yevchak[1], N.L. Hill[1], A.M. Kolanowski[1], D.M. Fick[1], *1. School of Nursing, The Pennsylvania State University, University Park, Pennsylvania, 2. University of Pennsylvania, Philadelphia, Pennsylvania*

Purpose: To explore how nurses report they assess and manage delirium in hospitalized elders and to describe barriers and facilitators . Methods: Focus group methodology was used with the discussion audio-recorded and transcribed verbatim. Seventeen nurses participated in three-60 minute groups in a central Pennsylvania hospital. Data were analyzed using content and thematic analysis. Results: Three broad themes were identified: Confusion as Normal, Our Duty is to Protect, and Balancing on a Tightrope. Nurses (mean age of 43, 13 years experience) did not have a formal way to assess delirium or to choose non-pharmacological interventions. They were often conflicted about how to balance the care of patients with confusion. Conclusions: In this context, a prominent theme was the need for nurses to protect themselves and their patients. Nurses used a variety of approaches to balance the demands of their patients with confusion. Implications for practice and research will be discussed.

## SESSION 2030 (SYMPOSIUM)

### ETHNOGRAPHIC RESEARCH METHODS: ILLUMINATING THE UNIQUE CULTURE OF AGING IN COMMUNITY ENVIRONMENTS, SPECIALIZED SENIOR ENVIRONMENTS, AND IN MEDICAL ENVIRONMENTS

Chair: *C.M. Gallogly, Community Health and Human Services, St. Joseph's College, Patchogue, New York*
Discussant: *L.K. Donorfio, University of Connecticut, Storrs, Connecticut*

The Qualitative Research Interest Group has discovered in its various sessions over the past two years a growing interest in how qualitative methods fit into research designs focused on elders in their various environments: community based models, senior segregated living models, and medically based models. Ethnographic methods seem particularly well suited to exploring the relationship between elders and the culture of their environments. This series of papers will demonstrate the traditional ethnographic approach of cultural immersion and participant observation of older adults in university linked retirement communities and in the hospital setting, specifically addressing the meaning of institutional ethnography. It will also show how ethnography can inform research on innovative, widely-studied programs such as Cash and Counseling, with an in-depth analysis of participant needs, using a wide variety of ethnographic approaches. The unifying theme in ethnography is culture so it is no wonder that gerontological researchers are experimenting with the longstanding anthropological research method of ethnography to better understand the evolving nature of the culture of aging.

### ETHNOGRAPHIC STYLE OF INQUIRY USING OBSERVER PARTICIPANT ROLE

A. Kydd, *Health Nursing and Midwifery, university of the west of scotland, Hamilton, Lanarkshire, United Kingdom*

It has been argued that ethnography is not possible within the welfare state due to the cultures and subcultures within the organization. However, adapting an ethnographic style of inquiry serves to illustrate the contexts and mechanisms within a health care setting. This study involved a combination of methods; exploring the political backdrop at the time of the study, using reflexive notes during the study to provide chronology, interviewing staff at different levels within the organization and taking on the role of observer participant in the field for a year. This paper outlines some of the challenges posed in seeking to uncover what life is like for older people in long term care focussing on the role of the observer participant. Such a role takes the power from the researcher and serves to facilitate a deeper relationship with the frail older people involved in the study.

### A COMMUNITY OF INTERESTED, INTERESTING PEOPLE: EXPLORING THE CULTURE OF UNIVERSITY-LINKED RETIREMENT COMMUNITIES

R.B. Meraz, *Leadership and Counseling, Eastern Michigan University, Ypsilanti, Michigan*

This presentation highlights findings from an ethnographic study which explored the culture of three unique university-linked retirement communities (ULRC) located in various regions of the United States. ULRCs have been growing in popularity since the mid 1980s and now exist on more than 50 campuses across the United States. This qualitative study was conducted as part of dissertation research which employed an interpretive, ethnographic approach utilizing site visits, life-history interviews, observations, and artifact analysis. Primary data was obtained from site visits to three ULRCs located in the Midwest, Northeast, and South which varied in the continuum from independent living to assisted and nursing care. Thematic coding and analysis was conducted on interviews with 47 individuals ranging in ages from 56-92 years old. The presentation focuses on the distinctive culture of academically oriented retirement communities. Emerging themes to be explored in the session include: (1)the level of importance residents place on opportunities for intellectual exchange and what they call "living among interested, interesting people"(2)the overwhelming sense of dedication residents had to the founding and continued growth of the community, and (3) internal conflicts around resident participation and involvement.

### INSTITUTIONAL ETHNOGRAPHY AS A PRACTICE OF FREEDOM

C.A. Leedham*, Department of Sociology, University of Kentucky, Lexington, Kentucky*

This paper will explore how Dorothy Smith's institutional ethnography may be used to explore the choices and transitions facing people as they age, in order to challenge researchers to incorporate Smith's approaches into their research. Institutional ethnography begins with the local actualities of people's everyday lives and traces how people are enmeshed in institutional relations and how texts coordinate people's activities across time and space through what Smith calls the "relations of ruling". Institutional ethnography's purpose is to expand people's knowledge rather than substituting the expert's knowledge for people's own knowledge. Details of institutional ethnography's methods will be discussed with examples from the literature, and institutional ethnography will be linked with Foucault's call to explore the webs of power relations in which we are caught, thus opening up the possibility of doing things differently and making us realize that we are far freer than we thought.

### TRAINING NEEDS FOR CONSUMER-DIRECTED CAREGIVERS AND OLDER CONSUMERS WITH DEMENTIA: AN ETHNOGRAPHY

L. Simon-Rusinowitz[1], K. Ruben[1], K.J. Mahoney[2]*, 1. University of Maryland, College Park, Maryland, 2. Boston College, Chestnut Hill, Massachusetts*

As the number of elders with dementia increases, so does the demand for caregivers. Consumer-directed (CD) services offer participants and their caregivers control over their services, which may increase satisfaction and caregiver retention. There is a need; however, to develop dementia-specific training informed by the views of diverse participants and caregivers. To better understand their training needs, we conducted in-depth interviews with five consumer teams and three program consultants. We addressed the following research questions: How do caregivers and older consumers with dementia in CD personal care programs describe their training needs? How can improved training lead to better care for this consumer group? Informants identified the following topics: CD program training, knowledge about dementia, technical and personal care skills, coping and problem- solving skills. Improved training can lead to better care quality, increased preparedness, and access to resources. Project findings will inform CD training programs for this consumer group.

## SESSION 2035 (SYMPOSIUM)

### NATIONAL DATA ON ORGANIZATIONAL CULTURE IN THE NURSING HOME SETTING

Chair: *J.C. Banaszak-Holl, Health Management and Policy, Univ. of Michigan, Ann Arbor, Michigan*
Co-Chair: *N. Castle, University of Pittsburgh, Pittsburgh, Pennsylvania*
Discussant: *M.K. Lin, University of Pittsburgh, Pittsburgh, Pennsylvania*

This symposium presents four papers using a national survey of organizational culture and staff turnover in a random sample of U.S. nursing homes. While culture change is critical in debates on nursing home quality, there is little evidence on cultural types predominating in the industry or on whether cultural values affect organizational structure and quality. Our data were collected through a 2009 mailed survey to 1,056 facilities across the country, out of which 37 closed facilities were dropped from sampling frame. Among the remaining facilities, response rate was 52.6% across facilities—-405 Nursing Home Administrators (39.7% responded) and 356 Directors of Nursing (34.9% responded). Surveys included a small incentive and non-respondents were pursued through telephone follow-up. The survey included an instrument of 16 questions for the Competing Values Framework (CVF) differentiating four types of organizational culture: 1) group culture, 2) developmental culture, 3) hierarchical culture, and 4) rational culture. The CVF instrument uses likert scales on which respondents evaluate the extent to which facility practices reflect those values. Respondents were also asked to report background demographics, how they implement organizational culture and current rates of staff turnover (administrator only). These four papers examine 1) how reports of organizational culture compare to other studies, 2) differences in the responses of NHAs and DONs, 3) differences among chain and non-chain and for-profit and nonprofits and 4) the impact of culture on nursing staff turnover rates. These talks suggest culture must be integrated with other elements of organizational change in nursing home reform.

### EVALUATING THE COMPETING VALUES FRAMEWORK FOR STUDYING NURSING HOME CULTURE

J.C. Banaszak-Holl[1], M.K. Lin[2], N. Castle[2]*, 1. Health Management and Policy, Univ. of Michigan, Ann Arbor, Michigan, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

We present comparisons of organizational culture across nursing homes using the Competing Values Framework (CVF). We compare the CVF to other commonly used measures of organizational culture, both in nursing home and hospital studies. The CVF has been used in other studies of nursing homes, largely to demonstrate that Group Cultures predominate within nursing homes although those studies have used questions that require facilities to make forced choices among organizational values. We allow facilities to report how they value individual components of the CVF independently and we find a substantial number of facilities balance several competing cultural values. Facility administrators and DONs both reported valuing multiple conflicting values fairly strongly, which implies administrative staff face harder choices regarding how values drive organizational practices. This suggests that organizational culture may be effective as an instrument of change to address specific types of needs.

### DIFFERENCES IN TOP MANAGEMENT PERSPECTIVES OF NURSING HOME CULTURE

N. Castle[2], J.C. Banaszak-Holl[1], M.K. Lin[2]*, 1. Health Management and Policy, Univ. of Michigan, Ann Arbor, Michigan, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

We compare Nursing Home Administrators (NHAs) and Directors of Nursing (DON) ratings of cultural values from facilities responding to a national survey on nursing home culture. Comparisons are made on dimensions of the Competing Values Framework (CVF). The CVF identifies four types of values: 1) group culture, 2) developmental culture, 3) hierarchical culture and 4) rational culture. Data come from 219 facilities in which both the DON and NHA responded. Descriptive analyses show NHAs are slightly more likely to rate facilities as having a stronger hierarchical culture (dimensions include predictability and dependability); whereas, DONs rate facilities stronger in group cultures (broader participation and decentralization). We present detailed comparisons of statistical tests of difference. Individual factors associated with larger differences in value ratings will also be presented. These results are important to understanding the diversity of perspectives within the nursing home's top management team.

### STRUCTURAL PREDICTORS OF NURSING HOME CULTURE

M.K. Lin[1], J.C. Banaszak-Holl[2], N. Castle[1], *1. Health Policy & Management, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. University of Michigan, Ann Arbor, Michigan*

To better understand variation in organizational culture across US nursing homes, we profile assessments of culture across a national sample of facilities based upon particular structural dimensions- for-profit status, chain ownership, and size. Organizational culture is identified through a relative quantitative basis using the Competing Values Framework. Ratings are reported by a facility's nursing home administrator and director of nursing. The results demonstrate that certain core structural characteristics are associated with organizational culture types: for-profit nursing homes are more likely than non-profits to have a group culture, while non-profits are more likely to have a rational culture. Chain facilities are more likely than independents to have a rational culture, while independents are more likely to lack a dominant culture. Larger-than-average facilities are more likely than smaller ones to lack a dominant culture. Given the association between culture and quality improvement, we will discuss the implications of these findings.

### RETAINING A CLINICAL WORKFORCE: WHAT ROLE DOES ORGANIZATIONAL CULTURE PLAY?

J.C. Banaszak-Holl[1], M.K. Lin[2], N. Castle[2], *1. Health Management and Policy, Univ. of Michigan, Ann Arbor, Michigan, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Organizational culture is a managerial tool for improving the nursing home work environments by reinforcing values meaningful to clinical staff. As such, it has been viewed as a means for improving retention of the clinical staff. We evaluate the role of culture in predicting staff turnover among RNs, LPNs, and nursing aide staff using multivariate linear models and several methods for measuring culture, including the presence and intensity of the four cultural types proposed by the Competing Values Framework, and a dichotomy of balanced vs. focused cultures. Analyses include controls for prior turnover levels, individual demographic characteristics and facility structural factors. Facility effects are tested using a hierarchical linear model. Preliminary analyses are underway and preliminarily show that the four types of culture, defined by the CVF do not impact the turnover of clinical staff. A comparison of the effects of culture and organizational structural factors will be presented.

## SESSION 2040 (SYMPOSIUM)

### PREPARING NURSES TO CARE FOR OLDER ADULTS

Chair: *T.J. Roberts, School of Nursing, University of Wisconsin - Madison, Madison, Wisconsin*
Co-Chair: *B.J. Bowers, School of Nursing, University of Wisconsin - Madison, Madison, Wisconsin*
Discussant: *R. Stone, American Association for Homes and Services for the Aging, Washington, District of Columbia*

Caring for older adults, regardless of setting, requires nurses to possess complex knowledge and skills. This session describes three research projects and a demonstration program that address the link between formal nursing education and the quality of nursing care for older adults. The first study explored nursing care of older adults in hospital settings and discusses some of the implications for admission to nursing programs and design of nursing education, particularly for skills development. The second study focuses on the influence of formal education on nurse attitudes toward older adults and preference to work in long term care settings, with a focus on the educational needs identified by nurses to care for older adults in long term care settings. The next presentation describes a nursing home workforce development intervention designed to help nurses improve their leadership and supervisory skills to work more effectively with direct care staff and manage organizational influences on nursing practice. The final presentation describes a long term care nurse residency program designed to improve recruitment, retention and nursing care quality in long term care settings. The residency program was created as a partnership with schools of nursing, the state department of health services and long term care provider organizations.

### GETTING PATIENTS MOVING: HOW NURSES DECIDE TO MOBILIZE HOSPITALIZED OLDER ADULTS

B.J. King, B.J. Bowers, *School of Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

New walking dependence, which is associated with limited mobility during hospital stays, occurs in 16.8% to 59% of hospitalized elders. Nurses have been identified as the providers' best positioned to increase patient mobility thereby decreasing new walking dependence. This study used Grounded Theory to examine how nurses make decisions about mobilizing patients and factors that influence whether, when and how patients are mobilized. Twenty-five registered nurses were interviewed. Inexperience with mobilizing patients had a significant impact on whether or not nurses got patients moving. Nurses indicated they initially learned how to mobilize patients in their schools of nursing. However this skill was taught in a laboratory setting on other health students with little reinforcement during the clinical rotation. Implications for nursing school curriculum such as completion of a nursing assistant course prior to entering a nursing program, and other options for teaching the psychomotor skill of mobilizing will be discussed.

### SYMPATHETIC BUT STILL NOT INTERESTED: RECRUITING BACCALAUREATE NURSES TO WORK IN LONG TERM CARE

T.J. Roberts, B.J. King, B.J. Bowers, *School of Nursing, University of Wisconsin - Madison, Madison, Wisconsin*

Research on health professional education suggests that curriculum can influence student attitudes toward older adults, however little is known about the relationship between these attitudes and preferences for working with this population. This paper describes a mixed method study that tracked students' (n=80) attitude toward older adults and work preferences (both for population and setting) at four time periods during their baccalaureate nursing program. Attitudes toward and preferences to work with older adults improved over time. However, working in long term care (LTC) settings was consistently the least preferred of 10 possible work settings. Contrary to research suggesting that students see LTC as not challenging, focus group data suggested that students believed work in LTC was quite complex and they felt they were unprepared clinically and administratively to work in LTC as new nurses. Implications for nursing education will be discussed.

### LEADERSHIP ENRICHMENT AND DEVELOPMENT (LEAD): PILOTING AN LVN LEADERSHIP TRAINING PROGRAM

K. Nolet[1], B.J. Bowers[1], A. Sanders[2], R. Stone[2], M.F. Harahan[3], *1. School of Nursing, University of Wisconsin-Madison, Madison, Wisconsin, 2. Institute for the Future of Aging Services, Washington, District of Columbia, 3. Consultant, Greensboro, North Carolina*

Despite research that demonstrates the relationship between supervisors and nurse aides has a significant impact on job satisfaction, turnover and quality of care, few nurses receive supervisory training. The purpose of this project was to develop and pilot a leadership training program for LVNs in four California nursing homes. Two cohorts of nurses participated in a one-day synchronous training on five modules: communication, critical thinking, coaching, staff diversity, and conflict resolution, with a half-day focused on implementing the new knowledge gained. Interviews with pilot facility nurses, CNAs and administrative teams were used to shape training delivery, content and support throughout the pilot. Pre- and post-test measures of supervisory skills were obtained from LVNs and CNAs. CNA ratings of most LVN supervisory skills improved following the training program. Barriers and facilitators to successfully implementing a nurse training program and implications for nursing home leaders and researchers implementing staff education are discussed.

### LONG TERM CARE NURSE RESIDENCY PROGRAM : A SCHOOL OF NURSING, DEPARTMENT OF HEALTH AND PROVIDER PARTNERSHIP

B.J. Bowers, K. Nolet, *Nursing, University of Wisconsin-Madison, Madison, Wisconsin*

Research conducted in acute care settings has documented that higher ratios of baccalaureate to non-baccalaureate prepared nurses are correlated with improved patient outcomes. However, only very few current long term care (LTC) nurses are baccalaureate prepared. A recent study identified barriers to new baccalaureate graduates considering a career in LTC. The barriers included insufficient preparation for managing residents with complex conditions and leading/supervising direct care staff. Residency programs that provide clinical and leadership training have proved successful in recruiting and retaining nurses in other settings. This session describes the development of a LTC nurse residency program through a partnership involving the UW Madison School of Nursing, the Wisconsin Department of Health Services and nursing home providers. The goals are to increase the number of baccalaureate nursing graduates taking positions in long term care settings, support tenured LTC nurses to continue their formal education, and improve patient outcomes.

## SESSION 2045 (PAPER)

## SUCCESSFUL AGING AND LIFE QUALITY

### ENGAGEMENT IN PRODUCTIVE ACTIVITIES AND SELF-RATED HEALTH AMONG OLDER ADULTS: MULTI-GROUP PATH MODELS

Y. Jung, *Social Welfare, UCLA, Los Angelels, California*

This paper examines pathways between productive activities and self-rated health focusing on gender as a moderator. Data are based on 551 adults aged 55 and older from the first (1995/1996) and the second (2004/2005) waves of the National Survey of Midlife Development of the United States (MIDUS), a nationally representative sample of adults aged 25-74. Multi-group path models used to investigate the associations between Wave 1 engagement in productive activities, measured by paid work, volunteering, and informal helping, and self-rated health at Wave 2 and if these associations differ by gender. Model fits were gradually tested from a baseline model where all the paths were constrained to be equal between males (n=244) and females (n=307) to a final model where paths between productive activities and paths from productive activities to self-rated health were allowed to vary by gender. The final model which relaxed the equality constraints fitted the data best ( $\Delta\chi2(6)=14.5$ p=0.02). For males, paid work negatively influenced volunteering (b= -0.19, p=0.00) and informal helping (b= -0.14, p=0.03), while no effects of paid work on volunteering and informal helping was found among females. Volunteering negatively influenced self-rated health (b= -0.17, p=0.01) for males, whereas paid work was the only activity that was associated with self-rated health (b= 0.15, p=0.00) for women in a positive direction. Results suggest that male and female older adults may experience productive aging differently in terms of the associations between activities and their influences to health.

### INCOME ADEQUACY, HOUSING AND ESSENTIAL ITEMS AND SERVICES FOR OLDER PEOPLE

C. Waldegrave[1], M.P. Cameron[2], *1. Family Centre Social Policy Research Unit, Wellington, New Zealand, 2. University of Waikato, Hamilton, New Zealand*

The aim of this research is to identify the drivers of wellbeing and quality of life among the older population. Amartya Sen's capabilities approach has formed the conceptual basis of the theoretical framework (Sen, 1999). This paper will report on the results of a study of ageing and wellbeing with a national random sample of 1,680 New Zealanders aged 65 to 84 years using computer assisted technology interviewing (CATI). Objective measures of income and wealth are compared with the older people's subjective assessments of the adequacy of their income to meet their everyday needs, their satisfaction with their economic standard of living, and with their assessment of overall wellbeing. Two internationally comparable poverty thresholds at 50 and 60 percent of median household income are also applied. The results showed that the subjective assessments of living standards were generally in line with the results of the objective indicators of income and wealth. Few experienced severe poverty, but most participants clustered between the two most currently applied poverty thresholds internationally. Income and housing were significantly associated with wellbeing. The importance of these findings lies in the significant associations between the subjective and objective measures of living standards and wellbeing among the older participants and their implication for capability and future policy settings. After attending this session participants will be much more informed about the significant challenges to the quality of life of older citizens if the critical issues of income, housing and affordable access to essential services are not adequately planned for.

### COMING TO ART IN LATER LIFE: ART AS IDENTITY

P.J. Brett-MacLean, *Arts & Hum in Health & Med Prog, University of Alberta, Edmonton, Alberta, Canada*

This inquiry explored the experience and significance of "coming to art" in later life. Eight women and three men (average age 71.6 years) participated in two in-depth conversational interviews. Seven participants described a serious commitment to art. The remaining participants described a somewhat more casual visual art practice. Narrative inquiry supported a close reading of the participants' stories that led to the identification of three primary storylines: 1) "Coming to Art," 2) "Flourishing through Art," and 3) "Art as Identity." In this presentation the last of these storylines is considered. The high biographical relevance of coming to art is described. While art was at the centre of their lives, the participants' "artist identity" claims, as such, were often ambivalent. Their shifting identity claims seemed to reflect the lack of "hard-and-fast definitions" regarding what may be taken as art (see Mishler, 1999, p. 102), and for some, their own uncertainty regarding what constitutes an artist. Identity claims were based on the artworks they created (which provided evidence of their art-making skills and abilities), and also given the matrix of "professional" art-making activities in which they were involved. These included: Art making practices; Spheres and Forms of Recognition; Cultural and Relational Understandings. When the participants offered variable, often tentative self-conceptions in relation to their involvement in art, this could be attributed in part to the fact that their livelihood did not wholly depend on their art making.

### QUALITY OF LIFE AS PERCEIVED BY FRAIL ELDERS IN URBAN AND RURAL CHINA: A QUALITATIVE STUDY

L. Li[1], Y. Sui[2], L. Gao[3], *1. School of Social Work, University of Michigan, Ann Arbor, Michigan, 2. Renmin University of China, Beijing, China, 3. University of Jinan, Jinan, China*

INTRODUCTION Quality of life (QoL) is a frequently used but ill-defined concept in aging research and services. This study examines the meaning and evaluation of QoL of frail elderly persons in China. METHODS In-depth interviews based on an interview guide were conducted with 24 frail elders residing in Jinan city (n=12) and nearby villages (n=12) in Shandong, China. FINDINGS The conception of quality of life differed between frail elders in urban and rural China. Rural elders perceived basic needs, particularly eating, to be the defining feature of QoL; whereas urban elders perceived QoL to include other dimensions besides basic needs—emotions, family relationships, health, mobility, medical care, friends, purpose, leisure, and grandchildren. Most respondents, except three urban elders, were very satisfied with their lives. Cognitive strategies, especially comparison with the past, were heavily employed by the respondents to attain a sense of contentment. They also selectively focused on positive life domains when evaluating their QoL. Rural elders were more salient in using "accepting, adjusting and avoiding" strategies to regulate emotions—accepting their status as farmers, adjusting expectation, and avoiding comparison with their urban counterparts who were much better off in terms of old age security. CONCLUSION The current cohort of elderly Chinese has experienced political turmoil, starvation, and extreme hardship during their lifetime. Historical events and current contexts play a role in shaping their perception of QoL. Cognitive strategies used by Chinese elders to regulate emotions fit some of the theories developed in the West.

## SESSION 2050 (SYMPOSIUM)

### TRANSLATING PROVEN CAREGIVER PROGRAMS INTO PRACTICE: CHALLENGES, OPPORTUNITIES AND NEXT STEPS

Chair: *L.N. Gitlin, Jefferson Center for Applied Research on Aging and Health, Thomas Jefferson University, Philadelphia, Pennsylvania*
Co-Chair: *R. Birkel, Rosalynn Carter Institute, Americus, Georgia*
Discussant: *L. Anderson, Centers for Disease Control and Prevention, Atlanta, Georgia*

Families provide the majority of care to older adults with cognitive or physical impairments yet continue to be underserved or receive services that are not evidence-based. Despite proliferation of interventions proven to be effective in randomized trials, programs are not fully integrated into community-based services and practice settings. Fewer still have been evaluated for sustainability within existing funding streams. This symposium presents recent successful efforts to translate proven caregiver programs for individuals with dementia in different care settings. Highlighted will be the steps used to translate programs from the randomized trial context to full integration within a service setting, outcomes of the translational processes, approaches for sustaining programs using existing 3rd party insurance and related funding mechanisms, methodological challenges, lessons learned and next steps. Specifically, the symposium will examine national progress to date in translating proven caregiver programs, showcase successful translational efforts, identify factors that support and those that threaten translation, and examine whether programs can be sustained. Exemplars to be presented include the Environmental Skill-building Program, a home-based intervention delivered by occupational therapists in homecare agencies using Medicare reimbursement mechanisms, the REACH II caregiver support program delivered by care managers through the Veterans Administration, and three Seattle proven programs (STAR, STAR-C, and RDAD) implemented in assisted living and other dementia-care settings. The discussant will discern underlying commonalities and themes across translational efforts, examine translational challenges including interventionist training, fidelity, scalability and sustainability, and identify investigational queries with the goal of advancing implementation science concerning dementia caregiver interventions. ¬

### TRANSLATING THE ENVIRONMENTAL SKILL-BUILDING PROGRAM IN HOMECARE AS A REIMBURSABLE MEDICARE SERVICE

L.N. Gitlin, T. Vause Earland, C.V. Piersol, *Jefferson Center for Applied Research on Aging and Health, Thomas Jefferson University, Philadelphia, Pennsylvania*

Families of dementia patients in skilled homecare do not receive supportive services themselves, a key factor preventing patient disability. This is the first translation of a proven program, the Environmental Skill-building Program (ESP), for delivery by occupational therapists (OTs) within homecare agencies which also evaluated reimbursement potential through Medicare (Parts A and B). We describe the theoretical base, delivery characteristics and outcomes from the original randomized trials, the five major translational activities to move ESP from randomized trial to its delivery in homecare, and translational outcomes using the RE-AIM framework. OT adoption was high: a total of 26 OTs from 2 agencies were trained with 96% continuing to use the program. To date, over 50 caregivers receiving ESP reported improvements in knowledge, skills and well-being. As ESP sessions were reimbursed through Medicare when integrated with patient-directed therapy, it has potential for being sustained through this mechanism.

### THE NATIONAL PERSPECTIVE: PROGRESS AND LINGERING CHALLENGES IN TRANSLATING CAREGIVER INTERVENTIONS

R. Birkel, *Rosalynn Carter Institute, Americus, Georgia*

This presentation will examine the status of 65 interventions for family caregivers that have been tested in randomized controlled trials (RCTs). Interventions for Alzheimer's caregivers make up approximately two-thirds of these interventions. The review will focus on: a) availability of support materials (e.g. operation manuals, fidelity checklists, etc) to facilitate implementation in community settings, b) training and certification in delivering the intervention, and c) ongoing or completed translations of the original intervention. A second part of the presentation will be a review of current translation work of: 1) the ADDSP effort of the Administration on Aging which is funding translation of seven Evidence-based interventions (EBPs) for Alzheimer's caregivers in eleven states, and 2) The Rosalynn Carter Institute/ Johnson and Johnson initiative which has funded translation of five interventions in ten different communities in nine states. The goal is to clearly identify current strengths and challenges in translating EBPs for family caregivers.

### THE ROAD TO TRANSLATION: THE SEATTLE PROTOCOLS GO OUT INTO THE WORLD

L. Teri, R.G. Logsdon, S.M. McCurry, *U. Washington — School of Nursing, Seattle, Washington*

Since 1986, intervention protocols for training family and staff to alleviate the behavioral problems characteristic and prevalent in persons suffering from Alzheimer's Disease have been developed in clinical and community settings and subjected to rigorous randomized controlled clinical trials. In recent years, three of these protocols have been selected for state-wide translational studies and community-partnership applications. This presentation provides an overview of the theoretical, clinical and empirical background of these protocols and then focuses on the challenges and opportunities their adaptation and implementation by these state and community groups creates. STAR (Staff Training in Assisted Living Residences) in Washington; STAR-C (STAR-Community Consultants) in New Mexico and Oregon; and RDAD (Reducing Disabilities in Dementia) in Ohio are three Seattle protocols programs that are being systematically refined and implemented in very different settings. While each setting is unique, enough commonalities exist to provide information to help guide future translations of other programs.

### TRANSLATING RESEARCH INTO PRACTICE IN A HEALTH CARE SYSTEM: REACH VA

L.O. Nichols[1,2,3], J.L. Martindale-Adams[2,1], R. Burns[4,2,3], M. Graney[1,2], *1. Health Services Research, VA Medical Center, Memphis, Tennessee, 2. Preventive Medicine, University of Tennessee Health Science Center, Memphis, Tennessee, 3. Internal Medicine, University of Tennessee Health Science Center, Memphis, Tennessee, 4. Geriatrics Group of Memphis, Memphis, Tennessee*

REACH VA was the first national clinical translation of a behavioral intervention for dementia caregivers, the NIA/NINR funded REACH II intervention. VA clinical staff from 24 medical centers in 15 states delivered the intervention to stressed caregivers. Outcomes from baseline to 6-month follow-up included significantly improved burden, depression, impact of depressive symptoms on daily life, caregiving frustrations, and troubling dementia related patient behaviors. Caregivers also reported per day decreases of one hour providing care and two hours on duty. Preliminary examination of Veteran health care use shows inpatient, pharmacy, and outpatient costs declined. Staff and caregiver satisfaction and perception of benefit were high. VHA costs to deliver the intervention would be $2.93 per day. Activities undertaken to implement the program will be discussed using the PARiHS implementation framework elements of evidence, context, and facilitation. For REACH VA, all elements were strong, which lead to successful implementation from research to practice.

## SESSION 2055 (SYMPOSIUM)

### FRONTLINE WORKERS AND FAMILY CAREGIVERS: STRATEGIES FOR STRENGTHENING THE WORKFORCE

Chair: *L. Noelker, Benjamin Rose Institute, Cleveland, Ohio*

The supply, readiness and retention of frontline workers and family caregivers to deliver care and support will be critical factors in the successful expansion of home- and community-based services in states' efforts to rebalance long term care. Drawing on the work of a national expert panel on the direct care workforce, convened at the request of the Administration on Aging (AoA), this presentation will address how the Aging Network can strengthen and support these caregivers. The panel also addressed the need to assess outcomes for frontline workers and family caregivers as part of the effort to improve their readiness and retention in long term care. A broad array of policy considerations for enhancing the direct care workforce will be discussed, including partnerships of federal agencies, additional labor pools, new training initiatives, and refinements to current policies affecting the workforce.

### CAN ELEPHANTS LEARN TO DANCE? OHIO'S EFFORTS TO CREATE A BALANCED LONG-TERM CARE SYSTEM

S. Kunkel, R. Applebaum, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

During its early days, the founder of APPLE was rumored to have said that IBM will develop a personal computer when elephants can dance. The analogous speculation in long-term care (LTC) is whether states with a heavy investment in institutional care can rebalance LTC. This presentation focuses on Ohio, which has a high supply of nursing home (NH) beds and associated costs, and a high ratio of NH to home care expenditures. This presentation will review the results of two initiatives designed to better balance LTC. In 2006, Ohio created a Unified LTC Workgroup to combine LTC services and finances under one umbrella. In 2009, the state passed legislation to be more aggressive about NH diversion and transition activities, setting goals for area agencies to decrease the use of NH care. The presentation will describe these efforts, and provide data about their impacts on creating a more balanced system.

### NATIONAL SURVEY OF PUBLICALLY FUNDED PARTICIPANT-DIRECTED SERVICES PROGRAMS

M. Sciegaj[1], L. Simon-Rusinowitz[2], K.J. Mahoney[3], *1. Pennsylvania State University, University Park, Pennsylvania, 2. University of Maryland, College Park, Maryland, 3. Boston College, Boston, Massachusetts*

The number of participant-directed programs has grown considerably over the past decade. With support from the Robert Wood Johnson Foundation and Atlantic Philanthropies, the National Resource Center for Participant-Directed Services (NRCPDS) at Boston College is conducting an inventory of existing programs to identify emerging state efforts to promote participant-direction. The inventory will identify these programs, describe their characteristics, and identify the extent to which participant-direction features are included along a continuum (i.e. few features to fully developed programs). This paper reviews the project goals, methods and preliminary findings regarding: 1) Medicaid programs serving elders and/or persons with disabilities; 2) Medicaid programs serving non-elder populations; and 3) Non-Medicaid funded programs.

## SESSION 2060 (SYMPOSIUM)

### ALZHEIMER DISEASE: ROLE OF IMMUNE AND INFLAMMATORY RESPONSES IN ITS DEVELOPMENT AND PROGRESSION

Chair: *T. Fulop, Université de Sherbrooke, Researche Center on Aging, Sherbrooke, Quebec, Canada*
Co-Chair: *G. Pawelec, University of Tubingen, Tubingen, Germany*
Discussant: *M. Weksler, Weill Cornell Medical College, New York, New York*

AD is the most common form of dementia. Its pathological hallmarks include profound neuronal loss, intraneuronal neurofibrillary tangles, and an increased concentration of cerebral amyloid beta peptide (Abeta). Although hallmarked by cognitive deficits, AD is accompanied by systemic inflammation. The etiological relationship between inflammation and AD is controversial. Some evidence suggests that Abeta stimulates autoimmunity leading to the development of a chronic inflammatory process. It is hypothesized that during the early phases of AD, the immune system seeks to eliminate excess Abeta by mounting acute innate and adaptive immune responses, initially beneficial for clearing the Abeta, but damaging when chronic and dysregulated in the elderly (also called "inflammaging"). Compromised immunity in the elderly, termed "immunosenescence", is characterised by changes to T and B cell subset distribution, increased autoantibodies and higher basal levels of inflammatory mediators. A major identified driving force for these changes is infection with the persistent, activating a herpesvirus, cytomegalovirus (CMV). In longitudinal studies of the very elderly, CMV infection was found to be linked to cognitive impairment, increased levels of CRP and IL 6, and mortality at 6 year follow-up. This speakers at this symposium will discuss the evidence for and against the contribution of immune and inflammatory responses to the development and progression of AD. Given the current interest in clinical trials of immunotherapy for AD, a clearer understanding of immunity and AD is crucial for designing rational and effective interventions.

### HALLMARK SHIFTS IN CIRCULATING CD4 BUT NOT CD8 T CELL SUBSETS IN MILD ALZHEIMER DISEASE

G. Pawelec[1,2], T. Fulop[2,1], *1. University of Tuebingen, Tuebingen, Germany, 2. Université de Sherbrooke, Researche Center on Aging, Sherbrooke, Quebec, Canada*

Healthy elderly commonly have fewer naïve T cells than young people, but increased numbers and clonal expansions of predominantly CD8+ late-stage memory cells. The latter are markedly enhanced in people infected with the common herpesvirus Cytomegalovirus (CMV). Age-associated changes in the CD4+ subset are usually minimal, regardless of CMV infection. However, in CMV+ patients with mild Alzheimer

Disease (AD), we also find greatly decreased percentages of naïve CD4+ cells and increased CD4+ memory-phenotype cells, as well as a reduction of CD4+CD25high T regulatory cells with a naïve phenotype. Together these data provide stronger evidence than hitherto available in favour of a more highly differentiated CD4+ as well as CD8+ compartment in AD patients, consistent with an adaptive immune system undergoing persistent antigenic challenge and possibly manifesting dysregulation as a result. We hypothesize that the source of persistent chronic antigenic stimulation potentially resulting in immune exhaustion is Aβ, exacerbated by CMV.

### ROLE OF CYTOKINES IN THE DEVELOPMENT AND PROGRESSION OF ALZHEIMER DISEASE

M. Pellicanò, G. Candore, S. Buffa, M. Bulati, S. Vasto, G. Colonna-Romano, C. Caruso, *University of Palermo, Palermo, Italy*

Many genetic studies have reported significant associations between different polymorphisms within several pro- and anti-inflammatory cytokines and AD, but there are other studies which did not replicate initial results. However, two recent meta-analyses of our group clearly demonstrate an association between IL-beta and TNF-alpha functional polymorphisms and AD, suggesting a key role for cytokines in AD. To gain insight in their role in AD, we have stimulated PBMCs from AD patients and healthy controls (HC) by beta-amyloid. The results show that it induces the over-production of the pro-inflammatory cytokines IL-1beta, IL-6, IFN-gamma and TNF-alpha, and of the anti-inflammatory cytokines IL-10 and IL-1Ra in AD respect to HC. Some chemokines as well as some growth factors are also over-produced by AD-derived stimulated PBMC. These results support the involvement of systemic immunity in AD patients. However, our study is an observational one so we cannot draw a conclusion about its contribution to AD development. However, this kind of study might be useful to obtain biomarkers of AD for monitoring the effectiveness of therapeutic interventions.

### EFFECTS OF CNS CYTOKINE EXPRESSION ON APP PROCESSING AND AMYLOID DEPOSITION

P. Das, *Mayo Clinic, Jacksonville, Florida*

Chronic inflammatory reactions are present in most age–related neurodegenerative disorders, including Alzheimer's disease (AD). In AD, it has been hypothesized that inflammatory cytokines can potentially alter APP processing and Aβ clearance mechanisms, creating "feedback loops", that promote further amyloid accumulation. We have generated data showing that over-expression of inflammatory cytokines (e.g., IL-6, IFNgamma and TNFalpha) does not significantly alter APP levels, APP processing or steady state amyloid peptide generation. Instead, they significantly "attenuate" amyloid deposition when expressed in mice prior to amyloid deposition or with moderate amyloid loads. As opposed to the pro-inflammatory cytokines, AAV mediated expression of the anti-inflammatory cytokine IL-10 significantly increased amyloid loads. Based on these data, we hypothesize that depending on the timing and context, the actions of individual cytokines may produce divergent and unexpected effects during the disease process, but it may possible to harness these immuno-modulatory effects to beneficially alter the AD phenotype.

### DIFFERENTIAL ALTERATIONS IN MACROPHAGE FUNCTIONS AND T CELL SIGNALLING FROM AMCI TO SEVERE AD

T. Fulop, N. Allard, K. Tsvetkova, *Université de Sherbrooke, Researche Center on Aging, Sherbrooke, Quebec, Canada*

Alzheimer diseases (AD) is the most common form of dementia. We propose that Amyolid beta peptide (Ab) is at the center-stage of the immune reactions leading to the development of a chronic inflammatory process. During early phases of AD, the immune system seeks to eliminate excess Ab by mounting an acute inflammatory response. The cellular immune response may play a crucial protective role. However, in the elderly, T cell immunity tends to be compromised and is further exacerbated in CMV-seropositive AD patients. The aim was to identify changes in specific aspects of the innate and adaptive immune response in patients with amnesticMCI and AD at different stages, with a focus on the macrophage and T cell functions in response to Ab. AD was diagnosed by criteria of NINCDS-ADRDA. MCI was diagnosed following guidelines. We found that macrophages originated from AD patients gradually decreased their phagocytic activity, while increased their proinflammatory cytokine production from amnecticMCI to severe AD. More the disease advanced more the processing of Ab by macrophages was decreased. 14/20 AD patients tested seropositive for CMV, as compared with only 4/13 very healthy elderly. The proliferation measured by CFSE was decreased in AD and dependent on the severity of the disease. The signalling of TCR and CD28 (Lck, LAT, SHP-1, Akt, mTOR) was also altered as more severe was the disease, related to alterations in their mobility between rafts and non-rafts correlating with decreased fluidity in T cell membranes depending on cholesterol content. Thus, macrophages and T cells may play a role in the pathogenesis and progression of AD, but in a differential manner.

### IVIG THERAPY OF MILD TO MODERATE ALZHEIMER'S DISEASE (AD) PATIENTS SHOWED SIGNIFICANT BENEFITS AS MEASURED BY NEUROIMAGING AND NEUROPSYCHOLOGICAL TESTING IN A PHASE II, RANDOMIZED, DOUBLE-BLIND, PLACEBO CONTROLLED CLINICAL STUDY

M. Weksler, P. Szabo, N.L. Relkin, *Weill Cornell Medical College, New York, New York*

Immunotherapy that targets amyloid beta peptide has been shown to clear amyloid beta from the brain and to prevent cognitive decline in murine models of AD. Dodel and his colleagues first showed the potential benefits of IVIg containing anti-Abeta antibodies in 5 AD patients. Our phase I study of 8 AD patients treated with IVIg confirmed and extended Dodel's report. Here we report the results of a randomized, placebo-controlled, double-blind phase II study of 3 groups of 8 patients with mild to moderate AD (MMSE scores 14-26) who were randomly assigned to either Baxter Gammagard liquid: 0.4 gm/kg/month or 0.8 gm /kg/month IVIg/month or placebo (saline). The plasma and CSF level of anti-Abeta peptides and Abeta antibodies were quantitated by ELISA. Cognitive and behavioral assessments using ADAS-cog, CGIC, 3MS, and ADL scales were made before and 3, 6, and 9 months of IVIg therapy. Cerebral glucose uptake was measured by PET scanning after the injection of 18-fluorodeoxyglucose before and after 6 months of IVIg therapy. IVIg infusions were associated with significant increases in anti-Abeta antibody and Abeta 40/'42 peptide levels in plasma and significant decreases in these peptides in CSF after compared to before IVIg therapy. A significant decline of 5% in glucose uptake in 4 cerebral areas compromised in AD patients was seen in saline-treated AD patients after 6 months. No decline in glucose uptake was seen over the same period in AD patients treated with IVIg. Finally, AD patients given IVIg infusions maintained ADAS-cog, ADL and 3MS scores compared with the progressive decline in the scores in AD patients given saline and these differences were significant ($p < 0.02$) after 9 months of IVIg therapy.

## SESSION 2065 (PAPER)

## AFRICAN AMERICANS AND THE EXPERIENCE OF AGING

### DOES SOCIAL DISADVANTAGE ACCELERATE AGING? EXAMINING AGE-BASED VARIABILITY IN WEATHERING AMONG BLACK AND WHITE ADULTS

J. Lin, J. Kelley-Moore, *Sociology, Case Western Reserve University, Cleveland, Ohio*

The weathering hypothesis states that socially-disadvantaged groups experience early health deterioration as a consequence of the body's repeated adaptation to stressors such as financial hardship, discrimination and marginalization. Previous research on weathering has been limited empirically (use of binary indicators of high allostatic load) and theoretically (confounding age and cohort effects in stress accumulation). Using the fourth wave of the National Health and Nutrition Examination Survey (NHANES IV), we estimate within-age variability in physiologic dysregulation among Black and White adults, as measured by a count of 10 allostatic load indicators, using Tobit models to account for the underlying distribution. Overall, we found that average allostatic load scores were greater at advanced ages but variability in these scores also increased with age. Black women had higher average allostatic load scores but less variability than other race/gender groups. Although White men had the lowest average allostatic load, variability in allostatic load was greater, particularly at the highest ages. Our examination of allostatic load by age has shown great amount of variability around the estimates, weakening the explanatory power of chronological age. The findings indicate the importance of examining weathering as a life-long accumulation of social adversities that tend to be amplified through individuals' interaction with structural circumstances, rather than presumed homogeneity in experienced disadvantage by race/gender categorization.

### CROSSING THE RACIAL DIVIDE: THE DIVERSE SOCIAL WORLDS OF AFRICAN AMERICAN ASSISTED LIVING RESIDENTS

C.L. Kemp, M. Ball, M.M. Perkins, C. Hollingsworth, E.J. Cochran-Jackson, A. Meadows, *The Gerontology Institute, Georgia State University, Atlanta, Georgia*

African American elders relocate to assisted living (AL) facilities at much lower rates than white elders, but they do reside in these settings, and are doing so with increasing frequency. Although these elders typically reside in predominately black facilities, our research shows that some reside in more integrated settings. This paper builds on our earlier work which has focused on African Americans in diverse AL settings and is the first to compare and contrast the social lives of those living in a racially segregated versus more integrated environments. Guided by principles of grounded theory we present an analysis of ethnographic data from a National Institutes of Aging study of social relationships in AL involving seven facilities in the metro-Atlanta area, including one upscale all-African American facility. Findings show that residents residing in the all-African American facility share culture and history that produce a sense of camaraderie and community that is not observed among residents residing in the predominately white facilities. Nevertheless, across settings African American residents experience a range of relationships -some are characterized by apathy or hostility, while others involve helping, sharing, friendship, and even romance. Class and racial attitudes, including in the all-African American facility,and attitudes about skin tone, influence the formation and quality of relationships. In the majority-white facilities, we find racism and lack of cultural competence on the part of white residents and providers sometimes impede relationships. Based on our findings, we discuss strategies for promoting more positive relationships among diverse groups of AL residents.

### HEALTH CARE SYSTEM DISTRUST AMONG OLDER AFRICAN AMERICAN WOMEN: ARE THERE DIFFERENCES BY SOCIO-DEMOGRAPHICS?

J.C. Wiltshire[1], E. Montague[2], G. Sarto[2], R.L. Brown[2], *1. Institute of Public Health, Florida A & M University, Tallahassee, Florida, 2. University of Wisconsin-Madison, Madison, Wisconsin*

A few studies have measured African Americans' distrust in the health care system; however, little attention has been paid to subgroup differences, especially among older adults. This study examined differences in distrust by age, education, income, and health status, using a community-base sample of 314 women aged 45 and over in Madison, WI. Data was drawn from a larger study assessing how older African American women make judgments about physician trustworthiness. A 10-item item scale with four domains (competence, confidentiality, honesty, fidelity) was used to measure health care system distrust. Structural equation modeling was used to assess differential item or domain functioning. Negative Betas (standardized) indicate less distrust and positive Betas more distrust. There were no significant differences in the overall distrust scale model. However, there were significant differences in distrust in the fidelity domain by income (b = 0.242, p=0.019) and health status (b = -0.249, p=0.002). As income increased distrust in fidelity increased. Better health status correlated with less distrust in fidelity. The confidentiality domain differed by health status (b = -0.011, p=0.049) and competence domain differed by education (b = 0.307, p=0.027). Higher education was correlated with more distrust in the competence of the health care system. These findings suggest that inferences about distrust among African Americans may be misleading if one does not considered which distrust domains are salient among African Americans.

### A CONTEXTUAL EXAMINATION OF REMINISCENCE FUNCTIONS IN AN OLDER AFRICAN-AMERICAN POPULATION

J. Shellman[1], E. Ennis[2], *1. University of Massachusetts Lowell, Lowell, Massachusetts, 2. Yale School of Nursing, New Haven, Connecticut*

Reminiscence functions have been shown to be associated with mental health and well-being in certain older adult populations. However, there is little known regarding the functions of reminiscence in older African-Americans. The purpose of this study was to examine the perceived benefits and functions of reminiscence in a sample of community-dwelling older African-Americans. The purposive sample included African-American adults (N=52) over the age of 60. Data were collected via focus groups and participant observations in senior centers and churches in an urban northeast state. Contextual data were analyzed using immersion/crystallization technique as described by Borkan (1999). The following themes representing participants' perceptions of reminiscence emerged from the data: 1) Something Like a Big Dictionary, 2) Moving On, 3) Fellowship, Faith and Family, 4) Teaching the Young and 5) A Brand New Knowledge of Ourselves. Using Webster's taxonomy of Reminiscence Functions to guide the analysis, results provide contextual support for the reminiscence functions of: Identity, Teach/Inform, Intimacy Maintenance, and Conversation in this sample of older African-Americans. However, these participants viewed reminiscing for Boredom Reduction, Bitterness Revival, and Death Preparation as negative and "leads to depression". Cultural differences in the functions of reminiscence have implications for how reminiscence is facilitated with this population. Recommendations to guide development of culturally sensitive reminiscence interventions for older African-Americans to promote their health and well-being will be discussed. Borkan, J. (1999). Immersion/crystallization. In B. Crabtree & W. Miller (Eds.), Doing qualitative research (2nd ed.) (pp. 179-194). Thousand Oaks, CA: Sage.

## SESSION 2070 (SYMPOSIUM)

### CUTTING EDGE THEORY, METHODS, AND RESEARCH ON AGING FAMILIES: A TASTE OF WHAT'S TO COME

Chair: *V.H. Bedford, University of Indianapolis, Indianapolis, Indiana, Indiana University, Bloomington, Indiana*
Co-Chair: *R. Blieszner, Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

This symposium presents cutting edge ideas, new findings, and future directions concerning theory, methods, and a selection of content areas on the topic of families in middle and old age. The sub-specialty of families and aging came of age in the 1990s when a critical level of development in the field was attained. Since that time, theory, methods, and new areas have exploded in social gerontology more generally. The chairs' introduction and the five papers comprising this symposium illustrate applications of these developments to aging families. As demonstrated by these presentations, we recommend revising terminology for naming the field, using "families" instead of "family" to reflect the diversity of family forms and increased number of diverse families that have evolved. Theory is addressed by Connidis whose application of a selection of theoretical perspectives uncovers the complexity of families as they age. Research methods are introduced by Townsend who addresses innovations to study designs, sampling, measurement, and data analysis. The remaining presenters highlight three emerging areas of family gerontology research. One examines the emerging new area of gerontechnology; Kinney and Kart show how three disparate fields in gerontology can be integrated into a framework for family gerontechnology. Another examines the neglected field of older families in rural America; Keating and Fletcher accomplish this task by systematically addressing the question of whether, in fact, these families are particularly vulnerable. Finally, Silverstein and Giarusso take on the challenging topic of cultural and racial ethnic diversity in aging families.

### THEORETICAL DIRECTIONS FOR EXPLORING FAMILY TIES AND AGING: MOVING FORWARD

I.A. Connidis, *Sociology, University of Western Ontario, London, Ontario, Canada*

A key challenge in studying family ties and aging is making effective use of theoretical perspectives that were not designed with this particular topic in mind. As a sociologist, I find a valuable approach to thinking theoretically about aging and family relationships involves selecting useful concepts from complementary approaches. The utility of concepts is judged by their capacity to facilitate multi-level analysis (micro-meso-macro), highlight the link between structured social relations and individual agency, to address diversity in family life, to emphasize the dynamics of negotiating family relationships over time, and to encourage change that serves the interests of aging individuals and their family members. To this end, I propose links among life course perspectives, critical approaches, feminist frameworks, and the concept of ambivalence that set useful theoretical directions for thinking about, studying, and interpreting observations about family ties and aging.

### INNOVATIVE RESEARCH METHODS FOR FAMILY GERONTOLOGY

A.L. Townsend, *Case Western Reserve University, Cleveland, Ohio*

Over the past decade or so, a number of exciting developments have emerged related to research design, methods, and analysis. This presentation will use examples drawn from recently published research on families and aging to illustrate how a few of these cutting-edge developments have been applied in family gerontology. Two notable study design innovations that will be illustrated are data collection from multiple family members and greater use of longitudinal designs. Two analytic innovations that will be illustrated are use of multilevel modeling and latent growth curve analysis to test hypotheses about variability within and between families, as well as over time. The presentation will conclude by briefly noting a few methodological innovations that have not been as widely used yet in family gerontology, such as mixed qualitative and quantitative methods.

### FAMILY GERONTECHNOLOGY: AN EMERGENT AGENDA FOR RESEARCH, POLICY AND PRACTICE

J. Kinney, C.S. Kart, *Scripps Gerontology Center, Miami University, Oxford, Ohio*

In this presentation we introduce our conceptual framework for the emerging area of family gerontechnology, which we define as the theoretical and practical application of science and technology in service to later life families. We begin by identifying what we believe to be some of the most important concepts from three different fields: gerontology (i.e., life span development and life course perspectives, fundamental principles from environmental gerontology, the newly emerging empowerment perspective), family gerontology (i.e., solidarity and conflict, ambivalence, family integrity), and gerontechnology (i.e., potential areas of applications, uses and outcomes of various technological interventions for individual older adults and their families). Next, we propose a conceptual model that integrates these three disparate substantive areas into the family gerontechnology framework and identify major assumptions that underlie the framework. We conclude with recommendations for research, practice and policy that derive from this framework.

### OLDER RURAL ADULTS AND THEIR FAMILIES

N. Keating, S. Fletcher, *Human Ecology, University of Alberta, Edmonton, Alberta, Canada*

For many years, the discourse on rural aging families has been one of loss: of young people, of basic services, of economic viability. In combination, such trends have lead to unease about the vulnerability of older rural adults amid rising concerns that families at a distance and fragile local support systems cannot compensate for the erosion of services in rural places. The purpose of this chapter is to document vulnerability discourses about older rural adults and their families in North America and around the world. A comparative review of patterns of population aging, living arrangements, family support and filial obligation is used to evaluate the extent to which older rural adults are 'vulnerable people in vulnerable places'. By the end of the session, participants will have knowledge of how family relationships, regional contexts and rural settings can shape late-life experiences of rural residents.

### ETHNIC DIVERSITY IN AGING FAMILIES: BLURRING RACIAL BOUNDRIES, SHIFTING CULTURAL VALUES

M. Silverstein[1], R. Giarrusso[2], *1. University of Southern California, Los Angeles, California, 2. California State University, Los Angeles, Los Angeles, California*

In this presentation we discuss how ethnic background shapes the filial experiences of individuals in aging families. Ethnicity is considered a multidimensional construct that, as a result of blurred racial categories and malleable cultural values, has contested definitions. Specifically, we explore distinctions between identifying ethnicity as a value system, a racial profile, and a shared national identity, and trace the implications of such distinctions for families that contain older adults. We consider the impact of relatively recent trends related to ethnicity and their implications for filial attitudes and behaviors toward and by older family members. These trends include (1) increased representation of multi-ethnic families, (2) growth in the immigrant population and the consequent process of acculturation, (3) swelling numbers of grandparents raising grandchildren where ethnicity is considered a resource. By examining substantive issues of caregiving, intergenerational transfers, solidarity and conflict, and lines of filial responsibility, we shed light on how relatively recent societal changes have variegated the very definition of ethnicity and its potency as a social force influencing family outcomes with respect to older individuals.

## SESSION 2075 (POSTER)

## EDUCATION AND TRAINING

### GERIATRIC EDUCATION EVALUATION TOOL: THE DEVELOPMENT AND ASSESSMENT OF ACTION PLANS

M. Lee, R. Price, C. Lau, J.C. Frank, *UCLA, Los Angeles, California*

Core objectives of the California Geriatric Education Center (CGEC) are to provide faculty development for health professions faculty and training to healthcare practitioners to improve the quality of care for older adults in California. Across 2008-2009, four faculty development programs were offered by the CGEC that utilized an evaluation tool that captured long-term effects of the programs. In addition to traditional program evaluation on participant satisfaction, the CGEC also used a personal action plan as an evaluation method. An action plan is a plan proposed by participants for applying the content knowledge and skills they have learned from the program to enhance their teaching or field practices. SMART objectives were developed by each participant, which includes Specific, Measurable, Achievable, Realistic and Time-framed activities. Of the 190 faculty attendees, 129 submitted action plans. Among them, 55% (n=71) responded to follow-up surveys to date. Findings of the surveys showed that 39% (n=28) had completed their action plan, 54% (n=38) were on track to complete their action plans, and respondents had trained 4,848 students in institutions and community agencies across the State of California. Action plan demonstrates to be an ideal evaluation tool, through which not only program administrators can present program effects on the quality improvement of participants' professional practices, but participants are granted the freedom to choose the topic area, method of delivery, and framework to increase successful implementation of their plans. Exemplary action plans implemented will be used to demonstrate the action planning process and ultimate tertiary outcomes. Project funded by the U.S. Department of Health and Human Services, HRSA, D31HP08842 and U.S. Department of Education, FIPSE, P116B060029.

## STUDENT EXPERIENCES WITH PEER AND FACULTY MENTORING IN GERONTOLOGY DOCTORAL EDUCATION

P. Cummins, H. Ewen, D.C. Carr, *Miami University, Oxford, Ohio*

This presentation describes data from a longitudinal study focusing on the experience of mentoring from both the student and faculty perspectives. The guiding research question is: How do faculty and peer mentoring influence the professional growth of students in gerontology doctoral education? Doctoral students in each of four years of study and program faculty at eight gerontology doctoral programs completed online surveys. We describe mentoring experiences of students throughout their doctoral training. Results indicate that in their early years, the majority of students report having a primary faculty mentor who provides guidance on curriculum planning, networking, research and publication opportunities. Towards the end of their study, two-thirds report serving as a peer mentor to other students in their programs and ninety percent have at least one peer to whom they go to for advice on their scholarly development. Doctoral candidates have received mentoring from faculty on qualifying/comprehensive exams, dissertation topics, and job searches, which aligns with faculty reports that students taking their qualifying/comprehensive exams during their third year of study and defend their dissertation proposals in their fourth or fifth year. Faculty responses indicate that, on average, they formally mentor five students and informally mentor six students per year. In this presentation, we describe the progression of peer mentoring among gerontology doctoral students as well as the dynamic mentoring relationships that evolve as students become independent scholars. We consider ways that this mentoring process is shaping the development of future gerontological leaders.

## IMPACT OF A DEMENTIA TRAINING PROGRAM ON PSYCHOSOCIAL OUTCOMES INVOLVING STAFF-RESIDENT RELATIONSHIPS

M.Y. Savundranayagam, M. Wallendal, *Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin*

Person-centered dementia care in nursing homes entails training staff to attend to residents' psychosocial needs. This study investigated the impact of a nine-week training program on attitudes toward dementia care, perceived distress associated with problem behaviors and communication difficulties, and perceived helpfulness of staff communication strategies. Participants (n=122) ranged in age from 20-73 years, with an average of 15.9 years of experience in long-term care. Data were collected prior to, during, and after training. Results from repeated measures multivariate analyses of variance showed no significant improvement in attitudes towards person-centered care because participants scored favorably on this factor throughout the training. However, there were significant improvements in attitudes toward resident autonomy. Participants exhibited no change in reactions to depressive behaviors or cognitive problems, but were less distressed by disruptive behaviors and communication difficulties. Participants reported on the perceived helpfulness of communication strategies used to resolve misunderstandings. Strategies were divided into effective and ineffective based on existing literature. The intervention had no effect on staff appraisals of the perceived helpfulness of effective nonverbal communication strategies and those used to express and repair misunderstandings. Appraisals of ineffective strategies such as "talk slower" and "louder" improved, but appraisals of other ineffective strategies such as "do things yourself" showed a need for further training. Intervention effects could be enhanced using targeted topics that addressed residents' psychosocial needs and staff monitoring of the application of learned skills. The links between intervention content, activities, and expected outcomes are central to successful staff training.

## FILMS AS TEACHING MATERIAL IN UNDERGRADUATE COURSE OF CLINICAL PSYCHOLOGY OF AGING: BROADENING STUDENTS' IMAGE AND UNDERSTANDING OF AGING

J. Kitayama, *Sophia University, Tokyo, Japan*

The purpose of this study is to investigate the students' experiences in a one semester undergraduate course of clinical psychology of aging in which the American and Japanese films were used as teaching aids. At each of the 8 sessions out of 12 for the semester, the lecturer selected one film, showed an edited part of it in 30-45 minutes and then lectured in the remaining time of the 90-minutes class. The themes and films are as follows: physical aspects (The Curious Case of Benjamin Button), personality (Nobody's Fool), loss experiences (About Schmidt), family issues (Tokyo Story), dementia (Iris), psychological assessment (Memories of Tomorrow), psychotherapy (Fried Green Tomatoes), death (Ballad of Narayama). After the course, 25 participants replied to the questionnaire. Through qualitative analysis, the results indicate that (a) films help the students comprehend the older persons' life, psychological characteristics or symptoms like dementia concretely and improve understanding of the lecture, (b) students' images of older people have changed through the course, (c) for the students, it was enjoyable to watch films in the class, (d) some students develop ideas on their own life and family members by the film. Analysis of the students' remarks concerning each film finds that (a) films attracted the interest of the students and enabled them to construct their view of aging, (b) students' impressions about a particular film were diverse with several independent viewpoints. It follows from these results that the films work as good educational materials and cultivate students' individual images of aging.

## INTEREST IN THE FIELD OF AGING AMONG AT-RISK HIGH SCHOOL STUDENTS: A CAREER DEVELOPMENT PROCESS

B. Costa, A. Horowitz, O.R. Burack, *The Jewish Home and Hospital for Aged, New York City, New York*

It has been anticipated that in the next 30 years there will be insufficient numbers of trained healthcare professionals to meet the needs of the growing aging population. To build the geriatric workforce we should look to those adolescents who will be entering the workforce in the near future. This study explored factors influencing adolescents in their choice of careers in aging. The participants (n=132) were high school students attending an intergenerational program within a long-term care facility targeting at-risk youth. Data were collected at the beginning and end of each academic year through self-administered questionnaires. The study was guided by the Social Cognitive Career

Theory (SCCT) model and included measurement of the following variables as potential predictors of the students' interest in an aging career: gender; prior relationships with elders; knowledge and attitudes on aging; self- efficacy appraisal; and relationships with staff and residents in the program. Interest in aging was rated on a 5 point scale (1=Not at all; 5= Very much) with a mean score of 2.9 at baseline and 2.3 at the last post-program assessment. Only one significant correlation(r=.22) emerged, with more positive relationships with nursing home staff associated with greater interest in an aging career. However, more positive evaluations of the program were significantly associated with greater interest in an aging career. The overall findings imply that relationship with the nursing home staff, how the program benefitted and influenced the participants' decision in entering aging careers are all influential factors in shaping their career decisions.

### CHALLENGING NEGATIVE STEREOTYPES OF AGING: A YEAR LONG INTERVENTION IN A MIDDLE SCHOOL SETTING

T.C. Andersen, *Neurology, Gerontology & Social Work, University of Utah, Salt Lake City, Utah*

The face of aging has continued to evolve over the last century and the need to continue to evolve in our attempts to shape not only the experience of aging, but the resources available for our aging population is an ongoing challenge. An underlying question is at what age is it appropriate to begin to challenge negative stereotypes and to encourage an increased investment in our aging population. This project has sought to instill accurate knowledge about the aging process and to increase an investment in a cohort of middle school students. Spanning a year, this project has combine two parallel modes of learning geared at engaging a class of eighth grade students in a didactic and experiential into the world of aging. Fourteen hour long class sessions were staggered throughout the year to instill accurate information about relevant topics related to the aging process. In addition to this the students have been assigned an older adult to meet with periodically and interview, culminating in a year end celebration of this collaboration. Pre and post intervention measures were gathered which included the Fact on Aging Quiz, a pre and post drawing of the student's perceptions of aging and an additional 6-item Aging Value Assessment scale. The results from the pre-post measures will be presented along with identified themes that emerged from the post project focus group, which included a sample of the students and older individuals.

### A COMMUNITY-BASED APPROACH FOR INTEGRATING GERIATRICS AND GERONTOLOGY INTO MEDICAL EDUCATION

I.L. Martinez, D.R. Brown, J.C. Mora, *Humanities, Health & Society, Wertheim College of Medicine, Florida International University, Miami, Florida*

Older adults consume the largest health care dollars in the United States, undergo 40% of surgical procedures, and represent a growing part of patient populations with risks of co-morbidities, poly-pharmacy and other challenges in clinical care. Yet, according to the American Association of Medical Colleges (AAMC) in 2002 only 56 out of the 125 allopathic schools of medicine have identifiable units in geriatrics or gerontology. The AAMC has recently identified 26 minimum graduating competencies for in geriatrics for medical students. We describe how these geriatric competencies are being systematically integrated into the new medical curriculum using a competency-based approach and community experiences, to adequately prepare students to address the complex and individual needs of their older patients. We begin by asking what we would like our students to be able to do by the time they graduate. We then match these educational objectives to course objectives and activities to ensure that they are integrated throughout the broader medical curriculum. First, students will be introduced to geriatrics during their basic sciences and clinical skills courses. They will be exposed to geriatric populations longitudinally in community settings during household visits under the auspices of the NeighborhoodHELP™ community program and through clinical experience in year two, as well as a geriatrics clerkship experience in both medicine and neurology. Students will also attend sessions during clerkships addressing common medical issues among older adults. The growing diversity of the older adult population makes it important to integrate and evaluate geriatrics education into undergraduate medical education.

### HOME CARE SERVICES PROVIDER EDUCATION: DEALING WITH CHALLENGING SOCIAL, EMOTIONAL, AND ETHICAL SITUATIONS

A. Hauger[1], B. Hauger[2], T. Wilson[3], *1. Psychology, The College of St. Scholastica, Duluth, Minnesota, 2. Gentiva Health Services, Duluth, Minnesota, 3. North Memorial Home Health Services, Robbinsdale, Minnesota*

Home care services providers encounter challenging social, emotional, and ethical situations when working in patients' homes. Their preparation for dealing with these situations varies widely. In this study, home care services providers were asked to rate the importance of having training to deal with 20 challenging situations and to rate their preferences for obtaining more information about topic areas (e.g., computer based activity or in-service workshop). Surveys, distributed through employers, were completed by home care services providers and mailed to the researchers. Respondents (N = 86) represented homemaker services, home health assistant services, nursing, physical therapy, occupational therapy, care coordination, and home health education. Length of employment in home care ranged from less than one month to 27 years (M = 8.0, SD =7.39). Respondents worked in rural areas, small towns, cities, and a metropolitan area. Ninety-six percent were females and 98% were Caucasian. Average age was 45.8 years (SD = 14.24). Having training in each of the 20 situations was rated as somewhat to very important. Seventy-five percent or more of respondents indicated it is important or very important to have training to deal with situations involving loneliness, safety, loss, death, extreme lack of home cleanliness, interactions with patients' families, and communication with sensory-impaired patients. Participating in discussions or in-service workshops sponsored by employers were preferred ways to obtain more information about these topics. Results are particularly relevant for agencies that provide home care services as well as educators who develop and deliver training.

### A FORGOTTEN CURRICULUM: TEACHING "PALLIATIVE CARE FOR DEMENTIA PATIENTS" TO GERIATRICS AND PALLIATIVE CARE FELLOWS USING ROLE PLAY, NEWS MEDIA AND THE LITERATURE

H. Herrington, *University of Alabama at Birmingham, Birmingham, Alabama*

It is estimated that over 4 million Americans have Alzheimer's disease; by 2050, that number is predicted to increase to thirteen million. Dementia is a terminal illness, estimated to account for at least 7% of all deaths in the United States each year; however, only one in ten patients will receive hospice care. Caring for patients with dementia can be exceptionally challenging for healthcare professionals as well as the patient's family and other caregivers. This care is often complicated by difficult issues such assessing and treating pain, agitation and behavior problems, difficulty estimating prognosis, answering questions related to artificial nutrition and treatment of infections at the end of life, etc. Despite the complexity of this terminal illness, Geriatric and Palliative Medicine Fellows are often ill-prepared to address these specific issues surrounding palliative care for dementia patients. This formal curriculum is designed to teach principles of palliative care in patients with dementia, focusing on issues specific to this population. Fellows will learn clinical skills and model appropriate communication skills needed to care for this special and growing population. The goal of this project is to increase knowledge in this area among Geriatric and Palliative Medicine fellows, and eventually among other healthcare professionals, in an effort to improve care in this rapidly growing patient population, with greater emphasis on comfort as the goal of care, with fewer painful, aggressive, and unnecessary medical treatments at the end of life.

### PROFESSIONAL RELATIONSHIPS ACROSS DISCIPLINES: INTERDISCIPLINARY RESEARCH TEAMS AND COLLABORATION

D. Oliver, D. Parker Oliver, *Family and Community Medicine, Univesity of Missouri, Columbia, Missouri*

The University of Missouri Interdisciplinary Center on Aging includes more than 90 faculty members (Center Fellows) representing six schools, five colleges, and 36 different departments across the University of Missouri campus. In an effort to build and sustain lasting professional and collaborative relationships across disciplines, interdisciplinary research teams that bring together senior and junior faculty as equal learners are encouraged. Currently there are 40 center fellow principal investigators leading interdisciplinary research teams that account for $46 million in aging-related research. To sustain professional relationships and collaboration, the following has been initiated: 1) a monthly research seminar featuring the work of interdisciplinary research teams, and 2) a small grants program to promote interdisciplinary scholarship and dissemination involving junior faculty and senior mentors. This poster presents a case study of a successful interdisciplinary research team which illustrates key variables that facilitate interdisciplinary collaboration and success (federal funding, publications, fun, fellowship, trust, and consensus). Attendees will 1) learn key do’s and don’ts in assembling research teams, and 2) how to sustain the team over an extended period of time.

### LONG-TERM IMPACT OF A TRANSITIONS OF CARE EXPERIENCE ON INTERNAL MEDICINE RESIDENT TRAINING IN GERIATRICS

J.M. Pavon, G.T. Buhr, *Internal Medicine, Duke University, Durham, North Carolina*

Purpose: The Transitions of Care (TOC) Experience is an innovative educational strategy, modeled after Eric Coleman’s Care Transitions Program, to teach interns about transitional care. Methods: Internal medicine interns participating in the TOC Experience were eligible for a survey study. A self-efficacy survey was completed during a debriefing session at the end of each TOC Experience, and after completion of a subsequent General Medicine rotation when the opportunity to apply the skills was expected to be highest. The survey assessed their ability to (a) identify potential threats to a well-executed transition, (b) anticipate consequences of a poorly executed transition, (c) address changes in functional status, (d) compile pre and post hospital medication records, and (e) evaluate medication discrepancies. Each skill was measured using a scale of 1 (not confident at all) to 5 (completely confident). Qualitative data were also collected. Results: After completing the TOC Experience, there was a significant improvement across all 5 areas, ($p<0.001$, Wilcoxon signed rank test). This effect on confidence was sustained at follow-up, with no significant difference between follow-up median scores and post-experience median scores across all 5 areas, ($p>0.05$). Qualitative data revealed that completion of the TOC Experience impacted the practice of the interns most strongly in the areas of medication reconciliation and inter-provider communication. Conclusion: The TOC intervention was effective in improving physician confidence in skill sets that are key to the care transition process. The increase in confidence was sustained, suggesting a long-term impact of this simple and innovative educational intervention.

### AREA GERIATRIC EDUCATION SCHOLARS: INTRODUCING YOUTH TO GERIATRIC HEALTHCARE CAREERS THROUGH LONG-TERM CARE SITE PLACEMENTS

C. Weissbach, *UPHEC, Marquette, Michigan*

The Area Geriatric Education Scholars (AGES)program has trained and placed 127 Upper Peninsula, Michigan high school juniors and seniors for 7-week summer long-term care positions since 2006. Students job shadow healthcare professionals, provide one-on-one companionship and lead group activities. A growing elderly population in this remote, rural region and a shortage of healthcare professionals (e.g. physicians, nurses, pharmacists, physical therapists) prompted the development of this effort. AGES’ success is largely attributed to its active partnership between the Upper Peninsula’s schools of health professions, 14 long-term care sites, high schools, universities and local funders. Youth completing AGES are more inclined to consider healthcare careers serving an older population and their attitudes about older people have been positively impacted by their AGES experience. Most AGES alums proceed on with studies and employment in the healthcare professions. Several have obtained their CNA credentials and work in long-term care sites post-AGES concurrent with their college studies. AGES is sponsored by the Upper Peninsula Health Education Corporation.

## SESSION 2080 (PAPER)

## EHEALTH/TELEMEDICINE

### A THEORY-BASED ONLINE HIP FRACTURE RESOURCE CENTER FOR CAREGIVERS: ITS EFFECTS ON DYADS

E. Nahm[1], D. Orwig[2], B. Resnick[1], J. Magaziner[2], M. Bellantoni[3], R. Sterling[2], *1. University of Maryland School of Nursing, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland, 3. Johns Hopkins University School of Medicine, Baltimore, Maryland*

Informal caregivers are important for older adults’ successful recovery from hip fracture because they can help older adults adhere to their rehabilitation regimens and improve their health behaviors. Few resources, however, are available to these caregivers. In this study, we developed a Theory-based Online Hip Fracture Resource Center (OHRC) for caregivers, and tested its feasibility. The OHRC included seven self-learning modules, discussion boards, Ask the Experts, and a virtual library. The feasibility of the OHRC was assessed by its usage and usability; the feasibility of the future trial was tested using a one group pre-post design. Thirty-six caregiver (CG)-care recipient (CR) dyads were recruited from six hospitals. The CGs used the OHRC for 8 weeks. Most CGs and CRs were white ($n = 32, 33$) and female ($n = 25, 25$) with a mean age of 56.2+13.0 and 75.5+10.5, respectively. On average, CGs reviewed 5 modules and used the discussion board 3.1 times. The mean perceived usability score for the OHRC was 75 (12–84). Experience with the OHRC significantly improved CGs’ knowledge on the care of hip fracture patients ($t=3.17$, $p = .004$) and eHealth literacy ($t = 2.43$, $p = .002$). Changes in scores on other CG outcomes (e.g., CG strain, coping, social support) and CR outcomes (e.g., self-efficacy for exercise and osteoporosis medication adherence) were favorable but not significant. This shows that the OHRC is user-friendly and can be beneficial for CGs. Further randomized controlled trials are needed to assess its effects on CG and CR outcomes.

### IMPROVING OLDER ADULTS’ E-HEALTH LITERACY THROUGH COLLABORATIVE LEARNING

B. Xie, *College of Information Studies, University of Maryland, College Park, Maryland*

Collaborative learning features students learning from both an instructor and other students and working in small groups toward common goals. To assess its effectiveness in informal settings of older adults, an exploratory field experiment was conducted during August 2009-February 2010 in two public libraries in Maryland, focusing on e-health literacy, or the ability to obtain, process, and use electronic health information. Ninety-three older adults aged between 60-87 (Mean=68.5; SD=8.0) participated in the 4-week long collaborative learning intervention. Almost half (46%) of the participants had less than one year of prior experience with computers. Results: several key measures showed statistically significant improvements from pre to post intervention, including: computer knowledge (Pre=3.22; Post=4.13; p<.001); Web knowledge (Pre=2.69; Post=4.24; p<.001); Internet health information searching skills (number of successfully completed tasks: Pre=14.59; Post=22.31; number of assistances: Pre=1.63; Post=.59; p<.001 in both cases); computer anxiety (Pre=2.31; Post=2.07; p<.01); perceived e-health literacy (Pre=2.64; Post=4.03; p<.001); perceived usefulness of the Internet in helping to make health decisions (Pre=4.00; Post=4.53; p<.01); and perceived importance of being able to access health resources on the Internet (Pre=4.33; Post=4.60; p<.01). Other key measures (self-esteem, self-efficacy, computer interest and efficacy, and attitudes toward the aging experience) showed trends toward positive changes. Seventy percent of participants reported that what they had learned through the intervention had helped them "a lot" in taking care of their own health or caring for a loved one. These findings provide preliminary support for the effectiveness of collaborative learning in improving older adults' e-health literacy in informal settings.

### DO THE COSTS OUTWEIGH THE BENEFITS? USING A RESOURCE-ORIENTED PERSPECTIVE TO EVALUATE MOBILE PHONE APPS

B. Walker, L. Lorenzen Huber, J. Camp, *Indiana University, Bloomington, Indiana*

New technologies will only be accepted if older individuals perceive that the benefits outweigh the costs. One of the "costs" associated with new technologies is the effort required to learn how to use them. We used a resource-oriented perspective as suggested Lindenberger et al (2008) to evaluate 3-G phone apps developed by a class in gerotechnology at Indiana University during the fall of 2009. Indiana University was one of twelve universities participating in a pilot of App Inventor for Android (a programming tool that lets students easily create mobile applications and customize existing applications) sponsored by Google. The target market for this class was identified as active adults 50 and over. Students were issued 3-G Android phones and prompted to consider applications that incorporate social networking, location awareness, and web-based data collections. Projects were evaluated on three principles: 1) did the phone app either minimize environmental demand or increase environmental support; b) did it have the ability to be customized to individual needs; 3) did the app promote learning and cognitive plasticity without being too challenging. Student groups created innovative phone apps to facilitate social connection, healthy lifestyles, personal safety, health monitoring and support for daily activities. While the applications were firmly grounded in the concept of active aging, the majority of applications failed on the first principle; the support provided was less than the environmental demands created by the complexity of the phone itself. This presentation will consider the use of a resource-oriented perspective for evaluating new technologies.

### A PRIVACY FRAMEWORK FOR EVALUATING IN-HOME TECHNOLOGIES

L. Lorenzen Huber, J. Camp, K. Connelly, K. Shankar, K. Caine, W. Hazlewood, Z. Zimmerman, *Indiana University, Bloomington, Indiana*

Previous research suggests that older adults' perceived risks are much less than their actual risks in regard to data collected by in-home technologies. They are sanguine about health and safety data being shared with close family members, but more concerned about sharing financial data with anyone. They are most willing to adopt technologies perceived as useful. As part of a three-year project funded by NSF, we have developed prototypes to provide support in the domains of health, safety, finances, social support, and activities of daily living. The prototypes are on display in an older home we use for a lab. We invited groups of older adults (n=72) to tour the lab and asked them to complete a survey to validate our previous findings about 1) what types of home technologies are most acceptable, 2) with whom older adults are most comfortable sharing information, and 3) if they would control the data (occasionally turn off the devices, etc). In summary, the most popular prototypes were related to safety, while the most common person that participants would allow to access the information was an adult child. More than half of participants indicated that they would very likely turn off devices occasionally. The full results have led to the development of a new privacy framework for understanding older adults' perceptions of privacy related to in-home technologies. This session will review our findings about the interactions between granularity of data, recipient of data, sensitivity of activity, and perceptions of utility and usability.

## SESSION 2085 (POSTER)

## HEALTH RISK AND BEHAVIOR

### SOCIODEMOGRAPHIC PREDICTORS OF DIABETES DIAGNOSIS AND MANAGEMENT

P. Sevak, *Economics, Hunter College, New York, New York*

Socioeconomic and neighborhood characteristics have been documented as predictors of obesity (Grafova et al., AJPH 2008). The effect of SES and neighborhood on "clinical" measures such as hemoglobin A1c (a measure of diabetes) and cholesterol have not been studied. This project uses the Health and Retirement Study (HRS), a nationally representative survey of Americans 50 and older which in 2006 asked half its respondents to undergo blood pressure measurements and submit blood spots which were submitted to labs for measures of hemoglobin A1c and cholesterol levels. These data allow for a unique study of diabetes incidence, diagnosis, and management along with other cardiovascular risk factors, in a sociodemographic context, among the elderly population. This project studies: 1. Socioeconomic predictors of blood glucose and cholesterol levels. Multivariate OLS regressions of A1c levels show that health insurance and White race is associated with lower A1c. Neither log income nor assets are correlated with A1c. Before GSA, we will merge data zip code data on neighborhood characteristics, fast food restaurants, other restaurants, and grocery stores, to estimate the effect of these factors on biomarkers. 2. The socioeconomic predictors of being undiagnosed diabetics. Sadly, about 50% of HRS respondents with A1c levels above the clinical threshold for diabetes (6.0) do not know they have diabetes. Those most likely to know they have diabetes are retired, Black, Hispanic, with health insurance, and of higher BMI, while neither income nor assets. Analyses before GSA will merge county level data on medical access.

### TIME WILL TELL: A LONGITUDINAL STUDY OF CHEMICAL ADDICTIONS, CO-OCCURRING DISORDERS AND AGING

P.A. Greenberg[1], J. Juan[2], M. Reichl[3], *1. Community Studies, St. Cloud State University, St. Cloud, Minnesota, 2. St. Cloud State University, St. Cloud, Minnesota, 3. St. Cloud State University, St. Cloud, Minnesota*

Older adults comprise the fastest growing segment of the chemical addiction population. The data (N = 285) were gathered April 2004 through June 2007. Participants were 55 years and older, interviewed two weeks into treatment in person and then after completion by telephone every six months for up to two years. Several significant findings emerged. People who have a defined, on-going support system were more likely to maintain their sobriety. Support systems included family, friends, community, aftercare and groups such as AA and NA. For many, family in particular played a key role in recovery. Co-occurring disorders (mental health and addiction) were prevalent in this population. An overwhelming majority (87%) came into the program and/or were diagnosed during the course of their treatment. Initially some participants worked with a therapist but during the second year of the project a mental health component was incorporated into the program as well. One finding, absent from the previous literature, was how the course of addiction, treatment, relapse and recovery may differ for women and men. Men still outnumber women in treatment, women are more successful in their sobriety and women have a slightly higher rate of co-occuring disorders. The nature of addiction is also changing. For older adults alcohol is still primary but there is an incease in drugs such as heroin, cocaine and marijuana. There are still relatively few treatment programs specifically for older adults which is not reflective of need. Data from this study can assist future development.

### ADULT AND CHILDHOOD SOCIOECONOMIC POSITION (SEP) AND HEALTH BEHAVIOR IN OLD AGE

I. Kåreholt, U. Strid, *Aging Research Center, Karolinska Institutet and Stockholm University, Stockholm, Sweden*

OBJECTIVES: To study how socioeconomic position (SEP) in childhood and adulthood correlate to smoking and alcohol drinking in old age (77+). METHODS: Adult SEP was obtained from the 1968 and 1981 and childhood position from retrospective questions in these surveys. The 1968 data is combined with information about smoking and drinking in the 1992 follow-up, the 1981 data with 2002. Childhood SEP: fathers' education and social class; adult SEP: own education and social class. Health behaviors are frequency of alcohol drinking and smoking (yes/no). Ordinal logistic regressions were used, controlling for age, sex, survey year, civil status, and place of residence. RESULTS: Alcohol drinking in old age correlates to having both high childhood and adulthood SEP, largest with high SEP both in childhood and adulthood and lowest with low SEP in both childhood and adulthood. Old age smoking correlates to high own education, having fathers with high education and fathers with low social class both for women and men. High adult class position was correlated to more smoking among women and less smoking among men. Among women, smoking is most common with low childhood and high adulthood class and least common with high childhood and low adulthood mobility. Among men smoking is most common when both childhood and adulthood class are low and least common when social class is high at both stages. CONCLUSIONS: Alcohol consumption in old age correlates to high socioeconomic position whereas smoking only to high education. The correlation between smoking and social class differed between sexes.

### UNDERSTANDING STRESS AND COPING: NEW FINDINGS ON MODERATE ALCOHOL USAGE PATTERNS AMONG OLDER ADULTS

M. Horn Mallers[1], S. Neupert[2], *1. Human Services, CSU Fullerton, Fullerton, California, 2. North Carolina State University, Raleigh, North Carolina*

Given the growing concern regarding the increasing prevalence of later-life problem drinking, the present study extends current scientific understanding of the interconnections between alcohol use and daily stressor reactivity among middle-aged and older adults. While previous literature documents a strong link between affect regulation and binge drinking, little is known about the role of moderate use of alcohol on coping processes during stressful situations. Furthermore, the causal relationship between stress and alcohol use is unclear. To explore the link between stress and moderate alcohol use among aging adults, daily diary data from the National Study of Daily Experiences (NSDE), a sub-sample take from the Midlife in United States (MIDUS) study, was used. Preliminary results indicate that older adults are more likely to drink moderately than younger adults. Further, hierarchical linear models indicate that days with increased alcohol use are characterized by increased emotional reactivity to daily stressors. Such findings are critical as they lend to a better understanding of daily "functioning" including age differences in maladaptive and proactive coping, as well as harm-reduction models.

### THE RELATION OF DEPRESSIVE SYMPTOMS TO SMOKING IN MIDDLE-AGED AND OLDER WOMEN

C.K. Holahan[1], C.J. Holahan[2], D.A. Powers[3], J.K. Ockene[4], *1. University of Texas at Austin-Department of Kinesiology and Health Education, Austin, Texas, 2. University of Texas at Austin-Department of Psychology, Austin, Texas, 3. University of Texas at Austin-Department of Sociology and Population Research Center, Austin, Texas, 4. University of Massachusetts Medical School-Division of Preventive and Behavioral Medicine, Worcester, Massachusetts*

Smoking research and intervention efforts have neglected older women. Moreover, most smoking research has investigated major depression, while much of women's depressive experience involves sub-clinical depressive symptoms. This study investigated the relation of depressive symptoms (standardized composite of history of depressive symptoms and current depressive symptoms) to smoking in the Women's Health Initiative Observational Sample (N = 91,177). Participants ranged in age from 50 to 70 at baseline and selection criteria excluded women with mental illness, including major depression. Analyses controlled for age, minority status, and socioeconomic status. In logistic regression analyses, overall depressive symptoms were significantly associated with a higher likelihood of current smoking at baseline, with each standard deviation increase in overall depressive symptoms linked to a 17% increase in the likelihood of being a smoker. In addition, overall depressive symptoms were significantly associated with heavy smoking among the 5,719 participants who were current smokers at baseline. These effects were consistent for a history of depressive symptoms (statistical trend for heavy smoking) and current depressive symptoms. The associations between current depressive symptoms and smoking outcomes were independent of a history of depressive symptoms. Age and SES were significantly associated with a lower likelihood of being a current or heavy smoker. The highest likelihood of current smoking was among African Americans and Native Americans, with heaviest smoking among whites and Native Americans. The depressive symptoms effects for both current smoking and heavy smoking were consistent across age, SES, and ethnicity. Implications for reducing smoking in older women are discussed.

### A WELLNESS MOTIVATION INTERVENTION TO REDUCE STROKE RISK IN OLDER ADULTS

A.L. Silva-Smith, *Nursing, University of CO-Colorado Springs, Colorado Springs, Colorado*

Background: According to the American Heart Association, a first time stroke occurs in approximately 600,000 people in the United States each year. While stroke is a leading cause of death and long-term disability, theoretically-driven interventions to reduce stroke risk have been limited. Education-only interventions have been minimally effective in achieving behavior change among older adults. Current literature suggests that motivational factors, rather than simply knowledge needs, are instrumental in efforts to change health behaviors. Purpose: This presentation describes a theory-based motivational intervention to reduce stroke risk through healthy eating and increased physical activity among older adults. The Wellness Motivation Theory (WMT) guided development of the Promoting Older Adult Wellness (POW) intervention. Methods: The POW intervention focuses on the mechanisms that link motivational resources to physical activity and healthy eating, fostering social contextual resources and behavioral change process variables. Motivational appraisal, self-knowledge, and self-regulation are key behavioral change processes addressed by the POW intervention. Critical inputs designed to foster social contextual and motivational resources are presented and include: (a) social network support, (b) empowerment education, and (c) motivation support specific to promote physical activity and healthy eating behaviors. Summary: Expected outcomes include changes in healthy eating and physical activity, and reduced stroke risk as measured by blood pressure and body composition measures. Implementation issues are identified, including material and community resources, use of the lay health advisor role, and interventionist characteristics.

## TRAJECTORIES OF ALCOHOL DEPENDENCE AMONG THE ELDERLY IN KOREA

J. Ahn[1], S. Jang[2], *1. Hoseo University, Cheonan, Republic of Korea, 2. Chungju University, Chungju, Republic of Korea*

Alcohol problems in late life have not received much attention. In this study, trajectories of alcohol dependence and their predictors were examined using multilevel growth curve modeling of data from the Korea Welfare Panel Study (KOWEPS). A nationally representative older community dwelling sample in South Korea (N=14,295) was surveyed at baseline and 1 and 2 years later(3 waves) from 2006 to 2008. At each time point, an inventory consisting of drinking dependence (CAGE), socio-demographic factors, and psychosocial stressors was completed. The results showed that degrees of alcohol dependence increased significantly with wave. The unconditional model revealed that there existed significant random variability for participants' initial levels of alcohol dependence (intercepts) and rates of change (slope). To fit a mixed model with random effects predicting alcohol dependence intercepts and slopes, socio-demographic predictors (time-invariant covariates of participants' age, gender, marital status, education, religion) and major bio-psychosocial stressors (self-rated health, poverty, and satisfaction of social relationship at baseline) were included in the conditional model. The initial levels of alcohol abuse were predicted by the following factors: participants' younger age, male gender, lower levels of education, and being poor. The increasing slope of alcohol abuse was predicted by satisfaction of social relationship only. Base on the results found, practical implications for implementing prevention and treatment programs for alcohol problems among the elderly in South Korea are recommended.

## DO HEALTH BEHAVIORS SHAPE THE BODY-WEIGHT TRAJECTORIES OF MIDDLE AGE AND OLDER AMERICANS? RESULTS FROM A 15-YEAR LONGITUDINAL STUDY

A. Botoseneanu, J. Liang, *Health Management and Policy, University of Michigan, Ann Arbor, Michigan*

There is very little knowledge of the impact of health behaviors on how body weight evolves in middle-aged and older adults. This study examined how smoking, physical activity, alcohol use, and their changes influence the trajectory of BMI over a 15-year period from middle to late adulthood. Data came from the Health and Retirement Study which entailed a national sample of Americans aged 51 to 61 years in 1992 with up to eight repeated observations. We analyzed the trajectory of BMI by using hierarchical linear models, with time-varying covariates including (a) lagged measures of smoking status, vigorous physical activity, and alcohol consumption, and (b) between-waves measures of change in these health behaviors. BMI increased in a largely linear fashion. Smoking (b= -1.268; p <.001) and changes in smoking over time (b= - 1.056; p <.001) were both associated with lower BMI. Physical activity (b=-.555; p<.001) and its differences over time (b=-.385; p<.001) had similar relationships with BMI. Furthermore, the effects of smoking (b=-.082; p<.001) and physical activity (b=-.041; p<.001) on BMI became more moderate over time, particularly when the baseline BMI was adjusted. In contrast, alcohol use and its change over time were not correlated with BMI. Health behaviors and their changes over time, especially smoking and physical activity, are significantly associated with how BMI changes over time. This information is essential for the design and implementation of interventions aimed at reducing overweight/obesity in middle and old age.

## SOCIAL TIES AND PATTERNS OF CHANGE IN ALCOHOL CONSUMPTION DURING OLD AGE IN JAPAN

B. Shaw[1], J. Liang[2], N. Krause[2], J.M. Bennett[2], E. Kobayashi[3], T. Fukaya[3], S. Shinkai[3], *1. University at Albany, School of Public Health, Rensselaer, New York, 2. University of Michigan, School of Public Health, Ann Arbor, Michigan, 3. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

Recent evidence suggests that Japanese adults drink alcohol well into old age, with normative declines in drinking not beginning until after approximately age 70. Such patterns are often attributed to greater social acceptance of alcohol use in Japan, particularly in comparison with the US. While this explanation suggests that the drinking behavior of aging Japanese adults is largely shaped by their social networks, few studies have examined this relationship comprehensively over an extended period of time. This study addressed this gap by assessing the linkages between various social ties and alcohol use patterns over time. Data came from more than 4,800 Japanese adults aged 60 and over, who were observed up to 7 times between 1987 and 2006. Multilevel multinomial logit models estimated the odds of abstinence and heavy drinking relative to moderate drinking. Over time, the odds of abstinence increased, whereas the odds of heavy drinking decreased, with highly educated adults showing the most rapid declines. While co-residing with an adult child was not associated with patterns of alcohol use, being married was associated with reduced drinking, especially among women. In contrast, maintaining social ties outside of the family was associated with increased drinking. These findings suggest that even during old age, alcohol use is part of the social milieu in Japan and may be particularly influenced by social ties that are external to the family.

## TRAJECTORY OF CIGARETTE SMOKING AMONG OLDER JAPANESE, 1987-2006

J.M. Bennett[1], J. Liang[1], B. Shaw[2], N. Krause[1], E. Kobayashi[3], T. Fukaya[3], S. Shinkai[3], *1. Health Management & Policy, University of Michigan, Ann Arbor, Michigan, 2. University at Albany, Rensselaer, New York, 3. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan*

We currently know little about how health behaviors (e.g., alcohol consumption and smoking) change in later life. This is because of a lack of high quality data derived from repeated observations at the individual level over an extended period of time. Furthermore, the vast majority of research is based on data derived from the western developed nations, particularly the U.S. With the highest life expectancy at birth of any major developed nation, Japanese live about 4 years longer than Americans. In addition, Japan differs significantly from the U.S. in its core cultural values, life style, and major social institutions such as family and religion. Hence, Japan presents many conditions unobservable in the U.S., which may yield useful insights concerning the underlying mechanisms. This research examined how cigarette smoking among old Japanese evolved over a period of 19 years. Data came from a national sample of over 4,800 adults aged 60 and over in Japan with up to 7 repeated observations between 1987 and 2006. Multilevel models with ordered logit were employed to analyze intrapersonal and interpersonal differences in smoking. On average the odds of smoking declined significantly over time (OR=.860, p<.001). Older age (OR=.958, p<.001) and female gender (OR=.049, p<.001) were associated with less smoking. Although older women (OR=1.041, p<.05) tended to smoke slightly more, smoking decreased at a more accelerated rate among them (OR=.992, p<.01). There were significant gender and age variations in the decline in smoking in old age.

### LONG-TERM CHANGES IN SMOKING BEHAVIOR AMONG MIDDLE-AGED AND OLDER-AGED ADULTS WITH HEART DISEASE

J. Newsom[1], N. Huguet[1], M. McCarthy[1], M.S. Kaplan[1], B. McFarland[2], *1. Institute on Aging, Portland State University, Portland, Oregon, 2. Oregon Health and Science University, Portland, Oregon*

For those with chronic heart disease, smoking cessation is critical to prevent recurrence of heart attack, to improve overall health, and to extend longevity. Few studies have investigated whether individuals with heart disease maintain behavioral improvements over the long-term and which social and psychological factors are associated with maintaining healthy behavior. In longitudinal analyses of the Health and Retirement Study over an 18-year period, we examined smoking cessation among participants age 50 and over who did not have heart disease at the beginning of the study but who subsequently reported diagnosis of a heart condition (N = 2,221). Only 39% of smokers quit smoking following diagnosis. Of the individuals who initially quit, 23% eventually relapsed. A piecewise growth curve analysis was used to model smoking propensity prior to and following diagnosis. Results indicated modest changes in smoking propensity prior to diagnosis, a significant average decline in smoking propensity following diagnosis, and significant individual variability in smoking changes over time. A subsequent piecewise growth curve model indicated that women, those with higher education, and older participants had a decreased propensity to smoke after diagnosis. Results from these analyses suggest that increased efforts to improve long-term maintenance of smoking cessation among those with chronic heart disease are needed. Because men, those with lower education, and younger participants are at greater risk of eventual relapse, cessation programs, physicians, and other care workers could improve long-term maintenance by devoting additional resources to preventing relapse for these high risk individuals.

## SESSION 2090 (POSTER)

## HEART DISEASE AND CANCER

### HEALTH DISPARITIES IN PROSTATE CANCER SCREENING KNOWLEDGE, ATTITUDES AND BEHAVIOR

C.B. Worley[1,2], J. Oliver[2,3], R.S. Allen[1,2], T. Thomas[1], *1. Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama, 3. Capstone College of Nursing, Tuscaloosa, Alabama*

Health disparities in cancer screening and prevention are well documented. In the United States, prostate cancer is the most commonly diagnosed cancer among men and the second leading cause of cancer death (ACS, 2009; NCI, 2009). Reliability and effectiveness of the prostate-specific antigen as the screen for prostate cancer has continued to be a source of disagreement within the medical community (ACS, 2009; Reynolds, 2008; Taylor et al, 2006); however, there is a consistent recommendation that men should have the opportunity to make an informed decision regarding prostate cancer screening (ACS, 2009; Reynolds, 2008; Taylor et al, 2006). African American men are less likely than White or Latino men to receive preventive services (Smedley, Stith & Nelson, 2003; Williams 2003) and are more than twice as likely to die of prostate cancer than Caucasian men (ACS, 2009). Using the HINTS national dataset, we explored factors contributing to prostate cancer awareness and screening in older men using binary logistic regression. First the data was restricted to men in the targeted age range for prostate cancer screening (aged 40-74). Older men, with more education, and those that endorsed trust in their physician were more likely to have heard about the Prostate Specific Antigen (PSA test), and to have their physician discuss prostate cancer screening with them. Older men with more education, and those that are Caucasian are more likely to have had a PSA. (Implications for health professionals and public health interventions to target older men for prostate cancer screening are discussed.

### AGE, GENDER AND SES DIFFERENTIALS VS. CLINICAL DIAGNOSTIC CRITERIA IN SELF-REPORTED HEALTH AMONG OLDER ADULTS WITH CANCER

G. Seckin, T. Turner, *University of Maryland, Baltimore County, Baltimore, Maryland*

This paper explores four different dimensions of self-reported health (cancer stage, perceived distress with physical symptoms, perceived distress with cancer treatments, and satisfaction with health status) among a convenience sample (n=350) of respondents (M age=50.23, S.D. =10.91). Patterns of associations between demographic variables, SES, perceived health control and self-reported health were examined. Analyses included t-tests and ANOVA at the bivariate and Ordinary Least Squares (OLS) regression analyses at the multivariate level. Three separate models of hierarchical multiple regressions were performed in order to estimate unique impact of patient demographic and SES characteristics and perceived control over health on self-reported health status variables. The results showed that demographic and SES characteristics create differential health patterns: a) lower income predicted higher perceived distress with physical symptoms (Slope = -.12; B= -.17, p =.002) b) older age predicted less perceived distress with cancer treatments (Slope = -.01; B= -.12, p =.019) and c) gender (female) predicted less satisfaction with health (Slope = -.36; B= -.15, p =.002). Interestingly, even though higher cancer stage predicted higher perceived distress with physical symptoms (Slope = .12; B= .17, p =.001), it did not predict perceived distress with treatments, and satisfaction with health status. Perceived control over health was a significant moderator only for satisfaction with health but not for other dimensions of self-rated health. These findings suggest that assessment of differential aspects of self-rated health among cancer patients can provide important additional information to supplement diagnostic clinical criteria to better understand patients' illness experience.

### PERSONALITY, COPING, AND PSYCHOLOGICAL WELL-BEING AMONG OLDER ADULT, LONG-TERM CANCER SURVIVORS: A PATH ANALYSIS

G. Deimling, M.L. Boehm, S. Brown, *Sociology, Case Western Reserve University, Cleveland, Ohio*

This research tests a model examining the role personality plays in mediating the relationship between cancer and other health factors and coping and psychological well-being. Recent research has indicated that personality may be more important than cancer-related factors in the utilization of coping strategies as well as the psychological well-being. Data are from a ten year longitudinal study of older adult (60+), long-term (5 yrs+) survivors of cancer (breast, colorectal prostate). Key predictors include severity of illness, extensiveness of treatment, co-morbidities, and dimensions of personality. Important covariates include race, gender, and cancer type. Focal outcomes are coping and depression. Preliminary factor analysis confirm the factor structure of the "Big Five" personality index, which includes openness to new experiences, conscientiousness, extraversion, agreeableness, neuroticism. Reliability of the coping inventory sub-groups (planning, acceptance, venting, denial, social support, religion) was strongly confirmed with all alphas ≥ .749. Looking at personality and coping, extraversion (beta= .298) and neuroticism (beta= .429) were significant path coefficients of venting as a coping strategy, while conscientiousness (beta= -.247) was a significant path coefficient of social support. Further, conscientiousness (beta= -.479) and neuroticism (beta= .556) were significant path coefficients to depression. R-squares were greater than .25 for all equations. Descriptive and regression analyses provide a clear picture of the role personality plays in how survivors react to stressful events and how this may affect survivors' psychological well-being. Results indicate the importance of considering personality with how those coping with cancer handle stressful moments in survivorship and their psychological well-being thereafter.

### DISTRESS AND COPING AMONG OLDER ADULTS: THE INFLUENCE OF MEANING AND IDENTITY IN CONFRONTING A CHRONIC ILLNESS

S. Brown, G.T. Deimling, M. Laroco, *Sociology, Case Western Reserve University, Cleveland, Ohio*

In facing the stress of a chronic illness, the meaning an individual places on the event is important to understanding their experience. Guided by a symbolic interactionist framework, this study examines the mediating role that meaning of illness and adoption of cancer-related identities play in influencing the relationship between illness, and coping and distress of older adults who experience a chronic health problem. Data were collected from a sample of older adult (M age = 70 years) long-term (5+ years) survivors identified using a tumor registry from a major Midwest cancer center (n = 230). Constructed meaning of illness was measured using an 8-item scale (modified, Fife 1995). Reliability and factor analyses indicated a unidimensionality of this indicator ($\alpha = .70$). Correlation and OLS regressions were used to analyze relationships between illness meaning and identity variables, and outcomes of coping and distress. Positive meaning of illness is correlated with adoption of cancer survivor and ex-cancer patient identities and is negatively associated with identifying as a cancer patient or victim. Multivariate analyses show, individuals who attribute a less positive meaning to the illness experience report higher levels of depression ($\beta$ = -.19), but not anxiety. Finally, giving positive meaning to the illness experience is associated with using a fighting spirit ($\beta = .34$) as a coping strategy, but unrelated to cognitive avoidance and fatalism. Overall, while chronic illness may generate stress, the meaning and mode of identification that older adults adopt appear to influence their adaptation.

### ILLNESS REPRESENTATIONS OF ACUTE CORONARY SYNDROME PATIENTS: AN EXAMINATION OF NOVEL CAUSAL ATTRIBUTIONS

T.M. Luger[1], R. Martin[1,2], H.S. Reisinger[1,2], *1. University of Iowa, Iowa City, Iowa, 2. Iowa City VAMC, Iowa City, Iowa*

Patient illness representations (or common sense models) are theorized to influence behavioral intentions and actions, in turn, influencing health outcomes (Leventhal, Brisette, & Leventhal, 2003). For patients with acute coronary syndromes (ACS), the illness representations influencing behavioral intentions and actions are especially important as these patients must implement various behavioral changes after a cardiac event, such as avoiding smoking or increasing exercise, in order to improve their health and avoid subsequent cardiac problems (Leon et al., 2005). An under-examined population of 433 veterans (1/3 African-American) with ACS were interviewed about their experiences, current health behaviors, and causal attributions of ACS. A Q-sort qualitative analysis (McKeown & Thomas, 1988) found that, apart from causal attributions to CHD risk factors like family history and poor diet, novel causal factors emerged, including alcohol consumption, provider medical mistakes, medication non-adherence, and PTSD. Identifying and addressing these factors post-ACS has the potential to improve CHD behavioral intentions and health behaviors in this population.

### THE EFFECTS OF AGE AND HEALTH ON PATIENT-PHYSICIAN INTERACTION IN TREATMENT DECISIONS FOR HIGH BLOOD PRESSURE

C.C. Gayer, J.M. Jacobs-Lawson, *Gerontology Center, University of Kentucky, Lexington, Kentucky*

Previous research has demonstrated the importance of shared decision making among patients and physicians when making treatment decisions. The present study examined the effects of age and self reported health status (SRHS) on hypertensive older adults' participation in the treatment decision making process for high blood pressure (HBP). Participants (aged 55-99; n= 267) identifying themselves as having HBP in the 2008 Health and Retirement Study completed a module regarding patient-physician interaction. Analyses consisted of a series of 2 (age) x 2 (SRHS) mixed ANOVA's. The dependent variables included patient involvement in treatment planning and decision making, as well as patient-physician interaction regarding treatment progress and options for their HBP. Analyses revealed that young-old patients (55-75) were more frequently asked their ideas about treatment, and about problems with medication and its effects, as well as helped to set eating and exercise goals than the older patients (75-99). In addition, analyses revealed a significant age by SRHS interaction on frequency of discussing health habits with the physician. For older patients SRHS was not related to the frequency of discussing health habits with their physician. For younger patients however, healthy individuals were more likely to be asked about health habits than those in poorer health. Analyses also showed that patient involvement in treatment decisions is related to health behaviors and outcomes. These results suggest that the shared decision making model, which emphasizes patient empowerment, may be underutilized in the clinical setting. Implications for clinical practice, medical ethics, and medical decision making are discussed.

### TEENAGE BODY HABITUS AND INCIDENT HEART FAILURE IN COMMUNITY-DWELLING OLDER ADULTS

E.B. Levitan[1], M. Mujib[1], M.A. Feller[1], L. Jones[1], P. Sawyer[1], A. Ahmed[1,2], *1. Department of Epidemiology, University of Alabama at Birmingham, Birmingham, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama*

**Background:** Obesity is a risk factor for heart failure (HF) in older adults. However, it is unknown whether teenage body habitus may predict incident HF in older adults. **Methods:** Of the 5795 community-dwelling adults ≥65 years in the Cardiovascular Health Study, 5521 were free of baseline HF, and 5293 had data on baseline body mass index (BMI) and teenage body habitus, self-reported as "heavier than average", "average", and "thinner than average". Multivariable-adjusted Cox-regression models were used to estimate the association of heavier-than-average teen body habitus with centrally-adjudicated incident HF during 12 years of median follow-up. **Results:** Participants had a mean (±SD) age of 73 (±6) years and BMI of 27 (±4) kg/m$^2$; 58% were women and 15% were African American. Overall, 1790 (34%), 3011 (57%) and 492 (9%) older adults had heavier-than-average, average, and thinner-than-average teen body habitus respectively. Among those with heavier-than-average teen body habitus, 45%, 41% and 14% had baseline BMI of 18.5–24.9, 25–29.9, and ≥30 kg/m$^2$. Incident HF occurred in 20% and 21% of participants with and without heavier-than-average body habitus as a teen respectively (unadjusted hazard ratio, 0.94; 95% CI, 0.83–1.07; P=0.38 and multivariable-adjusted hazard ratio, 0.99; 95% CI, 0.87–1.13; P=0.88). Heavier-than-average teen body habitus had no association with all-cause mortality or other cardiovascular outcomes. **Conclusion:** Nearly half of the community-dwelling older adults with self-reported heavier-than-average teen body habitus achieved normal BMI, which may explain the lack of the association between teen body habitus and incident HF in older age.

### TREATMENT ADHERENCE, OPTIMISM, AND SELF-EFFICACY IN OLDER AFRICAN AMERICANS WITH HEART FAILURE

C.J. Burant[1,2], R.A. Siders[1], G. Graham[1], R. Boxer[1], *1. Case Western Reserve University, Cleveland, Ohio, 2. Lewis Stokes VA Medical Center, Cleveland, Ohio*

African Americans (AA) have higher morbidity, mortality rates, more functional decline, and more hospitalizations associated with heart failure (HF) as compared to other races. Adherence to medication and low sodium diet are important to controlling symptoms, reducing hospitalizations, and improving quality of life. The current study examined the role of optimism, pessimism, self-efficacy, and quality of life in AA patients' adherence to HF treatment regimes Data were collected from 35 older AA subjects at a HF clinic at a large Midwest university affiliated hospital. A medium effect size of <.30 for correlations was used to determine potential relationships among the variables of interest. The mean age of the cohort was 76 years (SD=7.8), 72% women, 57% were New York Heart Association (NYHA) class II, and 37% NYHA class III, 83% had systolic HF with a mean ejection fraction of 41%. Adherence was measured by the Heart Failure Compliance Questionnaire which has three components: level of importance, level of difficulty and frequency of adherence. The level of importance in adherence to medication and dietary restrictions was positively associated with self-efficacy (r=.36). The level of difficulty in adherence was negatively associated with self-efficacy (r=-.37), optimism (r=-.31), and the Kansas City Cardiomyopathy Questionnaire (KCCQ) quality of life domain score (r=.-43). Frequency in adherence was positively associated with self-efficacy (r=.47), optimism (r=.31), KCCQ scores of self-efficacy (r=.37) and quality of life (r=.34). Preliminary findings suggest that in AA patients with HF, adherence is influenced by optimism and self-efficacy and may impact quality of life.

## SESSION 2095 (PAPER)

## IMPROVING QUALITY OF CARE FOR PERSONS WITH DEMENTIA

### ADAPTING TO THE CHANGING NEEDS OF PERSONS WITH DEMENTIA: THE EXPERIENCE OF HOSPICE SOCIAL WORKERS

J. Ataie, *Portland State University, Vashon, Washington*

With strong historical roots in a strengths-based and person-in-environment approach to practice and a longstanding tradition of working in a multi-disciplinary framework, the social work profession is uniquely positioned to take a leadership role in creating a continuum of interventions and services that addresses the changing needs of persons with dementia throughout the progression of the disease (Adams & McClendon, 2006). The present study explored the subjective experience of hospice social workers working with aphasic individuals in the later stages of dementia and investigated how access to, training in, and use of a 'mobile multi-sensory stimulation toolkit' impacted that experience. Semi-structured interviews were conducted with twenty social workers (seventeen women; three men). Interviews lasted between 30 and 60 minutes and thematic analysis was used to analyze the data. Initial findings confirm the results of earlier studies reporting that health care professionals struggle with the many feelings that are brought to the surface when faced with the finite nature of human existence and experience working with individuals in the later stages of dementia as emotionally challenging and stressful (e.g., Beck, 1996). Participants reported coping strategies such as avoiding interactions and spending less time with individuals who seemingly are no longer able to have meaningful communications. However, using a 'mobile multi-sensory stimulation toolkit' assisted participants to construct and create meaningful relationships with this population which in turn resulted in an increase in time spent and facilitated a sense of well-being for both individuals with dementia as well as social workers.

### RISKS ASSOCIATED WITH ANTIPSYCHOTIC MEDICATIONS IN PERSONS WITH DEMENTIA

M. Clapsadl, J.N. Laditka, S.B. Laditka, J. Troyer, *Public Health Science, University of North Carolina at Charlotte, Charlotte, North Carolina*

Behavioral and psychological symptoms of dementia (BPSD) are commonly treated using antipsychotic medications. These medications carry substantial risks, including metabolic issues and hallucinations. Although these risks are recognized, medications are often given to people with disruptive behaviors in long-term care, especially in facilities that are understaffed or when staff are inadequately trained in non-pharmacological interventions. We reviewed evidence for pharmacological and non-pharmacological interventions for BPSD. Computerized searches using MEDLINE, PUBMED, Academic Search Premier, PsycINFO, CINAHL, Health and Psychosocial Instruments, and Sage Journals online were conducted. Studies included: qualitative studies; randomized trials; economic costs of pharmacological versus non-pharmacological treatments; environmental factors associated with problem behaviors and symptoms such as lighting, auditory, and visual issues; and benefits of non-pharmacological treatments. Thirty studies that addressed the criteria were identified. Non-pharmacological interventions for disruptive behaviors in dementia patients were associated with more positive outcomes in health and quality of life than pharmacological treatments. Antipsychotic medicines treated behaviors and symptoms, but did not improve health and quality of life. Studies indicated that treating BPSD pharmacologically may dramatically increase the economic burden of dementia. Doing so was associated with greater resource use, and high risks of institutionalization. Treating BPSD with non-pharmacological interventions may help avoid nursing home use, reduce caregiver stress, and lower overall costs. Individuals using antipsychotic drugs should be assessed frequently for medication errors, adverse events, and comorbidities. Findings suggest that the risks and benefits of using antipsychotic medicines, as well as options for non-pharmacological interventions, should be discussed with families.

### CONFLICTING NEEDS IN THE LTC ENVIRONMENT: EFFECTS OF MIXING PEOPLE WITH DIVERSE FORMS OF DEMENTIA

S.D. Koehn[1,2], J. Kozak[1,2], E. Drance[3,2], *1. Centre for Healthy Aging, Providence Health Care, Vancouver, British Columbia, Canada, 2. University of British Columbia, Vancouver, British Columbia, Canada, 3. Vancouver Community Mental Health Services, Vancouver, British Columbia, Canada*

Purpose of the study: This study explores the dynamic and constructed nature of the physical and psychosocial environments that contribute to needs-driven dementia-compromised (NDDC) behaviors of nursing home residents. We examine an opportunistic case study of a resident with fronto-temporal dementia ("Leonard") to explore how healthy others' perceptions of these environmental features were influenced by Leonard's behavior which, in turn, was influenced by people's perceptions of him as a "problem." Design and Methods: This critical constructionist case study emerged from the qualitative component of a larger mixed methods study. Data reported here were obtained through participant observations, individual interviews with staff and residents, and focus groups with family members and nursing staff. Results: Leonard's NDDC behaviors are not recognized as such by many of the healthy others with whom he co-creates his psychosocial environment. He is held responsible by staff and family members for compromising the creation of a homelike environment. He is also accused of dominating the physical environment over which he is deemed to have greater control than other residents. Implications: Leonard is a common scape-goat for many of the problems associated with the physical and social environment. His behaviors are not understood in the context of his less typical dementia and unmet needs; rather he is constructed as deviant, which undermines his selfhood as well as his quality of life. Education of staff and family members as well as broad organizational change is needed to address the issues underlying the problems for which Leonard is blamed.

### TRIADIC RELATIONSHIPS BETWEEN INFORMAL CAREGIVERS, PEOPLE WITH DEMENTIA, AND HEALTH CARE PROFESSIONALS

C. Quinn[1], L. Clare[1], R.T. Woods[1], T. McGuinness[2], *1. Psychology, Bangor University, Gwynedd, United Kingdom, 2. for dementia, London, United Kingdom*

Informal caregiving for a person with dementia often takes place within a health care triad, whose members include the caregiver, the care-recipient, and the health care-professional. However, there has been little research specifically exploring these triadic encounters. The aim of the current study was to explore how the members work together with this triadic context. Six spousal caregiving dyads and the three health care professionals who worked with the couples were interviewed. Transcripts of these interviews were analysed to form case studies, each containing the perspectives of the three members. Three case studies were selected to illustrate the similarities and differences in the views of the members of the triad. The processes emerging in these case studies were encompassed under an overarching dynamic process of 'negotiating the balance'. This describes the ongoing struggle of the members to balance the perspectives of the other members against their own needs. This balance could influence the success of the working relationship between the triad. Coalitions could occur as members worked together to tackle problems. This process of 'negotiating the balance' was a dynamic process as the balance was constantly changing. In conclusion, the findings of this study highlight the importance of exploring the perspectives of all members of the triad. This should help health care professionals to improve the quality of the support they provide to caregivers and care-recipients.

### CAREGIVER PERCEPTIONS OF THE EFFECTIVENESS OF DEMENTIA DRUGS

N. Chappell[1], K. Kobayashi[1], M. Malcure[2], *1. Centre on Aging, University of Victoria, Victoria, British Columbia, Canada, 2. University of British Columbia, Vancouver, British Columbia, Canada*

Despite the popularity of cholinesterase inhibitors (ChEI) for those with mild to moderate dementia, research is inconclusive. While evidence for the clinical effectiveness of the drugs is strongest for cognitive function, less for behaviours or mood, even here statistical effects are small and clinical significance questioned. Effectiveness from the caregivers' point of view has not been studied, either in terms of consequences for the patient or the caregiver themselves. Yet caregivers observe patients in an ongoing manner and Rockwood and colleagues find caregiver views differ from those of physicians. This paper reports the results of a study that interviewed caregivers (>400 to date in B.C., Canada) whose family member is taking ChEI. Face-to-face interviews take place at 6 months, when a clinical judgment is also made, lasting 1.5 hours. Data on 11 areas where the drugs might affect the patient (communications skills, being calmer, etc.) were factor analyzed, resulting in 1 domain with a summative alpha of .88. This scale is related to various aspects of the relationship between caregiver and patient (such as whether the patient can be left alone) but not others (such as interest in activities). The paper also identifies which caregivers are most likely to perceive the drugs as beneficial (such as those who are more religious and who were more distant from the care recipient prior to drug usage). The scale is unrelated to caregiver self-esteem, burden or depression. The paper provides, for the first time, a multi-item scale to measure caregiver perceptions of ChEI.

## SESSION 2100 (POSTER)

## LIFE COURSE CHANGE

### LIFE HISTORY ANALYSIS: A QUALITATIVE STUDY OF AGING AND HEALTH AMONG ELDERLY AFRICAN AMERICANS

S.K. Kwan, *UCLA, Los Angeles, California*

The aim of this qualitative study is to explore the concepts of aging and health among older African Americans residing in Los Angeles, California. The study focuses on culturally-relevant themes extracted from 15 transcripts and summaries derived from in-depth interviews with African Americans, aged 60 and older. Additionally, the analysis includes a comparison of those themes with a review of 24 published peer-reviewed papers that explore different cultural perspectives of aging and health among non-Hispanic White, African American, Asian and Latino elderly. The results showed that, in general, common themes shared by African American elderly are unique, culturally-influenced perspectives on independence and autonomy, family, education, and spirituality that are shaped by childhood experiences in large families and tight-knit, African American communities, as well as lifetime exposure to varying degrees of racial segregation and discrimination. These experiences influence personal views toward health in late life and resilience in coping with chronic health conditions. I conclude that aging and health are multi-dimensional concepts and that there are shared, universal perspectives between different racial and ethnic groups. The variations which exist between the African American and other racial and ethnic groups are due to cultural patterns and structural forces that are driven early childhood experiences and to exposure to racial segregation and discrimination. I suggest that researchers integrate these unique perspectives and experiences into clinical practice to optimize health-related behavior toward the management of health in late life for elderly African Americans.

### INTERGENERATIONAL COMPARABILITY OF A MEASURE OF SENSE OF CONTROL AMONG ADULTS

M. Inoue, T. Tran, *Boston College, Chestnut Hill, Massachusetts*

Purpose: This study examined the comparability of reliability and validity of a measure of sense of control between the baby-boomer (39-57 years old) and older generations (58-84 years old). Methods: We used the 2004-2006 second wave data from the Midlife Development in the United States to evaluate the intergenerational comparability of the 12-item sense of control scale developed by Lachman and Weaver (1998). Our analysis involved 1,954 boomers and 1,678 older adults. Distributions of gender and race were similar between the two groups. First, we compared the corrected-item total correlation of each item between the two generations. Second, we performed exploratory factor analysis (EFA) within each generation. Third, we tested a series of five measurement hypotheses using confirmatory factor analysis (CFA) between the two groups. Results: Our analysis revealed that nine out of 12 items from the original scale had acceptable inter-generational comparability. These items represented two dimensions: personal masterly and perceived constraints. Multi-group CFA revealed that two out of five measurement hypotheses were supported by the data. The nine-item scale had similar factor pattern and factor loadings between two generations. Item measurement errors, variance and covariance among the factors were not supported. These nine-items can be used to compare correlates of sense of control between generations, but not the latent means. Implications: Cross generational comparison of causes and effect of sense of control requires measurement invariance or comparability. This study suggests that future research should include sex and race in the study of measurement comparability of sense of control.

### DAILY ASSOCIATIONS BETWEEN QUANTITY OF NIGHTLY SLEEP AND MOOD ACROSS MIDLIFE: DOES THE LENGTH OF A NIGHT'S SLEEP BUFFER THE EFFECT OF STRESS ON DAILY MOOD?

M.E. Braun, C.S. Bergeman, *Psychology, University of Notre Dame, South Bend, Indiana*

The main objective of this study was to examine associations between daily sleep, daily stress and daily mood in middle-aged adults. Mid-life has been associated with many role changes and is rated as one of the busiest, as well as stressful, times of life. This is also when many changes in sleep take place. Few studies have investigated the relationship between sleep and mood using a mid-life age group. Seventy-two subjects aged 42 to 69, from the Notre Dame Study of Health and Well-Being, completed 56 days of daily diary measures that included daily quantity and quality of sleep, daily positive and negative mood, and daily stress. Multilevel modeling was used to examine the effects of stress on the daily sleep-mood relationship. As expected, on days when stress was high, negative mood increased and positive mood decreased when compared to days when stress was low. In addition, individuals who had the highest average total sleep time over the 56 days reported the least increase in negative mood on days when stress was high. On the other hand, for those who had the lowest average total sleep time, negative mood increased most when both daily stress was high and the amount of sleep obtained the night before was less than one's average amount. The analysis testing the effect of stress on the sleep-positive mood relationship was not significant. Future directions as it relates to an aging population will be discussed.

## LONGITUDINAL RELATIONSHIPS OF AFFECT AND FUNCTIONAL ABILITIES IN VERY OLD AGE

S.K. Wiegering[1], O.K. Schilling[1], O. Reidick[1], H. Wahl[1], F. Oswald[2], *1. University of Heidelberg, Heidelberg, Germany, 2. Goethe University Frankfurt, Frankfurt, Germany*

Although the classic Disablement Process Model (Verbrugge & Jette, 1994) regards affect as predictor as well as outcome variables of functional abilities in old age, research into the dynamics of this relationship is rare. So far, existing study findings with old and very old individuals suggest an impact of functional abilities on emotional outcomes as well as an influence of emotional variables on functional abilities. The present study aims to qualify this relationship with new data speaking to the reciprocal effects between affect variables and indicators of functional health. We used longitudinal data derived from the project ENABLE-AGE and the follow-up project LateLine, consisting of 450 aged persons at baseline (78.4% women, age 80 to 89 years), covering three measurement occasions (2002/3, 2003/4, 2009). Measures of positive and negative affect (PANAS), depression (GDS), as well as measures of functional abilities and independence concerning the management of daily activities (ADL) were analyzed by means of longitudinal structural equation modeling. Analysis of changes across the one-year time interval as well as across the 6-years interval supports both directions of the affect-function-relationship without any clear dominance. However, our results also suggest that nonlinearity may play a role, that is, adaptation to functional decline seems to reduce affective responses when functional losses accumulate within the individual.

## THE ROLE OF COGNITIVE RESOURCES IN EMOTIONAL AGING: AGE DIFFERENCES IN EMOTIONAL COMPLEXITY

S. Thomas, U. Kunzmann, *Department of Psychology I, Life-Span Developmental Lab, University of Leipzig, Leipzig, Germany*

Dynamic Integration Theory (DIT; Labouvie-Vief, 2003) posits an age-related decline in the complexity of emotional reactions to negative events. One reason for this decline has been thought to be the normative loss of cognitive resources in old age. In a first laboratory study, we investigated age differences in the complexity of emotional reactions by having young (n = 25, age range 21 – 31) and older (n = 23, age range 60 – 92) adults think-aloud about four negative emotion-evoking vignettes. On the basis of a coding system developed for the present study, two trained students evaluated the transcribed think-aloud responses according to emotional complexity. Consistent with DIT, older adults' reflections about their emotional reactions were less complex than those of young adults. In a second vignette-based study with young adults (n = 57), processing load was manipulated by a dual task paradigm. More specifically, participants reported the intensity of anger, sadness, and fear in response to each of four negative emotion-evoking situations using standardized adjective lists; in half of the trials, they were distracted by an additional resource-demanding task. Findings were again consistent with DIT, that is, under limited cognitive resources, emotional reactions became less complex (i.e., less likely to be a mix of the present three target emotions anger, sadness, and fear). Together the present evidence supports the idea that at least certain aspects of emotional complexity decline with age and the associated loss in cognitive resources.

## TIMING OF OFFSPRING DEATH IN PARENTS' LIVES AND LATE-LIFE COGNITIVE DECLINE. THE CACHE COUNTY STUDY

D. Bradford[1], K. Smith[2], S. Schwartz[1], J. Tschanz[1], T. Ostbye[3], C. Corcoran[1], K. Welsh-Bohmer[3], M.C. Norton[1], *1. Family, Consumer, and Human Development, Utah State University, Logan, Utah, 2. University of Utah, Salt Lake City, Utah, 3. Duke University, Durham, North Carolina*

The trauma of losing a child to death may result in chronic stress for parents. Such an experience may result in lifelong cumulative physiological stress effects on the brain, leading to faster cognitive decline in old age and increasing risk for dementia. We examined the association between child death and rate of cognitive decline in a population-based sample of 2841 elderly without dementia over age 65 at baseline, as a function of timing of a child death within the parent's lifespan. We collected up to four measurements of the Modified Mini-Mental State Exam (3MS), spanning 10 years. Subjects were 58% female, age M=75.5, SD=7.3 years, with education M=13.1, SD=2.8 years. Experience of earliest child death was operationalized via genealogical and vital statistics records from the Utah Population Database, classified as having occurred when subject was teen-30 years (n=204), 31-44 years (n=162), or 45-64 years (n=125) vs. no child death (n=2350). Linear mixed models of cognitive change controlled for age, gender, education, and APOE genotype. In each age category, elderly who had experienced a child death had faster cognitive decline than those who had not experienced a child death, with the fastest decline among subjects experiencing child death when teen-30 years (p=.0991). Cumulative stress associated with child death may result in faster cognitive decline in late life. There may be differential effects based on parent's age at child's death.

## PARENTING A CHILD WITH CHRONIC MENTAL ILLNESS-LIFE COURSE IMPACTS ON FINANCIAL AND OCCUPATIONAL WELL BEING AND LIFE ASPIRATIONS

S. Ghosh, *School of Social Work, Waisman Center, University of Wisconsin Madison, Madison, Wisconsin*

Research on caregiving in chronic mental illness (MI) has rarely explored the long term impact of caregiving on the financial and occupational well-being of caregivers. Most of the research has been cross-sectional, based and on purposive sampling. We use a prospective research design to assess changes in well-being as individuals become caregivers. We use three waves of the Wisconsin Longitudinal Study to study this phenomenon. Our analysis is based on data from 141 respondents with a son/ daughter with chronic MI (Bipolar and schizophrenia) and a comparison group of 1055 respondents without a child with any form of disability. Data is obtained across three life phases- early 30's, 50's and 60's, to assess changes in financial adequacy and occupational satisfaction over time. Results showed that while the caregiving and the non-caregiving group did not differ from each other in their early 30's, significant differences emerged in their 50's and 60's. The parents of children with MI reported lower rates of employment, aspirations and subjective rating of life achievements in their 50's. A decade later they also reported severe financial difficulty, a greater need to have a job that would provide health insurance and pension when compared to non-caregiving parents. The study brings into attention the chronic financial strains that caregiving parents may face over time and their changing life aspirations following the onset of disability in their children. Social workers have an important role to address the financial needs of these families to help them plan for the future.

### SOCIAL SUPPORT AND PERSONAL GROWTH: IS IT POSSIBLE TO FLOURISH FOLLOWING STRESSFUL EVENTS?

L. Pitzer, C.S. Bergeman, *University of Notre Dame, Notre Dame, Indiana*

Research has established that there is a potential for growth following adversity. Yet, not much attention has been given to the consideration of social support in explaining personal growth or decline following stressful events. Although other longitudinal studies have not found social support to be particularly predictive of growth following adversity, change in personal growth over time and the role of support has not been explicitly modeled. Associations between stressful events and personal growth over time were assessed to estimate how different supports may account for change in these associations. The sample included 337 participants (age range 53 to 92; M = 69.09, SD = 5.09) from the Notre Dame Study of Health and Well-Being (NDHWB) who reported experiencing one or more stressors over the previous 12 months (e.g., experienced a death, health problem; deterioration of living conditions; age range 53 to 92). Multilevel growth curve models revealed significant quadratic change in the association between stressors and personal growth. Interestingly, changes in personal growth not only depended on stressors (estimate = -.90, $p < .05$), but stressors also modified curvature in the personal growth trajectories (estimate = .44, $p < .01$). This association is further dependent on perceived support from friends; Slope (instantaneous rate of change; estimate = .07, $p < .05$) and curvature (estimate = -.04, $p < .05$). These results give evidence of how personal growth or decline after stressful events depends particularly on the level of perceived support from friends over time.

### THE IMPACT OF SOCIOECONOMIC INEQUALITIES AND LACK OF HEALTH INSURANCE ON PHYSICAL FUNCTIONING AMONG OLDER ADULTS

J. Kim, *The Ohio State University, College of Social Work, Columbus, Ohio*

Socioeconomic inequalities and lack of private health insurance have been viewed as significant contributors to health disparities. However, few studies have examined their impact on physical functioning across time, especially in later life. This study investigates the impact of socioeconomic inequalities and lack of private health insurance on individuals' growth trajectories in physical functioning over time. Data from the Health and Retirement Study (1994-2006) are used to estimate the effect of socioeconomic inequalities and lack of private health insurance on the initial level of physical functioning and its rate of change. Latent growth curve modeling (LGM) is used to analyze inter- and intra-individual changes in physical functioning over time as they varied according to socioeconomic status and health insurance coverage. Results show that income, assets, and having a private health insurance plan significantly predict level of physical functioning and rate of change in physical functioning over time. Interestingly, changes in economic status such as decreases in income and assets or lack of private health insurance have a greater impact on women's physical functioning than on men's. Although the initial level of physical functioning is notably lower among Blacks, they do not suffer more rapid declines in physical functioning than Whites. Antipoverty and health insurance policies should be enhanced to reduce the negative impact of socioeconomic inequalities on individuals' growth trajectories in physical functioning. Implications for practice and research are also discussed.

### AGE-RELATED TRAJECTORIES OF CHANGE IN PHYSICAL AND MENTAL HEALTH ACROSS THE ADULT LIFESPAN

J. Morack, F. Infurna, D. Gerstorf, *Pennsylvania State University, State College, Pennsylvania*

Maintaining health across the adult years is a key marker of successful aging. To help alleviate health declines in the future, it is pivotal to better understand the nature and correlates of normative health changes and the vast between-person disparities therein. Using seven-year longitudinal data (N = 8,500; M age at T1 = 44 years, range = 15 – 95; 52% women) from the Household, Income, and Labour Dynamics in Australia survey (HILDA), we applied growth models to examine trajectories of change for the physical and mental health components of the Short-Form 36 health survey. We also examined how gender, education, and personality relate to level and age-related changes in health. Our results suggest that measures of physical health already start to decline in midlife and show steep declines in old age. In contrast, measures of mental health were found to remain relatively stable across most of adult life with average decline not setting in before old age. Being a woman, lower education, neuroticism, and lower extraversion were each related to both lower levels of physical and mental health and steeper age-related declines. Our results illustrate prototypical rates of change for measures of physical and mental health and highlight the role of socio-demographic factors and personality in partially accounting for between-person inequalities. We discuss avenues for future research targeting possible pathways through which these health disparities occur (e.g., health behaviors).

### IS THE SOCIOEMOTIONAL SELECTIVITY THEORY AN ADEQUATE FRAMEWORK FOR THE UNDERSTANDING OF ASSOCIATIONS BETWEEN SOCIAL NETWORK CHARACTERISTICS AND LIFE SATISFACTION EVEN IN THE OLDEST-OLD?

A. Berg, ÅSA. Pedersen Wermelin, L.B. Hassing, B. Johansson, *Department of Psychology, University of Gothenburg, Gothenburg, Sweden*

Background: The Socioemotional Selectivity Theory, SST (Carstensen et al 1999) postulates that the perception of limitation in future time horizons across the lifespan causes changes in social preferences in order to enhance emotional regulation. However, the evidence of associations of the SST and actual time left to live in oldest-old samples is sparse. Aim: To investigate the importance of quality and size of social network for time-to-death related changes in life satisfaction (LSI-Z) over a 6-year interval. Method: The study uses data from the Swedish OCTO-Twin-study of relatively healthy individuals aged 80+ (N = 453). Results: MLM Growth curve analysis showed a significant decline in life satisfaction as individuals approached death. Quality and size of social network was significantly related to level, but not change in life satisfaction. There was a significant interaction between widowhood (used as a measure of social vulnerability) and size, but not the quality, of social network at wave 1. A large social network reduced the negative effect of widowhood on life satisfaction. Conclusion: Despite the convincing evidence for SST in younger old-age groups, our results question the validity of the SST in late life and highlight the importance of recognizing the specific condition and needs of the oldest-old.

### RESIDENTIAL TRANSITIONS: A COMPARISON OF A YOUNG ADULT AND OLDER ADULT SAMPLE

J.A. Flinn, *Frostburg State University, Frostburg, Maryland*

Although residential transitions can occur at any point in the life span, they can sometimes be seen as infrequent, albeit significant, events for older adults (Choi, 1996; Patrick & Strough, 2004). For younger adults, these transitions are often viewed as more commonplace and developmentally appropriate (Arnett, 2000). This analysis focused on a comparison of younger and older adults residential transitions. Participants' information was taken from a larger database, including 136 younger adults (M = 19.22, SD = 1.30: 58 M, 78 F) and 81 older adults (M = 73.17, SD = 7.76: 38 M, 43 F). Correlation analysis indicated a significant relationship between age and number of residences in the past 5 years, r(212) = -.26, $p < .01$, with younger adults experiencing more residential transitions than older adults in that time period. Yet despite this current period of stability, older adults were more likely to have experienced residential transition in their lifetime than younger adults, F(1, 210) = 55.99, p<.05. Finally, when evaluating a problem-solving vignette addressing the issue of residential relocation, there was no significant different between younger and older adults in rating the importance of the issue. In all, the findings seem to support the developmental pattern demonstrated in previous research. Additional results, including motivation for residential transition among older adults, will be discussed.

### LIFE EVENTS AND PERSONALITY INFLUENCING LONELINESS AMONG CENTENARIANS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY

R.B. Hensley[1], P. Martin[2], J. Margrett[2], M. MacDonald[3], L. Poon[4], *1. Psychology, The College of Saint Scholastica, Duluth, Minnesota, 2. Iowa State University, Ames, Iowa, 3. Kansas State University, Manhattan, Kansas, 4. University of Georgia, Athens, Georgia*

The purpose of this study was to analyze the role that both life events (life-time positive events and life-time negative events) and personality(Neuroticism, Trust, Competence, and Ideas) played in participants of the Georgia Centenarian Study. These variables were analyzed to determine whether they predicted loneliness. Analyses indicated that life-time negative events significantly predicted loneliness, β = .229, p. < .05. In essence, the higher the number of life-time negative life events, the higher the loneliness score. Moreover, Neuroticism, Competence, and Ideas, were all significant predictors of loneliness, β = .448, p. < = .001, β = -329, p. < = .001, β = .286, p. < = .001, respectively. The higher the level of Neuroticism and intellectual curiosity, the higher the level of loneliness, whereas the lower the level of Competence, the higher the level of loneliness. In addition, both life-time positive and life-time negative life events were significant predictors of Neuroticism, β = -.228, p. < = .05, β = .238, p. < = .05. The higher the number of life-time positive events, the lower the level of Neuroticism, and the higher the number of life-time negative events, the greater the level of Neuroticism. These results indicate that life-time negative events indirectly affect loneliness via Neuroticism. These results not only add to our understanding of the link between personality and loneliness, but also provide new insight into how life events influence loneliness as well.

### PERSON'S BELIEFS ABOUT DEVELOPMENTAL CHANGE

D. Grühn, Y. Cheng, *Psychology, NC State University, Raleigh, North Carolina*

Normative beliefs about personality development influence people's attitudes and behaviors towards different age groups. For example, do people believe that some attributes are more common for certain periods of the lifespan than for others? Do people expect changes in personality at certain life periods? There is a vast amount of research on attitudes towards older. Less is known, however, about attitudes toward different ages. Are adolescents, for example, perceived differently from young adults? To answer these questions, the authors investigated normative beliefs about personality development in young, middle-aged, and older adults. Participants specified the age-relevance for 1,017 adjectives covering a broad spectrum of personality characteristics. Age-relevance was determined by asking for each adjective whether or not it is typical for (a) any age decade from 0 to 99 years and (b) any 3-year-bin from 0 to 30 years. The pattern of findings differed for positive and negative person characteristics. Whereas the total number of ascribed positive characteristics peaked in young adulthood and declined thereafter, the number of ascribed negative person characteristics peaked during adolescence, remained fairly low during middle adulthood, and increased again in old age (70+ years). As a consequence, the most positive profile was ascribed to young olds (60 to 69 years), whereas the most negative personality profile was ascribed to the oldest old. Findings are discussed in the context of how normative beliefs about developmental change may change actual development.

### FAMILY SIZE MODERATES THE ASSOCIATION BETWEEN OFFSPRING DEATH AND RATE OF COGNITIVE DECLINE. THE CACHE COUNTY STUDY

M.C. Norton[1,5], D. Bradford[1], K. Smith[2], S. Schwartz[4], J. Tschanz[5], T. Østbye[3], C. Corcoran[4], K. Welsh-Bohmer[3], *1. Family Consumer & Human Development, Utah State University, Logan, Utah, 2. University of Utah, Salt Lake City, Utah, 3. Duke University, Durham, North Carolina, 4. Utah State University Department of Mathematics and Statistics, Logan, Utah, 5. Utah State University Department of Psychology, Logan, Utah*

A proposed mechanism for Alzheimer's disease (AD) is central nervous system injury through lifelong cumulative effects of stress. Death of a child is a non-normative experience often generating chronic stress. Offspring death has been linked with long-term increased risk for depression, mortality, malignancy, myocardial infarction, and cognitive impairment. In a population-based study of dementia, we followed 2841 elderly without dementia (58% female; age M=75.5, SD=7.3 years; education M=13.1, SD=2.8 years) with up to four measurements of the Modified Mini-Mental State Exam (3MS), over 10 years. Using genealogies and birth/death records from the Utah Population Database, we classified subjects as experiencing offspring death (n=491) vs. no offspring death (n=2350) prior to subject age 65, in "small" (1-2 children) vs. "large" (3+ children) families. Linear mixed models of cognitive change controlled for age, gender, education, and APOE genotype. Effect of offspring death was associated with significantly faster cognitive decline, but only among subjects with small families (p interaction = .002). Cumulative stress from offspring death may result in faster cognitive decline in late life. However, large families appear to provide some degree of buffering. Continuing work will examine timing of offspring death in terms of both parent's age and child's age at the time of the death of the child, as well as the effect of offspring death later in life.

## SESSION 2105 (SYMPOSIUM)

### NOVEL INTERVENTIONS TO DECREASE TRANSITIONS TO ACUTE CARE

Chair: *S.L. Szanton, School of Nursing, Johns Hopkins University, Baltimore, Maryland*
Discussant: *P. Archbold, American Academy of Nursing, Washington, District of Columbia*

A key objective of the public health agenda is to reduce unnecessary hospitalizations and hospital re-admissions. However, while most health care research is conducted in institutional settings, most decisions about managing chronic conditions that make older adults vulnerable to hospitalization are made by older adults within their home settings. This symposium highlights novel, interdisciplinary research and practice models implemented in older adults' homes. The four presenters included in this symposium are conducting studies or clinical practices in older adults' homes to prevent transitions between home and institutional settings. Dennison and colleagues present the Navigator study. This study intervention recruits African American older adults with heart failure (HF) while they are in the hospital for a HF admission and provides a home educational and behavioral intervention, including tele-health to improve self care and prevent repeat re-hospitalization. Szanton and colleagues present the CAPABLE study. This study intervention provides bio-psycho-social-environmental services to older adults with ADL limitations to prevent hospitalization, nursing home admissions, and falls. Ornstein and colleagues present lessons from the largest geriatric physician house-calls program in the U.S. This program provides complete medical and mental health care to older adults to prevent emergency hospitalization. Tanner and colleagues present the CHEERS study which reports risks among older adults that lead to poor transitions and loss of independence when living in the community setting.

### THE MOUNT SINAI VISITING DOCTORS PROGRAM: A HOME-BASED PRIMARY CARE PROGRAM SERVING THE URBAN HOMEBOUND

K. Ornstein[2,1], L. DeCherrie[1], T. Soriano[1], *1. visiting doctors program, mount sinai, New York, New York, 2. columbia university, new york, New York*

The Mount Sinai Visiting Doctors program, a joint program of Mount Sinai Medical Center's Departments of Medicine and Geriatrics, is a multidisciplinary teaching, research, and clinical care initiative serving homebound adults in Manhattan since 1995. Caring for 1,000 patients annually, the program's providers make more than 6,000 urgent and routine visits each year, making it the largest program of its kind in the country. Services include 24-hour physician availability, palliative care, social work case management, collaboration with nursing agencies, in-home specialty consultation, and transitional care coordination by nurse practitioners. The patients served are primarily frail elderly individuals with complex needs, many who have previously received inadequate or inconsistent medical care. The program is designed to reduce lengthy and unnecessary hospitalizations for the homebound. Program participation is associated with decreased symptom burden for patients, increased vaccination coverage and advanced directives documentation, and decreased burden and unmet needs for caregivers.

### NURSE-LED HEART FAILURE CARE TRANSITION INTERVENTION (THE NAVIGATOR STUDY)

C.R. Dennison, *School of Nursing, Johns Hopkins University, Baltimore, Maryland*

Heart failure (HF) affects over 5.7 million Americans and costs $37.2 billion annually, with African Americans (AAs) and older adults disproportionately affected. Deficiencies in quality exist for patients undergoing transition across HF care settings, resulting in conflicting recommendations regarding HF self-care and medication regimen, inadequate follow-up, and inadequate preparation to coordinate care. To address these gaps, we have developed an innovative care model to improve HF care transition. The HF care transition intervention (HFCTI) is delivered by a nurse-community heath navigator team to AAs with HF and their caregivers. HFCTI components include medication and symptom self-care support, telemonitoring, and a personal HF care record. In a randomized controlled trial, we are testing the effect of the HFCTI on care transition, HF knowledge, HF self-care, and healthcare utilization. Key learnings from the intervention refinement phase, which included patient focus groups, clinician stakeholder assessments, and telehealth device feasibility testing, will be presented.

### A MULTI-COMPONENT PILOT TO ENHANCE AGING-IN-PLACE CAPACITY FOR LOW-INCOME OLDER ADULTS

S.L. Szanton[1], E. Tanner[1], E. Agree[1], C. Boyd[1], C. Weiss[1], J. Guralnik[2], L.N. Gitlin[3], *1. School of Nursing, Johns Hopkins University, Baltimore, Maryland, 2. National Institute on Aging, Bethesda, Maryland, 3. Thomas Jefferson University, Philadelphia, Pennsylvania*

One significant health disparity is in low-income older adults' ability to safely "age in place." Increased risk of disability and decreased functionality of low-income homes lead to a wider gap between function and environmental stress than those of higher income. The Community Aging in Place –Advancing Better Living for Elders (CAPABLE) pilot is a client-centered, multi-disciplinary home-based intervention to increase capacity to "age in place" for low-income older adults. CAPABLE is comprised of a previously proven occupational therapy intervention (ABLE program), a client-centered nurse intervention and safety/modification handyman services. Each service synergistically builds on the others by increasing the participants' bio-psycho-environmental capacity to function at home. This is theorized to avert costly health utilization by increasing medication management, problem-solving ability, strength, balance, nutrition, and home safety, while decreasing isolation, depression, and fall risk. The goal of the pilot is to assess feasibility, titrate intervention dose, and develop tri-service coordination.

### THREATS TO INDEPENDENCE AND AGING-IN-PLACE AMONG HIGH RISK OLDER

E. Tanner, *School of Nursing and Center on Aging and Health, Johns Hopkins University, Baltimore, Maryland*

Adults care coordination is critical to improving transitional care, reducing admissions and maintaining independence in older adults with co-morbidities. The CHEERS study examines threats to independence when community-dwelling older adults lack comprehensive care coordination. The sample (n=553) is 76.1% female, 1.8% white, with a mean age of 78.5. Fifty eight% reported functional dependence; 61.5% lived alone; 91.4% reported ≥ 2 chronic illnesses and 36% were depressed (GDS-SF>5). Logistic regression indicated loneliness, family support, functional status and diabetes were significant predictors of depression. Those with increased functional dependence had an increased odds of depression (OR=1.5). In contrast, those with increased family support had lower odds of depression (OR=0.69). Loneliness, family support, functional status, and diabetes were related to depression in older adults at risk for poor transitions of care. Care coordination strategies to promote aging-in-place should be developed to assist older adults with such risks.

## SESSION 2110 (SYMPOSIUM)

### PHYSIOLOGICAL STATUS RELATED TO QUALITY OF LIFE IN OLDER ADULTS

Chair: *K.F. Tennant, Ohio University - Nursing, Athens, Ohio*
Co-Chair: *S.Y. Hawkins, Yale University, New Haven, Connecticut*
Discussant: *J. Uriri-Glover, Arizona State University, Phoenix, Arizona*

Most studies of life at older ages have found that a person's health is associated strongly with their quality of life (Gabriel & Bowling, 2004; Netuveli, et. al., 2005; Wiggins, et. al., 2004). All of these studies relied on respondent's self-reports of health status, functional limitation, activities of daily living and so forth, which leaves the possibility that some third variable was influencing the self-reports of both health and quality of life (QOL). This third variable may indeed be objective measures of physiological status such as blood pressure, glycemia, fatigue and cognition. Therefore, conducting collaborative nursing research that includes physiological measures along with health status can contribute to the body of gerontological knowledge and ultimately improve the quality of life of older adults. The purpose of this research symposium is to explore research related to a variety of physiological processes that impact the QOL of older adults. Two presenters in this symposium will discuss factors related to specific physiological challenges in vulnerable populations including: malglycemia in older adults with cancer and fatigue in rural elderly. The other two papers will explore the relationship between cognition and physical activity and the mother/daughter relationship in managing hypertension. All of these papers represent research conducted by participants of the Hartford Institute for Geriatric Nursing Summer Scholars Program. Research outcomes will be directed toward innovative interventions for geriatric nurses and interdisciplinary professionals to help older adults manage their health and enhance their QOL.

### MONITORING GLYCEMIC STATUS FOR INFECTION CONTROL IN OLDER ADULTS WITH CANCER

M.J. Hammer, *College of Nursing, New York University, New York, New York*

Patients with cancer are susceptible to infections due to immunosuppressive states from the malignancies and related treatments. Evidence is emerging about the contribution of abnormal glycemic status, newly termed malglycemia (defined as hyperglycemia, hypoglycemia, or increased glycemic variability), to infections and related complications in patients with hematological malignancies receiving hematopoietic cell transplantation. New investigations are evaluating the influence of malglycemia in other cancer populations. Older age is a risk factor for both malglycemia, particularly hyperglycemia, and infections. Furthermore, there is a higher prevalence of diabetes and cancer in older adults compared to younger groups. Ultimately, glycemic control may significantly contribute to infection control and prevention in patients with cancer, particularly among older adults with cancer. Understanding the many contributors to malglycemia and monitoring glycemic status in older adults with cancer may be essential tools for better infection control.

### THE LIVED EXPERIENCE OF UNEXPLAINED FATIGUE IN RURAL ELDERLY

K.F. Tennant[1], B. Clark[2], J. Gau[3], D. Russ[4], *1. Nursing, Ohio University, Athens, Ohio, 2. Ohio University, Athens, Ohio, 3. Ohio University, Athens, Ohio, 4. Ohio University, Athens, Ohio*

Fatigue is a common complaint among the elderly and is strongly associated with the loss of independence. Fatigue is subjective and quantified differently among studies. Therefore, comparative research between different instruments and the correlation between quality of life (QOL) measures and physical functions will help us understand the impact of fatigue on older adults. This pilot study used a mixed method design: a non-experimental, exploratory design and a qualitative, grounded theory approach. Data was collected from older adults (70+ years) using twelve functional assessment instruments including the Fatigue Severity Survey (FSS); the FACIT Fatigue Scale; and a qualitative interview (four open-ended questions) developed by the researchers. Data were analyzed using correlation and regression models to explore the relationship between fatigue scores and QOL measures. Preliminary results suggest that rural Appalachian older adults with higher scores of fatigue have a poor QOL.

### COGNITION AND PHYSICAL ACTIVITY LEVEL AMONG OLDER ADULTS IN CONTINUING CARE RETIREMENT COMMUNITIES

E.P. Howard, *1. Northeastern University, Boston, Massachusetts, 2. Institute for Aging Research Hebrew SeniorLife, Boston, Massachusetts*

Using 1,970 older adults residing in continuing care retirement communities, this project examined the interplay between cognitive status and physical activity level, identifying those willing to seek help. The largest stratum (50%) had good cognitive and physical activity traits. Phenotypes within this stratum were content individuals (25.6%), cognitive strivers (10.5%) and physical strivers (13.9%), with strivers interested in improving their performance. The second stratum was older adults with good cognitive and poor physical activity (45%). Three phenotypes in this stratum were sedentary (17.4%), cognitive strivers (7.3%), and physical strivers (20.3%). Sedentary individuals were content with their cognition and physical activity level and not interested in improvement programs. The final stratum was poor cognition (5%) with two phenotypes, cognitive strivers (2.4%) and resigned (2.6%) or not interested in improving cognition. Targeting older adults with interest in improving cognition and physical activity level, regardless of current status is supported by this analysis.

### TRANSITIONS IN OLDER MOTHERS AND ADULT DAUGHTERS: HOW HIGH BLOOD PRESSURE BEHAVIORS ARE MODIFIED

C. Shawler, *School of Nursing, University of Louisville, Louisville, Kentucky*

The purpose of this study was to examine effects of self-rated health, comorbid health conditions, and blood pressure on Body Mass Index (BMI) and low-salt diet adherence. The sample was older mothers (n=51) with high blood pressure (mean age 77+ 7.2) and their adult daughters. Measures for this analysis were the Cantril ladder, Charleson Cormorbidity Questionnaire (CCQ), BMI, and low-salt diet adherence. Dyadic data were analyzed using Actor-Partner Interdependence Model (APIM) with distinguishable dyad-based regression. Significant findings included actor effects for both mothers and daughters for CCQ and low salt diet, daughters' actor effect of self rated health and BMI, partner effect of mothers' CCQ with daughters' low salt diet and partner effect of daughters' diastolic blood pressure and mothers' low salt diet. Implications for research and clinical practice include the importance of acknowledging that high blood pressure management involves both members of the mother-daughter dyad.

# SESSION 2115 (POSTER)

## PRODUCTIVE ACTIVITY AND CIVIC ENGAGEMENT

### EVALUATION OF A REGISTRY OF OLDER VOLUNTEERS PARTICIPATING IN AGEING RESEARCH

N.M. Peel[1], N.A. Pachana[2], *1. The University of Queensland, Herston, Queensland, Australia, 2. The University of Queensland, St Lucia, Queensland, Australia*

The University of Queensland 50 + Registry provides a pool of potential older volunteers for participation in a diverse range of University-based research. Data from a prior survey of Registry researchers indicated that solicitations for participants came roughly equally from student researchers and academics. However, academic researchers were better placed to pay for Registry access costs. Similarly, data from participants showed they were very positive about their experiences, and appreciated the opportunity to contribute to research into ageing issues. However, having more participants in the data pool would boost participation rates while avoiding participant burnout. Two initiatives addressed the issues of better access for student researchers and a broader participant pool. Access to the Registry was made free, with costs of newsletters and minor personnel time gradually covered by commercial sponsorship of the newsletter. An unexpected benefit of moving solicitation of participants from direct mailout to simply responding to researcher "ads" placed in an informative and engaging newsletter was to give participants a greater ability to take control of their own participation. This also allowed participants to give the newsletter to others, thereby increasing research participation as well as requests to be added to the Registry. Maintenance of such research registries can be expensive and time-consuming; better models are clearly needed. Such Registries can not only enhance University-based research efforts, particularly for student-led research, but also involve the community more fully in the research process.

### DAILY ACTIVITIES OF URBAN, OLDER ADULT VOLUNTEERS: FINDINGS FROM THE BALTIMORE EXPERIENCE CORPS® TRIAL

J.M. Parisi[1], M. Carlson[1], Q. Xue[2], T. Seeman[5], L.P. Fried[4], E. Tanner[3], E.J. Tan[2], G. Rebok[1], *1. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 2. Johns Hopkins School of Medicine, Baltimore, Maryland, 3. Johns Hopkins School of Nursing, Baltimore, Maryland, 4. Columbia University, Mailman School of Public Health, New York, New York, 5. University of California Los Angeles, David Geffen School of Medicine at UCLA, Los Angeles, California*

Remaining active may potentially reduce disability in later adulthood. Individuals most likely to benefit may be high-risk older adults; including African American elders and those with less education; however, little is known about engagement within these populations. Within the context of Baltimore Experience Corps®, a volunteer program designed to increase physical, social, and cognitive activity, this research characterizes participation in activities for study participants prior to randomization to the trial. For these analyses, older adults (N = 675; M = 67 years, SD = 5.95) were selected if they completed the Lifestyle Activity Questionnaire and measures of global cognition (MMSE) and verbal performance (WRAT). Over the past year, the most frequently reported activities were daily activities (e.g., preparing food), watching television, and listening to radio. Participation in specific activities was significantly related to cognition, such that individuals demonstrating better performance on cognitive measures (MMSE and WRAT) reported taking courses and using a computer to a greater extent. Additionally, individuals with higher MMSE scores more frequently engaged in volunteering and work; whereas, those with higher WRAT scores more frequently discussed local or national issues. Furthermore, individuals with greater education participated in a wider variety of activities ($r = .14$, $p < .01$); whereas, individuals in poorer health (self-reported) reported less participation in activities ($r = -.20$, $p < .001$), as well as demonstrated less variety in choice of activity ($r = -.15$, $p < .001$). In conclusion, individual differences in cognition, health, and education may influence activity patterns in adulthood.

### PREDICTING PROSOCIAL ENGAGEMENT AMONG OLDER ADULTS IN THE HEALTH AND RETIREMENT STUDY

G. Harris[1,3], H. Shin[2,3], R.S. Allen[1,3], *1. The University of Alabama, Department of Psychology, Tuscaloosa, Alabama, 2. The University of Alabama, School of Social Work, Tuscaloosa, Alabama, 3. The Center for Mental Health and Aging, Tuscaloosa, Alabama*

Faced with an aging population, social services struggle to offer programs that encourage productive participation of older adults in society. Interest in understanding older adults' prosocial behavior is growing. According to an Independent Sector survey, 44% of adult Americans actively volunteer at a variety of organizations, and numerous Americans participate in informal helping behavior. However, little research has examined the characteristics of older adults who engage in these forms of prosocial behavior. Using data from the 2008 wave of the Health and Retirement Study, we sought to examine how demographic and psychological factors as well as micro and macro social factors impact informal helping and formal volunteering. A secondary data analysis of a sample of 3479 community dwelling older adults was conducted for this study. Results of two binary logistic regression analyses revealed a different pattern of factors predicting the two forms of prosocial behavior. Helping behavior and volunteering were more likely to be reported by males, participants with more education, those with higher self-rated health, better cognitive ability, those who attend church more frequently, participants with higher positive affect and participants who scored higher on an Extraversion personality factor. Helping, but not volunteering, was more likely to be reported by Caucasians (when compared with African Americans and participants reporting a race/ethnicity other than African American or Caucasian), younger respondents, and those with a greater sense of neighborhood social cohesion. Knowing the characteristics of people who engage in prosocial behavior may assist social services in recruiting potential helpers and volunteers.

### OLDER ADULTS' AND TEACHERS' PERCEPTIONS OF PARTICIPATION IN INTERGENERATIONAL COMMUNITY PROGRAMS

T.L. Young, M. Janke, *School of Aging Studies, University of South Florida, Tampa, Florida*

Intergenerational programs involving school age children can also benefit older adults and teachers. To maximum and increase the benefits of participation, it is necessary to understand older adults' and teachers' concerns related to adults' involvement in these programs. However, little is known regarding older adults' concerns and even less literature explores teachers' concerns with adults' involvement. Therefore, this study examined perceptions of teachers' and older adults' concerns related to their participation in an intergenerational program prior to and after completion of their participation. The sample included older adults (n=195) and teachers (n=58) involved in The Linking Intergenerational Networks in Communities (LINC) Project, a statewide collaborative program offered in seven communities in South Carolina. Descriptive analyses and t-tests were conducted to examine the data. Findings suggested that prior to program participation older adults' greatest concerns were related to their ability to carry out LINC activities, their attendance, and the youths' responsiveness. Teachers were more concerned about the adults' ability to carry out LINC activities, communication with them, and the students' responsiveness. At the end of the program, older adults reported the school environment and youths' behavior as the main problems associated with their involvement. Teachers reported students' responsiveness and the older adult's health and attendance as major problems during the program. No significant differences in means were found among teachers' assessments of concerns and problems over time. Implications for assessing and incorporating participants' concerns prior to program implementation and the impact of their perceptions on program efficacy will be discussed.

### REVISITING RACE AND GENDER AS CONTEXTS FOR UNDERSTANDING HOW RESOURCES AFFECT PRODUCTIVE ACTIVITY

B. McIntosh[1], N. Danigelis[2], *1. School of Business Administration, University of Vermont, Burlington, Vermont, 2. Department of Sociology, University of Vermont, Vermont*

Interest in elders' productive activity has grown over the last half-century (Maddox, 1963; Butler and Gleason, 1985; Freedman, 2007). Currently, more attention is directed toward paid work, but productive activity also involves unpaid work in the home (e.g., care giving) and unpaid work outside the home (e.g., volunteering) (Arno et al., 1999). Survey data from the 1986 Americans' Changing Lives Study (ACL) showed that time use demands fall differently on race and gender subgroups, however, and are dependent in part on available resources (Danigelis and McIntosh, 1993). Difference of means and OLS regression results from diary data in the 2006 & 2007 American Time Use Surveys (ATUS) identifies current productive activity patterns among older (aged 65+) white males (N=1,329), black males (N=155), white females (N=1,780), and black females (N=226). Specifically, white females spend the most time in all productive activities followed in order by white males, black females, and black males. This contrasts with the 1986 ACL findings where the order was white females, black females, black males, and white males. Once resources like health and income are controlled, overall productive activity comparisons show that, within gender, whites do more productive activity than blacks, but the difference is significant only for women. Within race, women are significantly more productive than men for both whites and blacks. The ACL data showed the race difference among women to be non-significant; all other findings agreed. Comparisons between ACL survey and ATUS diary data are discussed in terms of method, theory, and social policy.

### APPROACHING CIVIC ENGAGEMENT OF MINORITY ELDERS: FROM INSTITUTIONAL TO SOCIAL CAPITAL AND BACK AGAIN

L. Holley, K. Kosloski, *Department of Gerontology, University of Nebraska at Omaha, Omaha, Nebraska*

This presentation describes evaluation and responsive re-design that has driven evolution of a series of service learning projects intended to enhance civic engagement of minority elders over eight consecutive semesters since 2006. Supervised by the same professor, each semester self-directed student teams conducted projects with four nonprofit organizations; each organization serves a different minority (African, Chinese, Latino and Native Indian Americans). Per semester, total community participants ranged from 43 to 60 older adults and 39 to 64 children. The initial approach was institutional and informational; it engaged elders in focus groups that reviewed public information about

Medicare and Medicaid. Evaluation of outcomes indicated modest increases in elders' awareness and interest, but revealed barriers that had to be addressed antecedent to their civic engagement, e.g. elders were socially isolated, felt culturally irrelevant, and trusted few public institutions. These findings suggested redirection of interventions toward building relevance and "social capital" (McBride, 2006-7; Holstein, 1999; Skocpol, 1999; Verba, 1995). The next projects were social activities for the elders. Evaluation of the age-segregated social activities then led to the current and most effective intervention - intergenerational activity in which elders collaborate to transfer their ethnic culture to the younger generation. Although a different format was effective for each group, engaging older minority adults in intergenerational transfer of culture was effective in all groups. The final step in this phase of intervention is working with elders and the organizations that serve them to institutionalize their planning and evaluation processes and ensure sustainability of the intergenerational activity.

### PREDICTING VOLUNTEER PARTICIPATION IN HEALTH CARE SETTINGS AMONG SENIOR VOLUNTEERS IN KOREA

H. Shin, E.L. Csikai, *The University of Alabama, Tuscaloosa, Alabama*

The rapidly aging population in Korea includes increases among healthy older adults and older adults who need assistance. Older adults are encouraged to remain connected with their communities through volunteer programs as one way to enhance healthy aging and through these activities it may be possible to meet needs of older adults in various health care settings as well. However, little is known about the willingness of senior volunteers to work in such settings with older adults rather than in settings involving work with children and families. In this study, a face-to-face questionnaire was conducted with 90 senior volunteers (ages 61-84) at one Korean community center. Variables measured were willingness to volunteer in health care settings with older adults, such as in hospitals, hospices, and nursing homes, and the factors that influenced their preferences. Only 34.4% of the senior volunteers indicated that they were willing to volunteer in health care settings with older adults. In addition, those who were willing to volunteer in a hospital, hospice, or nursing home reported only a moderate level of willingness. Attitudes toward older adults and levels of fear/anxiety about death and dying were not significant predictors of willingness to volunteer in health care settings with older adults. The results of this study may provide insight into important factors to address in the development of strategies to involve seniors in volunteer activities and to meet increasing demands on the health care systems.

## SESSION 2120 (SYMPOSIUM)

### RELIGIOUSNESS AND SPIRITUALITY IN END-OF-LIFE CONCERNS

Chair: *J.H. Patrick, Psychology, West Viginia University, Morgantown, West Virginia*
Co-Chair: *D. VonDras, University of Wisconsin, Green Bay, Wisconsin*
Discussant: *B. Hayslip, University of North Texas, Denton, Texas*

Similar to other attitudes, beliefs and behaviors, religiousness and spirituality may change over time and in concert with life events. This symposium examines the ways in which religousness and spirituality influence coping with normative and non-normative life events related to end-of-life concerns. Thus, this collection of papers discusses the theoretical underpinnings of religiousness as a coping resource, normative age differences in the way religiousness mediates death anxiety, and the ways in which religiousness influences adults in non-normative roles, including veterans and caregiving grandparents.

### SPIRITUALITY AND RESILIENCE AMONG DISABLED VIETNAM VETERANS

E. Covan, *Health and Applied Human Sciences, UNC Wilmington, Wilmington, North Carolina*

Vietnam veterans and wise therapists who treat them for Post-Traumatic Stress Disorder report that resilience following combat induced trauma depends on social connections with those who have shared similar experiences. Veteran expressions of spirituality reflect social engagement as discussed by Stancza and Miller in their work on spiritual and social transformation in Mainstream American Religious Traditions (2004). Aging veterans attend reunions and organize pilgrimages to Vietnam Memorials to foster connectivity. Life histories of a small sample of veterans will be discussed to explain why hospitalized strangers who complete treatment programs leave as "surviving therapy brothers," anxious to bear witness and to devote the rest of their lives to helping other veterans. How such resilience persists, even among veterans who are considered to be 100% disabled by United States Department of Veterans Affairs and among those who are terminally ill, will be discussed.

### ATTITUDES AND PREFERENCES OF AFRICAN AMERICAN CUSTODIAL GRANDPARENTS ON ADVANCE CARE PLANS

C.S. Huang[1,2], M.R. Crowther[1,2], R.S. Allen[1,2], *1. Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, University of Alabama, Tuscaloosa, Alabama*

Studies show that African Americans are less likely to make advance care plans than Whites. This tendency is also true of African American custodial grandparents. With the rapid increase of this population, there is a need to better understand the role of caregiver status and culture in advance care planning. The present study examined advance care plans among 22 female African American custodial grandparents (mean age=55). We found that 74% have plans regarding who will provide care for grandchildren if they become incapacitated but only 11% had a living will completed. None had discussed ACP with pastors; and only 21% with physicians. The findings suggest that custodial grandparents think about advance care plans but need assistance discussing a plan and subsequently implementing a plan. Methods to enhance advance care plans for this population along with culturally sensitive methods to increase the utilization of advanced care plans will also be discussed.

### RELIGIOUSNESS, RELIGIOUS DOUBTS, AND DEATH ANXIETY AMONG ADULTS

J. Henrie, J.H. Patrick, *Psychology, West Virginia University, Morgantown, West Virginia*

Consistent age and gender differences in death anxiety have been demonstrated, with females (e.g., Harding et al., 2005) and younger individuals (e.g., Rasmussen & Brems, 1996) having higher death anxiety. Using three groups, younger adults (N = 523, 73.8% female, age 18 to 30 years, mean age = 20.05), middle-aged adults (N = 89, 79.8% female, 31 to 56 years, mean age = 46.57), and older adults (N = 44, 75% female, 56 years or older, mean age = 62.82), two hierarchical regressions were conducted to determine if those relations were mediated by religiousness and spirituality. The relations were partially mediated. Religious beliefs and doubts were significant predictors in both regressions. Organizational religiousness was only significant when using the DAS-E (Templer et al., 2006). Spirituality and religious meaning were not significant in either regression. Results are discussed in terms of age differences in the use of religiousness/spirituality as a resource.

## SESSION 2125 (SYMPOSIUM)

### SITUATING STIGMA IN THE SOCIAL CONTEXT OF SENIOR HOUSING

Chair: *J.K. Eckert, Center for Aging Studies, University of Maryland, Baltimore County, Baltimore, Maryland*
Discussant: *M. Ball, Georgia State University, Atlanta, Georgia*

Stigma and the Cultural Context of Residential Settings for the Elderly is a large-scale, ethnographic study (NIA funded) examining the experience and social construction of stigma in seven diverse senior housing settings in the Mid-Atlantic region of the U.S. Moving to restricted senior housing settings (active adult communities, IL, AL and CCRCs) is on the rise and is often associated with circumstances that may be potentially stigmatizing, e.g., not being able to live alone and/or maintain one's home because of physical or cognitive decline. One goal of multi-level senior housing is to soften the potentially negative effects of stigma associated with physical and cognitive decline by fostering aging in place as care requirements change. While the provision of multiple levels of care in one setting offers the promise of aging in place, it also creates personal and social challenges for residents who struggle to manage conditions that may threaten their autonomy and residential stability. This symposium examines how older adults define stigmatizing traits in themselves and others and how such traits influence social dynamics and personal behaviors in three types of settings: an active adult community, IL with AL, and CCRC. While guided by the theoretical frameworks of Goffman, Link and Phelan among others, the focus of the study is to identify the emergent definitions and components of stigma operating in these settings. Understanding the social construction of stigma in specialized adult settings offers the possibility of improving the ability of residents, family and staff to counter their negative effects.

### 'I WOULDN'T SAY THEY'RE SENILE; IT'S OLD AGE' – DIMENSIONS OF STIGMA IN SENIOR HOUSING

A. Frankowski[1], E. Roth[1], J.K. Eckert[1], L. Morgan[1], R. Rubinstein[1], S. Zimmerman[2], *1. UMBC, Baltimore, Maryland, 2. Univ of North Carolina, Chapel Hill, North Carolina*

Contemporary theorists, building on Goffman's classic definition of stigma as a spoiled identity with 'marked' individuals being easily discredited or discreditable, consider the process of stigma to be situationally specific, dynamic, complex, and nonpathological. Thus, as a socially constructed phenomenon, the consequences of stigma are a function of the meaning that the situation has for the people with valued and devalued identities. In this paper we explore the complexity of identifying stigma in situations where some social groups tolerate generalized societal stigmas while other social groups distance themselves from them. Focusing on residents, management, and direct care staff, we examine the stigma-oriented cultures of five senior housing sites – their interactional and symbolic systems – to explore the situational dimensions of stigma which are related to attitudes toward aging, dementia, and frailty; socio-economic status; and senior housing residents' transitioning to higher levels of care.

### "SWEETIE" AND THE SOUR EFFECT OF AGEISM IN LONG-TERM CARE

E. Roth[1], A.D. Peeples[1], J.K. Eckert[1], D.J. Dobbs[2], *1. Center for Aging Studies, UMBC, Baltimore, Maryland, 2. University of South Florida, Wesley Chapel, Florida*

Ageism is perhaps the most insidious aspect of stigma in long-term care. It is a well-documented cultural and social reality in mainstream North American culture. And despite efforts to counteract this negative force in senior housing, especially efforts by the assisted living movement, these settings are not immune (Butler). At times infantilizing and condescending, a setting's rules, policies and practices often reinforce ageism. In this presentation we describe some of the patterns of ageist attitudes and behaviors exhibited by staff and administrators, and examine individual and group's varied interpretations and reactions. We also recognize the ways seniors generalize and deride young staff members. We will explore the impact ageism has had upon the people who work and live in these senior care housing settings.

### CUL-DE-SAC LIFE AND THE POTENTIAL FOR STIGMA IN AN ACTIVE ADULT COMMUNITY

L. Keimig, E. Roth, *University of Maryland Baltimore County, Baltimore, Maryland*

While active adult communities (AAC) for ages 55+ have developed rapidly in recent years, little is known about how individuals in these settings contend with changes in physical functioning and cognition over time. This research explores the experiences of neighbors aging together in an AAC. Our findings indicate that residents openly help one another in times of need, up to a point. When neighbors sense that their support may no longer be enough, they seek to involve adult children or nurses to arrange home care, or a move to assisted living. As such, a sense of vigilance exists in this setting that is at once caring and potentially stigmatizing. While living in a place where everyone is aging leads generally to tolerance and empathy for age-related changes; at times, decline may be met with denial, to defer relocation. Implications for policy initiatives concerning the reality of aging-in-place will be addressed.

### FROM CLASHES TO CLIQUES: TAMING THE DINING EXPERIENCE IN SENIOR HOUSING COMMUNITIES

M.C. Nemec, A. Frankowski, J. Schumacher, L. Keimig, R. Hrybyk, S. Goldman, *Center for Aging Studies, University of Maryland, Baltimore County (UMBC), Baltimore, Maryland*

A common transition in older adults' lives is relocation to senior housing communities where food and meal time represent a vital component of everyday life. Residents are thrust into communal dining rooms where they are faced with eating alone, an assigned seat, or choosing dining companions. Varied management styles, community rules, corporate regulations and the complexity of personalities complicate this experience. In this paper, we explore the social interaction in the dining room of five senior housing communities observed over a 2-1/2 year period. Our preliminary findings indicate that (1). Residents in multi-residential senior housing communities struggle with the loss of control, social anxiety, and potential alienation/isolation, all exacerbated by meal times; and (2). The actions of management, staff, and other residents result in residents feeling disempowered. The challenges of dining room interaction as well as suggestions for a positive meal time experience will be discussed.

### "IT'S PART OF THE BRAIN, IT'S NOT THE PERSON": CULTURAL DIFFERENCES IN STAFF PERSPECTIVES OF RACIAL STIGMA IN SENIOR HOUSING COMMUNITIES

B. Harris-Wallace[1], S. Goldman[1], E. Roth[1], A. Frankowski[1], S. Zimmerman[2], *1. University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of North Carolina, Chapel Hill, Chapel Hill, North Carolina*

Scholars have examined at length the relationship between racial prejudice and stigma. A common theme within our work addresses the issues of cultural diversity and sensitivity in senior residential housing communities, and suggests that race/ethnic differences play a role in social relationships in these settings. Drawing from in-depth interviews with staff and administrators, this presentation will explore differing staff perspectives in how stigma related to race/ethnicity presents in various senior housing environments. Preliminary findings indicate that while staff members are encouraged to be understanding of resident prejudices, they are also acutely aware of the fear and negative labels/comments residents assign to minority groups. Conclusions address the extent to which stigmatizing interpersonal and intergroup traits that influence social dynamics in the setting can be reduced and suggests possible interventions to address potential and actual conflict areas, such as education and training.

## SESSION 2130 (PAPER)

## SOCIAL SUPPORT: CULTURAL VARIATIONS

### ETHNICITY AND DETERMINANTS OF COMMUNITY SUPPORT IN BRITAIN

R. Willis, K.F. Glaser, D. Price*, King's College London, London, United Kingdom*

In Britain, as in the USA, there is a persistent belief that minority ethnic groups provide greater levels of informal support than do the white majority population. Academics in Britain usually dismiss this as a stereotype. However, in the USA there is a tradition that cultural values of minority ethnic groups may be related to support transfers with neighbours and friends. Other determining factors for support transfers, notably socio-economic status, have also been noted to differ between ethnic groups. This study reports a secondary analysis of the Home Office Citizenship Survey. This is a nationally representative dataset of England and Wales, containing a minority ethnic boost sample. Respondents aged 55 and over who gave practical help and support to non-relatives, and who received help and support from non-relatives, were studied. The Andersen behavioural model was used to structure the statistical analysis. A four-stage logistic regression analysis was used to predict informal support transfer. Five of the minority ethnic groups had significantly lower odds of giving informal support to non-relatives when compared to the White British reference group, and controlling for need, predisposing and enabling factors. In contrast, only one minority ethnic group had significantly lower odds of receiving informal support from non-relatives. The direction of the ethnic group findings opposed the assumption that minority ethnic groups provide greater levels of community support in comparison to the White British population. Other significantly predictive factors were illness, disability, gender, socio-economic status, and marital status.

### THE CHANGING UTILIZATION OF SOCIAL SUPPORT AMONG COMMUNITY-DWELLING CHINESE OLDER ADULTS IN CHICAGO CHINATOWN – A QUALITATIVE STUDY

E. Chang[1], M.A. Simon[2], E. Wong[3], K.A. Skarupski[1], B. Wong[3], X. Dong[1]*, 1. Rush Institute for Healthy Aging, Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois*

Background: Understanding the effectiveness of social support among Chinese older adults is instrumental in designing culturally appropriate service delivery programs to this population, who may be at higher risk of psychosocial distress. Methods: This study aims to qualitatively assess Chinese older adults' perceptions and utilizations of social support. Data were collected via four focus groups, each consisting of 9-10 Chinese elderly (age 60+) immigrants, residing in Chicago's Chinatown. Results: Similar to previous studies, we found that family support is identified as the most desirable relationship that occurs through elders' social network. However, among this population, support from family remains least satisfactory due to unfulfilled expectations. Some elders hesitate to turning to adult children for fear of becoming "an old burden" to their adult children, and fearing the loss of their parental role if they play the role of "a pauper." Still others are "active help seekers" in that they have replaced family support with community support. Thematic analysis further demonstrates that positive aspects of social support are often associated with community resources, whereas negative aspects are linked with family conflicts and disputes. Local community social service agencies that offer cultural and linguistic services become the immediate and primary resource of support when family care— albeit preferred— is not obtainable. Discussions: Future investigations are needed to understand the cultural and generational shift in social support and its relationship to mental health interventions in the immigrant Chinese aging population.

### SOCIAL SUPPORT AND ONSET OF DISABILITY AMONG COMMUNITY-DWELLING OLDER ADULTS

Y. Fujiwara[1], H. Yoshida[1], M. Nishi[1], H. Amano[1], H. Yoshida[1], S. Watanabe[3], T. Suzuki[2], S. Shinkai[1]*, 1. Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. National Institute for Longevity Sciences, Ohbu, Japan, 3. Obirin University, Tokyo, Japan*

Background/Purpose : Previous studies have reported that social support (SS) independently predicts health outcome in older population. However, the association between type of SS and onset of disability remains unknown. Methods: We examined a prospective cohort of 312 initially non-disabled persons aged 65 years and over in urban Koganei city (1991), with an interview regarding SS. Eight items were used to measure received SS: 4 emotional support items, "Do you have the person who (1) listens to your private worries; (2) cares for you; (3) encourages you; (4) relaxes you?"; 4 instrumental support items, "Do you have the person (1) whom you can ask some help in a daily life; who provides care when you are sick in bed (2) for several days; (3) for a long time, (4)who lends you money?" The participants were asked to rate the degree of each type of support from family members (FM), and friends or neighbors (FN) ("yes," or "no," scored 0-4), respectively, demographic variables, medical history, health habits, and a medical examination. Cox proportional hazard models were used to examine independent association between four types of SS and onset of disability in basic activities of daily living (BADL), controlling for important confounders. Results: Of 312 subjects who responded to all items of the baseline survey, 105 persons had onset of disability, during a median follow-up of 7.7 years. Participants who answered 'poor SS (scored<3)' in instrumental SS by FM [n=71, hazard ratio (HR): 1.56, 95% CI: 1.05-2.31], emotional SS by FN [n=87, HR: 1.61, 95% CI: 1.08-2.39], and instrumental SS by FN [n=198, HR: 2.23, 95% CI: 1.43-3.48] had increased risk. Conclusion: SS, especially from friends or neighbors, might predict onset of disability in BADL among community-dwelling older adults.

### TOWARD A CONTEXTUALLY VALID MEASURE OF SOCIAL SUPPORT AMONG MIDDLE-AGED AND OLDER AFRICAN AMERICANS

D. Lehman*, Mather LifeWays, Evanston, Illinois*

A gap in the literature on social support among middle-aged and older African Americans and limitations in scales measuring social support among this group indicate a need for a new measure of social support that is sensitive to the cultural context in which this population lives. The literature indicates that social support is a multidimensional, fluid phenomenon, i.e., it has many dimensions and each dimension may have significance for individuals and communities at different periods in time and in different geographical locations. The specific goals of this research were to (1) identify the domains and dimensions of support among middle-aged and older African Americans, ages 38 to 65, that potentially moderate the effects of psychosocial factors on health outcomes; (2) use the research findings to construct a new, contextually valid scale that measures social support among this population in a southern urban community; and (3) document the methodological process by which the first two goals were achieved. The iterative research process consisted of thirty-one methodological steps in nine phases over a four-year period. Data obtained from a content analysis of popular magazines, five types of interviews, a semi-structured questionnaire, a visual assessment of the community, and participant observation were analyzed for recurrent themes associated with social support. The findings were used to construct scale items that reflect culturally-relevant domains and dimensions of social support that are not typically assessed in traditional scales.

## SESSION 2135 (POSTER)

## SPIRITUALITY AND RELIGION

### IS THE ABSENCE OF SPIRITUAL WELL-BEING AT THE FACIT-SP EQUIVALENT TO SPIRITUAL DISTRESS IN OLDER PATIENTS?

S. Monod, E. Martin, E. Rochat, A. Martin-Durussel, C.J. Bula, *Service of Geriatric Medicine, University of Lausanne, Lausanne, Switzerland*

**Objective**: Although initially developed to assess spiritual well-being, the FACIT-Sp is increasingly used to assess the other end of the spectrum, i.e. spiritual distress. This study intends to investigate whether the FACIT-Sp could really contribute to this aim in older patients. **Method**: Patients (N=135, 81.4±7.1 years, 68.3% women) aged 65 years and over, with MMSE score>19, admitted consecutively in post-acute rehabilitation were enrolled. The FACIT-Sp (12 items, score 0 to 48, high spiritual well-being defined as score≧36) was administered and comments were systematically retrieved. **Results**: Overall, 32(23.7%) patients had high spiritual well-being. FACIT-Sp internal consistency was good (Cronbach's $\alpha$ 0.85) and a confirmatory factorial analysis was consistent with Meaning and Faith proposed subscales. Qualitative analysis showed that negative answers (score=0) to "My illness has strengthened my faith or spiritual beliefs" (N=76/135) could equally reflect the absence of impact (49/76, 64.5%) or a negative impact (religious struggle, 27/76, 35.5%) of illness on faith. However, former patients had significantly higher FACIT-Sp scores than the latter (30.3±5.6 vs 20.9±7.9, P<.001). Similarly, among patients (N=73/135) with negative answers (score<3) to "I feel a sense of purpose in my life" those mentioning their "old age" to explain their answer (N=34/73, 46.6%) had higher FACIT-Sp scores than those who did not (26.4±7.7 vs 22.5±8.1,P=.02). **Conclusion**: The FACIT-Sp identifies older people with high spiritual well-being but could underestimate well-being in some older patients. Low scores on some items could have very different meanings and interpretation of FACIT-Sp global scores below the usual cut-off should be cautious.

### FAITH AND DOUBT IN LATER LIFE

E. Farrington[1,2], J. McNamara[1], L. Noreika[1], T. O'Connor[1], T. Smith[1], S. Tedesco[1], A. Futterman[1], *1. Psychology, College of the Holy Cross, Worcester, Massachusetts, 2. Yale School of Nursing, New Haven, Connecticut*

Using standard measures of religious commitment and questioning, we developed norms for individuals who demonstrate deep faith (i.e., high ends religiosity) and persistent doubt (i.e., high quest religiosity) using a random sample of 350 community-dwelling older adults in Worcester, MA. We then assessed the faith and doubt of another sample of 80 adults using both standard measures and open-ended interviews. This sample consisted of elders living independently and in assisted living facilities, as well as a sample of Jesuit priests. Differences observed between the young-old (60-75) and old-old (75 and older) noted in the random sample were replicated in the quantitative analyses and interviews of the new sample. In the young-old, a positive correlation (r=.42) was noted between measures of faith and doubt and young-older adults were apt to question their strong faith. By contrast, in the old-old a negative correlation (r= -.20) was noted between measures of faith and doubt, and old-older adults who expressed deep faith were less likely to question. In general, faith originates in childhood, parental and religious models, and is maintained in marital and family relationships. Questioning and doubt occurs in reading of scriptural text, conversation, and considerations of the meaning of life. In young adulthood, questioning deepens faith as one reflects on the meaning of life. In late life, those with deep faith frequently expressed resistance to questioning their faith for two reasons, 1) intense focus on religious activities themselves, and 2) that questioning "diminishes" religious participation.

### GENDER AND ETHNIC DIFFERENCES IN OLDER AMERICANS' USE OF PRAYER FOR MAJOR CHRONIC DISEASES

E. Tait, J.N. Laditka, S.B. Laditka, *Public Health, University of North Carolina at Charlotte, Charlotte, North Carolina*

Prayer for health is the most common complementary and alternative medicine (CAM). Little research examines ethnic and gender variation in prayer for chronic conditions. We examined prayer for health among women and men ages 50+ with arthritis (n=3,224), cancer (n=1,220), or depression (n=325) using data from the 2007 National Health Interview Survey (10,104 respondents). Analyses included multivariate logistic regression, accounting for the survey design and weighted for national representativeness. Ethnic groups were non-Hispanic African Americans, Hispanics, Asian Americans, and non-Hispanic Whites (Whites). Controls included age, education, marital status, health insurance, comorbidities, body mass index, and region. In adjusted results, among those with depression, the odds that women would pray for health were over 4 times greater than the odds for men (Odds Ratio, OR 4.10, 95% confidence interval, CI 2.02-8.31). Among those with cancer, African Americans and Hispanics were much more likely to pray for health than Whites (OR 8.20, CI 2.71-24.85; OR 3.02, CI 1.65-5.56, respectively), and women were considerably more likely to pray for health than men (OR 2.32, CI 1.65-3.27). Among those with arthritis, African Americans were much more likely than Whites to pray for health (OR 3.36, CI 3.37-4.97), and women were more likely than men to do so (OR 2.05, CI 1.66-2.51). Religion and spirituality are important to many older people. The results suggest considerable ethnic and gender variation in prayer for health. CAM is often substituted for conventional therapies; further research should examine if substitution is associated with variation in prayer for chronic diseases.

### THE EFFECTS OF RELIGIOSITY ON POSITIVE ASPECTS OF CAREGIVING AFTER CONTROLLING FOR COGNITIVE FUNCTIONING OF DEMENTIA PATIENTS

M. Stephens, K. Vo, F. Moise, V. Samarina, E. Rogers, R. Gomez, *Palo Alto University, Palo Alto, California*

In an attempt to understand the impact of caregiving, Resources for Enhancing Alzheimer's Caregiver Health II (Schulz et al., 2001), is a nationwide initiative to help understand the impact of Alzheimer's Disease on caregivers. This study proposes to examine the previously collected data looking at the effects of religiosity (positive coping, negative coping, and active participation) on positive aspects of caregiving after controlling for cognitive functioning of dementia patients. Six hundred and thirty-seven dementia caregivers were included in this study. Correlational analyses indicated that positive aspects of caregiving were significantly related to dementia patient cognition, positive religious coping, and religious participation. It was not significantly correlated with negative religious coping. The regression analysis examined 4 possible predictors of positive aspects of caregiving as described by the caregiver. The regression model explained 12% of the variance. The ANOVA results were significant p<.001 F(4,641)= 21.8. The MMSE score was significant (Beta=-.105, p<.005). This suggests that those carereceivers caring for adults with a lower MMSE score will report less positive aspects of caregiving. Positive religious coping was significant (Beta=-.374, p<.000). This indicates that after controlling for dementia patient cognition, there is still an effect of religiosity on positive aspects of caregiving, specifically positive religious coping. These findings suggest that those who have higher levels of religious coping have less positive feelings about caregiving. One possible reason for this is that those with increased burden of caregiving, may depend on religion more for coping.

### GRANDPARENT INFLUENCES ON COLLEGE STUDENTS' RELIGIOUS BELIEFS, BEHAVIORS, AND QUESTIONS: WHAT ROLE DOES DEMENTIA PLAY?

S. McFadden[1], A. Tornow[1], R. Subramony[2], *1. Psychology, Uniersity of Wisconsin Oshkosh, Oshkosh, Wisconsin, 2. Northern Illinois University, DeKalb, Illinois*

College students whose grandparents do not have dementia (GPnD; n = 91) and students with at least one grandparent with dementia (GPD; n = 86) completed surveys that included questions answered with brief paragraphs. Question 1 asked about "any influence—either positive or negative—of grandparents" on their religiousness and/or spirituality. Question 2 asked about "any religious questions" arising from the relationship with the grandparent. For both questions, the GPD group was asked to think about the grandparent with dementia while the GPnD group was asked to reflect on "your grandparent(s)." Question 3 asked the GPD group about how they think young adults are affected by grandparents with dementia; the GPnD group responded to a more general question about grandparents' influences on young adults. We explored grandparent influence using a grounded theory approach and QSR NVivo 8.0 qualitative analysis software. Results indicated that the perceived level of emotional closeness affected influence in both groups. In the GPnD group, emotional closeness produced trust, respect for grandparent role-modeling, and acquisition of knowledge and wisdom. The GPD group's perception of emotional closeness was associated with questions about life meaning, increased religious behaviors like prayer, and a sense of the need for recognizing life's human vulnerabilities and strengths. The GPnD group was more likely to state lack of influence or negative influence on their religiousness/spirituality, the latter due to grandparent pressure. Their responses about religious questioning were more general, whereas the GPD group stated more specific existential questions about life meaning.

### PROFESSIONAL GERONTOLOGISTS VIEW THE FUTURE OF RELIGION AND SPIRITUALITY

J.W. Ellor[1], S. McFadden[2], *1. School of Social Work, Baylor University, Waco, Texas, 2. University of Wisconsin-Oshkosk, Oshkosh, Wisconsin*

Sociologists and psychologists have studied religion for over 100 years, but "spirituality," a term associated by social scientists with "spiritual well-being" at the 1971 White House Conference on Aging, has gained popular appeal and research attention. This research used an online study of 458 members of the American Society on Aging and the National Council on the Aging asking about their perceptions of the future role of religion and spirituality in their work and personal lives (mean age = 56; range = 23-90). The sample included nurses, social workers, business persons as well as all of the major service delivery areas affecting older adults. Participants rated their personal present and future sources of meaning, with "relationships" with others drawing the strongest agreement for the present and future as a source of meaning (M = 6.64 and 6.66 on a 7-point Likert scale). Participants describing themselves as religious and spiritual (R+S; n = 252) differed significantly from those who are spiritual but not religious (SnR; n = 153) on t-tests comparing responses to items about their anticipation of future personal religious/spiritual acts and experiences, as well as their beliefs about whether religious organizations are prepared to meet religious and spiritual needs of baby boomers ($p < .001$). Neither group appears to believe that religious organizations are prepared to meet the spiritual and religious needs of aging baby boomers, although the SnR group disagrees significantly more strongly than the R+S group ($p < .001$).

### THE INFLUENCE OF RELIGIOUS ATTENDANCE, PRIVATE RELIGIOUS ACTIVITY, AND SOCIAL PROVISIONS ON HEALTH STATUS AMONG AGING MALE OFFENDERS

A.J. Bishop[1], G. Randall[2], *1. Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma, 2. Bradley University, Peoria, Illinois*

The purpose of this investigation was to explore the interaction of religious attendance (RA), private religious activity (PRA) and social provisions (SP) on perceived health status and a count of self-reported health conditions using data from 261 male offenders in Oklahoma state correctional facilities, aged 45 years and older. Hierarchical regression analyses were computed to examine the influence of perceived stress (PS), social provisions (SP), and depressive affect (DA), on self-reported health outcomes (e.g., perceived health and number of health conditions). We controlled for the influence of confounding variables age, race, education, and physical activities of daily living. The second block included predictors of interest, including all possible interactions. For models predicting perceived health status, two interactions were significant, RA x SP ($\beta$ =.21; $p < .05$) and PRA x SP ($\beta$ =.19; $p < .05$); R2 = .25 and .24 respectively. For self-reported health conditions, only RA x SP was significant ($\beta$ =-.14); R2 = .29. The results have implications relative to further exploration of buffering effects which may impact the overall health status of aging prison inmates.

### THE EFFECTS OF RELIGIOUSNESS ON PHYSICAL AND MENTAL HEALTH AMONG THE ELDERLY IN TAIWAN

H. Hsu, *Asia University, Taichung, Taiwan*

Objective: The purpose of this study was to examine the effect of different religious activities on self-rated health and depressive symptoms over time among the elderly in Taiwan, especially among those who experienced different degrees of disability, economic status, or life stressors. Method: A longitudinal data set from 1999 and 2003 that included 3,537 elderly Taiwanese people was used. Hierarchical linear modeling was used for analysis. Results: Religious activities or religious coping was not significantly related to self-rated health when controlling for other variables. Some religious activities, such as praying or reading scriptures, could reduce depressive symptoms over time, but more religious coping might accompany more depressive symptoms. For the elderly with more physical function problems, religious activities reduce depressive symptoms over time, and religious coping could be related to better self-rated health over time but also to increased depressive symptoms. Conclusion: Religious activities may be beneficial to mental health. The elderly should be encouraged to learn and use positive coping strategies when they face the stressors of old age.

## SESSION 2140 (SYMPOSIUM)

### POLICY SERIES SYMPOSIUM: SUBJECTIVE WELL-BEING AFTER AGE 50 IN THE USA AND UK

Chair: *J. Smith, University of Michigan, Ann Arbor, Michigan*
Discussant: *L. Nielsen, NIA, Bethesda, Maryland*

Science and policy makers have much to gain by comparisons of subjective well-being in populations from countries with different age structures, rates of population aging, and social systems. Recent concerns about population aging, for example, have triggered a debate about the efficacy of an aging society to optimize opportunities for people to experience quality years after retirement and at the end-of-live. This symposium provides findings relevant to this debate from two large nationally representative studies of older adults, the Health and Retirement Study (HRS) and the English Longitudinal Study of Ageing (ELSA). These studies are designed to maximize sampling comparability and minimize methodological differences. Speakers representing each study present cross-sectional findings from the 2008 waves for life satisfaction as well as perceived life quality, meaning, and social integration. These indices of subjective well-being provide evaluative information that complements social and economic indicators of life quality. At an individual level, subjective well-being is manifested in personal decisions, behavior and physiological functioning. New evidence about mind-body interactions suggest that subjective well-being has important long-term implications for brain activation, immune functioning, physiological dysregulation, morbidity, and longevity. We focus on age cohort differences and gradients of subjective well-being associated with health and wealth and discuss the similarities and differences found in the US and UK. The session also includes reports of new developments in examining the experience of well-being on a daily basis in large surveys and determining how daily activities contribute to overall satisfaction with life.

### WELL-BEING DISPARITIES IN THE HEALTH AND RETIREMENT STUDY: THE IMPORTANCE OF HEALTH, WEALTH, AND AGE

L. Ryan, D. Weir, J. Smith, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Subjective well-being (SWB) is both an important outcome for older adults, as well as an established predictor of health and longevity. Previous research finds that disparities in SWB exist, especially across various social gradients. The present study aims to examine and illustrate SWB disparities by age, health status, and wealth using data from the 2008 wave of the Health and Retirement Study (HRS), a large nationally representative sample of American adults aged 50+ (N=7069). We examine four indices of SWB to identify differential disparities in emotional well-being (Positive Affect, Negative Affect), cognitive appraisals of well-being (Life Satisfaction), and social integration (Loneliness). Higher SWB is associated with greater wealth and better health. Age shows more complex relationships, such that highest SWB was found in the young old (age 60-69), compared to the middle-aged and oldest old. Implications of these subjective well-being gradients for health and society are discussed.

### PREDICTORS OF WELLBEING IN THE ENGLISH LONGITUDINAL STUDY OF AGEING (ELSA)

M. Bartoszek, A. McMunn, A. Steptoe, *Epidemiology & Public Health, University College London, London, United Kingdom*

Relationships between socio-demographic and health-related factors and wellbeing were examined among 7,297 participants aged 50 plus from the English Longitudinal Study of Ageing (ELSA). Initial analysis was conducted using the Diener Satisfaction with Life Scale to measure wellbeing. Measures of health included subjective reports of health and physical functioning, as well as objective biomarkers of disease risk (c-reactive protein, fibrinogen and waist-hip ratio). Mean life satisfaction increased with age up to age 80, increased with increasing wealth, was lower among those who reported poor health or limitations in physical functioning, and was lower among women. Relationships between biological markers and life satisfaction were less clear, as unfavourable biological profiles were observed among respondents reporting low as well as high life satisfaction. These analyses will be extended to include the UCLA loneliness scale and a measure of quality of life, the CASP19, which includes measures of control, autonomy, self-realization and pleasure.

### WELL-BEING EXPERIENCED YESTERDAY: LINKING TIME, ACTIVITIES AND AFFECT IN HRS

J. Smith, R. Gonzalez, L. Ryan, S. Becker, D. Weir, *University of Michigan, Ann Arbor, Michigan*

Behavioral indicators of well-being, such as the time individuals allocate in a day to activities that provide pleasure, complement survey measures of life satisfaction and emotional well-being. In 2009, HRS conducted a mail-out survey on Health and Well-being with a representative subsample (approx. N = 5200). The survey included questions about the affect experienced yesterday while doing eight activities and the time spent on the activities. The activities ranked highest for negative affect were managing money, watching TV and being alone: Socializing and time spent at work or volunteering ranked highest for positive affect. Participants who reported more activities also reported that they smiled or learned something interesting yesterday. We report differences in activities and experienced well-being associated with socioeconomic status, marriage, and health. Findings from this study will shed light on differences in the time and activity investment strategies of older adults and how these contribute to subjective well-being.

### ECOLOGICAL MOMENTARY ASSESSMENT OF POSITIVE AND NEGATIVE AFFECT IN ELSA

A. Steptoe[1], E. Leigh[1], A. McMunn[1], M. Kumari[1], J. Nazroo[2], *1. University College London, London, United Kingdom, 2. University of Manchester, Manchester, United Kingdom*

Ecological momentary assessments provide information about experienced affect that is complementary to standard measures of well-being and distress. 4324 participants in the English Longitudinal Study of Ageing (mean age 64.3, range 52 to 79 years) were asked to rate momentary affect on 4-point scales at four times over a day: on waking, 30 minutes later, 7:00 pm and at bedtime. The completion rate was 90.8%. Experienced happiness was unrelated to age, gender, or socioeconomic status (SES), but was greater in married individuals and reduced in participants with limiting long-standing illness. Anxiety by contrast was greater in younger respondents, in women, and in lower SES individuals. Loneliness was associated with reduced positive and greater negative affect independently of age, gender, SES, marital status, limiting long-standing illness and CESD depression. These findings suggest that illness and loneliness are strong determinants of experienced well-being in the everyday lives of older individuals.

## SESSION 2145 (SYMPOSIUM)

### TECHNOLOGICAL INTERVENTIONS FOR MENTAL HEALTH AND MEMORY

Chair: *A. Shah, University of Alabama, Tuscaloosa, Alabama*
Co-Chair: *R.S. Allen, University of Alabama, Tuscaloosa, Alabama*
Discussant: *M. Marsiske, University of Florida, Gainesville, Florida*

As older adults are increasingly using technology, this symposium attempts to introduce gerontologists to preliminary research on innovative technological interventions to improve older adult's quality of life. Four individual papers discuss how technology is being used to accomplish this goal. The first study as part of this symposium presents the results of a pilot study assessing telephone delivered cognitive behavioral therapy to improve the quality of life of older adults. Such an intervention would have great promise in overcoming barriers to care faced by older adults such as transportation and mobility limitations. Presentation of the second study will begin with information on the development of an audio-based cognitive behavioral therapy intervention for depression in older adults and the preliminary results of a randomized controlled trial assessing its efficacy. The third paper is on a computer-based intervention for depression in older adults. The preliminary results of a randomized control trial assessing the efficacy of this intervention will also be presented following a discussing of computer-based interventions and the development of this intervention. These two interventions show potential value in increasing the availability of alternative treatments for depression in older adults. The final study presents pilot data assessing the effect of the Nintendo DS game Brain Age on cognitive functioning in older adults. Numerous games are marketed to older adults and advertised to improve cognitive functioning without the research and evidence to support these claims. If the game Brain Age is found to be effective at staving off cognitive decline, it would provide an alternate effective tool for older adults.

### PILOT STUDY OF THE FEASIBILITY OF TELEPHONE COGNITIVE BEHAVIORAL THERAPY FOR VULNERABLE, RURAL OLDER ADULTS

E. DiNapoli, *University of Alabama, Tuscaloosa, Alabama*

The specific aim of this project is to provide information on the feasibility of delivering telephone-administered cognitive behavioral therapy (T-CBT) to rural, vulnerable older adults. The present study investigated the effects of T-CBT on quality of life (QOL) in a low-resource, ethnically diverse and vulnerable sample of rural dwelling elders. This cost-effective treatment would overcome barriers to traditional treatment approaches such as mobility and transportation limitations. There is a paucity of data on T-CBT in this population, thus warranting a small pilot study to evaluate its effectiveness. In its very limited sample, the pilot data indicates that CBT can be delivered successfully via telephone medium, to older adults.

### DEVELOPING AND ASSESSING AUDIO-BASED COGNITIVE BEHAVIORAL THERAPY FOR DEPRESSION IN OLDER ADULTS

A. Shah, M.P. Morthland, F. Scogin, A. Presnell, *University of Alabama, Tuscaloosa, Alabama*

This section of the symposium will discuss a current study that uses an audio-based intervention, delivered to community-dwelling and primary care older adults who endorsed symptoms of depression. Older adults have limited treatment options due to the number of barriers in obtaining adequate depression treatment. The goal of this study was to increase alternative treatments options by developing and testing the efficacy of a self-administered audio-based cognitive behavioral therapy (ACBT) for older adults with depression. An audio-based treatment can circumvent some barriers that older adults may face because it is low-cost, easily reproducible, self-paced, and less reliant on vision. Older adults age 55 and above who met eligibility criteria were randomly assigned to either the immediate treatment or delayed treatment group. Assessments of mood were provided at baseline and posttreatment. The intervention development process and the preliminary results will be discussed.

### DEVELOPING AND ASSESSING THE EFFICACY OF COMPUTER ASSISTED COGNITIVE BEHAVIORAL THERAPY FOR DEPRESSION IN OLDER ADULTS

M.P. Morthland, A. Shah, F. Scogin, A. Presnell, *Psychology, The University of Alabama, Tuscaloosa, Alabama*

The issue of limited access to mental healthcare, particularly for older adults and individuals in remote locations, has been emphasized in the literature and by national health agencies (e.g., HHS, Office of Rural Health Policy, 2007). Computer-assisted therapies are the most recent form of self-administered treatments (SAT). There is ample support in the literature that SATs, in the form of bibliotherapy, are efficacious for treating depression in older adults. There is also evidence that computer-assisted therapy (CAT) is similarly efficacious. These results, however, have not been replicated using portable CATs and older adult samples as the focus of research. This section of the symposium will discuss a current study that uses a portable CAT intervention, delivered to community-living older adults who endorsed symptoms of depression. Preliminary results will be discussed as will the general topics of CATs and older adults' usage of technology.

### TEACHING OLDER ADULTS TO PLAY VIDEO GAMES: A PILOT STUDY

A.H. Presnell, *Psychology, University of Alabama, Tuscaloosa, Alabama*

This presentation will discuss a three phase piloting project of that focused on the use of the Nintendo DS device and Brain Age video game. The project used a group of students, a group of college faculty members, and a focus group of older adults to look at issues in the use of the device and game. The first two phases were used to design an introduction and group of helpful tips for use when introducing these products to older adults. The older adults served as a focus group to work out, more completely, the necessary information and support needed to use the device as a cognitive intervention. This paper will discuss the comments and information gained from the focus group and look at generalizations that can be taken from the project for future projects involving novel technology and the older adult.

## SESSION 2150 (SYMPOSIUM)

### TRANSITIONS OF INFORMAL CAREGIVING ACROSS THE CANCER TRAJECTORY

Chair: *Y. Kim, Psychology, University of Miami, Coral Gables, Florida*
Discussant: *T. Blank, University of Connecticut, Storrs, Connecticut*

Cancer care involves several transitions not only for the patients but also for family caregivers, influencing diverse aspects of their quality of life. This symposium deals with these concerns. It presents comprehensive views of addressing cancer care at different transitional points for diverse subgroups of caregivers. Dr. Given illustrates the efficacy of nurse-delivered intervention for advanced cancer patients and their family caregivers in symptom management during the transition from formal to informal caregivers. Dr. Raveis identifies patterns and predictors of engagement in cancer care for older minority survivors among family caregivers recruited from community centers in a metropolitan city. Dr. Lee also highlights the significance of cultural strength and resources in elderly cancer caregivers' quality of life, particularly for Asian American immigrants and refugees. Dr. Kim further pinpoints the importance of understanding caregivers' unmet needs at different transitional phases of cancer care, comparing unmet needs of bereaved caregivers with those of former caregivers 5 years after the relatives' cancer diagnosis. Discussant identifies the unique challenges each patient-caregiver dyad deals with across different transitions of cancer care. The findings from diverse subpopulations of patients and caregivers will be contrasted and compared. The implications of these findings for how best to approach cancer care across the disease trajectory, both to improve overall quality of life of patients and family caregivers, and to suggest future directions for research, will be also discussed.

### UNMET NEEDS OF BEREAVED CAREGIVERS COMPARED WITH FORMER CAREGIVERS 5 YEARS AFTER THE CANCER DIAGNOSIS

Y. Kim[1,2], C. Carver[1], R. Spillers[2], *1. Psychology, University of Miami, Coral Gables, Florida, 2. American Cancer Society, Atlanta, Georgia*

Caregivers' needs may vary across different phases of the illness trajectory. This study examined the extent to which bereaved caregivers experience their needs as not being met, compared with caregivers whose care-recipients were in remission, at the 5-year mark since their relatives' cancer diagnosis. The prevalent unmet needs categories among bereaved caregivers (n=179) were understanding health care system (65.4%) and rebuilding relationships with family members and close friends (63.7%); among former caregivers (n=1108), those were managing psychosocial (35.6%) and medical (26.9%) concerns. Among individual items, "taking care of one's own health" (44.7%) was cited most frequently as an unmet need among bereaved caregivers, whereas "taking part in their usual social activities" (29.6%) among former caregivers. Results suggest need for further investigation of demographic, caregiving, quality of life correlates of unmet needs at different transition phases of cancer care and development of programs to assist bereaved caregivers in meeting their needs.

### FAMILY CAREGIVING TRANSITIONS: ADDRESSING THE CARE NEEDS OF OLDER ADULTS DURING THE CANCER SURVIVORSHIP PERIOD

V.H. Raveis[1], J. Tobin[2], D. Kraus[1], K.E. Faber[1], R. Zhao[2], M. Carrero[1], I. Estrada[1], *1. New York University, New York, New York, 2. Clinical Director's Network, INC, New York, New York*

Cancer incidence increases dramatically with age; 60% of cancer survivors are 65 and older. Completion of active treatment does not end a cancer illness event, especially for older patients who face lengthier recovery and more complex rehabilitation. Restoration to pre-illness functioning is not always possible. In an ongoing study of older (60+), minority, post-treatment cancer patients and their family caregivers recruited from Community/Migrant Health Centers in the NY metropolitan area, the majority of cancer survivors were experiencing pain (60%) and fatigue (65%). Family helped with shopping (70%), housekeeping (68%), cooking (56%), medical appointment travel (62%), obtaining illness-related information (61%), home health care (34%) and managing formal care (31%). These findings indicate that the transition to survivorship does not end elderly patients' care needs. Cancer- and treatment-related symptoms can persist that require further care provision. However, this phase of the illness course has not been targeted in caregiver programs and services.

### TRANSITIONS IN CANCER CARE: FAMILY CAREGIVERS INVOLVEMENT IN SYMPTOM MANAGEMENT

B.A. Given[1], P. Sherwood[2], C.W. Given[1], A. Sikorskii[1], *1. Michigan State University, East Lansing, Michigan, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Responsibility for cancer care has transitioned from formal to informal caregivers. The purpose is to describe an intervention designed to increase family caregivers involvement in cancer patients symptom management. The effect on caregivers emotional health is examined. Methods: Both caregivers and care recipients were recruited. Inclusion criteria for patients were ≥40 years of age, cognitively intact, diagnosis of a stage III or IV tumor. Dyads were randomized to a nurse-delivered intervention (N=88) versus a coach-led group (N=81). Data were collected at baseline, 10, and 16 weeks, including caregiver symptom involvement, depressive symptoms, burden, and patients symptom experience. Results: Caregivers with lower depressive symptoms provided assistance at 10 weeks if they received the nurse interventions. Significant effects were found only for sense of self-esteem ($p=0.04$). Conclusions: A nurse-delivered intervention increases caregivers' level of assistance in symptom management for those caregivers with low depressive symptoms.

### CULTURAL STRENGTHS AND RESOURCES THAT CONTRIBUTING TO ELDERLY CANCER CAREGIVERS' QUALITY OF LIFE

H. Lee, H.Q. Kivnick, *University of Minnesota, St. Paul, Minnesota*

Although cancer is the leading cause of death among Asian Americans (AA), research focused on caregiving issues in this population is scant. This study seeks to explore culturally-based strengths and resources that enhance elderly cancer caregiver's quality of life. Using qualitative research methods, we conducted face-to-face in-depth interviews with five elderly Korean and five non-Latino white caregivers who resided in the American Midwest. Grounded theory was used to analyze the data into thematic categories and dimensions, utilizing Atlas ti 5.0. Six major themes for cultural strengths and resources that contributing to caregiver's quality of life were produced. These are: (1) strong family support, (2) religion/spirituality, (3) positive outlook, (4) personal medical network, (5) extensive knowledge on cancer; and (6) support from health professionals. Identified strengths and resources can be served as baseline information to develop community and culture-specific cancer caregiving intervention strategies for specific cultural and ethnic populations of elders.

## SESSION 2155 (SYMPOSIUM)

### MILD COGNITIVE IMPAIRMENT (MCI) AND THE AGING BRAIN: MEASURING MEMORY IN THE SHADOW OF DEMENTIA

Chair: *S. Katz, Sociology, Trent University, Toronto, Ontario, Canada*

This paper traces the emergence of Mild Cognitive Impairment (MCI) over the past decade as a recent disease category and its current research focus as a potentially transitory stage between normal and pathological cognitive aging. MCI articulates psychogeriatric care with neuroscientific and pharmaceutical advances, public anxieties about cognitive deficits, and ethical controversies about cognitive enhancement in a 'hypercognitive' society. Hence MCI is also an ideal opportunity to think about the social patterns that connect aging and memory, the social determinants of health, and the biopolitics of dementia. Discussion considers the significance of these questions to the wider dialogue between scientific and cultural communities about growing older today and into the future, and the ways in which cognitive health is measured in relation to 'successful aging' and the image of a 'good old age.'

### DISABILITY AT THE CROSSROADS OF GERONTOLOGICAL PERSPECTIVES ON A GOOD OLD AGE

C.F. Mendes de Leon*, Rush University Medical Center, Chicago, Illinois*

Gerontology has always aspired to be an inter-disciplinary field of inquiry, which has motivated attempts from a variety of scholarly perspectives to define and measure a good old age. I will argue that the concept of disability has been at the crossroads of these attempts, as commonly used theoretical frameworks of disability illustrate. Disability has unified a broad spectrum of gerontologic research, which has informed clinical care, social services, and health care policy. However, its central place in gerontologic thinking has also led to highly variable and often poorly conceptualized definitions. This raises the question whether merely absence of disability is a satisfactory and sufficient definition of a good aging, or whether cultural or moral considerations are essential to inform the meaning and measurement of a good old age.

### WHAT IS A "GOOD OLD AGE"? LESSONS OF A LIFE-COURSE PERSPECTIVE

R. Settersten, J. Hendricks*, Human Development and Family Sciences, Oregon State University, Corvallis, Oregon*

Concepts and measures of a "good old age" are grounded in the life course. We compare notions of a "good old age" to parallel constructs in middle and early adulthood, probing commonalities and differences. We explore how a "good old age" is a culmination of prior life but somewhat beyond individuals' control. Old age is embodied with great possibility, yet realizing its potentials depends on some Big Ifs that cannot be predicted/controlled. These Big Ifs reflect life, health and resources: if we are healthy, can manage financially, live independently, and have relevant social support. As these contingencies come undone, so too does the prospect of a good old age. For individuals and families, a good old age—and the Big Ifs on the horizon—are conditioned by social class, familial/social resources, cohort and gender among other factors. Calculations of a good old age must consider social costs offsetting personal benefits.

### THE LONGEVITY DIVIDEND: CHALLENGES TO OUR UNDERSTANDING OF A GOOD OLD AGE

S. Olshansky*, University of Illinois at Chicago, Buffalo Grove, Illinois*

Questions about how a 'good old age' are measured from a biological perspective on aging include the search for explanation for why aging occurs from an evolutionary perspective; why there can be no death or aging genes; and why the absence of such genes means we have reason to be optimistic that interventions that slow aging are plausible. It is important to recognize that current efforts to attack the diseases associated with aging — and not aging itself — could inadvertently make us older longer, and that the time has arrived to focus our attention on slowing aging. The benefits of a successful effort to extend healthy life in this manner —referred to as the Longevity Dividend — will change our understanding and appreciation of old age.

## SESSION 2160 (SYMPOSIUM)

### AGING WITH OSTEOARTHRITIS: RESULTS FROM THE EPOSA STUDY

Chair: *L. Schaap, EMGO institute for health and care research, VU University medical center, Amsterdam, Netherlands*
Co-Chair: *D.J. Deeg, EMGO institute for health and care research, VU University medical center, Amsterdam, Netherlands*

Osteoarthritis (OA) is one of the most frequent causes of pain, loss of function and disability in older persons. In the literature, prevalence rates vary greatly and across countries. It is not known whether this variation is solely explained by differences in study design and OA definitions used or also by actual cross-national variations. Unravelling the mechanism behind this variation adds to understanding the causality of OA and may provide indications for preventive measures. Literature on the social consequences of OA is lacking. The European Project on OSteoArthritis (EPOSA) aims to study the determinants and consequences of OA in four population based studies across Europe (i.e. Progetto Veneto Anziani (Pro.V.A.), Italy; Longitudinal Aging Study Amsterdam (LASA), Netherlands; Ages in Peñagrande, Spain; Hertfordshire Cohort Study (HCS), United Kingdom; n=8601, mean age 72.7 [SD 8.4], 97.4% community-dwelling). During this symposium, the first results from the EPOSA study will be presented. Attendees will learn about OA definitions based on self-reported, clinical and radiographic information and how these different definitions correlate with physical functioning. The role of muscle strength in the association between BMI (dynapenic obesity) and OA will be discussed as well as the link between OA, diabetes and the metabolic syndrome. Also, the need for formal care in persons with OA will be investigated across countries. The discussant will consider the cross-national differences in each of the presentations.

### DEFINITIONS OF OA BASED ON SELF-REPORT, CLINICAL AND RADIOGRAPHIC INFORMATION

G. Peeters, *EMGO institute for health and care research, VU University medical center, Amsterdam, Netherlands*

Consensus regarding the diagnosis of Osteoarthritis (OA) in clinical practise or the international literature is lacking. Definitions that are available, such as the ACR and EULAR criteria, are complex and not yet the standard in population-based epidemiological studies. In EPOSA, post-harmonization algorithms were used to develop definitions for knee, hip, hand and non-specific OA based on self-reported, clinical and radiographic information (not all definitions were available in all countries). The definitions were validated by analysing the agreement and associations with known OA-related health outcomes. In two of the three countries, prevalences rates based on clinical judgement were lower than based on self-report (79% agreement). Associations with OA and various health outcomes were confirmed, but different effect sizes were found for the three OA definitions.

### HOW USEFUL IS A RADIOLOGICAL DIAGNOSIS OF OA WHEN ASSESSING PHYSICAL FUNCTION?

E.M. Dennison, *MRC Epidemiology Resource Center, University of Southampton, Southampton General Hospital, Southampton, United Kingdom*

While several studies suggest radiographic diagnosis of knee osteoarthritis (OA) is a poor predictor of physical function, it is unclear whether this also applies to hip OA. Data from EPOSA included self-reported OA, clinical judgement and radiography (where available). Physical function was measured using chair rises, walk test and tandem stand. Self-reported/ clinical diagnosis of OA at the hip or knee were associated with impaired chair stands performance ($p<0.001$), and summary physical performance ($p<0.01$). Radiographic hip OA was associated with chair stand performance (men $p=0.02$; women $p=0.008$), physical performance score ($p=0.009$ both sexes), tandem stands among men ($p=0.006$). However, a clinical diagnosis of OA at the hip or knee was the best predictor of all scores. While a clinical diagnosis or self-report of OA predicted physical performance better than radiographic diagnosis for hip OA, this distinction was less apparent at the hip than the knee.

### THE ASSOCIATION BETWEEN BMI, GRIP STRENGTH AND SELF REPORTED OSTEOARTHRITIS AMONG OLDER PERSONS

L. Schaap, *EMGO institute for health and care research, VU University medical center, Amsterdam, Netherlands*

Obesity is one of the strongest and best-established risk factors of knee OA, but the associations with hip and hand OA are unclear. Recently the term dynapenic obesity was introduced to identify persons with a combination of high BMI and low muscle strength, who have an increased risk of negative outcomes, such as decline in physical functioning. Whether dynapenic obesity is associated with an increased risk of OA has never been studied. Data from Italy and the Netherlands revealed a strong association between BMI and OA of the knee, hip and hand (e.g. OR for knee OA 1.7 (95%CI 1.4 – 2.0) in overweight persons and OR 2.1 (1.7 – 2.5) in obese persons compared to the reference group). Dynapenic obese persons (high BMI and low grip strength) were at greater risk of having OA than persons with a normal weight and a high grip strength.

### DIABETES, CHRONIC DISEASES AND OA ACROSS EUROPEAN COUNTRIES

S. Maggi, *National Research Council (CNR), Aging Branch, Institute of Neuroscience, Padova, Italy*

Clinical evidences of an association between diabetes and osteoarthritis are lacking. We investigated the prevalence of diabetes and its association with chronic diseases and osteoarthritis in 7215 subjects >65 years and older. The prevalence of diabetes was 10.3% in Italy (I), 10.3% in the Netherlands (N), 16.1% in Spain (S), and 6.4% in United Kingdom (UK) ($p<0.001$). Compared with non diabetic, cases were more frequently female in I, older in S, with higher BMI in all countries but S, less frequently smokers and drinkers. Compared to those without diabetes, cases were more frequently affected by cardiovascular, cerebrovascular and peripheral artery diseases, by cognitive impairment and depression symptoms. In I both self-reported and clinical osteoarthritis prevalence were higher in diabetic subjects than in controls, while in the other countries no differences were observed. These results show differences in diabetes prevalence and in the association between diabetes and osteoarthritis across European countries.

### ASSOCIATION OF OA WITH HOME CARE SERVICES ACROSS EUROPEAN COUNTRIES

A. Otero, *Department of Preventive Medicine and Public Health, Unit of Primary Care and Family Medicine, Faculty of Medicine, Universidad Autonoma de Madrid, Madrid, Spain*

The aim was to assess the association between osteoarthritis (OA) in elderly population with home care services received. Data from European Project on OA (EPOSA), belongs to Italy, Netherlands and Spain were studied (n=5364). Formal home care services was defined as receiving personal or domestic professional assistance. Clinical OA was defined in accordance with the EPOSA Project. Age, sex, marital status, education, and disability were used as co-variables. 12,3% of the population studied received formal care services at home with a big variation across countries (Netherlands 36,6%, Spain 12,3%, Italy 7%). A strong association between clinical OA and disability was observed. In the multivariate analysis the formal care received shows association with OA (OR=1.26; 95% CI:1.02,1.56), country, age, sex education and marital status. The variability observed of formal care received by the elderly populations in different countries needs insights in cultural aspects and in organization of their care systems.

# SESSION 2165 (PAPER)

## CARDIOVASCULAR DISEASE AND PREDICTORS OF OUTCOMES

### SERUM β2-MICROGLOBULIN AND CAUSE-SPECIFIC MORTALITY IN A GENERAL POPULATION OF OLDER ADULTS

S. Shinkai[1], Y. Fujiwara[1], H. Yoshida[1], M. Nishi[1], H. Amano[1], H. Yoshida[1], T. Suzuki[2], *1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. National Institute of Longevity Sciences, Ohbu, Japan*

Background/Purpose: The clinico-epidemiological relevance of moderately elevated serum β2-microglobulin (β2-M) has not been examined extensively. We reported that the serum concentration of β2-M is a strong predictor for total morality in a general older population (Arch Intern Med 2008). This study determined the association between serum β2-M and cause-specific mortality. Methods: 1,048 initially non-disabled older adults aged 65-89 in two communities in Japan were followed for 8 years. Mortality was categorized into three major causes of death. The Cox proportional hazard model was applied for determining independent association between serum β2-M and mortality, controlling for demographics, conventional mortality risk factors (medical history, alcohol drinking and smoking status, BMI, Hb, Alb, HbA1c, total and HDL-cholesterol, systolic BP, usual walking speed), and renal function (proteinuria, eGFR, cystatin C) and inflammation measures (WBC, CRP, TNF-α, IL-6). Results: During a median follow-up of 7.7 y, 58 cancer, 82 cardiovascular and 71 other causes mortality occurred. As compared with individuals having β2-M concentrations of less than 1.6 mg/L (lowest tertile), those having β2-M concentrations of 1.6-1.8 (middle tertile) and >1.8 mg/L (highest tertile) showed adjusted hazard ratios of 1.50 (95% CI: 0.75-3.00) and 1.34 (95% CI: 0.57-3.17) for cancer mortality, 3.12 (95% CI: 1.33-7.29) and 4.24 (95% CI: 1.75-10.3) for cardiovascular mortality, and 2.53 (95% CI: 1.11-5.77) and 4.16 (95% CI: 1.76-9.79) for mortality from other causes, respectively. Conclusion: Serum β2-M concentration is a novel and strong predictor for cardiovascular mortality in a general population of older adults, independent of renal function and inflammation measures.

### CARDIAC BIOMARKERS DO NOT PREDICT 6 MONTH MORTALITY IN FRAIL ORTHOPAEDIC-GERIATRIC PATIENTS

C.P. Chong[1,2], W. van Gaal[1,2], J. Ryan[1], L.M. Burrell[2], J. Savige[1,2], K. Lim[1,2], *1. Northern Clinical Research Centre, The Northern Hospital, Epping, Victoria, Australia, 2. Austin and Northern Health, The University of Melbourne, Melbourne, Victoria, Australia*

Background: Cardiac injury after orthopaedic surgery is problematic. The aim was to determine if Troponin I and N Terminal pro-Brain Natriuretic Peptide (NT-proBNP) predicted 6 month mortality after emergency orthopaedic-geriatric surgery in a frail population. Methods: Prospective observational study in Australia screening 383 consecutive patients. Forty-four patients were eligible for this study, 33 consented who either received high level care, had severe dementia or an illness with a prognosis of less than 12 months. Troponin I and NT-proBNP were tested peri-operatively and patients followed up at 6 months. Results: Mean age was 85.8± 9.6 years and 93.9% had a fractured neck of femur. The incidence of a pre-operative troponin elevation was 33.3% and post-operative elevation 60.6%. Mortality within 30 days of surgery was 15.2% (5/33 patients), rising to 39.4% (13/33) at 6 months with 46.2% (6/13) dying of a cardiac cause. Median pre-operative NT-proBNP was 1651.50 pg/l and median post-operative NT-proBNP was 3038.50pg/l. Troponin I and NT pro-BNP did not predict 6 month mortality or cardiac complications. Predictors of 6 month mortality were number of comorbidities OR 2.0 (95% CI 1.1-3.8, p=0.033) and pre-morbid atrial fibrillation OR 7.7 (95% CI 1.2-47.8, p=0.028). Conclusions: Troponin I and NT-proBNP were not predictors of 6 month mortality or cardiac events in an older frailer population of patients undergoing orthopaedic surgery. These patients sustained substantial cardiac morbidity and mortality at 6 months after surgery. The control of symptoms, rather than prolongation of life with cardiological intervention, may be more appropriate for this patient group.

### CORONARY ARTERY BYPASS GRAFTS AND ASSOCIATED POSTOPERATIVE STROKE AND READMISSION AMONG OLDER ADULTS

B.F. Ekezue, J.N. Laditka, S.B. Laditka, *UNC Charlotte, Charlotte, North Carolina*

Off-pump coronary artery bypass grafting (CABG) has been suggested to improve outcomes in high-risk patients. As a result, increasing age is a factor in selecting the off-pump procedure. Despite the expectation that the off-pump procedure will improve outcomes, evidence for these better outcomes is mixed and incomplete. There is little research on postoperative stroke and readmission following off-pump and on-pump CABG. Using the 2007 State Inpatient Databases for California and Florida, we evaluated the effect of on-pump (n= 18,474) and off-pump (n= 3,740) CABG on the risk of postoperative stroke and 7-day, 15-day, and 30-day readmission for patients age 65 and older. Analyses included descriptive statistics and multivariate logistic regression, which adjusted for age, gender, ethnicity, median household income, 16 comorbidities, and CABG volume. In multivariate results, persons ages 85 and older were more likely than those aged 65-74 to have off-pump CABG (odds ratio, OR 1.64, 95% confidence interval, CI 1.39-1.93). There was no significant difference between the CABG techniques in the risk of postoperative stroke. Off-pump CABG had higher likelihood of 7-day (OR 1.52, CI 1.13-2.04) and 15-day readmission (OR 1.26, CI 1.10-1.43). Results suggest off-pump CABG may not lower the risk of postoperative stroke, but is associated with early readmissions. Although the results may be affected by unmeasured frailty or illness levels at the older ages where off-pump CABG is more common, the results underscore the need for further research on the expectation that off-pump GABG improves outcomes.

### CORRELATION OF PERCEIVED EXERTION WITH HEART RATE DURING AEROBIC EXERCISE IN OLDER MEN WITH ALZHEIMER'S DISEASE

F. Yu, K. Bil, *School of Nursing, University of Minnesota, Minneapolis, Minnesota*

Background: Older adults reap many physical and health benefits from regular aerobic exercise, including improved cerebral structure and function. Aerobic exercise may be a salient intervention for mitigating cognitive and physical declines in older adults with Alzheimer's disease (AD). Safe aerobic exercise, however, is understandably challenging for this population due to decreased motivation, insights and awareness, impaired cognition and increased behavioral and psychological symptoms. Hence, it is important to identify appropriate methods to monitor exercise responses to ensure safety. Method: The purpose of this study was to examine the correlation of subjectively-reported perceived exertion with heart rate (HR) – the objective measure of exercise response during aerobic exercise in four community-dwelling older men with severe AD. The aerobic exercise was 2-month, moderate intensity cycling on a recumbent stationary cycle supervised by a personal trainer 3 times a week. During each exercise session (10-30 minutes), HR was measured by a Polar® HR monitor and perceived exertion was reported using the Borg Rating of Perceived Exertion Scale every 5 minutes. Results: There were 597 HR-perceived exertion data pairs for the four subjects (mean age 70 years, education 17 years, Mini-Mental State Examination –MMSE- Score 8). The Pearson's r for HR and perceived exertion was .571 which is significant at p = .01, 2-tailed, controlling for age, education and MMSE. Conclusion: Objectively-measured HR and subjectively-reported perceived exertion is moderately correlated in older men with severe AD, indicating that the Borg RPE scale can be used for monitoring exercise responses in this population.

## SESSION 2170 (SYMPOSIUM)

### ETHNICITY, ACCULTURATION AND HEALTH

Chair: *R.M. Tappen, College of Nursing, Florida Atlantic University, Boca Raton, Florida*
Discussant: *C.L. Williams, College of Nursing, Florida Atlantic University, Boca Raton, Florida*

The demographic trend toward increasing proportions of minority elders within the older populations raises questions about their culturally-derived health beliefs, levels of health literacy and present physical and mental health status. This symposium addresses some of these issues, drawing upon two large databases and two smaller samples from the southern U.S.: metropolitan Miami-Dade county and environs, metropolitan Atlanta and the state of Florida, encompassing both rural and urban areas. These regions which have substantial populations of multigenerational African Americans and first generation Afro-Caribbean and Hispanic American older adults. The first paper describes marked contrasts in levels of identification and involvement in the heritage culture and mainstream American culture across these ethnic groups. The second paper addresses differences in physical function and self-reported physical and mental health. Again, the effect of ethnic/cultural group membership is marked. The attention to mental health continues in the third paper on results from two well-known measures of depression which evidence effects of both ethnic group membership and acculturation, particularly a contrast of the Afro-Caribbean to the other groups, including European Americans. The two final papers address specific health-related concerns: health literacy in older African Americans and knowledge gaps and deep personal concerns about cognitive impairment, particularly in the African American and Hispanic American groups. Discussion will focus upon theory-based explanations for the differences found, implications for practice and directions for further research.

### BIDIMENSIONAL ACCULTURATION IN OLDER AFRICAN AMERICAN, AFRO-CARIBBEAN AND HISPANIC AMERICAN ADULTS

R.M. Tappen, *College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Much attention has been directed to acculturation and biculturalism in Hispanic Americans of various ages but much less to African Americans, Afro-Caribbeans and European Americans. We used the bidimensional Cross Cultural Measure of Acculturation to estimate identification and involvement with heritage culture and mainstream American culture in 438 lower income individuals age 54 to 100 (M = 72.88, SD = 10.08). Levels of education ranged from 0 to 24 (M = 10.75, SD = 4.15). The four ethno/cultural groups differed on both mainstream and heritage dimensions F(3,434) = 369.94 and 22.46 respectively, p <.0001. Controlling for age and education differences, all pairwise comparisons were signicant for the mainstream dimension. Regressions indicated large effects for education and ethnic group, not for age or gender, yielding an R2 of .44 for the mainstream dimension, and R2 of .09 for heritage culture, suggesting that ethnicity is a primary factor in predicting acculturation.

### COMPARISON OF DEPRESSIVE SYMPTOMATOLOGY IN COMMUNITY DWELLING OLDER ADULTS FROM FOUR ETHNIC GROUPS

C.L. Williams, *Christine E. Lynn College of Nursing, Florida Atlantic University, Boca Raton, Florida*

This descriptive comparison utilized two samples of community-dwelling older adults. Sample 1 (N = 666) consisted of 326 African American, 105 European American, 167 Hispanic American and 68 Afro-Caribbeans. There were significant differences in depression measured by Geriatric Depression Scale with African American and Afro-Caribbean subjects scoring lower than the others. The second sample of 509 consisted of 75 African American, 163 European American, 166 Hispanic and 105 Afro-Caribbeans. In this sample depression was measured by Cornell Scale (CSDD). The European American group was significantly more depressed than the other three groups. The Afro-Caribbean group was least depressed of the ethnic groups. Afro-Caribbean group had low levels of depression despite being measured by self report in study 1 (GDS) and by trained observers in the study 2 (CSDD). Regression analysis indicated that identification with the heritage culture and ethnic group membership predicted levels of depressive symptomatology.

### FUNCTION AND HEALTH STATUS ACROSS FOUR ETHNIC GROUPS

C.P. Buscemi, *Florida International University, Miami, Florida*

Differences in health status have been observed across ethno/cultural groups in the U.S. Four hundred twenty-eight lower income community dwelling adults age 54 to 100 were surveyed. Reported IADL levels were lowest in the European Americans, highest in the Afro-Caribbeans. Results on the physical health subscale of the SF-8 controlling for age, education, cognition and level of acculturation evidenced the same trend and significant differences by ethnic group. Age was a significant predictor of mental health but again ethnic group membership was the strongest predictor with Afro-Caribbeans evidencing most positive scores, followed by the African American and Hispanic Americans. European American scores were again the lowest. The 'healthy immigrant' effect which suggests that the healthiest individuals are those who choose to migrate is a possible explanation for positive Afro-Caribbean self-rated health.

### HEALTH LITERACY AND HEALTH SEEKING BEHAVIORS AMONG OLDER AFRICAN AMERICANS

T.R. Sanchez-Jones, *College of Health and Human Services, Kennesaw State University, Kennesaw, Georgia*

An estimated 90 million Americans lack the skills to manage their health or navigate the complex health care system due to low health literacy. Those at greatest risk are old, poor, members of ethno/cultural minorities, live in the south, reside in urban areas and lack education. The purpose of this study was to understand older African Americans' use of health care information and the health care system. Mixed methods were used with a purposive sample of twenty older African Americans. Assessment of health literacy was done with the Test of Functional Health Literacy in Adults, Rapid Assessment of Adult Literacy in Medicine and the Newest Vital Sign. The participants found to have the lowest health literacy were male, had lower incomes and fewer years of education. Participants found it difficult to "think aloud" about their responses to these measures. Those with low health literacy described difficulty managing their chronic conditions.

### PERCEPTIONS AND CONCERNS ABOUT MEMORY LOSS

S.E. Gibson, *College of Nursing, Florida Atlantic University, Boca Raton, Florida*

Seventy-eight multiethnic adults age 46 to 80 were interviewed prior to participation in cognitive screenings. Of these, 24 were African American, 20 Afro-Caribbean, 10 Hispanic and 20 European Americans.

The remainder was Asian and Native American. The majority across ethnic groups associated the term Alzheimer Disease (AD) with memory loss, forgetfulness and confusion. More Hispanic Americans expressed uncertainty over the cause or effects of the disease. One suggested the brain "probably collapsed," another thought it was related to tremors. African Americans expressed the highest concern for their own possible impairment, some saying they depend on others to remember things and do not leave their neighborhood for fear of getting lost. In summary, we found awareness of AD high but more misunderstandings in the Hispanic American group and highest personal concern in the Africa American group.

## SESSION 2175 (PAPER)

## EXERCISE: INTENSITY AND FUNCTION

### IMPACT OF HIGH-INTENSITY RESISTANCE TRAINING ON BODY COMPOSITION OF ELDERS

M. Powers, T. Lake, M. Tecmire, E. Bounds, M. Gray, *University of Cental Oklahoma, Edmond, Oklahoma*

Despite some evidence to support improved body composition following high-intensity resistance training, the results remain inconsistent especially among those of advanced age. The purpose of this study was to assess the impact of high-intensity resistance training on body composition over a 24-week training period. Twenty-five female volunteers (age = 81.64±4.82) were randomly assigned a high-intensity resistance training group (HI) or an active control group (AC). Both groups trained two days per week. The HI lifted free weights at 80% of their one-repetition maximum, while the AC performed the same exercises with no external weight. Body composition was assessed using an iDXA total body scan which measured fat mass (FM), lean tissue mass (LTM), bone mineral content (BMC), and percent body fat (%BF) before and after the intervention. The results indicate a significant group-by-time interaction for FM, F = 5.77, p = .025. FM decreased by 1.88 pounds in the HI, while increasing by 0.48 pounds in the AC. No significant effects were observed for %BF, LTM, or BMC. However, LTM increased by 1.19 pounds in the HI, while decreasing by 0.26 pounds in the AC. These results support the hypothesis that high-intensity resistance training does have a positive impact on body composition especially fat mass. Although non-significant, the slight increase in LTM is extremely important for maintaining independence since LTM is expected to decline in the absence of resistance training. Further study is recommended with a larger sample size, longer training duration, and the inclusion of males.

### AEROBIC TRAINING RESTORES ARTERIAL BAROREFLEX SENSITIVITY IN OLDER ADULTS WITH TYPE 2 DIABETES, HYPERTENSION AND HYPERCHOLESTEROLEMIA

K. Madden[1,2], C. Lockhart[1,2], T. Potter[1], D. Cuff[1,2], *1. Medicine, University of British Columbia, Vancouver, British Columbia, Canada, 2. VITALiTY (Vancouver Initiative to Add Life To Years) Research Laboratory, Vancouver, British Columbia, Canada*

**OBJECTIVE:** Lowered baroreflex sensitivity (BRS) predicts cardiovascular mortality and occurs with both increasing age and diabetes. We examined whether aerobic exercise could restore arterial baroreflex sensitivity in adults with a "worst case scenario" cardiovascular risk profile (diabetes, geriatric age group, hypercholesterolemia, and hypertension). **METHODS:** 45 older adults (mean age 71.5±0.7) with diet-controlled or oral hypoglycemic-controlled Type 2 diabetes, hypertension, and hypercholesterolemia were recruited to each of 2 groups: an aerobic group (AT, 3 months vigorous aerobic exercise), and a nonaerobic group (NA, no aerobic exercise). Exercise sessions were supervised by a certified exercise trainer 3 times per week. Baroreflex function was assessed using the spontaneous baroreflex method. **RESULTS:** The AT group demonstrated an increase in BRS that was not demonstrated in the NA group (+60.9±23.5 versus +2.2±7.9%, p=0.010). **CONCLUSIONS:** Our findings indicate that a relatively short aerobic exercise intervention can restore arterial baroreflex function in older adults at high cardiovascular risk.

### EFFECT OF STANDING POSTURE DURING WHOLE BODY VIBRATION TRAINING ON MUSCLE MORPHOLOGY AND FUNCTION IN OLDER ADULTS

R. Orr[1], M. Mikhael[1], F. Amsen[1], D. Greene[2], M.J. Seibel[3], M.A. Fiatarone Singh[1], *1. Faculty of Health Sciences, The University of Sydney, Lidcombe, New South Wales, Australia, 2. Australian Catholic University, Strathfield, New South Wales, Australia, 3. Concord General Repatriation Hospital, Concord, New South Wales, Australia*

Aim This study examines the effects of standing posture during low magnitude whole body vibration (WBV) exercise on muscle morphology and function in older adults. Methods In a 6-month randomised controlled trial, 19 adults (50-80 years) were allocated to: WBV with flexed knees (FK), WBV with locked knees (LK), or sham WBV (C). Exposure was intermittent WBV:rest (1min:1min) for 20 minutes, three times/week. Primary outcomes included upper and lower body muscle function (strength, power and velocity). Secondary outcomes were muscle morphology, balance and gait velocity. We report three month outcomes. Results Sixteen subjects completed three months of exposure. Relative (%) upper body contraction velocity improved significantly after WBV with FK compared to LK (FK 16.0%, LK -7.6%, p=0.01). Absolute (p=0.05) and relative (p=0.03) lower leg strength significantly improved with both standing postures (LK 14.4%; FK 10.7%). Only LK differed significantly from C in relative leg strength gains (p=0.02). Relative upper body strength (LK 15.1%, p=0.02; FK 12.1%, p=0.04) increased significantly following WBV compared to control. Potentially clinically meaningful but statistically non-significant improvements in lower leg muscle cross-sectional area (p=0.13) were observed with LK compared to the other groups. No significant effects of WBV on functional performance were observed. Conclusions WBV may improve muscle strength and contraction velocity in some muscle groups in older adults. Hypothesised differential adaptation to standing posture was observed only for upper body contraction velocity, making recommendations regarding WBV inconclusive. The efficacy of WBV for musculoskeletal health in older adults warrants continued investigation in robust future studies.

### DON'T COUNT ON YOUR PAST EXERCISE: IMPACT OF PREVIOUS AND LIFELONG VERSUS NEWLY-DEVELOPED EXERCISE PATTERNS ON THREE YEAR MORTALITY IN CHINESE OLDER ADULTS

Q. Feng[1], Z. Zhen[3], P.W. Duncan[1,2], Y. Zeng[2,4], J. Purser[1,2], *1. Division of Physical Therapy, Duke University, Durham, North Carolina, 2. Division of Geriatrics, Duke University, Durham, North Carolina, 3. Shanghai University of Finance and Economics, Shanghai, China, 4. Peking University, Beijing, China*

Benefits of exercise have been long documented, but few studies consider past exercise history along with current exercise status to examine the health impacts of lifelong exercise patterns in later life. We investigate how exercise subtypes defined by historic and current exercise status differently influence three-year mortality. Using the Chinese Longitudinal Healthy Longevity Survey (CLHLS), we followed survival of 16,020 Chinese elders (65+) over three years. Four exercise subtypes were indentified: 1) people who have never exercised regularly; 2) people who previously exercised regularly but are not currently; 3) people with no previous regular exercise who exercise regularly now; and 4) people who have exercised regularly in the past and present. Using Cox proportional hazards, we estimated mortality risks, controlling for age, gender, ethnicity, income, education, living environment and arrangements, self-reported health, comorbidities, self-reported and performance-based physical disability, visual problems, cognitive impairment, depression, weight, knee height, previous labor, fruit intake, vegetable intake, smoking, drinking and religious participation. Compared with people who never exercised, exercise in the past without ongoing current exercise conferred no protection against mortality (HR 1.01 [0.93, 1.10]); By contrast, people maintaining exercise had a much lower mortality risk (0.86 [0.80, 0.93]), while newly-developed exercise patterns surprisingly conferred the greatest protective effect (0.81 [0.70, 0.94]). Our results demonstrate the unreliability of the past exercise practice alone in health prediction in contrast with current regular exercise or newly initiated regular exercise. These results may have important implications for physical activity recommendations.

## SESSION 2180 (SYMPOSIUM)

### SMALL-SCALE, HOMELIKE CARE ENVIRONMENTS FOR PEOPLE WITH DEMENTIA: AN INTERNATIONAL PERSPECTIVE

Chair: *H. Verbeek, School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*
Co-Chair: *J. Hamers, School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*
Discussant: *L.K. Evans, University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

Long-term care for people with dementia is increasingly organized in small-scale and homelike environments. This cultural change emphasizes values such as quality of life, wellbeing and preserving autonomy. In many countries, small-scale, homelike care settings have been developed. Despite this expansion, little is known about residents' experiences and effects of these homelike care environments on residents. Insight in these features is essential to improve dementia care and contribute to future planning and realization of care settings. This symposium presents findings from four recent studies, performed in different populations and countries. The first presentation focuses on residents' experiences of home in US long-term care and how to measure this in residents with cognitive impairments, such as dementia. Results are presented from two mixed-methods longitudinal studies examining changes in physical, psychosocial and cognitive wellbeing, as well as perceptions of "at-homeness" in older adults experiencing residential transition. The second presenter addresses results from a longitudinal study in Germany into the effects of small-scale living on newly admitted residents. Quality of life and various outcomes of physical and psychological health are presented. The third presentation discusses results from a large longitudinal study (n=260) in the Netherlands, investigating effects on residents. Results focus on cognition, ADL functioning, quality of life and neuropsychiatric symptoms. Finally, findings are presented from the Living Arrangements for people with Dementia (LAD-) study. Effect of the variety of group living home care (n=136 facilities) on the amount of required staff and the quality of life of residents is addressed.

### METHODS AND MEASUREMENT OF PERSON-ENVIRONMENT FIT IN SMALL HOUSES

S.L. Molony*, Nursing, Yale University, New Haven, Connecticut*

This paper uses findings from two mixed-methods longitudinal pilot studies examining changes in physical, psychosocial and cognitive well being, as well as perceptions of "at-homeness" in older adults experiencing residential transition. Study 1 enrolled rural-dwelling older adults who elected to move to a small house (SmH; n=15) or remain in a usual-care nursing home (NH; n = 10). Study 2 enrolled urban-dwelling minority PACE program members living in community (n = 10) or nursing home (n=7) who experienced either residential stability, or residential transition to a supportive housing environment, including six nursing home residents who were being de-institutionalized. The studies used quantitative measures with diverse response formats, biobehavioral measures, and qualitative interviews. Cognitive and sensory impairments were prevalent among subjects, posing measurement challenges. We will share strategies and recommendations to enhance data quality in future studies within and across innovative LTC environments.

### HEALTH OUTCOMES IN RESIDENTS OF SHARED HOUSING ARRANGEMENTS IN BERLIN: RESULTS OF THE DEWEGE-STUDY

K. Wolf-Ostermann[1], T. Fischer[2], A. Worch[1,2], J. Nordheim[2], I. Wulff[2], A. Pannasch[1,2], S. Meye[1]*, 1. Alice Salomon University, Berlin, Germany, 2. Charité Universitätsmedizin Berlin, Berlin, Germany*

Objectives Shared Housing Arrangements (SHA) are a Specific German Kind of Small-Scale Living Facility for Care-dependent Persons, being served by Community Care Services and disconnected from Residential Facilities. Methods Using a Longitudinal Design, New Residents of Small-Scale Living Arrangements Suffering from Dementia (MMSE < 24) were surveyed for one Year. Measures include ADL Functioning, BPSD, Additional Social Factors and QoL (Qualidem). SHA-Residents are also compared to Residents of Special Care Units (SCU). Results Persons moving into SHA tend to have Better Cognitive Function than those moving into SCU. Need-driven Behaviours were frequent in Both Groups as were Impairments in Physical Functioning. Psychotropic Drugs were slightly more often prescribed for Residents in Nursing Homes. Conclusion Data indicate that both Types of Facility attract a slightly different Population. The Study Results will add some Clarification as to whether or not Claims of Improvement of Quality of Life in SHA are viable.

### SMALL-SCALE LIVING FACILITIES IN THE NETHERLANDS: EFFECTS ON RESIDENTS

H. Verbeek, S. Zwakhalen, E. Van Rossum, G.I. Kempen, J. Hamers*, School for Public Health and Primary Care, Maastricht University, Maastricht, Netherlands*

In the Netherlands, small-scale living facilities (SSLF) for people with dementia are rapidly increasing. A small number of residents, usually 6 to 8, live together in a homelike environment and are encouraged to participate in daily activities. Nursing staff actively participates in the household and have integrated tasks. Little research has been conducted yet into effects on residents. This study used a longitudinal, quasi-experimental design, in which residents in SSLF (n=125; mean age 82 years) were compared with those in traditional nursing homes (TNH) (n=135; mean age is 83 years). No baseline differences were found for cognition, ADL-functioning and global deterioration. In both groups, neuropsychiatric symptoms (mean NPI-NH score 16.2 for SSLF; 15.7 for TNH) were quite low and quality of life relatively high. Longitudinal analyses are presented to investigate effects in more detail and investigate whether SSLF contributes to a improvement of QoL for residents with dementia.

### THE EFFECT OF VARIETY IN GROUP LIVING HOME CARE ON THE AMOUNT OF REQUIRED STAFF AND QUALITY OF LIFE OF RESIDENTS

A. Pot[1,2], B. Willemse[1], D. Smit[1], J.D. Lange[1]*, 1. Program on aging, Netherlands Institute of mental health and Addiction, Utrecht, Netherlands, 2. Department of Clinical Psychology, Faculty of Psychology and Education, VU University, Amsterdam, Netherlands*

A large variety of group living home care appears, ranging from group living homes in an archetypical house to large arrangements where group living home care (GLHC) is provided. The question rises what the effect of the variety in GLHC is on the amount of staff required in the future and the quality of life of the residents. The Living Arrangements for people with Dementia (LAD-) study is designed to answer this question among others. In this study 136 living arrangements were included. Organizational characteristics including staff ratio, quality of life (Qualidem) and functional status of residents are assessed (N=1366 residents). The amount of staff ratio in smaller and larger arrangements providing group living home care differs. In smaller group living homes more nursing staff is required. Considering the quality of life of the residents in small and large arrangements providing GLHC differences are found in benefit of the small arrangements.

# SESSION 2185 (PAPER)

## TRANSITIONS OF CARE

### TRANSITIONS OF CARE: HOSPITAL TO HOME CARE – CHALLENGES OF TEAMING ACROSS SILOS

J. Cotter[1], S. Barsness[1,2], M.A. Tetterton[2], *1. Gerontology, Virginia Commonwealth University, Richmond, Virginia, 2. Virginia Association for Home Care and Hospice, Richmond, Virginia*

Transitioning through levels of care has been identified as a significant challenge for patients, families, and healthcare professionals. Medicare reimbursement is designed for acute care and not the management of chronic and/or multiple conditions. As a result, hospital discharge planners' goals are driven by a system that does not sufficiently recognize the chronic care needs and co morbidity in a growing older population. In post-acute transitions, hospital discharge planners play a significant role. The purpose of this study is to explore the special challenges when referring to home care. Constructs from structural lag theory are used to explore the reasons for difficulty in transitions. Two focus groups were held – one with 10 home health liaison and assessment nurses and one with 10 discharge planners/care coordinators and individual interviews were held with members of both groups to identify key issues in transitions of care. A survey of 145 hospitals and 244 Medicare certified home health agencies will be reported upon that explores attitudes toward issues such as increasing patient acuity at discharge, time crunch issues of discharging a patient, patient freedom of choice of home health providers, role of hospitalists, coordination of multiple home and community based services, capacity of home care agencies, and role of patient. Session leaders will discuss suggested improvements needed for a smoother transition of care from hospital to home care. The session will explore future research needs and the education needed for hospital based providers and for community based providers.

### GIVING A VOICE TO THE PATIENT: TELEHEALTH IN HOME HEALTH CARE

E. Chichin, D. Bobe, M. deLisser, B. Gallagher, *Jewish Home Lifecare, New York, New York*

Burgeoning health care costs and older persons' desire to age in place mandate creative approaches to home health care. Using telehealth technology can supplement clinician pain assessment, giving a voice to patients, enabling them to report symptoms in real time and enhancing quality of care. Health buddy units, small monitors with Q&A dialogues in English or Spanish, were placed in home care clients' homes. Patients answered simple questions about their pain, rating it on a scale of 0-5, with scores greater than 3 triggering a "red alert" and a call from a nurse. Pending the call's outcome, a case conference was held with the care team and a palliative consultant to decide upon modification of the care plan and need for a consultant visit. Over three months, 25 out of 207 patients required case conferences. Analysis of conference notes revealed that arthritis was the cause of pain in 48% (n=12) of cases. Other musculoskeletal conditions accounted for 32% (n=8) of the conferences, and three patients had experienced pain after a fall. Two patients had no pain on follow-up, and three had concomitant psychiatric histories. In 44% of cases, patients had medication available that was effective when taken, but additional patient education was needed and continues to be provided. Recommendations in remaining cases included modification of medication or referrals to physical therapy, psychiatry or social work. Implications of findings and replication strategies and will be discussed.

### ESTABLISHING GOALS OF CARE – FACILITATING CARE TRANSITIONS: INTERDISCIPLINARY LESSONS FOR MANAGING THE ACUTELY ILL, EXTENDED STAY ELDERLY PATIENT

B. Ohta[1,2], D. Shine[1,3], *1. New York University Langone Medical Center, New York, New York, 2. New York University Silver School of Social Work, New York, New York, 3. New York University School of Medicine, New York, New York*

Problems related to acute care patient transitions tend to be multidimensional and multidisciplinary. Nowhere is this experienced more dramatically than among the population of elderly patients which comprises a new level of patient acuity, that of the "chronically-acutely" ill (multi-system organ failure, intractable infections, high-tech/intensive care intervention). The ability to manage patients at this highest acuity level, and the patient's/family's desire to do so, places patients and providers in a dire stalemate of continued aggressive care with limited hope of recovery or transition. The current study explored factors affecting treatment decisions and care transitions, and the effectiveness of interventions available through: 1) proactive interdisciplinary action; 2) culturally sensitive communication; and 3) expanded use of the care continuum, from the long term acute facility to hospice care services (n=300+). This approach has demonstrated progressively improved and significant reductions in the number of extended stay patients ($p< .01$), as well as reductions in associated acute care bed days. It has facilitated culture change fostering greater acceptance/utilization of hospice care services (29% increase), end-of-life/goals-of-care discussions, and DNR/comfort-care orders. Additionally, lessons learned have led to the development of a unique, interdisciplinary, electronic-documentation approach regarding goals-of-care and Advance Directives. For patients and families who enter the acute care setting from a perspective of "doing everything", proactive medical management, exploration of options throughout the continuum, and skilled interdisciplinary communication are essential. Study implications underscore the critical need for broad and integrative approaches to managing the highest complexity of patient care acuity among our frailest elderly patients.

### TRANSITIONS OF CARE FOR OLDER PATIENTS WITH MOBILITY DEFICITS: PATIENT AND CAREGIVER PERSPECTIVES

A. Dossa[1], B. Bokhour[1], H. Hoenig[2], *1. Center for Health Quality, Outcomes, and Economic Research, Bedford VA, Bedford, Massachusetts, 2. Durham VA, Durham, North Carolina*

Older patients with chronic complex disease and mobility deficits are frequently discharged from the hospital with continuing community nursing and rehabilitation services. Quality transition of care is essential for these patients to achieve optimal outcomes such as preventing readmissions and improving functional status. Research on transitions has focused primarily on the medical issues, rather than on problems for patients who have undergone rehabilitation therapy in the hospital with follow-up therapy at home. Our qualitative pilot study examined transition experiences of nine medical and surgical patients 70 years and older, and their caregivers following hospital discharge. We conducted 90-minute face-to-face semi-structured interviews two weeks post-discharge, and two 30-minute telephone interviews at one and two months post-discharge. Audio-recordings of the interviews were transcribed verbatim and analyzed using grounded thematic analysis to identify emergent themes. Our findings included the following patient experiences: Patients reported difficulty accessing hospital staff and lacked information on who to call for post-acute care problems; they lacked follow-up from the physician about pain issues and post-acute coordination and scheduling of rehabilitation therapy; they reported discrepancies between surgeon, home care therapist, and out-patient therapist regarding therapy protocol, they reported home equipment safety issues and delay in receiving equipment; and reported lack of communication between rehabilitation staff and the physician or surgeon. Improved systems are needed to address patient concerns after discharge from the hospital and to facilitate recovery at home, particularly with regards to better coordination and communication between patients, hospital providers, and home care providers.

## SESSION 2190 (SYMPOSIUM)

### VA GREC SYMPOSIUM: FACILITATING THE TRANSITION OF FRAIL VETERANS TO THE COMMUNITY

Chair: *J. Schnelle, Center for Quality Aging, Vanderbilt University Medical Center, Nashville, Tennessee, Tennessee Valley GREC, Nashville, Tennessee*
Discussant: *J. Powers, Center for Quality Aging, Vanderbilt University Medical Center, Nashville, Tennessee*

A primary objective of VA community living centers and Post Acute Rehabilitation units is to facilitate the transition of veterans to home. This symposium will describe research relevant to the rehabilitation of veterans receiving care in these settings. The first presentation will review recommendations for research and education released in July of 2010 by a consensus group for the World Health Organization and the International Association for Geriatrics and Gerontology (Morley). This presentation will provide the background information to understand the importance of the research described by the symposium participants that follow. The second and third speakers will focus on the importance of nutrition. More specifically, the second speaker will describe the role of nutrition and associated inflammatory markers in preventing functional decline (Sullivan) The third speaker will describe an intervention to prevent unintentional weight loss in community living centers. (Simmons). One aspect of this nutrition intervention was to offer residents more dining choices, which is consistent with national and VA efforts to promote culture change in long term care. The fourth presentation will provide data describing the importance of sleep in a VA post acute care rehabilitation unit (Alessi). The final presenter will describe an innovative observational protocol to measure staff behaviors related to pressure ulcer prevention and management of staff in three VA community living centers (Dellefield). The overall objective of the symposium is to describe current approaches to preventing or addressing barriers to the successful transition of veterans from post acute and community living centers to home.

### A STAFF TRAINING AND MANAGEMENT INTERVENTION TO IMPROVE NUTRITIONAL CARE IN VA NURSING HOMES

S.F. Simmons, *1. Division of General Internal Medicine & Public Health, Vanderbilt University, Center for Quality Aging, Nashville, Tennessee, 2. VA GRECC, Nashville, Tennessee*

Unintentional weight loss is a common problem among long-term care (LTC) residents, and one that can lead to adverse and costly clinical outcomes. The primary objective of this translational research project was to train LTC staff how to identify residents in need of feeding assistance and effectively monitor daily care delivery. A multiple baseline design was used to evaluate the effectiveness of the staff training and management intervention in two VA facilities. Primary outcome measures were feeding assistance care processes provided by staff during and between meals and residents' oral food and fluid intake. Research staff trained LTC staff in the implementation of program protocols during a 12-week intervention period and monitored program maintenance during a 12-week follow-up period. Facilitators and barriers to LTC staff improvements in nutritional care will be discussed in the context of this translational research effort.

### DEVELOPMENT OF A NONPHARMACOLOGICAL INTERVENTION TO IMPROVE SLEEP PATTERNS AMONG OLDER ADULTS UNDERGOING INPATIENT POST-ACUTE REHABILITATION

C. Alessi[1,2], J. Martin[1,2], L. Fiorentino[2], C. Chung[2], K. Josephson[1], S. Jouldjian[1], *1. VA Greater Los Angeles Healthcare System, Los Angeles, California, 2. David Geffen School of Medicine at University of California, Los Angeles, Los Angeles, California*

Older people who suffer functional decline related to acute hospitalization often undergo inpatient rehabilitation to improve functional status. We previously performed a descriptive study among adults aged > 65 years (N=245) admitted to inpatient post-acute rehabilitation units and found that less daytime sleeping during the post-acute rehabilitation stay was associated with greater functional recovery (even after adjusting for other important predictors of functional recovery); a relationship that persisted at 3-months follow-up. Based on these findings, we are currently performing a randomized, controlled trial testing a multi-modal behavioral sleep intervention in a Veterans Administration inpatient rehabilitation unit (N = 214 participants). This inpatient intervention combines elements of behavioral strategies for insomnia with efforts to limit daytime in-bed time, increase daytime bright light exposure and other measures. Here we present data on the process of this intervention, including practical aspects of implementing this type of intervention in an inpatient rehabilitation setting.

### OBSERVATIONAL PROTOCOL MEASURING NURSING BEHAVIORS: CLINICAL SUPERVISION & PRESSURE ULCER PREVENTION

M.E. Dellefield[1], M. Shively[2], C. Harrington[3], C. Der-Martisorian[4], J. Schnelle[5], *1. research, VASDHS, San Diego, California, 2. VASDHS, San Diego, California, 3. UCSF, San Francisco, California, 4. UCSD, San Diego, California, 5. Vanderbilt, Nashville, California*

Preventing pressure ulcers (PUs) in frail veterans receiving institutional care may increase the likelihood of their transition home. We pilot tested an observational protocol to measure in real-time RN clinical supervision and RN and CNA direct care associated with PU prevention. Work sampling and trained observers using personal assistive devices (PDAs) were used. Protocol reliability and validity was tested and demonstrated. Counts and frequencies were used in data analysis. Many observed RN and CNA clinical behaviors could not be linked to PU prevention behaviors or an identifiable clinical domain. RNs were rarely observed providing clinical supervision. Findings suggest that RNs and CNAs may benefit from performing more targeted preventive nursing behaviors. Using staff self-report with observation to collect data could increase observers' abilities to link nursing behaviors to specific clinical domains. Increased RN performance of clinical supervision targeted to pressure ulcer prevention in frail veterans is recommended.

### WHO/IAGG RECOMMENDATIONS FOR NURSING HOMES

J.E. Morley, *1. St Louis VAMC, St Louis, Missouri, 2. Geriatrics, Saint louis University, St louis, Missouri*

In June 2010 the WHO/IAGG committee on nursing homes met. This symposium will provide a summary of their recommendations to improve future care in nursing homes.

### CHANGES IN ACTIVITIES OF DAILY LIVING, NUTRIENT INTAKE AND SYSTEMIC INFLAMMATION IN ELDERLY PATIENTS

D.H. Sullivan[1,2], K.K. Garner[1,2], L. Johnson[1,2], P.K. Roberson[2], M.M. Bopp[1,2], R. Dennis[1,2], *1. Central Arkansas Veterans Healthcare System, Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences, Little Rock, Arkansas*

In order to evaluate the interrelationships among recovery of physical function, systemic inflammation, and nutrient intake, 275 older [age 78.9 + 7.5 yrs] patients admitted to a recuperative care unit were evaluated. Walking endurance [WalkEndur] and markers of inflammation were measured at admission and discharge [median length of stay = 24 days (IQR = 16-44d)]. Complete nutrient intake assessments were performed daily. By univariable analyses, the change in WalkEndur was positively correlated with nutrient intake and inversely with multiple indicators of inflammation. When all covariates were included in a multivariable least-squares regression analysis, the strongest correlate of WalkEndur change was change in protein intake followed by change in albumin, tumor necrosis factor soluble receptor 2, and IL-6 (model $R^2 = .18$, $p<0.001$). These results suggest that both inflammation and nutrient intake appear to be important independent determinants of functional recovery among older recuperative care patients.

## SESSION 2195 (SYMPOSIUM)

### A ROADMAP FOR ACCREDITATION IN GERONTOLOGY/GERIATRICS

Chair: *D.C. Burdick, School of Social and Behavioral Sciences, The Richard Stockton College of NJ, Pomona, New Jersey*
Co-Chair: *A.O. Pelham, San Francisco State University, San Francisco, California*
Discussant: *F. Whittington, George Mason University, Fairfax, Virginia*

Gerontology programs face serious, primarily structural, challenges to survival. The discipline, academic programs, students, graduates, and the public all suffer because programs are not accredited. The Association for Gerontology in Higher Education (AGHE) is arguably the most appropriate provider of accreditation based on its Standards and Guidelines first written in 1989, its Program of Merit (POM) began in 1998, and its emerging Consultation Program. The POM is a step towards accreditation, yet is currently un-recognized by university administration as equivalent to accreditation, and thus underutilized. Consequently, gerontology programs lack bargaining power and capital in fighting for scare and diminishing college and university resources to support basic needs. Over time, this has weakened academic gerontology programs. Several have vanished, many others are at risk. Unfortunately, this is happening when workforce demands for credentialed/skilled professionals in aging are soaring and the public seeks quality services. The 2010 Tibbitts Awards Lecture by Frank Whittington at AGHE's Conference highlighted the interconnectedness of AGHE's health with the well-being of academic gerontology programs and the ability to address the growing exigencies of an aging society. It issued a clear and convincing call to action. This symposium responds to that challenge, beginning with elaboration on the proposed causal relationship between no accreditation and the weakening and unfulfilled promise of gerontological education. Next alternative accreditation models are explored – from other interdisciplinary fields, from international perspectives, through a macro-level social construction lens, and finally through the perspective of AGHE's past groundwork and future plans for the evolution of POM.

### FRAMING THE ISSUES AND ONE VISION FOR A ROAD MAP TOWARDS ACCREDITATION

A.O. Pelham, *San Francisco State University, San Francisco, California*

Academic gerontology programs face serious challenges with mostly structural causes. This presentation proposes that the lack of recognized national accreditation has directly caused hardship for the discipline, gerontology programs, graduates, and the public. Programs routinely queue up at the end of budgetary lines for diminishing university funds, in part, because they cannot hold up accreditation standards for even minimum support for urgent needs such as faculty lines, staff support, curricular and professional development. Over time, these opportunity costs weakened academic gerontology programs. Some have not survived (demonstrated by fewer programs in the AGHE Directory from the 2000 to the 2009 editions), many are at risk (as demonstrated by numerous anecdotal reports and concerns expressed at the 2010 AGHE Annual Meeting. Program accreditation must proceed for our discipline and programs to survive. An initial road-map for accreditation will be presented – a theme which will be magnified and illuminated in subsequent presentations.

### SOCIALLY CONSTRUCTING THE REALITY OF ACCREDITATION: A MACRO LEVEL VIEW

C.L. Estes, *University of California, San Francisco, San Francisco, California*

What do current social science perspectives contribute to understanding both the issues and debate of academic gerontology program accreditation? Bringing the unique and long view of a former AGHE president and social theorist to the discussion, academic program accreditation is analyzed from a macro political economy perspective. Particular attention is given to the vastly changing environment of academic programs in gerontology where diminishing resources and budget cuts face higher education for years to come. Academic programs in gerontology are stressed and struggling nationwide. What are the larger political and economic forces behind this disquieting trend? A macro critical theory analysis will contribute to both an understanding and way forward in terms of recommendations for the future policy of AGHE.

### VALUES AND IMPORTANCE OF ACCREDITATION: LESSONS FROM EUROPE

R. van Rijsselt, *Windesheim University of Applied Sciences, Amersfoort, Netherlands*

In Europe each individual national government is responsible for the quality assurance system in higher education. The quality systems vary largely in terms of indicators and the underlying educational policy. The development of one European Educational Area presupposes the unification and elaboration of these quality systems. In the context of the Bologna Agreement forty-five EU countries agreed in Berlin in 2003 on a coherent set of quality indicators based on the agreements between the European Quality Bodies (collaborating in ENQA), the educational institutes and student bodies. The further development of transatlantic educational programs (including double and dual degrees) requires a good understanding of educational models as well as the underlying quality assurance models. In this presentation the European experiences related to accreditation are elaborated and compared with the US. Furthermore, the necessity of accreditation for (inter)national gerontology programs is stressed.

### ACCREDITATION: A MULTIDISCIPLINARY PERSPECTIVE

R. Maiden[1], J.L. Howe[2], *1. Alfred University, Alfred, New York, 2. Mount Sinai Medical School, New York, New York*

A key challenge facing gerontologists in the 21st century is ensuring there is an appropriately trained workforce providing quality services to meet the pressing needs of an older population that is becoming larger, more ethnically diverse, and more educated than previous generations. The 2008 Institute of Medicine report advocates that providers of services receive minimal levels of training and education to provide quality services for older adults. One method of ensuring that individuals receive training sufficient to meet the needs of older people is through accrediting programs. We will discuss how professions such as social work and psychology have addressed accreditation concerns including those related to competency development and minimum practice and education requirements. For example, the PsyD Program in School Psychology at Alfred University successfully sought accreditation from the American Psychological Association. An analysis of other disciplines will provide guidance to the field of gerontology as it contemplates accreditation.

### AGHE PROGRAM OF MERIT EVOLVES TO ACCREDITATION

M. Gugliucci[2], D.C. Burdick[1], *1. School of Social and Behavioral Sciences, The Richard Stockton College of NJ, Pomona, New Jersey, 2. University of New England, Biddeford, Maine*

The Association for Gerontology in Higher Education (AGHE) first developed standards and guidelines for gerontology instruction at associate, baccalaureate and graduate levels in 1989 after 5 years of careful deliberation by a distinguished national taskforce. The guidelines have been periodically updated to include recommendations for online instruction, doctoral programs and osteopathic medicine. A forthcoming update will address standards in health professions programs. AGHE's Program of Merit (POM) was established in 1998 to acknowledge best practice in gerontological instruction, and was a natural evolution of AGHE's foundational work in standards and guidelines. Recently the POM was expanded to include curriculum review in gerontology and geriatrics in health professions. Clearly, current trends in academia and demographics demonstrate that accrediting Gerontology programs is important for the discipline. AGHE seeks to continue its leadership through an expanded POM, Consultation Program and other services. An overview of process, progress, and plans will be presented.

## SESSION 2200 (SYMPOSIUM)

### DIRECT-CARE WORKER TRAINING SYSTEM DEVELOPMENT: CHALLENGES AND OPPORTUNITIES

Chair: *D. Tyler, Center for Gerontology, Brown University, Providence, Rhode Island*

Co-Chair: *J. Angelelli, PHI National, New York, New York*

Discussant: *C.E. Bishop, Brandeis University - Heller School, Waltham, Massachusetts*

Training for direct-care workers (DCW) is an increasingly significant issue as more elders and persons living with disabilities require care and support while the care needs become more complex and the settings where care and support are provided become more diverse. The Nursing Home Reform Act established federal training requirements for nursing assistants in nursing homes and many states have instituted their own additional standards. However, no similar federal regulations exist for the training of DCWs providing only activities of daily living assistance in home care agencies, adult day service centers, or assisted living residences. State regulations, where they exist, vary widely. This symposium will illustrate some of the challenges and opportunities related to DCW training system development by describing the breadth of state regulations for DCW training and the practical and policy implications surrounding the declining availability of nursing home based DCW training. State response to the training needs of DCWs will be illustrated through the example of programs in two states. The design and implementation of a model curriculum for DCWs in Pennsylvania will be described as will the Jobs to Careers program developed in North Carolina.

### PRACTICE AND POLICY IMPLICATIONS OF DECLINING NURSING HOME-BASED NURSE AIDE TRAINING

D. Tyler[1], H. Jung[1], Z. Feng[1], V. Mor[2], *1. Center for Gerontology, Brown University, Providence, Rhode Island, 2. Brown University, Providence, Rhode Island*

All nurse aides (NAs) must receive training and pass a certification exam before working in Medicare/Medicaid certified nursing homes (NHs). According to the 2004 National Nursing Assistant Survey, the majority of NAs (57%) received their pre-employment training in NHs. However, our research shows that prevalence of NH-based training and certification programs has been dropping, with 37.6% of NHs providing these programs in 1997 and only 22.8% providing them in 2008. The purpose of this study was to examine the characteristics of NHs that dropped or adopted these training programs during this period. We found that a high deficiency score was a strong contributor to NHs dropping these programs, as was being located in an urban area. Large NHs were more likely to adopt programs, whereas facilities with higher NA staffing were less likely to adopt them. There are a number of practice and policy implications related to these findings.

### THE ROLE OF THE COMMUNITY COLLEGE IN NURSING ASSISTANT TRAINING: CHALLENGES AND LEVERAGE POINTS

J.C. Morgan[1], S.L. Ocander[2], B. Farrar[3], *1. UNC Institute on Aging, Chapel Hill, North Carolina, 2. Metropolitan Community College, Omaha, Nebraska, 3. North Carolina State University, Department of Sociology, Raleigh, North Carolina*

Population aging is driving an increase in the demand for healthcare services, the bulk of which, particularly in long-term care (LTC), is delivered by low-wage workers in jobs with low educational requirements. Community colleges are playing an increasing role in providing nursing assistant training. Using case studies from the evaluation of the Jobs to Careers: Promoting Work-based Learning for Quality Care program and the National Fund for Workforce Solutions, this paper seeks to illustrate how partnerships between LTC employers and community colleges can leverage resources to increase the skills, create career opportunities and improve retention. Data come from partnership case studies (40 key informant interviews) and local evaluation data. Interviews were audio-taped, transcribed, and coded for themes. Findings indicate that successful educational programs layer basic skills, support services, coaching and engage employers. Implications and challenges related to career pathways, skill development, care provision and partnership system change will be discussed.

### EXPLORING INTERSTATE DIFFERENCES IN THE CERTIFICATION OF THE HOME CARE WORKFORCE

C.M. Kelly, J. Deichert, L. Holley, K. Kosloski, *Department of Gerontology and Center for Public Affairs Research, University of Nebraska, Omaha, Nebraska*

Our research defines two distinct types of workers that constitute the home care workforce in the United States. Home health aides, who are typically credentialed, work for certified home health or hospice agencies and help with personal care and perform clinical procedures. Personal home care aides, who are typically uncredentialed, work for various public and private agencies or are hired directly by the patient or the patient's family. The latter provide companionship and custodial care and help with chores such as housekeeping and meal preparation. Training requirements for both types of workers vary widely from state to state. For example, some states require aides to complete specific training courses before they are allowed to work in the homes of clients. This study explores differences in credentialing requirements for home care workers across the 50 states and their potential impact on patient outcomes.

### DESIGNING A TRAINING AND CREDENTIALING SYSTEM FOR ENTRY-LEVEL DIRECT CARE WORKERS: LESSONS FROM PENNSYLVANIA

J. Angelelli, *PHI National, New York, New York*

There exist no national standards for the training and credentialing of Personal and Home Care Aides who are employed in home care agencies, adult day service centers, assisted living residences and/or disability service agencies to provide hands on activities of daily living assistance to elders and persons living with physical disabilities. This paper presents a sampling of state approaches to training this workforce and describes the Commonwealth of Pennsylvania's experience designing and field-testing a 77 hour model curriculum for entry-level direct care workers. The model curriculum was designed based on adult learner-centered principles and a competency-based approach developed for the US Department of Labor. Lessons are shared from a multi-employer (n=40) learning collaborative in Southwestern Pennsylvania that leveraged resources from the PA Department of Aging and the PA Dept of Labor and Industry.

# SESSION 2205 (PAPER)

## HOUSING, NURSING HOMES, AND RESIDENTIAL CARE III

### FULL-TIME RVING AS AN ALTERNATIVE HOUSING OPTION FOR OLDER PEOPLE

E. Sikorska Simmons[1], A. Gens[2], *1. Sociology, University of Central Florida, Orlando, Florida, 2. University of Central Florida, Orlando, Florida*

Full-time RVing (i.e., living in a recreational vehicle) has been recognized as an important housing alternative for older people. With the growing older population and the retirement of baby-boomers, the appeal of full-time RVing is increasing. It is estimated that 750,000 seniors live in RVs for part or all of the year. Little, however, is known about the quality of their housing, why they choose it, and how they manage their health and service needs over time. This paper reviews what is currently known about full-time RVing as an alternative housing option for older people. The Lawton's ecological model of adaptation and aging provides a conceptual framework for this analysis. Factors that influence the decision to live in an RV are classified into three categories: 1) personal preference (e.g., needs for independence and privacy), 2) enablement (e.g., health status, income, and geographic location), and 3) required support (e.g., access to health services and public facilities). The quality of RV housing is examined according to two dimensions: 1) macroenvironment (e.g., community structure and neighborhood) and 2) microenvironment (e.g., physical aspects of housing, safety, and satisfaction). As the number of older people who choose full-time RVing as a housing option increases, more research will be needed to understand how they manage their health and service needs. Such research could benefit policy-makers, planners, and mobile home/RV retirement park developers who are interested in improving the quality services for their residents.

### CONSIDERING FUTURE RELOCATION TO A RETIREMENT VILLAGE: PREDICTORS FROM A COMMUNITY SAMPLE

D. Crisp, T. Windsor, K. Anstey, P. Butterworth, *Australian National University, Canberra, Australian Capital Territory, Australia*

The prospect of downsizing to a smaller home or relocating to an age-segregated community such as a retirement village is one many people consider as they move through post-retirement phases of life. However, despite declines in health and functioning which often accompany ageing, and the appropriateness of one's home environment, a significant majority of people hold a preference to age in place and do not consider retirement community living as an option for their future. While research has highlighted motives that may prompt the eventual move, little focus has been placed on factors predicting whether or not people would consider the prospect of retirement village living in the future. Using a random sample of 540 community residents, aged 55 to 94 years, from the Australian Capital Territory, the present study examines psychosocial, environmental and health characteristics predicting favourable consideration toward relocating to a retirement village; and investigates factors which encourage or discourage people from wanting to move into such a community. Present retirement status, self-rated health and a negative perception of one's current living environment were associated with consideration given to retirement village living. The nature of village facilities and the probability of reduced stress were identified as factors that may influence the decision to relocate. The findings are discussed in terms of implications for aged care providers.

### SOCIAL CARE FACTORS AFFECT HOSPITAL LENGTH OF STAY FOR AN URBAN HOMEBOUND POPULATION

D. Foer[3], K. Ornstein[1,2], T. Soriano[1], N. Kathuria[4], *1. visiting doctors program, mount sinai, New York, New York, 2. columbia university, new york, New York, 3. Yale University, New Haven, Connecticut, 4. Mount Sinai Hospital, new york, New York*

A major financial concern for medical institutions, prolonged hospital length of stay (LOS) is also a factor of clinical importance for older adults who are at greater risk for adverse outcomes. The goal of this project was to identify factors associated with high LOS in the growing homebound population who may have unique discharge needs because of their commitment to be cared for at home. The study included all 2007 discharges that occurred for patients in the Mount Sinai Visiting Doctors Program, a primary care program serving homebound adults. Using the University HealthSystems Consortium Database to adjust for a variety of institutional and patient clinical and demographic factors, expected LOS was calculated. A systematic chart review was used to determine when patients were medically ready to return home and outliers were characterized as social vs clinical stays. Average observed LOS for 479 discharges was 7.84 days. Seventeen discharges were determined to have LOS outliers, defined as two standard deviations above the mean. Eight of these cases were defined as social stays and accounted for a combined 136 days longer in the hospital (mean =17 days). The most common reason for social stay was nursing facility placement delays and lack of cooperation among family members around discharge. Our findings highlight the significant contribution of social care factors to prolonged LOS among the homebound. Educating hospitalists and administrators about the impact of social factors on LOS and increasing involvement of social workers in the outpatient setting may help to avoid costly and medically unnecessary LOS.

### THE EMERGENCE OF ELDER HOMELESSNESS AS A SOCIAL PROBLEM: POLICY TRENDS AND COMMUNITY RESPONSES

J.G. Gonyea, K. Mills-Dick, *Social Work, Boston University, Boston, Massachusetts*

Recent statistics offer troubling evidence of a growing number of older Americans who are either homeless or marginally housed. According to the U.S. Department of Housing and Urban Development (2009) statistics, over 250,000 homeless elders were sheltered in emergency or transitional housing programs in the U.S. during 2008. In 2005, the National Alliance to End Homelessness estimated that 744,313 people experienced homelessness in the U.S. Using the recent estimates of homeless elders as representing 10% to 15% of the total homeless population, this suggests that there are 74,431 to 111,646 homeless elders today. Further, it is predicted that the number of homeless elders will continue to rise as the baby boomer generation ages. Yet, despite their growing numbers, homeless older adults have largely been invisible within our communities and a forgotten group in the homeless service system. There is, however, evidence that elder homelessness is emerging as a social problem. This attention is fueled by changing perceptions of homelessness in general. Previously viewed primarily as an individual problem, homelessness is now seen as a social problem related to broad, underlying social and economic conditions. Our focus is on the examination of the impact of this redefinition, recent legislation and the role of national advocacy groups in fueling local communities' and states' actions in addressing elder homelessness. In particular, we explore the rise in supportive permanent housing for homeless or marginally housed seniors, including evidence of the effectiveness of this model. A central aim is to identify a research agenda to advance solutions to end elder homelessness.

### HEALTH PUBLIC SERVICES IN ALTERNATE HOUSING MODELS: ARE RESIDENTS AND FAMILIES SATISFIED WITH CARE?

N. Dubuc[1,2], M. Dubois[1,2], L. Demers[3], M.Y. Tousignant[1,2], A. Tourigny[4], J. Desrosiers[1,2], C. Corbin[1], *1. Research Center on Aging, Sherbrooke, Quebec, Canada, 2. Faculty of medicine and Health Sciences, Université de Sherbrooke, Sherbrooke, Quebec, Canada, 3. École d'administration publique (ENAP), Quebec, Quebec, Canada, 4. Faculté de médecine, Université Laval, Quebec, Quebec, Canada*

An evaluation project was carried out to know if new alternate housing models (AHMs) meet the needs of elders and their families in a comparable or superior way than in nursing homes (NHs). As a part of this larger study, this paper will compare satisfaction of residents and their families with care and services in AHMs as well as NHs. Using a cross sectional comparative design, 238 disabled elderly and their family caregivers (n=30) were met in 45 facilities (23 AHMs, 22NHs). Residents were chosen according to a 2-stage sampling and matched by gender, age and disability profiles. They were evaluated on demographic characteristics, functional disability, cognitive status, behavioral symptoms, social functioning, and satisfaction with care and services. From eight AHMs and their NH counterparts, semi-structured interviews were conducted with two family caregivers of residents selected in the comparative study. Findings revealed that in both settings residents are relatively satisfied (Health Care Satisfaction Questionnaire). However, residents from AHMs are significantly more satisfied than those in NHs (mean total score 10.29/16 [standard error of the mean (SEM) 0.25]) and 9.28/16 [SEM 0.33] (p= 0.0354)) respectively. Interviews showed also that caregivers from the AHMs reported more satisfaction than those in NHs with personalized care, time to obtain an answer to their requests, attention to the state of their relatives and the physical environment. In summary, this new approach is a good strategy to provide a range of housing types in communities that can satisfy the elderly with moderate to severe disabilities.

## SESSION 2210 (PAPER)

## LABOR FORCE PARTICIPATION AND RETIREMENT ISSUES

### MULTIPLE CAREGIVING RESPONSIBILITIES AND LABOR FORCE PARTICIPATION IN LATER LIFE

Y. Lee, F. Tang, *University of Pittsburgh, Pittsburgh, Pennsylvania*

In terms of allowing amounts of time and efforts, caregiving responsibilities sometimes might conflict with labor force participation. On the other hand, caregivers may be more likely to engage in working to search for the respite place from the caregiving roles or to secure earned income. This study explores the relationship between the multiple caregiving responsibilities, which include care to spouse/partner, parents, grandkids, friends, and relatives, by informal caregivers and labor force participation using role theory. This study used data from the Health and Retirement Study (HRS) and the sample was composed of the respondents aged 50 to 74 years old at the 2004 survey (N= 11,185). While female older adults with multiple caregiving responsibilities were less likely to participate in the labor force, caregiving responsibilities did not affect labor force participation for male respondents. In both female and male respondents, while those with higher levels of household income were more likely to participate in the labor force, those with higher levels of assets were less likely to participate in the labor force. In addition, married status was positively associated with the likelihood of labor force participation. Findings have implications for relieving caregiving burden and reconciling with work responsibility. Policies and programs are needed to make informal caregiving valuable by providing credits for the time care given, providing paid sick leave and subsidized daycare to help ease caregiving burden. Additionally, flexibility of work schedule will increase the ability to meet the conflicting demands of the caregiver roles.

### REDEFINING RETIREMENT: THE EXPERIENCES OF THOSE WORKING IN RETIREMENT AND THE IMPLICATIONS FOR EMPLOYERS

M. Brown[2,1], M. Pitt-Catsouphes[2,1], E. Galinsky[3], K. Aumann[3], J.T. Bond[3], *1. Social Work, Boston College, Chestnut Hill, Massachusetts, 2. Center on Aging and Work, Chestnut Hill, Massachusetts, 3. Families and Work Institute, New York, New York*

The aging of the workforce is more than a mere shift in demographics. It has been accompanied by the emergence of new attitudes and expectations about aging, in general, and about the relationships between aging and work, in particular. The increasing number of older workers who continue to work in retirement is reflective of these fundamental changes. However, little is known about those who continue to work in retirement and the factors associated with important outcomes for these older workers as well as their employers. Using data from a nationally representative study of the U.S. workforce, we explore what it means to be working in retirement and how employers might best meet the needs of older workers, to the advantage of workers and the employers themselves. We find that by most measures, those working in retirement are doing quite well. Overall, they are quite satisfied with their lives, their jobs, and their workplaces. We then explored if there were differences between those working in retirement and those not yet retired in the workplace characteristics associated with job satisfaction. While there was some overlap between the groups, we also found some notable differences in the factors associated with this important outcome. The findings of our study indicate that managers should not assume that older workers who have previously retired look at their work experiences and relationship to work in the same way as older workers who have never retired, even though they may be of similar ages.

### FACTORS AFFECTING DECISIONS TO WORK AFTER RETIREMENT: IS HEALTH MORE INFLUENTIAL THAN WEALTH?

E. Choi, *School of Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania*

Purpose: Although financial factors are thought to be the most influential in older individuals' decisions to work beyond retirement, a health factor may be neglected. This study examined how individuals' decisions to work after retirement are shaped both by financial and health factors and compared the effects of the two factors. Methods: Using the 2006 dataset of the Health and Retirement Study (HRS), this study compared people 65+ (N=9,901) who are retired, and have part-time or full-time work. Health was measured by self-rated health and number of chronic diseases. The financial factor was captured as net worth at the time of the interview. The model was analyzed by Ordinal Probit and PRE (predicted probabilities) analysis. Results: Probit analysis finds that health is a significant factor after controlling for demographics; people working beyond retirement are more likely to rate their health "good" or "excellent" ($\beta$= .198, p=.000) and report fewer chronic diseases ($\beta$= -.080, p=.000). Further, when health is accounted for, the financial factor is not significant. The PRE analysis supports the Probit analysis findings; people 65+ with excellent health have a 27.3% likelihood of working, either part- or full-time, compared to those with very poor health who show 8.1%. Discussions: Health appears to be a crucial factor in determining the labor market activities of older adults. Policies assisting the low-income elderly should give a priority to those with the poorest health.

### ‘CAN I HELP YOU DEAR?’: AN OLDER FEMALE ACADEMIC RESPONDS TO THE SERVICE INDUSTRY AND WELL-MEANING STRANGERS

J. Birkbeck, W. Hulko, *Social Work, Thompson Rivers University, Kamloops, British Columbia, Canada*

Much attention has been paid to the plight of older women in terms of their susceptibility to poverty and ill health in later life as well as pressure to maintain standards of beauty and/or correct age-associated ‘deficiencies’. At the same time, personal accounts of aging are becoming more common and gerontology is embracing the humanities as a way to better understand the aging process and sensitize students to the lives of older adults. Little attention has been devoted to everyday interactions between older women and members of the service industry, however. The question ‘can I help you dear?’ directed to a woman over sixty is seldom answered with ‘yes, you can start by not calling me dear!’ Such a response might assist service workers to appreciate the effect of their words and the dismissiveness with which they approach older women. This paper presents an analysis of an older female academic’s experience with dismissive reactions from service personnel since she became visibly older. This auto-ethnography is a reflective look at the uncomfortable experience of aging into the margins while functioning as an academic, colleague, friend, mother, daughter, grandma, and person in the world. Through the use of journal entries and photographs, the authors weave a story of a woman becoming aware of her diminished status as she grows older; first enduring differential treatment, then developing strategies of resistance.

### WORK IN THE NETWORK: EMPLOYEES, STAFFING PRACTICES AND CHALLENGES IN AREA AGENCIES ON AGING

J. Straker, A. Lackmeyer, *Scripps Gerontology Center, Oxford, Ohio*

Area Agencies on Aging (AAAs) are at the heart of the Aging Services Network. And, like all other aging services providers, the future will bring an increased need for staff to meet the demands of a growing population of older adults. While a great deal of attention has been focused on health providers such as nurses and geriatricians, or direct care workers such as nurse aides, almost no information exists to describe the staff positions used in AAAs, the types of credentials held by AAA staff or the benefits and management practices AAAs employ to attract and retain their workers. Who works in AAAs? What are their jobs? What are the conditions of employment? An internet survey of 630 AAAs in January 2010 resulted in 363 responses (57.7%). Results suggest that AAAs hire workers with many different educational backgrounds and types of credentials. They have fairly stable workforces, with staff turnover ranking the lowest of any of their staffing challenges. Location and organization of the AAA office affects staffing issues, with metro/non-metro offices and offices with different organizational structures showing different staffing patterns. Implications of AAA workforce findings for meeting the needs of tomorrow’s older population and the changing Aging Services Network will be explored.

## SESSION 2215 (SYMPOSIUM)

### THE EMERGENCE OF INSTITUTIONAL ELDER CARE IN CHINA

Chair: *V. Mor, Community Health, Brown University, Providence, Rhode Island*

China’s population is aging rapidly, and pressures are building to grow institutional long-term care (LTC) as a policy. Not surprisingly, there has been a rapid growth of elder care institutions across major Chinese cities in recent years. Little is currently known, however, about the structure, ownership, financing, personnel and residents of these institutions. In an ongoing project funded by the NIH Fogarty International Center, a team of experienced long-term care (LTC) researchers from both the U.S. and China have developed a uniform institutional survey instrument, and using that instrument, recently collected systematic data from virtually all elder care homes in two major cities in China: Nanjing (N=140) and Tianjin (N=180). This symposium presents major findings from this survey, organized around four themes concerning current elder care institutions in each city: (1) their structure, ownership and financing; (2) personnel and staff; (3) resident demographics and conditions aggregated at the facility level; and (4) city district-level demographic and socioeconomic correlates of institutional elder care development. Combined, these data provide a comprehensive profile of existing elder care institutions in the two study cities. Information and insights gained from this study will help symposium participants understand the recent emergence, growth and character of institutional LTC services for the elderly in urban China as well as the socioeconomic, cultural and market forces driving their development. Study findings can also inform government agencies in China as well as other international organizations concerned with policy making, planning and regulations in this area.

### INSTITUTIONAL STRUCTURE, OWNERSHIP, AND FINANCING

V. Mor, H.J. Zhan, *Community Health, Brown University, Providence, Rhode Island*

This paper focuses on three aspects of recent developments in elder care institutions in urban China using data collected in Nanjing, China. The institutional structure of facilities is characterized by its recent establishment, diverse ownership and management, and ambiguous professionalization. Based on preliminary data analysis, we find institutional ownership elder care facilities consist of four models: government (40.7%), individual (43.6%), partnership/corporation ( 22%), and mixed (8 or 5.7%). The mixed model is usually a local government owned facility that is contracted out to an individual or a group of individuals to manage. In terms of financing, 40% of facilities reported completely relying on residents’ monthly payment as their revenue. Roughly 53% reported receiving partial or full government assistance as their annual revenue. Over 70% of facilities reported receiving some level of government subsidy monthly or annually from various levels of the government.

### DEMOGRAPHIC AND SOCIOECONOMIC CORRELATES OF INSTITUTIONAL ELDER CARE DEVELOPMENT

Z. Feng, *Center for Gerontology & Health Care Research, Brown University, Providence, Rhode Island*

In this paper, we investigate the demographic and socioeconomic characteristics of urban communities that correlate with both the supply and demand of institutional elder care services. Facility-level information is aggregated to the municipal district level and merged with most recent population and socioeconomic data at the district-level (11 and 15 districts in Nanjing and Tianjin, respectively). Preliminary analysis based on the Nanjing data suggests that the total numbers of both elder care home beds and residents are positively associated with the share of 65+ population, per capita income and total number of hospitals at the district-level. We will examine this correlation with additional district-level variables such as the percent of older people living alone, percent not married, average family size, population in poverty, and availability of various community-based residential care facilities. Implications of these findings are discussed in the context of shifting demographics and social change in urban China.

### PROFILE OF PERSONNEL AND STAFF

X. Guan, *Social Work & Social Policy, Nankai University, Tianjin, China*

This paper examines the profile of personnel and staff in 140 elder care homes in Nanjing, China. Based on data analysis, most facilities (67%) do not differentiate direct care staff from other care workers, Care workers are mainly recruited from migratory laborers (68%) from rural China; Roughly ¼ of facilities reported hiring laid-off workers; 15%

reported hiring retired worker. Regarding staff retention: 43% of facilities reported one or more care workers having left their post while 49% reported hiring new care workers in the same year. In terms of medical professionalization, majority of elder care homes (70%) have neither a trained nurse nor physician. Among all staff and administrative workers, only 26% are government employees. This figure shows that there is a heavy reliance on the elder care market; and the private market is predominant in the current elder care industry.

### PROFILE OF ELDER CARE HOME RESIDENTS

X. Feng, *Sociology, Nanjing University, Nanjing, China*

This paper provides a detailed description of current elder care home residents in the two study cities. Preliminary analysis based on the Nanjing data indicates that on average, there are 50 residents per facility, 55% are female, and 95% are 60 years old or older. In a typical home, more than 80% have medical insurance coverage, 63% are pensioners, and 40% pay out of pocket. Over 15% of residents are government welfare recipients, who are concentrated in a small number of homes. Regarding health conditions, on average 18% of residents need help with eating (fed by others), 40% need assistance with dressing, 41% need assistance with walking, 27% are bladder incontinent, 21% are bowel incontinent, and 23% have dementia. Relatively few residents have pressure ulcers, receive tube feeding or are physically restrained. Importantly, there is substantial variation across facilities in resident demographics and case mix.

# SESSION 2220 (PAPER)

## AGING FOR WOMEN: PRACTICAL AND MORAL ISSUES

### SHIFTING THE FOCUS: GENDER THEORIES IN RESEARCH SURRENDERING EMPLOYMENT-BASED HEALTH INSURANCE AS A PREDICTOR OF LABOR FORCE PARTICIPATION PATTERNS

A. Daub, *CWRU, Cleveland Heights, Ohio*

Prior research examining employment-based health insurance as a predictor of remaining at one work-place —or “job lock” literature— often examines the dichotomous outcome work versus retirement. Just recently, researchers started to include different labor force statuses such as disability and part-time labor. However, it is known that especially women become disabled and hold part-time positions. Furthermore, the life course of men can now be less described in terms of full-time work and retirement. Rather, “newer” forms of labor force patterns come into play which makes it more socially acceptable to hold part-time jobs also for men. These developments can be attributed to the de-institutionalization of the life course which is likely to be influenced by employment- based health insurance differently for men compared to women in the United States. These observations of existing literature on labor force participation patterns in the context of health insurance have not been addressed in regards to gender inequalities in time spent at work and stigmatized exit pathways taken, which is attributable to the dearth of gender theoretical guidance in this field. Here, it is suggested that gender theories could shed more light on gender inequalities in time spent in the labor force and in exit pathways taken which is likely to be influenced by employment-based health insurance not only for men.

### GENDER DIFFERENCE IN PARTICIPATED IN BASIC PENSION INSURANCE IN CHINA

H. Yang, *Women’s Studies Institute of China, All-China Women’s Federation, Beijing, China*

Objective: The study was designed to analyze the gender difference in ratio of Participated in Basic Pension Insurance in rural and urban area of China. Data: Data obtained from part of the sample survey on population in 2005, and there were 317385 older respondents (49.90% females). Method: Cross table analysis and chi-square partitioning procedure were computed for the individual columns of Participation. Results: (1) There was a statistical significant difference in Participated in Basic Pension Insurance between rural and urban area. Only about 3% rural older people and more than 62% urban older people Participated in Basic Pension Insurance ($p<0.001$); (2) Only 2.46% rural older women and 52.57% urban older women Participated in Basic Pension Insurance, which accounts 64% of rural old men and 73% of urban old men seperately($p<0.001$); (3) About half of urban older women and more than 97% rural older women had not participated in Basic Pension Insurance. Conclusion: Most of women Participated in informal employment before they were old, while there was a strong relationship between Basic Pension Insurance and formal employment in China, so most of women couldn’t Participated in Basic Pension Insurance, they had to depend on thire family, and there are high risks to be poor and reduce the quantity of living matter of those older women. Keywords: Basic Pension Insurance; Gender Difference; in China

### OLDER WOMEN’S MORAL REASONING: AN ANALYSIS BASED ON CAROL GILLIGAN’S THEORETICAL FRAMEWORK

E.K. Dakin, *School of Social Work, Colorado State University, Fort Collins, Colorado*

This study examined moral reasoning among older women, a group that has received little attention in moral development and reasoning research and theory, based on the female moral development model developed by psychologist Carol Gilligan. This model was developed as a result of the finding that females are deficient in comparison with males when tested within the framework of Lawrence Kohlberg’s moral development theory (Gilligan, 1982). Gilligan’s alternate theoretical understanding of female moral development was developed through research with subjects diverse in gender, ethnicity, age (6 through 60), and socioeconomic status. This research emphasizes real-life decision making, for instance reasoning around the decision of whether or not to have an abortion (Gilligan; Gilligan & Attanucci, 1988). One limitation of Gilligan’s model, however, has been the lack of research on older adult (i.e., over age 60) subjects. This study addressed this gap by assessing the utility of Gilligan’s model among 88 African American, Latina and Caucasian women age 60 and over from varying socioeconomic backgrounds who participated in eight focus groups that examined ethical dilemmas within adult protective services (APS) related to mandatory reporting, involuntary protective services, and criminalization of elder maltreatment (Dakin & Pearlmutter, 2009). The participants’ reasoning in responding to the dilemmas reflected underlying decision-making processes based in an ethic of care and responsibility and recognition of the limitations of autonomy. This type of reasoning is clearly consistent with Gilligan’s description of the care perspective, an orientation emphasized by females in responding to ethical dilemmas (Gilligan & Attanucci).

### OLDER WOMEN’S BODY IMAGE: A LIFE COURSE PERSPECTIVE

T. Liechty[1], C.M. Yarnal[2], *1. Kinesiology and Health Studies, University of Regina, Regina, Saskatchewan, Canada, 2. The Pennsylvania State University, State College, Pennsylvania*

Body image research has traditionally focused on younger women and girls, ignoring women in later life. Recent literature, however, has called for more research into the body image of older women, specifically from a life course perspective. The life course perspective can address the complexity of body image by identifying personal and/or environmental factors that shape body image and the trajectories of body image across the life course. The purpose of this study, therefore, was to explore older women’s body image using a life course perspective. We conducted individual interviews and follow up focus groups with 13 women aged 60 to 69. We analyzed transcripts using open and axial coding, to identify over-arching themes. Findings highlight the influence of interpersonal relationships (e.g., with husbands or mothers), key life events (e.g., pregnancy or education) and the larger society on participants' body image. In addition, the findings suggest that with age, women de-prioritize appearance in favor of health or internal characteristics. Finally, the findings clarify body image as a construct applied to aging women, which includes attitudes toward appearance, evaluation of health and physical ability, as well as assessment of appearance. This research demonstrates the value of studying participants within the context of their overall life stories by highlighting connections between past life experiences and current body image perspectives. Furthermore, findings of this study provide insight into the process by which aging women negotiate body image concerns. Such insights can be key to improving body image interventions for younger women and girls.

## SESSION 2225 (SYMPOSIUM)

### AGING IN US URBAN NEIGHBORHOODS: QUALITY OF LIFE AND QUALITY OF LIVING

Chair: *I. Yen, University of California, San Francisco, San Francisco, California*
Co-Chair: *Y. Michael, Drexel University, Philadelphia, Pennsylvania*
Discussant: *J. Kelley-Moore, Case Western Reserve, Cleveland, Ohio*

Neighborhood environment and health of older adults is gaining increasing attention in the public health and gerontology research literature. The majority of older adults live in urban areas in the US and industrialized nations around the world. How are neighborhoods contributing to quality of life of older adults and what is the quality of living for older adults in urban areas? This symposium session features qualitative and quantitative research from US urban areas with diverse racially/ethnically study populations, highlighting what aspects of neighborhoods contribute to quality of life for older adults. Qualitative research will be presented from Portland, Oregon. Survey results are from Chicago, Oakland, Chicago, and Miami. Key findings highlight: 1)importance of social relations for keeping active; 2) the role of built environment features such as front porches and community centers in maintaining a sense of community; 3) the role of visibility of the street in providing a sense of support contributing to less psychological distress; 4) how access to services contribute to quality of life; and 5) whether access to stores and services and physical disorder contribute to differences in Black-White differentials in perceived neighborhood quality. The symposium objectives are to emphasize mechanisms through which neighborhoods support quality of life among older adults in contrast to much of the research which has highlighted problems and stresses. Additionally this symposium showcases the role of both qualitative and quantitative research methods toward that end.

### THE RELATIONSHIP OF BUILT ENVIRONMENT ≤EYES ON THE STREET≤ FEATURES TO SOCIAL SUPPORT AND PSYCHOLOGICAL DISTRESS IN HISPANIC ELDERS IN MIAMI, FL

S.C. Brown[1], C.A. Mason[2], J.L. Lombard[3,1], F. Martinez[3,1], E. Plater-Zyberk[3,1], A.R. Spokane[4], H. Pantin[1], J. Szapocznik[1,3], *1. Dept. of Epidemiology & Public Health, University of Miami Miller School of Medicine, Miami, Florida, 2. University of Maine College of Education and Human Development/Center for Community Inclusion & Disability Studies, Orono, Maine, 3. University of Miami School of Architecture, Coral Gables, Florida, 4. Lehigh University College of Education, Bethlehem, Pennsylvania*

OBJECTIVE: To examine whether architectural features of the built (physical) environment theorized to promote observations and social interactions (e.g., porches; stoops) predict Hispanic elders' psychological distress. METHODS: Coding of built environment features of all 3,857 lots in East Little Havana, Florida, and enumeration of elders in 16,000 households was followed by assessments of perceived support and psychological distress in a population-based sample of 273 low-socioeconomic status Hispanic elders. Structural equation modeling was used to assess relationships between block-level built environment features, perceived social support, and psychological distress. RESULTS: Architectural features of the front entrance such as porches that promote visibility from a building's exterior were positively associated with perceived support. Perceived support in turn was associated with reduced psychological distress, controlling for demographics. Additionally, perceived social support mediated built environment's relationship to psychological distress. CONCLUSIONS: Architectural features that facilitate direct, in-person interactions may be beneficial for Hispanic elders' mental health.

### ACTIVE AGING: BUILT AND SOCIAL ENVIRONMENTAL INFLUENCES

Y.L. Michael, *Department of Epidemiology and Biostatistics, Drexel University School of Public Health, Philadelphia, Pennsylvania*

The goal of this mixed-methods study was to examine the role of neighborhood context in active aging. Nine focus groups were conducted in 2002 and 2003 with residents aged 55 and over (n=60). In addition, a random sample of street segments were audited using the Senior Walking Environmental Assessment Tool (SWEAT) and residents on audited streets were interviewed to assess psychological sense of community and walking behavior (n=128). Older adults discussed the role of formal and informal social connections in their neighborhoods in keeping them active. Further, these older adults identified aspects of the built environment, such as front porches and community centers that increased sense of community. Quantitative findings support a positive association between neighborliness and the cumulative presence of characteristics providing semi-private space for informal interaction, including front porches, continuous sidewalks, and freedom from high traffic streets, bars on windows and doors, and litter and graffiti.

### LOWER-BODY FUNCTION, NEIGHBORHOODS, AND QUALITY OF LIFE IN AN OLDER POPULATION

W. Satariano, M. Kealey, E. Kurtovich, S.L. Ivey*, University of California, Berkeley, Berkeley, California*

This is a report of whether neighborhood qualities moderate the association between poor lower-body function and disability and thus enhance quality of life. A sample of 884 people aged 65 years and older was identified through service organizations in four US counties. Interviews addressed neighborhood characteristics, lower-body function, and disability. The main outcome was disability (level of reported difficulty in walking 2+ city blocks). Functional capacity was based on measures of lower-body strength, balance, and walking speed. Estimates of main and interaction effects were derived from GEE regression models. Poor lower-body function was less likely to be associated with disability in neighborhoods with qualities, such as better access to services, greater traffic safety, and with residents who are more likely to assist others. These results suggest that particular neighborhood factors may enable older people, even those with reduced capacity, to experience a better quality of life.

### RACIAL DIFFERENCES IN NEIGHBORHOOD SATISFACTION: RESULTS FROM THE CHICAGO HEALTH AND AGING PROJECT

I. Yen[1], L.L. Barnes[2], C.F. Mendes de Leon[2], *1. University of California, San Francisco, San Francisco, California, 2. Rush University, Chicago, Illinois*

Which characteristics of neighborhood are associated with neighborhood satisfaction? Using data from the Chicago Health and Aging Project ( n=4727; 73% African American), we investigated whether access to services (e.g. pharmacy, park, bank, or beauty shop), physical disorder, social cohesion, and proportion of people over age 65 in the census block group were associated with neighborhood satisfaction.

Satisfaction was measured with the question: How would you rate this neighborhood to live in [fair/poor 16%]? African Americans reported fair/poor ratings much more than whites (21% vs 2% p<0.0001). Poor access to services was associated with fair/poor rating [OR=1.57; 95% CI: 1.26,196]. Physical disorder was strongly associated with fair/poor rating [OR=2.19; 95% CI 1.89,2.53]. Proportion of people over age 65 affected African Americans' rating but not whites (p<0.01). For African Americans, for every increase in percent of people over age 65 there was a 6% reduced odds of reporting fair/poor neighborhood.

# SESSION 2230 (PAPER)

## ATTITUDES TOWARD TECHNOLOGY

### OLDER ADULTS' USE AND ATTITUDES TOWARDS TECHNOLOY: TRANSFORMING COMMUNITIES, ENVIRONMENTS AND TECHNOLOGIES FOR AGEING-IN-PLACE

O. Brian, B. Knapp, A. O'Hanlon, R. Bond, L.E. Carragher, *Dundalk Institute of Technology, Dundalk, Ireland*

With unprecedented demographic changes comes an urgent challenge to support older people in their homes as they grow older. Technology offers much potential for addressing this challenge, yet little is known about adults' attitudes, preferences and use of different forms of technology, or the ethical boundaries around those attitudes and preferences. A series of studies are outlined to explain adults' attitudes and behaviour around technology through the use of the newly developed Extended Technology Acceptance Model. Study 1 is a large survey in the north-east of Ireland (n = 1000) which examines adults' attitudes and use of communication, information, entertainment and health technologies; it also examines the predictors of those attitudes and their consequences on health, quality of life and relationships. Study 2 is a physical home-environment in a lab setting where a home environment is simulated through CAVE technology. The Cave Automatic Virtual Environment (CAVE) is a fully immersive virtual reality environment offering a multi-person, room-sized, high-resolution 3D video and audio environment. As the user moves within the display boundaries, the correct perspective is displayed in real-time to achieve a fully immersive experience. Study 3 is a Lab-in-the-Home (Pop. 15-40) which provides a place-based evaluation framework from 16 living apartments within Dundalk, Co. Louth; it also provides state-of-the-art ambient assisted living (AAL) technologies to operate pilots for future developments and retrofits within the community. Results from these studies show the value of the Extended Technology Acceptance Model in explaining adults' attitudes and use of technology. Insights are also offered around ethical issues of confidentiality, responsibility, privacy and non-maleficence. The surveys also provide a diverse testbed of matched groups for follow up interviews, surveys, trials and simulations.

### RELATIONSHIP BETWEEN PERSONALITY TRAITS AND ATTITUDES TOWARDS NEW TECHNOLOGIES IN SPANISH ELDERLY

E. Urdaneta, A. Navarro, M. Gonzalez, A. Garcia, C. Buiza, C. Sobrino, M. Iturburu, J. Yanguas, *Fundacion Instituto Gerontologico Matia INGEMA, Donostia-San Sebastian, Spain*

INTRODUCTION Research on the elderly and the adoption of new technology suggests that personality traits could play a role on older people technology adaptation. The aim of this study is to examine whether personality traits are associated with beliefs and attitudes towards new technologies. METHODOLOGY The study included 62 elderly people ranging from 55 to 90 years old (M=69.67, SD=7.82). According to the aims of this work, NEO-FFI-Inventory (Costa and McCrae, 1992) was used. Also, a Likert type scale questionnaire was developed for this study composed by 19 items assessing beliefs about new Information and Communication technologies (ICT), personal resources to use and how to interact with them. RESULTS Pearson correlations show that trait Conscientiousness is significantly positively related to beliefs: "older people need to use ICT" (r=-0.59) and "older people have the resources to use ICT" (r=-0.44) and negatively with "only young people are able to use ICT" (r=-0.32) "it is very difficult for older people to use ICT" (r=-0.38), "it is very difficult for seniors to understand the management of ICT" (r=-0.34), "older people are reluctant to use ICT" (r=-0.57), "the elderly often forget the ICT skills" (r=-0.31) and "older people prefer to use something familiar but old and with less functionality than something new and with more guarantees of success" (r=-0.37). DISCUSSION Results point that being organized, careful, cautious, meticulous and having persistent goals is associated with better beliefs and more positive attitudes towards new technologies, which should be taken into account when developing new technological tools.

### WHAT DO OLDER ADULTS UNDERSTAND ABOUT THEIR PRIVACY RISKS WHILE ONLINE?

J. Camp, L. Lorenzen Huber, L. Borrero, *Indiana University, Bloomington, Indiana*

At what age group does general age-related cognitive decline intersect with susceptibility to phishing and computer fraud? To what kinds of attacks are adults most susceptible? And critically, armed with this understand how can we enable elders to protect themselves from fraud? In a two year study funded by NSF, we are answering these questions through an innovative integration of video, surveys, and scenarios in order to explore the anxiety-fraught domain of financial fraud. In an iterative series of focus groups used to inform the development of the multimedia approach, 20 older adults provided insight on older adults' understanding of two common threats: phishing and "pump and dump." The mechanics and avoidance of phishing were understood by 80% of participants. None of the participants were familiar with "pump and dump," in which scammers infiltrate online accounts, pump up the prices of penny stock, and then dump the holdings, thus emptying the account. The combination of the concentration of wealth among older American elders, the global unsecured network, availability of personally identifiable information used for authentication, and disproportionate lack of technical expertise among elders creates a problem of such a distinct scale that it is arguably of a new type altogether. The findings from this study provide a critical first step in the development of functional models to understand older adults' financial risks. Outcomes of the study include a methodology to communicate risk as well as an understanding of elders' susceptibility and suggested best practices avoid fraud.

### EXAMINING USE OF INTERACTION SUPPORT FOR EVERYDAY TECHNOLOGIES BY OLDER AND YOUNGER ADULTS

M.A. O'Brien, S. Reeves, *Psychology, UAHuntsville, Huntsville, Alabama*

Headlines from the 2010 Consumer Electronics Show revealed an increased interest among manufacturers in developing technologies that specifically appeal to the growing population of older adults. Research suggests that older adults are slower to adopt new technologies than younger adults, but older adults' adoption of new technologies may be enhanced through training (e.g., Rogers, Cabrera, Walker, Gilbert, & Fisk, 1996). A focus study exploring older adults' preferred method of training found that text (i.e., manuals) was participants' favored method to support use of new technologies, but several other methods such as one-on-one demonstrations were also frequently mentioned (Mitzner, et al. 2008). Beyond initial training, these methods may also be important to support intermittent use, technology maintenance, and discovery of other features that satisfy new goals. To cost-effectively develop support that helps all user groups, the actual usage and effectiveness of user-selected methods on technology success must be considered. The present study investigated actual use of support by older and younger adults in their everyday technology interactions. Over a ten day period, participants reported all encounters with everyday technologies in a journal. Then, they returned to the university for a structured interview that elicited strategies for success and problem-resolution in these encounters. Both age groups reported accessing support for problem-resolution more than for successes, with older adults more likely than younger adults to use this support to resolve problems. Differences in support use will be discussed in terms of general preferences and other factors influencing use in specific situations.

## SESSION 2235 (PAPER)

## MEDIA DISSEMINATION ABOUT AGING

### DEPICTION OF OLDER ADULTS IN ANIMATED MOTION PICTURES IN THE U.S.: 2000-2009

K. Dooley, J. Terhune, *Psychology, Murray State University, Murray, Kentucky*

As both art form and entertainment, motion pictures simultaneously reflect and influence the values of a . For example, one may examine themes and images portrayed in movies in order to discover dominant beliefs and attitudes toward older adults and the aging process more generally. Furthermore, social learning theory and cultivation theory suggest that individual attitudes and behavior are influenced by the stereotypes depicted in all media. This influence is especially powerful in shaping the beliefs of children. This study examines how a sample of the most popular animated motion pictures released since 2000 represent aging and older adults. Principal selection criterion was U.S. box office sales in the year released. We reviewed 32 films using a standardized questionnaire then conducted a content analysis of the following: demographic and biopsychosocial characteristics of older characters, aging-related themes, common aging stereotypes, and interpersonal relationships between older and younger characters. Many of the movies contained older adult characters and portrayed them as healthy, competent, and positive in other ways. This was somewhat surprising given general under-representation and negative aging stereotypes often depicted in other animated media. We discuss the potential effects of animated films on children's beliefs, attitudes, and behavior toward older adults.

### COGNITIVE HEALTH: MOVING BEYOND ALZHEIMER'S DISEASE

A.E. Vandenberg, *Graduate Institute of the Liberal Arts, Emory University, Atlanta, Georgia*

Alzheimer's Disease has emerged as a cultural boogie man for the baby boom generation, and representations of it drive fear, health vigilance, and symptom seeking. Has publicity been helpful in promoting awareness of brain health and healthy lifestyle behaviors within public health, or has it been a counterproductive distraction? Although prevalence rates seem low compared with other major age-related diseases, the social costs of Alzheimer's are enormous, and powerful aging institutions have aligned themselves behind an agenda of finding a cure. In evaluating the value of an Alzheimer's focused research agenda within a larger gerontological context, this presentation will examine public opinion poll data, official and unofficial histories of Alzheimer's research, public funding of cognitive initiatives, and data on health strategies enlisted by the "worried well." The synthesis of this systematic review suggests that attitudes and policy towards Alzheimer's are indicative of Americans' anxieties about aging in general. It also suggests that focusing on the overwhelmingly negative Alzheimer's scenario may fuel anti-aging attitudes and denial of cognitive aging rather than promote acceptance, creative adaptation, and healthful cognitive engagement throughout the life course.

### WHAT MAKES NURSING HOMES NEWSWORTHY? CONTRASTING CONTENT ANALYSIS OF NEWSPAPER STORIES WITH JOURNALISTS' REPORTED INTERESTS

J. Rozanova, T. Wetle, W. Rakowski, R.R. Shield, *Center for Gerontology and Health Care Research, Brown University, Providence, Rhode Island*

Media influence public deliberation by bringing important issues into the news spotlight. Nursing homes and their residents have often been a focus of media attention. However, the socio-cultural conventions, political agendas, and economic interests that determine which stories about nursing homes are published and become influential have not been studied. This paper addresses this knowledge gap by comparing the perspectives of 20 journalists who wrote about nursing homes in national and state American newspapers from 1999-2008 with key themes about nursing homes and their residents in the articles. Thematic analyses of 150 articles retrieved from the LexisNexis database identified the polarized discourse of (un-)healthy aging in nursing homes in a broader framework of individual responsibility and personal control. Portrayals of the frailest nursing home residents reveal residents' relative "success" or "failure" measured by continued participation in the market economy. Interviews with journalists focused on the factors that influence how stories are written and changed by editors, and which stories are published. This paper examines the potential for disconnect between the journalists' personal interest in the increasing needs and daunting experiences of individual nursing home residents, and the broader economic/political environment of the media that focuses on reducing public spending on longterm care and on stories with "shock value" to attract readership . The paper also discusses stories about nursing homes the journalists might not have been able to write due to the difficulty of getting the ideas past editors or unavailability of investigative time and resources to conduct research.

### SEEKING 'FORBIDDEN KNOWLEDGE' : BARRIERS TO GENETIC RESEARCH ON HUMAN AGING

M. Lambrix, E. Juengst, *Case Western Reserve University, Cleveland, Ohio*

Kempner and colleagues have written about the concept of 'forbidden knowledge' as a key obstacle to increased public and political support for scientific research. The authors argue that the idea that there are "things we should not know" animate both formal and informal social constraints on the direction and pace of science, with "a palpable effect on what science studies, how studies are performed, how data are interpreted and how results are disseminated." Genetic biomedical research has been progressing rapidly since the completion of the Human Genome Project. However, genetic research on human aging has not been on pace with the successes of specific disease based genetic research. We hypothesize that this could be due to the union of two contested areas of 'forbidden knowledge' – the quest to slow aging and genetic manipulation/enhancement. Given this contentious combination it's no surprise the field of genetic aging research faces numerous challenges in gaining and sustaining public and political support. Using data from 18 in-depth interviews with field experts, this paper seeks to better understand the unique challenges these researchers' face, particularly in terms of how this quest of 'forbidden knowledge' is influenced by the formal and informal constraints as outlined by Kempner et al. This analysis will document how scientists perceive these barriers and how they think it impacts their work and the field on a broader level. Exploring these perceptions may potentially lead to a renewed debate among both expert and lay people surrounding the quest to genetically manipulate human aging.

## SESSION 2240 (PAPER)

## PRODUCTIVE USE OF TIME

### ON/IN OUR OWN TERMS: ELDERS' MEANINGS OF COMMUNITY INVOLVEMENT AND HEALTHY AGING

M. Martinson, *1. Health Education, San Francisco State University, San Francisco, California, 2. University of California, Berkeley, Berkeley, California*

Research, policy and practice have recently focused on older adult civic engagement as a component of healthy aging. The empirical research has operationalized civic engagement primarily as formal service volunteerism. Furthermore, research has focused on individual health and wellbeing outcomes of volunteering as assessed through quantitative methods, while few studies take a critical standpoint or explore meanings elders themselves have about community involvement, healthy aging, and the broader contexts of involvement and health. This qualitative study takes a constructivist, modified grounded theory approach to explore the lived experiences of community involvement among a diverse sample of 22 elders, ages 60-93 years old, who are engaged in a range of community activities often missed by traditional definitions of volunteerism, e.g. spiritual leadership, community activism, cultural preservation, and community organizing. In-depth interviews are analyzed to explore subjective meanings of community work, the relation of those meanings to experiences of aging, and the elders' definitions of "healthy aging." Themes of community involvement include: doing what I can; being in and building community; finding personal enjoyment; slowing down or stepping back with age. Meanings of healthy aging include: care of the body; a positive approach; a supportive and respectful environment; feeling free; and how I'm trying to live. Key findings reveal that community involvement and healthy aging reflect reciprocal interactions between individual, interpersonal and broader social, political and economic contexts. Community involvement, aging and health are processes elders negotiate, employing varying degrees of agency to create a sense of "aging on my own terms."

### CONTRIBUTING TO OTHERS, CONTRIBUTING TO ONESELF: GREATER PERCEIVED CONTRIBUTION TO OTHERS PREDICTS BETTER FUNCTIONING AND HEALTH IN LATER LIFE

T. Gruenewald, *University of California, Los Angeles, Los Angeles, California*

Growing evidence suggests that the ability to provide support to and play useful roles in the lives of others may have health-promoting influences in older adulthood. The current analysis examines the association between perceptions of contributions to others and disability and mortality in later life. Method: Data comes from participants aged 55 and over (n = 713) in The Study of Midlife in the U.S. (MIDUS), a longitudinal study of healthy aging (baseline and 9-year follow-up). Perception of contributions to others was assessed with a single rating (0 - worst to 10 - best possible). ADL disability was assessed with a count of 9 basic ADLs (e.g., bathing, bending, lifting) that participants indicated "a lot" of impairment in performing. Mortality status was obtained via the National Death Index. Covariates included age, gender, number of health conditions, educational attainment, and baseline ADL impairment. Multinomial logistic regression analyses were used to examine the odds of increased disability or death over the follow-up as a function of baseline level of perceived contributions to others. Results: Compared to those who showed no change/slight improvement in disability level over the follow-up, the odds of a large increase in ADL impairment (3+ domains) or death was lower in those with higher perceptions of contributions to others at baseline (adjusted ORs = .88 (95% CI = .79, .97) and .87 (95% CI = .80, .95), respectively). Conclusions: Results suggest that perceptions of making valuable contributions to others are associated with more positive health trajectories in later life.

### A COMPARISON OF OLDER AND MIDDLE-AGED VOLUNTEERS AT THE 2010 WINTER OLYMPICS: HEALTH AND BURNOUT

A.V. Wister, *Gerontology, Simon Fraser University, Vancouver, British Columbia, Canada*

There has been a growing interest in the effects of volunteerism among older adults. One body of research has examined volunteerism from the point of view of its short- and long-term social and health consequences for those who help others. Yet, there may be adverse consequences for those who volunteer, especially if the volunteer activity is intense, such as at major sporting events. This paper examines whether and to what extent older volunteers experience similar or different outcomes associated with their volunteer experience. Data were collected before and after the volunteer experience from 251 persons aged 45 and over who participated as volunteers at the 2010 Winter Olympics in Vancouver Canada. Change in measures of perceived health; psychological well-being; stress and Maslach's Burnout Inventory were examined, as well as open ended responses to questions pertaining to their volunteer experience. Results indicate that there were few differences in the health outcomes and experience of older and middle-aged volunteers. These findings are explained in terms of selection factors and strong altruistic tendencies of volunteers of all ages. Participants to this session will obtain an understanding of the similarities and differences in the health outcomes and volunteer experience among older and middle-aged adults at a major sporting event.

### ENGAGEMENT IN PRODUCTIVE ACTIVITIES AND SOCIAL WELL-BEING IN LATE ADULTHOOD

Y. Jung[1], T. Gruenewald[2], *1. Social Welfare, UCLA, Los Angelels, California, 2. UCLA, Los Angeles, California*

This paper aims to examine whether engagement in productive activities (i.e., paid work, volunteering, and informal helping) is associated with the change in older adults' social well-being defined as the perceived quality of social functioning and relationship with other people, neighborhood, and communities. Analyses are based on the participants aged 55 or older (n=491) from the first (1995/1996) and the second (2004/2005) waves of the National Survey of Midlife Development of the United States (MIDUS), a nationally representative sample of adults aged 25-74. Separate ordinary least squared regressions on five domains of social well-being - meaningfulness of society, social integration, social contribution, acceptance of others, and social actualization - indicated that engagement in volunteering (none vs. some) at baseline was associated with increased levels of social integration (b=0.95, p=0.01) and social contribution (b=0.95, p=0.00) at Wave 2 after controlling for the Wave 1 values. When the number of activities at baseline was examined, those participants who engaged in all three activities reported higher levels of social integration (b=1.70, p=0.02) compared to those who engaged in no activity. Those who performed two activities and who engaged in all three activities showed increased levels of social contribution (b=1.35, p=0.03 and b=1.40, p=0,05, respectively) compared to those with no activity. Findings suggest that engagement in multiple productive activities and volunteering, in particular, may promote older adults' perceived levels belongingness to their communities and society as well as their own evaluation of their values and contribution to society.

### WHERE DOES THE TIME GO? GENDER, RACIAL, AND EDUCATIONAL DIFFERENCES IN TIME USE AMONG OLDER ADULTS

S.A. Robert, J. Mullahy, *University of Wisconsin-Madison, Madison, Wisconsin*

Background: There is growing interest in older adults' contributions to society—particularly through volunteer and care work—and understanding racial/ethnic differences in these contributions. We examine gender, racial/ethnic, and educational differences in time use among older adults across the following seven competing time use categories: leisure, caring for someone in the household, caring for someone outside the household, volunteering, work, sleep, and household tasks/personal care. Specifically, we examine whether there are racial/ethnic differences in time spent providing care work versus engaging in volunteer activities. Methods: We use time use daily diary data from the combined 2003-2008 American Time Use Surveys for adults 65 and older (n=11,966). Novel econometric share equation techniques allow us to compare predictors of time use across seven competing time use categories. Results: There are no racial/ethnic differences in the amount of time spent on volunteering or care work, even among women. Women spend more time than men in volunteer activities, and less time in leisure activities, though men spend more time in paid work. Across gender and racial groups, greater education is associated with more time volunteering and less time in leisure activity among older adults. Discussion: Contrary to some prior work, there are no racial/ethnic differences in time spent on either informal care work or volunteering among older adults. Education level is the most consistent predictor of volunteer activities among older adults. With an increasingly highly educated older adult population, non-paid activities considered productive are likely to increase among all gender and racial/ethnic groups.

## SESSION 2245 (PAPER)

## QUALITY NURSING HOME CARE: VIEWS OF RESIDENTS AND STAFF

### AN EXPLORATION INTO THE MEANINGS OF CARE: A VIEW FROM THE INSIDE

R.A. Siders, *Sociology, Case Western Reserve University, Cleveland, Ohio*

Throughout the care literature, care appears as a standard set of service delivery practices that are defined and unilaterally imposed by professional and clinical experts. Yet, the matter of what care is and what it means in specific contexts has not been critically considered. For example, the "quality of care" in LTC settings is judged and evaluated in terms of performance of physical tasks or medical treatment, which are recorded in the patient's charts. However, what is neglected in the language of medicine and its institutions is the care work that involves social relations, comprised of intricate and uncharted mental and emotional work, special knowledge and skills involved in tending to the other's needs (Diamond, 1986). Since care is defined primarily by those who provide it, there has been virtually no investigation of definitions and meanings of care from the perspective of care recipients. It is necessary to give systematic scholarly consideration to the meaning of care by focusing on those who are cared-for; therefore, this project enlists the voices of elder care recipients living in LTC in developing a systematic and theoretically grounded approach to the concept of care. It is an approach that holds the promise not only of advancing institutional practices of care and its effects at the level of personal experience. Qualitative results of care definitions, meanings and experiences articulated by elder care recipients and frontline staff will be presented.

### NURSING HOME RESIDENTS' PREFERENCES, VALUES, AND SATISFACTION WITH COMPONENTS OF PERSON-CENTERED CARE

C. Berdes[1,2], M. Anichini[2], J. Grad[2], L. Anichini[2], *1. Buehler Center on Aging, Health & Society, Northwestern University, Chicago, Illinois, 2. Presbyterian Homes, Evanston, Illinois*

While much attention has been given to specifying the artifacts of culture change toward person-centered care, not much work to date has reflected the understanding that person-centered care is by definition individualized, and thus that its components are differently valued by different residents, and cumulatively, therefore, these values may indicate different components for different facilities. Our research developed and pilot-tested a measure of residents' preferences, values, and satisfaction with the person-centered care they receive. Our aim was to tap residents' opinions on the components of person-centered care, the value they place on each component they name, and their satisfaction with how each component they value is respected by the staff who care for them. The measure was piloted in face-to-face contacts with 27 nursing home residents. Findings: We found disparities between which components residents valued, and which they were most satisfied with. In particular, we found that residents attributed high value to but low satisfaction with caring attitudes of nurses aides and nurses, choice of activities, and participating in decisions about health care and care plans. Because such data may be useful to facilities as a direction-finder in or measure of their progress in the process of culture change toward person-centered care, we are now seeking additional ways to systematize and automate the collection of such data.

### "IT'S A DIGNITY THING": NURSING HOME CARE WORKERS' USE OF EMOTIONS

J. Rodriquez, *Institute for Health, Health Care Quality, And Aging Research, Rutgers University, New Brunswick, New Jersey*

This article examines how nursing home care workers use emotions to construct dignity at work. Previous scholarship has shown how the financial and organizational characteristics of nursing homes shape and constrain emotion work among staff. Using evidence gathered during eighteen months of participant observation in two nursing homes and 65 interviews with staff, this article analyzes how, despite obstacles, nursing home care workers generated authentic emotional attachments to residents. In particular, staff enjoyed caring for and about residents whom were difficult to control. Such attachments to "feisty" residents generated dignity among the staff, who felt accomplished when such residents successfully transitioned from life at home to life in institutional care. Emotions created dignity for staff and induced compliance among residents. Emotions are not only generated by organizations and imposed on workers. Staff themselves produce emotions – sometimes in ways consistent with organizational demands, and sometimes not – but they consistently found in their emotions a resource to manage the strains of their work lives.

## SESSION 2250 (PAPER)

## RESEARCH ETHICS: CONSENT AND BUY-IN

### LOCAL TELEVISION BRIDGES GERONTOLOGY, THE NORM OF BENEFICENCE, AND THE GSA ETHICS CODE

J. White, *1. Whitedeer Gerontology Consulting, LLC, Huntsville, Alabama, 2. Capella University, Minneapolis, Minnesota*

As the only gerontologist in North Alabama, she has presented over 300 aging topics via live television every Wednesday morning for over seven years to a rural viewing audience. Working without compensation, the premise for acting in this capacity as aging educator is ethical code #6 of the Gerontological Society of America Ethics Statement: "To society as a whole we owe the benefit of our knowledge and understanding of Biological, Cultural, Social, and Psychological Aspects of Aging. We should communicate our understanding of human aging to the society at large" (GSA, 2002). Known as the Norm of Beneficence, the values of altruism, charity, and giving something for nothing challenges gerontologists to disseminate accurate aging information to those who otherwise would have no access to it. The nontraditional sentiments of loyalty, gratitude, and faithfulness (Hiller & Barrow, 2007), are clearly indicated in our Ethics Statement and challenge gerontologists to share academic findings without material reward. This unique method of disseminating aging research via television transmission has recently expanded to a global audience via live streaming on the world wide web. After attending this activity, participants will be able to use live local television for dissemination of aging research and application of the GSA Ethical code.

### OLDER ADULTS IN RESEARCH: ON ALL SIDES OF THE CONSENT TABLE

D.D. Beaty, *1. graduate college of social work, university of houston, Houston, Texas, 2. West Texas A&M, Canyon, Texas*

This presentation will report on the findings of a research study examining the communication of researchers and ethics review boards regarding research with adults who may have cognitive impairment. Older adults are often excluded from research due to complications of co morbidities. Assessment of cognition in older adults to insure true informed consent is time consuming and there are unclear guidelines in the research regulations. Older adults in the research community have often positioned themselves with experience and education to lead or review experimental projects. This session examines the roles of older adults as investigators, ethics reviewers and participants in the research community.

### ETHICAL ISSUES IN END-OF-LIFE RESEARCH: CONCERNS AND MANAGEMENT STRATEGIES

S. Hickman[1,2], J. Cartwright[2], C.A. Nelson[2], K. Knafl[3], S. Bankowski[2], *1. Indiana University, Indianapolis, Indiana, 2. Oregon Health & Science University, Portland, Oregon, 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina*

Background: Ethical issues were identified as a key barrier to the advancement of end-of-life (EOL) research in the 2004 NIH State of the Science Consensus Conference. However, data are lacking regarding perceptions of ethical issues in EOL research, approaches used to manage ethical concerns, and the impact on the conduct of EOL research. Methods: This NIH-funded study used a qualitative, exploratory case study design to follow the development of EOL research from proposal development through study execution. Cases were identified through publically available resources (e.g., NIH CRISP database). Data were collected from a purposive sample of 21 EOL investigators who were interviewed by telephone. Results: Investigators reported numerous ethical concerns that were self-identified or raised during reviews including: the evaluation of decisional capacity to participate in research; avoiding inadvertent disclosure of diagnosis or prognosis; sensitivity to issues of burden and vulnerability; and ensuring access to the benefits of research. Investigators reported several strategies to manage ethical concerns including: modifying consent procedures; careful attention to language in the recruitment; consent and data collection materials; the creation of back-up protocols; and partnering with the IRB prior to submission to proactively address concerns. Some strategies to mitigate concerns impacted recruitment and study timelines. Overall, investigators were confident in their ability to identify and manage research risks for this population. Conclusion: Investigators identified numerous ethical concerns that arise in EOL research that may impact research. They reported a variety of strategies to manage actual and perceived ethical issues in the conduct of EOL research.

## SESSION 2255 (SYMPOSIUM)

### SOCIAL INTERACTIONS OVER THE COURSE OF DEMENTIA

Chair: *P. Saunders, Georgetown University School of Medicine, Washington, District of Columbia*
Co-Chair: *K. de Medeiros, Georgetown University School of Medicine, Washington, District of Columbia*
Discussant: *S.R. Sabat, Georgetown University School of Medicine, Washington, District of Columbia*

Friendships have been linked to a psychological and emotional well-being and better physical functioning for older adults. Conversely, there are negative consequences (e.g., depression) associated with losing friendships and having ones' social networks decrease. The potential consequences of declining social engagement make friendship formation and social interactions critical topics to study and understand. While a decline of cognitive ability is a potential limiting factor for the person with dementia to establish friendships, research on how friendships are navigated throughout the course of dementia is lacking. Understanding how people with dementia can maintain social functioning is invaluable information because of the potential to preserve high quality of life throughout the experience of this disorder. The papers in this symposium will discuss the social worlds of people with dementia in different contexts. The objective of this symposium is to present information concerning how socialization changes or maintains over the course of dementia. Saunders et. al. examines ethnographic data of social relationships among persons with dementia in long-term care. This paper analyzes language used to create and maintain social relationships. Harris examines semi-structured interview data conducted with persons with mild to moderate dementia to show factors that underlie the maintenance of friendships. Hamilton presents data on the language of descriptions, evaluations, and personal experience narratives produced by individuals with AD viewing art exhibitions. Sabat as the discussant will reveal themes across these papers in the area of person centered care and social relationships. Practice implications will be discussed.

### LINGUISTIC MARKERS OF FRIENDSHIP AMONG PERSONS WITH DEMENTIA IN LONG TERM CARE

P. Saunders[1], K. de Medeiros[2], P.J. Doyle[2], A. Mosby[2], *1. Georgetown School of Medicine, Washington, District of Columbia, 2. Copper Ridge Research Institute, Sykesville, Maryland*

The value of social relationships throughout the life course, no matter a person's abilities or limitations, is an important area of study. Friendships have been linked to psychological and emotional wellbeing and better physical functioning for older adults. Conversely, there are negative consequences (e.g., depression) associated with losing friendships and having ones' social networks decrease. Given that language and functional abilities decline as dementia progresses, it is challenging to identify markers of friendship. The Friendship Project is an ethnographic study of social interaction among persons with dementia living in a long-term care setting. The data are from transcripts and field-notes of social interactions among residents with a range of cognitive impairments over a six-month time period. Results reveal that persons with dementia employ specific linguistic features such as narrative, evaluation, evidentials, and pronominal reference to make meaning and create relationships over time. Practical implications will be discussed.

### MAINTAINING FRIENDSHIPS ALONG THE DEMENTIA JOURNEY: FACTORS TO CONSIDER

P. Harris, *Sociology, John Carroll University, Cleveland, Ohio*

Friendships and the importance of social connectiveness play a critical role in aging successfully, regardless of gender, race, social class, or impairment. However, as research has demonstrated, it is not necessarily the quantity of the relationships, but the quality of the relationships, having that confidant, that can make a meaningful difference in one's quality of life. This qualitative study examines in-depth eight case studies of people in the early and middle stages of dementia who have been able to maintain a strong friendship despite the diagnosis. So much of the literature focuses on the friends that withdraw, but what can be learned about the friendships that remain? Factors that seem to play important roles are: retention of similar values, ability to look beyond the disease, flexibility, recognition of personal strengths, a sense of humor, and a trusting relationship. Practice implications will be discussed.

### TALK SPARKED BY ART: MUSEUM INTERACTIONS FOR PEOPLE WITH ALZHEIMER'S DISEASE

H.E. Hamilton, *Georgetown University, Washington, District of Columbia*

Proponents of innovative programming at the intersection of Alzheimer's disease and the arts claim that these multi-sensory experiences that focus on personhood are especially good at promoting the social and creative wellbeing of individuals with this disease. Because language is an observable representation of mental activity, rigorous linguistic analyses would arguably provide powerful evidence of the cognitive and social effects of such programs on participants. To my knowledge, however, no linguist has yet studied the discourse produced within such artistic endeavors. In this study, I examine the language of descriptions, evaluations, and personal experience narratives produced by individuals with Alzheimer's disease as they view museum paintings as part of three weekly hour-long video-recorded small group tours at the National Gallery of Australia. The findings of this study may illuminate contextual features of the complex relationship between language and Alzheimer's disease while simultaneously providing an important step toward improving the everyday lives of people living with this disease.

## SESSION 2260 (PAPER)

## SPOUSAL LOSS, DEPRESSION, AND MORTALITY

### CONFIRMING THE DISTINCTIVENESS OF GRIEF FROM DEPRESSION AND ANXIETY AMONG BEREAVED CAREGIVERS

I. Nam, *School of Social Work, Univeristy of Pittsburgh, Pittsburgh, Pennsylvania*

Studies have shown that symptoms of grief constitute a dimension distinct from symptoms of depression and anxiety. This study was designed to replicate these findings in the samples of bereaved dementia caregivers by examining the distinctiveness of grief from other psychological symptoms and the distinctiveness was invariant across races. Data were from the Resources of Enhanced Alzheimer's Caregiver Health project. Bereaved dementia caregivers (N = 200) were provided ratings on measures of grief (the Texas Revised Inventory of Grief), depression (the Center for Epidemiologic Studies Depression), and anxiety (Anxiety Inventory Questionnaire). Confirmatory factor analyses were performed. Results indicated that the 3-factor model of grief, depression, and anxiety fits the data reasonably well (CFI = .963, RMSEA = .065, SRMR = .005). The chi-square difference test resulted in 2(3, N = 200) = 133.101, p < .000 between the 1-factor and the 3-factor model which indicated that the 3-factor model fit statistically better than the unidimensional model combining grief, depression, and anxiety. Factor loadings of each factor were all significant. Correlation of grief with depression and anxiety were r = 4.00 and r = 2.21, respectively, and depression were highly correlated with anxiety (r = 7.04). When examining multiple-group confirmatory factor analyses and chi-square difference test were conducted to examine the invariance of factor model across racial groups. Results were indicative of invariance of the factor structure across races. Confirmatory factor analyses confirm the distinctiveness of grief from depression and anxiety in bereaved dementia caregiver population and the distinctiveness is invariant across races.

### THE ASSOCIATION OF FINDING MEANING IN SPOUSAL LOSS AND DEPRESSIVE SYMPTOMS

W.D. Brynildsen, S.L. Foy, *Sociology, Duke University, Durham, North Carolina*

Stress process researchers note that people are not simply the passive recipients of psychologically distressing experiences; through a variety of coping mechanisms, they actively seek to alter the impact of stressful life events. Empirical evidence suggests that one such mechanism often employed to alleviate bereavement is meaning-making, a process by which the bereaved may both make sense of and identify positive aspects of loss. However, the impact of meaning-making on mental health, when employed as a coping mechanism for dealing with spousal loss, is unclear. In the present study, we examine how attempts to construct meaning and the successful finding of meaning regarding spousal loss affect depressive symptoms. We use the first wave of the American Changing Lives Survey (1986) to examine the impact of searching for and finding meaning after spousal loss among a sample of widows and widowers. We find that while there is a direct effect of searching for meaning on depression symptoms, there is no direct effect of finding meaning. However, we find that finding meaning is an important moderator in the relationship between searching for meaning and depression. A significant interaction exists between searching for and finding meaning, whereby individuals who search for meaning and do not find it have higher levels of depression than either individuals who search for and find meaning or who do not search for meaning. This paper serves to further elaborate the role of meaning-making in the stress process and explain individual variation in the consequence of bereavement on depression.

### AGE-DEPENDENT EFFECT OF SPOUSAL LOSS ON MORTALITY AMONG OLDER MEN IN SOUTH KOREA: A KANGWHA COHORT STUDY

J. Kang[1], M. Lee[2], *1. Yonsei University, Seoul, Republic of Korea, 2. ChungAng University, Seoul, Republic of Korea*

Objectives: We estimate the effect of spousal loss on mortality for Korean older adults and examine if the effect is differential by gender and timing of spousal loss. Data and Methods: The baseline survey of Kangwha Cohort Study was collected for 6,291 residents in Kangwha County, aged 55 and older in 1985. The study not only performed a second-wave survey in 1994 but also followed the cohort for their cause-specific death up to the end of 2005. We conducted Cox proportional hazard model for mortality. Results: Being bereaved at the time of survey, either 1985 or1994, increases the hazard ratio of death for male respondents by 16%. We,however, found no effect of spousal loss for female respondents. This male-only effect decreases with age at the time of survey: Being bereaved at relatively younger ages is more harmful to men in South Korea. Discussions: The findings suggest that old men are more vulnerable to spousal loss as a stressful life event than old women in South Korea. We also suspect that those stressful events will be acuter when facing old men earlier in their life time.

### MORTALITY DIFFERENCES IN WIDOWHOOD

A.R. Sullivan, *Population Studies Center, Unversity of Pennsylvania, Philadelphia, Pennsylvania*

Being widowed elevates mortality risk, relative to married men or women of the same age. I investigate how risk varies by sub-population of widows and widowers. Specifically, using data from the Health and Retirement Study, I test for differences in widowhood mortality by education, by number of children, and by how sudden or expected the death of the pre-decedent spouse was. Consistent with other studies, I find an increased hazard of mortality upon widowhood. In contrast with other studies but consistent with the larger literature on socioeconomic status and mortality, education is protective in widowhood. Number of children has a u-shaped association with mortality in widowhood, with those having 3-4 children having the lowest levels of mortality after death of a spouse. Lingering deaths (deaths after a chronic condition) of the predecedent spouse are much for the surviving spouse than sudden deaths or other types of death. Important gender differences occur with each of these effects. These findings illuminate mechanisms through which mortality is affected by widowhood, and provide evidence on the power of SES and social support in vulnerable populations.

## SESSION 2265 (PAPER)

### SUBSTANCE ABUSE AND ANXIETY

### DIFFERENTIAL EFFECTS OF ACUTE STRESS AND SOCIAL ANXIETY ON SELF-CONTROL IN YOUNGER AND OLDER PEOPLE

S. Forstmeier, M.E. Mortby, *Dept. of Psychology, University of Zurich, Zurich, Switzerland*

The delay discounting paradigma has been shown useful to measure self-control vs. impulsivity on a behavioural level. It has been found that in general older people have lower discounting rates that younger ones, i.e., they are more self-controlled. Aim of the present study is to investigate whether older vs. younger people differ in the degree to which self-control is influenced by acute stress and social anxiety. The sample consists of 72 cognitively healthy, community dwelling participants between 18 and 40 years (mean 23) and 64 between 60 and 80 years (mean 70). The Montreal Imaging Stress Task (MIST) was used to induce acute stress. The MIST is a computerized control and stress task combining challenging arithmetic problems with social-evaluative threat and has previously been found to increase cortisol level, heart rate, and alpha-amylase levels, and to reduce respiratory sinus arrhythmia. The Kirby Delay Discounting Questionnaire was used to measure self-control on a behavioural level; participants were offered choices between monetary rewards available immediately and larger rewards available after delays ranging from 1 week to 6 months. A significant stress x anxiety interaction was found in the young sample, but not in the old sample. Younger people with low social anxiety were more self-controlled than people with high social anxiety when not stressed and decreased in their self-control under acute stress. This effect is reversed in the older sample, although not significantly. These results suggest that the effects of stress and social anxiety on self-control might change with age.

### ALCOHOL USE IN MIDDLE ADULTHOOD: FUNCTIONS AND RATIONALE

M.A. Montpetit[1], C. Bergeman[2], *1. Psychology, Illinois Wesleyan University, Bloomington, Illinois, 2. University of Notre Dame, Notre Dame, Indiana*

The present study investigates the roles that alcohol plays in coping with the stressors accompanying midlife (functions), as well as how drinking motives (rationale) affect the relationship between drinking behavior and emotion. In particular, data from N=311 middle aged adults (Mage=51.7 years; SDage=6.3 years) were used to investigate hypotheses concerning the relationships between stress, drinking behavior (both frequency of alcohol use, and the number of drinks typically consumed), and affect (both negative and positive), which speak to the function of alcohol use. A second set of hypotheses explore the rationale for drinking; it was believed that a coping motive of drinking would mediate the relationship between alcohol use and negative affect, while social- or enhancement-motives would likely explain relationships between alcohol use and positive affect. Results suggest that the amount of alcohol consumed moderates the stress -> NA relationship (but that the frequency of drinking behavior does not); conversely, the frequency of alcohol use moderates the stress -> PA relationship (but, that the amount of alcohol consumed does not). Furthermore, the relationship between the amount of alcohol consumed and negative affect is mediated by both coping and enhancement motives. Because there was no direct effect relationship between the frequency of alcohol use and positive affect, no further analyses were conducted. Overall, evidence suggests that, for those choosing to drink, alcohol use plays an important role in the stress-and-coping process. Interestingly, the relationship between the typical amount of alcohol one consumes while drinking and negative emotion is almost entirely explained by an individual's rationale for drinking. In particular, evidence suggests that a desire to decrease negative affect (i.e., a coping motive) and a desire to increase positive affect (i.e., an enhancement motive) play particularly important roles in explaining the relationship between alcohol use and negative affect.

### PREVALENCE AND CHARACTERISTICS OF MENTAL HEALTH SERVICES USE IN OLDER AMERICANS WITH AND WITHOUT MOOD AND ANXIETY DISORDERS

A.L. Byers[1,2], P.A. Arean[1], K. Yaffe[1,2,3], *1. Department of Psychiatry, University of California, San Francisco, San Francisco, California, 2. San Francisco VA Medical Center, San Francisco, California, 3. Departments of Neurology, Epidemiology and Biostatistics, University of California, San Francisco, San Francisco, California*

**Introduction:** Population-based studies of mental health services use in elderly Americans to date are limited. Therefore, we determined updated, nationally representative estimates. We used the Andersen behavioral model of health services use, which posits 3 major predictors of use—predisposing (e.g., age, gender), enabling (e.g., income, health insurance), and need (e.g., psychiatric, medical). **Methods:** The data are from a population-based probability sample, the National Comorbidity Survey Replication (NCS-R), a study of 9,282 participants 18 years and older. For this analysis, we examined 1,372 participants aged 55 and older [sample: 48% 55-64; 52% 65+]. Twelve-month mental health service use was assessed by self-report, classified into specialty mental health, general medical, and non-health care services. Twelve-month mood and anxiety disorders were assessed by the WHO's World Mental Health Survey Initiation version of the Composite International Diagnostic Interview, using DSM-IV criteria. Analyses included frequency measures and logistic regression using weights and complex design-corrected statistical tests. **Results:** In multivariable logistic regression models, we found in those 55-64 years old diagnoses of mood and anxiety disorders, younger age, never married, being divorced\separated\widowed, and having a prior stroke and functional impairment were associated with greater use of specialty mental health. While in those 65 and older, only need factors explained greater use of specialty mental health services (i.e., DSM-IV disorders, heart disease, chronic pain, not having cancer, and varying domains of functional impairment). **Conclusions:** Mental health service use was highly influenced by need, especially in adults 65 and older who have high rates of medical comorbidities.

### SCREENING AND BRIEF INTERVENTION FOR ALCOHOL AND OTHER SUBSTANCE: THE FLORIDA BRITE PROJECT

L. Schonfeld[1], D. Hedgecock[1], R. Hazlett[2], V. Burns[2], D. Duchene[2], J. Balser[2], *1. Aging and Mental Health Disparities, University of South Florida, Tampa, Florida, 2. Florida Dept of Children & Families, Tallahassee, Florida*

The Florida BRITE Project (BRief Intervention and Treatement for Elders) is funded by a five year SAMHSA/Center for Substance Abuse Treatment to screen adults 55 and older for risky and nondependent use of alcohol and other substances. Now in its fourth year, BRITE has screened approximately 40,000 unduplicated cases across 28 sites in 18 counties in Florida and is targeting a total of 66,000 cases by the end of the grant. About 11% of cases screened positive for substances, primarily medication misuse and/or alcohol and required brief intervention in most cases. Follow-ups on a 10% sample conducted at six months indicate decreased alcohol consumption and decreased drug use. Site comparisons where screenings were conducted show that aging services have a higher proportion of positive screens compared to medical settings. Implications for sustainability following the end of federal funding include Medicare, Medicaid, and Insurance billing codes, as well as strategies for aging resource centers.

# SESSION 2270 (PAPER)

## ADAPTATION AND MAINTAINING INDEPENDENCE

### SIGN CHI DO AND ADAPTATION TO AGING IN OLDER ADULTS

C.E. Rogers, *College of Nursing and Health Innovation, Arizona State University, Phoenix, Arizona*

Sedentary older adults are at risk of decreased physical function and maladaptation to aging that may lead to loss of independence. SCD is a mind-body approach that has multiple health benefits including improving strength and balance. The Roy Adaptation Model guided the design of a 12 week intervention that tested the effects of SCD exercise compared to a sedentary wait-list control group on physiologic and self-concept adaptation among sedentary community dwelling adults over 55. 67 older adults (mean age = 74.46, SD =8.15) were recruited and randomized to SCD or control group. Measurement of physiologic adaptation (Timed Up & Go [TUG], 6-minute walk [6-MW], weekly physical activity [PA], pedometer steps, systolic and diastolic blood pressure) and self-concept adaptation (Functional Assessment of Chronic Disease Spiritual-wellbeing [FACIT-SP] and Exercise Self-efficacy [ESE] ) were completed at baseline (T1), 6 and 12 weeks (T2 and T3). Physiologic adaptation improved over time for three measures while self-concept adaptation did not. The TUG and PA scores improved significantly from T1 to T3 for the intervention group (actual change -2.53, p = .000 and 1512.71, p = .001 respectively). There was a significant between group difference of 271.36 feet walked for the 6-MW at T3, p = 0.02. The self-concept measures were high at baseline and higher baseline FACIT-SP scores were associated with faster 6-MW, more PA, and higher ESE. These results indicate that the theory based SCD intervention improved measures of balance and physical function among sedentary older adults.

### SILVER: SUPPORT FOR INDEPENDENT LIVING AND A VITAL, ENERGETIC RETIREMENT

V.F. Rempusheski[1], M. Kennedy[1], B. Laster[2], *1. School of Nursing, University of Delaware, Newark, Delaware, 2. Jewish Family Services of Delaware, Wilmington, Delaware*

Mobility options, safety, available housing and recreation, services and support within Naturally Occurring Retirement Communities often determine the ability of older adults (OA) to age-in-place successfully. This study used a community-based participatory research approach and a structure-process-outcome framework. We measured four outcomes (awareness, access, support, understanding OA needs) of comprehensive age-in-place services (i.e., care management, social work, health care, education, volunteer opportunities) for OA in three zip codes in New Castle County, DE, from the perspective of OA, age 65+ and community stakeholders (CS), age 18+. Outcomes were measured by two valid and reliable scales: Social Provisions Scale (SPS, Russell & Cutrona, 1984) ($\alpha = 0.945$) and Perceptions of Community (POC, Chellappoo, 2008) ($\alpha = 0.895$). Printed scales were administered in various service/community settings pre and post outreach and yielded a convenient stratified sample of 593 subjects: 318 OA (M age 75.8, SD 6.8; 83% retired; 54% married, 29% widowed) and 275 CS (M age 47.3, SD 14.3, 57% married, 29% single). Subject characteristics approximated the zip code population characteristics: 68% female; 74% white. There were no statistically significant differences between T1 and T2 outcomes. There were significant differences between OS and CS in perceptions of safe access, promote independence and recreation POC subscales; attachment support was excluded from the OA regression model and reliable alliance support was excluded from the CS model. These findings raise further questions about CS awareness of OA needs, priorities of each and complexity of aging-in-place decisions. Supported by an Administration on Aging grant.

### ROLE OF TECHNOLOGY IN THERAPEUTIC ENVIRONMENTS FOR SENIORS WITH MENTAL HEALTH AND OTHER COMPLEX NEEDS

L. Liu[1], C. Schalm[2], B. Wilkey[2], S. Maisey[2], E. Stroulia[1], S. King[1], L.N. Seale[1], C. Laing[2], *1. Occupational Therapy, University of Alberta, Edmonton, Alberta, Canada, 2. Shepherd's Care Foundation, Edmonton, Alberta, Canada*

Simple technological supports could be used to address issues such as sundowning, wandering, monitor activity engagement, help ensure safety and provide therapeutic interventions. Technologies could: (1) minimize visible barriers while still ensuring an appropriate level of safety, (2) augment normal non-technological care, service and supports available through staff and the physical and social environments, and (3) expand ways that staff (and family members) could appropriately and respectfully monitor the movements of the individual for the purpose of providing help at the right moment (e.g., automatic lighting for night time activities, to minimize fall risk and notify staff who can check to offer care and support) or by providing automatic reminders for routine or “event triggered” activities (e.g., electronic notification of individual medication needs and documentation). The overall objective of this project is to perform a comprehensive environmental scan of research studies, public- and private-sector initiatives, demonstration projects, best practices and protocols around the application of technologies in supportive housing and assisted living environments for older adults with complex physical and mental problems. We will present (1) a critique of relevant publications on this topic in appropriate databases and repositories; (2) key projects in this area of local, provincial, national and international scope, and data from interviews with project leaders; and (3) results of a one-day Think Tank where key representatives of research, health care and industry communities discuss, present and respond to the key findings of this project.

### FACTORS INFLUENCING VARIABILITY IN ASSESSMENT PROCEDURES FOR MEDICALLY AT-RISK DRIVERS

B. Vrkljan[1], A. Myers[2], S. Marshall[3], R.A. Blanchard[2], *1. McMaster University, Hamilton, Ontario, Canada, 2. University of Waterloo, Waterloo, Ontario, Canada, 3. Ottawa Hospital Research Institute, Ottawa, Ontario, Canada*

Prior surveys (e.g. Korner-Bitensky et al., 2006) have shown tremendous variability in both off- and on-road procedures for assessing medically at-risk drivers. As part of a larger project examining linkages with ministry policies for medical review, 91 centres that conduct assessments of drivers for medical purposes were identified throughout Canada. Each centre was sent two electronic surveys: one for managers and the other for frontline personnel. Managers were asked about operation, staffing, clientele, assessment and reporting procedures. Assessors were asked about their backgrounds, caseload and client profiles, as well as general assessment tools and procedures. To examine consistency of practices, they were then asked to consider four specific vignettes with different presenting problems (paraplegia, stroke, probable dementia and schizophrenia). Surveys were completed by 44 centres (48% response) and by 46 assessors. About half the centres operated in hospitals and for-profit settings. Caseloads varied considerably (1 to 50/month), as did client costs, wait times and procedures. For instance, only 62% used a standardized scoring system for road tests. The wide variability in assessment tools and procedures supported the findings of prior surveys. Analysis of the vignettes and confidence ratings provided greater insight into the clinical decision-making process. Assessor training (predominately occupational therapists), program differences (e.g., DriveABLE™) and provincial criteria explain some of the differences found. Surprisingly, however, not all managers or assessors were aware of these criteria. Findings have implications with regard to standardizing protocols and informing policy concerning equitable and fair assessment of medically at-risk drivers.

## SESSION 2275 (SYMPOSIUM)

### EMERGING ISSUES IN AGING IN ASIA

Chair: *A. Chan, Sociology, National University of Singapore, Singapore, Singapore, Duke-NUS, Singapore, Singapore*

As Asia's populations age and research and data availability on aging expands, several themes are emerging as important yet understudied. As individuals live longer they face increasingly complex health care issues. Moreover, existing research often focuses on the older individual and does not model the effects of older adult health on family members and the larger society, e.g., the labor market. This symposium presents papers that examine such emerging issues in Japan, Korea and Singapore. The presentations are aimed at stimulating discussion and enriching the high quality work that is already being done. One of the serious concerns of population aging is how to provide care for older individuals with cognitive impairment in a way that is effective, humane and sustainable. A systems dynamics approach, based on empirical findings from Singapore, will be used to discuss this dynamic and complex issue. Another paper from Singapore will present a multidimensional understanding of the health of older adults spanning fifteen different health dimensions. We explore the relationship between self-rated health and these other health outcomes focusing specifically on gender differences. A paper from Japan will provide insights into the epidemiology of body pain, a condition so common among older adults that it is most often considered to be a part of normal aging. Finally, the paper from Korea addresses an understudied issue in Asian countries that is the provision of family care for older adults and the impact of informal caregiving on the labor market.

### THE EFFECT OF INFORMAL CAREGIVING ON LABOR MARKET OUTCOMES IN SOUTH KOREA

Y. Do[1], E. Norton[2], S.C. Stearns[3], *1. Duke-NUS Graduate Medical School Singapore, Singapore, Singapore, 2. University of Michigan, Ann Arbor, Michigan, 3. University of North Carolina, Chapel Hill, North Carolina*

This study investigates the effect of informal caregiving on labor market outcomes in South Korea, an Asian society with traditional norms, a highly gendered division of labor at home, and gender differences in labor market outcomes. Using data from the 2006 Korean Longitudinal Study of Aging, the current study examines multiple labor market outcomes by gender and age group, and accounts for the endogeneity of informal caregiving using the instrumental variable method. Our overall results suggest that informal caregiving has substantial labor market opportunity costs. Compared with otherwise similar non-caregivers, female intensive caregivers, who provide at least 10 hours of care per week, are at an increased risk of being out of the labor force by 15.2 percentage points and of being out of the employment sector by 8.2 percentage points, and receive lower hourly wages. Informal care is an important economic issue in South Korea.

### FIFTEEN DIMENSIONS OF HEALTH AMONG ELDERLY SINGAPOREANS

C. Malhotra[1], A. Chan[2,1], R. Malhotra[1], T. Østbye[3], *1. Duke-NUS Medical school, Singapore, Singapore, 2. National University of Singapore, Singapore, Singapore, 3. Duke University, Durham, North Carolina*

The objective of the study was to present a broader perspective of the health of older Singaporeans spanning 15 dimensions of health. Self-rated Health (SRH) and 14 other health dimensions were assessed using data from 5000 older Singaporeans (60+) . Generalized logit model was used to assess the relative contribution of these 14 dimensions with positive (very healthy, healthier than average) and negative (somewhat unhealthy, very unhealthy) SRH, compared to average SRH. About 86% of older Singaporeans reported themselves to be healthy (average and positive SRH). Independence in mobility, no difficulty in hearing and vision, absence of major physical ailments, freedom from pain, strong personal mastery and perceived financial adequacy were associated with significantly increased odds for positive SRH and decreased odds for negative SRH, relative to average SRH. The study supports a multidimensional understanding of health of the elderly.

### PREVALENCE, LOCATION, AND EFFECT ON DAILY LIFE OF PAIN AMONG OLDER JAPANESE PEOPLE: A POPULATION-BASED STUDY

V. Yong, Y. Saito, *Nihon University, Tokyo, 0, Japan*

Pain is commonly experienced by older adults, particularly among those with health conditions or diseases. It is also often a precursor to functional limitations and difficulties with activities of daily living. To date, few studies have used population-based data to examine pain among older Japanese people. In this paper, we use a nationally-representative sample of 4,493 Japanese aged 65+ to establish the prevalence and location of pain as well as the extent to which the pain hinders daily life, including sleep. We present results for the overall population and by pertinent sociodemographic characteristics. This study has important implications for pain management and intervention measures in Japan where almost one in four (23%) persons is aged 65+ and which has the world's longest life expectancy.

### A SYSTEMS MODEL FOR ADDRESSING COGNITIVE IMPAIRMENT AND DEMENTIA IN SINGAPORE

D. Matchar, *Duke-NUs, Singapore, Singapore*

Developing a case for one clinical or public policy strategy or another is exceedingly challenging because of the complexity of the health system, breadth of health care needs, and variety of health care providers. To address this challenge and to have an impact on the health and well being of the population, it is increasingly apparent that health services research must: (1) take a systems perspective; (2) engage all stakeholders in the first instance to promote insight to and ownership of solutions; and (3) establish a scholarly foundation for research. A preliminary model that addresses the issues involved with the development and management of cognitive impairment and dementia in Singapore will be presented. The methods and procedures underlying the development of this model will be discussed; the strategy for engaging stakeholders will be outlined; and approaches to identify and apply relevant data as inputs to the model will be explained.

## SESSION 2280 (SYMPOSIUM)

### EXPLORING THE TRANSITIONS OF LONG-TERM CARE RECIPIENTS: UNPACKING HOSPITALIZATIONS

Chair: *K. Abbott, University of Pennsylvania - School of Nursing, Philadelphia, Pennsylvania, NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*
Discussant: *C. Murtaugh, Center for Home Care Policy and Research:Visiting Nurse Service of New York, New York, New York*

Hospitalizations among long-term care (LTC) recipients have consistently been associated with poor health outcomes, including increased rates of adverse clinical events; accelerated cognitive, physical, and functional decline; high rehospitalization rates and increased mortality. In addition to the tremendous human burden, these hospitalizations also have contributed to rapidly escalating health care costs. Improving health care quality and reducing costs is a substantial challenge. This is especially true for frail elderly LTC recipients who suffer from multiple chronic illnesses and serious disabilities superimposed on the aging process. The need to understand the experiences of elders and, providers as well as predictors of hospitalizations are crucial to developing preventative interventions. In this symposium we will explore this transition through a variety of lenses. First longitudinal data from 208 older adults new to LTC (nursing homes, assisted living facilities or home and community-based services (H&CBS)) were used to predict hospitalizations. Predictors included being in a nursing home and lower self-rated health. Second, a sub-sample of data collected on 31 elders in H&CBS will examine the hours of nursing care delivered and the unique contributions nurses provide in transitional care. Finally, common facilitators and barriers to quality of care in the hospitalization experience from both elder and provider perspectives are discussed. Common themes are presented using data from qualitative interviews with 46 hospitalized elders and 12 provider focus groups. This symposium highlights the multiple perspectives needed to explore transitions among LTC recipients from a person, provider, and system level understanding of transitions.

### PREDICTORS OF HOSPITALIZATIONS IN OLDER ADULTS NEW TO LONG-TERM CARE

C. Zubritsky[1], K. Abbott[2,3], A. Hanlon[2], C. Murtaugh[4], M.D. Naylor[2,3], *1. University of Pennsylvania - School of Medicine, Philadelphia, Pennsylvania, 2. University of Pennsylvania - School of Nursing, Philadelphia, Pennsylvania, 3. NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania, 4. Center for Home Care Policy and Research-Visiting Nurse Service of New York, New York, New York*

The primary aim of this study is to examine predictors of hospitalizations for elders in LTC. Attention to the identified predictors of hospitalization that are potentially preventable could reduce the risk and cost of these hospitalizations and increase the quality of life of individuals in LTC. Self-report and medical chart abstraction data from 208 older adults new to the LTC system interviewed quarterly through 12 months were collected. Generalized Estimated Equations were used to model repeated measures of hospitalizations as a function of quality of life, self-rated health, age, functional limitations, cognitive impairment, gender, depression, and facility type. Independent predictors of increased hospitalizations included being in a nursing home (p=.024) and lower self-rated health (p=.005). Findings suggest that self-rated health can be used as an additional prognostic indicator of a patient's risk for hospitalization and further research is needed in the development of interventions.

### HOURS OF NURSING CARE IN TRANSITIONAL CARE OF ELDERS ENROLLED IN HOME AND COMMUNITY BASED SERVICES

J.H. Van Cleave[1], J. Prvu Bettger[1], J. Foust[2], C. Tocchi[3], S. Chopra[4], M.D. Naylor[1], *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. University of Massachusetts Boston, Boston, Massachusetts, 3. Yale School of Nursing, New Haven, Connecticut, 4. Visiting Nurse Service of New York, New York, New York*

The primary aim of this study was to examine hours of nursing care delivered to 31 patients newly enrolled in H&CBS. Seven consecutive days of data were collected at 1, 3, and 6 months from date of admission from computerized agency records. Data collected included total time of care coordination and direct care provided by Registered Nurses, Licensed Professional Nurses, and Home Health Aides. Results indicated the complex care needs of hospitalized elders transitioning across health settings. Emblematic is Mrs. X, an 81 year old who desired to return home after hospitalization. H&CBS nurses spent 6 hours, placed 18 telephone calls across three health care systems, and visited Mrs. X for 90 minutes over a one week period to coordinate goals of care and discharge planning. This study represents one of the first attempts to illustrate the unique contributions nurses provide in transitional care.

### TRANSITIONS OF ELDERLY LONG-TERM CARE RECIPIENTS TO AND FROM HOSPITALS: THE ELDERS' PERSPECTIVES

K. Abbott[1,2], L. DiGiovanni[1], L. Lechtenberg[1], J. Synder[1], M.D. Naylor[1,2], *1. University of Pennsylvania - School of Nursing, Philadelphia, Pennsylvania, 2. NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*

The primary aim of this study was to understand the experience of elders in LTC hospitalized for an acute episode of illness. Semi-structured open-ended qualitative interviews were conducted to elicit the experience of the elder and the impact of these transitions. Forty-six elders age 65 or older from NHs and ALFs who had a recent hospitalization (past 30-60 days) were interviewed. Qualitative analysis was conducted to identify common themes. Residents believed that hospital staff were understanding of their needs and that they received the care they needed. Barriers that emerged included: a lack of communication and information exchange between the LTC provider, hospital, and resident; confusion regarding medical condition; significant wait time in the emergency department; and a lack of knowledge regarding questions to ask health care providers. Findings revealed several areas for increased transfer of information and improved transitions across settings.

### TRANSITIONS OF FRAIL ELDERS TO AND FROM HOSPITALS: THE HEALTH CARE PROVIDERS' PERSPECTIVES

K.B. Hirschman[1,2,3], K.H. Bowles[1,2,3], M. Bixby[1], S. Panzer[1], M.D. Naylor[1,2,3], *1. Institute on Aging, University of Pennsylvania, Philadelphia, Pennsylvania, 2. NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania, 3. Institute on Aging, Philadelphia, Pennsylvania*

The primary aim of this study was to understand the experience of frail LTC recipients admitted to the hospital for an acute episode of illness by eliciting the perspectives of health care professionals involved in their care. Qualitative analysis of eleven focus groups of providers from multiple settings (e.g., hospital, NH, ALF, H&CBS) revealed common facilitators and barriers. Both LTC and hospital providers identified communication and information transfer back and forth about the resident as a barrier to providing optimal care and a smooth transition (i.e., lack of information sent, poor quality of information, patients managed too aggressively at end of life). LTC providers noted that the stability of their staff (e.g., length of employment), ability to function as a team as major facilitators in promoting good transitions for their service recipients. Findings revealed multiple opportunities to improve communication between sites and among providers.

## SESSION 2285 (PAPER)

## FRAILTY AND FUNCTION IN OLDER LIFE

### FRAILTY IN KOREA

G.S. Hong[1], J. Song[2], M. Park[3], I. Shin[4], *1. Hanyang University, Seoul, Republic of Korea, 2. Korea University, Seoul, Republic of Korea, 3. Keimyung University, Daegu, Republic of Korea, 4. Catholic Univ.of Daegu, Daegu, Republic of Korea*

No consensus on the definition of frailty exists. The aims of the study were 1) to develop the Korean Frailty Index and investigate the prevalence of frailty in Korea, and 2) to examine differences in demographics (gender, age, educational level), number of chronic illnesses, nutritional status, physical function, cognitive function, number of falls, and depression among non-frail, pre-frail, and frail elderly. As a part of the 2008 national study of Korean elderly, this study was conducted using a sample of 15,146 respondents who were over 60 years old and living in communities. The Korean Frailty Index was based on Fried et al's (2001) index, composed of five main markers (weight loss, exhaustion, physical activity, walking speed, and grip strength). Frail and pre-frail groups were categorized by whether they were in the lower 25 percentile on 3 or on 2-3 out of five indexes, respectively. Oneway ANOVAs and Chi-square tests were used for data analyses. The percentages of frail, pre-frail, and non-frail elderly were 6.9%, 46.3%, and 46.8%, respectively. Frail elderly were more likely to be female, older, and of lower education level as compared to the other groups. Mean numbers of chronic illnesses (F=436.01, p <.001), nutritional status ($\chi$2 = 1472.20, p<.001), physical activity (F=1745.50, p<.001), cognitive function ($\chi$2 = 295.98, p<.001), number of falls (F=32.32, p<.001), and depression (F=1611.59, p<.001) were significantly different among 3 groups. Interventions should be developed to improve all types of functions, which must postpone frail process.

### A 6-MONTH STUDY OF MK-0773 (A SELECTIVE ANDROGEN RECEPTOR MODULATOR) IN WOMEN WITH SARCOPENIA

S. Ather[1], H. Zhu[3], J. Chandler[2], J. Lutkiewicz[1], D. Papanicolaou[1], *1. Merck, Rahway, New Jersey, 2. Merck, Upper Gwynedd, Pennsylvania, 3. Forest Research Institute, Jersey City, New Jersey*

BACKGROUND: Sarcopenia refers to the loss of muscle mass, strength and function, and is a major contributing factor to frailty in the elderly. MK-0773 is a selective androgen receptor modulator designed to improve muscle function while minimizing effects on the skin and uterus. STUDY DESIGN: A 6-month study was conducted in women aged 65 and older with sarcopenia and moderate physical dysfunction to examine the effects of MK-0773 on muscle strength (BLP), LBM (by DEXA), physical performance (SPPB, SCP, gait-speed), and drug safety and tolerability. Patients were randomized in a 1:1 ratio to receive either MK-0773 50 mg b.i.d. or placebo; all patients received Vitamin D and protein supplemenation. RESULTS: MK-0773 showed a statistically significant increase in LBM from baseline at Month 6 vs. placebo (p<0.001). Both MK-0773 and placebo showed a statistically significant increase in BLP from baseline to Month 6, but the mean difference between the two groups was not significant (p=0.269). Both groups showed significant improvement from baseline at Month 6 in physical performance measures, but there were no statistically significant differences between MK-0773 and placebo. There were no differences in the proportion of patients with hirsutism, acne or androgenic alopecia between MK-0773 and placebo groups. A significantly greater number of patients experienced elevated transaminases in the MK-0773 group vs. the placebo group. In all cases the elevations resolved after discontinuation of study therapy. MK-0773 was generally well-tolerated. CONCLUSION: The increase in LBM did not translate to improvement in strength or function vs. placebo.

### SLEEP PARAMETERS AND INCIDENT FRAILTY STATUS IN OLDER MEN

K. Ensrud[1], T. Blackwell[2], S. Ancoli-Israel[3], S. Redline[4], P. Cawthon[2], M.L. Paudel[5], T.L. Dam[6], K.L. Stone[2], *1. VA Medical Center / University of Minnesota, Minneapolis, Minnesota, 2. California Pacific Medical Center, San Francisco, California, 3. University of California - San Diego, San Diego, California, 4. Case Western Reserve University, Cleveland, Ohio, 5. University of Minnesota, Minneapolis, Minnesota, 6. Columbia University, New York, New York*

Sleep problems and frailty are increasingly common with aging, but the association between these conditions is uncertain. To determine whether non-frail older men with poorer sleep at baseline are at increased risk of greater frailty status at follow-up, we measured subjective (Pittsburgh Sleep Quality Index (PSQI) and Epworth Sleepiness Scale (ESS)) and objective (actigraphy and polysomnography) sleep parameters in 2503 non-frail men ≥67 years at baseline and re-examined frailty status (robust, intermediate stage, frail, dead) 3.4 years later. After adjusting for multiple confounders (age, race, site, health status, education, social support, alcohol intake, smoking, medication use, medical conditions, cognition, and body mass index), poorer sleep quality (proportional odds ratio (POR) 1.11, 95% CI 1.03-1.21 per 1 SD increase in PSQI) and greater daytime sleepiness (POR 1.13, 95% CI 1.05-1.23 per 1 SD increase in ESS) at baseline were each associated with a higher odds of greater frailty status at follow-up. Associations for objective measures of lower sleep efficiency (POR 1.08, 95% CI 0.99-1.17 per 1 SD decrease), greater nighttime wakefulness (POR 1.06, 95% CI 1.00-1.12 per 30 min increase) and nocturnal hypoxemia (POR 1.08, 95% CI 1.00-1.18 per 1 SD increase in % sleep time with SAO2 <90%) nearly reached the level of significance. Objective measures of total sleep time, sleep latency, and respiratory disturbance index at baseline were not associated with frailty status at follow-up. Among older non-frail men at baseline, poorer sleep quality and greater daytime sleepiness independently predicted an increased risk of greater frailty status at follow-up.

### INSULIN-LIKE GROWTH FACTORS AND PHYSICAL PERFORMANCE IN OLD AGE: THE BOYD ORR AND CAERPHILLY STUDIES

K. Birnie[1], Y. Ben-Shlomo[1], S. Ebrahim[2], J. Gallacher[3], A. Bayer[3], D. Gunnell[1], J.M. Holly[4], R.M. Martin[1], *1. Department of Social Medicine, University of Bristol, Bristol, United Kingdom, 2. London School of Hygiene and Tropical Medicine, London, United Kingdom, 3. Cardiff University, Cardiff, United Kingdom, 4. Department of Clinical Sciences at North Bristol, University of Bristol, Bristol, United Kingdom*

Aims: The insulin-like growth factor (IGF) system regulates growth and IGF-I increases muscle mass, strength and body composition. Height and leg-length are markers for circulating IGF-I in pre-pubertal children; trunk length may be a marker for factors influencing pubertal growth. We assessed associations of the IGF system and height with physical performance in old age. Methods: Physical performance was measured with the get-up and go timed walk and flamingo balance test at 63-86 years. We examined cross-sectional associations in the UK Boyd Orr cohort (n=405) and prospective associations in the Caerphilly prospective study (CaPS) (n=730) from stored samples (average 17 years earlier). Results: In CaPs, a standard deviation (SD) increase in IGF-I was associated with a 2% faster walking time (95% confidence interval -4% to -1%; P=0.009) and 11% lower odds of poor balance (odds ratio 0.89; 0.78 to 1.02; P=0.10). There were no associations with IGF-II or IGFBP-3. Cross-sectional effects of IGF-I on walking time were weaker in Boyd Orr (1% faster; -4% to 1%; P=0.39). Cross-sectional trunk-length was a better predictor of walking time than leg length (Boyd Orr 5% faster per SD increase; -8% to -2%: CaPS 2% faster per SD increase; -3% to 0%), but this was not seen for childhood trunk length or in the prospective CaPS data. Conclusion: These results are consistent with IGF-I in young to middle adulthood being more important in establishing peak physical performance, and reductions in trunk length due to "shrinkage" being a predictor of later life function.

## SESSION 2290 (PAPER)

### FUNCTIONAL HEALTH: PREDICTORS AND INTERVENTIONS

### MIDLIFE GRIP STRENGTH, LIVING HABITS AND PARENTAL LONGEVITY AS PREDICTORS OF FULLY DEFINED LENGTH OF LIFE IN A MALE COHORT BORN 100 YEARS AGO

T. Rantanen[1], K. Masaki[2], Q. He[2], R.D. Abbott[2], L. White[2], *1. Gerontology Research Center, University of Jyvaskyla, University of Jyvaskyla, Finland, 2. Pacific Health Research Institute, Honolulu, Hawaii*

Information on long-term predictors of longevity, especially of becoming a centenarian is missing from prospective studies. Only few datasets exist, which provide an opportunity to examine measures of midlife physiological function and lifestyle in a large panel of subjects followed until death. We studied hand grip strength and living habits assessed at the age of 62 and parental age as predictors of longevity up to becoming a centenarian. The design is a prospective cohort study within the Honolulu Heart Program/Honolulu Asia Aging Study of 2239 men born before the end of June 1909 who took part in hand grip strength tests and other assessments at baseline in 1965-68 when they were on average 62 years old (range 56-68) and whose death dates were followed up for 44 years until end of June 2009 with complete coverage. Survival time after baseline was expressed in years. Longevity was categorized as centenarian (≥100 years, n=47), nonagenarian (90-99 years, n=545), octogenarian (80-89 years, n=847) and ≤79 years (n=801, reference). The average survival time after baseline was 20.8 years (SD 9.62). Longer survival time adjusted for baseline age and other confounders was observed among those with higher grip strength, maternal longevity and physical activity and among never-smokers, while prevalent diabetes or high blood pressure correlated with shorter survival time. Those in the highest third of grip strength distribution had 2.5 times (Odds Ratio, OR, 2.52, 95% Confidence Interval, CI, 1.23-5.10) and those in the middle third double (OR 2.02, 95% CI 0.84-4.87) the odds of becoming centenarian rather than dying at the age of ≤79 years as compared to those in the lowest third of grip strength. Never vs. ever smoking (OR 5.75 95% CI 3.06-10.80), participating in intensive or moderate physical activity outside work (OR 1.13 per daily hour, 95% CI 1.02-1.25) and mothers longevity ≥80 years vs. ≤60 years (OR 2.3, 95% CI 1.06-5.01) predicted becoming a centenarian. The models for nonagenarians and octogenarians vs. reference (≤79 years) showed parallel results. Adjusting for chronic conditions or excluding people with known chronic conditions at baseline did not materially change the models. Good grip strength and having a long-lived mother may indicate constitutional physiological and genetic resilience to aging and processes which may be enhanced with physical activity and diminished with smoking.

### GERIATRIC CONDITIONS AND CHRONIC DISEASES AND THEIR DISABILITY AND MORTALITY OUTCOMES: A NEW APPROACH

C. Cigolle[1,2,3], C. Blaum[2,3], W. Ye[4], Y. Lee[2], J. Liang[4], *1. University of Michigan Department of Family Medicine, Ann Arbor, Michigan, 2. University of Michigan Department of Internal Medicine, Ann Arbor, Michigan, 3. VA Ann Arbor Healthcare System Geriatrics Education, Clinical and Research Center (GRECC), Ann Arbor, Michigan, 4. University of Michigan School of Public Health, Ann Arbor, Michigan*

Geriatric conditions, in addition to diseases, define the health status of older adults. Previous research used latent class analysis to examine the structure of underlying patterns of conditions and diseases to produce profiles of older adult comorbidity. We hypothesized that these profiles were associated with distinct disability and mortality outcomes. We analyzed the 2004-2008 waves of the Health and Retirement Study, a nationally-representative longitudinal health interview survey. Our study sample included adults >=65 years old (n=11,113, representing 37.1 million). Independent variables included 5 geriatric conditions (dementia, falls, incontinence, poor vision, poor hearing) and 7 chronic diseases (diabetes, hypertension, heart, stroke, lung, psychiatric, musculoskeletal). Outcome variables included new dependency in activities of daily living (ADL) and instrumental activities of daily living (IADL) and mortality. We used latent class analysis to investigate profiles/clusters of older adult health status and their two- and four-year outcomes. Six profiles/classes were identified: (1) Healthy, 47% of older adults nationally; (2) Intermediate (diabetes/hypertension), 19%; (3) Intermediate (diabetes/hypertension/heart), 9%; (4) Intermediate (without diabetes), 15%; (5) Dementia with geriatric conditions, 6%; and (6) Multimorbid without dementia, 4%. New ADL/IADL dependency at 2 years was 33.4%/18.8% for Class 3 and 25.7%/35.5% for Class 6, versus 4.5%/7.3% for Class 1. Two- and four-year mortality were 39.8%/64.1% for Class 3 and 25.2%/43.6% for Class 6, versus 6.0%/15.4% for Class 1. Latent classes or profiles of geriatric conditions and diseases predict disability and mortality outcomes. This approach may offer new insight into older adult comorbidity, how it accumulates over time, and its outcomes.

### THE RESPONSIVENESS OF THE ACTIVITIES-SPECIFIC BALANCE CONFIDENCE SCALE AND TINETTI'S PEFORMANCE ORIENTED MOBILITY ASSESSMENT IN OLDER ADULTS WITH IMPAIRED BALANCE

E. Hood[1], K.K. Chui[2], M. Lusardi[2], *1. Warren Hospital Balance Center, Phillipsburg, New Jersey, 2. Physical Therapy and Human Movement Science, Sacred Heart University, Fairfield, Connecticut*

Introduction: Impairments of balance are frequent and problematic for many older adults. Physical therapists often administer a battery of self-reported and performance-based outcome measures to measure the effectiveness of their intervention. There is, however, little evidence to assist practitioners with the interpretation of change scores from these outcome measures. This study evaluated the responsiveness of two outcome measures frequently used in rehabilitation: the (self-reported) Activities-specific Balance Confidence Scale (ABC) and the (performance-based) Tinetti's Performance Oriented Mobility Assessment (POMA). Methods: Sixty-one consecutive community dwelling older adults (mean age = 77.3±7.0 years) referred to physical therapy (PT) participated in this study. All participants had diagnoses that impaired their balance (mean duration 12.5±14.0 months). PT interventions included balance exercises, gait training, and strength training among others (mean number of visits = 10.3±4.3). Distribution-based indexes of responsiveness were calculated and include standard error of the measurement (SEM), minimal detectible change (MDC), effect size (ES), and standardized response mean (SRM). Results: Indexes of responsiveness were calculated for the ABC (SEM = 5.8, MDD = 16.0, ES = 0.64, SRM = 0.87), POMA-balance subscale (SEM = 0.74, MDD = 2.0, ES = 0.97, SRM = 1.4), POMA-gait subscale (SEM = 0.74, MDD = 2.0, ES = 0.56, SRM = 0.69), and POMA-total score (SEM = 1.26, MDD = 3.45, ES = 0.88, SRM = 1.3). Conclusion: The indexes of responsiveness reported can assist practitioners with the interpretation of changes scores from two outcome measures frequently used for patients with impaired balance, the ABC and POMA.

### THE EFFECT OF AGING ON THE FUNCTION OF THE FEMALE HAND

C. Irwin, M. Sesto, *Trace Center, University of Wisconsin-Madison, Madison, Wisconsin*

Introduction: Hand function is critical for activities of daily living and independence. The aging process has been shown to adversely affect strength, the ability to produce force quickly and muscle synergy. Both strength and rapid force production (in the lower extremity) have been strongly correlated with function but only strength has been studied in the hands. A new and validated instrument, the Multi-Axis Profile (MAP) dynamometer, was used to simultaneously evaluate three grip-related variables; strength, rate of force production and force orientation. Methods: A total of 20 healthy, community dwelling, right handed adult females participated (n=10 older participants; avg. age=74 (SD=7.7) years and n=10 younger participants; avg. age=24.5 (SD=3.7) years). Participants were instructed to build up force as quickly as possible during a maximum voluntary grip activity. Participants also completed the 9-hole peg test to evaluate manual dexterity and the Short Form-36 to assess self-reported global function. Results: Older females averaged 69% the grip strength ($p<0.05$), 62% the force production rate ($p<0.05$) and oriented their forces up to 56 degrees more proximally ($p<0.05$) than younger females. Strength, force production rate and force orientation were significantly correlated with the SF-36 (0.40 to 0.62) and manual dexterity (0.47 to 0.67). Conclusion: Changes in grip strength, force production rate and force orientation were observed in healthy older females and were correlated with self-reported function and manual dexterity. Collectively these results may indicate a muscle force imbalance affecting hand function.

# SESSION 2295 (PAPER)

## RECOMMENDATIONS AND RESOURCES IN MUSCULOSKELETAL HEALTH

### PREDICTORS OF OLDER ADULTS' USE OF RECOMMENDED ARTHRITIS PAIN TREATMENT

D.D. McDonald, *School of Nursing, University of Connecticut, Storrs, Connecticut*

Non-steroidal anti-inflammatory drugs (NSAIDs) are not recommended for treatment of osteoarthritis pain in older adults due to the potential for adverse events. Exercise and acetaminophen remain the first line treatments for osteoarthritis pain. The purpose of this descriptive secondary analysis was to identify factors predictive of older adults' use of exercise and/or acetaminophen, and avoidance of NSAIDs. Data was analyzed from 455 adults age 60 and older with moderate or greater osteoarthritis pain intensity who responded to the Brief Pain Inventory between 2006 and 2007. A total of 212 (46.6%) reported using exercise and/or acetaminophen and did not report using NSAIDs. The following predictors were entered into a logistic regression to predict use of the exercise and/or acetaminophen and nonuse of NSAIDs: age, gender, Hispanic/nonHispanic ethnicity, White/nonWhite race, less than high school/high school or greater education, arthritis treatment by a practitioner, pain treatment by a practitioner, pain intensity, functional interference from the pain, and percent of pain relief from current treatments. Older adults reporting arthritis treatment by a practitioner were 2.19 (CI 1.07 – 4.51) more likely to use recommended arthritis pain treatment, $p < .03$. Only 3% to 4% of the variance for use of recommended pain management treatment was explained by the predictors. All of the older adults reported moderate or greater pain intensity, but less than half reported current use of the first line recommended pain treatment. Results underscore the importance of guidance by practitioners who are knowledgeable about safe osteoarthritis pain management for older adults.

### EDUCATION, COGNITION, AND FUNCTIONAL RECOVERY FROM A HIP FRACTURE

N. Chiles, A.L. Gruber-Baldini, D. Orwig, J. Magaziner, *University of Maryland Baltimore, Baltimore, Maryland*

Cognitive ability impacts recovery from hip fracture. Education is positively correlated with cognition; however the details of the relationship between years of education, cognition, and hip fracture recovery remain unclear. This study hypothesizes that higher education would be an independent predictor of better cognition and improved functional recovery post-hip fracture. Data was from 163 patients with a hip fracture from an ongoing study (Baltimore Hip Studies, BHS-7, 75 male and 79 female), recruited from 8 Baltimore-area hospitals. Baseline Modified Mini-Mental State (3MS) scores were used to determine cognitive impairment. Functional Recovery was measured by lower extremity physical activities of daily living (LPADLs) at 2 months post-fracture. At baseline, 75.5% were not cognitively impaired (3MS>=78), while 12.9% were moderately impaired (3MS 66-77) and 11.7% were severely cognitively impaired (3MS<66). Compared to non-cognitively impaired, severely cognitively impaired patients were older (Mean=85.8+/-SD=10.1 vs. M=81.0+/-7.8), less educated (M=11.3+/-2.9 vs. M=13.5+/-3.3), and more disabled (LPADL M=11.4+/-1.4 vs. M=7.0+/-3.1) (all p<.05). Linear regression examined the impact of education on 3MS and 2-month LPADL, adjusting for age, sex, history of dementia, and in-hospital delirium, as well as pre-fracture LPADL for the 2-month LPADL regression. Years of education were positively associated with 3MS scores (b(SE)=1.0(0.3), p<.01, Model R-squared=0.33), as well as 2-month post-fracture functional outcomes (b(SE)=-0.2(0.1),p<.05, Model R-squared=.35). Our findings indicate that education is associated with cognitive functioning and recovery in physical functioning following a hip fracture.

### THE USE OF "DICHOS" TO COMMUNICATE RESOURCES FOR PHYSICAL ACTIVITY IN OLDER LATINAS

A. Perez, J. Fleury, C. Keller, N. Shearer, M. Belyea, *College of Nursing and Health Innovation, Arizona State University, Phoenix, Arizona*

Introduction: Studies have shown that older adults achieve better health outcomes when health communication is linguistically and culturally appropriate. The purpose of this paper is to describe a theory-driven approach to developing a culturally relevant intervention grounded in formative research and partnerships with community members to promote physical activity (PA) among older Latinas. Methods: A series of community-based focus groups provided a systematic description of cultural meaning, social and contextual strengths, and resources related to PA. Insights gained from thematic analysis were integrated throughout intervention and materials development. Promotoras used "dichos" to open up sessions and include in reminder postcards and calendars as a way or reinforcing PA goals for self and family. Results: Family, friends and group setting were identified as important in promoting PA, Intervención de Motivación Para Actividad Fisica was open to family members, comadres, vecinas, and new walking support system of 6 to 10 women at sites closest to their neighborhood. Strategies focused on family interaction and activities included: joining children/grandchildren for activity at the park, home, and using short walks to talk to their comadre, vecina, or hermana. Women acknowledged age as a factor in remembering to do things, including PA, and recommended writing things down, using calendars for the refrigerator door, and using "dichos" as a culturally relevant way to communicate health as a priority on a regular basis. Discussion: Results may help guide clinicians in developing feasible and culturally appropriate communication strategies that promote regular PA in older Latinas.

# SESSION 2300 (SYMPOSIUM)

### ASSESSING READINESS FOR MOBILITY MANAGEMENT: FINDINGS FROM THE LIFE SPACE & MOBILITY STUDY

Chair: *M. Berg-Weger, School of Social Work, Saint Louis University, St. Louis, Missouri*
Discussant: *T.M. Meuser, University of Missouri-St. Louis, St. Louis, Missouri*

Mobility is a key factor in maintaining autonomy and quality of life in advancing age. Little is known about older adults' perceived meanings and emotions regarding changing life space and mobility. Life space–person's physical space–encompasses values, attitudes and needs. Researchers can help professionals identify and understand spaces in which older adults live, the impact of perception on mobility and strategies for responding to mobility changes and develop tools that practitioners need for effective mobility assessments and interventions. This symposium explores transitions across the aging and mobility continuum with attention to meanings and emotions associated with individuals' definitions of life space and relationships to anticipated mobility changes. Utilizing data from the Life Space and Mobility Study, three papers explore the multi-phased development of a person-centered measure focused on personal meanings and emotional aspects of anticipated life space mobility changes. The papers emphasize contributions of qualitative and quantitative approaches for successful mobility-related intervention. "Investigating Subjective Responses to Mobility Changes in Older Adults" presents data from three focus groups in which participants discussed perceptions of current and future mobility. "Development of the Mobility Preparedness Inventory" presents debuts the Person-Centered Mobility

Inventory. “Reflections on Mobility: The Elder Perspective” analyzes the participants’ written reflections on their life space and mobility changes.

### INVESTIGATING SUBJECTIVE RESPONSES TO MOBILITY CHANGES IN OLDER ADULTS

A. Harmon, M. King, *University of Missouri-St. Louis, St. Louis, Missouri*

The attitudes, meanings and emotions associated with personal life space and mobility status were explored in three focus groups. Thirty adults (57 – 92 years, mean age 74) participated in one of three focus groups defined as Low Disability/Broad Life Space, High Disability/Broad Life Space, and Mixed Disability Level/Constricted Life Space based on self-reported scores on the Life Space Questionnaire (LSQ) and SF-12v2 Physical Composite Score (PCS). Recordings of each meeting were transcribed and a grounded, consensus conference approach was used to identify four major themes across all three groups: Definition of Mobility and Mobility Related Change, Mobility Loss in Aging, Managing Loss and Change, and Self-Perception and Mobility. Common themes and key between-group differences will be discussed in the context of mobility-related intervention by social service professionals.

### DEVELOPMENT OF THE MOBILITY PREPAREDNESS INVENTORY

T.M. Meuser[1], J. Chibnall[2], *1. University of Missouri-St. Louis, St. Louis, Missouri, 2. Saint Louis University, St. Louis, Missouri*

This presentation will detail the development and initial validation of a new inventory for mobility counseling and management interventions, the Person-Centered Mobility Preparedness Inventory (PCMPI). A set of 87 test items were administered, along with other established measures (e.g., mood, self-rated disability, personality), to a volunteer sample of 300 community-dwelling adults (mean age 72, 77% female, 75% Caucasian, 80% current drivers). Factor analysis with rotation yielded a 24-item scale with sound reliability and validity characteristics. Unlike tools which emphasize transportation options, the PCMPI was designed to focus on a critical precursor to active mobility planning, namely awareness of real or potential change and the felt motivation (readiness) to address it. Various suggestions for implementation will be presented.

### REFLECTIONS ON MOBILITY: THE SENIOR PERSPECTIVE

M. Berg-Weger[1], J. Stowe[2], *1. School of Social Work, Saint Louis University, St. Louis, Missouri, 2. University of Missouri-Columbia, Columbia, Missouri*

The development of effective clinical tools and interventions for older adult mobility can be enhanced by incorporating the experiences of individuals. This paper will present a qualitative analysis of written comments provided by older adults participating in the Life Space and Mobility Study. An analysis of the comments highlight five general themes: 1) lack of awareness regarding a need to plan for mobility changes; 2) belief that mobility changes will be devastating; 3) belief that aging and mobility can be adequately addressed through positive thinking, exercise, a healthy diet and/or prayer; 4) concern about the lack of viable mobility resources, alternatives and supports for older adults; and 5) concern that mobility changes had not yet been personally considered. A small segment of the respondents indicated they had planned for impending or existing mobility changes. Implications for research and practice will be discussed.

## SESSION 2305 (PAPER)

## DIVERSITY IN AGING II

### EFFECTS OF PERCEIVED CAREGIVING BURDEN ON ECONOMIC WELLBEING AMONG EMPLOYED AFRICAN AMERICAN WOMEN

J. Kim[1], S. Kang[2], L.A. Chadiha[1], *1. University of Michigan-Ann Arbor, Ann Arbor, Michigan, 2. University Texas at Alington, Alington, Texas*

The effects of perceived caregiving burden on economic well-being of employed caregivers providing eldercare have not been widely examined. The purpose of this study is to examine this problem among female African American employed caregivers. Using cross-sectional data from Black Rural & Urban Caregiver Mental Health & Functioning Study, this study pays particular attention to employed African American women (n=235, average age 46) providing eldercare for a dependent adult aged 65 and older. Structural equation modeling (SEM) is used to investigate how perceived caregiving burden influences women’s economic well-being through their work performance. Results show that economic status is not directly but indirectly associated with employed African American women’s perceived caregiving burden. Specifically, caregivers’ work performance mediates between perceived caregiving burden and women’s economic status. The fit indices provide strong support for the hypothesized model: NNFI= .93, CFI= .95, GFI= .99, RMSEA= .05 and $\chi 2$ (df=14) = 23.19 (p=.06). Perceived caregiving burden tends to decrease African American women’s work performance (beta=-0.23, p<.001), resulting in decreased income status (beta=-2.53, p=.012). Policy makers, employers, and service providers can use this study’s findings to better understand how perceived caregiving burden among employed caregivers is associated with their work performance and economic well-being. In particular, findings point to the need for programs and services that reduce undesirable effects of perceived caregiving burden on work performance and minimize decreases in economic well-being among employed African American women.

### HEALTH STATUS BY NATIVITY AND LENGTH OF STAY IN THE U.S. AMONG OLDER INDIVIDUALS: TESTING DIFFERENT PERSPECTIVES

S. Choi, *Department of Social Work, State University of New York, Binghamton, Binghamton, New York*

This study compares health status of older adults by nativity (U.S.-born vs. foreign-born) and length of stay in the U.S. using four different health care measures. A “healthy immigrant effect” has been empirically supported among young immigrants. However, studies are inconclusive regarding late-life immigrants. Using three waves of data from the Second Longitudinal Study of Aging (1994-2000) and the linked mortality file, this study compared 1) chronic health conditions (yes/no for 10 conditions; the number of conditions (0-10)); 2-3) longitudinal trajectories of the number of functional impairments in ADL and IADL (0-13) and self-rated health; and 4) mortality through 2002 between three groups (age 70+) - 1) late-life immigrants with less than 15 years of residence in the U.S. ( n=133); 2) older foreign-born individuals with 15+ years in the U.S. (n=672); and 3) the U.S.-born (n=8,642). Logistic and Poisson regression, Hierarchical Generalized Linear Modeling, and survival analysis (Kaplan-Myer and Cox proportional hazard models) were used. First, after controlling for demographic variables, late-life immigrants were less likely to suffer from osteoporosis and cancer and demonstrated lower numbers of chronic conditions compared to their U.S.-born counterparts. Second, the U.S.-born and longer-term immigrants reported better self-rated health over time, as well as lower numbers of functional impairments compared to late-life immigrants. Finally, late-life immigrants were associated with longer survival time and lower hazards of mortality over time. In conclusion, a healthy immigrant effect was only partially supported among older adults depending on the health status measure selected.

### HEALTH DECLINES AND WEALTH TRAJECTORIES: A LONGITUDINAL ANALYSIS AND EXPLORATION BY RACE

L.A. Sullivan, T. Meschede, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

This study investigates the impact of negative health events on life cycle savings and wealth building and assesses differential effects by race. The analysis reveals the ways in which health declines can influence long-term savings trajectories as households approach and enter into retirement. Using over twenty years (1984-2007) of longitudinal data from the Panel Study of Income Dynamics (PSID), a sample of self-assessed healthy working age (25-55) and employed adults was selected and followed across 8 waves to better understand long-term wealth building trends across the life course. By selecting initially healthy, working households, our identification strategy helps to address endogeneity concerns and presents a new approach to the study of health and wealth as households age. Throughout each year of the study, households with heads who have poor health have significantly lower mean wealth ($p<.0001$) than households with heads in better health. By 2007, study sample households with healthy heads had on average \$133,040 in greater net financial assets (wealth not including home equity) compared to the wealth of households in poor health: \$326,254 versus \$193,215 ($p<.0001$). Analysis by race reveals that health status is significantly related to wealth for whites, but not for African-Americans. Unhealthy white households hold 50 percent fewer financial assets, than their healthy peers in 2007 (mean=\$235,156, $p=0.001$); however, health is not a significant factor in determining the wealth of African-Americans, who hold very few assets (mean = \$72,693, $p=0.50$). Pooled time-series analyses further test the long-term impact of health on wealth.

## SESSION 2310 (PAPER)

## END OF LIFE AND PALLIATIVE CARE II

### CARE COORDINATION AND TRAJECTORY OF ILLNESS FOR END-OF-LIFE MEDICARE BENEFICIARIES

I. Chan, S. Shen, L. Alecxih, *The Lewin Group, Falls Church, Virginia*

Similar to the general population, among decedents, a small proportion of high spenders constitutes a large proportion of spending. While studies show that most people want to die at home and minimize care transitions at end-of-life, this high-spending subgroup of decedents has trajectories of multiple settings changes and illness deterioration. Longitudinal analysis was performed on 1,195 decedents for three years from the Medicare Current Beneficiary Survey. Analysis on the top 10% of spenders found that top decile spending decedents spent five times what others spent in the last year of life (LYOL) because their service mix is significantly different. High-spending decedents spent seven times as much on hospitalization and six times as much on post-acute services compared to lower-spending decedents, but had shorter hospice stays. About 73 percent of high-spending decedents had three or more inpatient admissions in the years leading up to LYOL. Among the lower-spending group, 21 percent had three or more inpatient admissions. Health trajectories compound the difficulty of death for high-spending decedents. The high-spending decedents have a drastic development of new chronic conditions and ADLs—half of higher-spending decedents reported a new chronic condition in LYOL. Our closer look shows considerable variation in spending within the decedent population, and the variation appears to be associated with health and utilization trajectories. The question now is how to execute decedent care to meet their needs in symptom management and quality of care. The analysis suggests that end-of-life care coordination requires flexibility for trajectories of escalating conditions.

### A STATEWIDE STATUS REPORT ON HOSPITAL-BASED PALLIATIVE CARE PROGRAMS

A.P. Glass, M. Burgess, *University of Georgia Institute of Gerontology, Athens, Georgia*

A decade ago, the palliative care (PC) movement was in its infancy. There is increasing evidence that PC has much to offer to improve end-of-life care, especially for frail older patients, but how is it progressing? In order to determine the current status of hospital-based PC programs in one southern state, a survey of 128 hospitals on Georgia's Medicare.gov listing was conducted. Of these, 24 (19%) reported having a PC program: 15 large (300+ beds), seven mid-sized (50-300 beds), and two small hospitals (<50 beds), comprising 50%, 10%, and 7% by respective hospital category. Only one program was in a for-profit hospital. This total was less than the number reporting PC in an earlier state-by-state report card (Morrison, Dietrich, & Meier, 2008), which identified 33 PC programs among 103 hospitals, and these percentages are below their national averages. A comparison with a current provider listing (getpalliativecare.org) shows 19 hospitals are included on both lists, 11 hospitals on the website directory reported no PC in the current survey, and five hospitals not on that list now report offering PC. Additionally, PC program representatives in the current study were asked to complete a survey to assess their accordance with recently established national consensus guidelines (Weisman & Meier, 2008). Most PC programs do not yet have a board-certified PC physician, and in-patient units are rare. Overall, results show that the spread of PC has been slow in this state and there is a need for increasing awareness and education about PC.

### IS NURSING HOME PROFIT STATUS ASSOCIATED WITH INNOVATIONS IN ADVANCE DIRECTIVES?

J.A. Davis, *Management and Marketing, The University of Alabama, Tuscaloosa, Alabama*

End-of-life (EoL) care continues to undergo ongoing evolution as service providers and other groups seek improved instruments for individuals to convey their last wishes. Three such instruments that have increased in prominence are Five Wishes, Physician Order for Life-Sustaining Treatment (POLST), and Last Acts. Each of these programs offer a unique advantage over many of the traditional advance directives, thus each may represent an innovation in way EoL wishes are communicated. However, the presence or use of these innovations varies by numerous organizational characteristics. One important organizational characteristic that has been shown to impact innovation is the ownership status of the nursing home. There is a rich body of research suggesting that for profit (FP) nursing homes behave quite differently than not-for-profit (NFP) nursing homes and this difference manifests on numerous levels. The purpose of this project is to explore the relationship of profit status to innovative instruments used to communicate EoL wishes. Data for this project comes from the 2004 National Nursing Home Survey (NNHS). After removing observations with missing data, the final unweighted sample consisted of 929 nursing homes. The results of the Poisson regression revealed that FP/Freestanding nursing homes, nursing homes with medical directors who had EoL training, those that offered in-house hospice care, those with certain characteristics associated with culture change, and those with more registered nurses per patient day were more likely to offer EoL innovations. Thus, nursing home ownership is associated with EoL innovations. However, the utilization of these innovations remains woefully low.

## SESSION 2315 (PAPER)

## HEALTH INTERVENTIONS ACROSS DIVERSE SETTINGS

### PRACTICE MAKES PERFECT?: FACILITY VOLUME EFFECT ON TIME TO DISCHARGE AMONG HIP FRACTURE PATIENTS

P.L. Gozalo[1], N. Leland[1], J.M. Teno[1], J. Bynum[2], T. Wetle[1], V. Mor[1], *1. Community Health, Brown University, Providence, Rhode Island, 2. Dartmouth University, Lebanon, New Hampshire*

Objective: While volume of admissions leads to improved outcomes in acute care hospitals, the volume effect is unknown for skilled nursing homes (SNF). We compared Medicare Beneficiaries' outcomes when admitted to NH with higher vs. lower volume of rehabilitation. Population Studied: Medicare Beneficiaries 75 and older who experienced initial surgery for hip fracture between 1999 and 2006, discharged to nursing home (NH) for rehabilitation. Subjects were excluded if they enrolled in manage care, hospice, or resided in NH at the time of the hip fracture. Methods: A multivariate model that accounted for censoring due to death or discharge to an inpatient rehabilitation facility tested the association of SNF hip fracture admission volume with the time to NH discharge after adjusting for age, gender, race, year, and hospital LOS. Results: During the 8 years, 50% of NH were low volume (1-15 admissions), 25% medium volume (16-43 admissions), and 25% were high volume (44-918). The median days in the NH before discharge to the community were 36, but it varied by hip fracture volume: 52 (low) 49 (medium) and 33 (high). Relative to SNF patients in a low volume facility, those in a medium volume SNF had a 12% higher probability of being discharged within a year (HR 1.12, 95%CI 1.09-1.15), while those in a high volume SNF had a 64% higher probability of being discharged within a year (HR 1.64, 95%CI 1.60-1.67). Conclusions: The volume of hip fracture admissions to a NH is associated with an early transition to home.

### IMPLEMENTATION OF A HEART FAILURE MANAGEMENT PROGRAM IN SKILLED NURSING FACILITIES TO IMPROVE TRANSITIONS IN CARE

M.A. Dolansky[1], J. Hitch[1], I. Pina[1], R.S. Boxer[2,1], *1. Nursing, Case Western Reserve University, Cleveland, Ohio, 2. University Hospitals of Cleveland, Cleveland, Ohio*

Approximately 30% of heart failure (HF) patients are discharged to skilled nursing facilities (SNF) following hospitalization as a transition from hospital to home. The purpose of the study is to evaluate the implementation of an interdisciplinary HF management protocol in two inner city free standing SNFs. The HF protocol consists of nursing HF management standing orders (identification of HF signs and symptoms, risk assessment, documentation of left ventricular function, guideline medication management, and weight monitoring) and organizational tools to implement and sustain the protocols (HF patient log and tracking binder, assignment of HF champions, weekly HF rounds, and audits). Implementation success was monitored weekly for 4 months and monthly for 5 months. During the weekly audits, cycles of coached improvement were implemented. After the first 4 months, the weekly audits indicated that the protocols were adhered to 77.5%. Nursing orders that were not adhered to were filling out additional forms (47%) and interdisciplinary rounds (19%). During the next 5 months, monthly audits indicated that protocol adherence dropped to 60%. Difference between the sites were significant as site 1 had a 47% adherence and site 2 had a 80% adherence. Four key elements emerged as necessary for success; interdisciplinary champions, coached implementation, multiple cycles of change, and supportive leadership. Barriers consisted of high staff turnover and hierarchal SNF culture. Instituting a program of staff education, HF management protocols, and self-sustaining management tools may greatly enhance the care of patients with HF and decrease the risk rehospitalization.

### THE TECHNOLOGY AND AGING PROJECT (TAP): OUTCOMES FROM A RANDOMIZED FIELD TRIAL

A.T. Woodward[1], P.P. Freddolino[1], C. Blaschke-Thompson[1], D.J. Wishart[2], M. Fox[2], L. Bakk[1], R. Kobayashi[1], *1. School of Social Work, Michigan State University, East Lansing, Michigan, 2. Otsego County Commission on Aging, Gaylord, Michigan*

There is increasing evidence that use of information and communication technologies (ICTs) can improve the physical and mental health of older adults by enhancing social support and psychosocial well-being. Although rates of ICT use among older adults are increasing, they are still below other age groups in the US. The absence of good training opportunities is one reason for this difference. The Technology and Aging Project attempts to address this barrier by evaluating a training program in ICT use provided to adults aged 60 and older in a rural county in Northern Michigan. The study randomly assigned 45 participants to an experimental group that participated in a six-month training program and 38 to a control group. Data were collected at baseline, 3 months, 6 months, and a 9-month follow-up. Data includes measures of loneliness, depression, quality of life, social networks, perceived social support, computer self-efficacy and the use of various ICTs. Analysis was conducted using mixed regression models. Compared to the control group, the experimental group reported a greater overall increase in computer self-efficacy, the number of ICTs used, and the proportion of their network they communicated with by email, instant messaging, and Skype. The experimental group also reported a greater increase in the number of people in their social network and in the social support they received from their network, particularly from friends. These results support previous research suggesting that older adults can and are willing to learn how to use ICTs in the appropriate setting.

### INFLUENZA VACCINATION AND ABSENTEEISM AMONG NURSING HOME STAFF

M.K. Lin, B.Y. Lee, *Health Policy & Management, University of Pittsburgh, Pittsburgh, Pennsylvania*

Researchers at the Pennsylvania Department of Health and University of Pittsburgh developed a survey to be administered at the end of the 2008-2009 influenza season. This survey was sent to 56 facilities participating in a program to receive free influenza vaccination doses supplied by a vaccine manufacturer. Among the key measures of effectiveness, comparative influenza vaccination rates and employee absenteeism rates were collected. Researchers asked the survey respondent to describe their facility's vaccination policies, and their perceptions regarding barriers and facilitators to influenza vaccination among employees. Results: Among the facilities that participated in the free vaccination program, approximately half (49%) reported that vaccination rates among employees increased, and only a few (5%) reported that vaccination rates decreased from 2007-2008 to 2008-2009. No facilities reported that absenteeism increased, and 33% reported that it decreased. Only 16% of facilities require that their staff provide documentation of vaccination, and only 27% of the facilities participating in the vaccination program reported having a formal policy for visitors. Conclusions: Offering free influenza vaccinations to nursing facilities is an effective way to increase the receipt of influenza vaccination among nursing home staff. However, simply offering free vaccinations may not be sufficient to protect regular employees and residents from contracting influenza due to issues regarding actual receipt of a vaccination, the effectiveness of a particular vaccination, and the presence of visitors and agency staff. Participants reported that policymakers should prioritize educational awareness programs over alternative options, such as offering free vaccinations or creating regulatory requirements.

### NIGHTIME URINATION, AGEING AND SLEEP DISTURBANCE: STRATEGIES AND ADJUSTMENTS

S. Venn, S. Arber, *Department of Sociology, University of Surrey, Guildford, United Kingdom*

Objectives Going to the toilet frequently in the night is a commonly reported cause of sleep disturbance among older people, which impacts on quality of sleep and daytime functioning. Yet older people often do not seek help for nighttime urination as it is regarded as part of the normal ageing process by both the medical community and older people themselves. This paper will examine older people's strategies for coping with nighttime urination. Methods Data is presented from 76 community dwelling men and women aged 65-95 with poor sleep in SE England. Respondents completed detailed sleep and activity diaries over a 24 hour period for 14 days, along with rating sleep quality. In-depth interviews were also undertaken (n=61). Results Respondents reported varying frequencies of going to the toilet, ranging from once a night to three or four times a night. Results indicate that those respondents who were aware of possible causes of urination, such as consuming drinks prior to bedtime, often failed to make adjustments to those behaviours. Adjustments that were made included avoiding any fluid intake for several hours before bedtime. Conclusion Respondents expected an increase in nighttime urination as part of the 'normal' ageing process yet often adopted strategies that may actually increase sleep disturbance. Targeted advice on coping with nighttime urination may contribute to older people either seeking professional help, or undertaking more appropriate strategies. Research supported by the New Dynamics of Ageing initiative, a multidisciplinary research programme supported by AHRC, BBSRC, EPSRC, ESRC, MRC (RES-339-25-0009).

## SESSION 2320 (PAPER)

## HOUSING, NURSING HOMES, AND RESIDENTIAL CARE IV

### WHOSE CHOICE IS IT ANYWAY? INDEPENDENT LIVING AND AGEING IN PLACE IN QUESTION

S. Hillcoat-Nalletamby, J. Croxall, *School of Human and Health Sciences, Centre for Innovative Ageing, Swansea University, Swansea, Wales, United Kingdom*

UK policy makers increasingly emphasize the importance of facilitating ageing in place and independent living for older people to ensure their wellbeing. This policy drive partly stems from research showing that their preferred option is to live at home for as long as possible rather than move to a residential or institutional setting. It therefore becomes increasingly difficult to question the premise that the home environment is best suited to meeting later life needs. This poster offers a critical perspective to this policy drive, with a view to understanding what "independence" itself may mean to older people, and the risks that promoting ageing in place may represent for certain social groups. Qualitative findings from a Welsh study on older people's care needs gathered from three different settings, extra-care facilities (N=59 participants), residential homes (N=66 participants) and the community (N=59 participants) are presented. We have examined how older people aged 60 or more and receiving some form of care in each setting, perceive their sense of independence, and what their motives have been for their choice of residential setting. Results suggest that motives are multiple, that risks of social isolation, as well as enhanced feelings of social inclusion can occur in both residential and community settings and that independence takes on a myriad of meanings. We interpret findings in relation to theories of structured dependency and humanist, post-modern perspectives which argue for the diversity of meanings and experiences in later life.

### THE IMPACT OF SMALL-SCALE LIVING IN THE NETHERLANDS AND BELGIUM: TRIANGULATION OF DATA ANALYSIS

A. De Rooij[1], K. Luijkx[2], A. Declercq[3], J. Schols[4], *1. Tilburg University / Tranzo / De Wever, Tilburg, Europe, Netherlands, 2. Tilburg University / Tranzo, Tilburg, Europe, Netherlands, 3. Catholic University Leuven / Lucas, Leuven, Europe, Belgium, 4. Maastricht University / CAPHRI, Maastricht, Europe, Netherlands*

Introduction The considerable increase of the number of people suffering from dementia implies an increasing demand for residential care. At the same time, transformations to more homelike environments are taking place. The rapid expansion of small-scale living facilities is not accompanied by sufficient scientific evidence about the effect of these facilities. This study addresses the following question: What is the impact of small-scale living arrangements on quality of life of residents with dementia in Belgium and the Netherlands, compared to similar residents in regular nursing home wards. Methods and materials With a time interval of 1 year data were gathered from 67 residents of small-scale living facilities and 61 residents of regular nursing home wards about quality of life, Activities of Daily Living, neuropsychiatric and depressive symptoms, use of psychotropic medication and social engagement. To reach triangulation of data analysis, the data were analyzed using a Qualitative Comparative Analysis (QCA; crisp set analysis) and using regression analysis, to explore what configuration of characteristics leads to maximum quality of life. Results The paper will show that qualitative and quantitative analyses of the same data provide congruent results. It reveals under what circumstances demented residents reach maximum quality of life scores, and differences between the Netherlands and Belgium. Conclusion After attending this session participants will have insight into the outcome differences between small-scale living facilities and regular residential care on older people with dementia. Furthermore, participants will get methodological information on the complementarities of QCA and regression analysis.

### DO THEY MEAN WHAT WE MEAN? DIFFERING INTERPRETATIONS OF TERMS IN NURSING HOME RESEARCH AND POLICY

D. Tyler[1], R.R. Shield[1], M. Rosenthal[2], S. Miller[1], T. Wetle[3], M. Clark[1], *1. Center for Gerontology, Brown University, Providence, Rhode Island, 2. Rutgers University, New Brunswick, New Jersey, 3. Brown University - Public Health Program, Providence, Rhode Island*

Purpose: Cognitive-based testing of surveys has not been standard practice in nursing home (NH) research. Many terms used in the literature do not have standard definitions and may be understood or interpreted differently by researchers, research subjects, and policymakers. The purpose of this study was to use cognitive-based testing to determine how Directors of Nursing (DON) and NH Administrators (NHA) understand and interpret terms and concepts commonly used in NH research and policy. Methods: Using existing survey questions with established validity and reliability and input from experts, we developed questionnaires to be administered to DONs and NHAs. Cognitive-based interviews using focused probing methods were conducted with 50 participants. Detailed notes were taken during all interviews and two researchers independently coded these notes for key themes and important points of divergence in the interpretation and/or understanding of terms and concepts. Results: Many terms and concepts routinely used by NH researchers and policymakers, such as "direct-care workers" and "resident-centered care", are not uniformly interpreted by those managing NHs. At times, two different professionals working in the same NH had different understanding of key terms and concepts. For example, respondents' definitions of "direct-care workers" ranged from nursing assistants to broader categories of clinical and other staff members. Implications: Our results may help explain discrepant findings across NH studies. They also clarify the necessity of cognitive testing for survey development and have important implications for policy decisions.

For example, reimbursement pass-throughs intended to increase direct-care staffing could be affected by differing understanding of this term by policymakers and NH managers.

### THE VIEW FROM HERE: A COMPARISON OF FRONTLINE WORKER AND MANAGER PERCEPTIONS OF NURSING HOME SAFETY CULTURE

J. Meagher[1], B. Kitch[2], *1. Brandeis University, Waltham, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts*

Nursing home quality and safety has been a cause for concern for over three decades. It is estimated that medication errors occur in nearly one in five medication doses in nursing homes. A recent trend in quality and safety improvement is to learn from high-reliability organizations (HROs), or those with complex processes and high risk for failure but very low error rates. A common feature of HROs is a culture that prioritizes and supports proactive safety. Nursing home researchers and administrators have begun to examine the extent to which long term care facilities support safety and identify weaknesses in their cultures in order to improve quality of care. Because the majority of nursing home resident care is delivered by an entry level workforce, the buy-in of these workers to a culture of safety is critical. Using exploratory survey data collected from eight nursing homes in Massachusetts, this analysis examines the extent to which the frontline workforce, comprised of Certified Nursing Assistants (CNAs), perceives a culture of safety in their organizations. This study also compares CNA and manager opinions about safety culture in order to understand how perceptions of culture differ across organizational hierarchy. Results show that responses from the two groups differed significantly on nearly half of all survey items. CNAs had a consistently more negative perception of safety culture compared to management, particularly regarding communication and feedback. These findings suggest potential challenges lay ahead for developing a culture that supports proactive resident safety.

## SESSION 2325 (SYMPOSIUM)

### INCREASING CAPACITY FOR CAREGIVING THROUGH PARTNERSHIPS

Chair: *D.J. Sheets, School of Nursing, University of Victoria, Victoria, British Columbia, Canada*
Co-Chair: *M. Marcus, Harry and Jeanette Weinberg Foundation, Inc., Owings Mills, Maryland*
Discussant: *G. Alkema, The SCAN Foundation, Long Beach, California*

An $8 million, 3 year initiative funded by the Harry and Jeanette Weinberg Foundation was launched in September 2009 to support development of community partnerships and innovative approaches to support family and informal caregivers. This was one of the first initiatives in the nation to focus on family caregivers rather than the care recipient. This symposium highlights the implementation and evaluation of three of the programs developing innovative community partnerships. The Transitions in Caring collaborative links caregiver support programs in four rural counties of Western New Hampshire and is building community capacity to support caregivers of older adults through a person-centered, caregiver focused model. The Asian Pacific Islander Dementia Care Network (APIDCN) in Los Angeles is establishing a service network with carefully selected partners which is designed to provide culturally appropriate and comprehensive access to services. A third presentation focuses on the Caregiver Ombudsman Outreach Program (The Co-Op), a collaboration of eight community-based agencies and a School of Social Work. The Co-Op is training a cadre of indigenous case managers in underserved neighborhoods of Northern Manhattan to identify caregivers of older adults and link them to available resources and information, thus supporting the independence of older adults in the community. Evaluation includes assessing the impact of a wiki tool being used to create a database and website of caregiver health and psychosocial resources in the area. All presenters will describe implementation successes and challenges, using examples from the first year of program evaluation.

### THE CAREGIVER OMBUDSMAN OUTREACH PROGRAM (THE CO-OP): AN INNOVATIVE APPROACH TO SUPPORTING CAREGIVERS AND THEIR FAMILIES

C.R. Gelman[1,2], T.A. Sokoloff[2], E. Alvarado[2], C. Greer[3], *1. Hunter College School of Social Work, New York, New York, 2. Isabella Geriatric Center, New York, New York, 3. New York University, New York, New York*

The Caregiver Ombudsman Outreach Program (The Co-Op) is a collaboration of eight community-based agencies and a School of Social Work to train a cadre of indigenous case managers in underserved neighborhoods of Northern Manhattan to identify caregivers of older adults and link them to available resources and information, thus supporting the independence of older adults in the community. The expectation is that this training of community members will build community capacity, reduce caregiver burden, promote strategic use of existing programs, and identify gaps in services. A wiki format will be used to create a database and website of caregiver health and psychosocial resources in the area. The evaluation of the impact of the Co-Op through focus groups eliciting the experience of caregivers served and of the ombudspeople providing the service are described. Other evaluation methods to assess the outcomes of the program on caregiver well-being are also discussed.

### COMMUNITY PARTNERSHIPS TO SUPPORT CAREGIVERS IN RURAL NEW HAMPSHIRE

S. Fox, *Institute on Disability, University of New Hampshire, Concord, New Hampshire*

The Transitions in Caring initiative links caregiver support programs in four rural counties of Western New Hampshire and features intensive caregiver training and respite care for the caregiver and care-recipient. This collaborative is building community capacity to support caregivers of older adults through a person-centered, caregiver focused model. Community Asset Mapping is being conducted to identify and build on existing volunteer networks, including faith based communities. A unique aspects of this initiative is the mentoring partnership between 2 more experienced counties who are sharing their service delivery expertise with two adjoining counties to develop the capacity to support family and informal caregivers living in rural areas. This paper discusses implementation and evaluation of this model for addressing the needs of rural caregivers.

### ASIAN PACIFIC ISLANDER DEMENTIA CARE NETWORK (APIDCN): SERVICES FOR CAREGIVERS (ALZHEIMER'S ASSOCIATION)

K.G. Kietzman, *1. Partners in Care Foundation, San Fernando, California, 2. Health and Aging Policy Fellow, Washington, District of Columbia*

The Asian Pacific Islander Dementia Care Network (APIDCN) in Los Angeles seeks to improve knowledge and increase access to culturally sensitive support services that reflect the values and traditions of Asian populations. Asian elders are less likely to receive a timely diagnosis of Alzheimer's Disease resulting in limited access to early intervention. Additionally, family caregivers of Alzheimer's patients are reluctant to seek assistance from non-family members, due, in part, to perceived shame in relation to the disease. To address the multitude of needs experienced by families, a service network was developed with partners including the Alzheimer's Association, Little Tokyo Service Center, Chinatown Service Center, Asian Pacific Health Care Venture, Los Angeles Caregiver Resource Center, and Bet Tzedek (legal aid). This paper describes the development of the APIDCN, with specific attention given to the challenges of program evaluation of the diverse and often non-English speaking caregivers enrolled in network services.

## SESSION 2330 (SYMPOSIUM)

### NEW RESEARCH ON RESIDENT CHARACTERISTICS, PROGRAM OUTCOMES, AND POLICIES IN LOW-COST HOUSING

Chair: *P. Carder, Institute on Aging, Portland State University, Portland, Oregon*
Co-Chair: *C. Levine, U.S. Department of Housing and Urban Development, Washington, District of Columbia*
Discussant: *J. Pynoos, University of Southern California, Los Angeles, California*

This symposium presents new research on the need for and outcomes of programs designed to support individuals, especially those with low incomes, as they age in the places where they live. Housing settings that offer low-cost options are explored: multi-family subsidized housing, NORCs, and manufactured home parks. The papers reflect recent research on resident characteristics and service programs. The Golant et al paper offers a theory-driven conceptual framework by which to organize and assess current knowledge regarding the quality of the assistance and services found in "affordable clustered housing-care." Vladeck el al present the development and analysis of a structured instrument to identify health risk factors and interventions for NORC residents. Cotrell describes findings from a needs assessment of 130 residents of a publicly-subsidized high rise building. Stone et al present findings from an evaluation of a pilot program to support families who are care partners for older adults in subsidized housing. Tremoulet presents a policy analysis of the effects of mobile home park closures on older persons. The common theme across these papers is how both needs and program outcomes vary by the racial and ethnic profiles of resident populations and the outcomes that result from the relationship between the health and service characteristics of resident populations and the availability of services. Such research is critical to states, local jurisdictions and housing and service providers as they respond to the aging of the current population and to the projected shortage of affordable housing in the future.

### AGING IN PLACE IN MANUFACTURED HOME PARKS: REWARDS AND RISKS

A. Tremoulet, *Institute on Aging-IOA, Portland State University, Portland, Oregon*

Manufactured home parks are one of the least-studied settings where older adults of modest means age in place. This Oregon-based case study profiles the rewards and risks associated with aging in place in this setting. Data from the 2005 Oregon Population Survey are used to profile the characteristics of park residents in the state. Findings from six focus groups conducted with park residents statewide provides insights about why older residents choose this setting and hope to live the rest of their lives there. But when parks close, residents lose more than just a place to live. The risk of this residential stetting is analyzed by examining the impacts of the closure of a 270-unit park on its older residents. Participants will leave this session with a greater understanding of both the benefits and the drawbacks of this housing form as a setting for aging in place.

### ASSESSING THE QUALITY OF HEALTH AND SUPPORTIVE SERVICES IN AFFORDABLE CLUSTERED HOUSING-CARE ARRANGEMENTS: JUSTIFYING FUNDING FROM THE PUBLIC AND NONPROFIT SECTORS

S. Golant[1], P. Parsons[2], P. Boling[2], *1. Geography, University of Florida, Gainesville, Florida, 2. Virginia Commonwealth University, Richmond, Virginia*

Purposively planned or adapted affordable community-based housing arrangements now accommodate low and modest income older persons who have functional limitations and chronic health illnesses. Referred to as "affordable clustered housing-care," these housing arrangements introduce various physical infrastructure and dwelling design changes, and make available supportive and health-related services that enable their vulnerable older occupants to live independently and manage their health problems. Many of these housing arrangements are federally subsidized, rent assisted, multiunit apartment projects with low-income older occupants who have aged in place. Drawing on the work of Donabedian, this paper constructs a theory-driven conceptual framework by which to organize and assess our current knowledge regarding the quality of the assistance and services found in these housing-care settings. Such evaluations are essential to justify organizational and funding support from the public and nonprofit sectors and to encourage the participation of housing and service providers.

### REDUCING HEALTH RISKS OF OLDER ADULTS LIVING IN LOW AND MODERATE INCOME HOUSING DEVELOPMENTS: IMPLEMENTATION OF THE HEALTH INDICATORS IN NORC PROGRAMS INITIATIVE

F. Vladeck[1], M. Oberlink[2], *1. United Hospital Fund, New York, New York, 2. Visiting Nurse Service of New York, New York, New York*

This paper describes Health Indicators in Naturally Occurring Retirement Community (NORC) Programs, a web-based, community-sensitive, data collection tool used by the NORC programs of New York City Department for the Aging to identify several key risks to healthy aging (access to care, use of prevention and health promotion services, and management of chronic conditions and falls risks) among more than 5,000 older adults living in public and private low and moderate income NORCs. Findings include striking geographic differences in health status and risks and identified health disparities along racial and ethnic lines. Armed with the results of a 75-item questionnaire that takes 15 minutes to administer and is based largely on the BRFSS and AdvantAge survey instruments, NORC programs are now able to target diabetes, heart disease, and falls risk sub-populations with comprehensive risk-reduction interventions to improve the health status of older adults in their communities.

### USING STRUCTURED ASSESSMENT TO PLAN SERVICES FOR ETHNICALLY DIVERSE RESIDENTS OF A SUBSIDIZED APARTMENT BUILDING

V. Cotrell, P. Carder, *Institute on Aging, Portland State University, Portland, Oregon*

This paper describes a structured resident needs assessment that was developed and used to assess the health-related status of 130 older residents of a subsidized high-rise apartment building. The goal was to identify appropriate supportive services to meet the needs of individuals who wanted to age in place. Findings indicate that the residents are diverse, with 5 language groups identified (English, Mandarin Chinese, Cantonese Chinese, Russian and Farsi). A sizable number of individuals were found to either exhibit functional losses that required assistance or were struggling to maintain independence. A significant difference in health status and behavior was found between the ethnic groups. The findings are being used to guide the property owner's decisions about service provision. Such an assessment is useful in identifying the complex causes of functional loss before those losses lead to excess dependency, resulting in the need for increased health service use or institutional care.

### FAMILY CAREGIVER SUPPORT IN AFFORDABLE SENIOR HOUSING

R. Stone[1], A. Sanders[1], R. Meador[2], V. Parker[3], *1. AAHSA, Washington, District of Columbia, 2. Cornell University, Ithaca, New York, 3. Boston University, Boston, Massachusetts*

This presentation will profile the development and pilot of a training program for family caregivers of older adults residing in affordable, independent senior housing communities. The program's goal is to help strengthen the knowledge, skills and capacity of residents' family caregivers and to build partnerships between the family members and the property, thereby enhancing their collective capacity to support the residents' ability to remain safely in their apartment. Data gathered through a resident self-assessment survey, focus groups with family caregivers and residents, and interviews with property staff to understand the nature and degree of family care giving occurring in affordable senior housing properties and to inform the content of the program curriculum will be presented. Results of the program pilot in three affordable housing will also be shared.

# SESSION 2335 (PAPER)

## RESEARCH METHODOLOGY

### SELF-MANAGEMENT IN CHRONIC ILLNESS: A REVIEW ON THE PERSPECTIVE OF ELDERLY LIVING ALONE

J. Haslbeck[1], R. McCorkle[3], D. Schaeffer[2], A. Büscher[2], *1. Careum Patientenbildung, Careum Foundation, Zurich, Switzerland, 2. Bielefeld University, Bielefeld, Germany, 3. Yale University School of Nursing, New Haven, Connecticut*

BACKGROUND: Elderly living alone with chronic conditions are considered vulnerable as they have few resources and/or social support for chronic illness management. So far, they have received limited attention in the debate on self-management support in chronic illness. AIMS: The purpose of this on-going study is to fill this gap by providing insight into needs and abilities of elderly living alone with chronic conditions. METHODS: Evidence on the perspective of elderly living alone with chronic conditions has been systematically examined in an integrative review. 173 articles relevant on the topic were identified and using inclusion criteria, so far, 27 studies were retained into the review. FINDINGS: A growing number of studies address the views of those living alone and how they manage chronic illness. Yet, the evidence is spreading across journals and databases, is poorly indexed and terms are inconsistently used. The group of elderly living alone is heterogeneous and complex, varying in terms of age, gender, socio economic status, diseases, living location, or ethnicity. Studies show various efforts of active engagement used by elderly living alone, symbolizing a struggle to remain independent. DISCUSSION: Living alone in later life with chronic illness is increasingly recognized as relevant. Elderly living alone appear to be often frail and homebound, but they have an active role in chronic illness self-management. Because of the heterogeneity and complexity of this group, there is a need to increase awareness, risk assessment and responsiveness amongst health professionals.

### COMMUNITY OF RESIDENCE HELPS EXPLAIN VARIATIONS IN BLOOD PRESSURE AND BODY MASS INDEX IN MEXICO

F. Wheaton, E. Crimmins, *University of Southern California, Los Angeles, California*

Mexico is characterized by substantial regional and local inequalities in level of development. Differences in infrastructure and affluence between communities are hypothesized to contribute to later life health disparities net of individual characteristics. We use data from the 2002 Mexican Family Life Survey (MxFLS). The analytic sample includes 4,606 respondents aged 50 years or older distributed across 154 communities. We estimated OLS regression models with and without community fixed effects to determine if accounting for community of residence explained additional variation in systolic and diastolic blood pressure and body mass index, above and beyond individual-level variables, such as age, sex, and socioeconomic status (SES). Results showed that the addition of community fixed effects substantially increased the proportion of variance explained in the outcome as measured by the R2 statistic. The individual-level model including only age, sex, years of education, and presence of an indoor toilet (a proxy measure of SES) explained only 1% of the variation in systolic blood pressure and 4.9% of the variation in diastolic blood pressure, compared with 9.7% and 13% of variation explained by the model that additionally controlled for community. Similarly, the explained variance increased from 10% to 18.3% in the BMI regression model. Controlling for differences in community of residence also accounted for some of the association between SES and health. These results suggest that community-level factors are significantly associated with health in later life in Mexico. Further work is needed to identify which features are most consequential to health at older ages.

### AN EXAMINATION OF THE MEASUREMENT ADEQUACY OF THE CES-D SCALE AMONG AFRICAN AMERICAN WOMEN FAMILY CAREGIVERS

P.A. Rozario[1], N. Menon[2], *1. School of Social Work, Adelphi University, Garden City, New York, 2. Fordham University, New York, New York*

Background and Purpose: Researchers studying caregiver distress have typically focused on depressive symptoms and have extensively used the Center for Epidemiologic Studies Depression Scale (CES-D) to assess depressive symptoms. While the CES-D has high internal consistency, many researchers have questioned its adequacy for use among different racial/ethnic groups because of its factor invariance. Method: We used data from a cross-sectional study of 521 urban and rural African-American women family caregivers in a mid-Western state. We conducted item-by-item description and item-total correlations of a modified 18-item CES-D Scale. Following Perreira et al. (2005), we performed nested confirmatory factor analyses (CFA) using the maximum likelihood method (MLE), to examine the dimensionality of the CES-D by testing four different measurement models. Given that the CES-D items were ordinal in nature, we re-estimated the four CFA models using weighted least squares (WLS) estimation. Results: While we found support of the statistical superiority of the four-factor CFA model over the other models, the results also indicate poor fit indices with MLE estimation. Using WLS estimation, we found that the four-factor CFA model is a better fit than the single-factor and one three-factor (Positive Affect) CFA model. At the same time, we also find that the three-factor (Somatization) model is statistically equivalent to the four-factor model. Conclusions and Implications: Our study findings point towards the limitations of considering depression as a one-dimensional construct, especially among African-American female caregivers. Our analysis using the WLS suggests two equivalent measurement models of depression. We conclude with implications for future investigations of depression using CES-D with diverse populations.

### CREATING A QUALITY OF LIFE ASSESSMENT MEASURE FOR RESIDENTS IN LONG TERM CARE

M. Iris[1], N.A. DeBacker[2,1], R.C. Benner[1], *1. Leonard Schanfield Research Institute, CJE SeniorLife, Chicago, Illinois, 2. Feinberg School of Medicine Northwestern University, Chicago, Illinois*

One goal of long term care (LTC) is to maintain and enhance quality of life (QoL) for residents. However, because QoL is a complex concept, assessment can be difficult, especially in the presence of dementia. A full understanding of QoL requires empirical investigation of individual and collective views of various “stakeholders.” This project conceptualized QoL for LTC residents, created a visual map of the domain, and identified key indicators used to develop an assessment instrument. The project was conducted at a 240 bed, not-for-profit, religiously affiliated long term care facility. Fourteen stakeholder groups were convened, with residents, front-line staff, administrative staff, and family members, to brain-storm indicators of resident QoL. A final list contained 88 unique indicators. Next, a card sorting task was conducted to identify the component structures of the overall domain, along with a rating task that established the relative importance of indicators vis-à-vis one another. Using Concept Systems software, we generated a graphic, quantitative synthesis of participants' conceptualization of the field, expressed entirely in the language of participants, and showing key indicators and their relationships. Methodology includes principal components analysis, multidimensional scaling, and cluster analysis. Concept maps display relationships among components as well as the importance of each concept and its feasibility of measurement, using 3-dimensional representations. Results were used to develop a questionnaire to assess resident QoL in LTC, and to enhance staff training and education about QoL and its meaning to different constituents.

## SESSION 2340 (SYMPOSIUM)

### HELP SEEKING FOR DEMENTIA BY SOUTH ASIAN CANADIANS

Chair: *L. McCleary, Nursing, Brock University, St. Catharines, Ontario, Canada*

This study explored experiences of South Asian Canadians, Canada's largest visible minority group, prior to dementia diagnosis. Six persons with dementia and nine of their family carers described their early perceptions of dementia related changes; actions taken, including help seeking and diagnosis; and affective responses. Early signs were attributed to aging or personality. Even after prescription of cognitive enhancers, several family carers continued to believe that the dementia symptoms were "normal". Affective response may be related to carer attributions. Before seeking medical attention, family carers modified physical or social environments because of symptoms. Recognition of a health problem was influenced by safety, emergence of new symptoms following trauma, and treatment for other health problems. For some, family living outside the home or outside Canada were instrumental in recognizing a problem and convincing participants to seek medical attention. Help seeking was delayed up to two years, even with significant dementia symptoms.

### PRACTICE AND POLICY IMPLICATIONS OF THE CANADIAN CROSS-CULTURAL PATHWAYS TO A DIAGNOSIS OF DEMENTIA PROGRAM: FEDERAL AND PROVINCIAL PERSPECTIVES

N. Drummond[1], C. Cohen[2], S.D. Koehn[3], L.J. Garcia[4], J. Silvius[5], V. Emerson[6], W. Dalziel[7], L. McCleary[8], *1. Family Medicine, University of Calgary, Calgary, Alberta, Canada, 2. Sunnybrook Health Sciences Centre, Toronto, Ontario, Canada, 3. Providence Health, Vancouver, British Columbia, Canada, 4. University of Ottawa, Ottawa, Ontario, Canada, 5. Alberta Health Services, Calgary, Alberta, Canada, 6. Acuity Research, Ottawa, Ontario, Canada, 7. Ottawa Hospital-Civic Campus, Ottawa, Ontario, Canada, 8. Brock University, St Catharine's, Ontario, Canada*

Four independent but conceptually and methodologically linked projects investigated early problem identification and help-seeking by people with dementia and family caregivers in four Canadian cultural, ethnic or linguistic groups (Anglo-Canadian, French Canadian, South Asian Canadian and Chinese Canadian) in four major urban centres (Calgary, Ottawa, Toronto and Vancouver, respectively). This paper will analyse and interpret the data from those studies in the context of the local health and social systems applying in each centre, with a specific focus on the systemic similarities and differences between them, and the implications of those factors for both health policy and clinical practice. In addition, the paper will address the implications of the findings for federal policy development relating to ethnicity and care for seniors. Finally, the paper will place particular emphasis on the role of the not-for-profit, non-governmental and voluntary sectors in responding to early care needs of ethnic minority people with dementia.

### IS FRENCH THE ISSUE?: THE PATHWAY TO DIAGNOSIS OF FRENCH-SPEAKING CANADIAN INDIVIDUALS LIVING WITH EARLY DEMENTIA IN A MINORITY SITUATION

L.J. Garcia[1,3], V. Emerson[2,1], H. Léopoldoff[1,3], W. Dalziel[4,1], N. Drummond[5], S.D. Koehn[6], L. McCleary[7], *1. University of Ottawa, Ottawa, Ontario, Canada, 2. Acuity Research Group Inc, Ottawa, Ontario, Canada, 3. Elisabeth Bruyère Research Institute, Ottawa, Ontario, Canada, 4. Ottawa Hospital, Ottawa, Ontario, Canada, 5. University of Calgary, Calgary, Alberta, Canada, 6. Centre for Healthy Aging at Providence, Vancouver, British Columbia, Canada, 7. Brock University, St Catharines, Ontario, Canada*

In Ontario, health services must be made available in French to French-speaking citizens. To explore the experience of individuals with dementia (care recipients) and caregivers during the peri-diagnostic period, fourteen participants (7 care recipients and their caregivers) who spoke French as their primary language were recruited for this study. Completed interviews were transcribed verbatim and analyzed using open, axial and selective coding. Differences existed between care recipients' and caregivers' perceptions of the indicators leading to help-seeking. Caregivers identified more changes in the patient, and these were more indicative of pathology than those identified by the care recipients. Pathways took anywhere from 4 months to 6 years and were complicated by physical ailments. Family physicians were the gateway to care for all our participants. Results will be discussed in relation to the influence of language and culture and to the need for earlier symptom identification.

### PERCEPTIONS AND EXPERIENCES OF ANGLO-CANADIANS REGARDING THE PRE-DIAGNOSIS PERIOD OF ALZHEIMER'S DISEASE AND RELATED DEMENTIAS

K. Leung[1], J. Finlay[1], J. Silvius[2], S.D. Koehn[3], L. McCleary[4], C. Cohen[5], L.J. Garcia[6], N. Drummond[1], *1. University of Calgary, Calgary, Alberta, Canada, 2. Alberta Health Services, Calgary, Alberta, Canada, 3. Centre for Healthy Aging at Providence, Vancouver, British Columbia, Canada, 4. Brock University, St. Catharines, Ontario, Canada, 5. University of Toronto, Toronto, Ontario, Canada, 6. University of Ottawa, Ottawa, Ontario, Canada*

Six Anglo-Canadians with early-stage dementia (4 men, 2 women) and seven family caregivers (2 men, 5 women) were recruited from the Alzheimer's Society of Calgary to participate in semi-structured interviews exploring their experiences of problem identification and help-seeking. Individuals with dementia in our sample were the first to notice their memory difficulties, but initial symptoms were often perceived as ambiguous and interpreted within the context of their experiences. Early memory loss was typically attributed to inattention, distraction, and comorbid health problems. A diagnosis of dementia was not made until more serious cognitive deficits emerged including difficulties in decision making and driving. In addition, the role of caregivers evolved with time; caregivers initially served as a source of encouragement and support, but they eventually became actively involved over concerns about the diagnosis and its management. These findings may elucidate some of the barriers to an earlier diagnosis.

### A NON-ESSENTIALIZING VIEW OF CHINESE-CANADIAN PATHWAYS TO A DIAGNOSIS OF DEMENTIA IN METRO VANCOUVER

S.D. Koehn[1,2], M. Spence[1], J. Kozak[1,2], L.J. Garcia[4], K. Leung[3], L. McCleary[6], C. Cohen[7,5], N. Drummond[3], *1. Centre for Healthy Aging, Providence Health Care, Vancouver, British Columbia, Canada, 2. University of British Columbia, Vancouver, British Columbia, Canada, 3. University of Calgary, Calgary, Alberta, Canada, 4. University of Ottawa, Ottawa, Ontario, Canada, 5. University of Toronto, Toronto, Ontario, Canada, 6. Brock University, St. Catharine's, Ontario, Canada, 7. Sunnybrook Health Centre, Toronto, Ontario, Canada*

This retrospective study used qualitative semi-structured interviews to explore the pre-diagnosis experiences of ten community dwelling persons of Chinese descent aged 60+ recently diagnosed with an Alzheimer's-type dementia and their family caregivers living in Vancouver. Using an analytic inductive method, we found that more than half of the dyads reported that a diagnosis was either denied or not explained by a family doctor, yet some of these physicians simultaneously prescribed dementia drugs such as donepezil. Often they described the presenting symptoms to family caregivers as "normal aging." These ascriptions were challenged by the caregivers' own knowledge of dementia. "Cultural" explanations of help-seeking behaviour may fail to consider the multiple and mutually constitutive influences on the caregiver's decision to secure a diagnosis. Consideration of social determinants is essential to inform health service decision-makers aiming to optimize the timing of diagnosis to ensure quality of care.

## SESSION 2345 (SYMPOSIUM)

### APPROACH AND AVOIDANCE TENDENCIES AND NEGATIVE SOCIAL EXCHANGES IN MIDLIFE: A LONGITUDINAL ANALYSIS

Chair: *T. Windsor, The Australian National University, Canberra, Australian Capital Territory, Australia*

Negative social relationships characterized by tensions, arguments and criticism are recognized as having strong implications for health and well-being over the lifespan. This study investigated longitudinal changes in negative social exchanges with family members and friends in a large sample of 2529 midlife adults (ages 40 to 44 at baseline) assessed on three occasions over an 8 year interval. Associations of socio-demographic characteristics, physical health, and approach-avoidance aspects of personality with negative exchanges were examined. Results of adjusted latent growth models indicated that reported negative exchanges with both family and friends remained relatively stable over time. Women reported lower levels of negative exchange with friends, but higher levels of negative exchange with family relative to men. Sensitivity toward aspects of both approach and avoidance behavior were associated with higher initial levels of negative social exchanges. Results are discussed in the context of developmental influences with specific relevance to midlife.

### SOCIAL ROLES AND MIDLIFE PERSONALITY DEVELOPMENT: TAKING THE PATH LESS TRAVELED

N. Newton[1], A. Stewart[2], *1. University of Michigan, Ann Arbor, Michigan, 2. University of Michigan, Ann Arbor, Michigan*

Research suggests a strong link between personality development and social roles, particularly for women (Roberts, 1997; Vandewater & Stewart, 1998; Wood & Roberts, 2005). Societal gender norms are also influential: the social roles or life paths women undertake can be considered normative or non-normative. The current study examines the relationship between social role, personality, and well-being in late midlife for three groups of women who have pursued non-normative life paths: long-term divorced women; those without children; and those who entered male-dominated occupations. Two longitudinal samples of women currently in their early 60s were combined and analyzed using Significance Analysis of Microarrays (SAM) software to create permutation tests on personality data. Results indicated that not only does each non-normative life path relate to a different personality profile, but there are shared norm-challenging and norm-fitting attributes across the three groups. Non-normative life paths also differentially affected well-being.

### GLOBAL FORGIVENESS IN LATE ADULTHOOD

C. Torges[1], B. Ingersoll-Dayton[2], N. Krause[2], *1. North Dakota State University, Fargo, North Dakota, 2. University of Michigan, Ann Arbor, Michigan*

Overwhelming evidence suggests that experiencing forgiveness across various domains contributes to aging well. Enright's pioneering work suggests that a worldview of forgiveness –or experiencing forgiveness across multiple domains simultaneously – is especially powerful in promoting mental health and well-being. Considering the importance of religion in late adulthood, we have added to Enright's conceptualization of forgiveness by including feeling forgiven by God to create the construct, global forgiveness. Using a national probability study of older adults (49% African American), we explore the predictors and outcomes of global forgiveness using Structural Equation Modeling. We have found initial evidence that feeling connected to God promotes global forgiveness, and in turn, global forgiveness is associated with elevated life satisfaction and lower levels of depressive symptoms.

### SPOUSAL SUPPORT AND ENGAGEMENT: A DYADIC ANALYSIS OF WELL-BEING IN THE HEALTH AND RETIREMENT STUDY

L. Ryan, J. Smith, *Institute for Social Research, University of Michigan, Ann Arbor, Michigan*

Social engagement and spousal support are important sources of subjective well-being (SWB) but often are not studied directly. Using recent statistical advances, the present study directly evaluates individuals' and spouses' reports of positive and negative support, relationship closeness, and social engagement with four indices of SWB (Positive Affect, Negative Affect, Life Satisfaction, Loneliness) in a large sample of married, older adults from the 2008 wave of Health and Retirement Study (N=1544 couples). Actor-Partner Interdependence models (Kenny et al.,2006) using SAS PROC MIXED indicated that significant variance in each SWB component was due to interindividual and intercouple differences. Significant effects of individual and spouse support, relationship closeness, and social engagement are identified, over and above demographic, health, and personality. Age and gender interactions and the differential pattern of effects for each component of SWB are discussed. Results demonstrate the importance of considering the greater social context when examining well-being in adulthood.

## SESSION 2350 (PAPER)

### CARDIOVASCULAR DISEASE AND HYPERTENSION

### CAREGIVING TRAJECTORY: A LONGITUDINAL EXPLORATION OF THE WORK OF CARING FOR SPOUSES IN HEART FAILURE

L.A. Kitko, J.E. Hupcey, *School of Nursing, The Pennsylvania State University, University Park, Pennsylvania*

Introduction: The number of patients with heart failure is at epidemic proportions. Heart failure significantly changes and impacts life for the patient and family. Heart failure requires complex home medical management, typically done by a spouse. While providing this important care, spouses face significant threats to their own health. Yet, little is known about the actual "work" of caregiving over time in the context of the unpredictable trajectory of heart failure. Purpose: The purpose of this study was to define the types of work manifested in long-term spousal caregiving across the trajectory of heart failure. This was a qualitative secondary analysis of a larger longitudinal study of the palliative care needs of older patients with heart failure and their spouses. The in-depth serial interview data of 20 spousal caregivers of patients over age 62, collected monthly over 12-14 months, were analyzed utilizing the tenets of grounded theory methodology. Results: The work of spousal caregiving impacted all aspects of the lives of spouses and patients. This "work" was constant across the trajectory of heart failure. The core variable was committed obligation, which encompassed the competing demands of life. Work was expressed as living with the illness, care provision, vigilance, preserving normalcy, navigating complex systems, managing the household, and maintaining self. Conclusions: The work of caregiving was evident in times of heart failure exacerbation and in times of stability. Thus, caregivers should be assessed for unmet needs and may benefit from specific models of supportive care throughout the trajectory of heart failure.

### PILOTING A RANDOMIZED CONTROLLED TRIAL FOR IMPROVING BLOOD PRESSURE IN LOW INCOME, HYPERTENSIVE, SPANISH-SPEAKING, LATINO OLDER ADULTS: DESIGN, METHODOLOGY, AND SAMPLE BASELINE CHARACTERISTICS

S. Fernandez, F. De la Calle, M.E. Barrios, G. Ogedegbe, *Medicine, New York University School of Medicine, New York, New York*

Introduction: Efficacious behavioral interventions for controlling blood pressure (BP) are underutilized with hypertensive Latino older adults, a group with low BP control rates and a higher risk of related morbidity and mortality. Methods: Spanish-speaking Latino older adults with hypertension were recruited from three Senior Centers in the New York Metropolitan area. Participants were randomly assigned to Intervention Condition(IC) or Waitlist Control Condition (WC). IC participants received six weekly and 2 monthly classes on lifestyle changes (e.g. reduce dietary sodium, increased physical activity, etc.) to improve blood pressure. Automated BP measurement and questionnaires were completed at Baseline, 3 months, and 5 months post randomization. Results: Of the 80 screened, 57 were eligible and randomized. Sample was primarily female (80.7%); young old (mean = 70.5 + 6.4 years); non-U.S. born (96.5%); separated/widowed/divorced (71.9%); average years in the U.S. was 46.8 (SD = 9.4). Further, participants had on average 8 years of education (SD = 4.5); were low income (87.5% < \$20,000/year income); received Medicare (80.4%). Mean systolic and diastolic blood pressure were 134.2 + 19.9 mm Hg and 72.3 + 9.0 mm Hg, respectively. Participants were prescribed an average of 1.6 antihypertensive medications (SD = .86); one third of the sample (29.6%) were taking a diuretic; one quarter (14.8%) had resistant hypertension; over one third (38.5%) reported medication non-adherence. Most (96.4%) reported one or more comorbid medical conditions, with over half (83.9%) reporting two or more. Conclusions: Participants in this Spanish-speaking, low income sample had multiple medical barriers to BP control. Results of the trial will shed light on efficacy of implementing an evidence based intervention in senior center settings for older adults with multiple comorbidities and significant barriers to behavior change, and initial estimates of the impact of such an intervention on change in BP.

### IMPROVING HYPERTENSION CONTROL OF RURAL, OLDER ADULTS

C.J. Dye, J.E. Williams, J. Evatt, *Public Health Sciences, Clemson University, Clemson, South Carolina*

Use of Community Health Workers (CHWs) is a cost-effective strategy in facilitating individuals' adherence to recommended health behavior changes, self-management of their health conditions, and access to health care (Brownstein, Bone, Dennison, Hill, Kim, & Levine, 2005). This presentation will report results of a program delivered by trained, volunteer CHW's, known as "Health Coaches" to older patients with hypertension residing in a rural county in South Carolina. In this county, 42 percent of those over 65 years have less than a high school education, experience poverty rates as high as 27%, and suffer higher rates of hypertension and heart disease than state peers. The program, developed through a partnership between primary care physicians, state and local health departments, and university researchers, is funded by Health Resources and Services Administration (HRSA). Health Coaches provide classes, support group facilitation, and telephone counseling to patients in order to facilitate improvement of hypertension self-management behaviors. The presentation will provide evidence of program impacts measured by changes in self-efficacy, knowledge and beliefs of program participants as well as changes in hypertension self-management behaviors such as sodium intake, physical activity, blood pressure monitoring, and stress management. Changes in blood pressure levels (primary outcome) and process evaluation findings will also be presented.

### FACTORS ASSOCIATED WITH HYPERTENSION SELF-CARE IN AFRICAN AMERICAN ADULTS

J. Warren-Findlow[1], R. Seymour[2], *1. Department of Public Health Sciences, The University of North Carolina at Charlotte, Charlotte, North Carolina, 2. Center for Research on Health and Aging, University of Illinois at Chicago, Chicago, Illinois*

The importance of chronic illness self-management in improving individual health outcomes has been well-documented. This exploratory study examined hypertension self-care practices in African Americans aged 22-88 (mean age 53.1, n=180). We assessed 6 hypertension self-care behaviors using self-report measures. Fifty-eight percent reported consistently taking medications as directed; 48% engaged in physical activity 7 days a week; 75% were non-smokers; two-thirds abstained from alcohol; 30% practiced good weight management techniques; 22% followed low salt diet guidelines. Logistic regression analyses were conducted for each self-care practice using the following hypothesized factors: greater age, being female, home ownership, education, greater religiosity, living alone, BMI, years with hypertension, and higher self-efficacy to manage hypertension. For medication, age (OR 1.03, CI 1.00-1.05) and religiosity (OR 1.09, CI 1.04-1.114) were associated with consistent adherence. For weight management, home ownership (OR 2.45, CI 1.16-5.16), living alone (OR 2.69, CI 1.19-6.08), and self-efficacy to manage hypertension (OR 1.51, CI 1.14-2.01) were associated with good practices. Years with hypertension was associated with better low salt diet behaviors (OR 1.03, CI 1.01-1.06). Age (OR 1.04, CI 1.02-1.07), home ownership (OR 2.15, CI 0.95-4.86), a college degree (OR 2.98, CI 1.21-7.34), and BMI (OR 1.07, CI 1.01-1.14) were associated with being a non-smoker. No factors were associated with exercise. Age (OR 1.06, CI 1.03-1.08), gender (OR 3.79, CI 1.77-8.11), and BMI (OR 1.07, CI 1.01-1.13) were associated with abstaining from alcohol. These findings highlight the need for multifaceted approaches in diverse settings to improve the health behaviors needed to manage hypertension.

## SESSION 2355 (PAPER)

## DRIVING AND ALTERNATIVES

### SELF-REGULATION OF DRIVING: FACILITATING THE TRANSITION FROM DRIVING

L.J. Molnar[1,4], D.W. Eby[1,4], S. Roberts[2], J. Langford[3], J. Charlton[3], *1. University of Michigan Transportation Reseach Institute, Ann Arbor, Michigan, 2. University of Michigan School of Public Health, Ann Arbor, Michigan, 3. Monash University Accident Research Centre, Melbourne, Victoria, Australia, 4. Michigan Center for Advancing Safe Transportation throughout the Lifespan, Ann Arbor, Michigan*

Appropriate self-regulation of driving (i.e., adjusting driving patterns by driving less or avoiding specific situations) shows considerable promise as a strategy for compensating for functional declines and enabling older drivers to extend safe driving. However, there is considerable variation across studies, making it difficult to determine the extent of self-regulation by older drivers. This study involved: developing a computer-based questionnaire to measure self-regulation; and pilot testing it with a sample of older drivers with clinically-determined impairments in vision, cognition, or psychomotor ability, as well older adults from the general population. Feedback on the questionnaire was positive, with most participants from both groups considering questions easy to read and understand (98.5%, 89.1%, respectively) and the length reasonable (93.4%). Most (91.2%) were satisfied with the computer format, despite only 11% reporting a high level of computer experience. A majority of participants reported trying to avoid a variety of specific driving circumstances including driving at night or in rush hour traffic, in bad weather, and at night in bad weather. Other circumstances avoided by one third or more included making unprotected left turns, driving on high traffic roads, and in unfamiliar areas. Many planned their trips ahead of time or reduced overall travel by combining trips. Few reported making modifications to their vehicles. A majority tried to avoid in-vehicle distractions with the exception of changing radio stations, and most tried to leave more room between their cars and the cars ahead of them. Differences by sex, functional ability, and age group are discussed.

### AN EVALUATION OF THE CORAL GABLES' SENIOR TAXI DISCOUNT PROGRAM

D.P. McCarthy, A. Haskell, S. Salazar, G.M. Anderson, P.C. Hunt, *Occupational Therapy, Florida International University, Miami, Florida*

Background: Automobile preference and barriers to alternative modes of transportation have caused seniors to experience difficulties with community mobility. There is a need for acceptable alternatives to driving. Many communities are now turning to taxi discount programs to help fill the mobility needs of seniors. The purpose of this study was to examine seniors' experiences with the use of taxis. Methods: A telephone survey was conducted with participants of the Coral Gables Senior Taxi Discount Program, open to residents aged 60 and older. Each participant was allowed to purchase up to eight vouchers, each worth $10 in taxi rides, for $5 per voucher. Results: In this on-going study, of the 22 participants who used their vouchers so far, 16 responded to survey questions (72.7%). Seventy percent reported having driven a car within the previous month and 80% had used a taxi. Other modes of transportation included walking (44%) and MetroRail (38%). Most taxi trips (37%) were for medical/health reasons, while 32% of trips were to the Miami airport. Riders reported a high satisfaction level in nine of 10 categories including ease of use, wait time, and safety (100%). Lower levels of satisfaction were seen for driver-provided assistance, when needed (60%). Conclusion: Few new taxi users were attracted to this program. Those purchasing vouchers were likely to be current drivers. If communities choose to address senior mobility issues with taxi discount programs, methods for exposing former drivers and new users to taxis should be considered.

### FATALITY TRENDS FOR YOUNGER, MIDDLE-AGED, AND OLDER DRIVERS AND PASSENGERS

N.W. Mullen[1], S. Dubois[2], M. Bedard[1,2], *1. Lakehead University, Thunder Bay, Ontario, Canada, 2. St. Joseph's Care Group, Thunder Bay, Ontario, Canada*

Using data from the United State's Fatality Analysis Reporting System (FARS), Bédard et al. (2001) examined fatality trends from 1975 through 1998 and projected future trends to 2015. The present project included FARS data from 1975 through 2008 to examine the accuracy of Bédard et al.'s projections and to project future trends to 2025. It was hypothesized that, as Bédard et al. projected, 1) the number of fatalities involving younger drivers and passengers (<30 years) would decrease from 1999 to 2008, while the number of fatalities involving middle-aged (30-64 years) and older (65+ years) adults would increase; and 2) older female fatalities would increase from 1999 to 2008 at a faster rate than older male fatalities. Data for driver and passenger fatalities were stratified by age group (younger: <30 years, middle-aged: 30-64 years, and older: 65+ years) before fitting least squares regression models. These models were used to perform fatality projections to 2025. Data for older adults were also examined by gender. Results showed that from 1999-2008, fatalities decreased for younger drivers and passengers, and increased for middle-aged adults. Since 1997, fatality rates of middle-aged adults have exceeded those of younger individuals. If these trends continue, by 2025 fatalities for middle-aged adults will be approximately twice as high as fatalities for drivers and passengers aged <30 or 65+ years. Unexpectedly, fatalities decreased for older adults, decreasing at a faster rate for females. Future research could investigate the cause of this trend-reversal and reasons for the gender difference.

### THE SAFE DRIVING BEHAVIORS MEASURE: A SELF-REPORT FOR OLDER DRIVERS AND THEIR CAREGIVERS

S. Classen, *University of Florida, Gainesville, Florida*

This paper will address the results of a collaborative NIH-NIA funded project entitled: Community Participation in developing a Safe Older Driver Behaviors Measure(SDBM). The goal of the research project was to use converging evidence and community participation to develop and pilot test a safe driving behaviors measure for older adults with potential for public health application. We will provide a systematic overview of the research process to develop and test, and improve upon a 68-item self/ proxy Safe Driving Behaviours Measure that has application to the broader population of older drivers and caregivers in North America. We will address (1) the item development to capture safe driving behaviors that was based on theoretical frameworks, previous research, and measurement theory; (2) establishing face validity and content validity; (3) psychometrics properties of the SDBM, specifically construct validity and criterion validity; (4) rater effects (leniency vs. severity of ratings) and rater reliability among three groups of raters, i.e. the older drivers, caregivers and the driving evaluators (gold standard). Future directions for translational research will be outlined.

## SESSION 2360 (PAPER)

## MARRIAGE AND HEALTH

### THE ASSOCIATION OF COMORBID CHRONIC ILLNESS SYMPTOMS AND DAILY MARITAL INTERACTIONS IN OLDER COUPLES

J. Yorgason, S.O. Roper, J. Sandberg, *Brigham Young University, Provo, Utah*

Physical health symptoms in one spouse have been linked to partner mood in later life couples (Yorgason, Almeida, Neupert, Spiro, Hoffman, 2006). Health declines have also been linked to marital quality within long-term panel studies (Booth & Johnson, 1994). However, the micro links between daily illness symptoms and daily marital interactions are less well understood. Using data from 28 married couples wherein one spouse was diagnosed with both diabetes and osteoarthritis, the current study explored the links between daily illness symptoms and daily marital interactions. Results from multilevel models indicated that when the wife was the partner with the illnesses, higher average daily concerns with blood sugar levels (grand mean centered) were predictive of higher positive marital quality reported by husbands. In addition, higher than average blood sugar concerns (person mean centered) were also related to higher negative marital interactions as reported by husbands. When husbands were the ones with chronic illnesses, their higher average arthritis symptoms and higher average activity limitations (both grand mean centered) were positively related with negative marital interactions as reported by wives (although only at the trend level). Findings related to wife blood sugar concerns are consistent with the idea of support mobilization, in that husbands interact more with their spouse in positive and negative ways when their wife has higher health concerns. Findings related to husband arthritis symptoms and activity limitations appear to support a stressor model, where only negative interactions increase.

### EFFECTS OF ONE'S OWN AND SPOUSE'S HEALTH ON OLDER ADULTS' PERCEIVED MARTIAL SUPPORT

J. Ha, J. Kim, L. Waite, *University of Chicago, Chicago, IL*

Previous research has suggested that spouse's illness has a negative impact on marital quality and tends to produce shared emotional distress among couples. However, few studies have examined the unique effects of one's own and spouse's health on older adults' perceived levels of marital support based on dyadic data. Using data from 2006-2008 waves of the Health and Retirement Study, this paper examines: (1) the effects of one's own and spouse/partner's self-rated health on the level of perceived marital support among older adults and (2) the extent to which these effects differ by gender. Data on self-rated health and marital support are collected from both the respondents and their spouses/partners. We used Actor-Partner model (multi-level model for dyadic analysis) to estimate the effects of one's own (actor effect) and spouse's (partner effect) health, taking into account the unobserved couple-level variances. The results suggest that those who are healthier report higher levels of marital support. However, there is no significant gender difference in this actor effect. Partner's health is also positively associated with marital support. Partner effect is stronger for women than men, suggesting that the effect of men's health on the women's perceived support is stronger than the effect of women's health on the men' perceived support. The findings highlight the important role of one's own as well as spousal health in marital relationship and encourage us to think about the ways to assist older adults in maintaining their social support in the face of health deteriorations.

### MARITAL QUALITY, AGE, AND FUNCTIONAL LIMITATIONS

H. Choi[1], M. Sliwinski[2], *1. Penn State University, Altoona, Pennsylvania, 2. Penn State University, State College, Pennsylvania*

Most research on marital quality and physical health has focused on examining the negative health consequences of marital strain. Building from the broader literature on social relationships and health, we evaluated positive as well as negative marital quality in relation to functional health. Guided by a life course perspective, we also explored how age might moderate the association. Our data consisted of 727 adults aged 23 or older who participated in two waves of the National Survey of Midlife Development in the United States (T1: 1995-1996, T2: 2004-2006) and who remained continuously married to the same spouse between the waves. We fitted two-level individual growth models to estimate the contribution of marital support, marital strain, and age to baseline and change in functional health over 10 years. Results indicated that marital support at T1, marital strain at T1, and age were not associated with baseline functional health. Regarding their effects on functional health change over time, marital quality, either positive or negative, did not appear to have significant influences among younger adults. For older adults, however, higher levels of both marital support and marital strain at T1, with each as the control for the other, were associated with greater increases in functional limitations over the 10-year period. These findings suggest that marital quality may have a greater impact on physical health later in the life course, and the physical health implications of marital support further need to be examined.

### ONSET OF AND RECOVERY FROM FUNCTIONAL IMPAIRMENT AMONG OLDER ADULTS: THE IMPORTANCE OF MARRIAGE

D.F. Warner, S. Adams, *Sociology, Case Western Reserve University, Cleveland, Ohio*

Older adults are at significant risk of disability. Far from being universal though, disability is experienced unevenly across social groups. Prior research indicates that marriage is particularly salient for disablement: married persons exhibit lower risks for the onset of disability relative to the unmarried. However, understanding how marriage affects disablement requires knowledge of both how marriage influences the onset of functional impairment and how it is associated with improvements in functioning (recovery). Yet prior research has not addressed whether the protective influences of marriage extend to recovery and result in greater rates of improvement once disabled. To address this gap in the literature, we used data from the 1992-2006 Health and Retirement Study (HRS) to estimated sex-stratified discrete-time hazard models to examine marital status differences in the onset of and recovery from functional impairment. We found that not only do divorced, widowed, and never married older men and women have higher risks of disability onset than their married counterparts, but that they also experience lower rates of recovery. Divorced and never married men and women demonstrate the greatest disparities in onset and recovery relative to their married counterparts. Widows and widowers, while still disadvantaged, are more similar to married individuals—and this is especially the case for men. Overall, socioeconomic characteristics and health behaviors reduce—but do not eliminate—the marital status differences in disability onset and recovery. The findings suggest that the marriage institution shapes the disablement process both through differential onset and differential ability to recover once impaired.

### DIFFERENTIAL IMPACTS OF SENSORY IMPAIRMENT ON SUCCESSFUL AGING FOR OLDER MARRIED COUPLES

W. Strawbridge[1], M.I. Wallhagen[2], S. Shema[3], *1. Institute for Health and Aging, San Francisco, California, 2. University of California, San Francisco, San Francisco, California, 3. Northern California Cancer Center, Fremont, California*

We analyzed longitudinal relationships between older spouses' baseline sensory impairment and subsequent successful aging for them and their partners five years later. All measures were by self-report. Subjects were 352 Alameda County Study community-dwelling older husbands and wives age 65 – 91 married to each other. Baseline sensory impairment was assessed by scales measuring difficulty hearing and seeing in three different settings. Logistic regression models adjusted for paired data and included both spouse and partner sensory impairments as well as adjustments for age, chronic conditions, and financial problems. Interaction tests assessed gender differences. Overall 57% of the wives and 45% of the husbands reported aging successfully. For wives, both impairments negatively impacted their own subsequent successful aging with hearing impairment having the stronger relationship. Wives' assessment of their own successful aging was also negatively impacted by their husbands' hearing impairment but not by his vision impairment. In contrast, neither sensory impairment had any impact on husbands' successful aging regardless of the impairment's source. These gender differences were statistically significant. Our results suggest that hearing impairment is more important for wives' successful aging than is vision impairment. That older wives' but not older husbands' successful aging is impacted by their partners' hearing impairment is consistent with research suggesting that older wives value spousal communication more than do older husbands. An important additional implication of our results is that older wives use different criteria for assessing successful aging than do older husbands.

## SESSION 2365 (PAPER)

## PERSONALITY AND DISPOSITIONS

### USING AUTOBIOGRAPHICAL MEMORY SHARING TO ELICIT EMPATHY FOR OLDER AND YOUNGER ADULTS IN CHRONIC PAIN

J.M. Baron, S. Bluck, K. Gold, A. Gesselman, *Psychology, University of Florida, Gainesville, Florida*

One theorized social function of autobiographical memory is the use of memory-sharing to elicit empathy for others. The current study investigates the role of autobiographical memory-sharing in increasing empathy towards older and younger persons in chronic pain. What is the relation of empathy to memory? Empathy is a psychological process involving affective and cognitive (perspective-taking) components. When individuals lack an understanding of another's suffering they can draw on autobiographical memories of their own experiences as a basis for relating to how another person feels. Participants' empathy levels were assessed after reading a pain narrative by a person thought to be either

85 or 25 years of age (pre-test) and again after assignment to one of two conditions (post-test). Conditions included either sharing one's own autobiographical memory of having been in pain, or as a comparison, recalling a movie in which a character was in pain. Attitudes toward aging, personality, social desirability, and memory characteristics were also assessed. Empathy for both older and younger target persons increased in the autobiographical memory condition but not in the comparison condition. That is, participants did not show age biases: increases in empathy were reported across older and younger targets. Regression analyses identified two personality factors, conscientiousness and agreeableness, as predictors of increases in empathy. When social-desirability was entered in the model, however, only conscientiousness remained a significant predictor. Findings are discussed in the context of using personal memories to promote empathy in formal and informal caregiving settings for older and younger adults.

### EVALUATION OF TWO ELDER RISK BEHAVIOR MEASURES FOR IMPULSIVITY AND RISK-TAKING PROPENSITY

K. Daniel, M. Cazzell, C.L. Cason, *Nursing, University of Texas at Arlington, Arlington, Texas*

Background/Significance: Risk behaviors, studied in adolescents, are also reported in older adults. Elder risk behaviors include: alcohol and tobacco use, seatbelt use, omission of immunizations or preventive screenings, overweight, not exercising regularly, or using unprescribed medications. Risk-taking propensity, a predictor of risk behavior engagement, has been studied in adolescents using behavioral measures. Impulsivity behavioral measures have been correlated with prefrontal cortex functions: planning ability, response inhibition, emotional regulation, and working memory. No behavioral measures or neurobiological correlates have been identified for use in elder risk behavior research. Purpose: The purpose is to examine the reliability and validity of the Tower of Hanoi (TOH) and the Balloon Analogue Risk Task (BART) in an elderly sample. Methodology: In this correlational study design, a convenience sample of 50 community-living participants, 65 years or older, were recruited. Study measures included the Mini-Cog, Eysenck Impulsivity Subscale, self-reported elder risk behaviors, four trials of TOH, and 30 balloon inflation trials on the computerized BART. Results: BART, TOH, and Eysenck scores achieved internal consistency reliability of .926, .652, and .837, respectively. Moderate predictive validity correlations between TOH with yearly mammograms (-.320) and with no condom use (.249) were found. Mild predictive validity correlations between BART with alcohol use (.238) and yearly prostate exams (.361) were also found. Conclusions: BART provided strong reliability and TOH demonstrated moderately strong reliability, both with mild to moderate validity when correlated with self-reported risk behaviors. These behavioral measures could be used to prospectively identify elders with risk-taking propensity and impulsivity.

### PARTNER PERSONALITY AND HEALTH: A GROWTH CURVE ANALYSIS

L.L. Vie, C.A. Reynolds, M. Kern, H.S. Friedman, *Psychology, University of California, Riverside, Riverside, California*

Personality has increasingly been linked to subjective and objective health outcomes. Recent evidence suggests that in older couples, spouse personality, especially conscientiousness, is important to an individual's physical health. The extent to which personality relates to a partner's state of health versus his or her trajectory is unknown. The current study used data from the Terman Life Cycle Study to consider self and spouse conscientiousness and neuroticism, measured in early adulthood (mean age = 30 years), as predictors of initial self-rated health level and change across five decades for the Terman participants. Participants self-reported their physical health in 1940, 1945, 1950, 1955, 1960, 1972, 1977, 1982, 1986, and 1991 (N = 1,166 participants with health assessed at least once). Growth curve analyses determined the intercept (i.e., health status in 1940) and change in health status for each participant. Self- and spouse-rated conscientiousness and neuroticism were then used to predict initial level and change. For participant self-ratings on personality, higher levels of conscientiousness predicted better initial health for Terman males, whereas higher levels of conscientiousness in Terman females predicted a slower decline in health. Higher self-ratings on neuroticism predicted worse initial health for both Terman males and females, and did not predict the rate of health decline over time. Neither spouse self-ratings on conscientiousness nor neuroticism predicted the level or change in health for participants. Future work should consider longitudinally measured spouse personality and health ratings to further examine self-spouse dynamics, particularly when variability in self-rated health increases.

### PERSONALITY TRAITS SHAPE SENIOR HEALTH THROUGH EVERYDAY BEHAVIORS

J. Lodi-Smith[1], B.W. Roberts[2], *1. Behavioral and Brain Sciences, Center for Vital Longevity; University of Texas at Dallas, Dallas, Texas, 2. University of Illinois, Urbana-Champaign, Champaign, Illinois*

Individual differences in personality traits are robust predictors of physical health (Roberts et al., 2007; Mroczek & Spiro, 2007). In the present research, we provide evidence for this within the 617 adults assessed during the first wave of the Health and Aging Study of Central Illinois (HASCI; a large-scale study of adults age 18-89). Further investigation revealed that the relationship between personality traits and health is most robust in individuals past age 60. In addition, the relationship between personality traits and health is driven by the everyday experiences of seniors. For example, conscientious seniors in HASCI have better physical health because they engage in preventive health behaviors such as exercise and regular physician visits (Lodi-Smith et al., in press). The findings of this study inform our understanding of how personality traits shape individual lived lives, how this is of particular importance for seniors, and address how certain seniors stay physically healthy as they age.

## SESSION 2370 (PAPER)

## PREDICTORS OF SUCCESSFUL AGING

### SUCCESSFUL AGING IN URBAN CHINA: IS IT WHO THEY ARE, OR WHERE THEY LIVE

J. Zhang, *School of Social Work, University of Michigan, Ann Arbor, Michigan*

Frequently at the core of the research on successful aging is the notion of personal responsibility (e.g. personal lifestyle). However, whether there are larger macros issues affect individual opportunity to age well is rarely investigated. This study tries to expand this body of literature by identifying individual-level and macro-level factors associated with successful aging among non-Western older people. Data for this study came from the 2005 Chinese Longitudinal Healthy Longevity Survey and the 2005 China Provincial Statistical Yearbook. The sample consisted of 6,980 older adults (average age: 86) from 22 provinces across China. Respondents were classified as successful agers if they (1) had no cognitive impairment; (2) had no ADL limitations; (3) had no serious chronic diseases; and (4) were actively engaged in life. Individual-level factors included: (1) demographics; (2) lifestyle; (3) social support, and (4) psychological disposition. Macro-level factors include province-level GDP per capita and income inequality (calculated as log wage differentials between the 80th and 20th percentiles), given the fact that rapid economic growth and fast-growing income inequalities are the two most prominent issues in China since economic reforms. Multilevel logit regression analyses showed an independent effect of macro-level factors on successful aging after adjusting for individual variables. Individual background, lifestyle, and psychological disposition still mattered in terms of successful aging among Chinese older people, while the impact of economic development on aging well differed by the level of income inequality. This study thus suggests that promoting successful aging should be a joint effort from individual and government.

### FINDINGS ON SUCCESSFUL AGING IN BLACK OLDER ADULTS

M. Troutman, *UNC Charlotte, Charlotte, North Carolina*

Health disparities persist across older adult racial groups. Though research on successful aging has advanced during the past decades, there is a gap in knowledge of successful aging in Black older adults. The purpose of this study was to examine psychometric properties of the Successful Aging Inventory (SAI) in Black older adults and gain information on their perceptions of the phenomenon. Ninety-nine participants completed a demographic form, the SAI, Life Satisfaction Inventory-A, Purpose in Life Test, Mastery Scale, and Center for Epidemiologic Studies Depression Scale. Content analysis of responses to an open-ended question, “What does successful aging mean to you?” was done. Participants tended have high scores on successful aging, and lower scores on depressive symptoms and mastery (lower sense of personal control), relative to the range of possible scores for each instrument. The SAI demonstrated sound psychometric properties when administered to Black older adults. Content analysis revealed six broad themes of successful aging: health; family; independence/ability; activity/service; state of mind; and spirituality. These findings provide information about successful aging that can be used to develop tailored interventions for promoting successful aging in Black older adults, that that are relevant, acceptable, and more likely to be adopted by this group.

### RETIREMENT STATUS, PSYCHOLOGICAL WELL-BEING, AND INFLAMMATION: AN INTEGRATIVE APPROACH TO SUCCESSFUL AGING

E. Friedman, C. Ryff, *Institute on Aging, University of Wisconsin-Madison, Madison, Wisconsin*

Levels of systemic inflammation, which typically increase with age, are moderated by psychological and social factors. In this analysis we focus on inflammation in the context of both aging and an age-related life-course transition, retirement. We test the hypothesis that positive psychological functioning will moderate the associations of both (1) age and inflammation and (2) retirement status and inflammation. Data are from the biological subsample of the National Survey of Mid-Life in the United States (MIDUS; N = 950). Information on demographic characteristics, work status, health status, psychosocial functioning, and health behavior came from telephone interviews and self-administered questionnaires. Fasting blood samples for measurement of inflammatory proteins were obtained during an overnight clinic stay. Our analyses focused on interleukin-6 (IL-6), a pro-inflammatory cytokine that typically increases with age. Positive psychological functioning was assessed using Ryff’s (1995) Psychological Well-Being scales. Multivariate analyses adjusting for potential demographic and health confounds showed that age predicted higher levels of IL-6 ($p<.01$), while personal growth, a dimension of well-being that has previously been shown to decline with age, predicted lower levels of IL-6 ($p<.05$). Retirement status was marginally associated with IL-6 ($p=.06$) with retirees having higher levels of IL-6 than those still working. However, a significant interaction showed that personal growth was inversely related to IL-6 among retirees, but not among those still working ($p<.05$). These results suggest that positive psychological functioning, particularly the sense of self-realization, predicts lower levels of inflammation among retirees, and they highlight the importance a biopsychosocial approach to successful aging.

## SESSION 2375 (PAPER)

## PROMOTING PHYSICAL ACTIVITY AND EXERCISE

### IN CAREGIVERS’ VOICES: CREATING OPPORTUNITIES TO EXERCISE FOR COMMUNITY-DWELLING ADULTS WITH DEMENTIA

S.D. Rogers, *East Carolina University, Greenville, North Carolina*

Although there is growing research that documents the benefits of exercise for adults with dementia, evidence-based community-centered programs are unavailable. Notably, caregivers’ interest in or expectations for the effects of a community-based exercise intervention for their care recipient is undocumented. We investigated the views of local caregivers of community-residing adults with dementia (N=20). Focus group techniques were used to provide data regarding caregivers’ perceptions of the current status and anticipated trajectory of their care recipient’s physical abilities and functioning while living at home and their interest in and insights regarding the logistics of a community-based exercise program for their care recipient. Caregivers expressed motivation to care for the other at home as long as possible and had a strong preference to have their care recipient engaged in appropriate activities, including exercise. Caregivers expressed feelings of isolation and helplessness when discussing current options to keep the other stimulated. Most caregivers reported that mid-morning and early afternoon were optimal times for activity; yet, due to work or other obligations, caregivers would be unreliable to provide transportation, paying for activities would be difficult, and acclimatizing the care recipient to another routine would be challenging. Community activities for adults with dementia are scarce and although are wanted by caregivers, logistical hurdles may be prohibitive of participation. Partnering with local caregivers, support groups, adult day services, senior centers, and other local organizations may enable successful launching of such programs.

### ATTITUDES TOWARD PHYSICAL ACTIVITY IN AN URBAN AFRICAN-AMERICAN COMMUNITY

G.M. Huber[1], J. Lewis[2], W.E. Healey[1], C. Kohrman[2], *1. PTHMS, Northwestern University, Chicago, Illinois, 2. West Side Health Authority, Chicago, Illinois*

Purpose: Physical activity (PA) participation of older African-American (AA) men and women is lower than in either white or Hispanic groups. In the AA community, low levels of PA have been linked to many chronic diseases. The purpose of this study was to describe community members’ attitudes about PA to assist in the development of community interventions. Methods: Using principles of community-based participatory research (CBPR), a partnership between Northwestern University Department of Physical Therapy & Human Movement Sciences and the West Side Health Authority collaborated in developing focus groups to discuss attitudes toward PA in an urban, AA community. Four previously trained community health advocates (CHAs) assisted in the development of focus group interview guides and recruitment of focus group participants. Transcribed audiotapes from community focus groups were analyzed using qualitative methods. The analysis process included the authors and the CHAs. Results: Two focus groups were held with 22 participants (16 women, mean age=70.6 yrs). Four major themes were identified: 1) health was characterized as longevity, mental health, dependent on family history and not being housebound; 2) physical activity and diet contribute to health; 3) family/social support acted as both barriers and facilitators of PA; and 4) community members were knowledgeable about PA resources in the community but were concerned about safety and condition of the physical facilities. Implications: Based on the focus group results, future PA programming in this community should build on existing community resources. Strategies for PA promotion should focus on safety, social and environmental factors.

### PHYSICAL ACTIVITY AMONG URBAN AND RURAL AFRICAN AMERICANS

L. Hannon[1,2], R.M. Allman[2,3], P. Sawyer[2], *1. Tuskegee University, Tuskegee, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. Birmingham/Atlanta VA GRECC, Birmingham, Alabama*

This study examines physical activity among urban and rural African American participants in the UAB Study of Aging (N=500). In-home interviews conducted in 1999-2001 included measures of physical and mental health, life-space, the Leisure Time Physical Activity (LTPA) Questionnaire, and the Short Physical Performance battery (SPPB). Chi square and ANOVA were used to examine bivariate comparisons. Excluding persons unable to perform the walking task of the SPPB, logistic regression was used to examine factors associated with kcal expenditure approximately equal to the recommended 30 minutes 5 times/week. Mean age was 75.9 (51% rural and 50% female). 35% reported incomes less than $8000/year and less than a 6th grade education. 40% reported difficulty walking; usual walking pace was reported as casual (<2mph) by 59% and 16% did not perform the timed walk of the SPPB. 23% reported no LTPA. Being "a lot less active" currently compared to their adult life before the age of 65 was reported by 47%. Rural African Americans had significantly lower incomes and fewer years of education, more symptoms, lower cognition, and higher depression. Rural persons were more likely to report a decline in their physical activity compared to their younger years (less than 65) however there were no significant differences in the SPPB or life-space mobility. Having more symptoms was significantly associated with not achieving the recommended weekly physical activity level (p=.013). Low physical activity was very common among older African Americans. Despite sociodemographic and health differences, this was true in both urban and rural settings.

### ARE PHYSICAL ACTIVITY AND PHYSICAL PERFORMANCE ASSOCIATED WITH BIO-MARKERS AMONG ELDERLY LATINOS?

G. Moreno[1], C.M. Mangione[2,3], P. Wang[3], L. Trejo[4], A. Butch[5], C. Sarkisian[6,3], *1. UCLA Dept. of Family Medicine, Los Angeles, California, 2. UCLA Dept. of Medicine, Division of General Internal Medicine & Health Services, Los Angeles, California, 3. UCLA, Dept. of Medicine, Division of Geriatrics, Los Angeles, California, 4. City of Los Angeles, Dept. of Aging, Los Angeles, California, 5. UCLA Pathology & Laboratory Medicine, Los Angeles, California, 6. VA Greater LA Healthcare System, Los Angeles, California*

Background: Physical activity is associated with better health outcomes but biological mediators for this relationship are unclear. They are even less understood among the growing elderly Latino population. We examined associations between physical activity and physical performance with biological markers of health among elderly Latinos. Methods: We examined baseline and 6-month data from 127 elderly sedentary Latinos (>60 years) recruited from 27 Los Angeles senior centers. We measured inflammatory (IL-6, CRP, and TNF-alpha), metabolic (waist circumference, HDL-cholesterol, triglycerides, insulin, glucose), and physiologic (blood pressure) markers of health, and self-reported physical activity (YALE survey). Physical performance was measured with the NIA battery (gait speed, chair stands, balance). We used Spearman's correlations, t-tests and linear regression adjusted for age and gender to explore correlations between physical activity, physical performance, and biological markers. Results: Eighty percent of the sample was female and mean age was 73 years. In cross-sectional analyses of baseline data, physical activity did not correlate with any biological markers. Total performance scores correlated ($p<0.03$ for all) with triglycerides ($R= -0.23$), insulin ($R=-0.20$), and waist circumference ($R= -0.31$). In adjusted models, higher summary performance scores were associated with lower waist circumference (b-coef. = -2.50; $p < 0.001$). In longitudinal analyses, change in physical activity level correlated inversely with change in insulin ($R=-0.25$, $p=0.02$) and CRP. Conclusions: In this sample of sedentary older Latinos, physical performance was associated with some biological markers of health in cross-sectional analyses. Increasing physical activity was associated with improvements in some metabolic and inflammatory markers of health.

### PREDICTING OPTIMAL HEALTH-RELATED QUALITY OF LIFE IN US ADULT TAIJIQUAN (TAI CHI) PRACTITIONERS

M.F. Komelski, R. Blieszner, Y. Miyazaki, *Virginia Polytechnic Institute and State University, Blacksburg, Virginia*

Working from the adaptive developmental theory of Selective Optimization with Compensation (SOC), we constructed and evaluated a framework for examining the contributions of Taijiquan (T'ai Chi) to optimal physical and psychological aging. The framework considers the effects of Taiji-related practice goals and environmental constraints (selection), organizes Taiji practices into domains based on their expected benefits (optimization), and details the importance of loss-based gains and adaptive strategies (compensation) in predicting optimal aging among Taiji practitioners. As a first step in evaluating the framework, we used a testing-the-limits design, focusing on experienced practitioners (N = 94; age range = 24-83, M = 55.82). We predicted optimal health status through analysis of Taiji practitioner data related to curricular complexity (total number of domains regularly practiced), frequency of practice, demographics, and lifestyle (including diet and other activities). A regression analysis showed that after controlling for age, practice experience, and practice frequency, diet and curricular complexity remained significant predictors of health status. Also, a significant interaction between out-of-class practice and curricular complexity suggested that the most integrated curricula were associated with better health across practice frequencies, but practitioners with simpler curricula could achieve comparable health outcomes by engaging in substantially more out-of-class practice. These findings suggest the importance of well-rounded curricula, out-of-class practice, and healthy diet for optimizing HRQoL through Taijiquan.

## SESSION 2380 (PAPER)

## SOCIAL NETWORKS AND HEALTH

### REVISION OF THE LUBBEN SOCIAL NETWORK SCALE FOR USE IN LONG TERM CARE SETTINGS

K. Brown, J. Munn, *College of Social Work, Florida State University, Tallahassee, Florida*

Background and Purpose: This study involves revising and adapting the Lubben Social Network Scale for use in assessing social support networks of older adults living in long term care settings. Assessment is important because adequate social networks are correlated with better well being in elderly populations (Lubben & Gironda, 2004). The current research is a unique contribution as no social network scale has been developed and validated for this population. Methods: The revised scale will have additional subscales for the purpose of capturing different aspects of the social networks of older adults residing in long term care. Those eligible to participate in the study are drawn from a sampling frame of older adults residing in long term care settings. Results: Reliability and validity statistics will be reported. Statistical results will be obtained for skewness and kurtosis of each scale item. The Cronbach's alpha will be reported for the subscales retained which measure the social networks involving family, residents, volunteers, friendships, and/or staff persons. The global and stratified alpha will be reported. Confirmatory factor analysis will be conducted to analyze factor structure and validity. Relevant model fit indices will be obtained and considered. Convergent and discriminant validity will also be analyzed and reported. Conclusions and Implications: The anticipated benefits of this research include a better understanding of social support experiences of older residents of long-term care facilities. The revised and adapted scale is expected to be able to more accurately identify levels of social support, for research and clinical purposes.

### ARE OLDER PEOPLE LIVING ALONE AT RISK IN TERMS OF HEALTH OR HEALTH SERVICE USE?

A. O'Hanlon[1,2], H. McGee[2], A. Hickey[2], *1. Dundalk Institute of Technology, Dundalk, Ireland, 2. Royal College of Surgeons in Ireland, Dublin, Ireland*

Living alone is an increasingly common experience for older people but it is unclear if this readily-identifiable characteristic should be considered a marker of risk by health and social service professionals. A nationally representative sample of community based older people (n=2,033; 68% response) were interviewed in their homes. Measures included household composition, health and health service use. Those living alone were more functionally impaired than those living with partners only and those in extended family groups. They also reported less support and higher levels of loneliness. However, those in extended family groups reported higher levels of support than others, but also higher levels of depression. No differences in general practitioner or hospital use were found among groups. Those living alone were more likely to avail of home services such as home help, while those in extended family groups were more likely to avail of community services such as hearing and dietician services. Living alone can be a marker of risk in terms of health and health service use. However, health and social service professionals should not always assume adequate psychosocial well-being for those living in extended family groups.

### SOCIAL SUPPORT DEFICIENCY IN HOME CARE CLIENTS

D.A. Forbes[1], M. Gibson[2,1], P. Montague[3], J. Hirdes[4], K. Clark[5], *1. Nursing, University of Western Ontario, London, Ontario, Canada, 2. Parkwood Hospital, St. Joseph's Health Care London, London, Ontario, Canada, 3. Custom Analytica, Guelph, Ontario, Canada, 4. University of Waterloo, Waterloo, Ontario, Canada, 5. Conestoga College, Waterloo, Ontario, Canada*

People in poor health tend to experience a reduction in social support as they age. The purpose of this research was to explore: (i) how social support deficiency (SSD) differs in male and female long-term home care clients; and (ii) how SSD is associated with health outcomes and use of health services in those who receive long-term home care services and the difference in men compared to women? Data from the Resident Assessment Instrument for Home Care (RAI-HC) was used. An Ontario, Canada sample was drawn from the fiscal years April 2006 to March 2007 and included 32,042 men and 68,852 women. Fourteen RAI-HC variables that reflected social support deficiency were identified. From a gender perspective, univariate and logistic regression analyses revealed that levels of SSD were similarly distributed in men and women, however, the variables tended to reflect social isolation in women and relationship issues in men. Interventions targeting these differences will be described. Significant, independent associations were found between SSD and a variety of health and service outcomes. Of concern is the finding that clients with fewer or no informal support received less home care services and day care compared to whose with greater social support. These clients may be particularly vulnerable to poor health outcomes. The RAI-HC instrument can be used to identify men and women who are deficient in social support. Approaches, supports and policies can then be implemented that aim to address the deficiency.

### TRANSITIONS IN HEALTH CONSULTATION NETWORKS AMONG ELDERLY RECIPIENTS OF LONG TERM CARE

K. Abbott[1,2], J. Prvu Bettger[1,2], A. Hanlon[1], G. Flanigan[1], M.D. Naylor[1,2], *1. University of Pennsylvania - School of Nursing, Philadelphia, Pennsylvania, 2. NewCourtland Center for Transitions and Health, Philadelphia, Pennsylvania*

We examined change in the size of health consultation networks (HCN) among elders receiving long-term care (LTC) services in three types of settings. Data were gathered through quarterly interviews with elders who had recently moved into a nursing home (NH), assisted living facility (ALF), or started to receive home and community based services (H&CBS). Elders identified people they consulted about symptom or disease information, what the doctor said, and about consulting health care providers. Data was analyzed for 208 adults enrolled in these three LTC options and interviewed at baseline, 12 months, and at least two of the three other interviews (3, 6 or 9 months). Generalized Estimated Equations were used to model repeated measures of HCN size as a function of baseline age, gender, self-rated health, functional status, depression, LTC setting, and cognitive status. On average, elders were 81 years of age and 72% were female with 12 years of education. One-third of the sample moved to ALF, 17% to NH, and 50% were receiving H&CBS. Bivariate analysis demonstrated that HCN size decreased over time ($p = .025$). Multivariate analysis show predictors of decreased HCN size were lower functional status ($p=.05$), lower cognitive status ($p= .004$), and being in a NH ($p=.002$). Findings show that HCN size decreases over time, which could lead to less support. Those who are in NH have the smallest HCN followed by ALF with H&CBS having the largest HCN. Facilitators and barriers to maintaining or increasing HCN size in elders receiving LTC are discussed.

## SESSION 2385 (SYMPOSIUM)

### TRANSITIONING TO HOME CARE: HEALTH AND FUNCTIONAL STATUS CHALLENGES AND SOLUTIONS

Chair: *K.H. Bowles, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*
Co-Chair: *M. O'Connor, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*
Discussant: *K.H. Bowles, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

The experience for older adults transitioning to home care services is filled with challenges especially when the elder suffers from impaired functional status. Poor functional status is a prevailing risk factor for hospital admission and readmission. To compound this problem, hospitalization places elders at risk for further decline. This symposium reflects the interdisciplinary and collaborative research concerning geriatric transitions in care conducted by investigators in the University of Pennsylvania New Courtland Center for Transitions and Health. A state of the science describing the relationship between functional status and acute care hospitalization is presented as background then two potential solutions to combat declines in functional status and quality of life are presented in the remaining two papers. The first intervention, telehomecare is an emerging technological tool where medical devices and video technology are placed in patient homes and used by the patient daily to transmit data to the home health agency via the elder's telephone line. Results from an NIH funded randomized control trial will be presented to show the impact of telehomecare on the quality of life of heart failure patients. Next, results from an NIA funded study of the Transitional Care Model will elucidate the impact of advanced practice nurses working with hospital and community providers to support the transition of the cognitively impaired elder to home. This symposium highlights the functional status and quality of life needs of older adults and details two home based interventions that support the transition from hospital to home.

### THE RELATIONSHIP BETWEEN FUNCTIONAL STATUS AND HOSPITALIZATION AMONG GERIATRIC HOME CARE RECIPIENTS

M. O'Connor, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

This state of the science presents a synthesis of published empirical evidence regarding the relationship between functional status and hospitalization and includes a discussion of the latest strategies used to combat functional decline among elders living in the community. Thirty-one studies were reviewed between the years 2000 and 2010 and ranged from randomized controlled trials to feasibility pilots. Poor functional status is a prevailing factor in predicting hospital admission. Moreover, 30 to 60% of elders will experience further decline during a hospitalization, with decline beginning as early as day two. Strategies to overcome functional decline include assistive technology and home modification interventions, advance practice nurse-administered post-hospitalization management, telerehabilitation, functional decline risk assessments, and high intensity home-based progressive strength training programs. Further research is needed to discover the most effective ways to improve functional status and how to efficiently structure home care services to reduce hospitalization among this chronically ill population.

### TRANSITIONAL CARE FROM HOSPITAL TO HOME: COGNITIVELY IMPAIRED OLDER ADULTS AND FAMILY CAREGIVERS

K.B. Hirschman, M. Bixby, E. McPartland, K.H. Bowles, C. Bradway, K. McCauley, M.D. Naylor, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Hospitalized older adults with cognitive impairment (CI) typically experience prolonged hospital stays, higher rates of complications, increased hospital readmissions and higher health care costs. Available evidence suggests that this population may benefit from interventions aimed at improving care management of both CI and co-morbid conditions. One potential intervention to improve transitions and health outcomes for this population is the Transitional Care Model (TCM) in which nurses work with the team of providers at the hospital and in the community to transition the patient home (average 1-3 months). Using a prospective cross-sectional design study, hospitalized older adults with deficits in orientation, recall or executive function or who had a diagnosis of dementia and who had a family caregiver were enrolled during an acute hospitalization. Changes in health status over time (through 24 weeks) for the first 150 dyads who received the TCM intervention will be presented.

### THE EFFECT OF TELEHOMECARE ON HEALTH STATUS

K.H. Bowles, *School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Older adults hospitalized with heart failure were randomly assigned to skilled home care or skilled home care with telehealth (TH) (use of wireless blood pressure cuffs, scales, glucometers, pulse oximeters). Patients used the equipment daily and agency nurses monitored the data and interacted via video phones. The control group received skilled home care with in-person nurse visits. 218 patients were enrolled and assessed for 6 months for health status using the Kansas City Cardiomyopathy Questionnaire (KCCQ). The KCCQ is a 23 item questionnaire that quantifies physical limitation; symptom frequency, severity, and change over time; quality of life; social interference; self-efficacy and knowledge. A 5 point change in score is clinically significant. Control group patients had statistically and clinically significant improvements in symptom burden (mean 80 (SD23) vs 68 (SD27), p.03) and social limitation (mean 69(SD31) versus 52(SD36), p=.03). Use of telehealth had no effect on any of the KCCQ measures.

## SESSION 2390 (PAPER)

## VIOLENCE AND SELF-NEGLECT

### CORONER INVESTIGATIONS OF SUSPICIOUS ELDER DEATHS IN CALIFORNIA

A. Wiglesworth, L. Mosqueda, R. Austin, *Program in Geriatrics, University fo California, Irvine, Orange, California*

The decision by Coroner's and Medical Examiner's offices to investigate a suspicious elder death can be particularly challenging since disease and death are more likely with advanced age. Little work has been done to study this issue, despite evidence from research and Elder Death Review Teams that homicides due to physical abuse and neglect of elders go undetected. In an ongoing study, the 58 county coroner/medical examiner's offices in California were contacted to invite their participation in a phone survey. The purpose of the survey was to ask about decision-making processes currently used for assuming jurisdiction over a reported elder death. The counties were also asked for data associated with elder death investigations. Forty-seven counties participated and 31 shared their data on elder death investigations, autopsies and homicides. Survey questions covered a variety of issues such as current intake screening methods and staffing. Data were converted to ratios based on elder deaths in the county for the same year, so that they could be compared across counties. Participation was confidential and findings are reported by numbers of counties and groupings by county size. For example, there were more elderly homicides per total number of elderly deaths and more homicides per total number of autopsied cases in larger and medium-sized counties ($p<.05$ and $p<.001$, respectively). The final phase of the study will pilot test a brief questionnaire to be used by those who dispatch coroner investigators, evaluating its effectiveness in selecting suspicious elder deaths for further investigation and autopsy.

### A PROSPECTIVE POPULATION-BASED STUDY OF RACIAL/ETHNIC DISPARITY IN ELDER SELF-NEGLECT AND ALL-CAUSE MORTALITY

X. Dong[1], M.A. Simon[2], T. Fulmer[3], C. Mendes De Leon[1], D. Evans[1], *1. Rush University, Chicago, Illinois, 2. Northwesern University, Chicago, Illinois, 3. New York University, New York, New York*

Background: Elder self-neglect is associated with increased mortality. Report of elder self-neglect is more common among black older adults. However, the racial/ethnic differences in the association of elder self-neglect and mortality remain unclear. Methods: Chicago Healthy Aging Project (CHAP) is a prospective population-based cohort study conducted from 1993 to 2005. A subset of these participants had suspected self-neglect reported to social services agency. Mortality was ascertained during follow up and the National Death Index. Cox proportional hazard models were used to assess the black (non-Hispanic black) and white (non-Hispanic white) differences in elder self-neglect to mortality risk using time-varying covariate analyses. Results: There were 5,811 (63.8%) black older adults and 3,293 (36.2%) white older adults. Of the 1,461 reports of self-neglect from 1993 to 2005, 1,291 (88.4%) were black older adults and 170 (11.6%) white older adults. In multivariable analyses, reported self-neglect was associated with a significant increased risk of 1-year mortality in black older adults (HR, 7.99(6.99-9.12)) and in white older adults (HR, 4.56(3.35-6.21)). Mortality risk was lower but still elevated after 1 year for black older adults (HR, 2.62(2.21-3.13)) and white older adults (HR, 1.52(1.08-2.12)). Confirmed self-neglect was also associated with increased mortality. Reported and confirmed self-neglect was associated with increased mortality risk across multiple medical conditions in both black and white older adults. Conclusion: Black and white older adults with self-neglect reported to social services agency were both associated with increased risk of mortality. This increased mortality risk may be higher among black older adults.

### MID AND LATER LIFE INTIMATE PARTNER HOMICIDE SUICIDE: THE ROLE OF FIREARMS AND POLICY

S. Salari, *Family & Consumer Studies, University of Utah, Salt Lake City, Utah*

Intimate partner homicide suicide (IPHS) constitutes a psychological transition to commit fatal domestic violence followed by self abuse. This research focused on the methods used to end life in these events. Suicide represents a controlled, but potentially impulsive end of life decision. In contrast, the homicide victim is often unaware and unable to defend themselves. Firearm use significantly increases the lethality of the event. Quantitative and qualitative content analyses are used to examine 402 murder suicide events (830 deaths) among middle aged and elderly dyads collected from a national archive of news articles, transcripts, police reports and obituaries 1999-2005. Dyads are compared by age of oldest member 1) middle aged (age 45-59 n=177) or 2) elderly (age 60+, n=225). Most perpetrators were men (middle aged 91% and elderly 96%) and used firearms (91% and 88%), but some perpetrators used mixed methods. Primary intent (suicide vs. homicide) differed by perpetrator age, with older perpetrators characterized as more suicidal. Consensual suicide pacts and mercy killings (CDC defined) were rare (1% middle aged and 4% elderly). Illness was cited for elderly (55%) more than middle aged dyads (9%), but 30% of sick elderly and 70% of middle aged couples had only a perpetrator who was ill. State by state firearm restrictions and gun culture were examined with respect to mid and later life IPHS. Regions with greater firearm restriction and enforcement had fewer events. Implications suggest access to guns in the home should be limited among those who are at risk of IPHS.

### EXAMINATION OF DIRECT AND INTERACTION EFFECTS OF AGE GROUPS AND COPING STRATEGIES ON SUICIDAL IDEATION AND DEPRESSION AMONG KOREAN ELDERLY: A TWO-WAY ANOVA REPORT

M. Chun, *Social Work, Chongshin University, Kangnam-ku,, Seoul, Republic of Korea*

Based on the Life-course theory, it was suspected that different age cohorts among Korean elderly would use different coping strategies which subsequently affect their mental health, such as depression or suicidal ideation. This study examined the effect of age groups and coping strategies on suicidal ideation and depression. Research hypotheses were: 1) The older the age group, the lower the levels of problem-focused coping and the higher the levels of depression and suicidal ideation; 2) The older the age group, the higher the levels of emotion-focused coping and the higher the levels of depression and suicidal ideation. To examine these hypotheses, a sample of 247 elderly persons in Korea was interviewed using a structured questionnaire. For the analysis, the two-way ANOVA was conducted. The results indicated that according to the problem-focused coping model analysis, age groups and problem-focused coping showed direct effects on suicidal ideation and depression, however, interaction effects of age groups and problem-focused coping were only found in the depression. Additionally, the use of emotion-focused coping influenced the higher levels of suicidal ideation and depression. Age group only affected the levels of suicidal ideation in the emotion-focused model. In sum, the levels of suicidal ideation and depression were affected by the age groups and by the use of coping strategies. The results of this study suggest that to better manage suicidal ideation and depression among elderly persons in Korea, it is beneficial to pay attention to the use of coping strategies by different age groups.

## SESSION 2395 (PAPER)

## VULNERABILITY

### HOW TO BETTER ASSESS INDIVIDUALS' VULNERABILITY FOR ACTIVITY-RELATED PAIN INCREASE IN DEMENTIA

R. Kaspar, *Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt am Main, Germany*

Guidelines for pain assessment in severe dementia suggest using observational tools under calm and activated conditions. Psychometric preconditions for comparing scores across observed conditions, however, often go untested. Objective. To assess the vulnerability of nursing home residents suffering from dementia to experience increased pain in activation. Method. Nursing staff observed N=196 residents with varying degrees of cognitive functioning (MMSE 12,5±10,0) using a total of 39 pain indicators extracted from the Pain Assessment in Advanced Dementia (PAINAD) and Checklist of Nonverbal Pain Indicators (CNPI) scales. Latent variable modeling with categorical indicators was used to estimate and compare item diagnostics across calm and activated conditions. A latent difference component model was employed to estimate an individual's vulnerability to experience augmented pain under activation. Results. Only a subset of pain behaviors satisfied both reliability and measurement invariance and therefore qualified as indicators for activity-related pain change. Estimated pain severity in activation was half a standard deviation in excess of baseline (i.e in rest). Impairment in ADL functioning was only marginally related to pain increase under activation. Non-cognitive dementia symptoms, however, were predictive for both pain at rest and pain change. Discussion. On the basis of these results, neither of the inventories could be suggested for the assessment of activity-related pain change without qualifications. The findings can be used as an item bank to inform the construction of more goal-specific pain observation tools in dementia. Evidence for substantial confounding of pain behavior and agitation questions the validity of intensity-oriented pain observation in dementia.

### DISPARITY IN DISABILITY BETWEEN NATIVE BORN NON-HISPANIC WHITE AND FOREIGN BORN ASIAN OLDER ADULTS IN THE UNITED STATES: EFFECTS OF EDUCATIONAL ATTAINMENT AND AGE AT IMMIGRATION

M. Lee, *Dept. of Sociology, Chung-Ang University, Seoul, Republic of Korea*

Objectives. The purposes of this study were to compare disability of native born non-Hispanic White and foreign born Asian older adults in the United States and examine if and how educational attainment and age at immigration are associated with disability of foreign born Asian older adults. Methods. 2006 American Community Survey Public Use Microdata Sample (ACS PUMS) was analyzed by logistic regression techniques. Results. Logistic regression analyses reveal that educational attainment has differential effects across the two groups. Foreign born Asian older adults are likely to have disability more than native born White counterparts with same educational levels in general. Also, foreign born Asian older adults are less likely to have disability if they migrated earlier in life time. Interestingly, testing interactions between age at immigration and educational attainment for foreign born Asian older adults shows that early migration is beneficial to less educated older adults. Discussion. The study shows that educational attainment has differential effects not only between the two racial groups but also within the Asian group by timing of immigration. Elaborated theoretical frame and careful analytic approach are required to explain immigrant health dynamics in the United States.

### TRAUMATIC BRAIN INJURY IN OLDER ADULTS: NEWLY RELEASED NATIONAL ESTIMATES

L.C. McGuire, M. Faul, M. Wald, L. Xu, V. Coronado, S. Basavaraju, V. Kapil, *CDC, Atlanta, Georgia*

For U.S. adults 65 years old and older, approximately 5.8 million persons in 2006, reported at least one fall during the preceding 3 months. For this age group, falls are the leading cause of all injuries and the leading external cause of traumatic brain injury (TBI). Our presentation will describe the latest national incidence numbers, rates, and trends of TBI and fall-related TBIs among U.S. adults aged ≥ 65 years old. Data from the 2002-2006 National Hospital Ambulatory Medical Care Survey, National Hospital Discharge Survey, and the National Vital Statistics System was used. Our findings indicated that annually, 1.7 million people sustained a TBI. Of those with a TBI, approximately 52,000 died, 275,000 were hospitalized, and 1.3 million were treated and released from an emergency department. For older adults (≥ 65 years old), 237,844 people received a TBI and 14,347 died, 81,500 were hospitalized, and 141,998 were treated and released from emergency departments. Approximately 60% of TBIs among persons aged ≥ 65 years old were fall related compared to 35% in the general population. The trends from 2002-2006 for fall-related TBI visits to emergency departments increased while hospitalizations and deaths remained relatively stable. Our presentation will discuss modifiable fall-related risk factors that have a potential to decrease the likelihood of fall-related TBIs and methods that caregivers can use to help older adults live better lives and stay independent through TBI education and prevention activities.

### SEVERITY OF DEPRESSIVE SYMPTOMS BEFORE AND AFTER FIRST STROKE: EFFECTS OF GENDER AND OTHER FACTORS

M. McCarthy[1], J. Newsom[1], N. Huguet[1], M.S. Kaplan[1], B. McFarland[2], *1. Portland State University, Portland, Oregon, 2. Oregon Health and Science University, Portland, Oregon*

Depression is the most common psychological condition associated with stroke, affecting approximately 33% of survivors. While the association between stroke and depression is well-established, it is less clear whether stroke, with its associated physical and social sequela, contributes to survivors' experiences of depression or whether, conversely, depression contributes to stroke risk. This presentation describes preliminary analyses of the Health and Retirement Study with respect to this issue. The CES-D was used to assess depression symptomatology before and after stroke in 8 waves (1992 to 2006) of a nationally representative sample of adults aged 50 to 85 (N = 302). Results indicated that, while the severity of men's depression did not change significantly after stroke (n = 152, mean difference = .05, ns), the severity of women's depression increased significantly at the trend level (n = 150, mean difference = .34, $p < .10$). Hierarchical lagged regression was used to control for known correlates of post-stroke depression including demographic factors, premorbid depression, and post-stroke ADL dependence and self-rated health. The final model accounted for approximately 48% of the variance in post-stroke depression (R2 = .48, $p < .001$) and, after controlling for these factors, female gender remained a significant independent predictor of post-stroke depression ($\beta = .09$, b = .38, $p < .05$). Further analyses of other physical and psychosocial factors are underway but these findings, derived from an extremely rich longitudinal dataset, provide evidence about the direction of the relationship between stroke and depression and the potential influence of gender.

## SESSION 2400 (SYMPOSIUM)

### EXPLICATING INEQUALITY: APPLYING THE THEORY OF CUMULATIVE INEQUALITY FROM CELL TO SOCIETY

Chair: *T. Kruger, Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

The theory of cumulative inequality (CI), as outlined by Ferraro and colleagues (Ferraro & Shippee, 2009), provides an evidence-based and intuitively appealing framework under which gerontological research can be conducted at any level, from cell to society. In this symposium three scholars will present the findings that indicate the applicability of CI to a wide range of research in the field of aging. First, through the lens of Alzheimer's disease, Rodney Guttmann will discuss the evidence regarding the unequal accumulation of genetic and cellular risk and protective factors over the life course that differentially predispose older adults to positive or negative outcomes. Next, Tina Kruger will discuss the unequal accumulation of risk and protective factors at the level of the individual, highlighting the processes by which personal factors such as prenatal and early childhood experiences, educational attainment, engagement in exercise and appropriate diet as well as mental activity throughout life provide cognitive protection or increased risk of cognitive decline in old age. This symposium will conclude with Amanda Sokan's presentation on the accumulation of social/societal risk and protective factors across the lifespan and how such unequal accrual affects an older adult's likelihood of being abused or mistreated. This symposium will contribute to the development of CI theory as requested by Ferraro as well as incorporating a bidirectional component to CI, highlighting how biological processes affect individual and societal outcomes rather than focusing solely on the biological implications of societal forces as Ferraro describes.

### ACCUMULATION OF INEQUALITY WITHIN PERSONS: HOW INTRA-INDIVIDUAL FACTORS BUILD OVER THE LIFECOURSE TO AFFECT RISK OF COGNITIVE DECLINE

T. Kruger, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

The unequal accumulation of risk and protective factors at the level of the individual greatly affect the likelihood that a person will age with their cognition intact or experience significant cognitive decline or dementia. In this presentation I highlight the processes by which intra-individual factors such as prenatal and early childhood experiences, educational attainment, exercise habits and diet as well as patterns of mental activity throughout life accumulate unequally both within a person and across people to provide cognitive protection or increased risk of cognitive decline in old age. Furthermore, I address the bidirectional nature of the relationship between societal factors and the biological features that accumulate unequally across the lifecourse to influence each person's cognitive outcomes. This discussion furthers the work of Ferraro and colleagues on Cumulative Inequality by stressing the relevance of the accumulation of inequality within a person over the lifecourse to cognitive outcomes in old age.

### ACCUMULATION OF INEQUALITY AT THE CELLULAR LEVEL AND RISK MODULATION OF ALZHEIMER'S DISEASE

R. Guttmann, *1. Gerontology, University of Kentucky, Lexington, Kentucky, 2. Sanders-Brown Center on Aging, Lexington, Kentucky*

Cumulative inequality begins at conception, as the shuffled genetic material from haploid cells pair together to form each human being. Although Alzheimer's Disease (AD) is a disease of the aged, we are discovering that genetic makeup as well as the environment in which genes are expressed impact the likelihood of developing or avoiding AD. Many genetic contributions (e.g., APOE, APP) have been discovered through observation of inheritance patterns and modern DNA methodologies that likely protect from or contribute to AD. Additionally, there are numerous heritable traits that may affect, for example, levels of motivation, blood pressure, and risk of diabetes that are also likely to accumulate unequally over the lifecourse and increase or decrease one's risk of AD. Thus, through the lens of AD, we suggest cumulative inequality theory to be a usable framework for the study of aging from cell to society.

### THE NOTION OF ACCUMULATION: HOW RISK/PROTECTIVE FACTORS DETERMINE ELDER MISTREATMENT POTENTIAL

A.E. Sokan, *Graduate Center for Gerontology, University of Kentucky, Lexington, Kentucky*

Cumulative inequality theory posits that social systems produce inequalities, which, subject to available resources and human agency, accumulate and influence lifecourse trajectories with advantages increasing an individual's exposure to opportunity and disadvantages increasing exposure to risk (Ferraro & Shippee, 2009). This notion of accumulation of inequalities provides a means to understand the potential for elder mistreatment as the result of a complex balancing of personal risks (negatives) and opportunities (positives) that the potential victim and perpetrator have accumulated over time. The result is a system of checks and balances in which an abundance of positives is protective against mistreatment while the abundance of negatives creates disequilibrium - conditions for the "perfect storm," leading to mistreatment.

Understanding the role of accumulation may help explain how and why factors work to protect older adults or trigger abuse and illuminate how risk indicators can be used to predict mistreatment, ultimately informing preventive strategies.

## SESSION 2405 (PAPER)

## KEY CONCEPTS IN PHYSICAL PERFORMANCE

### PREDICTION OF MINOR SOFT TISSUE INJURIES IN OLDER COMMUNITY-LIVING PEOPLE: AN EXPLORATIVE STUDY

I. Logghe[2,1], A. Verhagen[1,6], A. Rademaker[2], S. Bierma-Zeinstra[1], E. Van Rossum[3,4], M. Faber[5], B. Koes[1], *1. Departement of General Practice, Erasmus MC, Rotterdam, Netherlands, 2. Avans University of Applied Sciences, Research Group Gerontology, Breda, Netherlands, 3. Department of Health Care and Nursing Science, Faculty of Health, Medicine and Life Sciences, Maastricht University, Maastricht, Netherlands, 4. Zuyd University of Applied Sciences, Centre of Research on Autonomy and Participation, Heerlen, Netherlands, 5. Scientific Institute for Quality of Healthcare, Radboud University Nijmegen Medical Centre, Nijmegen, Netherlands, 6. Avans University of Applied Sciences, School of Health, Breda, Netherlands*

Background. Few studies have investigated risk factors for minor fall related injuries. Clinicians may use predictive information on minor fall related soft tissue injuries to refine their referral to a full falls risk assessment. Objective. To evaluate which circumstances are related to falls and to build a predictive model for falls related to minor soft tissue injuries in community–living people with high fall risk. Methods. Participants (n=269) filled out a fall calendar on a daily basis for one year, including circumstances and consequences of falls. Prior to analyses possible predictors for minor soft tissue related injuries were identified from literature. Multivariate logistic regression techniques were used to build predictive models related to these injuries. Results. Over a period of 12 months 205 falls were reported of which 108 were injurious. Most injurious falls resulted in minor soft tissue injuries (94%); six falls resulted in a fracture. The most common fall type were falls on level due to slipping, tripping and stumbling (38%). In a model for clinical usage including age, female sex, previous falls and fear of falling the AUC was 0.67 (95% CI 0.59-0.75). Conclusion. Preliminary results show that most falls resulted in minor soft tissue injuries. The probability in which falls in community-living people with high fall risk will be related to minor soft tissue injury can predicted with a model. After validation, this model could be used to refine referral to a full falls risk assessment.

### THE RELATIONSHIP OF VITALITY WITH ADL AND IADL DISABILITY IN MEXICAN AMERICAN OLDER ADULTS

G.D. Weaver, K. Ottenbacher, *Rehabilitation Sciences, University of Texas Medical Branch, Galveston, Texas*

Evidence suggests that low vitality (lack of energy, tiredness) is a common health complaint among older adults. This study examined the extent of vitality in Mexican American community-dwelling older adults. It also examined if vitality was independently associated with disability status after accounting for the effects of socio-demographic characteristics, muscle strength, mobility (rapid walk & repeated chair stands), body mass, depressive symptoms, cognitive status, and chronic medical conditions. A cross-sectional study of a subsample of the Hispanic Established Population for Epidemiologic Study of the Elderly was conducted on 791 participants, ages 75-100 years. Bilingual interviewers administered structured questionnaires and physical measures of mobility performance and muscle strength. ADL and IADL indexes were used to measure disability status. A subscale from the SF-36 Health Survey was used to measure extent of vitality in the last four weeks. Chi square and multiple linear regression analyses were performed. Moderate to low vitality was reported by 26% of men and 42% of women. Regression analyses showed that vitality maintains its independent association with ADL ($\beta$=-.14, p<.001) and IADL ($\beta$=-.27, p<.001) disability after controlling for all covariates. However, ADL disability was most strongly associated with repeated chair stands, rapid walk and hand grip strength, while vitality and cognitive status were the strongest predictors of IADL disability. These findings support previous research that vitality is common among older adults and that vitality is an important indicator of ADL and IADL disability status along with gender, repeated chair stands, hand grip strength, and cognitive status.

### AEROBIC EXERCISE IMPROVES ORTHOSTATIC TOLERANCE IN OLDER ADULTS WITH TYPE 2 DIABETES

K. Madden[1,2], C. Lockhart[1,2], T. Potter[1], D. Cuff[1,2], *1. Medicine, University of British Columbia, Vancouver, British Columbia, Canada, 2. VITALiTY (Vancouver Initiative to Add Life To Years) Research Laboratory, Vancouver, British Columbia, Canada*

**BACKGROUND:** Previous investigations of aerobic exercise as treatment for orthostatic intolerance have shown mixed results, demonstrating either an improvement or a worsening of orthostatic tolerance with training. We examined whether aerobic exercise improved orthostatic tolerance in older adults with Type 2 diabetes. **METHODS:** Forty older adults (25 males and 15 females, mean age 73.4±0.7, ranging in age from 65 to 83) with diet-controlled or oral hypoglycemic-controlled Type 2 diabetes were recruited. Subjects were randomized to each of 2 groups: an aerobic group (AT, 3 months vigorous aerobic exercise), and a non-aerobic group (NA, no aerobic exercise). Exercise sessions were supervised by a certified exercise trainer 3 times per week, and utilized a combination of cycle ergometers and treadmills. After being given 400 micrograms of sublingual nitroglycerin (GTN), each subject was placed in a 70 degree head-up tilt for 30 minutes. **RESULTS:** When the two groups were compared using a Cox proportional hazards model (with length of time on the tilt table on the x-axis), tilt table tolerance (TTT) at baseline was no different between the NA group and the AT group ($\chi^2_{MC}$=1.309; p=0.253). After 3 months vigorous training TTT was significantly better in the AT group as compared to the NA group ($\chi^2_{MC}$=7.271, p=0.007). After the exercise intervention, the AT group demonstrated an average tilt table duration of 22.29±2.32 minutes as compared to 13.22±2.07 minutes for the NA group. **CONCLUSIONS:** Our findings indicate that a relatively short aerobic exercise intervention can improve orthostatic tolerance in older adults with Type 2 diabetes.

### PHYSICAL PERFORMANCE AMONG OLDER ADULT MEN: THE PRIEST STUDY

D. Klima[1], R.A. Newton[2], A. Davey[2], E. Keshner[2], *1. UMES, Princess Anne, Maryland, 2. Temple University, Philadelphia, Pennsylvania*

Purpose/Hypothesis: Studies examining physical performance among older adult men remain limited. The purpose of this study was to compare gait and balance ability among two cohorts of Roman Catholic priests(age 60-74 years of age and 75+ years) and to confirm the hypothesized prediction that markers used to traditionally track the frailty trajectory (body mass index, physical activity, and grip strength) would significantly contribute to balance and gait performance among the clergy. Participants: Subjects included 131 community-dwelling Roman Catholic priests over 60 (x= 76.1 yrs;SD=9.0;range:60-97 yrs) living in rectories, senior housing, or religious communities in 10 states. Materials/Methods: Subjects completed a basic demographic profile, the Berg Balance Scale (BBS), Timed Up and Go (TUG) Test, and the Dynamic Gait Index (DGI). Additional assessments included BMI, blood pressure, grip strength, and the Physical Activity Scale for the Elderly (PASE). Data were analyzed using descriptive statistics, ANOVA tests, and multiple regression modeling. Significance was set at the 0.05 level. Results: Demographic profiles revealed that 46 subjects (35%) had fallen over the past year. Eighty-six (65%) subjects were taking four or more medications. Significant differences (p<0.001) in physical performance between the younger (n=56) and older age cohorts (n=75) were noted on the BBS(53.4+/-4.8 vs. 45.5+/-7.5), TUG(10.4 sec.+/-2.3 vs. 13.4 sec.+/-4.2), and DGI(22.6+/-2.6 vs. 19.0+/-4.2) respectively. Multiple regression analysis demonstrated that BMI, grip strength, and physical activity predicted 32% of the variance in the BBS, 29% of the variance in the DGI, and 22% of the variance in the TUG(all p<0.001). Conclusions: Physical activity, BMI, and grip strength are predictive determinants of the functional profile of the older adult priest. Data findings suggest that markers of frailty should be addressed in tandem with common tests of physical performance to establish target interventions for balance, gait, and functional mobility.

## SESSION 2410 (PAPER)

### MEDICATIONS IN CHRONIC DISEASE MANAGEMENT

### MEDICATION ADHERENCE EXPERIENCES AND CHALLENGES AMONG OLDER ADULTS LIVING WITH HIV/AIDS AND CO-MORBIDITIES

E.H. Anderson[1], R. Fortinsky[2], T. Pare[1], J. Song[1], *1. School of Nursing, University of Connecticut, Storrs, Connecticut, 2. Center for Aging University of Connecticut Health Center, Farmington, Connecticut*

Background: Adults aged >50 years (older adults by CDC definition) represent a growing proportion of the U.S. population living with HIV/AIDS. Adherence to anti-retroviral therapy (ART), required to improve immune system function, is especially important for older adults living with HIV/AIDS due to increased likelihood of comorbid conditions that could compromise health status. Little is known about medication-related challenges among older adults living with HIV/AIDS and other co-morbidities. Therefore, we asked an open-ended question about this topic as part of a larger study. Methods: Older adults with HIV/AIDS and other co-morbidities were recruited from clinics and community-based centers. Using the phenomenological method, audiotaped interviews were conducted until saturation; three independent reviewers identified significant phrases, formulated meanings, and developed themes regarding ART adherence. Results: 56 subjects completed interviews (39% female; 41% African-American, 30% Caucasian, 22% Hispanic). Seven themes emerged from 249 significant phrases: Constant Battle; Motivators to Adherence; Missing Doses Won't Hurt; I Do What I Have to Do Like Clockwork; Side Effects; Mood-Adherence Interactions; and What Condition (HIV or co-morbidity) Is More Life-threatening. Motivators to adherence included having insurance, desire for quality of life, and family relations. Adherence ranged from leniency with missed doses to medication regimens imbedded in their minds. Negative moods and side effects reduced adherence, while positive moods and encouraging motivators improved adherence. Some individuals valued medications for heart disease and diabetes more than HIV medications. Conclusions: Results suggest that a variety of psychological and environmental factors must be addressed to assist older adults with ART adherence.

### ARE PATIENTS WITH DEMENTIA LESS LIKELY TO RECEIVE RECOMMENDED DIABETES CARE?

C. Thorpe[1], J.M. Thorpe[2], A. Kind[1], M.A. Smith[1], *1. University of Wisconsin School of Medicine and Public Health, Dept. of Population Health Sciences, Madison, Wisconsin, 2. University of Wisconsin School of Pharmacy, Division of Social and Administrative Sciences, Madison, Wisconsin*

Diabetes treatment guidelines for complex, older patients recommend less stringent disease control, but continued monitoring of HbA1c, cardiovascular risk, and diabetes complications. In dementia patients, receipt of these care processes can inform treatment decisions and may minimize further decline of cognition, function, and quality of life. However, it is unclear if and when dementia patients receive these processes. We analyzed 2003-2004 Medicare claims and electronic health records for 4,091 fee-for-service diabetes patients receiving outpatient care within a large academic group practice, to determine whether receipt of diabetes care processes in 2004 differed for patients with and without dementia, and factors associated with receipt of these processes in dementia patients. Multivariate logistic regression models, adjusted for clustering within clinics, included socio-demographics, co-morbidities, HCC risk score, and diabetes complications assessed in 2003. 321 (8%) patients had dementia per an established claims-based approach. Dementia patients tended to be older, female, and have greater co-morbidity. 80% of dementia patients received ≥1 A1c test, 40% received ≥1 LDL test, and 35% received an eye exam, versus 87%, 71%, and 40% of non-demented patients, respectively. After adjustment, patients with dementia were less likely to receive A1c tests (OR=0.59, p<.01), LDL tests (OR=0.37, p<.01), and eye exams (OR=0.83, p<.05). Older age, higher HCC risk score, depression, and absence of hypertension reduced likelihood of receiving an LDL test for dementia patients. More research is needed to understand reasons for reduced diabetes monitoring in patients with dementia and how this impacts patient functioning, adverse events, and quality of life.

### DOES INCREASED MEDICATION ADHERENCE LOWER MEDICARE SPENDING AMONG BENEFICIARIES WITH CONGESTIVE HEART FAILURE?

J. Lloyd[1], J. Shoemaker[1], R. Lopert[2], A.J. Davidoff[1], B. Stuart[1], T. Shaffer[1], *1. University of Maryland, Baltimore, Baltimore, Maryland, 2. Therapeutic Goods Administration, Woden, Australian Capital Territory, Australia*

Background: Hospitalizations attributed to heart failure cost the Medicare program 10 billion dollars in 2007. Better disease management through adherence is postulated to result in lower Medicare expenditures. Objective. To measure medication adherence for recommended heart failure medications and to assess whether higher adherence is associated with lower Medicare spending, controlling for biases common to previous adherence studies. Data Source: Medicare Current Beneficiary Survey (1997-2005) Study Design. Longitudinal study of renin-angiotensin-aldosterone system (RAAS) inhibitors, beta blockers, diuretics, and cardiac glycosides utilization over 3 years in 2,310 beneficiaries with heart failure. Adherence to heart failure medications is measured by three-year medication possession ratios (MPR). Data Collection. Relationship between MPR and Medicare costs was tested among users in a sequence of uncensored multivariate models with extensive behavioral variables to control for healthy adherer effects and reverse causality. Principal Findings. Over three years, median MPR values ranged from 0.77 for RAAS, to 0.28 for cardiac glycosides. The highest reduction in Medicare spending was found for cardiac glycosides with a 10-point increase in MPR being associated with a reduction of $2318 Medicare spending (p<.01). Additionally, a 10-point increase in MPR for beta blockers, diuretics, and RAAS similarly reduced Medicare spending by $861 (p<.01), $520 (p<.01) and $390 (p<.05), respectively. Conclusions. Greater adherence to treatment heart failure medications by Medicare beneficiaries with heart failure is associated with lower cumulative Medicare spending over three years.

### ELDERS' RATE OF HOSPITALIZATIONS AND COSTS OF MEDICATIONS

J.H. Van Cleave, K. Abbott, A.L. Hanlon, M.D. Naylor, *University of Pennsylvania, Philadelphia, Pennsylvania*

Purpose: Illustrating the relationship between elders' rate of hospitalizations and inability to obtain medications due to costs may inform public policy and practice. The primary aim of this study was to examine the relationship between elders' report of medication costs as a barrier to filling prescriptions and hospitalizations per three month period. Sample: Elders (mean age 82.4) newly enrolled in long term care (LTC) residing in assisted living facilities (N=158) and nursing homes (N=105) in northeastern United States. Methods: Baseline data from LTC patients enrolled in a study of natural history of changes in Health Related Quality of Life. Chronic illnesses and hospitalizations were abstracted from medical records. Activities of daily living (ADL), symptoms, depression and demographic data were gathered by patient self report. Elders were also asked to rank from 1 to 5 whether costs prevented filling prescriptions (1=strongly agree, 5=strongly disagree). Statistical analysis: Descriptive statistics and regression analysis using Poisson distribution with number of hospitalizations as outcome variable. Results: Greater than 85% of elders in this study agreed that costs prevented filling their prescriptions. While controlling for age, race, facility type, depressive symptoms, ADL, total co-morbidities, and functional status, those who strongly agreed that costs prevented them from filling their prescriptions had significantly higher number of hospitalizations during previous three months than those strongly disagreeing (p<0.001). Conclusion: These results suggest a high prevalence of elders newly enrolled in long term care report that costs of medications prevent filling prescriptions and this may be associated with rate of hospitalizations.

## SESSION 2415 (PAPER)

### PSYCHOSOCIAL FACTORS AND HEALTHCARE

### EFFICACY OF PSYCHOSOCIAL GROUP REHABILITATION ON LONELY, OLDER PEOPLE: A RANDOMIZED, CONTROLLED TRIAL

K.H. Pitkala[1,2], P. Routasalo[1,2], H. Kautiainen[3], R.S. Tilvis[4,2], *1. University of Helsinki, Department of General Practice, University of Helsinki, Finland, 2. The Central Union for the Welfare of the Aged, Helsinki, Finland, 3. Orton Foundation, Helsinki, Finland, 4. University of Helsinki, Department of General Internal Medicine and Geriatrics, Helsinki, Finland*

Introduction: Loneliness predicts impaired cognition, well-being and health, and survival. The aim of this study is to determine efficacy of psychosocial group rehabilitation on lonely older individuals. Methods and material: This multicenter trial included 235 older people (>74 years) suffering from loneliness randomized into intervention and control arms. Rehabilitation groups (7-8 participants + two professional leaders) met once a week for 3 months (12 times). Intervention based on closed group dynamics aimed to empower participants, to enhance their self-efficacy, and to promote their social engagement. Subjects participated in activities according to their interests 1) Therapeutic writing 2) Exercise, and 3) Art. Results: Mean age was 80 years, 73% were females. Psychological well-being score improved significantly in the intervention group compared to the control group. The ADAS-Cog scale improved more in the intervention group than in the control group, with mean changes of -2.5 points (95%CI -3.2 to -1.8) and -1.3 points (95%CI -1.9 to -0.7), respectively. At two years, survival was 97% in the intervention group and 90% in the control group (p=0.047) (Adjusted HR 0.39, 95% CI 0.15 to 0.98). The intervention group had significantly lower health costs in 2-year follow-up: the difference between the groups was -943 [|#8364#|]/person per year; (95% CI -1955 to -127; p=0.039). Conclusions: Intervention improved lonely older people's health, psychological well-being, and cognition, and reduced their mortality and use of health services.

### HEALTH CARE AIDES' PERCEPTIONS OF RAI-MDS 2.0 FEEDBACK REPORTS

A.E. Sales[1], H.M. Jerke[1], M.B. Baylon[1], C. Schalm[2], G. Gao[1], *1. Faculty of Nursing, University of Alberta, Edmonton, Alberta, Canada, 2. Shepherd's Care Foundation, Edmonton, Alberta, Canada*

Background: The Resident Assessment Instrument-Minimum Data Set (RAI-MDS 2.0) is a long-term care (LTC) resident assessment tool. Resident health and functional status information from the RAI-MDS 2.0 may be used to improve quality of care. However, LTC organizations rarely use RAI-MDS 2.0 data to inform health care aides (HCAs), who represent 70% of LTC care providers, about their respective unit's performance. Objectives: To describe how HCAs in long-term care facilities respond to feedback reports focused on improving quality of care and to understand (i) HCA perceptions of comprehensibility and utility of the feedback reports and (ii) the influence of these reports on self-reported intent to change behavior. Methods: We delivered monthly RAI-MDS 2.0 feedback reports to HCAs in four LTC facilities for 13 months. Reports described a unit's performance compared to the eight other units in the study in relation to falls, depression, and pain. Post-feedback report surveys captured HCA perceptions of the feedback report and intent to change practice behavior. Results: Preliminary results indicate that over half of the HCAs surveyed found the report useful (51% to 74% per cycle) and those perceptions of utility showed an increasing trend over time. Responses were frequently more positive about intent to change practice behavior than about usefulness of the report (66% to 84% per cycle). Conclusions: This suggests that RAI-MDS 2.0 data can be presented to HCAs in a way that they find useful and has an influence on their intent to change behavior. Future analysis will examine whether intent to change behavior is correlated with changes in resident outcomes over time.

### SELF-REPORTED AGE-RELATED EYE DISEASE AND VISUAL IMPAIRMENT IN THE NYC SENIOR CENTER POPULATION

L. Evans, M.C. Fahs, *Hunter College / City University of New York, Hunter Brookdale Center for Healthy Aging & Longevity, New York, New York*

The National Eye Institute estimates the number of Americans with age-related eye disease and vision impairment will double within the next three decades. Visual disability lowers one's quality of life and reduces functional ability, increasing risk for depression, falls and social isolation. Yet determinants of prevalence and eye care utilization across racial/ethnic groups remain under-studied. In this presentation, we report results from a representative sample (n=1870) of the NYC senior center population. The estimated lifetime prevalences for diagnosed eye diseases are: cataract, 54.42%; glaucoma, 17.61%; macular degeneration 5.97%; and diabetic retinopathy, 5.43%. Analyses reveal striking differences by ethnicity. Compared to their white counterparts, African Americans were 3.972 times more likely to have been diagnosed with diabetic retinopathy (95% CI 2.256, 6.992; p < .0001); those of Hispanic/Latino ethnicity were 2.619 times more likely (95% CI 1.462, 4.691; p < .0012). Factors related to appropriate eye care utilization include gender; men were .576 times less likely than women to have utilized eye care within in the past two years (95% CI .437, .759; p <.0001). Further results of multi-level models will be presented. These analyses underscore the pressing need to improve older adult eye care across gender and ethnicity. Results may help inform effective prevention strategies to increase eye care utilization and reduce disability in the aging population.

### FACTORS ASSOCIATED WITH HOSPITALIZATION AMONG OLDER LATINO ADULTS

B. Meisner[1], L. Trejo[2], J. Wang[3], J. Frank[3], C. Sarkisian[3], *1. York University, School of Kinesiology & Health Science, Toronto, Ontario, Canada, 2. City of Los Angeles, Department of Aging, Los Angeles, California, 3. UCLA, Division of Geriatrics, Los Angeles, California*

BACKGROUND/OBJECTIVE: Older Latinos are the fastest growing sociodemographic group in the United States and it is important to understand which older Latinos are most likely to be hospitalized. This study explores demographic, biomedical, and psychosocial factors as associates of hospitalization among sedentary older Latinos. METHODS: In-person interviews were conducted with sedentary Latinos aged >=60 years, recruited from 27 Los Angeles senior centers participating in an exercise intervention (Caminemos!). Logistic regression was used to examine factors relating to hospitalization in the past year (yes/no). Independent variables were age, gender, annual household income, education, and previously-tested measures of aging expectations, intrinsic religiosity, physical and mental health-related quality of life (HRQoL), activities of daily living, co-morbidities, and depression. RESULTS: Mean age was 73 years, 77% were female, 14% reported no formal education, and 15% reported having been hospitalized in the previous year. In the bivariate analyses, low income and education, depression, and activities of daily living impairments were associated with greater odds, while better physical and mental HRQoL were associated with lower odds of previous hospitalization (P<0.05). In a multivariate model, adjusting for all independent variables, only depression and education were independently associated with previous hospitalization: older Latinos with depression had 1.8 greater odds of hospitalization than those without depression (CI=1.0-3.3) and those with no formal education had 2.5 greater odds of hospitalization than those with any education (CI=1.4-4.4). CONCLUSIONS: In this community-based sample of urban older Latinos, having depression and no education were independently associated with hospitalization in the previous year. Funded by National Institute on Aging (5 R01 AG024460-05).

## SESSION 2420 (PAPER)

## THE SCOPE OF DEPRESSION: COMORBIDITIES, INTERVENTIONS AND OUTCOMES

### IMPACT OF COMORBID DEMENTIA ON ANTIDEPRESSANT UTILIZATION IN MEDICARE POPULATION WITH DEPRESSION

H.K. Yang[1], L. Simoni-Wastila[1], G.B. Rattinger[1], I.H. Zuckerman[1], S.W. Lehmann[2], J. Qian[1], S.K. Dutcher[1], B. Stuart[1], *1. Peter Lamy Center on Drug Therapy and Aging, University of Maryland, Baltimore, Baltimore, Maryland, 2. Johns Hopkins University, Baltimore, Maryland*

Objective: To examine how the presence of comorbid dementia impacts antidepressant utilization in depressed Medicare beneficiaries. Methods: We conducted a retrospective analysis of Medicare beneficiaries in the MarketScan Medicare Coordination of Benefits database. The study cohort included beneficiaries ≥ 65 years old, diagnosed with depression, and continuously enrolled from 2006-2007. Using descriptive and regression analyses, we examined the impact of dementia diagnosis on antidepressant utilization and duration of antidepressant therapy, controlling for sociodemographics, hospitalization, physician visits, and comorbidities (using hierarchical condition categories [HCC]). Results: The prevalence of dementia in this depressed Medicare population (n=27,066) was 12.4%. Depressed beneficiaries with dementia were significantly older (79.1 vs. 73.9 years), had more comorbidities (mean HCC=7.1 vs. 5.7), more hospitalization days (12.9 vs. 5.6), and more medications (9.5 vs. 8.4) than their non-demented peers (all p<0.0001). Antidepressant use was 80% among the entire depression elderly cohort, with no difference by dementia status. However, mean duration of antidepressant therapy was significantly shorter for depressed beneficiaries with dementia than those without (507 days vs. 557 days; p<0.0001). Multivariable regression analyses demonstrated that dementia was associated with 4% lower use (p<0.0001) and 3% shorter duration of antidepressant therapy (p=0.0001). Conclusion: Depressed Medicare beneficiaries with dementia were less likely to use any antidepressant medication and use was of shorter duration than non-demented beneficiaries. Older adults with comorbid depression and dementia may be unable to express depressive symptoms and consequently, may receive inadequate treatment. The complexities of caring for this comorbid vulnerable population warrant awareness among practitioners.

### ASSOCIATION BETWEEN DEPRESSION PREVALENCE AND AGE IN A LARGE REPRESENTATIVE GERMAN SAMPLE OF PEOPLE AGED 53 TO 80 YEARS

B. Wild[1], W. Herzog[1], D. Schellberg[1], H. Brenner[2], E. Raum[2], *1. University Hospital Heidelberg, Department of General Internal Medicine and Psychosomatics, Heidelberg, Germany, 2. German Cancer Research Center, Division of Epidemiology and Aging Research, Heidelberg, Germany*

Introduction: The association between depression prevalence in late life and age is controversially discussed. The aim of the study was to determine the association between prevalence of clinically significant depression and age in a large representative sample of elderly German people. Method: In the second follow-up (2005-2007) of the German ESTHER cohort study, the 15-item geriatric depression scale (GDS-15) was administered to a representative sample of 8270 people aged 53 to 80 years. Prevalence of clinically significant depression was estimated using a GDS cut-off score of 5/6. The association between depression prevalence and age was investigated using the age categories [53-59; 60-64; 65-69; 70-74; 75-80]. The final logistic regression model included known risk factors for depression: gender, education, marital status, chronic disease, smoking, physical activity, cognitive impairment, and antidepressive medication. Results: 7897 participants (=95%) completed more than 12 GDS items and were included in the study. The prevalence of clinically significant depression was 15.9% (95%CI = [15.1; 16.7]. In the youngest age group, prevalence of depression was highest compared to the other age groups. Female gender, education of eighth grade or less, being separated, current smoking, multimorbidity, little physical activity, cognitive impairment, and antidepressive medication were significantly associated with higher depression prevalence. Adjusted Odds Ratios for the various age categories still reflected a U-shape association between age and depression. Conclusion: Depression prevalence in late life is associated with age. People older than 59 years have a significantly lower chance to be depressive than people aged 53 to 59 years.

### DEPRESSIVE SYMPTOMS, CHRONIC DISEASE, AND PHYSICAL DISABILITY AS PREDICTORS OF COGNITIVE FUNCTIONING

J. Chodosh[1,2], D. Miller-Martinez[1], C. Aneshensel[3], R.G. Wight[3], A.S. Karlamangla[1], *1. UCLA Division of Geriatrics, Los Angeles, California, 2. VA Greater Los Angeles Healthcare System, Los Angeles, California, 3. Community Health Sciences UCLA, Los Angeles, California*

Objective: The concurrent influence of depressive symptoms, medical conditions, and disabilities in activities of daily living (ADL) upon the rates of decline in older Americans' cognitive function is unknown. Design: This study examined a national sample of 6,476 adults born before 1924 to determine differences in cognitive function trajectories by prevalence and incidence of depressive symptoms, chronic diseases, and ADL disabilities. Cognitive performance was tested 5 times between 1993 and 2002 with a multifaceted inventory that we examined as a global measure (range: 0-35, standard deviation (SD) 6.00) and with word recall (range: 0-20, SD 3.84) analyzed separately. Results: Baseline prevalence of depressive symptoms, stroke, and ADL limitations were each independently and strongly associated with lower baseline cognition scores, but did not predict future cognitive decline. Each incident depressive symptom was independently associated with 0.06 point reduction (95% confidence interval (CI):0.02-0.10) in recall score, incident stroke with 0.59 point reduction in total score (95% CI:0.20-0.98), each new basic ADL limitation with 0.07 point (95% CI:0.01-0.14) reduction in recall score and 0.16 point reduction in total score (95% CI:0.07-0.25), and each incident instrumental ADL limitation with 0.20 point reduction in recall score (95% CI:0.10-0.30) and 0.52 point reduction in total score (95% CI:0.37-0.67). Conclusion: Prevalent and incident depressive symptoms, stroke, and ADL disabilities contribute independently to reductions in cognitive functioning in older Americans, but do not appear to influence rates of future cognitive decline. Therefore, prevention, early identification, and aggressive treatment of these conditions may ameliorate the burdens of cognitive impairment.

### QUALITATIVE FINDINGS FROM A RANDOMIZED CLINICAL TRIAL OF PSYCHOTHERAPY FOR ELDERS WITH DEPRESSION

E.K. Dakin, *School of Social Work, Colorado State University, Fort Collins, Colorado*

One advantage of qualitative research is its ability to elicit valuable data beyond the original, intended area of inquiry. This qualitative study examined the treatment experiences of participants in a 12-week course of psychotherapy as part of an NIMH-funded randomized clinical trial (RCT) comparing Problem Solving Therapy (PST) to Supportive Therapy (ST) for depressed older adults with mild cognitive impairment. In addition to the intended purpose of evaluating the research participants' therapy experiences, this study also revealed meaningful information about ways that their experiences as research subjects in an RCT had impacted their depression. Semi-structured individual qualitative interviews were conducted with 22 older adults with depression and mild cognitive impairment who had participated in the RCT. Individual qualitative interviews elicited participant perspectives about various aspects of their treatment experiences (e.g., expectations regarding treatment, what was most and least helpful about treatment). Interviews were digitally recorded and transcribed, and a transcript analysis was conducted using the qualitative analysis software NVIVO. A useful finding was participants' indication that the research component of the study impacted their treatment experience in both positive and negative ways. For example, some participants found that quarterly neuropsychological assessments associated with the study contributed to a marked increase in depressive symptoms. Findings from this study urge the consideration of possible unintended clinical implications when planning geriatric mental health interventions research. The implications of research participation as a treatment effect in addition to the psychotherapy itself must be considered when translating new psychotherapies from research to community settings.

## SESSION 2425 (SYMPOSIUM)

### USING VIDEO ANIMATION TO ASSESS MOBILITY IN OLDER ADULTS

Chair: *A. Marsh, Health and Exercise Science, Wake Forest University, Winston Salem, North Carolina*

The importance of the context of task performance in the assessment of mobility in older adults is generally understood but there is little empirical evidence that demonstrates how sensitive older adults might be to subtle changes in task demands. We collected data from 234 older adults (mean age=81.9y) on item responses to animated video clips, where mobility-related tasks were modified in a systematic fashion. There was a profound and systematic effect of walking speed, using a handrail while negotiating stairs, walking at different speeds outdoors, and carrying an object on older adults' perception of function, e.g., a three-fold increase in reporting the inability to walk at the fast speed compared to the slow speed for a minute or less. The data provide evidence that the contextual features and demands of a simple task such as stair climbing have a significant impact on older adults' self-reporting of ability related to mobility.

### VIDEO-ANIMATION ITEM BANKING, CALIBRATION, AND SELECTION USING ITEM RESPONSE THEORY

E. Ip, *Biostatistical Sciences, Social Science & Health Policy, Wake Forest University School of Medicine, Winston-Salem, North Carolina*

The development of the Mobility Assessment Tool—MAT-involves several components: (1) item bank of animation-based items, (2) item selection for a short-form, and (3) computerized adaptive test (CAT) implementation. We focus on (1) and (2). Item banking includes: domains identification, item generation and refinement, data collection, and item calibration. Using item response theory (IRT), a sample of 234 of older adults was used to calibrate the items. Based on item performance and other substantive considerations, we selected 10 items from the item bank to form the short form: MAT-sf. The IRT framework provides a rigorous scientific approach to assess mobility and also allows future adaptation of MAT to computer adaptive testing and the assessment of possible differential item bias across different subpopulations. To facilitate the general use of the MAT-sf, both a portable program that could be downloaded to a local computer and a web-based program were developed.

### DEVELOPMENT AND VALIDATION OF A VIDEO-ANIMATED TOOL FOR ASSESSING MOBILITY

W. Rejeski, *Wake Forest University, Winston-Salem, North Carolina*

We describe the development and validation of the Mobility Assessment Tool—MAT-sf—that consists of 10 animated videos. Measures used in validation included the Pepper Assessment Tool for Disability (PAT-D), the Short Physical Performance Battery (SPPB), and 400-m walk test. Participants (166 women, 68 men, average age=81.9y) had a variety of comorbidities. The study sample had evidence of compromised physical function, yet was heterogeneous on the SPPB (Mean = 8.6, range 2-12). The MAT-sf had good content validity, excellent test-retest reliability (r = 0.93), and criterion validity with the PAT-D. The MAT-sf added unique variance to the prediction of SPPB scores and 400-m gait speed over and above the PAT-D mobility subscale. The MAT-sf also discriminated between older adults who completed or failed the 400-m walk test. The MAT-sf is an innovative, psychometrically sound measure of mobility. It has utility in epidemiological studies, translational science, and clinical practice.

## SESSION 2430 (SYMPOSIUM)

### ART CART: DOCUMENTING THE CULTURAL LEGACY OF AGING ARTISTS

Chair: *V.H. Raveis, Psychosocial Research Unit on Health, Aging and the Community, New York University, New York, New York*

Co-Chair: *J. Jeffri, Teachers College Columbia University, New York, New York*

Discussant: *L. Quijano, Colorado State University, Fort Collins, Colorado*

A recent study of professional NYC visual artists (n=146) age 62+ (ABOVE GROUND, www.tc.edu/rcac ), revealed that 61% have made no preparation for their work after their death, 75% have no will, 95% have not archived their work; 75% made no use of services offered by arts service organizations, and 20% have no documentation of their work at all. These statistics are even more alarming due to the fact that more than half feel they have done the best work of their lives. This symposium will describe ART CART, an innovative, intergenerational, arts legacy educational project. ART CART connects aging professional artists with graduate students from different disciplines to undertake the preparation and documentation of the artist's creative work. It offers artists and students an educational experience that will help shape the future of our cultural legacy. Over the course of an academic year, after completing a targeted curriculum in gerontology, teams of students, each working with a single visual artist, document a number of works, guided by standards and tools developed by the Research Center for Arts & Culture and the Joan Mitchell Foundation, e.g., obtaining high-quality digital images and relevant historical, biographical, and artistic background information. A University-wide partnership of graduate programs in Arts Administration, Art Education, Public Health, Social Work, and Occupational Therapy at Columbia University is piloting ART CART, establishing a replicable methodology and comprehensive toolkit to implement this interdisciplinary, intergenerational gerontological educational program in other academic settings throughout the country.

### PERSPECTIVES ON USING THE ARTIST'S STUDIO AS AN EDUCATIONAL RESOURCE

J. Jeffri, *Teachers College Columbia University, New York, New York*

The ABOVE GROUND study revealed an unmet need as artists "transition" into older age and confront end-of-life issues. ART CART represents an innovative educational program that both educates and provides an important service to the aging population while preserving our cultural legacy. By pairing interdisciplinary teams of graduate students with some of the study's aging artists, we help artists document and review their life's work, create a deeper understanding of the aging population across disciplines, and educate younger artists about what it takes to create, cultivate and document work to help them make informed decisions about their professional practice and artistic legacy. Working in an older artist's studio to help the artist document his artistic efforts will give graduate students exposure to the lived experiences of aging artists and hands-on experience applying classroom instruction to a real world setting and will counter positive and negative stereotypes of aging.

### INVOLVING AGING ARTISTS IN INTERDISCIPLINARY ACADEMIC TRAINING AND SERVICE PROGRAMS: LESSONS LEARNED

V.H. Raveis, *Psychosocial Research Unit on Health, Aging and the Community, New York University, New York, New York*

ART CART's intergenerational, educational experience and mentorship in the preservation of artistic and cultural legacy is contributing to the volunteerism and generativity paradigms. The program includes formal course instruction as well as didactic learning experiences. Older artists are actively engaged in the program's instructional activities, serving as exemplars of the continuity and evolution of artistic expression across the life course and challenging students to rethink the way one grows old. In turn, aging artists participating in the program receive assistance in the process of organizing their studios and documenting their work. The presentation will describe ART CART's program components as well as the initiative's strategic planning phase and the development of the interdisciplinary university partnerships. Lessons learned from the program implementation process will be discussed with specific focus on strategies to sustain interdisciplinary academic training and service programs and procedures to facilitate replication of this program in other institutions nationwide.

### ART CART: INTERDISCIPLINARY TEAMWORK TO MAXIMIZE OLDER ADULTS' CONTINUED PARTICIPATION AS ARTISTS

P.A. Miller, *Columbia University, New York, New York*

ART CART, a didactic, community service-learning project, incorporates interdisciplinary teamwork. The project represents an academic partnership involving faculty and students from six different schools. Two-person teams of graduate students from the humanities and allied health sciences are paired with an aging artist. Working in the classroom and artists' studios, the student teams, guided by program faculty, learn together the process of documenting the artists' work, defining and negotiating their role while ensuring that the individual artists are included in collaborative strategies to meet their identified needs, specific objectives and goals. Consistent with adult learning theory, interdisciplinary teamwork and collaborative action research, the team members will ask each other regularly: "To what extent did we meet our objectives today? How might we do better?" This process is ongoing and evaluative. This pilot program illustrates the complementary relationship and combined utility of adult learning theory, interdisciplinary teamwork, and collaborative action research.

### INFUSING GERONTOLOGICAL CONTENT INTO AN INTERDISCIPLINARY ARTS ACADEMIC PROGRAM

V.M. Rizzo, *Columbia University, New York, New York*

Students participating in the ART CART educational program are likely to have limited knowledge of the current aging demographics, theories of aging behavior and human development, social/cultural issues factors related to the aging experience, coping with change and loss, and theoretically based skills that students can apply to their work with the aging artists. These skills include, but are not limited to social work/occupational therapy assessments, communication skills and techniques used for work with older adults, and strategies for teaching older adults new skills, such as the use of the computer software to document their art work. This presentation will describe the infusion of gerontological content into academic course work and the ART CART internship experience to help students gain knowledge about, and experience working with older adults, and aging artists in particular. Participants will be provided with the syllabus for the interdisciplinary graduate course in gerontology specifically designed for students participating in the ART CART Program. We will discuss lessons learned from the implementation of this course in the pilot program. We will also discuss other ways to infuse gerontological content into the program including supervision, collaboration with student organizations focused on aging to sponsor events focused on innovative educational programs in aging and the arts, and presentations by students in the ART CART educational program.

### INTEGRATING FIELD EDUCATION IN SOCIAL WORK WITHIN AN ARTS AND AGING SERVICE PROGRAM

W.B. Nowell, *Columbia University, New York, New York*

For the last ten years with funding from the John A Hartford Foundation, the Social Work Leadership Institute at the New York Academy of Medicine has developed and implemented the Hartford Partnership Program in Aging Education (HPPAE), a specialized rotation model of field education for masters degree level social work students interested in working with the older adult population. Seventy-two U.S. schools of social work currently offer HPPAE in their graduate level programs. Social work students participating in the ART CART internship program are HPPAE Fellows, who will complete their spring internship rotation in the ART CART program. In this presentation, we will discuss the integration of the ART CART educational program into an existing graduate education program specifically designed for social workers interested in the older adult population. We will discuss: 1) how the HPPAE model, training materials, and ongoing evaluation informed the development of the ART CART implementation; 2) how the ART CART program has encouraged further innovation in the existing HPPAE model; and, 3) how the multi-disciplinary faculty/student participation in ART CART has enhanced learning and raised awareness of aging issues across disciplines on the university campus.

## SESSION 2435 (PAPER)

## DISABILITIES IN THE LIVES OF OLDER ADULTS

### PATHWAYS TO SUCCESS: EMPLOYMENT JOURNEYS OF OLDER WORKERS WITH DISABILITIES

N. Shugrue, I.C. Reed, J. Robison, *University of Connecticut Center on Aging, Farmington, Connecticut*

Older adults with disabilities are an often-overlooked group of existing and potential workers, despite having a strong desire to work. The combination of age and disability presents unique challenges for those who wish to remain in or re-enter the workforce. It also presents public policy issues for state and federal governments attempting to encourage employment of older adults and people with disabilities. This qualitative study, funded by the Centers for Medicare and Medicaid Services Medicaid Infrastructure Grant, employs a longitudinal series of in-depth, in-person interviews chronicling the experiences of people with disabilities in their journeys, over time, to find and maintain meaningful, competitive employment. The study began in early 2008 and has continued with interviews at six-month intervals. Twenty-nine people have enrolled in the study, ten of whom (34%) are over the age of 50. Participants were recruited through follow-up telephone calls to people who sought information and assistance from a state-run technical assistance center for people with disabilities. This paper describes results, with particular emphasis on the cohort of adults age 50 and above and how their journeys differ from their younger counterparts. Themes that emerged in the study include employment-related issues such as finding a job, problems on the job due to disability, experiences with external sources providing help, barriers encountered, and the importance of personal and family attitudes. Results for the first two years of the study provide insight into the employment barriers, challenges, and successes of study members, and how they differ by age.

### THE IMPACT OF AGING AND DISABILITY ON LABOR FORCE PARTICIPATION RATES

K. Robinson[1], C. Roehrig[1], D. Klayman[2], K. Lida[3], P. Hughes-Cromwick[1], *1. Altarum Institute, Alexandria, Virginia, 2. Social Dynamics, LLC, Gaithersburg, Maryland, 3. U.S. Department of Labor, Washington, District of Columbia*

Labor force participation (LFP) rates decline steadily after people reach age 50. Using data from the American Community Survey, this study compares LFP rates for employees with disabilities, to those without, to calculate a ratio to estimate labor force years lost to disability. Between ages 50 and 60, 20 percent of the decline is attributable to increased prevalence of disabilities; and by age 70, only a small portion of the decline is attributable to disabilities. The types of disabilities that have the greatest impact on LFP are difficulty walking, dressing, and doing errands; least impact, difficulty seeing and hearing. Disabilities associated with concentrating, while a significant barrier to LFP, do not grow in prevalence between the ages of 50 and 75. As more people, especially women, remain in the labor force past age 50, these findings will help policymakers better understand the growing trend in older workers with disabilities.

### FRAILTY, DISABILITY AND OLD AGE: A REAPPRAISAL

P. Higgs, C.J. Gilleard, *Research Strategy, UCL, London, United Kingdom*

Frailty has become a topic of increasing interest in health care. No longer treated as a catch-all term for agedness, decline and disablement it has acquired a more precise definition, applied to those individuals whose ‘aged’ state is seen to put them at risk of adverse outcomes. This transformation is we argue the outcome of a more general differentiation of terms that were previously used to categorise the weak and marginal within society. Old age now labelled as ‘later life’ has become re-articulated as a successful life stage relatively free from impairment. Disability has been re-positioned and its links with impairment attenuated while chronic illness has acquired a new narrative of its own. This has left frailty behind, redolent still with all the old negative attributes of marginality, but now more than ever evacuated of any remaining elements of ‘status’ or ‘agency’. Frailty is defined less by the identities of those who are deemed frail than by what frailty seems to augur in its direction of travel – a journey toward unspecified adverse outcomes. This re-positioning, we suggest, helps lay the foundation of a social imaginary of ‘the fourth age’.

# SESSION 2440 (PAPER)

## FAMILIES AND SOCIAL RELATIONSHIPS

### THE GRANDPARENT-GRANDCHILD INTERACTION AND ITS IMPACT ON GRANDPARENTS’ WELL-BEING

S. Won, *Social Welfare, Daegu Cyber University, Gyeongsan, Republic of Korea*

Grandparents are considered a resource in the family because they provide alternative child care support and serve as role models for grandchildren. Thus, the purpose of this study was to identify factors associated with the closeness between the grandparent and the grandchild. Also, the researcher sought factors affecting the association between the grandparent-grandchild relationship and the grandparent’s well-being. This study conducted secondary data analysis using the National Survey of Families and Households (NSFH). Structural Equation Modeling (SEM) was applied to address the relationship among variables. Findings indicated that grandparents who spent more nights with their grandchild had lower levels of the well-being than those who rarely spent nights with their grandchild. On the other hand, frequency of communication, frequency of meeting, and the grandparent’s self-rating of closeness with his or her grandchild were positively related to the well-being of grandparents. Thus, it is assumed that the grandparents’ well-being increased up to the point where grandparenting became a burden for them. In this study, spending nights with the grandchild without the parent of the child seems to be the point where the grandparents start feeling burdened. This study suggested that social support should target both custodial and noncustodial grandparents because noncustodial grandparents who put great effort into child care feel the same kind of stress as custodial grandparents. In addition, cultural diversity should be considered in work with grandparent caregivers because various factors are associated with the well-being of the grandparents.

### INTIMATE PARTNER VIOLENCE AND OLDER WOMEN: A EUROPEAN STUDY

B. Penhale[1], T. Goergen[2], B. Nagele[3], B. Haller[4], H. Perista[5], M. Halicki[6], O. Toth[7], *1. Centre for Health & Social Care Studies, University of Sheffield, Sheffield, United Kingdom, 2. German Police University, Munster, Germany, 3. Zoom NGO, Gottingen, Germany, 4. IKF (Institute of Conflict Research), Vienna, Austria, 5. CESIS NGO, Lisbon, Portugal, 6. University of Bialystok, Bialystok, Poland, 7. Hungarian Academy of Sciences, Budapest, Hungary*

This EU-funded (Daphne III programme) study on Intimate Partner Violence (IPV) and Older women includes partners from Austria, Germany, Great Britain, Hungary, Poland, and Portugal. The study runs between January 2009 and December 2010 and addresses the question to what extent women aged sixty or older experience violence by partners or ex-partners (intimate partner violence), what kind of help and support they seek and receive and what kind of support they need. Until now, comparatively little is known about this issue and this research will help to address that knowledge deficit. The first phase of the study consisted of data collection about IPV and older women from a variety of sources (criminal justice agencies, social services etc) in each country. Phase two consisted of a survey of organizations about the extent to which they have worked with older women who have experienced IPV since 2006 and a number of interviews were held with professionals who had experience of work in this area. The final phase consists of interviews with a small number of older women who have experienced IPV in later life. This presentation will outline the method and content of the study. Findings from the different phases will be presented. This will be followed by discussion of some of the issues raised by the topic and the research. This paper will provide participants with an understanding of the key issues relating to Intimate Partner Violence and older women in Europe. It will provide opportunities for international discussion and comparison.

### AGE AND LONELINESS: A COMPARATIVE ANALYSIS OF 25 EUROPEAN COUNTRIES

C. Victor[1], K. Yang[2], *1. Brunel University, Uxbridge, United Kingdom, 2. Durham University, Durham, United Kingdom*

Background: The relationship between age and loneliness is intriguing. While loneliness is perceived as a problem of old age, there is some evidence suggesting that the peak age for experiencing loneliness is adolescence. Examining this relationship demonstrates more complexity if we adopt a cross-national perspective. Data for examining both the prevalence of loneliness across age groups and a range of nation states are sparse. This exploratory study describes the prevalence of loneliness across different age groups in twenty-five European nations, focussing upon those aged 65+. Method: Analysis of 3rd wave of the 2006/7 European Social Survey which included a 'self rating' loneliness scale asked of all 47,099 participating adults aged 16+. Results: Significant' loneliness demonstrates an 'age-related' linear trend from 6.9% (aged 15-19) to 16.9% (aged 80+): the trend for intermediate loneliness is U-shaped with the highest rate, 29.5%, reported by those aged 20-29. We developed a tripartite typology of countries based upon age-related trends and levels of significant loneliness thus: (a) Western and Northern European countries with age related linear trend but low prevalence rates (6% aged 65+); (b) Eastern European countries with the same pattern but high prevalence rates (25% aged 65+); and (c) a diverse range of countries with a U-shaped distribution with the youngest and the oldest groups reporting the highest levels of loneliness Conclusions: We need to examine the common features among countries included in our differing groups as a first step towards explaining these significant variations in loneliness in later life across Europe.

### FRAMING SOCIAL ISOLATION IN LATER LIFE: A LIFE COURSE PERSPECTIVE

D. Cloutier-Fisher, K. Kobayashi, *Geography and Centre on Aging, University of Victoria, Victoria, British Columbia, Canada*

According to the literature being socially integrated is health promoting, while social isolation increases individual vulnerability in relation to health and well-being. Social isolation refers to having limited access to positive social supports. This paper uses a life course perspective (LCP) to frame our understanding of how the risk of social isolation is influenced by the interplay between occupational, family and geographical trajectories and not just the size of support networks in later life. An interdisciplinary research team analyzed data from qualitative interviews with 27 older adults living on Vancouver Island, British Columbia. The results, organized into four categories, underscore the importance of personal identity (e.g., preferences for solitude vs. social integration), support network composition (e.g., the nature of social relationships), life transitions and trajectories (e.g., work and family) and geographical/environmental characteristics (e.g., residential mobility of families) as key influences on experiences of social isolation. Findings indicate that older adults are a very diverse group and relationships in later life are highly variable. The LCP is an appropriate analytical framework for examining the highly complex, multilayered nature of social isolation, an experience that cannot simply be understood with reference to the number of friends or family one has to rely upon. Policymakers must remain attentive to the diversity of individual characteristics and experiences among older adults, acknowledging the insights that emerge from such individuals' narrated life histories in order to more fully interpret the meaning of social isolation and its implications for health and well-being in later life.

## SESSION 2445 (PAPER)

## HOSPICE UTILIZATION

### STATE POLICIES ON FREESTANDING HOSPICE FACILITIES

K. Chung, E.L. Essex, J. Jung, I. Sheelam, *Governors State University, University Park, Illinois*

While hospices usually provide care at patients' homes, one in 5 hospices also operate facilities. Particularly, a recent growth in the number of freestanding hospice facilities (FHF) is noticeable. FHFs are defined as freestanding facilities (not in a hospital or a nursing home) owned and operated by hospices that also operate home hospice programs. Despite this new trend, no systematic study has been done on the state policies that may affect the supply and the geographical distribution of FHFs. To identify classification themes for the policies, we examined state hospice licensure law, certificate of need (CON) law, and administrative rules on FHF licensure applications. This examination has led to the identification of seven themes for classifying FHF state policies: 1) whether state licensure law recognizes FHF as a licensure type; 2) whether state licensure law limits the number of FHFs; 3) whether state licensure law specifies rules that will ensure an equitable distribution of FHFs; 4) whether there is a CON law requiring the permission for establishing FHFs; 5) whether a state imposes a bed-number limit on a FHF; 6) whether there are distinctions in the bed type (e.g., a bed licensed for inpatient care only, or a dual bed licensed for both residential and inpatient uses); 7) whether there are reimbursement policies for Medicaid eligibles who stay in FHFs. This study will help state policy makers compare their own policies with other states' and adopt features that are most relevant to their evolving circumstances surrounding the supply/demand for FHFs.

### THE ROLE OF HOSPICE IN MAINTAINING RESIDENTS IN ASSISTED LIVING

D.J. Dobbs, *School of Aging Studies, University of South Florida, Tampa, Florida*

In these times of fiscal constraint, state policymakers find it necessary to provide the most cost effective LTC. In Florida, assisted living (AL) is a LTC option that is potentially more cost effective than a nursing home (NH). The provision of hospice care in AL may be a way to reduce state costs of LTC while providing necessary palliative care to residents. This study conducted Cox proportional hazards regression models to estimate risk of NH placement over a 2-year study period (2005-2007) (N=2,615). The Cox model was used to estimate whether the risk of discharge varied according to individual covariates (age in years, gender, 12 month total Medicaid claims, race, Charlson Comorbidity baseline index, hospice use, and hospital use, and facility covariates (for profit status, bed size category, geographic location, and licensure type). Datasets included FL Medicaid Utilization files, Hospice Medicaid claims data, publicly available provider information and vital statistics. Approximately 22% of decedents had used Medicaid hospice while residing in AL. There were 720 (27.5%) who had the event of discharge to NH. Individual covariates that increased the risk of discharge to NH included female, increased 12 month total Medicaid claims, White race, higher CCI score, and receiving hospice. Facility covariates that increased the risk of discharge included urban location, larger bed size category, and limited mental health license. Implications for the role of hospice in maintaining residents in AL will be discussed.

# SESSION 2450 (PAPER)

## SPIRITUALITY AND RELIGION - SRPP PAPER SESSION

### COMPARING THE ASSOCIATIONS OF WELLBEING, FAITH AND RELIGIOUS PRACTICE DURING MIDLIFE AND OLDER LIFE

C. Waldegrave, *Family Centre Social Policy Research Unit, Wellington, New Zealand*

The aim of this research is to identify the drivers of wellbeing and quality of life among the midlife and the older population. Amartya Sen's capabilities approach has formed the conceptual basis of the theoretical framework (Sen, 1999). This paper will report on the results of a study of ageing and wellbeing with two national random samples of 1,680 New Zealanders aged 65 to 84 years and 1,958 aged 40 to 64 years, using computer assisted technology interviewing (CATI). A theory driven approach to the survey questionnaire construction led to the selection of the domains of wellbeing, which included faith and religious practice. These variables were compared with a range of objective and subjective wellbeing measures, including the World Values Survey Life Satisfaction Question and various leisure pursuits. For the older group, significant associations were found between the importance of faith, religious practice and wellbeing. A higher than expected number of older people considered faith to be important to them. Strong gender and significant cultural differences were found. Other important associations included the importance of faith and particular community involvement and leisure pursuits. For the midlife group similar significant associations were found, but fewer were affiliated to some form religion and considered faith to be important. Gender differences were less apparent. The results demonstrate significant associations between faith, religious activities and wellbeing. The findings are particularly important given the general neglect of this area of satisfaction and wellbeing for many older people in ageing research and public policy environments.

### SPIRITUALITY IN CHINESE CONTEXT: A PERSPECTIVE FROM ELDERS AND THEIR RELATIVES IN HONG KONG

C. Chan[1], “. Lou[2], S. Fok[1], A. Tsui[1], *1. Elderly Services Section, Community Services Division, Tung Wah Group of Hospitals (TWGHs), Hong Kong, Hong Kong, 2. Department of Social Work & Social Administration, Sau Po Center on Ageing, The University of Hong Kong, Hong Kong, Hong Kong*

Aims: Spirituality is the basic dimension of human development and plays an important role in performing a holistic care of the human being. This study aims to explore the elder's views on the perception and conceptualization toward spirituality in Chinese context. Method: Four focus groups were run that guided by a semi-structured interview guideline. Participants were purposefully recruited from residential homes and community centres run by TWGHs including elders, staff and carers. Results: In the views of the Chinese older adults and their caregivers, the conceptualization of spirituality is in line with Chinese collective culture tradition such as family-oriented and relationship-directed with very limited religious element. Traditional Confucian value also guided them to interaction with those complex social relations. Maintaining a harmonious relationship is a way to achieve their spirituality and optimal being in life. The framework of Chinese spirituality model is then developed, which conceptualizes spirituality as a dynamic status of purposing harmonious relationships between the person and his/her environment. This includes his/her ancestors, and/or "God", the nature, the people around and him/herself. Conclusion: The findings of the current study suggest that from elders' and their relatives' perspective, the concept of spirituality in Chinese context should be understood in regard with relation-orientation and interdependent self-construct of Chinese people. Emphasis on helping elders to expand harmonious relationships with different systems can improve their spirituality in holistic care.

### FACTORS RELATED TO JEWISH AND CHRISTIAN ELDERS HELP SEEKING FROM CLERGY VERSUS FORMAL MENTAL HEALTH SERVICES

J. Pickard[1], F. Tang[2], *1. Universtiy of Missouri-St. Louis, St Louis, Missouri, 2. University of Pittsburgh, Pittsburgh, Pennsylvania*

Background: Clergy provide substantial amounts of counseling services to older adults, and they are an important component of the de facto system of mental health services. The purpose of this study was to determine which factors are predictive of older adults' seeking help from clergy versus other forms of mental health counseling. Methods: This study used the Andersen's behavioral model of health service utilization. Data were from the Naturally Occurring Retirement Community (NORC) Demonstration Project in which study participants (N=317) were over age 65 and lived in the community; 65% were Jewish, 25.6% were Christian, and 9.5% reported another or no faith tradition. Multinomial logistic regression was used to compare sources from which help was sought. Results: Study participants reported seeking help from clergy at rates greater than from other sources. Younger age, higher levels of intrinsic religiosity, and greater feelings of stress were associated with seeking help from clergy versus not seeking help. Feelings of stress and attendance at religious services were positively associated with seeking help from a formal source versus not seeking help. Those most frequently attending religious services were likely to seek help from clergy rather than from other formal sources. No differences were found between Jewish and Christian participants. Discussion: The demand for limited resources will leave a shortage of trained workers to address older adults' mental health issues. This shortage requires creative solutions, such as public private partnerships in which mental health professionals can help clergy better to identify problems and make referrals.

### FACTORS RELATED TO CLERGY REFERRAL OF OLDER ADULTS FOR MENTAL HEALTH SERVICES

J. Pickard, *Universtiy of Missouri-St. Louis, St Louis, Missouri*

Background: Clergy provide large amounts of counseling and mental health services to older adults experiencing emotional upset, yet at times clergy need to refer older adults for more in-depth mental health services. The purpose of this study is to determine what factors are associated with clergy referral of older adults to social workers and other professionals for further mental health services. Methods: This study employed Dillman's tailored design method (Dillman, 2007). Clergy from St Louis City and County (N=521) completed the survey that included basic demographic information, questions regarding training, relationships with mental health professionals, and a 7-item measure of attitudes toward older adults and mental illness. Logistic regression was used to test the hypothesis that clergy with more positive attitudes toward older adults' mental illness are more likely to refer older adults that they counsel for further help from mental health professionals. Results: Results indicate that clergy who report better relationships with mental health professionals, those with higher levels of education, females, and those reporting more positive attitudes toward older adults' mental illness are more likely to refer older adults to further help from mental health professionals. Discussion: To help improve the efficacy of this important part of the de facto mental health system, social workers should consider taking the lead in reaching out to clergy to improve relationships and to help reduce stigmas and misinformation regarding older adults and issues of mental health.

## SESSION 2455 (SYMPOSIUM)

### THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF): A NEW RESOURCE ON A KEY SECTOR OF THE LONG-TERM CARE INDUSTRY

Chair: *L. Harris-Kojetin, National Center for Health Statistics, Hyattsville, Maryland*
Co-Chair: *E. Rosenoff, Office of the Assistant Secretary for Planning and Evaluation, U.S. Department of Health and Human Services, Washington, District of Columbia*

The aging of the U.S. population, particularly those 85 and older, will lead to an increase in the number of people who need long-term care services and supports. This is especially true for people who can no longer live alone but do not require the skilled level of care provided by a nursing home. No national data collection effort exists for residential care settings, yet previous estimates suggest their magnitude may rival that of nursing homes. This symposium introduces a first time nationally representative survey by the federal government—conducted by the U.S. Department of Health and Human Services—that focuses on residential care facilities and residents. The main goals of NSRCF are to estimate the size of the U.S. residential care industry and determine the characteristics of facilities and residents. This symposium will inform the research community about NSRCF and future data availability, as the results will be of interest to policy makers, researchers, and providers. Individual presentations in this symposium will cover: 1. Purpose and Goals of NSRCF; 2. Sample Design and Sample Frame Development for NSRCF; 3. Data Collection Approach, Challenges, and Experience on NSRCF; and, 4. Overview of Content in NSRCF.

### PURPOSE AND GOALS OF THE NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF)

E. Rosenoff[1], L. Harris-Kojetin[2], *1. US DHHS- Assistant Secretary for Planning and Evaluation, Washington, District of Columbia, 2. National Center for Health Statistics, Hyattsville, Maryland*

This presentation highlights the need for NSRCF, explains why the U.S. Department of Health and Human Services is conducting NSRCF, and describes the goals of NSRCF. A shift in Medicaid long-term care policy towards community-based care over the past 30 years and independent growth in private-pay residential care since the late 1980s have led to a growing, yet still not clearly understood, set of alternatives to care provided at home and in nursing homes. NSRCF fills a gap in our knowledge of the long-term care system by providing estimates of the universe of residential care places (e.g., assisted living, board and care homes, etc.) and the characteristics of people living in these settings. Collecting this information is critical because it is impossible to understand the changing dynamics of long-term care without a complete picture of the entire spectrum of options available to elders who need assistance with daily living activities.

### SAMPLE DESIGN AND SAMPLE FRAME DEVELOPMENT FOR THE NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF)

J. Wiener[1], A.M. Greene[1], L.J. Lux[1], R.E. Johnson[1], E. Rosenoff[2], *1. RTI International, Washington, District of Columbia, 2. U.S. Department of Health and Human Services, Washington, District of Columbia*

Constructing the sample frame and sample design for the NSRCF was complicated. Definitions and nomenclature regarding residential care facilities (RCFs) vary widely across states. Two difficult issues in applying the study definition of RCFs were identifying and excluding licensure categories that exclusively serve persons with intellectual disabilities or severe mental illnesses and determining whether the regulations required 24-hour care supervision. Obtaining lists of licensed facilities, contact information, owners, administrators, and other information was an arduous process involving extensive interaction with state officials. Developing an effective sample design was challenging because of the large number of small facilities that accounted for a small proportion of beds. Criteria to evaluate alternative designs included their ability to detect differences of varying magnitudes. The final study design is a random sample stratified by bed size with a goal of obtaining 2,250 facility interviews and 8,190 interviews about residents.

### DATA COLLECTION APPROACH, CHALLENGES, AND EXPERIENCE OF THE 2010 NSRCF

M. Sengupta, A. Moss, E. Park-Lee, C. Caffrey, L. Harris-Kojetin, *CDC/NCHS, Hyattsville, Maryland*

A new establishment survey presents new challenges in data collection, requiring practical and innovative approaches to enhance the field experience. This presentation will outline the challenges during data collection, and the strategies and tools used to overcome these challenges, in the context of the first national survey of residential care facilities. These include approaches to improve response to the survey and to enhance data quality. Approximately 2,250 facilities were selected for the study to be representative of all state-regulated residential care and other assisted living providers in the United States with four or more beds. Within participating sampled facilities, between three and six residents were randomly sampled per facility, based on facility size. Between April and October 2010, in-person interviews were conducted with residential care administrators and their staffs to collect information about the facilities and residents; no residents were interviewed.

### CONTENT OF THE 2010 NATIONAL SURVEY OF RESIDENTIAL CARE FACILITIES (NSRCF)

C. Caffrey[1], E. Park-Lee[1], E. Rosenoff[2], L. Harris-Kojetin[1], *1. National Center for Health Statistics, Hyattsville, Maryland, 2. Assistant Secretary for Planning and Evaluation (ASPE), Washington, District of Columbia*

This presentation provides an in-depth look at the content collected in the NSRCF and provides examples of potential policy and practice-relevant topics that may be explored using the data. NSRCF will collect facility level information as well information on sampled residents. Using data from NSRCF, researchers and policymakers will be able to describe facility characteristics, services provided, and fees charged; describe the socio-demographic characteristics and physical and cognitive functioning of residents; and compare these facility and resident characteristics by facility size or geographic region. Of interest for researchers, providers, and policymakers, it will also be possible to explore special topics, such as electronic information systems, end-of-life care, medication management, dementia special care units, staffing, admission and discharge policies, use of Medicaid coverage for services, emergent care use, and vaccination programs. The presentation will also discuss the limitations in survey content.

## SESSION 2460 (SYMPOSIUM)

### THE MONEY FOLLOWS THE PERSON REBALANCING DEMONSTRATION: FINDINGS FROM NATIONAL AND STATE EVALUATIONS

Chair: *J. Robison, University of Connecticut Health Center, Farmington, Connecticut*
Co-Chair: *S. Simon, Mathematica Policy Research, Inc, Washington, District of Columbia*
Discussant: *D. Lipson, Mathematica Policy Research, Inc, Washington, District of Columbia*

The Money Follows the Person Rebalancing Demonstration (MFP) is a multi-year, 30 grantee program, funded by the Centers for Medicare and Medicaid Services (CMS), seeking to help states shift long term care (LTC) Medicaid services from a historical institutional orientation to greater use of Home and Community-Based Services (HCBS). All participating states set benchmark goals for transitioning people out of nursing homes and other institutional settings and for increasing the proportion of Medicaid LTC dollars spent on HCBS, in addition to other state-specific benchmarks related to rebalancing. The national MFP evaluation examines extensive financial, quality of care and quality of life data for participants who transition out of institutions at multiple time points. Further, many ongoing state-level evaluations examine other aspects of the transition process and their own success at reaching state-specific goals. This symposium includes one paper with results from the national evaluation and two papers from MFP state evaluations. The national evaluation paper presents quality of life data collected from residents of institutions prior to transition to the community. A second paper addresses the myriad challenges to transitioning out of an institution, collected by the Connecticut MFP evaluators. The third paper focuses on the economic impact of an MFP-supported program in Arkansas, identifying Medicaid recipients living in the community in need of HCBS, and diverting them from institutionalization. Taken together, these three papers illustrate the broad reach of MFP to demonstrate long term care rebalancing on a large scale.

### INSTITUTIONAL QUALITY OF LIFE AMONG MONEY FOLLOWS THE PERSON PARTICIPANTS: VARIATION ACROSS POPULATIONS

S. Simon, C. Irvin, *Mathematica Policy Research, Cambridge, Massachusetts*

Because transition to the community is likely to have a differential effect across target populations, the objective of this paper is to examine variation in quality of life across institutional long-term care settings for MFP participants prior to transition to the community. We examined a cross-section of 999 participants' MFP-Quality of Life survey responses prior to discharge from an institutional setting. Our initial analyses indicate that, in terms of general satisfaction with the way they live their lives in institutional settings and help received in the institution, younger nursing home residents (under age 65) and elderly nursing home residents (aged 65 and older) were significantly less satisfied compared with residents of ICFs-MR. Due to lower levels of self-reported quality of life, younger nursing home residents may be the most interested in participating in transition programs and have the greatest potential for improvement in quality of life.

### CHALLENGES TO TRANSITIONING OUT OF AN INSTITUTION: FINDINGS FROM THE CONNECTICUT MFP PROGRAM

J. Robison[1], M. Porter[1], N. Shugrue[1], D. Lambert[2], *1. University of Connecticut Health Center, Farmington, Connecticut, 2. CT Department of Social Services, Hartford, Connecticut*

Almost 200 people moved from institutions to the community during the first 14 months of Connecticut's Money Follows the Person Rebalancing Demonstration. Transitions took from 3 days to almost a year. Further, over 350 cases closed without transitioning. Numerous challenges arise that slow or even prevent transitions. Understanding the types and frequency of specific challenges is critical for successful program implementation. This paper reports data from a systematic, standardized transition challenge tracking process that is part of CT's MFP evaluation. MFP Transition Coordinators complete a cumulative Transition Challenge checklist in a web-based consumer tracking system. The most common challenges are physical health problems (16%), lack of consumer engagement or life skills (15%), mental health problems (13%), difficulties with HCBS waivers (13%), and housing (11%). We present differences in challenges between those who transition versus close without transition, and across disability types. Strategies developed to address common challenges will be discussed.

### USING COMMUNITY HEALTH WORKERS AND CONSUMER CHOICE TO REBALANCE LONG-TERM CARE AND COSTS IN ARKANSAS

G.P. Mays, H. Felix, *University of Arkansas for Medical Sciences, Little Rock, Arkansas*

Consumer preferences and cost pressures led Arkansas to develop a two-pronged approach to redirect long-term care. Upstream, the Arkansas Community Connector Program (CCP) uses community health workers to identify residents at high risk of entering institutional care and link them to needed home and community-based services (HCBS). Downstream, the Arkansas MFP Transitions Program gives institution-dwelling residents expanded choices for returning to HCBS care. Using a pre-post analysis of 919 CCP participants compared with a propensity-score matched group of nonparticipants, we find that HCBS use increased and nursing home admissions declined significantly under the program ($p<0.01$), resulting in a 24% reduction Medicaid spending over three years. Correspondingly, the MFP program transitioned 63 institutionalized recipients to HCBS care during its initial two years, with a reinstitutionalization rate of less than 5%. Findings suggest that LTC models using community health workers and consumer choice may help rebalance service needs, preferences, and resources efficiently.

## SESSION 2465 (PAPER)

## ASSESSMENT OF NEEDS AND CAPACITIES

### INSTRUMENTS FOR COMPREHENSIVE NEEDS ASSESSMENT IN INDIVIDUALS WITH COGNITIVE IMPAIRMENT AND DEMENTIA

R. Schmid[1,2], A. Eschen[1], B. Ruegger-Frey[2], M. Martin[1], *1. Center for Gerontology, University of Zurich, Zurich, Switzerland, 2. City Hospital Waid, Zurich, Switzerland*

Background: In recent years, it has become more common to complement the objective assessment of symptoms with an assessment of individual need patterns that are created by the individual symptomatology. However, little is known on need patterns in individuals with cognitive complaints, MCI and dementia. Moreover, there is no agreement between clinicians on instruments covering subjective needs with regard to a biological, psychological, social, and environmental level. Based on a process model of needs development, we provide an overview on the existing needs assessment instruments with respect to feasibility, validity, and reliability. Methods: We conducted a literature search in PsychINFO and PubMed including all publications until September 2009. We included needs assessment instruments for use in older individuals with mental or cognitive disorders and dementia. Results: We identified 17 needs assessment instruments mainly for older individuals with mental disorders, cognitive impairment or dementia. The analysis of selected articles demonstrated a wide range of needs indicators within different subgroups. Validity and reliability range between moderate and good. Conclusion: Even though a wide range of needs assessment instruments is available, most instruments lack sensitivity to comprehensively assess the needs in individuals with cognitive complaints, MCI and dementia. In addition, the development of improved instruments would profit from a model-based approach and standardised procedural guidelines.

### COGNITIVE CAPACITY AND FUNCTION ASSESSMENTS IN HEALTHY ELDERLY ADULTS

S.L. Schandler[1,2], J.V. Flowers[1], G. Meir[2], R. Ho[2], M.J. Cohen[2], *1. Psychology, Chapman University, Orange, California, 2. California State University Long Beach, Long Beach, California*

The burgeoning population of healthy adults aged 60 years through the early nineties places new demands on the assessment of function in these persons. Cognitive function is related directly to the person's ability to maintain acceptable quality of life as physical function reduces with advancing age. Most instruments designed to assess cognitive function in the elderly either provide a general yes/no verification of global deterioration (e.g., dementia) or are more precise existing instruments normed on younger populations and statistically extended to provide a very general idea of cognition function. Four instruments were used to examine cognitive function in two groups each of 50 healthy elderly adults without history of dementia. Using National Institute on Aging criteria, one group was classified as Young-Old (YO, 61-74 years) and the other Old-Old (OO, 75-92 years). The instruments were the Mini-Mental State Examination (MMSE); Blessed Information-Memory-Concentration Test (BIMC); Shipley Institute Living Scale (SILS); and Reynolds Intellectual Screening Test (RIST). RIST possesses norms extending to 94 years while SILS norms are statistically extended beyond 70. All subjects scored in the instruments' normal range. Lacking normative data and precision, MMSE and BIMC yielded similar, very general assessments of cognitive status. With their higher resolution, RIST and SILS showed age-related patterns in function. However, SILS scores were significantly elevated and more variable for OO subjects. The findings demonstrate the viability of assessing cognitive function in the elderly and emphasize the importance of applying assessment instruments with high resolution and actual norms rather than statistical extrapolations.

### ASSESSING HEALTH CONCERNS AND CARE NEEDS OF LESBIAN, GAY, BISEXUAL, AND TRANSGENDER (LGBT) ELDERS: LESSONS FROM A MIXED-METHOD PILOT STUDY

A. Van Wagenen, J. Bradford, *Center for Population Research in LGBT Health, The Fenway Institute, Boston, Massachusetts*

LGBT aging is a significant and emerging research area. In this paper, we review the growing literature in the field, present findings from our mixed-method pilot research, and reflect upon methodological challenges of studying older LGBTs. A confluence of findings from a small number of community-based studies and convenience samples has shown that LGBTs face distinct health concerns, care needs, and challenges as they age. They are more likely than heterosexual peers to live alone, less likely to have children, and more likely to rely upon "chosen family"—networks of friends and partners—rather than biological family in times of need. They experience and expect to face discrimination in accessing formal care, health and social services designed for older adults. Further, social isolation, social support, loneliness, depression, alcohol use, living with HIV (for men), and smoking (for women) have been shown to be areas of increased concern for older LGBTs. Our own pilot research has confirmed several of these findings. In our analysis of a pooled Massachusetts Behavioral Risk Factor Surveillance System dataset, we found population-based evidence that older LGBs are more likely than heterosexuals to live alone. Our qualitative data sheds light on the systems of informal caregiving provided by families of choice. The young field of LGBT aging research faces several methodological challenges, including the lack of routine collection of sexual orientation data in older adults, the hidden nature of the characteristics that define the populations of interest, and the practical challenges of sampling small populations.

## SESSION 2470 (PAPER)

## FAMILY AS A SAFETY NET

### "BREAKABLE LIKE GLASS" SKIPPED GENERATION FAMILIES AFFECTED BY HIV/AIDS: A FOCUS ON OLDER CAREGIVERS IN VIETNAM

L.B. Maradik Harris, B. Kim, *Social Welfare, University of California, Los Angeles, Los Angeles, California*

Increasingly, older adults are parenting grandchildren in "skipped generation" families, defined as households where both grandparents and grandchildren reside without either biological parent present. The HIV/AIDS epidemic in Vietnam has claimed the lives of many parents and is a contributing factor to the skipped generation phenomenon. Little is known about the lives of older caregivers in terms of role, access to HIV/AIDS education and support systems. The study aims to explore the impact of caregiving on the lives of older adults in the wake of HIV/AIDS in Vietnam. In-depth qualitative interviews with 15 older caregivers of skipped generation households and 7 service providers examined the vulnerability of these households and their coping mechanisms. The study found that older caregivers of skipped generation families suffered from 1) financial struggles 2) stigma 3) limited access to schooling for children 4) limited access to government subsidies 5) lack of HIV/AIDS educational information 6) social isolation and 7) age related cognitive impairments. Older caregivers coped with their financial struggles through taking out small loans from individuals within their social networks, and found strength through familial love and social support. Key to this discussion will be how these qualitative findings can be utilized in future interventions to create programs that offer HIV/AIDS education, economic opportunities and psychosocial support for older caregivers of persons affected by HIV/AIDS. The study will be used to develop recommendations for the humanitarian and HIV/AIDS sectors on how to identify and support skipped generation households in Vietnam.

### EXPECTATIONS VERSUS REALIZATIONS OF FAMILIAL INSURANCE: EVIDENCE FROM THE GREAT RECESSION OF 2008

D. Cox[1], M.M. Way[2], *1. Economics, Boston CollegE, Chestnut Hill, Massachusetts, 2. Babson College, Wellesley, Massachusetts*

How much did private transfers alleviate the financial distress of older Americans during the great recession of 2008? Were transfer receipts in line with expectations of households? The question is important since private transfers can often act like public transfers for insuring families against income shortfalls. But while eligibility for public transfers is usually transparent to researchers—e.g. Medicaid benefits are available to those who fulfill means tests and age cutoffs—coverage by private familial networks is generally not. So we know little about which families can rely (or think they can rely) on private safety nets in the event of financial distress; nearly all studies of private transfers concentrate on realized rather than potential private transfers. We take advantage of a unique question asked of Health and Retirement Survey (HRS) respondents, who indicated whether they could depend on family members for substantial financial assistance from family members in the event of severe financial distress. We investigate the connection between the expectation of familial safety nets and the realization of private transfers during the Great Recession. Our preliminary work indicates that actual transfers are an exceedingly poor guide to the prevalence of familial safety nets; receiving a transfer turns out to be neither necessary nor sufficient for the availability of help in time of severe need. One implication is that surveys seeking to gauge the extent of familial safety nets should expand the domain of their attention from actual transfers to potential transfers.

### INFLUENCE OF INTERGENERATIONAL SUPPORT ON OLDER ADULT'S PSYCHOLOGICAL WELL-BEING IN JAPAN

E. Takagi[1], Y. Saito[2], *1. Health Science, Towson University, Towson, Virginia, 2. Nihon University, Tokyo, Japan*

This study investigated differential impacts of support exchange between older parents and adult children on Japanese older adult's psychological well-being. We analyzed two waves of data in the Nihon University Longitudinal Study of Aging (NUJLSOA) in 2003 and 2006 (n=3,311). We categorized support exchange patterns as: only receiving support from adult children, only providing support to adult children, and both receiving and providing support. We categorized intergenerational support by three different types of assistance: instrumental support, financial support, and emotional support. The study examined exchange patterns of these three types of support and analyzed their impact on older adult's psychological well-being measured by the PGS morale scale. The analysis showed that the most commonly exchanged type of support was instrumental support (40%), followed by emotional support (31%) and financial support (29%). Regression analyses suggested that while exchange of emotional and financial support did not have a significant impact on older adult's psychological well-being, only receiving instrumental support from adult children (but not providing) appeared to have a negative impact on older adult's psychological well-being. We also identified that living with an adult child tended to have a strong positive influence on older adult's psychological well-being. These results suggest that although to some extent, older adults express cultural acceptance and expectation towards intergenerational dependency on their adult children, one-way flow of hands-on support from adult children tends to have a negative impact on their sense of well-being.

### PREDICTORS OF NUTRITIONAL STATUS IN GRANDPARENT CAREGIVERS IN KENYA

G. Ice[1], J.V. Yogo[1], V. Heh[1], E. Juma[2], *1. Social Medicine, Ohio University, Athens, Ohio, 2. KEMRI, Nairobi, Kenya*

Due to the HIV/AIDS pandemic, an increasing number of grandparents are caring for orphaned children. Several early reports suggested that grandparents, particularly grandmothers suffered ill health and poor nutrition. The Kenyan Grandparents study is a longitudinal study, with participants (age 73.6 ± 7.9) from three districts within Nyanza Province. The sample consists of 60+ year olds, half caregivers and half non-caregivers, who were enrolled on a rolling basis over four waves of data collection. Approximately 400 grandparents participated in each of four waves. Standard anthropometric measures were used to determine nutritional status. The impact of caregiving was examined using SEM. There was little impact of caregiving on the nutritional status of men or women, although different indicators responded differently across time. When there was an impact, female caregivers were advantaged and male caregivers were disadvantaged. When examined cross-sectionally, the set of predictors were different for men and women. Generally household composition variables, including adult children and orphans were more important in the models of women's nutritional indicators. SES, caregiving status and number of recent sick household members were more important indicators for men. Taken as a whole these results suggest that grandmothers may benefit from more children and fewer adults, while the opposite is true for grandfather's. This is possibly due to the impact on household income and production and gender patterns food distribution within the household. This project was funded by the National Science Foundation, Grant No.0515890.

### THE PREVALENCE OF IADL LIMITATIONS IN ELDERLY COUPLES AND FACTORS ASSOCIATED WITH RECEIVING HELP

H. Shen, S. Feld, R. Dunkle, H. Kim, J. Kim, *University of Michigan, School of Social Work, Ann Arbor, MI*

Recent research has identified a significant proportion of married elders with IADL limitations. However, little is known about IADL prevalence and help receipt within couples. Using Andersen-Newman's health service utilization model, we examined the influence of predisposing, enabling, and health need factors on help receipt among older couples. Nationally representative data from the 2004 Health and Retirement Study identified 3,265 elderly couples (at least one age 65+). Among these couples, 697 (17.8%) were ones in which at least one member had any IADL limitation. Logistic regression was used to model the likelihood that each member of these couples with any IADL limitation received some IADL help. Results showed IADL help receipt was more likely when the couples had certain enabling resources (Medicaid coverage for health care), and health needs (only one partner had IADL limitations; one or more partners had several IADL limitations, any chronic health condition, or used equipment for walking or bed transferring). Help receipt was not associated with other enabling resources (number of proximate daughters and of proximate sons, the poverty ratio), health needs (cognitive problems, any ADL limitation), or the predisposing factors (race/ethnicity, age). We conclude that among couples in which at least one member has any IADL limitation, the likelihood that each member with any limitation receives some IADL help may be lower when both partners have any IADL limitation and the couple does not have additional health needs. Ways to target interventions to meet the needs of such high risk couples will be discussed.

# SESSION 2475 (PAPER)

## GRANDPARENT ROLES, NORMS AND IMPACT

### FAMILY NATIONAL GUARD, ECONOMIC HELP AND CHILDCARE: COMPARATIVE ANALYSES OF GRANDPARENTING NORMS

R. Shura, P. Uhlenberg, B. Danforth, *Carolina Population Center, University of North Carolina, Chapel Hill, North Carolina*

Do perceptions of grandparents' responsibilities to help with grandchildren vary within and across countries? Are norms of grandparenting monolithic within countries, or are attitudes about grandparenting diverse and patterned according to gender, cohort, social class, intergenerational family structure, and country-specific contexts? Using SHARE data from 14 European countries, this paper explores older adults' attitudes about grandparents' intergenerational responsibilities. Attitudes about three grandparent responsibilities – helping in times of difficulty, providing economic support, and assisting in childcare – are analyzed. A central hypothesis of this research is that the grandparent role and grandparents' experiences may vary considerably within and across countries due to different cultural norms and expectations regarding grandparents; due to different levels of resources such as social class and time; and due to different country-specific structural circumstances which relate to provision of welfare and support to families. Results indicate meaningful differences in attitudes about the grandparent role across and within countries.

### DO WE WANT TO SPEAK OF A GRANDPARENT ROLE? THEORETICAL REFLECTIONS AND NEW RESEARCH FINDINGS

G.O. Hagestad, *NOVA, Oslo, Norway*

In my first publication on grandparenthood, 25 years ago, I questioned whether there was a grandparent role. My view was in part based on content analyses of a well-known woman's magazine in the US. Around the turn of the century, there were conflicting images, in the press and in research reports. Time Magazine called grandparents "child-savers"; a well-known researcher described them as "redundant". Recently, several large-scale European studies have explored the question of how much consensus we find in different societies regarding what grandparents should do and how the role is enacted in different contexts. Do welfare regimes account for variations in enactment? The presentation is based on material from SHARE, which covers ten different countries, and two waves of NorLAG, the Norwegian study of Life Course, Ageing and Generation. In addition, I use data from NorGRAND, my own study of how Norwegian children and their parents view grandparents. In all these data sets, there is remarkable consensus that grandparents should help and support their adult children in their role as parents. In the Norwegian data, 90 % of both parents and grandparents agreed on this expectation. We find more consensus regarding role expectations than we observe communalities in grandparent behaviours. The findings are discussed in relation to cultural and structural factors. How do social structures, such as welfare regimes, create family interdependencies that shape grandparent roles?

## SESSION 2480 (PAPER)

## ISSUES OF RELOCATION

### MAKE MINE HOME: THE ROLE OF CUSTOMIZATION IN INDEPENDENT LIVING OPTIONS FOR OLDER ADULTS

T. Perry, *University of Michigan, Ann Arbor, Michigan*

Purpose: This paper examines individual and community-wide challenges that occur when residents are permitted to customize their living spaces. Design and Methods: Ethnographic data are drawn from interviews, participant observation and document review with 20 older adults from Ann Arbor, MI, their kin and retirement community professionals in three stages: pre-move planning, move in-process, and post-move adjustment. Findings: After following the first cohort of older adults moving into an independent retirement community, this research on residential transitions for older adults indicates challenges in personalizing one's units while maintaining the retirement community's interest in uniformity and ability to market to future residents. Secondly, there remains an individual and community dilemma of mixing style and individuality with cost-efficiency. The tension between present residents' interests and future residents' concerns as the first residents aim to "customize" their spaces serves as a detailed example of complex residential concerns in line with the conference's theme of "Transitions of Care." Implications: In order to consider ways to support older adults and their families in residential transitions, the practice-based implications of this research address the role of personalization of one's residential space as a way to control part of the moving process which often experienced as a series of losses by older adults. The policy implications of this research identifies possible approaches retirement communities may utilize to set policies around housing modification.

### ASSESSING FUNCTIONAL WELL-BEING AFTER RELOCATING TO AN INDEPENDENT LIVING COMMUNITY

K. Hiroto, L.N. Anderson, S.H. Qualls, B. Yochim, *University of Colorado, Colorado Springs, Colorado*

Tailoring smooth transitions of care from independent to assisted living presumes that residents are matched to an appropriate level of supportive services based on their functional abilities. Few facilities assess functional well-being however, and very few studies have described cognitive and psychosocial functioning upon moving into independent living communities (ILC). This paper describes the psychosocial and cognitive profiles of the first 29 IL residents within one year post-relocation into a new senior community. Residents of this university-affiliated ILC engaged in wellness checks assessing cognition, general health, and psychosocial well-being. Residents were European American, primarily female (70%), and approaching old-old age (age R=64-93, M=83.37). Despite relative psychosocial health (i.e., low rates of anxious and depressive symptoms; general satisfaction with quality of life and emotional and functional support from family and friends), signs of cognitive impairment also surfaced. A brief cognitive screen (St. Louis University Mental Status exam; SLUMS) revealed levels of cognitive functioning (maximum score 30; R=13-29, M=21.11; SD=5.50) that would typically be associated with need for substantial support. Residents with lower cognitive functioning did not differ from those with more intact cognitive abilities in terms of education and overall psychosocial well-being. Discussion of results will include the importance of assessing functional well-being to identify residents' needs in order to create a smooth continuum of care between independent and assisted living communities.

### LESBIAN AND GAY ELDERS AND RESPECTFUL LONG-TERM CARE: IDENTIFYING THE UNIQUE PSYCHOSOCIAL PERSPECTIVES AND CHALLENGES

G.L. Stein[1], N.L. Beckerman[1], P.A. Sherman[2], *1. Wurzweiler School of Social Work, Yeshiva University, New York, New York, 2. Kean University, Union, New Jersey*

Little is known about the experiences, concerns, and perspectives of lesbian, gay, bisexual, and transgender (LGBT) elderly living in residential care facilities, or contemplating such a move. While LGBT seniors have been residents of long-term care facilities, community members are generally invisible to staff and other residents. This may result in the failure to receive adequate services; unaddressed needs for emotional and social support; failure to acknowledge and respect partners and close friends; and isolation from the wider residential community. An exploratory inquiry comprised of two focus groups was conducted among 16 gay and lesbian elders receiving services at a community-based social service organization and a long-term care setting. Participants were asked about their thoughts and experiences regarding community living, retirement communities, and long-term care, as well as how providers could be more responsive to gay individuals. Participants reported fear of being rejected or neglected by healthcare providers, particularly personal care aides; fear of not being accepted by other residents; fear of having to go back into the closet if placed in a long-term care setting; and a preference for gay residential options. Participants suggested staff training to promote acceptance and respect for gay people. All favorably perceived gay-specific and gay-friendly living arrangements, and emphasized a preference for having gay or gay-friendly healthcare providers so they would not worry about discrimination. These findings will promote awareness of the special concerns of gay and lesbian seniors, and form the basis for a larger research project.

### PHYSIOLOGICAL AND PSYCHOSOCIAL STRESS REACTIONS IN RESPONSE TO A LATE-LIFE STRESSOR: RELOCATION TO CONGREGATE SENIOR HOUSING

H. Ewen, J. Chahal, *Miami University, Oxford, Ohio*

One of the most significant late life stressors is relocating to a new residence. Previous research has shown that forced moves result in increased illness, mortality, and dissatisfaction, while planned moves may facilitate increases in social contact and support, independence, and well-being. Psychosocial reactions to relocation stress may vary, but the physiological stress response is uniform. The primary stress hormone, cortisol, provides benefits in the short-term, while extended secretion can increase co-morbidity and mortality. This presentation presents findings from a mixed-method study of relocation stress examining the relationship between self-reported experiences of stress and physiological reactivity for older women relocating to congregate senior housing. It was hypothesized that recent movers who: a) reported the move as a significant life stress would show greater physiological stress reactivity (via salivary cortisol measures) and b) planned the move would have less physiological reactivity, greater psychosocial well-being, and better health. Only partial support was found for these hypotheses. Findings indicate that recent movers who reported the move as stressful showed elevated cortisol levels, but the differences were not significant. Movers who chose the move showed better overall well-being, as measured by the PANAS (Mrozek & Kolarz, 1998), but differences in cortisol reactivity were not significant. These results support extant findings that control over the decision to move is beneficial to the older adult. Despite the stresses surrounding the move, the diurnal cortisol profiles remained intact.

## SESSION 2485 (SYMPOSIUM)

### LATE-LIFE SUICIDE RISK AND RESILIENCY

Chair: *S. Nazem, Department of Psychology, West Virginia University, Morgantown, West Virginia*
Co-Chair: *M. Smith, Department of Psychology, West Virginia University, Morgantown, West Virginia*
Discussant: *M.J. Heisel, The University of Western Ontario, London, Ontario, Canada*

This symposium will focus on the nature of suicide risk in older adults. Older adults have the highest rate of death by suicide in the United States, with 16% of all deaths by suicide in the United States occurring in adults over the age of 65, despite only comprising 12.4% of the population (CDC, 2006). The objective of the symposium is to highlight current research on cognitive, behavioral, and environmental variables that may operate as protective or risk factors in suicide among older adults. A study examining the relations among perceived burdensomeness, meaning in life and depression, will be presented. Second, functional and dysfunctional coping strategies and their relation to suicide ideation and reasons for living will be presented. Third, results from younger and older adult samples will illustrate the differential relation between autonomy and suicidal behaviors across the life-span. Fourth, a population based longitudinal study will examine the relation between cognitive impairment and suicide risk. Finally, a critical review will evaluate the literature on suicide, suicidal ideation, and indirect self-destructive behavior prevalence rates in long-term care facilities. This symposium will present critical risk and protective factors essential in suicide research, assessment and treatment.

### PROSPECTIVE ASSOCIATION BETWEEN BURDENSOMENESS AND MEANING IN LIFE IN OLDER ADULT OUTPATIENTS

P. Bamonti, K. Van Orden, D. King, P. Duberstein, *University of Rochester, Rochester, New York*

The current study investigates the relationship between the belief that one is a burden on others and the belief that one's life lacks purpose among older adults. We hypothesized that greater perceived burdensomeness would be prospectively related to lower perceived meaning in life, and that this relationship would remain even when controlling for current depressive symptoms. Patients (n=56) 60 years of age or older receiving care at an outpatient mental health clinic with a chart diagnosis of a mood, anxiety, or adjustment disorder were recruited. Results indicated that greater perceptions of burdensomeness significantly predicted lower perceived meaning in life one month later after controlling for depression ($\beta = .55$, $t = 4.67$, $p < .001$). Beliefs about burdensomeness were associated prospectively with beliefs about meaninglessness, suggesting that one mechanism whereby perceived burdensomeness confers risk for suicidal ideation and other adversities in older adults is by decreasing meaning in life.

### RELATIONSHIPS BETWEEN DISPOSITIONAL COPING STRATEGIES, SUICIDAL IDEATION, AND PROTECTIVE FACTORS AGAINST SUICIDE IN OLDER ADULTS

M. Marty, D.L. Segal, *Psychology Department, University of Colorado at Colorado Springs, Colorado Springs, Colorado*

The present study examined the associations between diverse dispositional coping strategies, suicidal ideation, and protective factors against suicide in community-dwelling older adults. Participants (N = 108, M age = 71.5 years, age range = 60-95 years) completed the Coping Orientations to Problems Experienced Scale, Geriatric Suicide Ideation Scale, and Reasons for Living Inventory. Problem- and emotion-focused coping were associated negatively with suicide ideation and positively with reasons for living. Dysfunctional coping was associated positively with suicide ideation, but results did not support the hypothesized negative relationship with reasons for living. Thus, problem- and emotion-focused coping appear to be adaptive, whereas dysfunctional coping appears to be somewhat less related to resilience to suicidal ideation among community-dwelling older adults. Implications of the results are that some coping strategies may serve as protective factors against suicide and should be evaluated as part of a thorough assessment of suicidal risk among older adults.

### THE RELATION BETWEEN AUTONOMY AND SUICIDAL IDEATION IN YOUNGER AND OLDER ADULTS

A. O'Riley, *1. West Virginia University, Morgantown, West Virginia, 2. University of Rochester, Rochester, New York*

Researchers have hypothesized that certain vulnerabilities might increase risk for depression. For example, Beck and colleagues (1982) have postulated that a style marked by an excessive need for control, defensive separation, and perfectionism (a style Beck has labeled "autonomy") might increase risk for depression. It is unclear whether this same vulnerability might increase risk for suicidality. Two studies will be presented which examined the relation between aspects of autonomy and suicidal ideation (SI) in younger and older adults. These studies indicated that perfectionism ($B = .149$, $SE = .03$, $p <.01$, and defensive separation ($B = .04$, $SE = .01$, $p = .003$) significantly predicted SI in younger adults and need for control($B = .234$, $SE = .10$), $p <.05$) significantly predicted SI in older adults. These findings provide further evidence of age differences in suicidality, which may have important implications for the development of interventions for preventing suicidal behavior.

### THE RELATION BETWEEN COGNITIVE DYSFUNCTION AND SUICIDE IN A POPULATION-BASED SAMPLE

S. Nazem, A. Fiske, *Department of Psychology, West Virginia University, Morgantown, West Virginia*

Previous research on the relation between cognitive impairment and suicide is inconclusive. Studies using in-patient registries or selected clinical samples suggest that early cognitive changes may increase the risk for suicide whereas dementia may serve as a protective factor. The present study evaluated the risk of suicide (or undetermined death) associated with cognitive dysfunction or dementia in the HARMONY study (Gatz et al., 2005). The population-based study ascertained dementia in 14,435 individuals aged 65 or older in the Swedish Twin Registry. Cognitive screening was conducted by computer-assisted telephone interview; clinical diagnoses were based on in-home cognitive testing and somatic examination. It was hypothesized that cognitive dysfunction, but not dementia, would increase the risk of suicide. Survival analyses demonstrated a two-fold increase in suicide risk associated with cognitive dysfunction among individuals without dementia. Results highlight the need to evaluate suicide risk among individuals with early signs of cognitive dysfunction.

### A CRITICAL EXAMINATION OF RESEARCH ON THE PREVALENCE OF SUICIDE IN NURSING HOMES

M.R. Nadorff, P. Prentice, A. Fiske, *Psychology, West Virginia University, Morgantown, West Virginia*

There are reasons to believe that suicide rates may be higher in nursing homes than in the community. Nursing homes are home to nearly 1.5 million older adults (Jones et al., 2009), and older adults have the highest suicide rate of any age group (Heron et al. 2009). Additionally, more individuals are admitted to nursing homes with serious mental illness than with dementia only (Fullerton, et al. 2009). However, the literature on suicide in nursing homes is mixed. The authors will present a critical analysis of the literature on suicide, suicidal ideation, and indirect self-destructive behaviors in nursing homes. Although some studies have found lower rates of suicide in nursing homes than in the community (Abrams, et al, 1988; Copeland 1987), several methodologically-strong studies show higher rates (Menghini & Evans, 2000; Scocco, et al. 2006). The authors will discuss possible reasons for the differences and recommendations for further research.

## SESSION 2490 (PAPER)

## LEARNING ABOUT AGING

### PREEMPTIVE EXPOSURE TO GERIATRICS: AN UNDERGRADUATE CHRONIC CARE INTERNSHIP

M. Waldron[1], J. Eppensteiner[1], M.A. Paniagua[2], T. Malmstrom[2], *1. Saint Louis University, St. Louis, Missouri, 2. Saint Louis University Medical School, St. Louis, Missouri*

PURPOSE: The demographic imperative for preparing the physician workforce to care for increasing numbers of elder Americans is looming. To preempt efforts of medical schools to educate students in areas of gerontology, Saint Louis University has taken initiative at the undergraduate level with an experiential nursing home-based internship. This was conceived from a curricular need assessment utilizing student-derived course objectives. The topics desired included patient experience, medical school application enhancement, shadowing experience, exposure to medical professions, Geriatric Medicine exposure, and exposure to ethics-related issues. METHODS: A “Chronic Care Internship” was created to encompass six course themes through a weekly resident companionship, weekly Geriatric Medicine rounds, a student-initiated quality improvement project, and a topical weekly lecture series. Pre and post-course surveys examined students’ attitudinal changes towards elders. Weekly lecture reflections and a post-course essay qualitatively evaluated the effect on students’ perception of geriatrics. RESULTS: On a five-point Likert scale (strongly disagree to strongly agree), an average 0.77 point decrease was observed when asked if “Treatment of chronically ill old people is hopeless” ($p<.001$). This change indicates a reduction in negative attitudes toward the elderly. The qualitative analyses showed increased knowledge of aspects of geriatric medicine including learned helplessness, frailty, and effective communication. CONCLUSION: Early and frequent exposure to nursing home residents proved to be integral in decreasing students’ negative attitudes towards gerontology. Further analysis of qualitative data from the reflection exercises have illustrated a rich understanding of communication challenges as well as an appreciation of the concepts of learned helplessness and frailty.

### THE LIFE OF A TEACHER

M. Wolf, *Gerontology, Saint Joseph College, West Hartford, Connecticut*

The Life of a Teacher Can gerontological educators evolve? This awareness may strike the empirical world of social science as a nonlinear phenomenon. However, we know that growth and development of individual content specialists can be a marked result of interaction with students and colleagues. Can research and concrete findings shift? When are educators permitted to “ad lib” and refocus basic theoretical underpinnings in the world of gerontology? How do they revise and renew their understandings of curriculum, particularly in the light of new technology and learning styles? And, as they mature, how do they change and differentiate their constructs of the nature of the learning process? This presentation explores the growth and development of the teacher of gerontology within a constructive developmental framework. Using the psychosocial framework of Erik Erikson, Robert Kegan, as well as object relations (Piaget), it looks at other developmental discussions such as that of David Galenson, whose concept of the “life cycles of human creativity” can be applied to the understanding of the cognitive and affective growth of a teacher. It is based on narrative interviews (Seidman) and in-depth analysis of phenomenological literature (Wolf). A sample of Gerontological educators (N=12) was interviewed and reflected on how he or she has changed over the course of a career. Using data excerpts, we examine how the personal phases of the educators’ lives inform their 1) understanding of the literature of aging, 2) process within the classroom, and 3) meaning-making of our field and its relevance to education.

### AGING SAVVY SOCIAL WORKERS IN THE COMMUNITY: IMPACT OF A NATIONAL EDUCATIONAL MODEL

N. Rowan[1], A.C. Faul[1], J. Birkenmaier[2], J. Damron-Rodriguez[3], *1. Kent School of Social Work, University of Louisville, Louisville, Kentucky, 2. Saint Louis University, St. Louis, Missouri, 3. University of California at Los Angeles, Los Angeles, California*

Social work student knowledge of community services for older adults and community-based care is imperative for direct practice with older adults. Evaluation data will be presented on a national multi-site effort (N = 353) from a total of 35 schools to increase graduate social work student’s competency related to community services for older adults. Results suggest statistically significant improvement of pre and post mean scores on the Geriatric Social Work Knowledge of Aging Quiz and the Geriatric Social Work Competency Scale II. A positive trend was also noted in the pre and post test mean scores measured by the Community Care Quiz from all available sites involved with the project. The model of educating social workers as described in this presentation sets forth positive outcomes in the education of aging savvy social workers.

### LEADERSHIP DEVELOPMENT WITHIN A GERONTOLOGICAL FELLOWSHIP IN AN ADVANCED GENERALIST MSW PROGRAM

E.K. Dakin, L. Quijano, *School of Social Work, Colorado State University, Fort Collins, Colorado*

This presentation will describe the development of leadership skills among students participating in a gerontological fellowship program within an advanced generalist MSW program, funded through a three-year Hartford Partnership Program in Aging Education (HPPAE) grant. One cornerstone of this grant is the identification of specific geriatric social work competencies, including leadership competencies, that must be met by students enrolled in the HPPAE program through classroom and field instruction. We have implemented a number of activities to promote leadership development among our fellows. One component of this fellowship is our monthly gero-rounds, which involve education on topics that are relevant to policy and services within local aging services organizations. As part of their fellowship experience, each fellow takes a role as presenter at one of the monthly gero-rounds, often presenting on results of a master’s thesis or program evaluation project. In one case, fellows presented on findings from a major community Summit on Aging, the results of which are being summarized by a fellow and one of the presenters for submission in a peer-reviewed journal. Another unique aspect of this fellowship program is the requirement that each fellow have both a macro and a micro field placement. Fellows’ macro field placements have provided rich opportunities for leadership development, for example by the opportunity to participate actively in the board of a nonprofit organization or multidisciplinary community collaboration. This presentation will discuss how the leadership development activities through this grant may be implemented in other kinds of professional and educational settings.

## SESSION 2495 (PAPER)

## OLDER ADULTS’ ATTITUDES TOWARD AGING

### CULTURAL VARIATIONS IN ATTITUDES TO AGEING AND THE EXPERIENCE OF AGEISM

F. O’Donnell, A. O’Hanlon, M. Maguire, *Dundalk Institute of Technology, Dundalk, Ireland*

Evidence suggests that attitudes to ageing can predict morbidity and mortality, yet there continues to be little research in this area, not least given the paucity of measures available. This study describes the development of measures aimed at measuring general attitudes to ageing, and also cognitive-emotional evaluations about own ageing and later life. It also describes possible explanations for those attitudes. Possible items for scales were developed from focus group data and from a detailed critique of literature. Scales were piloted amongst a convenience sample of mid-life and older adults, and found to have good psychometric properties. They were then tested further with community based adults differing in cultural groups (geographical location, and social economic status). Well-being was assessed using measures of pathology and well-being including the Hospital Anxiety and Depression Scale (HADS-A), psychological well-being (Ryff, 1998), relationships with family and friends. The scales were short (typically 5 items), and easy for participants to rate and researchers to score. They have acceptable internal reliability and external validity. Multivariate analyses indicate that general attitudes to ageing were predicted by cultural differences including geographical location and social economic status. Health and relationships also contributed to variance in scores. Attitudes to ageing can impact adversely on health and well-being. The current study offers new tools for researchers in this area and new insights about explanations for attitudes based within the culture of the individual. Further research in this area can promote optimal well-being and quality of life for more people.

### PSYCHOLOGICAL WELLBEING IS ASSOCIATED WITH GREATER SATISFACTION WITH AGING AMONG OLDER ADULTS OVER 11 YEARS FOLLOW-UP

K.A. Sargent-Cox[1], K. Anstey[1], M. Luszcz[2], *1. Australian National University, Canberra, Australian Capital Territory, Australia, 2. Flinders University, Adelaide, South Australia, Australia*

Satisfaction with aging may reflect the ability to adapt to transition and change in late life. Recent studies have shown that satisfaction with aging declines over time in very old adults and this decline is associated with a decrease in functional health outcomes and an increase in mortality risk. We propose that psychological resources and well-being, mechanisms amenable to intervention, may be important in the preservation of positive satisfaction with aging. Our objective was to investigate how change in psychological resources (general Locus of Control: LOC) and well-being (number of depressive symptoms) is associated with change in satisfaction with aging over 11 years in a large representative sample (N=2034) of older adults (65+years) from the Australian Longitudinal Study of Ageing. Multi-level models revealed that decline in satisfaction with aging was significantly correlated with change in LOC and depressive symptoms. On average, participants satisfaction with aging decreased by .05 points (95% CI = -.07, -.05) for every 1 unit increase in LOC (more external LOC). Similarly, mean satisfaction with aging decreased by .09 points (95% CI = -.09, -.08) for each additional increase in depressive symptoms over time. There were considerable intra- and inter-individual differences in patterns and rates of change in satisfaction with aging. The findings demonstrate that maintaining well-being and psychological resources in later life is accompanied by positive perceptions of aging. Findings have clinical implications regarding psychological interventions aimed at improving resilience in older adults, which may ultimately increase health outcomes and quality of life.

### CHANGE IN PERCEIVED AGE IN MIDDLE AND LATER LIFE

R. Ward, *Sociology, SUNY-Albany, Albany, New York*

Studies of perceived age in middle and later life find that people feel and would like to be younger. Feeling younger is associated with positive self-assessments; wishing to be younger is associated with less positive assessments. Little research has investigated change over time in perceived age. Longitudinal patterns are analyzed for 1,815 respondents in two waves (1995-96, 2204-06) of the MIDUS survey who were aged 40+ at Wave 1, assessing the ages people "feel" and "would like to be" relative to current age. In aggregate people feel about the same amount younger but become increasingly distant from preferred age: mean felt age changed only 1.4 years; mean ideal age changed 5.8 years. Individual variability on these dimensions is investigated with the following predictors: age, gender, marital and employment status, and past and expected future health and financial situation. For felt age: older age is associated with feeling younger but not with change; better expected future health is related to feeling younger and change in that direction. For ideal age: older age and being male is associated with wishing to be younger and change in that direction; education and better expected financial future are associated with less youthful ideal age and less change. Associations between feeling younger and better health expectations reflect images of later life as a time of physical decline. Ideal age appears more to reflect economic considerations, with more youthful preferred age reflecting disadvantages of lower socioeconomic status in later life.

### OLDER AMERICANS AND OUT-GROUP TOLERANCE IN THE GENERAL SOCIAL SURVEYS: AGE, PERIOD & COHORT EFFECTS

N. Danigelis[1], S. Cutler[1], M. Hardy[2], *1. Sociology, University of Vermont, Burlington, Vermont, 2. The Pennsylvania State University, State College, Pennsylvania*

Recent evidence (Danigelis, Hardy & Cutler, 2007) has shown an unexpected intracohort aging effect on individuals' tolerance of five outgroups: atheists, communists, homosexuals, militarists, and racists. Specifically, the intracohort aging effect is decidedly liberal among those aged 60+, while trending toward conservative among those aged 25 – 39. However, we do not know whether this liberal trend among older people reflects aging itself, the historical period, or some combination of the two dynamics. After controlling for compositional effects, we employ linear decomposition analysis (Firebaugh, 1989, 1997) to disentangle intracohort aging from cohort replacement effects and then estimate a mixed effects model for hierarchical age-period-cohort (APC) analysis (see e.g. Yang, 2008) to further disentangle intracohort aging into its APC components. Data on 6,000+ adults aged 60+ from the 1972 – 2008 General Social Surveys show significant liberal intracohort trends regarding attitudes toward Communists and homosexuals, a nearly significant trend regarding atheists, and liberal but non-significant trends regarding militarists and racists. Our APC estimates suggest a significant age effect in the conservative direction regarding attitude toward racists and non-significant conservative effects regarding the other outgroups. By contrast, random effects solutions show period to have a consistently – and generally significant – liberalizing effect from the 1970s through the 1980s, 1990s, and the 2000s for all outgroups. Birth cohort membership, based on five-year intervals, has no effect. The clear reason for the liberal intracohort aging effect, therefore, appears to be historical period. Results illustrate the complementarity of linear decomposition and mixed effects modeling and are discussed accordingly.

## SESSION 2500 (SYMPOSIUM)

### REVEALING THE ONGOING CANCER EXPERIENCE: QUALITATIVE APPROACHES TO CANCER AND AGING

Chair: *T. Blank, Human Development and Family Studies, University of Connecticut, Storrs, Connecticut*

Discussant: *C.A. Leedham, Markey Cancer Center, University of Kentucky, Lexington, Kentucky*

This symposium, jointly sponsored by the Research on Cancer and Aging and Qualitative Research Interest Groups, explores the use of qualitative approaches to understand the rich, dynamic experience of cancer survivorship among older persons. The presentations present both focus group and interview data gathering and each addresses different major topics. Yet, they all center around one major theme: the construction of meaning and active quality of life after one has been significantly and permanently changed by one's cancer experience. Each presentation also indicates the complexity of impacts, including both negative and positive aspects. First, Kelly Trevino describes a focus group-based study of the role of religion/spirituality in the lives of older veteran cancer survivors, addressing how one's religion/spirituality level impacts coping with the cancer experience and is itself affected by that experience. Then, Heather Bell presents a study of how breast cancer survivors experience a group physical activity to reap mental and physical benefits in their survivorship. The final paper, presented by Boaz Kahana, uses thematic analysis of interviews with elderly survivors to reveal the richness of the cancer experience using a post-traumatic stress/post-traumatic growth orientation, in which negative change/suffering, positive change/growth, and sense of lack of change/stability all interact in complex ways to impact survivorship. Finally, Cynthia Leedham as discussant will integrate themes across these papers and discuss how they illustrate the ways that qualitative research on cancer and aging can be useful for theoretical understanding and development of intervention strategies with older persons surviving cancer.

### RELIGION AND SPIRITUALITY IN VETERAN CANCER SURVIVORS: A QUALITATIVE PERSPECTIVE

K. Trevino[1,2], E. Archambault[1], M.M. Hilgeman[1,2], R.L. Billings[1,2], J. Gosian[1], J. Schuster[1], J. Moye[1,2], *1. VA Boston Healthcare System, Brockton, Massachusetts, 2. Harvard Medical School, Department of Psychiatry, Boston, Massachusetts*

The purpose of this study is to explore the role of religion/spirituality in coping with cancer and the impact of cancer on individuals' religion/spirituality. Fourteen veteran cancer survivors participated in one of three focus groups. Participants were asked: "How have your spiritual or religious beliefs affected how you cope with your cancer? How have your spirituality or religious beliefs changed as a result of your experience with cancer?" Religion/spirituality was generally characterized positively. The role of God as a source of support who provides resources and has a plan for each individual was prominent. Participants reported that God had intervened to help ("God got me to that [doctor]"). Participants also generally reported that their religious/spiritual beliefs and the beliefs of others in their lives were strengthened as a result of their cancer. Although less frequent, some participants reported no change in their religious/spiritual beliefs or feeling "fed up" with religion.

### BREAST CANCER SURVIVOR SPORT TOURISM: DRAGON BOAT PADDLING EXPERIENCES

H.L. Bell, H. Gibson, *Tourism, Recreation & Sport Management, University of Florida, Gainesville, Florida*

The number of breast cancer survivors (BCS) continues to grow (NCI, 2006), and many enjoy mental and physical benefits through participation in leisure activities after completing treatment. BCS dragon boat paddling has become one way for survivors to find "life after breast cancer" (McKenzie, 1998, p. 378). Six women in their 50's and 60's who travelled from Pennsylvania and Ontario to take part in the 2009 Orlando Dragon Boat Festival were interviewed about their experiences in sport, travel and survivorship. The interviews were transcribed verbatim and analysed manually using thematic analysis. The data suggest there is a synergy between each participant's personal experiences with breast cancer, with sport and with travel. These aspects combine to create opportunities for participants in dragon boat paddling and other sports, to meet other survivors and to travel to destinations they "don't normally go".

### ELDERLY CANCER SURVIVORS REFLECT ON POSTTRAUMATIC GROWTH AND TRANSFORMATION

B. Kahana[1], E. Kahana[2], *1. Cleveland State University, Cleveland, Ohio, 2. Sociology, Case Western Reserve, Cleveland, Ohio*

We report on themes derived from 153 qualitative interviews with community dwelling older adults, who reported a cancer diagnosis. Survivors represented a broad range of cancer diagnoses and included both recent and long-term survivors. Themes were analyzed in relation to coping approaches and identity relevant transformations. Coping orientations ranged from a minority expressing passive acceptance, fear, and resignation, to a majority reporting preparedness and determination to fight. Themes of transformation reflected three typologies of response: positive change, lack of change, and suffering. Findings will be discussed in terms of typologies of survivorship in relation to theories of posttraumatic growth and posttraumatic transformation. Cumulative life experiences of older adults and their encounters with prior stressors may support constructive adaptations to life threatening illness.

## SESSION 2505 (SYMPOSIUM)

### TRANSITIONS OVER THE LIFE COURSE: REFLECTIONS OF LEADING GERONTOLOGISTS ON THE EVOLUTION OF THEIR CAREERS

Chair: *M. Castora-Binkley, Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*
Discussant: *L. Noelker, Katz Policy Institute, Benjamin Rose Institute, Cleveland, Ohio*

This session highlights the personal, social and historic events that shaped the lives of leading scholars in gerontology, some occurring by chance while others are by choice. The session brings together four individuals, each of whom has made distinguished contributions to the field, to give their accounts of how they became a leader in gerontology and how this has, in turn, affected their lives. Each will highlight transitions throughout his or her career as their thinking and work in the field of gerontology evolved. The objective of this session is to feature the personal perspectives of the panelists and acknowledge how the individual and personal is intertwined with the historical and social context influencing their lives and careers. Panelists will highlight their careers and what events or occurrences (e.g. places, projects, people, and political events) took place that led them to their work today. After attending this session, participants will have acquired a keener appreciation of the diversity of their backgrounds in gerontology and a greater understanding of career transitions in the field of aging.

### DEFINING THE FIELD OF AGING AMONG MEXICAN AMERICANS

K. Markides, *University of Texas Medical Branch, Galveston, Texas*

In graduate school in sociology at LSU (1970's) I specialized in demography and sociology of economic development. I had little exposure to gerontology. In 1976, at the UT Health Science Center, I ran a project evaluating a program for older people which covered aspects of lives of older people (health, mental health, family relations and other matters typical in studies of older people). Our experience enabled us to obtain NIA funding for the Three-Generations Study of Mexican Americans and, later, to analyze data from the Hispanic Health and Nutrition Examination Survey. Additionally, funding was obtained to conduct the Hispanic Established Population for the Epidemiological Study of the Elderly (EPESE). This study defined the field of aging among Mexican Americans. Being at the right place at the right time, and also doing the right thing were very much part of my story. Having a supportive network also plays a major role.

### STRATEGIES AND PARTNERSHIPS TO ENHANCE RESEARCH IN GERONTOLOGY IN A NON-TRADITIONAL ACADEMIC SETTING

B.A. Given, *Michigan State University, East Lansing, Michigan*

This presentation will focus on how the environment and deliberate choices made in response to that environment led to development of a professional career with a focus in gerontology. Being in a health care school without a traditional medical school and without an academic medical center challenges one to select colleagues and problems that are supportive of the existing environment. Discussion will focus on choices made. Traditional PhD programs were also missing interdisciplinary partnerships and community based settings fostered working in gerontology. The lack of strong research colleagues fostered external networking and partnerships. During this presentation discussion will focus on environment, opportunities and choices that led to research focus and research partnerships in gerontology.

### PERSONAL REFLECTIONS OF AN EXTENSIVE JOURNEY IN AGING AND PROFESSIONAL ADVICE ON GRANT WRITING

E. Kahana, *Case Western Reserve University, Cleveland, Ohio*

I will reflect on a career that started with a personal interest in old age and aging and was reinforced by reading Cumming and Henry's 1961 book Growing Old, found on the New Books shelf of the public library. My fascination with the topic and excitement about unraveling its secrets are still with me. In sharing my journey of almost 40 years I will reflect on the importance and interconnected roles of peers, mentors, and students as fellow learners. I will note that pursuit of a scholarly career demands that one's work also becomes well integrated and, hopefully a welcome friend to one's family. I will discuss important decisions that shape one's career trajectory focusing on choosing mentors, dissertation topics, jobs, collaborators and topics for study. Since my own career has been largely built on funded empirical research I will speak about the rapidly changing world of grant writing.

### FAMILIAL EXPECTATIONS AND POLITICAL INFLUENCES

A. Achenbaum, *University of Houston, Houston, Texas*

Familial directives and historical exigencies influenced my decision to become a gerontologist. My father expected me to become a doctor of medicine or a doctor of law; when I said I wanted to be a Ph.D. in the humanities, he winced, and told me to study something forward-looking. So I pursued a career in aging because I watched Richard Nixon preside over the 1971 White House Conference on aging. And the rest is history.

## SESSION 2510 (PAPER)

## WISDOM

### WISDOM AND LIFE STORIES: HOW DIFFERENT TYPES OF LIFE EVENTS FOSTER THE DEVELOPMENT OF WISDOM

S. Koenig, K. Naschenweng, U. Redzanowski, L. Dorner, I. Strasser, J. Gluck, *Psychology, University of Klagenfurt, Klagenfurt, Austria*

Although wisdom is a topic of growing scientific interest and is often considered as the ideal endpoint of human development (Clayton & Birren, 1980) only a few studies explored wisdom in real life so far. How does wisdom develop in the course of ones individual life – which role does the experience of different life events and the reflection upon these events play for becoming wise? These questions are in the focus of attention of a greater wisdom research project which is currently conducted at the University of Klagenfurt Through public calls people were asked to nominate a wise person they personally know. Nominees as well as age matched and young control participants were invited to participate in the study. In a first step participants listed their most important, most difficult and best life-events and evaluated them concerning several criteria (e.g. valence of the event, valence of consequences). In standardized interviews the most difficult and best events were investigated in more detail. Frequent contents were relationships, birth of children, death, illness and education/occupation. Although the majority of participants recalled single events, wisdom nominees also tended to talk about generic and extended events which were temporally and causally linked to later life events or their life story as a whole. Wise participants and control participants also differed concerning the event ratings. The results support theoretical notions about the importance of life experiences for the delopment of wisdom and offer new insights about ways of fostering the acquisition of wisdom in real life.

### WISDOM - BEST PRACTICE IN AGING

K. Naschenweng, S. Koenig, J. Gluck, *University of Klagenfurt, Klagenfurt, Carinthia, Austria*

Within the research project "The Development and Manifestation of Wisdom" (Glück et al., 2008) more than 40 wisdom nominees have participated both in established instruments for wisdom measurement (Ardelt, 2003, Webster, 2003) and a new approach using extended standardized interviews about important events and conflicts in their lives. Five particularly wise participants were reinvestigated using ethnographic methods (participant observation, extended interviews, document collection and analysis) to portray the lives of these wise people in detail. The main goal of the ethnographic research was to go beyond testing pre-specified hypotheses in the project and explore new facets in the life management of wise individuals. The first author spent two weeks with each of five wise individuals and collected various data to characterize the everyday-lives of wise people, their worldly wisdom, their philosophy of life, their handling of strokes of fate, special characteristics and important values in their lives. The results show that wise people are highly aware of their values like family and friends, honesty, gratitude, faith, and unpretentiousness. Their lives are also characterized through their housing situations which reflect specific needs and preferences and through a very deliberate use of media. Furthermore it could be shown how they are able not only to integrate, but also to appreciate difficult life events as enrichment for their lives. In the presentation, the five wise individuals are briefly characterized and relevant commonalities and differences are highlighted. The five wisdom-portraits could be viewed as a kind of best practice models for successful aging.

### WISDOM CONCEPTS IN THE WORLD RELIGIONS

S. Rappersberger, J. Gluck, *Psychology, University of Klagenfurt, Klagenfurt, Kaertnen, Austria*

Wisdom is one of a few positive concepts associated with old age (Heckhausen et al., 1989). Furthermore, wisdom is one of six core virtues, which are present in all world religions (Dahlsgaard et al., 2005). Indeed, a good deal of religious writings focuses on the development of wisdom (Brown, 2005). It has been shown that different cultures carry different wisdom concepts (e.g. Takahashi & Overton, 2005); still, religious concepts of wisdom have hardly been investigated. Hence, the aim of this study is to explore and compare Buddhist, Christian, Hindu, Islamic and Jewish views of wisdom. For this purpose, 20 representative dignitaries per religion are interviewed about their concepts of wisdom and its development. The recorded interviews are transcribed and content analyzed. Until now, interviews with 20 Buddhists and 20 Christians have been analyzed and revealed between-group differences as well as overlaps in definition, characterization, and development of wisdom. Buddhists defined wisdom as a "deeper understanding of reality" and underlined the importance of compassion, while Christians mostly mentioned "life experience." High overlap between the two groups was found concerning the meaning of reflection for the development of wisdom. Currently, Hindu, Islamic and Jewish responses are analyzed. This study gives a review of five mayor religious conceptualizations of wisdom and compares them Investigated aspects are the definition of wisdom, typical characteristics of wise people, development of wisdom and the age-dependency of wisdom. The discussion focuses on commonalities and differences and on implications of religious perspectives for wisdom research.

### ASSESSING EXPERIENCED MEANING IN LIFE AMONG OLDER ADULTS: THE DEVELOPMENT AND INITIAL VALIDATION OF THE EMIL

M.J. Heisel, *Psychiatry and Epidemiology & Biostatistics, The University of Western Ontario, London, Ontario, Canada*

Older adults have high suicide rates, necessitating research on resiliency, health, and well-being in later life (Heisel, 2006). Meaning in Life (MIL), an existential variable typified by a profound sense of worth, coherence, or purpose, is positively associated with psychological well-being (Braam et al., 2006; Krause, 2003; Nygren et al., 2005) and negatively associated with psychopathology (Prager et al., 1997) and late-life suicide ideation (Heisel & Flett, 2007, 2008). Existing MIL scales were typically neither developed nor validated with older adults and treat the construct as a unidimensional entity. The present study describes the development and initial validation of the Experienced Meaning in Life scale (EMIL), a novel measure of MIL developed to assess Viktor Frankl's (1985) multidimensional treatment of the construct, assessing Creative (what one contributes to the world), Experiential (what one receives through life experiences), Attitudinal (one's attitudes towards life's successes and challenges), and Ultimate MIL (one's sense of transcendence). A multidimensional approach to MIL fits well with the transitions characteristic of later life. The EMIL is the first measure designed specifically to assess these four sources of MIL among older adults. The EMIL was developed with a community-residing sample of adults 65 years or older in London, Ontario, a medium-sized Canadian city. The present study reports on the EMIL's initial internal consistency, 2-week test-retest reliability, convergent (life satisfaction, purpose in life, spirituality, and psychological well-being), discriminant (suicide ideation, depression, hopelessness, and physical health complaints), and predictive validity (depressive symptom severity and suicide ideation at follow-up assessment).

## SESSION 2515 (PAPER)

### ASSESSING PHYSICAL CHANGE IN OLDER ADULTS

### MEANINGFUL CHANGE IN MEASURES OF LOWER EXTREMITY STRENGTH AND PHYSICAL PERFORMANCE IN OLDER WOMEN WITH SARCOPENIA

A.M. Nguyen[1], V. Mehta[1], D. Papanicolaou[2], J. Liao[1], J. Chandler[1], *1. Merck & Co., Inc, North Wales, Pennsylvania, 2. Merck & Co., Inc, Rahway, New Jersey*

This study estimates meaningful change in physical performance measures for older women with sarcopenia. Blinded data from a RCT of an investigational drug for sarcopenia were analyzed. Lower extremity strength (LES), lower extremity power (LEP), physical performance (SPPB) and gait speed (GS) were assessed at BL, 3 and 6 months by bilateral leg press (1 rep max), stair-climbing power, SPPB, and 4-meter walk. Participants (n=170) were women ≥65 years, with sarcopenia and evidence of impaired mobility. Distribution and anchor based methods were used to estimate meaningful change in LES, LEP, GS and SPPB. Distribution-based methods included standard error of measurement (SEM) and minimal detectable change at 90% confidence level (MDC90). The anchor-based approach used the optimal operating cutpoints (OOCs) from ROC curves to identify 1) the increase in GS and SPPB that optimally predicts self-reported improvement at 6 months and 2) increases in LES and LEP that optimally predicts GS of ≥1.0 m/s or SPPB of≥10 at 6 months. The SEMs (minimum change above noise) were 13.4 lbs, 10.8 watts, 0.93 points and 0.08 m/sec for LES, LEP, SPPB and GS respectively. The MDC90s (considered 'true' change) were 31.1, 25.2, 2.15 and 0.18, respectively. OOCs for LES and LEP were similar to the MDC90 estimates (LES: 15-25; LEP 17-18). OOCs for SPPB and GS were consistent with established literature of 1.0 and 0.1 m/s, but lower than the MDC90 in this sample. These estimates of meaningful change may be used for planning and interpreting longitudinal assessments in this population.

### CHANGES IN GRIP STRENGTH OVER 6 YEARS AMONG OLDER WOMEN

P. Gaspar[1], M. Johnson[2], *1. University of Toledo, Toledo, Ohio, 2. Winona State University, Winona, Minnesota*

Grip strength (GS) has been identified as a predictor of overall function and mortality. Aims of this study were: 1) describe the changes in GS over 6 years of a select group of older women, and 2) explore differences among subjects who had decline in GS compared to those who without decline. The epidemiological web of causation was the framework that guided the study. This study was a secondary analysis using the database of the longitudinal study "Health Status and Behaviors of a Midwestern Community of Religious Sisters". Only those subjects who had 2 or more years of GS available on the database were included. Mean age of the 87 subjects was 75.6 (SD=7.4) ranging from 65 to 98 years. Data analyzed included: GS (dynamometer), cognitive status (MMSE), functional performance (Guralnik Battery) and general self rated health (SF-36). Highest GS (of either hand) for each year of participation was used for analysis. Mean GS each year was consistently 22 (+/- .5) kg, which is between the 50th and 75th percentile for females of the corresponding age group. Changes in GS ranged from a loss of 15 kg to a gain of 8 kg with 46 subjects having an improvement and 41 with a decline of 2 or more kg. Those with a decline in GS had more functional disability, lower self-rated health, and a greater chance of falling. A negative association of age and GS existed. Further study is necessary to identify clinical outcomes related to a decline in GS.

### ACCURACY OF 10-YEAR AND 20-YEAR RECALLED WEIGHT IN LATE LIFE

A. Dahl[1], C.A. Reynolds[2], N. Pedersen[3,4], *1. Institute of Gerontology - Jönköping University, Jönköping, Sweden, 2. University of California - Riverside, Riverside, California, 3. Karolinska Institute, Stockholm, Sweden, 4. University of Southern California, Los Angeles, California*

Weight changes might be better indicators of an ongoing pathological process than a single measure. Often, both in clinical practice and in research, self-report might be the only possibility to capture past weight. The objective of the study was to evaluate the accuracy of self-reported recalled weight in old age. Six hundred fourteen men and women (mean age, 71.3 years), participants of the Swedish Adoption/Twin Study of Aging (SATSA), were asked in a questionnaire to recall their weight ten and twenty years ago. Recalled weights were compared with self-reported weight ten years ago, and self-reported and assessed weight twenty years ago. Compared to self-reported weight, ten - year recall overestimated weight by 0.26 ± 5.0 kg and twenty year recall underestimated by 0.55 ± 5.2 kg. Moreover, twenty year recalled weight underestimated the assessed weight by 1.89 ± 5.9 kg. Recalled weight was influenced by present weight; overweight persons underestimated their past weight. The accuracy of recalled weight was not influenced by sex, age or low cognitive ability. At the mean level there were small differences between retrospective and initial self-reported and/or assessed weight, but at the individual level recalled weight was less reliable. Accuracy of recalled weight was influenced by present assessed weight. At the population level, recalled weight comes close to the truth, although accuracy is influenced by present weight.

### CHANGES IN LEAN BODY MASS, LOWER EXTREMITY STRENGTH AND PHYSICAL PERFORMANCE IN OLDER WOMEN WITH SARCOPENIA

J. Chandler[1], A.M. Nguyen[1], V. Mehta[1], J. Liao[1], D. Papanicolaou[2], *1. Merck & Co., Inc., North Wales, Pennsylvania, 2. Merck & Co., Inc., Rahway, New Jersey*

Sarcopenia, characterized by low lean body mass (LBM), is associated with impaired strength and physical performance. This study evaluated the relationships between 1) LBM and lower extremity strength and power (LES, LEP) and 2) LES, LEP and gait speed (GS). Blinded data from a RCT of an investigational drug for sarcopenia were analyzed. LBM, LES, LEP, and GS were assessed at BL, 3 and 6 months by DXA, bilateral leg press (1 rep max), stair-climbing power, and 4-meter walk, respectively. Participants (n=170) were women ≥65 years, with sarcopenia and impaired physical performance (SPPB score 3-9). Spearman correlations were calculated between: LBM and LES, LBM and LEP, LES and GS, LEP and GS at each timepoint and longitudinally (change [Δ] from BL to 6 months). Random effects regression models assessed the effect of ΔLBM on ΔLES and ΔLEP, and ΔLES and ΔLEP on ΔGS at 6 months. Cross-sectional/longitudinal correlations: between LBM and LES, LEP were weak (range: r=0.13-0.27 / 0.10-0.17); between LES, LEP and GS were 0.11-0.44 / 0.27-0.38, with higher correlations between GS and LEP. Regression results: the largest gain in LBM (>1.49 kg) was associated with increases in LEP ($p<0.03$) but not LES; highly significant relationship between LEP and GS ($p<0.001$) and a significant, modest relationship between LES and GS ($p<0.04$). Larger gains in LBM may contribute to LEP increases, but not to LES; both LES and LEP increases impact physical performance and may have important treatment implications.

## SESSION 2520 (SYMPOSIUM)

### CHALLENGES TO TRANSITIONS IN CARE AND HEALTH: STRATEGIES TO ENHANCE HOME HEALTH CARE

Chair: *J.K. Davitt, School of Social Policy & Practice, University of Pennsylvania, Philadelphia, Pennsylvania, New Courtland Center for Transitions and Health, University of Pennsylvania, Philadelphia, Pennsylvania*
Co-Chair: *K.H. Bowles, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*
Discussant: *M. Naylor, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

This symposium highlights the interdisciplinary and collaborative research emphasizing transitions in health care and health status supported by the New Courtland Center for Transitions and Health (NCCTH) at the University of Pennsylvania. The NCCTH defines transitions broadly to include transitions between/within health care settings, transitions in an individual patient's health status, and transitions in practice methods to improve health status. The Center's research focuses on enhancing quality of life for chronically ill patients by enhancing our understanding of such transitions. This symposium presents innovative research in the area of post acute care, namely home health care. The papers discuss strategies to enhance transitions in care and to improve health status within transitional care settings. The symposium will begin with a study designed to test 2 specific discharge planning tools with the aim of improving transitions between acute and post acute settings. The next paper focuses on the use of technology to enhance access to home health care thus generating positive transitions in health status for home health care recipients. The third paper addresses innovative strategies to increase access to mental health services in home health care and thus improve health status. Finally, the fourth paper focuses on understanding barriers to improved health outcomes for vulnerable home health care patient subgroups, specifically racial minorities. Increased emphasis on cost containment and use of less restrictive care alternatives, require ongoing study of health and care transitions.

### IMPROVING TRANSITIONS IN CARE: TOOLS TO ENHANCE DISCHARGE PLANNING

D.E. Holland[1,2], K.H. Bowles[2], *1. Mayo Clinic, Rochester, Minnesota, 2. University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania*

The quality of hospital discharge planning decisions determines whether hospitalized older adults receive the health and social services they need, or are sent home with unmet needs and without services, leading to increased risk of developing costly, poor outcomes. Lack of time and resources available to hospital discharge planners calls for improved methods to efficiently and accurately identify patients in need of post acute care. This paper summarizes research testing two tools that target critical decision points in the discharge planning process. The first tool assists discharge planners in identifying which patients need priority assessment of their discharge needs. The second focuses on which patients should be referred for post acute services. This paper presents the development and testing of these two decision support tools that optimize and standardize the efficiency and effectiveness of discharge planning to enhance the safety, quality and efficiency of the health care delivery system.

### ENHANCING HEALTH TRANSITIONS: IMPROVING ACCESS TO HOME-BASED MENTAL HEALTH SERVICES

J.K. Davitt[1,2], Z. Gellis[1], *1. School of Social Policy & Practice, University of Pennsylvania, Philadelphia, Pennsylvania, 2. New Courtland Center for Transitions and Health, University of Pennsylvania, Philadelphia, Pennsylvania*

Substantial rates of untreated mental illness, e.g. depression/anxiety, have been documented in the homebound elderly. Untreated, these conditions negatively impact recovery/stabilization, thus increasing the risk for poor health outcomes and more costly care needs. This paper presents research focused on identifying Medicare policy barriers to providing mental health treatment in home health care. We outline the existing policy and the critical assumptions that create barriers to treatment, including: metaphysical dualism in health care thinking – assumption that the mind and body are separate and should be treated thus; assumptions regarding skilled vs. nonskilled services in home health care; and assumptions regarding which professions can be recognized to provide mental health treatment in a home health care setting. Policy, practice and research recommendations are made to enhance transitions in health status for home health patients with a mental illness and to expand upon recent policy advances in mental health parity in Medicare.

### TELEHOMECARE: IMPROVING ACCESS TO HOME HEALTH CARE AND ENHANCING HEALTH TRANSITIONS

K.H. Bowles[1], M. O'Connor[1], M.D. Naylor[1], B. Riegel[1], M. Weiner[2], H. Glick[2], *1. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania, 2. University of Pennsylvania-School of Medicine, Philadelphia, Pennsylvania*

Many challenges exist in providing skilled home care to elders, including limited staff, travel time, patient acceptance and number of in-home visit limitations imposed by managed care organizations. Telehomecare is an emerging technological tool where wireless devices and video technology are placed in patient homes, transmiting data to the home health agency via the patient's telephone line. Telehomecare increases access to care by allowing home care patients to have more contact with home care providers via use of technology. Results from a National Institute of Nursing Research-funded randomized control trial show that on average, patients received three video visits per length of stay in addition to in-home nursing visits. Elders utilized at least one wireless device 83% of the days the technology was available for use. Telehomecare may improve quality of care through increased monitoring and access to care and may prevent rehospitalizations as patient instability could be identified sooner.

### CHALLENGES TO TRANSITIONS IN CARE: UNDERSTANDING DISPARITIES IN HOME HEALTHCARE

J.K. Davitt[1,2], R. Frasso[1], J. Bourjolly[1], K.H. Bowles[3,2], *1. School of Social Policy & Practice, University of Pennsylvania, Philadelphia, Pennsylvania, 2. New Courtland Center for Transitions and Health, University of Pennsylvania, Philadelphia, Pennsylvania, 3. School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania*

Home health care plays a pivotal role in transitional care, helping to stabilize, rehab, and enhance health status of older patients. However, recent studies indicate disparate outcomes for minority recipients of home healthcare. There is a critical lack of understanding regarding the role that practice factors play in home health disparities. We conducted focus group interviews with home healthcare staff from a variety of agencies in a diverse metropolitan area. This work explores their perspectives on the complex, often unarticulated, practice factors that may contribute to disparate health outcomes, including: challenges in providing home healthcare; staff diversity; staff-patient cultural, racial/ethnic barriers; institutional racism; agency policies; individual bias/stereotyping; and physical, geographic and logistic barriers to consistent quality. Ultimately, the goal of this research is to alleviate disparities and improve health outcomes for all patients thus enhancing health care transitions and creating a more equitable health care system.

# SESSION 2525 (PAPER)

## COMORBIDITIES AND DEMENTIA

### IMPACT OF DEMENTIA ON DRUG USE PATTERNS AMONG MEDICARE BENEFICIARIES WITH CONGESTIVE HEART FAILURE

S.K. Dutcher, G.B. Rattinger, I.H. Zuckerman, L. Simoni-Wastila, H. Yang, J. Qian, B. Stuart, *Peter Lamy Center on Drug Therapy and Aging, University of Maryland Baltimore, Baltimore, Maryland*

Objective: To evaluate impact of comorbid dementia diagnosis on congestive heart failure (CHF) medication adherence patterns among older Medicare beneficiaries. Methods: Using the MarketScan Medicare Coordination of Benefits database, we conducted a retrospective analysis of Medicare beneficiaries diagnosed with CHF. Beneficiaries were ≥65 years, had a CHF diagnosis in 2006, and were continuously enrolled from 1/1/06-1/31/07. Our two year adherence measures for evidence-based drugs indicated for chronic use in CHF treatment included: 1) any use (prevalence); 2) days of therapy (duration); and 3) medication possession ratio (MPR). We describe the cohort and medication adherence patterns, and apply multivariable regression to assess impact of dementia on any use and duration of CHF treatment, adjusted for sociodemographics, comorbidities, healthcare utilization, and loss to follow-up. Results: Of 117,510 beneficiaries with CHF, 7.5% also had dementia. Dementia patients were older (82.6 vs. 78.1 years), disproportionately female (58.6% vs. 50.9%), and more often had 'unspecified' CHF diagnoses (92.6% vs. 88.3%), compared to patients without dementia. Chronic CHF medication prevalence was lower in patients with dementia compared to patients without dementia (67.7% vs. 81.4%). Duration was significantly shorter for those with both diagnoses (460 vs. 565 days), though MPR did not differ. In regression analyses, dementia was associated with 14% lower prevalence and 11% shorter duration of chronic CHF medication use (both p<0.0001). Conclusion: Findings suggest that dementia status may affect treatment decisions for chronic diseases such as CHF. Further investigation into reasons for disparate treatment patterns and their impact on outcomes is warranted.

### DELIRIUM OUTCOMES IN A RANDOMIZED TRIAL OF BLOOD TRANSFUSION THRESHOLDS AMONG HIP FRACTURE PATIENTS

A.L. Gruber-Baldini[1], E. Marcantonio[2], D. Orwig[1], J. Magaziner[1], M. Terrin[1], J.L. Carson[3], E. Barr[1], R. Hebel[1], *1. Epidemiology & Preventive Medicine, University of Maryland School of Medicine, Baltimore, Maryland, 2. Beth Israel Deaconess Medical Center, Brookline, Massachusetts, 3. UMDNJ-Robert Wood Johnson Medical School, New Brunswick, New Jersey*

Delirium is common after hip fracture and associated with poorer functional outcomes. Postoperative anemia is associated with delirium, but it is unclear if blood transfusion to increase anemic patients' hemoglobin affects delirium. The Transfusion Trigger Trial for Functional Outcomes in Cardiovascular Patients Undergoing Surgical Hip Fracture Repair (FOCUS) Cognitive Ancillary Study is a randomized clinical trial designed to assess a Liberal 10 g/dL blood transfusion strategy (L) versus a Restrictive transfusion (R) for symptoms or if hemoglobin <8 g/dL among hip fracture patients with cardiovascular disease (CVD) or CVD risk factors. Delirium was assessed using the Memorial Delirium Assessment Scale (MDAS, primary outcome) and Confusion Assessment Method Diagnostic Algorithm (CAMDA). Subjects were assessed pre-randomization (before third post-operative day) and up to 3 times post-randomization. Generalized Estimating Equations were used to test for a treatment by group interaction over time (pre- versus post-randomization). Across 11 clinical sites, 139 patients had hemoglobin <=10 g/dL during the acute hospital stay and were randomized, with 67 in group L and 72 in group R. Mean+/SD age was 81.5+/-9.1, 73.4% female, and 90.7% white. MDAS means+/-SD were: pre-randomization group L 6.7+/-5.3, group R 6.4+/-5.2, post-randomization day 1 group L 6.8+/-4.4, group R 6.9+/-4.6 (Time*treatment p=0.501). For CAMDA: pre-randomization 24.6% group L and 23.8% group R delirious, post-randomization 30.2% group L, 40.0% group R delirious (Time*treatment p=0.367). Blood transfusion to maintain higher hemoglobin levels did not significantly affect in-hospital delirium occurrence or severity.

### CO-OCCURRENCE OF WANDERING WITH FEATURES OF THE PHYSICAL ENVIRONMENT

D. Algase[1], E. Beattie[2], C. Antonakos[1], C. Beel-Bates[3], L. Yao[1], *1. Swchool of Nursing, University of Michigan, Ann Arbor, Michigan, 2. Queensland University of Technology, Brisbane, Queensland, Australia, 3. Grand Valley State University, Grand Rapids, Michigan*

Background: According to Lawton's environmental docility hypothesis, environment assumes greater salience to behavior as cognition declines. This notion is further reflected and refined in the need-driven dementia-compromised behavior (NDB) model, which postulates that cognitive impairment constitutes a context within which features of an environment exert influence on behavior. In this study, the NDB model was used to evaluate influences of the physical environment on wandering behavior amonag persons with dementia in long-term care settings. Purpose: Our aim was to evaluate aspects of the physical environment on overall wandering and by type of wanderer (classic, moderate, and subclinical). Design and Methods: Using a descriptive, cross-sectional design, 122 wanderers from 28 LTC facilities were videotaped 10-12 times; data on wandering, light, sound, temperature and humidity levels, location, ambiance, and crowding were obtained. Associations between environmental variables and wandering were evaluated with Chi-square and t-tests; the model was evaluated using logistic regression. Results: 80% of wandering occurred in the resident's own room, dayrooms, hallways, or dining rooms. When observed in four specific locations (other residents' rooms, hallways, shower/baths, or off-unit locations), wanderers were highly likely (60-92% of observations) to wander. The data were a good fit to the model overall (LR X2 (5) = 50.38, p < .0001) and by wandering type. Conclusions: Location, light, sound, proximity of others, and ambiance are associated with wandering overall and may serve to inform environmental designs and care practices. The importance of each environmental variable to the occurrence of wandering varied by wandering type.

### HEARING LOSS AND INCIDENT DEMENTIA

F.R. Lin[1], E. Metter[2], R.J. O'Brien[3], S. Resnick[2], A.B. Zonderman[2], L. Ferrucci[2], *1. Otolaryngology-Head & Neck Surgery, Johns Hopkins, Baltimore, Maryland, 2. National Institute on Aging, Baltimore, Maryland, 3. Johns Hopkins School of Medicine, Baltimore, Maryland*

Background: Earlier studies have suggested that hearing loss, which is prevalent in over 30% of adults > 60 years, may be a risk factor for dementia, but this hypothesis has never been investigated prospectively. Methods: We performed audiometry in 639 participants (age 36 – 90 y) of the Baltimore Longitudinal Study of Aging who were dementia-free in 1990-1994 and prospectively followed them for incident dementia. Hearing loss was defined by a pure-tone average of hearing thresholds at 0.5, 1, 2, and 4 kHz in the better-hearing ear (normal <25 dB, mild loss 25-40 dB, moderate loss 41-70 dB, severe loss >70 dB). Diagnosis of incident dementia was made in a consensus diagnostic conference. Cox proportional hazard models were used to model time to incident dementia according to the severity of hearing loss. Results: During a median follow-up of 11.9 years, 58 cases of incident all-cause dementia were diagnosed. The risk of incident all-cause dementia increased linearly with the severity of baseline hearing loss (HR 1.27 per 10 db loss, 95% CI: 1.06 – 1.50). Compared to normal hearing, the hazard ratio for incident dementia was 1.89 for mild hearing loss (95% CI: 1.00 – 3.58), 3.00 for moderate hearing loss (95% CI: 1.43 – 6.30), and 4.94 for severe hearing loss (95% CI: 1.09 – 22.4). Conclusions: Hearing loss is an independent risk factor for all-cause dementia and Alzheimer's disease. Whether hearing loss is a marker for early stage dementia or is actually a modifiable risk factor for dementia deserves further study.

## SESSION 2530 (SYMPOSIUM)

### INTEGRATING TRANSITIONAL CARE INTO HEALTH SYSTEMS

Chair: *A.B. Stevens, Scott & White Healthcare, Temple, Texas*
Discussant: *N.L. Wilson, Baylor College of Medicine, Houston, Texas*

Researchers estimate that one-fifth of all Medicare beneficiaries are rehospitalized within 30 days of discharge, and that 75% of readmissions are preventable. Poor transition outcomes for older adults yield dangerous results including caregiver burden, medication errors, and mortality. Fortunately, innovative service models and interventions are available to address risks associated with care transitions. Evidence exist that interventions also reduce readmissions for up to 6 months. Models of transitional care, however, require healthcare systems to provide enhanced discharged services or to better coordinate hospital discharges with community agencies that are prepared to deliver transitional care services. This symposium will present models used by two healthcare delivery systems to improve transitional care. Models share numerous characteristics including detailed attention to the process of targeting transitional care to patients at greatest risk of preventable readmissions, integration of health system discharge planners and community-based service organizations and the use of social workers in the delivery of transitional care services. Models are unique in the populations served (rural vs. urban) and the use of telephonic verses home visits methods to deliver transitional care services. Preliminary data suggest that both models are efficacious and are potential candidates for dissemination to other healthcare settings. Yet, the potential impact of these models of transitional care will be limited without reforms to the current Medicare payment system, suggesting the need for policies that will support embedding and sustaining transitional care services.

### IDENTIFYING TARGET GROUPS FOR TRANSITIONAL CARE INTERVENTIONS USING HEALTHCARE RECORD DATA

A. Hochhalter[1,2], K. Broglio[4], L. Sklar[1], K. Brasla[3], *1. Scott & White Healthcare, Temple, Texas, 2. Texas A&M Health Science Center, College Station, Texas, 3. Scott & White Health Plan, Temple, Texas, 4. Texas A&M University, College Station, Texas*

The effectiveness of patient-directed transitional care interventions may depend on appropriate targeting of interventions to patients with the highest need for the services. This paper describes the use of two datasets to identify patient characteristics associated with days to rehospitalization or use of ER services following discharge for groups of hospitalized older patients: (1) Scott & White Memorial Hospital patients aged 65 and older, and (2) members of a Medicare Cost Contract offered by Scott & White Health Plan. Univariate analyses and Hazard Ratio Models identified several patient characteristics associated with time to hospital or ER use following discharge, but few variables were significantly associated with these adverse outcomes in both datasets. While available clinical and medical claims data are useful for identifying target intervention groups, they are insufficient for fully identifying socioeconomic and psychosocial characteristics of persons who may be most likely to benefit from transitional care interventions.

### THE ENHANCED DISCHARGE PLANNING PROGRAM (EDPP) AT RUSH UNIVERSITY MEDICAL CENTER

A. Perry, R. Golden, *Rush University Medical Center, Chicago, Illinois*

Rush University Medical Center's efforts to implement innovative care coordination span over a decade and draw upon the institution's commitment to interdisciplinary education, research, and care of the highest quality. The Enhanced Discharge Planning Program (EDPP), Rush's transitional care program, employs social workers as transition managers, intervening from a biopsychosocial perspective to address the clinical, behavioral health, and social issues impacting patients' transitions from hospital to home. The program identifies a set of biopsychosocial markers to identify older adults at risk for a complex transition from hospital to home. It then applies a templated telephonic intervention delivered by a social worker that includes two elements: 1) care coordination services (connecting the acute hospital discharge plan of care and the patient's longitudinal community plan of care) and 2) psychosocial assessment and intervention. The program has been designed, piloted and implemented. Findings associated with implementation of the program will be discussed.

### A COMMUNITY/HEALTH SYSTEM PARTNERSHIP TO DELIVER THE CARE TRANSITIONS INTERVENTION

E. Smith[1], A. Hochhalter[1], A.B. Stevens[1], R. McGhee[2], *1. Scott & White Healthcare, Temple, Texas, 2. Central Texas Aging and Disability Resource Center, Belton, Texas*

The Central Texas Community Living Program (CLP) is a partnership between the Central Texas Aging and Disability Center (ADRC) and Scott & White Healthcare to serve older adults who are at risk for nursing home placement. Embedded within the CLP is the Coleman Care Transitions Intervention (CTI) aimed at reducing re-hospitalizations. Program specialists were trained in CTI and began enrollment throughout Scott & White Hospital or the surrounding community. To date, 185 persons have been enrolled and 34% of the participants have received the CTI. Readmission rates are lower among program participants as compared to Scott & White's current Medicare population. Furthermore, the 30 day readmission rate among participants was 3.4% and the 90 day readmission rate was 17.3%. The goal of this presentation will focus on the implementation of the CTI within a hospital setting, the integration of the CTI with the CLP program, and hospital utilization outcomes.

### SUSTAINING THE PROMISE OF TRANSITIONAL CARE: THE NEED FOR PROVIDERS AND RESEARCHERS TO INFLUENCE POLICY

R. Golden, A. Perry, *Rush University Medical Center, Chicago, Illinois*

Researchers estimate that one-fifth of all Medicare beneficiaries are rehospitalized within 30 days of discharge, and that 75% of readmissions are preventable. Poor transition outcomes for older adults yield dangerous results including caregiver burden, medication errors, and mortality. Innovative transitional care programs such as the Enhanced Discharge Planning Program (EDPP) and the Care Transitions Intervention (CTI) address this national imperative while creating an evidence base for diverse approaches to supporting older adults across care transitions. These programs have garnered significant attention in the context of healthcare reform as a method for controlling costs and improving quality. Providers must now take an active role influencing policy to ensure transitional care models move from pilots and demonstrations to an integral part of care delivery for older adults. This presentation will discuss the ways strong evidence from transitional care programs can influence policy and create a sustainable future for these promising models.

# SESSION 2535 (PAPER)

## ADULT PROTECTION AND ELDER ABUSE

### BANKS AS MANDATED REPORTERS: TRENDS FOLLOWING ELDER ABUSE LEGISLATION IN CALIFORNIA

A.E. Navarro, K. Wilber, *Davis School of Gerontology, University of Southern California, Los Angeles, California*

Financial abuse, also referred to as financial exploitation, is defined as the taking or misappropriation of an older person's property, possessions, or financial assets. Social changes and technological advances are predicted to add to its prevalence. In response, The California Financial Elder Abuse Reporting Act (SB 1018) was passed requiring employees of banks, savings associations, and credit unions to report suspicious activity. The legislation is slated to sunset in 2013. To inform future policy we examined four years of elder abuse reporting in Los Angeles County, the most heavily populated county in the nation, with 9.9 million residents. A retrospective review of administrative records included both manual and electronic data collection from the Central Intake data systems. From among a total of 19,309 reports in the first year of mandated bank reporting (2007), the total number of reports increased 4.9% (n=906), whereas financial abuse reports increased 14.3% (n=593), and reports by banks experienced a jump of 640.2% (n=813). Within 24 months (January 2007 to December 2008), among 39,355 total APS reports, the percentage increased 8.9% (n=1,643) for total reports, 33.1% (n=1,371) for all financial abuse reports, and a massive 696.1% (n=884) for reports by financial institutions. These rates of increased reporting suggest the legislation successfully improved elder abuse awareness among financial personnel, along with the motivation to take action in exposing probable incidents of financial abuse. Implications from these results include the need for added investigative resources.

### BEYOND COGNITION: TOWARD A RELATIONAL UNDERSTANDING OF DECISION-MAKING CAPACITY

D. O'Connor, M. Hall, *Centre for Research on Personhood in Dementia, University of British Columbia, Vancouver, British Columbia, Canada*

Internationally, growing attention is being placed on refining how issues of decisional capacity are understood and assessed. Too frequently however, these efforts are limited by a focus on cognition that is decontextualized and predicated upon notions of individualized autonomy and independence. The problematics of this approach become particularly clear when applied to understanding how older adults in situations of abuse make decisions about taking action. Drawing upon two different data sets related to understanding decision-making in situations of abuse, the purpose of this paper is to begin to theorize an understanding decision-making capacity that is more relationally –driven. In the first data set, as part of a broader evaluation study, in-depth personal interviews were held with nine victims of abuse in order to understand from their perspective how they understood their situation and needs for support. The second study draws on a retrospective document analysis of ten cases where assessments of incapacity to turn down support services by older adults experiencing abuse were conducted. Combined, these data highlight the importance of understanding both need and responses to adult protective services within a relational context. What could appear to be cognitive dysfunction in decision-making often had a strong relational base that was easily overlooked or misinterpreted. These data provide the foundation for developing a theoretical lens for reconceptualising decision-making capacity in a way that recognizes that cognition does not operate in a vacuum. Potential legal strategies– such as undue influence – are identified as offering particular promise for bi-passing individualized discussions of capacity to get at more relevant, relational constructs.

### UTILIZATION OF ADULT PROTECTIVE SERVICES BY OLDER PERSONS IN RURAL AREAS

D. Mukherjee, *Social Work, Southern Illinois University Carbondale, Carbondale, Illinois*

The recent economic downturn has negatively affected the well-being of older adults everywhere, however, those who lived in rural areas have been affected the most. States hardest hit by the economic meltdown was first to eliminate basic services to older adults in the rural settings, putting enormous financial pressures on family caregivers and gerontological social workers. Wide-scale unemployment resulted in higher incidence of migration of jobless young-to-middle-aged adults from urban to rural areas as they chose to move with their elderly parents. Under these circumstances, it is important to examine how the socioeconomic developments post-2008 economic meltdown impacted the problem of elder mistreatment and the utilization of adult protective services. In rural areas. This study examines the Adult Protective Services (APS) database in southern Illinois since April 2008 to explore the characteristics in elder mistreatment reporting and utilization of services and compares that information to the pre-economic meltdown database (between 2005 and 2008) to analyze if there has been any significant shift in the demographic and clinical characteristics of elder mistreatment reporting and service utilization between these two phases. The findings of the study indicate, and expanding trend of financial abuse in rural areas with the higher percentage of perpetrator's hailing from victims' families. The study provides important baseline information that may help APS workers to change their intervention strategies and will also help strategize for the prospective retirement of baby boom retirement that might pose the identical problem to the APS.

# SESSION 2540 (PAPER)

## CARE INTERVENTIONS IN NURSING HOME SETTINGS

### COGNITIVELY IMPAIRED NURSING HOME RESIDENTS STUCK IN THE REVOLVING DOOR OF THE EMERGENCY ROOM

C. Stephens[1], C. Harrington[1], A. Bostrom[2], *1. University of California, San Francisco, San Francisco, California, 2. University of California, San Francisco, San Francisco, California*

NH residents use the ED more frequently than community-dwelling seniors & nearly two-thirds of NH residents cared for in the ED have CI. Many ED visits are unnecessary/preventable and lead to iatrogenic complications, increased morbidity & mortality, and higher costs. Utilizing a national random sample of NH residents with & without CI, this secondary analysis of 2006 MDS and CMS claims data examined the prevalence of ED use (with & without hospitalization) and how the risk of utilization varied by the presence & severity of CI. Of the 133,363 NH residents, 57.8% had CI, 68.8% were female, 80.5% were 76+ years, 9.4% were AfricanAmerican. Residents with CI had higher average rates of ED visits without (vs. with) hospitalization/year (2.20 vs. 1.66, p<.0001), but overall those with CI had fewer total ED visits/year compared to those without CI (3.66 vs. 4.88, p<.0001). Controlling for sociodemographic & health characteristics, however, ED utilization varied based on CI severity. Those with mild CI (MDS-COGS=1) had 12% higher odds of ED use with hospitalization than residents without CI (AOR 1.12, p<.0001), & risk declined as CI worsened. Risk of ED use without hospitalization was greatest for mild CI (MDS-COGS=1,2) and moderate-severe CI (MDS-COGS=7) (AOR 1.07, 1.10, 1.08; p<.0006, <.0001, .004), suggesting some ED utilization may be avoidable/preventable. Identifying & modifying factors responsible for ED use during an illness episode may result in more appropriate ED use, reduced costs & better health outcomes. Using ED utilization without hospitalization as a NH quality indicator may be warranted.

### CONNECT FOR BETTER FALLS PREVENTION IN NURSING HOMES: AN INTERVENTION

R.A. Anderson[1], K. Corazzini[1], E.S. McConnell[1,2], D.K. Thornlow[1], S. Pinheiro[1], C. Colon-Emeric[1,2], *1. School of Nursing, Duke University, Durham, North Carolina, 2. Durham Veterans Adminstration Medical Center, Durham, North Carolina*

Standard approaches to improving nursing home outcomes (NHs) use quality improvement (QI) programs which focus on individual mastery, didactic modules, audit and feedback, and academic detailing. Social constructivism theory and complexity science suggest, however, that learning is a social process that occurs within the context of relationships and interactions; thus alone, traditional QI will not result in optimal behavior changes. Accordingly, we developed an educational/behavioral intervention (CONNECT) in which staff learn to improve connections within and between workgroups, improve information exchange, and seek diverse perspectives in problem-solving. The study aims to determine whether CONNECT improves staff-interaction measures, fall-related process measures, and reduces fall rates when combined with a standard QI program about fall risk-factor reduction (FALLS). We will report preliminary results of this randomized, controlled, single-blind study of the effect of CONNECT on changes between baseline and the first follow-up staff-interaction measures (communication, participation-in-decision-making, relational coordination, psychological safety, and safety culture). Two NHs received CONNECT+FALLS and 2 NHs received FALLS alone; to date 83 staff-subjects have responded to baseline surveys. Mean scores for communication- openness, accuracy, timeliness, participation-LPNs, participation-aides, relational coordination, psychological safety, and safety culture respectively for the CONNECT+FALLS group were 3.15, 2.91, 3.21, 6.11, 5.00, 4.36, 3.99, 3.09 and for the FALLS group were 3.80, 3.07, 3.96, 6.38, 5.97, 5.49, 5.17, 3.64. Intervention delivery and fidelity will be described and pre and post differences presented. This project will extend knowledge about how NH staff learn, and improve care processes, with implications for culture change initiatives and staff education.

### ELDERLY NURSING HOME RESIDENTS' PERSPECTIVES ON FILIAL PIETY AND INSTITUTIONALIZATION IN SHANGHAI

L. Chen, *Social Welfare, University of California, Los Angeles, Los Angeles, California*

The purpose of this study is to understand elderly Chinese nursing home residents' decision-making process around institutionalization and the evolving notion of filial piety during this process. Contextual, crisis, and cultural factors helped to conceptualize this study. This qualitative study entailed semi-structured, open-ended interviews with 11 elderly Chinese residents in a government-supported institution in Shanghai. Results show that prior to institutionalization, participants faced caregiving crises at home, including sudden health decline, children's limited availability, and financial constraints. Participants proposed suggestions for alternatives to care by their children, including living on their own and moving into an institution. Participants also described their children's reactions, including asking parents to stay with them, hiring a paid caregiver, and institutionalization. Institutionalization became the compromise between generations. Participant responses reveal the contrasts between generations in the redefined notion of filial piety as a result of urbanization: participants already in an institution were more reciprocal in reinterpreting filial piety, whereas their children were more concerned about traditional obligations when making the institutionalization decision. Results may have implications on future research should also consider negotiation and decision-making non-institutionalized Chinese elders and their children, to explore if those elders' perceptions of filial piety are also reciprocal. A combination of crisis theoretical framework and a Confucian framework would help to offer more insights.

### NURSING HOME EFFECTIVENESS FOR CHRONIC ILLNESS CARE: ADVERSE EVENT ANALYSIS

C.E. Bishop, J. Meagher, J. Perloff, G. Khatutsky, *Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts*

Avoidable hospitalizations and emergency department (ED) visits are disruptive for chronically ill long-stay nursing home residents and costly for payers. State payment policy has been shown by others to affect resources of nursing homes, possibly supporting or impeding homes' ability to provide chronic illness care. Treating nursing homes as the ambulatory medical care setting for long-stay residents, we estimated models of time to event for adverse events associated with less effective medical care: ambulatory care sensitive (ACS) hospitalizations and ED visits not resulting in hospitalization. Survival analysis allowed appropriate treatment of censoring by death, discharge, and observation time. Multivariate models estimated the impact of nursing home, market, and policy characteristics on risk of adverse event while accounting for individual health and disability for 54,250 long-stay elders aged 65+ living in a nursing home for at least 3 months by 1/1/2000. Variables including ownership, staffing by type, state Medicaid payment rate, state bed hold policy, and hospital beds per elder were tested for significance as predictors of time to ACS hospitalization and to ED visit. Registered nurse and nursing assistant hours per resident day were tested for a protective impact preventing adverse events. The hypotheses that ACS hospitalization and ED visit risks were greater where states paid lower Medicaid rates or paid to hold beds while Medicaid residents are hospitalized were also tested. The results have implications for nursing home staffing and state Medicaid policy.

## SESSION 2545 (PAPER)

## HEALTH PROMOTION PROGRAMS

### IMPLEMENTATION AND EVALUATION OF THE HEALTHY BRAIN INITIATIVES' DEMONSTRATION PROJECT: IMPROVING THE COGNITIVE HEALTH OF AFRICAN AMERICAN OLDER ADULTS

F.T. Fuller, A. Johnson-Turbes, T. Osuji, D. Beauchesne, S. Abood, *Alzheimer's Association - National Office, Chicago, Illinois*

As the U.S. population ages, cognitive decline is a growing public health concern because the risk for cognitive decline increases as people age. A growing body of evidence supports the link between vascular risk factors and increased risk for cognitive impairment. Studies indicate that African Americans are at greater risk for vascular risks such as hypertension and diabetes. This study is an evaluation of the Healthy Brain Initiatives' demonstration project, the nation's first community-level, culturally relevant demonstration project designed to increase knowledge/awareness of the healthy brain, increase intentions to engage in physical activity, and promote prevention and management of vascular risks among African Americans born from 1946 through 1964. Five theoretical models: (1) Planned Approach to Community Health (PATCH), (2) Empowerment Model, (3) Networking Model, (4) Socio-Ecological Model, and (5) Theory of Reasoned Action were used which focused on providing older people with skills to improve their physical and social well being. The evaluation used a quasi-experimental, mixed-method design involving collection and analysis of qualitative and quantitative data in two sites – Atlanta, GA and Los Angeles, CA. The evaluation assessed fidelity regarding the projects' core components - strategic partnership/coalition outcomes, half-day Healthy Brain Champion Workshops, media and Community Events. The findings indicate that the project increased knowledge/awareness of brain health and increased intentions to engage in health protective behaviors to maintain overall and potentially brain health among participants. Additionally, the findings suggest the value of motivating community members to be advocates for cognitive health in their own communities.

### FIT AND STRONG!, AN EVIDENCE-BASED INTERVENTION FOR OLDER ADULTS WITH OSTEOARTHRITIS: FINDINGS FROM THE TRANSLATION AND DISSEMINATION TRIAL

S.L. Hughes[1], R. Seymour[1], P. Desai[1], G. Huber[2], *1. Center for Research on Health and Aging, University of Illinois Chicago, Chicago, Illinois, 2. Northwestern University, Chicago, Illinois*

The successful and timely translation of evidence-based health promotion programs for older adults is a major public health priority. Osteoarthritis (OA) is the most common condition affecting older people today. Lower extremity (LE) joint impairment caused by OA has been shown to be a risk factor for future disability. Fit and Strong!, was developed to address this risk factor. It is an award winning, evidence-based, multiple-component exercise/behavior change program for older adults with OA. The program is currently being diffused in Illinois and North Carolina through partnerships with local Area Agencies on Aging with funding from the Centers for Disease Control and Prevention (R18DP001140). We are using the RE-AIM framework to guide our efforts. To date, we have partnered with 32 providers, trained 101 instructors, and enrolled over 430 participants. Analyses of participant outcomes show significant improvements on exercise participation (p=0.025), LE joint pain (p=0.002), LE joint stiffness (p=0.006), energy/fatigue (p=0.000) and self-efficacy for exercise (p=0.000), and a borderline significant difference on Body Mass Index (p=0.067). Factors that facilitate and impede program adoption, fidelity/ adaptation, and sustainability will be discussed. Practical issues involved in providing Fit and Strong! in the community will be discussed, including space, equipment, recruiting, training and monitoring exercise instructors, and methods for monitoring fidelity of Fit and Strong!. We will also describe our interactive website (www.fitandstrong.org) and the cadre of Master trainers that make it possible for us to more broadly disseminate Fit and Strong! to other communities that seek to adopt it.

### THE EVALUATION OF A PAIN PROTOCOL INTERVENTION IN LONG TERM CARE

S. Kaasalainen[1], K. Brazil[1], J. Ploeg[1], N. Akhtar-Danesh[1], L. Dolovich[2], E. Coker[1], T. Hadjistavropoulos[1], *1. McMaster University, Hamilton, Ontario, Canada, 2. University of Regina, Regina, Saskatchewan, Canada*

OBJECTIVES OF STUDY: The objectives of this project were to evaluate the effectiveness of (a) the implementation of a pain protocol in reducing pain in LTC residents, and (b) dissemination strategies in improving clinical practice behaviours related to pain management (e.g., frequency and documentation of pain assessments, use of pain medication) among health care team members. METHOD: We used a controlled before-after design to evaluate a pain protocol intervention that used a multifaceted approach to its implementation, including a site working group, pain education and skills training, and other quality improvement activities. We collected data (i.e., pain assessments, quality indicators related to pain management) for 200 LTC residents; 100 for the intervention and 100 for the control group across four LTC homes. RESULTS: We found that pain increased significantly more for the control group than the intervention group. The percentage of residents with a non-pharmacological intervention documented for pain increased to 28.6% in the intervention group and decreased to 18.3% in the comparison group. Also, there were statistically significant findings between the intervention and comparison groups representing a positive change in clinical practice behaviour favouring the intervention group for the following indicators: use of a standardized pain assessment tool, the assessment process accommodated for residents with cognitive and/or language problems, and an admission/initial pain assessment was completed. CONCLUSIONS: These study findings indicate that the implementation of a pain protocol intervention improved the way pain was managed and provided pain relief for LTC residents.

## SESSION 2550 (SYMPOSIUM)

### IT'S NOT PLUG AND PLAY: THE CHALLENGE OF MOVING TELEHOMECARE FROM PILOT TO FULL ADOPTION

Chair: *A.P. Glascock, Culture and Communication, Drexel University, Philadelphia, Pennsylvania*
Discussant: *D. Lindeman, Center for Technology and Aging, Oakland, California*

Although Telehomecare, in one form or another, has been in existence for at least a decade, the overall commercial success has been limited at best. There have been numerous pilot, demonstration and feasibility studies in different countries, with various care and business models, but few, if any, have evolved into full-scale adoption in which Telehomecare has become the mainstream care model. The symposium brings together researchers from three countries—the Netherlands, the United Kingdom and the United States—each of whom has direct empirical experience with the effort to move Telehomecare beyond pilot studies. Their presentations focus on the challenges that face care organizations and technology companies as they attempt to ramp-up from small-scale pilot studies to full implementation by discussing, among other issues: 1) the inherent strengths and weaknesses of pilot studies; 2) the differences between installation and adoption; 3) what does success mean to the different stakeholders and how can it be measured; 4) the role played by ROI (return on investment) in the full-scale adoption of Telehomecare; 5) can "better" care be demonstrated in a pilot study, and if it can, does it really matter; 6) what does saving money have to do with the wide-scale adoption of Telehomecare and 7) the appropriate role of government in the introduction of Telehomecare. Attendees will come away from the symposium with a better understanding of the problems and possible solutions relating to Telehomecare adoption.

### TELEHOMECARE INTERRUPTUS: LESSONS LEARNED ABOUT THE CHALLENGES OF ADOPTION FROM TWELVE PILOT STUDIES

D.M. Kutzik, A.P. Glascock, *Drexel Unversity, Philadelphia, PA*

Findings from research in the United States, England and the Netherlands of a specific Telehomecare system—QuietCare®—indicate that the assumption that if a pilot study is successful, full adoption will follow is false. Although the care and business models of the twelve organizations varied, the results were surprisingly similar: as a care tool, QuietCare® was a success, and yet, none of the organizations made it an integral part of an ongoing care model. The reasons for this failure vary somewhat from one entity to another, but four major problems were common to all twelve pilots: 1) the studies were organizationally marginalized; 2) the downside risk of full adoption outweighed potential gain; 3) no sustainable business model to pay for full adoption existed; and 4) the organizational changes required for full adoption were viewed as too disruptive.

### ADOPTING TELEHEALTHCARE AS A MAINSTREAM SERVICE INNOVATION

S. Brownsell, M.S. Hawley, *School of Health and Related Research, University of Sheffield, Sheffield, United Kingdom*

The mainstream adoption of innovation is always challenging, especially in large organisations and systems, but telehomecare seems to have encountered particular problems after a flurry of high profile and 'successful' pilots. Based on over a decade's experience of introducing and evaluating telehomecare initiatives we present three factors involved in achieving mainstream adoption (1) Prerequisites: building blocks to give the best chance of success and determine if an initiative should even proceed. (2) Components of success: what factors constitute success, how can these be defined, and how programme teams can work together to achieve a shared vision. (3) Quantifying success: how we measure, in a robust manner, these components of success in such a way that the evidence generated can be used to inform decision makers and thus promote mainstreaming of telehomecare. These three themes will be expanded and discussed in order to inform strategy for mainstreaming telehomecare.

### TELEHOMECARE IN THE PERSPECTIVE OF AGEING IN PLACE FOR FULL IMPLEMENTATION

H. Kort[1,2], J. van Hoof[1,2], *1. Health Care, Hogeschool Utrecht, University of Applied Siences, Utrecht, Netherlands, 2. Hogeschool Utrecht, University of Apllied Sciences, Utrecht, Utrecht, Netherlands*

Telehomecare is one of the solution for ageing in place (AiP) in addition to: care support for (I)ADL, physical activity or home modification (architecture and technological solutions). Solutions for AiP have been examined by use of the framework of the International Classification of Functioning, disabilities and health (ICF), and the Model of Integrated Building Design (MIBD). This model consist of six value domains: basic, functional, local, ecological, strategic value and economic values, which gives an outline for six described building systems. In the ICF-MBID framework, needs of individual persons determines the basic values as requirements for a building. Integration of needs derive from health conditions, and requirements for building systems set the conditions for home environment design for AiP. To achieve full implementation of telehomecare: multidisciplinary teams, home modification and the available care support should be taken into account. All these factors will be addressed in the presentation.

### FROM PILOT PROJECT TO MAINSTREAM SERVICES: LESSONS FROM THE WORLD'S LARGEST REMOTE CARE PROGRAMME

J. Hendy, J. Barlow, T. Chrysanthaki, *Health Management Group, Business School, Imperial College, London, United Kingdom*

A key agenda for governments worldwide is how best to care for older people, whilst limiting the demand for expensive hospital and nursing home beds. One solution is the development of technologies that support care remotely. Faith in the potential of this technology has led to the UK government to take a world lead in promoting this approach. Funding has been allocated to introduce remote care into 150,000 homes (the Preventative Technologies Grant, PTG) and the largest randomised control trial of remote care services in the world – the Whole System Demonstrators Programme (WSD) – is now underway in three locations. Drawing on findings from two longitudinal research projects on the organisational and economic factors influencing the implementation of remote in both the PTG and WSD, the presentation will explore the lessons for policy makers and health and social care providers.

## SESSION 2555 (PAPER)

## MENTAL HEALTH AND AGING

### THE IMPACT OF SUBSTANCE USE DISORDERS ON MEDICARE AND MEDICAID EXPENDITURES FOR ELDERS WITH BEHAVIORAL HEALTH DISORDERS

W. Lin[1,2], R.E. Clark[1,2], J. Zhang[1], G. Leung[1], *1. Center for Health Policy and Research, University of Massachusetts Medical School, Shrewsbury, Massachusetts, 2. Department of Family Medicine and Community Health, University of Massachusetts Medical School, Worcester, Massachusetts*

The rate of alcohol and drug abuse and the number of people requiring addiction treatment are likely to increase substantially as baby boomers age. However, the influence of substance use disorder (SUD) on elders' healthcare expenditures has not been well documented. Using merged Massachusetts Medicare and Medicaid claims data (CY2005), we investigated the impact of SUD on healthcare expenditures covered by Medicare and Medicaid for community-dwelling elders receiving behavioral health care (N=61,403). Behavioral and physical healthcare expenditures, separately and combined, were examined. We included expenditures on prescription drugs for dual eligibles which were paid for by Medicaid in CY2005. However, we did not have medication expenditures for non-dual eligibles. Regardless of the dual eligibility, a co-occurring SUD was associated with significantly higher median expenditures for behavioral and physical healthcare, separately and combined. For example, median total expenditures for dual eligibles with co-occurring severe mental illness and SUD were two times higher ($40,270 vs. $20,527); physical healthcare expenditures were almost twice as high ($27,744 vs. $15,443); and behavioral healthcare expenditures were three times higher ($4,335 vs. $1,458) than for those without co-occurring SUD. Adjusting for the overall disease burden mitigated the impact of co-occurring SUD on total and physical healthcare expenditures, but the impact remained considerable. Although SUD is generally associated with higher physical comorbidities, factors beyond the overall disease burden may also contribute to the higher healthcare expenditures. Access to medical care, use of community-based and preventive services, and treatment compliance are potential areas for further investigation and improvement.

### URBAN RURAL DIFFERENCES IN DISCHARGING HOSPITALIZED OLDER ADULTS WITH MENTAL HEALTH NEEDS

L.L. Popejoy, C.M. Galambos, K.C. Moylan, *University of Missouri, Columbia, Missouri*

The purpose of this study was to identify challenges of hospital discharge planning as perceived by healthcare professionals (HCPs) including social workers, case managers, nurses, and physicians. Using a cross sectional descriptive design, research participants completed a 31-item questionnaire administered through Survey Monkey. Participants were recruited using a snowball sample technique that yielded 367 usable surveys from across a Midwestern state. Data were analyzed first to identify the frequency of reported problems in finding post acute care for people with mental illness, and second to identify if there was a relationship between urban rural classification and frequency of reported problems in finding care for people with mental illness. Data were analyzed for urban rural differences using Spearman Rank Correlations that were adjusted for multiple tests using the False Discovery Rate. Hospitals reported problems finding skilled nursing care for people with mental illness (mean 2.2), mental retardation developmental disability [MRDD] (mean 2.83), and dementia (mean 3.2). There were problems in finding residential care for those with mental illness (mean 2.4), MRDD (mean 2.62), and dementia (mean 2.7). There were significant urban and rural differences in finding skilled nursing care for people with mental illness ($p=0.14$), MRDD ($p = .022$), and dementia ($p = .00005$) with more problems reported in urban areas. The same trend held for urban and rural differences in finding residential care for people with mental illness ($p= .023$), MRDD ($p = .015$, and dementia (.0036). Research implications for policy and practice will be discussed.

### PROMOTING POSITIVE MENTAL HEALTH: A PEER SUPPORT PROGRAM FOR MEDICAID HCBS/FE WAIVER RECIPIENTS

R.K. Chapin, S.T. Landry, R. Rachlin, J.F. Sergeant, T. Koenig, H. Nelson-Becker, L. Hasche, *School of Social Welfare, University of Kansas, Lawrence, Kansas*

One in five seniors living in the community may be experiencing mental health problems, yet few use formal mental health services. Area Agencies on Aging (AAA) have a unique opportunity to connect older adults to mental health resources. The Peer Support Program is a pilot study developed through a cooperative effort between an AAA, University, and state Department on Aging, that aims to reduce symptoms of depression and anxiety and increase the quality of life for seniors. Methods: The Peer Support Program uses a strengths-based approach to train older adult volunteers. Volunteers are paired with participants for 10 weeks to identify and develop personal goals and provide social support. Pre- and post-evaluations involved the Geriatric Depression Scale (GDS), Beck Anxiety Inventory (BAI), the Ferran and Powers Quality of Life Index (QLI) and items about healthcare utilization. Results: The sample was recruited from three AAA service regions in a Midwestern State, and included over 20 older adult participants and volunteers. The participants were over age 60 and were receiving Medicaid HCBS/FE waiver services. Preliminary paired-sample t-tests indicate decreased mental health distress and improved quality of life. Qualitative findings from post-intervention interviews and a review of bi-weekly logs tracking goal development and attainment further support these findings. Implications: The Peer Support Program demonstrated promising clinical outcomes and an innovative means of using volunteers to respond to mental health concerns. Inclusion of volunteers may help promote the feasible replication of this program into other AAAs.

### MENTAL HEALTH CONSEQUENCES OF GIVING UP THE KEYS: DRIVING CESSATION AMONG OLDER ADULTS

A. Horowitz, B.E. Gibson, K. Boerner, J.P. Reinhardt, *Jewish Home Lifecare, New York, New York*

For many older adults, driving is equated with a sense of autonomy and independence. While emerging evidence suggests that driving cessation is a risk factor for the onset and persistence of depression, little is known about why some older adults are better able than others to make driving transitions with relatively less psychological distress. This paper presents findings from the baseline and 1-year follow-up data of a NIA-funded study of older drivers, ("Driving Transitions and Mental Health in Disabled Elders," R01AG20579). The baseline sample consists of 381 older drivers, age 55+, (mean =75 years), with functional vision problems. Of the 254 baseline participants who completed their 1-year follow-up, 45 (18%) reported being ex-drivers at that time. Findings indicated that ex-drivers had significantly higher CES-D depression scores than current drivers at the 1-year follow-up (10.6 and 7.3 respectively, $p<.05$; potential range 0-60). Regression analyses identified driving cessation as an independent risk factor for increased depression from Baseline to 1-year follow-up after controlling for other known correlates of depression (e.g. health, social support). Among ex-drivers, greater depression at the 1-year follow-up was associated with younger age, higher disability, lower self-rated health, less perceived availability and adequacy of social support, and lower levels of autonomy and mastery. Findings highlight the importance of understanding the psychosocial meaning of driving for older adults and of developing services to both prevent and treat the mental health consequences of driving cessation.

## SESSION 2560 (PAPER)

## RETIREMENT

### TRANSITION FROM WORK TO RETIREMENT: PATTERNS, STATUS, AND PROBABILITIES

F. Tang, L. Yin, Y. Lee, *University of Pittsburgh, Pittsburgh, Pennsylvania*

Retirement patterns have undergone great changes in the U.S. Instead of following the traditional retirement pattern – leaving a full-time career job for complete retirement, many older Americans choose a gradual transition to retirement. However, previous studies are limited to descriptions of static patterns or trends in retirement. Using the data from the Health and Retirement Study, this study examines the dynamic process in retirement transition through three discrete stages of changes: full-time employment, part-time employment, and full retirement. Latent transition analysis was used to analyze the change patterns, statuses, and transition possibilities among 6,523 respondents who reported working in 1998. Three categorical variables were used as indicators of transition: annual working hours (none, less than 1680 hours, or 1680 hours or more), self-reported retirement status (completely retired, partial retired, not retired, or others), and receiving social security (yes or no) in 2000, 2004, and 2008 respectively. The most common latent status at Time 1 (2000) was full-time work status (55.7%); however, the retired became the most prevalent status (62.9%) at Time 3 (2008). There was strong stability in the retired status membership over time, but less satiability in the full-time and part-time status memberships. Focusing on change, the most common transition to a different status was from part-time work to the retired, yet there was still possibility to move from the retired to part-time work or even full-time work status. Findings have implications for changes in workforce practices and public policies to adjust for retirement transition among older workers.

### RETIREMENT TIMING AND SUBJECTIVE WELL-BEING: AN INSTRUMENTAL VARIABLES APPROACH

E. Calvo[1], C. Tamborini[2], N. Sarkisian[3], *1. HAVARD UNIVERSITY, Boston, Massachusetts, 2. US Social Security Administration, Washington, District of Columbia, 3. Boston College, Chestnut Hill, Massachusetts*

This article explores the relationship between retirement timing and subjective well-being at the onset of the retirement transition. Using panel data from the Health and Retirement Study (HRS), and instrumental variable techniques, two-stage Probit regression models estimate the effect of retirement timing on subjective health and feelings, while controlling for a large range of determinants of well-being, including pre-retirement health and feelings, prior job characteristics, and the retirement context. The results provide evidence supporting the hypothesis that the response of subjective well-being to retirement differs according to the timing of the transition. Both very early and very late retirement transitions are more likely to be detrimental for subjective well-being. Interestingly, workers who begin their retirement transition around age 62, Social Security's early eligibility retirement age, experience the greatest relative improvements in subjective well-being. The importance of cultural expectations and institutional cues attached to age transition patterns are underlined as potentially important structural factors shaping subjective well-being changes among workers transitioning to retirement. Policy and theoretical considerations from the findings are discussed.

### TRANSITIONING TO RETIREMENT AND THE EFFECTS OF SOCIAL TIES ON LIFE SATISFACTION

K.A. Zurlo[1], T. Kim[2], *1. Rutgers University, New Brunswick, New Jersey, 2. Adelphi University, Garden City, New York*

Transitioning to retirement is a critical phase in the life course. Although researchers have focused on the importance of life satisfaction as it relates to retirement, little research has been conducted measuring different types of social support as they relate to life satisfaction among retirees. Based on social capital theory, we empirically investigate the relationship between life satisfaction and social ties among retired adults. This research consists of a quantitative analysis using two components of the Health and Retirement Study, the core survey and a Psychosocial Leave-Behind Participant Lifestyle Questionnaire. To manipulate dyadic data structure, we analyzed the data with Hierarchical Linear Modeling. Our results indicated that there is a significant relationship between social support and life satisfaction among retirees. As levels of social support increase, life satisfaction increases. We separately analyzed the effect size for four different types of social support, measured by the relationship type and include: spouse/partner, children, other family members, and friends. We found that three of the four types of social support are significant. They include: spouse, children, and friends, where spousal support has the largest effect size. The implications of this study apply to social work practice, policy, and research. Gerontological social workers are in a key position to assist older adults build stronger social networks through their relationships with their spouse, children and friends. We recommend that practitioners, educators and policy makers work to integrate content on social support into the curriculum for health care providers, geriatric practice protocols, and health policy.
